THE PARABLES

READ IN THE LIGHT OF THE PRESENT DAY.

BY THOMAS GUTHRIE, D.D.

INTRODUCTORY.

ONCE saw Moffat, the South African missionary, address a thousand children—the most formidable congregation, in one sense, before which any speaker could appear. The difficulty, after having aroused their attention, of keeping it awake, was increased on that occasion by two things. His address extended beyond an hour, and the time was evening, when sleep is so apt to fall on young eyes; yet there was not a sleeper in the whole house. The sea of young faces was all turned radiant on the orator; he was the centre for two thousand eager glancing eyes; and for more than the time usually occupied by a sermon he held his audience by the ears. It was a great achievement: and how accomplished? In a very simple way. Suiting the action to the word, and drawing on his own observation and experience, he told them stories, illustrative of the labours and purposes, of the difficulties and dangers of a missionary's life. In giving this form to an address which was not childish, though suited to children, he dexterously availed himself of one of the strongest and earliest developed principles of our nature. How often have I seen a restless boy, whom neither threats nor bribes could quiet, sit spell-bound by a nursery tale! We can all recollect the time when we sat listening to a mother's or nurse's stories for long hours around the winter hearth. So passes the time with the soldier by his watch-fire; with the sailor on the lonely deep; and so, when the day's journey is done, and tents are pitched, and they have had their evening meal, the Bedouin, seated beneath a starry sky, on

the sands of the silent desert, will spend half the night.

Now, parables are just stories; they are told for instruction through means of entertainment; and when Moffat, by anecdotes, analogies, and illustrations, sought to win the attention of his hearers, and convey truth into their hearts, as the arrow, by help of its feathers, goes right to the mark, he was only copying his Master. No addresses recorded in history, common or sacred, have so much of the parable character as our Lord's. Not dry bones, nor, though skilfully put together, mere naked skeletons, they are clothed with flesh and instinct with life. Man has a threefold character; he is a being possessed of reason, of affection, and of imagination; he has a head, a heart, and a fancy. And now proving, and now painting, and now persuading, our Lord's discourses, unlike dry and heavy sermons, along with the strongest arguments, the most pointed and powerful appeals, are full of stories, illustrations, and comparisons; and by this circumstance, as well as by the divinity of his matter, and the blended mildness and majesty of his manner, we explain the fact that Jesus was the prince of preachers,—one whom the common people heard gladly, and who, in the judgment even of his enemies, spake as never man spake. The suitableness of this style of preaching a gospel, intended as well for the unlearned as the learned, for converting the unlettered poor, whose souls are as precious in God's sight as those of philosophers or kings, is obvious; and was well expressed by a

humble woman. Comprehending best, and most interested and edified by those passages of Scripture which present abstract truth under concrete forms, and of which we have examples in such comparisons of our Lord's, as these—the kingdom of heaven is like unto a grain of mustard seed, unto a treasure, unto a merchant, unto a householder, unto a king, she said, "I like best the *likes* of Scripture." These are all parables, a form of speech which our Lord used, indeed so often, and to such an extent, that the evangelists say, "Without a parable spake he not unto them." Occasionally used to conceal for a time the full meaning of the speaker, the chief and common object of a parable is by the story to win attention and maintain it; to give plainness and point, and therefore power, to truth. By awakening and gratifying the imagination, the truth finds its way more readily to the heart, and makes a deeper impression on the memory. The story, like a float, keeps it from sinking; like a nail, fastens it in the mind; like the feathers of an arrow, makes it strike, and, like the barb, makes it stick.

While Parables differ from fables, also a very ancient form of speech and instruction, in this, among other things, that fables use the fanciful machinery of beasts and birds and trees, they are allied to proverbs and allegories. They are stories of events that may or may not have happened, but told for the purpose of conveying important truths in a lively and striking manner. They need not be in words; they may be acted; and sometimes men inspired of God, have, instead of telling, acted them with dramatic power. Go, said the Lord to Jeremiah, and get a potter's earthen bottle, and take of the ancients of the people, and of the ancients of the priests; and go forth unto the valley of the son of Hinnom, and proclaim there the words that I shall tell thee. To his summons they assemble, and the preacher appears—nor book, nor speech in hand, but an earthen vessel. He addresses them. Pointing across the valley to Jerusalem, with busy thousands in its streets, its massive towers and noble temple glorious and beautiful beneath a southern sky, he says, speaking as an ambassador of God, I will make this city desolate and an hissing: every one that passeth thereby shall be astonished and hiss: I will cause them to eat the flesh of their sons and the flesh of their daughters, in the siege and straitness wherewith their enemies and they that seek their lives shall straiten them. He pauses—raises his arm—holds up the potter's vessel—dashes it on the ground; and planting his foot on its shivered fragments, he adds, Thus saith the Lord of hosts, Even so will I break this people, and this city, as one breaketh a potter's vessel. The scene, the aspect of the man, the beautiful but fragile vase, the crash, the shivered fragments, these, all-important aids to the speaker, were calculated to make an impression through the senses and the fancy, much deeper than the mere message could have done.

After the same manner, we find another acting

his parable, charged also with a burden of coming sorrows. To the amazement of the people, setting them all a wondering what he could mean, Ezekiel appears one day before them with fire, a pair of scales, a knife, and a barber's razor. These were the heads, and doom was the burden of his sermon. Sweeping off, what an Eastern considers it a shame to lose, his beard, and the hair also from his head, this bald and beardless man divides them into three parts; weighing them in the balance. One third he burns in the fire; one third he smites with the knife; and the remaining third he tosses in the air, scattering it on the winds of heaven. Thus—he himself representing the Jewish nation; his hair the people; the razor the Chaldeans; the cutting off of the hair impending national disgrace; the balances, God's righteous judgment; the part burnt, those destroyed in the city; the part smitten with the knife, those slain when attempting to escape; and the remaining part scattered to the winds, the dispersion of the survivors,—by this acted parable, and in a way most likely to imprint the truth on their memories and impress it on their hearts, he foretells the desolations that were impending over them.

The Parable may assume a variety of forms, but the rule of interpretation is the same in all cases. The nearer we can make everything in the parable apply, and stand out as the medium of an important truth, so much the better. But while there may be a meaning in many of the circumstances, the clothing, as you might say, of the story—and it is our business to find that out—any attempt to regard everything as charged with a distinct meaning, to find a spiritual truth in each minute circumstance, would often land us in the regions of fancy; and sometimes in those of error. Take, for example, the parable of the Rich Man and Lazarus. Our Lord represents Abraham and Dives as talking to each other across the gulf which yawns, unbridged, between heaven and hell. But are we to infer from this that the intercourse of this world is maintained in the other, and that sighs or sounds of misery disturb the blessed rest of the saints of God? Certainly not. It would be as contrary also to all that we believe, to infer from the rich man expressing a desire for the welfare of the brothers he had left behind him, that virtues grow amid these fires which grew not in the more genial clime of earth. The lost are not certainly improved by their association with devils. If the longer in prison the greater criminal, the longer in perdition the greater sinner! The dead fruit grows more rotten, and the dead body more loathsome in its change to dust; even so they that are filthy shall not only be filthy, but shall be filthier still.

Take another example in the parable of the Ten Virgins. I read that as a solemn warning. It calls us to be up and doing; to hold ourselves ready for the Lord's coming, since we know neither the day nor the hour the Bridegroom may come; to work while it is called to-day, seeing how the night

THE PARABLE OF THE LEAVEN.

cometh when no man can work—when shops are shut, and there is no oil to buy. But if, allowing nothing for what might be called the drapery of the story, we are to find divine truth set forth not only in the main but in the minor circumstances, in every particular of the parable, see where this leads us! There were five wise and five foolish; five taken in, and five shut out, to whose applications for admission, and earnest, long, loud knocking no answer came but, The door is shut. The first five represent the saved, and the second the lost. But are we to infer, since the number of the wise and the foolish virgins was equal, that the lost are as numerous as the saved? This would be a dreadful, and, I venture to say, a very rash conclusion. Nowhere has God revealed such solemn secrets. Our Lord rebuked the curiosity that asked, Are there few that be saved?—replying, Strive to enter in at the strait gate, for many, I say unto you, will seek to enter in, and shall not be able. To force such an utterance from the parable, to conclude because there was an equal number of wise and foolish virgins, that the lost are as numerous as the saved, has no warrant in the Word of God, and is contrary to the ideas we fondly cherish of Christ's final, glorious, and most

triumphant conquest. If, at the close of the war, Satan retains half his kingdom, his head is not crushed, nor, if he carries off half his forces from the battle-field, is he defeated, as I would hope he shall be. We cling to the hope that equal numbers will not stand on the right and on the left hand of the Judge, and that the wail of misery, piercing as it is, shall be drowned and lost in the louder burst of praise. It were a sad account of any government were half its subjects immured in prison; and I would not believe without the strongest evidence that under the reign of a benign and merciful God, and notwithstanding the blood poured out on Calvary, that half the inhabitants of a world are lost upon which the Saviour descended on wings of love, while his angel escort sang, Glory to God in the highest, and on earth peace, goodwill toward men.

In explaining a parable, what we are therefore to seek is its great central truth, the one, two, or three grand lessons which the story was told to teach—setting aside such parts as are no more than colour, clothing, drapery thrown around it, to impart life and interest. Keeping this in view, let us now turn to study this woman at her household work, and learn the lesson that she teaches.

I.—THE PARABLE OF THE LEAVEN.

“The kingdom of heaven is like unto leaven, which a woman took and hid in three measures of meal, till the whole was leavened.”—MATTHEW xiii. 33.

The Kingdom of Heaven is sometimes used in Scripture as equivalent to the kingdom of God, but it has not here the wide meaning of that expression. There are kingdoms, our own for instance, which embrace so many different and such distant countries, that, as is said and boasted of, the sun never sets on them—before he has set on one province he has risen on another. But how much greater the kingdom of God? The sun never sets on it! The sun never rose and shone but on a corner of it. Its provinces are not countries, nor even continents, but worlds. It stretches not from shore to shore, but from sun to sun, and from star to star. Its extent was never surveyed; its inhabitants never numbered; its beginning never calculated. It had no beginning, and it has no bounds. Its beginning is in eternity, and its bounds are lost in illimitable space. Over this kingdom, which includes heaven and hell, the angels that kept and those that lost their first estate, all things visible and invisible, Jehovah reigns—glorious in counsel, fearful in praises, continually doing wonders. Sole monarch of this empire, he has made all things for himself, yea, “he hath made the wicked for the day of evil.”

It is not of this, but of the gospel kingdom, or the kingdom of grace, that the parable speaks; and before showing how it is like leaven, we may turn our attention on some of its peculiar characteristics.

Different and distinct from that kingdom of Jehovah's power and providence, which embraces all created beings from angels down to insects, this has men alone for its subjects. It does not concern itself, unless indirectly, with matter, but only with mind; controlling not the waves of the sea or the winds of heaven, but what are more uncontrollable than either, the passions and wills of men. Again, this kingdom is felt, but not seen; “the kingdom of God cometh not with observation:” it is in the world, but not of it; “My kingdom is not of this world,” said Jesus; “if my kingdom were of this world, then would my servants fight:” a spiritual kingdom, its foundations have been laid in the death of its King, and, with a far higher object than any for which mortal men are raised to tottering thrones, its purpose is the salvation of lost, but precious and immortal, souls.

See how many and important differences there are between it and any earthly kingdom! There never was a man born in it; but many have been born for it. Its subjects are all twice born; for “except a man be born again, he cannot enter into the kingdom of heaven.” Never in a sense did an old man enter its gates; for who would enter here must retrace his steps along the path of life; return the way he came, and, born again, become a little child. Calling a little child to him, Jesus set him in the midst of them, and said, Verily I say unto

you, Except ye be converted, and become as little children, ye shall not enter into the kingdom of heaven. There gold, for which so many here slave, and drudge, and scheme, and sin, is reckoned of no more value than common dust. They buy and sell, indeed; buy the most precious wares, bread of life, immortal beauty, sinless purity, pearls of great price, and crowns of eternal glory; but then it is without money—what is priceless is got without price, got for the asking: "Whatsoever ye ask in my name believing, ye shall receive." And so far from gold being of any advantage here, it is rather an encumbrance than otherwise: "It is easier," said the King, "for a camel to pass through the eye of a needle, than for a rich man to enter the kingdom of heaven." Nor is that which secures man great advantages here, industry, sobriety, honour, honesty, or virtue, any passport into this kingdom; the worst are as welcome as the best: "Whosoever cometh unto me," says the King, "I will in no wise cast out." Beggars whom armed sentinels would challenge, and servants turn from the gates of earthly palaces, are here admitted as freely as the highest nobles. See there, outside the gate, the Pharisee! while the poor, despised, detested publican who stood afar off, beating his breast in conscious guilt, is invited in, and, going down to his house justified rather than the other, sings with Hannah, "The Lord bringeth low and lifteth up; he raiseth up the poor out of the dust, and lifteth up the beggar from the dunghill, to set them among princes." Yes, this is the kingdom for the poor! In its palace there are more peasants to be met than peers; many subjects and few kings. In your earthly kingdoms the rich and noble carry off the lion's share. It is high-born men and women that fill high places, and stand near our Queen's throne; but this kingdom bestows its noblest honours on the humble, the poor, the obscure, the meek, the lowly; for "to the poor the gospel is preached," and "not many mighty, not many noble are called." More extraordinary than any of these things, all the ordinary rules of other kingdoms are reversed in this. Here, the way to grow rich is to become poor—the path to honour lies through shame—to enjoy rest we must plunge into a sea of troubles—peace is only to be enjoyed in a state of war—who would live must die—and who would gain must part with all that men hold most dear: Verily, verily, says the King, there is no man that leaveth father, or mother, or wife, or children, or houses, or lands, for the kingdom of God's sake, who shall not receive manifold more in this life, and in the world to come life everlasting. Blessed are they who have been brought into this kingdom! Robed in the white linen of Christ's righteousness, they shall be priests, and, crowned with glory, they shall be kings to God.

In regard to the leaven to which our Lord likens the kingdom of heaven, it may surprise some to find that which is usually employed in a bad sense

otherwise employed here. I am aware that leaven is often, and indeed usually, in the Sacred Scriptures, an emblem of sin; and a very suitable one it is, seeing, as is known to all who are familiar with its action in household or other arts, that it changes the natural properties of those substances on which it acts, breeds in liquids a poisonous gas, and applied to meal, for instance, swells it up and sours it. But to infer from this that leaven stands here for unsound doctrine and ungodly practice, and that the parable itself is a prophetic description of the corruptions which early crept into the Church of Christ, and had leavened and corrupted the whole mass of Christendom in the dark ages of Popery, were inconsistent with the plain meaning of the parable; and is not required by the rules which should guide us in studying the Word of God. There are other instances in which the sacred writers employ a figure, sometimes in a good sense, sometimes in a bad one. For example, Satan is compared to a lion; and what emblem could be more appropriate, if you take into account its cruel nature, its stealthy approach, its frightful roar, its terrible aspect, its bloody jaws, its ravenous appetite, and the death that follows a blow of its paw? Yet if the destroyer of souls is a lion, so is their Saviour; he is "the Lion of the tribe of Judah." The other most common scriptural emblem of the devil is a serpent. It was in the form of that reptile he stole into Eden; and, with malice gleaming in its fiery eye, poison concealed in its crooked fangs, fascination in its gaze, death in its spring, and this peculiar habit, that while other creatures usually content themselves with a portion of their prey, the serpent, crushing the bones and covering the body with slime, swallows it entire—the animal world furnishes no creature that represents so well the deceiver and destroyer of souls as this hateful, horrid reptile. But who, on the other hand, does not know that a serpent was employed as a type of the Redeemer? Referring to that scene in the desert, where, raised high upon a pole, the brazen serpent gleamed over the dying camp, and whosoever caught sight of it revived and lived, our Lord says, As Moses lifted up the serpent in the wilderness, even so must the Son of man be lifted up, that whosoever believeth in him should not perish, but have eternal life.

Having removed a difficulty which has staggered some and set others on a wrong track, we are now ready to see in what respects the kingdom of heaven is like unto the leaven which this woman takes and hides in meal till the whole is leavened. We may understand our Lord as describing either the influence of the gospel on the world, and its final universal manifestation; or the influence and operation of divine grace on those in whose hearts the Spirit of God has lodged it. The parable may be applied either way; but we prefer the latter.

I.

The woman takes the leaven to lay it not on, but in the meal, where, working from within outwards,

it changes the whole substance from the centre to the surface. It is through a corresponding change that the man goes to whom the Spirit of God communicates his grace. It is hidden in the heart. The change begins there; the outward reformation not preparing the way for regeneration, but springing from it; growing out of it as a tree grows out of its seed, or a stream flows out of its spring. Observe that this view is in perfect harmony with God's requirement, "Give me"—not thy habits, or thy service, or thy obedience, but "thy heart, my son;" in perfect harmony, also, with his promise, "I will take away the stony heart out of your flesh, and I will give you an heart of flesh, and I will put my Spirit within you"—then, as following such a change, "I will cause you to walk in my statutes, and ye shall keep my judgments and do them;" and in perfect harmony also with the remarkable saying of our Lord, "The kingdom of God is within you;" in other words, religion does not lie in the denomination we belong to, in attendance on churches whose stony fingers point to heaven, in having a pew in the house of God, or even an altar in our own, in professions of piety, or even in works of benevolence. It lies in the heart. If it is not there, it is nowhere; these other things being but the dress which may drape a statue, and give to a corpse the guise, or rather the mockery of life. In consequence of its being lodged in their hearts, true Christians, so far from being hypocrites, have more of the reality of religion than of its appearance. They are better than they seem to be; and less resemble those fruits which, under a painted skin, and soft, luscious pulp, conceal a rough, hard stone, than those within whose shell and husky covering there are both milk and meat. With more religion in his heart than you would infer from outward appearances, or than he is able to carry out in his daily life and conversation but after a long struggle with old habits, a converted man may be like Lazarus, when, standing before his tomb still bound in grave-clothes, he looked as much like a dead man as a living. Even Paul himself said, The good that I would, I do not; but the evil that I would not, that I do. His heart, burning with love to Christ, set on fire not of hell but heaven, was better than his habits; his desires were purer than his deeds; his aims were loftier than his loftiest attainments. And those who, though it is a confession of shortcoming, can say so of themselves, have good reason to hope that the leaven has been hid in the meal. Their hearts have received that grace which works in holy desires toward holy efforts; and which shall never cease to work till, extending its influence over all their nature, the whole is leavened, and they, however imperfect now, become perfect men in Jesus Christ.

II.

Suppose that the woman, taking, instead of leaven, a stone—a piece of granite, a common pebble, or even a precious jewel, any metal such

as gold or silver, or any like inert and inactive substance, had placed that in the heart of the meal, the meal had remained the same; changing neither to stone nor metal. But so soon as leaven is imbedded in its substance, a change immediately ensues; a process of fermentation is set a-going, and, extending from within outwards, goes on till by a law of nature the whole lump is leavened. Neither art nor nature could supply a better simile of the grace of God than this. An active element, so soon as it is lodged in the heart, it begins to work; nor ceases to extend its holy influence over the affections and habits, the inward and outward character, till it has moved and changed the whole man, and that consummation is reached which is to be devoutly wished for, and which the Apostle prays for, in the words, May the very God of peace sanctify you wholly.

There are influences which may powerfully affect without permanently changing us. There may be motion, and even violent emotion, without change. In the valley where Ezekiel stood with the mouldering dead around him, there was motion—the bones were shaken. He saw bone approach bone, till, each nicely fitted to the other, they formed perfect skeletons; and, clothed with flesh and covered over with skin, each seemed a warrior taking his rest, and sleeping on under a wizard's spell till his sword had rusted beside him. Still, in all that was essential they were unchanged; as breathless, lifeless, dead, as when the bones lay scattered, withered, and dry on that old field of battle. To borrow an illustration from familiar objects—the sea which reflects like a liquid mirror ship and boat that lie sleeping on its placid bosom, is thrown by the storms of heaven into the most violent commotion. Its calm depths are stirred, and foaming breakers beat its shore; but it is still the salt, salt sea. And when the wind falls and the storm blows past, and waves sink to rest, it presents the same characters as before—the tempest came and the tempest went, nor has left one trace behind. So it is, alas, too often and too much with the impressions of sermons, and sacraments, and revival seasons.

All changes truly are not from bad to good, or good to better. They may be from good to bad, or from bad to worse. Moisture dims the polished blade, and turns its bright steel into dull, red rust; fire changes the sparkling diamond into black coal and grey ashes; disease makes loveliness loathsome, and death converts the living form into a mass of foul corruption. But the peculiarity of grace is this, that like leaven it changes whatever it is applied to into its own nature. For as leaven turns meal into leaven, so divine grace imparts a gracious character to the heart; and this is what I call its assimilating element. Yet let there be no mistake. While the grace of God changes all who are brought in conversion under its influence, it does not impart any new power or passion, but works by giving to those we already have a holy bent; by

impressing on them a heavenly character. For example, grace did not make David a poet, or Paul an orator, or John a man of warm affections, or Peter a man of strong impulses and ardent zeal. They were born such. The grace of God changes no more the natural features of the mind than it does those of the body—as the negro said, it gave him a *white* heart, but it left him still, to use the language of another, the image of God carved in ebony. Be the meal into which that woman hides the leaven, meal of wheat or meal of barley, it will come from her hands, from the process of leavening, from the fiery oven, cakes of the same grain. For it is not the substance but the character of the meal that is changed. Even so with the effect of grace. It did not give John his warm affections; but it fixed them on his beloved Master—sanctifying his love. It did not inspire Nehemiah with the love of country; but it made him a holy patriot. It did not give Dorcas a woman's heart, her tender sympathy with suffering; but it associated charity with piety, and made her a holy philanthropist. It did not give Paul his genius, his resistless logic, and noble oratory; but it consecrated them to the cause of Christ—touching his lips as with a live coal from the altar, it made him such a master of holy eloquence that he swayed the multitude at his will, humbled the pride of kings, and compelled his very judges to tremble. It did not give David a poet's fire and a poet's lyre; but it strung his harp with chords from heaven, and tuned all its strings to the service of religion and the high praises of God. So grace ever works! It assimilates a man to the character of God. It does not change the metal, but stamps it with the divine image; and so assimilates all who have received Christ to the nature of Christ, that unless we have the same mind, more or less developed, in us that was in him, the Bible declares that we are none of his.

III.

It is said of the meal in which the woman hid the leaven, that "the whole," not a portion of it, large or small, "was leavened." The apostle brings out the same diffusive character of this element where he says, "A little leaven leaveneth the whole lump." Even so, teaching us not to despise the day of small things, a little grace lodged in the heart spreads till it sanctifies the whole man. Some things diffuse themselves rapidly. There are deadly poisons so rapid and indeed sudden in their action that the cup falls from the suicide's hand; he is a dead man before he has time to set it down. To these grace stands out in striking contrast, not only because it is saving, but because it is ordinarily slow in bringing its work to a holy and blessed close; and in that respect grace and sin correspond well to their figures of life and death. Five hundred summers must shine on an oak ere it attain its full maturity; and not less than twenty or thirty years spent in growth and progress must elapse ere an infant

arrives at perfect manhood—our mind has acquired its full power, our bones and muscles their utmost strength. And besides the lapse of so many years, how much care and watching, how much meat and medicine, are needed to preserve our life, and guard it from the accidents and diseases which are ever threatening its destruction! Yet this work of years it needs but an instant of time, a wrong step, a drop of poison, a point of steel, a pellet of lead, to undo. Death is perfected in a moment; the shriek, the prayer may die unuttered on the lips. Look at Adam! Sin, a sudden as well as subtle poison, shoots like lightning through his soul; and he falls in a moment, in the twinkling of an eye, from the state of a pure and happy, into that of a sinful, and wretched, and lost, and ruined being. Unless in such rare and extraordinary cases as that of the dying thief, what a contrast to this the progress of the best in grace? Years have come and gone, perhaps, since we were converted, and how many Sabbaths have we enjoyed, how many sermons have we heard, how many prayers have we offered, how many communions have we attended, how many providences have we met to help us on in the divine life—goodnesses that should have led us to repentance, and waves of trouble that should have lifted us higher on the Rock of Ages, and yet, alas! how little progress have we made, how far are we from being perfect as our Father in heaven is perfect! Have we not learned, by sad experience, that there is nothing so easy as to commit sin, and nothing so difficult as to keep out of it—even for one hour to keep the heart holy, and the garment unspotted of the world? It seems as natural for man to fall into sin as it is for water to sink to the lowest level, or for a stone to fall to the earth. But to rise! ah, that requires such sustained and continuous efforts as those by which the lark soars to the skies, through constant beating of its wings. The devil can make man a sinner; nor is there a poor, miserable, mean, wretched creature but may tempt us into sin. But it needs the Almighty God to make a man a saint. The vase, statue, beautiful machine which it required the highest skill and long hours of thought and labour to make, may be shattered by the hands of a madman or of a child.

Still, let God's people thank him, and take courage. Though grace, unlike sin, and like leaven, is slow in its progress, it shall change the whole man betimes; and the motto which flashed in gold on the High Priest's forehead shall be engraven on our reason, heart, and fancy; on our thoughts, desires, and affections; on our lips, and hands, and feet; on our wealth, and power, and time; on our body and soul—the whole man shall be "Holiness to the Lord."

These three characters of grace form three excellent tests of character, of the genuineness of our religion. It is internal: have we felt its power within us, on our hearts? It is assimilating: is

it renewing us into the likeness of Jesus Christ, into the image of God? It is diffusive: is there a work begun in us, and on us, which shall at length "sanctify us wholly"? If not so, we need to begin at the beginning—by the Holy Spirit of God to be born again. But if so, though in many respects defective, and having often to confess with Paul, "The good which I would I do not, and the evil which I would not, that I do," happy are we! Happy are the people that are in such a case, for the Lord will perfect that which concerneth us—the whole shall be leavened.

Be it our business, by earnest prayer and diligence, to hasten on such a blessed consummation; and also to bring the grace that is within us to act as well without as within! No candle is lighted for itself: no man lights a candle to lock the door, and leave it burning in an empty room. We are not lighted for ourselves; nay, nor leavened for ourselves. No man liveth for himself. Let us be

as leaven in our families; among our friends and fellows; in the neighbourhoods around us. Nor let us rest till there is not one within the sphere of our influence whom we have not, through God's blessing, leavened, or attempted to leaven, by our grace. Freely we have received; freely give! At the fires of our piety let others be warmed; at the light of our grace, let other lights be kindled. Let us act like leaven on the inert, dead mass around us—every living Christian a centre from which living influence shall emanate toward all around him. Were we so, how soon would the dull mass begin to work, ferment, move, and change! Then would it be seen, to the glory of God, and the wellbeing of society, and the happiness of many a family, and the saving of many souls, that through the influence of those who had little influence, and seemed to have none, as in the case of a humble domestic or little child, that "a little leaven leaveneth the whole lump."

ON THE CHARACTERISTICS OF THE AGE.

EVERY age has its characteristics; some noble and generous, others criminal and degrading. To strike the fetters from the slave—to give freedom to oppressed communities—to carry the lights of education into the haunts of ignorance and crime—to propagate the gospel among heathen and barbarous tribes—to reform the corruptions of unprincipled governments, have been characteristics of times that have gone by,—blessed characteristics, that cannot fail to shed their benign influence over the future.

At other times the age is characterized by revolutions, and outbursts of human passion, which threaten us with a relapse into social disorder or primitive barbarism. Amid such convulsions, war—the incarnation of crime—the bloody game at which nations delight to play, is ever ready, with its motives of conquest or revenge, to exhibit deeds of savage ferocity, in which the Christian soldier sinks into the hyæna or the tiger.

When the war-cry has ceased, and the tocsin is dumb, humanity seeks for some new excitement in the discussion of principles and opinions which startle us by their extravagance, and run counter to every article of our faith. Were we to characterize the passing age we should describe it as remarkable for its love of the mysterious and the marvellous, its passion for the supernatural, and its morbid craving for what the eye cannot see, nor the ear hear, nor the judgment comprehend. To those who have lived much and long in the world nothing is more curious than to study those social epidemics, and vulgar superstitions, which in less than very quarter of a century rise and culminate and decline, giving way to others equally startling and ephemeral. Some of these heresies claim admission into the temple of science, as the result of

observation and experiment, while others, less subject to the scrutiny of reason, appeal unblushingly to the evidences of our bewildered senses. But whatever be their character, one general principle pervades them all. They all seek to know, by some short-hand and easy process, accessible to the meanest capacity, what is not permitted to be known, if known at all, but from careful study and observation. Instead of gathering the moral character of individuals from their daily walk and behaviour, and their intellectual character from their conversation, their writings, or their professional success, the Phrenologist finds all this information, and much more, like a ready-made article, stereotyped in the inequalities of his skull, presuming that the same inequalities consist in the brain which it encloses. The Physiognomist of form seeks the same information in the shape of the head, nose, hands, and feet, of his neighbour. The philosopher of the boudoir describes the soul of her correspondent oozing out of the tips of her thumb and two digits, thus giving evidence under her own hand of her virtues or her vices. The Animal Magnetist finds in an *odylic force* a new power over matter, which, issuing from the hand, turns tables, lifts them from their place, and even suspends a living body, like Mahomet's coffin, in the air. The mesmerized clairvoyante sees without eyes and hears without ears. To see through a millstone is one of her easiest achievements, for she can take cognizance of her antipodes through the 8000 miles of earth and ocean which intervene! The Phrenomesmerist is not content with seeing the moral and intellectual condition of his neighbour in the inequalities of his head; he draws them forth by his *odylic touch*, making the musician sing, the pietist pray, the fool laugh, and the madman rave. The

Magnetoscopist goes much farther. He makes each of the thirty-six phrenological organs record its intensity numerically, by the range of a pendulum, which it puts in motion after the influence has passed from the bump to the pendulum through the body of the operator! The Glossologist—the inventor of a newly-started characteristic of the present year—unable to detect the seats of disease by patient observation—finds them painted in the slime which covers different regions of the tongue!

That such presumptuous speculations should become matters of faith in an age when knowledge is so widely diffused, appears at first sight incredible; but if we consider with what delight the half-educated and half-witted community must grasp at the opportunity of becoming at once philosophers and prophets, we see immediately the motive of the embryo charlatan, and discover the genus to which he belongs. Nor is it more difficult to understand how opinions thus fostered and propagated must entrap even individuals of the educated classes,—nay, even some real philosophers and statesmen. The phrenologist, the symbolist of human form, and the crinoline philosopher, record their respective powers in written characters deduced from the head, the hands, and the handwriting of their patients. Although it sometimes happens that there is not one word of truth in their verdict, yet it often turns out that some points in it are singularly true. Nay, it is probable that many ambiguous expressions may have the aspect of truth, and it is possible that the predicted character may have such an approximation to truth as to perplex even the sceptic. Though facts of this kind are mere coincidences, as we shall presently show, yet the moment they are known they rush along the gossip-wire of society, gaining strength as they pass, till they are received not merely as insulated facts, but are consecrated as general truths which establish the credibility of doctrines which would require hundreds of the same facts to give them even the shadow of probability.

Before entering more minutely into the subjects we have been discussing, we may ask the old and interesting question, "What is truth?" We would not venture to say what is moral, or metaphysical, or political truth, but we are bold enough to declare what is physical truth—that species of truth which is founded on observation and experiment. Physical truth, like mathematical truth, is what I can compel a man to believe, provided he is sufficiently instructed, and of a sound and unprejudiced mind. To such a test none of the speculations we have been considering have ever been submitted. No sceptic was ever compelled to believe them, and no *experimentum crucis*, as a test of physical truth, was ever offered in their support.

In confining ourselves to a brief notice of the newest and least known of the speculations to which we have referred, we could have wished to make an exception of phrenology as the basis of so many heresies, because it is really capable of

scientific treatment, and of being tried by the principles of inductive research; but its doctrines are so well known, and it has lingered so tenaciously among some excellent men, that we think it more prudent to leave it in the hands of our readers, and to ask them to judge of the parent by the character of his offspring. Two facts, however, in the history of the art, may amuse and perchance instruct the student.

When the celebrated Dr. Spurzheim came to Edinburgh in 1817, to teach his new anatomy of the brain, he was invited to dine with a distinguished phrenologist, and it was arranged that one of the children, who had a singular passion for music, should be brought in after dinner, and examined by the doctor. The boy came, but on his way to the head of the table, the lady mother, forgetting the object in view, said to Dr. Spurzheim, "This is the boy that has such an extraordinary passion for music;" thus disclosing the secret which the phrenologist was to have discovered. "Yes," said Dr. Spurzheim, after a slight inspection of the organ, "he will be very fond of Mozart's music." Sitting by him I asked the grounds of this opinion. "The boy," he replied, "has a large organ of ideality, and as Mozart's music is distinguished by its philosophical combinations, the boy must necessarily admire it." Without inquiring into the accuracy of this judgment, we proceed with our narrative. About ten years or upwards after this event, the writer of this article, and another gentleman, a stanch phrenologist, were dining with a large party at the house of a distinguished barrister, where the merits of Dr. Spurzheim were canvassed. Our phrenological friend adduced the above-mentioned prediction of the German *savant*, as at once a proof of his sagacity and of the truth of his art. Seated at the lower end of the table, he had not heard the lady of the house let out the secret of the boy's passion for music, and he had believed that Dr. Spurzheim had both discovered and characterized it. Thus did an erroneous impression of the fact linger in Edinburgh for ten years, and it probably lingers still, as an indisputable proof of the truth of phrenology, and the sagacity of its expounder.

During Dr. Spurzheim's visit to Edinburgh, he made known his peculiar views of the anatomy of the brain. Dr. John Gordon, a young lecturer on anatomy, prematurely cut off at the commencement of a distinguished career, had called in question the new doctrines. In order to explain and defend his views, Dr. Spurzheim gave two public demonstrations of the brain, which were attended by Dr. Gordon, and a great number of medical and other gentlemen. At the second demonstration, Dr. Gordon objected strongly to the accuracy of the dissections, and to the conclusions which were drawn from them.* An exciting discussion consequently

* See Ellis's *Life of Dr. Gordon*, 1823; and Gordon's *Estimate of the Claims of Drs. Gall and Spurzheim to discovery in the Anatomy of the Brain*, 1817.

took place, and as the public could not be supposed to know much about the brain, they were divided into two parties, the phrenologists and the anti-phrenologists, or the Spurzheimites and the Gordonites.

In this strife of parties, Mr. Alexander Nasmyth, the celebrated landscape painter, sent to his phrenological friend, Dr. —, the cast of a remarkable head. The cast was carefully examined, and its high moral and intellectual development duly recorded, and presented to the artist. But, alas! for science, the cast had been taken from a remarkable turnip that had presumed to compete with the craniology of man. The result of the experiment was instructive as well as amusing. It outweighed a thousand arguments, and gave occasion to the following lament:—

“The Tide of Fame to Spurzheim’s name
Rolled o’er the German deep;
The tide was Spring, but fickle thing,
It now has ebbed to *Neap!*”

Passing over the pretensions of table-turners, clairvoyantes, and phreno-mesmerists, and the infamous and disgusting impostures of spirit-rapping and spirit-raising, we shall endeavour to give our readers a distinct account of the more elegant German speculation, called the *Physiognomy of the Human Form*. The avowed object of this new art is “to teach men how they may, with little trouble, ascertain the characters of their neighbours.” The fundamental assumptions on which it rests are “that the outer form of man has been divinely designed on purpose that the inner mind may be known to those who watch the outer man,” “that the invisible is revealed in the visible,” “that the body is the image of the mind,” and that every man’s mental nature may be discovered in his external form. The physiologist who has taken the most active part in advocating these opinions is Dr. Carus of Dresden, physician to the late King of Saxony, and so eminent professionally that he was recently elected a corresponding member of the Imperial Institute of France. He travelled in Scotland some years ago with the King, and has published a very interesting account of his journey, which has been translated into English. Having on that occasion spent several days with him at Taymouth, under the hospitable roof of that most excellent nobleman, the late Marquis of Breadalbane, and had an opportunity of appreciating his moral as well as his intellectual character, nothing but a sense of duty could have induced us to criticise the speculations I have referred to, and had they remained, as they were published, in the German tongue, we should not have ventured to bring them into public notice. They have been adopted, however, and extended both by French and English writers, and having been brought prominently forward and defended in one of the most religious, conservative, and best circulated

quarterly journals of the day, they have taken an aggressive position which it is a public duty to assail.

The leading argument in favour of the new physiognomy called “The Symbols of the Human Form,” is derived “from the nearly universal assent to it implied in the practice of judging of men by their personal appearance.” Addison, for example, asserts that “every one forms to himself the character and fortune of a stranger from the features and lineaments of his face;” and that “when he meets a man with a sour shrivelled face he cannot forbear pitying his wife.” Fielding conceived that “it is owing to want of skill in the observer that physiognomy is of so little use and credit in the world.” Cowper tells us “that faces are as legible as books,” and that his “skill in physiognomy never deceived him.” Sir Thomas Browne alleges that there are “characters in our faces which carry in them the mottos of our souls,” and that the countenance proclaims the heart and inclinations. Now all this is common physiognomy, in which we all profess to be adepts, but we never believe that the “features and lineaments” from which we form our judgments, are original in the human face, or “divinely” placed there for any special purpose. That the emotions of the past and the present leave permanent traces on the human countenance is often true. Among all classes of society we encounter faces which we instinctively shun, and others to which we as instinctively cling; but it is out of our power to discover the causes of these abnormal features, or the moral and intellectual condition which is supposed to underlie them.

“I do not like thee, Dr. Fell,
The reason why I cannot tell;
I do not like thee, Dr. Fell,—

must be the language of every modest physiognomist, who feels how falsely the world would have interpreted the sad and ruffled expression which may have occasionally darkened his own honest and happy countenance. In judging of the temper and character of a stranger, or of a neighbour, how often have we found our estimate to be false! The repulsive aspect has proved to be the result of physical suffering, or congenital malformation, of domestic disquiet, or of ruined fortunes, and under the bland and smiling countenance, a heart deceitful, vindictive, and “desperately wicked,” has frequently been concealed. The countenance, too, which in youth and manhood was noble and benign, we may have seen scarred in the battle of life, and furrowed with the deep lines which the baseness of friends and the injustice of the world never fail to imprint. And when the manly aspirant after wealth or fame has been cruelly worsted in the race of ambition, and has displayed on the outer man the impress of the emotions that disturbed him, how often have we seen him, when the world had smiled upon his lot, resuming the joyous expression of his early days which misfortune had but temporarily disguised!

* Carl Gustav Carus: *Symbolik der Menschlichen Gestalt*. Leipzig, 1859.

The danger of inferring character from lines and forms in the human countenance will more clearly appear if we examine large groups of individuals living under the same influences. In the haunts of vice, within the precincts of the jail, in the stock exchange, in the marts of commerce, and even in the Houses of Parliament, we shall find the same variety of form and expression, and the same difficulty in discovering virtue and vice in the human countenance. The criminal in the dock, charged with murder, will often bear an honourable comparison with the functionary who prosecutes him, the advocate who defends him, or the judge who tries him.

Hitherto we have been speaking of the physiognomy of *the human face*, in which all of us to a certain extent believe, and upon which we often act without doing violence to the character and interests of our neighbour. We may not court his acquaintance, and yet we may not offensively shun it. We may not seek his counsel, and yet we may not despise it if kindly proffered. The Christian physiognomist, in short, will form no harsh judgments from the countenance of his neighbour, and the severest sentence he will pass upon the uncomely stranger is, "that he would not like to meet him in the dark."

From this physiognomy, that of the "Symbols of the human form" is essentially different. It differs from it in its principles, in its practice, and in its tendencies. It assumes, as its fundamental principle, that the Almighty has fashioned the human body *on purpose* to represent the emotions and passions of the soul, and all the intellectual powers. And hence it follows that lines straight and curved, surfaces flat and round, angles acute and obtuse, parts great and small, coloured and colourless, are the indices of the highest spiritual functions, and, when carefully studied, that they will enable the physiognomist to lay bare the character of his neighbour, nay, even of "the beasts that perish." "There is a correspondence," says the reviewer, "between forms and minds in the lower animals, on the principle that an unusual likeness between the features of any person and those of some lower animal will indicate a corresponding likeness in their minds."

As the seat of intelligence is thus extended over the whole body, we may fairly inquire if such a doctrine is compatible with the anatomy of the present day. M. Flourens, the most distinguished of our anatomists and physiologists, has just communicated to the Academy of Sciences* the result of his researches on the brain. "I come now," says he, "to the most delicate difficulty of all those which I have raised. *This difficulty is that of the SEAT OF THE SOUL.* Those who have hitherto followed me cannot have any doubt about the precise seat of the soul. The seat of the soul, or of intelligence, is the brain (*cerveau*), properly so

called (the lobes or cerebral hemispheres). I add : It is the brain properly so called *as a whole (tout entier)*, and the brain properly so called *alone*. None of the other parts are the seats of intelligence."

Thus contradicted by anatomy in its fundamental principle, we shall not have to encounter many scientific difficulties in considering its details. According to Dr. Carus, the brain consists of *three parts*—the organs of the principal manifestations of the mind—namely, the intelligence, the feelings, and the propensities. The three divisions of the brain are—1. The cerebral hemispheres; 2. The encephalic ganglia which are covered by the hemispheres; and 3. The cerebellum in the back and lower part of the skull. The chief force and prevailing tendency of the mind is marked by the degree in which either of these three main divisions preponderates over the two. A well-formed, large head, with some predominance in the forehead, is symbolical of great intellectual power and of scientific genius. When there is a full and high arch in the mid-region of a large head, the feelings predominate, as in men of fervent piety, warm heart, and deep feeling. When the strength and the chief mass of a large head are in the hinder region, it indicates work and practical ability of "the mass of a people," not of philosophers or poets, but of men with strong and earnest will, from whom will spring persons with historic names. Breadth and good modelling in a large head indicate "a capacious and wide-expanding intellect," holding crowds of ideas, apprehending them clearly, and retaining them firmly in the memory. While large heads are symbolical of genius, small ones are often symbolical of talent. A frontal development in small heads gives woman an ascendancy over men. Heads altogether small, and without frontal development, indicate unsteadiness of character and immoderate excitement of feeling, and Dr. Carus tells us that "a great part of the misery of society issues from these heads!"

In quitting the symbols of the head, our readers will observe that Dr. Carus's system is incompatible with Phrenology, and his English expositor distinctly states, "that the phrenological division of the cerebrum into the assumed organs is *utterly inconsistent with physiology.*"

While the head is thus rich in symbols, it does not scorn to take a little help from the *hair*. Long, soft, and light hair in man "betrays a feminine or child-like character." Dark coarse hair in a woman reveals a masculine nature. Brown and black indicate activity, red and blonde passiveness. Lavater asserts that red hair characterizes a man singularly good or singularly bad, and he would not trust a man whose hair is very different in colour from that of his eyebrows.

The symbols of the *face* are transient, habitual, and inherent, the last of which only is the affair of the symbolist. The upper half of the face is the facial region of intellect and feeling; the lower

* *Comptes Rendus*, etc., Nov. 17, 1862, tom. lv. p. 745.

half of the propensities and will. The nose is primarily symbolical of variety of intellect, the eyes of varieties of disposition, and the mouth of varieties of sensuous character. The snub, flat, *retroussé*, and upturned nose, indicate meanness of intellect; the larger snubs indicate sensuous character; a turn-up, with wide nostrils, evinces "an empty and inflated mind." Large male noses, if not too fleshy or lean, are generally good signs; if Roman, they show strength of will; if Jewish or hawk-like, shrewdness; and if Greek and straight, a taste for the fine arts, and "astuteness and craft."

The eyes are the most telling feature, symbolizing the feelings rather than the will. Large eyeballs suggest brute force, and small ones meanness and feebleness. *The mental character may often be measured by the retina!* The colours, too, are important. A *pure white* indicates purity of mind; a *dirty yellowish white*, impurity. Dark-blue eyes indicate effeminacy; light-blue, grey, and green, hardness and activity; hazel, masculine vigour. So full of character is the eye that Dr. Carus pronounces it to be so richly symbolical, that instead of saying, "The style is the man," we might more justly say, "The eye is the man."

We cannot follow our physiognomists in their appreciation of the intellect and feeling which reside in the *brow*, the *mouth*, the *chin*, the *ear*, the *neck*, and the *trunk*.

The hands claim a brief notice. M. D'Arpentigny has written a book upon them, entitled *Chirognomie*, and speaks of the hands "as if they were the whole mind!" Dr. Carus reduces D'Arpentigny's *six* groups to *four*, namely, the *elemental*, the *motor*, the *sensitive*, and the *psychical* hand. The *elemental* hand symbolizes "a rough, unfinished mind;" such hands are those of "the mighty unwashed," and "make the show of hands at the hustings." The *motor* hand, strong, large-jointed, and broad-tipped, is that of the old Romans, symbolizing resolution and strength of will. The *sensitive*, or proper feminine hand, indicates, in man, feeling, fancy, and wit. The *psychical* hand, the rarest and most beautiful, indicates a rare mind, "with peculiar purity and grandeur of feeling."

The typical forms of the *foot* are the *elemental*, or the feet of the mass, "singly powerless, in multitude mighty;" the *sensitive motor* the proper foot of woman, "stamping a feeble and effeminate character;" the *athletic motor* of great size and strength of bone and muscle, indicating vehemence of will and a vigorous constitution.

In concluding our notice of the new physiognomy, we are met with a difficulty which fortunately has not disturbed its expounders. If head, face, trunk, eyes, nose, mouth, ears, and feet, all and each indicate the intellectual and moral character of their possessor, which of their various indications is to be accepted as true, for Dr. Carus has not ventured to conjecture even that they can possibly harmonize? In physiognomy, "the eye may now say to the hand, I have no need

of thee; and the head to the feet, I have no need of you."

If the reader has followed us intelligently in these details, he cannot but have come to the conclusion that the physiognomy of the human form is a daring and presumptuous speculation *without a single fact* to support it: and that in its social relations and intellectual bearing, it is full of danger. Even at the social board the phrenologist has some difficulty in scanning the bulging iniquities of his neighbour's brain, but the open countenance and the naked hand cannot be hid, and the symbolist who pledges with us the cup of kindness, may be peering into our infirmities; and he who "dippeth his hand with us in the dish," may be studying in the taper of our fingers, or in the shape of our nails, the proofs of imbecility or the indications of crime. A symbolist jury would be sorely tempted to modify their verdict from the lines and forms of the prisoner at their bar, even if they had applied the same test to the evidence of the witnesses; and the symbolist judge could hardly refuse, under the same influences, to shorten or lengthen the term of penal servitude. To desire more knowledge of our neighbour than is shown in his daily life, is to court an unenviable privilege, and to gratify a dangerous curiosity. Society could hardly have existed had such a power been conferred upon man; and if it is impertinently assumed, every exercise of it is either an offering to vanity, or a calumny against virtue. Nor is it less dangerous in its intellectual bearing. If the soul of man is inwrought into every part of his corporeal frame, modifying its outline and moulding its form—the body the woof, and the spirit the warp,—it cannot be otherwise than material.

While writing these pages, a new work was sent to us by its author, accompanied with the question, "Is the enclosed work a characteristic of the age?" The title of the volume* did not make this appeal to us very intelligible, but a glance at its pages revealed the fact that it contained a system of *Glossology*, or the *additional means of diagnosis of disease, to be derived from indications and appearances on the tongue!* Such a system we willingly recognise as a characteristic of the age, and as another of those bold attempts to take science by storm, by dispensing with the only sure though slow process by which inductive truth can be reached. Had we, from our public hospitals, numerous photographs of tongues exhibiting a connexion between their unclean phases and the diseases of their possessors, we should have considered Glossology as a valuable element of diagnosis; but our author has given us no such proofs of his art. He informs us that he discovered more than twenty years ago "that some of the most important organs of the body had a local position on the tongue, and that whenever

* *Ourselves, our Food, and our Physic.* By Benjamin Ridge, M.D., F.R.C.S.A.

disease of a distinctive character occurred in them, the corresponding portion of the tongue pointed it out." To these "new powers" he gives the name of *Glossology*, or "the laws of the fouling and cleaning of the tongue." In this system the tongue is divided into six tracts, each tract being double, and occupying a similar part on each longitudinal half of the organ. These tracts are—

1. The respiratory and lung tract.
2. The pleural tract, the general seat of pleurisy.
3. The stomach and digestive tract.
4. The large intestine tract.
5. The kidney tracts, and
6. The brain tracts.

As the merit of this new art can be readily tested by experiment we leave it in the hands of the Faculty, and recommend the photographer as a valuable auxiliary in the inquiry.

Though as extraordinary as the creation of the world out of nothing, we pass by the homœopathic characteristic of the age, in order to find space for another more interesting and instructive. Some years ago Dr. Leger exhibited and used in London an instrument which he called a MAGNETOSCOPE, to which we have already made a brief reference. A pendulum, consisting of a thread and a ball of wax, was suspended from a brass knob at the top of a glass jar, so that the pendulum could move in circles within the jar, which rested on paper, with a series of circles at different distances, marked 1, 2, 3, 4, 5, etc. With this apparatus Dr. Leger pretended to ascertain the moral and intellectual state of any person seated by him. He had printed schedules, enumerating the 36 phrenological organs, including 10 propensities, 10 sentiments, 12 intellectual faculties, and 4 reflective faculties, and he inserted in the schedule, which he gave to every sitter, the numerical value or intensity of each organ, 5 being its average value. A common development would therefore be measured by 5×36 or 180, upon the supposition that none of the organs exceeded or fell below the average. From the numbers thus obtained Dr. Leger deduced the character of the sitter, and inserted it in the last page of his schedule.

When the sitter had taken his place, Dr. Leger placed a finger of his right hand on the brass knob of the magnetoscope, and a finger of his left hand on each phrenological organ, and its intensity was measured by the numerical extent of the circle described by the pendulum. Some of the organs made the pendulum revolve from right to left, others from left to right; some in a straight line from north to south, and others from east to west. In order to show that the pendulum was not put in motion, or in any way influenced by the pressure of his finger, Dr. Leger connected another pendulum with the brass knob, by means of a piece of whalebone, or dead animal matter, along which it is supposed that human electricity would not pass, though it would convey to the second pendulum any

mechanical influence exerted upon the first. This subsidiary pendulum always stood still whatever were the movements of the other, and convinced the sitter that the acting pendulum was moved only by an influence from the organ under examination.

Many individuals of rank and talent submitted themselves to the ordeal of the magnetoscope, and we have seen in a well-filled volume the various characters given them by Dr. Leger. Lord Macaulay was described as "a great historical painter," a character which, though it did not gratify himself, was considered not very inappropriate by some of his friends. The writer of this article went frequently to see Dr. Leger's process, and on one occasion he accompanied a party of five gentlemen of high rank and position, who were desirous of submitting their characters to the analysis of the pendulum. The party consisted of the Duke of —, the Earl of C—, the Earl of E—, Lord D—, and the Bishop of —. It was previously arranged that, during the *séance*, none of us should be addressed by our names, in order that Dr. Leger might not give his pendulum any information regarding its patients; and that the schedules with their characters should be sent to them through me on the following day. The Bishop of — was obliged to leave before the operations commenced, but all the rest of the party submitted their thirty-six phrenological organs to the scrutiny of the pendulum. The Duke of — was pronounced a fluent and able speaker; the Earl of C— an orator and a poet, both of them with high intellectual faculties; Lord D—'s development was good, but without any very special quality. The examination of Lord E—'s head was very interesting. Upon placing his finger upon the organ of number, Dr. Leger was surprised at the pendulum refusing to move. Thinking that he had not found the right spot, he moved his finger up and down, but still the pendulum was immovable. When the operator had expressed his surprise at a result entirely new to him, he was greatly relieved when the Earl of E— said to him, "Don't take any farther trouble in finding the right spot, for I never could add up twenty figures in my life." But though Lord E—'s organ of number was put down at *zero*, the pendulum was so active during the examination of his other organs, that the numerical amount of them—upwards of 300—was greater than Dr. Leger had observed in any other person. In summing up his character, he made the remarkable statement, that if the gentleman who had, so extraordinary a development was not pre-eminent in all the moral and intellectual qualities which distinguish the greatest men, it must have been owing to some peculiar causes which influenced his physical and mental organization. Upon mentioning this opinion to a gentleman, now occupying a high official position, he expressed his surprise at its accuracy. "I have known the Earl of E—," he said, "from his boyhood. I was at school and at

college with him. I sat with him in the House of Commons, and on Committees of that House, where the most important questions were discussed, and in all these positions his great talents were exhibited and recognised; but hereditary gout, which almost never left him, interfered with the development of his genius, and the cultivation of those powers which would have fitted him for the highest offices in the state."

In order to exhibit the powers of his magnetoscope, Dr. Leger examined with it the various criminals and other persons in the Coldbathfields, one of the great prisons in the metropolis, and in a letter which we received from Colonel Chesteron, the governor, he mentions his astonishment at the accuracy of the results which were obtained.

Interesting as these facts are, and influential as they must be in misleading the parties to whom they relate, we have no hesitation in pronouncing them to be *mere coincidences*, which, in many cases, will admit of a satisfactory explanation. The cases of utter failure are never recorded. Lord D— for example; one of the party which Dr. Leger examined, went to him a second time in a new costume, and obtained a character essentially different from the first; and we have no doubt, that if the Earl of E— had returned in disguise, he might have forfeited the high character which the pendulum was pleased to assign to him. When we tell the reader that the pendulum will not move if the operator shuts his eyes, he will hesitate to believe that a picture of the pendulum upon the retina can excite the influences and produce the motions which determine the moral and intellectual condition of the patient.

We have dwelt thus long on the pendulum experiments, as they have recently acquired a scientific importance, and led to the discovery of the principle upon which their success so frequently depends. Philosophers have long ago endeavoured to ascertain, if any electrical influence can be drawn from the human body. It has been placed beyond a doubt by M. Matteucci and M. Dubois Raymond, that electric currents exist in animals, and the last of these philosophers has constructed a delicate galvanoscope, consisting of $3\frac{1}{2}$ miles of wire $\frac{1}{5000}$ th of an inch in diameter, by means of which the electricity of the human body can be exhibited by its action upon the needle of the galvanoscope, and even by its power to decompose water. The current, however, is so very feeble, that it cannot be communicated by ordinary contact to material bodies, so as to exercise over them any physical influence; and hence the phenomena of table-turning, the divining rod, and pendulum

rotation must be ascribed to influences of a very different kind.

These influences have been studied by M. Chevreul, a distinguished French philosopher, who has shown, in a treatise "on the Divining Rod," how illusions may be mistaken for realities when we are occupied with phenomena in which an organ such as that of touch performs a part. When, for example, we hold the pendulum between the fingers, the muscular motion of the arm causes it to oscillate, and its oscillations to increase by the influence which the sight exercises in putting the operator into the peculiar state of a *disposition or tendency to motion*. In like manner the pendulum will stop when we have simply *the thought of trying if such a thing will stop it*. "There is then," says M. Chevreul, "an intimate connexion established between the execution of certain movements and the act of thought which is relative to it, though this thought is not yet the will which commands our muscular organs."

This theory of what may be called involuntary action accounts for the popularity of the divining rod and the pendulum, and the faith which has for such a long period of time been placed in their indications.

So early as the fourth century,* a ring suspended by a thread was an instrument of divination. It was made to oscillate in the space between the letters of the alphabet, and the letters at which it stopped formed the questions which were proposed to it. When suspended in a glass vessel half-full of water, it struck the hour of the day,† especially after the repetition of a verse of a psalm. At the close of the last century, and the commencement of the present, men of some considerable reputation in science were induced to study the movements of the pendulum, and it was in consequence of the prevailing belief in its indications that M. Chevreul was led to the remarkable theory to which we have referred.

Some of our more eminent physicians have studied the influence of concentrated attention upon our muscular action, and Sir H. Holland has shown that it gives rise to new and specific sensations, "communicates movement to objects with which the muscles are in contact, and even unconsciously renders such movements conformable in direction to the expectation entertained." If the conjurer with his divining-rod and his magnetoscope is thus acquitted of the charge of deliberate deception, we cannot find the same apology for those impostors, male and female, who tamper with the laws of the moral and material universe, and lay claim to influences and powers which the Almighty has never, but in his Word, granted to the wisest and best of his creatures.

THE MONKS AND THE HEATHEN.

"WISDOM is justified of all her children," is a hard saying for human nature. Justified of her children she may be, after we have settled which are to be her children and which not: but of all her children? That is a hard saying.

And yet was not every man from the beginning of the world, who tried with his whole soul to be right, and to do good, a child of wisdom, of whom she at least will be justified, whether he is justified or not? He had his ignorances, follies, weaknesses, possibly crimes; but he served the purpose of his mighty mother. He did, even by his follies, just what she wanted done; and she is justified of all her children.

This may sound like optimism: but it also sounds like truth to any one who has fairly studied that fantastic page of history, the contrast between the old monks and our own heathen forefathers. The more one studies the facts, the less one is inclined to ask, "Why was it not done better?"—The more inclined to ask, "Could it have been done better? Were not the monks, from the fifth to the eighth centuries, exceptional agents fitted for an exceptional time, and set to do a work which in the then state of the European races, none else could have done? At least, so one suspects, after experience of their chronicles and legends, sufficient to make one thoroughly detect the evil which was in their system: but sufficient also, to make one thoroughly love the men themselves.

A few desultory sketches, some carefully historical, the rest as carefully compiled from common facts, may serve best to illustrate my meaning.

The monk, or celibate clergyman, worked on the heathen generally in one of three capacities: As tribune of the people; as hermit or solitary prophet; as colonizer; and in all three, worked as well as frail human beings are wont to do, in this most piecemeal world.

Let us look at him first as Tribune of the people, supported usually by the invisible, but most potent presence of the saint, whose relics he kept. One may see that side of his power in Raphael's immortal design of Attila's meeting with the Pope at the gates of Rome, and recoiling as he sees St. Peter and St. Paul floating terrible and threatening above the Holy City. Is it a myth, a falsehood? Not altogether. Such a man as Attila probably would have seen them, with his strong savage imagination, as incapable as that of a child from distinguishing between dreams and facts, between the subjective and the objective world. And it was on the whole well for him and for mankind, that he should think that he saw them, and tremble before the spiritual and the invisible; and confess a higher law than that of his own ambition and self-will; a higher power than that of his brute Tartar hordes.

Raphael's design is but a famous instance of an influence which wrought through the length and breadth of the down-trodden and dying Roman Empire, through the four fearful centuries which followed the battle of Adrianople, when for the first time, German men, standing face to face with the terrible man-god, magical, omnipotent, wise with the wisdom of centuries, actually, to their own utter astonishment, conquered and killed him, and behold he died. They could kill a Roman Cæsar. What was there after that that they could not do? And they swept over Europe far and wide in blood and plunder, ruin and fire, never checked, really, save by the priest and the monk, who worshipped over the bones of some old saint or martyr, whose name they had never heard.

Then, as the wild King, Earl, or Comes, with his wild reiters at his heels, galloped through the land, fighting indiscriminately his Roman enemies, and his Teutonic rivals—harrying, slaughtering, burning by field and wild—he was aware at last of something which made him pause. Some little walled town, built on the ruins of a great Roman city, with its Byzantine minster towering over the thatched roofs, sheltering them as the oak shelters the last night's fungus at its base. More than once in the last century or two, has that same town been sacked. More than once has the surviving priest crawled out of his hiding-place when the sound of war was past, called the surviving poor around him, dug the dead out of the burning ruins for Christian burial, built up a few sheds, fed a few widows and orphans, organized some form of orderly life out of the chaos of blood and ashes, in the name of God and St. Quemdeusvult whose bones he guards; and so he has established a temporary theocracy, and become a sort of tribune of the people, magistrate and father—the only one they have. And now he will try the might of St. Quemdeusvult against the wild king, and see if he can save the town from being sacked once more. So out he comes—a bishop perhaps, with priests, monks, crucifixes, banners, litanies. The wild king must come no further. That land belongs to no mortal man, but to St. Quemdeusvult, martyred here by the heathen five hundred years ago. Some old Kaiser of Rome, or it may be some former Gothic king, gave that place to the saint for ever, and the saint will avenge his rights. He is very merciful to those who duly honour him: but very terrible in his wrath if he be aroused. Has not the king heard how the Count of such a place, only forty years before, would have carried off a maiden from St. Quemdeusvult's town; and when the bishop withstood him, he answered that he cared no more for the relics of the saint than for the relics of a dead ass, and so took the maiden and went? But within a year and a day, he fell down

dead in his drink, and when they came to lay out the corpse, behold the devils had carried it away, and put a dead ass in its place!

All which the bishop would fully believe. Why not? He had no physical science to tell him that it was impossible. Morally, it was in his eyes just, and therefore probable; while as for testimony, men were content with very little in those days, simply because they could get very little. News progressed slowly in countries desolate and roadless, and grew as it passed from mouth to mouth, as it did in the Highlands a century ago, as it did but lately in the Indian Mutiny; till after a fact had taken ten years in crossing a few mountains and forests, it had assumed proportions utterly fantastic and gigantic.

So the wild king and his wild knights pause. They can face flesh and blood: but who can face the quite infinite terrors of an unseen world? They are men of blood too, men of evil lives, and conscience makes them cowards. They begin to think that they have gone too far. Could they see the saint, and make it up with him somewhat?

No. The saint they cannot see. To open his shrine would be to commit the sin of Uzzah. Palsy and blindness would be the least that would follow. But the dome under which he lies all men may see; and perhaps the saint may listen, if they speak him fair.

They feel more and more uncomfortable. This saint, in heaven at God's right hand, and yet there in the dom-church—is clearly a mysterious, ubiquitous person, who may take them in the rear very unexpectedly. And his priests, with their book-learning, and their sciences, and their strange dresses and chants—who knows what secret powers, magical or other, they may not possess?

They bluster at first: being much of the temper and habits, for good and evil, of English navvies. But they grow more and more uneasy, full of childish curiosity, and undefined dread. So into the town they go, on promise (which they will honourably keep, being German men) of doing no harm to the *plebs*, the half Roman artisans and burghers who are keeping themselves alive here—the last dying remnants of the civilisation, and luxury, and cruelty, and wickedness, of a great Roman colonial city; and they stare at arts and handicrafts new to them; and are hospitably fed by bishops and priests; and then they go, trembling and awkward, into the great dom-church; and gaze wondering at the frescoes, and the carvings of the arcades—marbles from Italy, porphyries from Egypt, all patched together out of the ruins of Roman baths, and temples, and theatres; and at last they arrive at the saint's shrine itself—some marble sarcophagus, most probably covered with vine and ivy leaves, with nymphs and satyrs, long since consecrated with holy water to a new and better use. Inside that lies the saint, asleep, yet ever awake. So they had best con-

sider in whose presence they are, and fear God and St. Quemdeusvult, and cast away the seven deadly sins wherewith they are defiled; for the saint is a righteous man, and died for righteousness' sake; and those who rob the orphan and the widow, and put the fatherless to death, them he cannot abide; and them he will watch like an eagle of the sky, and track like a wolf of the wood, till he punishes them with a great destruction. In short, the bishop preaches to the king, and his is a right noble and valiant sermon, calling things by their right names without fear or favour, and assuming, on the mere strength of being in the right, a tone of calm superiority which makes the strong armed men blush and tremble before the weak and helpless one. Yes. Spirit is stronger than flesh.

"Seecamber!" said St. Remigius to the great conquering King Clovis, when he stepped into the baptismal font—"Most Gracious Majesty," or "illustrious Cæsar," or "by the grace of God Lord of the Franks," but Seecamber, as a missionary might now say Maori, or Caffre,—and yet his life was in Clovis's hand then and always),—"Hate what thou hast adored, and adore what thou hast hated!" And the terrible Clovis trembled and obeyed.

So does the wild king at the shrine of St. Quemdeusvult. He takes his bracelet, or his jewel, and offers it civilly enough. Will the bishop be so good as to inform the great Earl St. Quemdeusvult, that he was not aware of his rights, or even of his name; that perhaps he will deign to accept this jewel, which he took off the neck of a Roman General—that—that on the whole he is willing to make the *amende honorable*, as far as is consistent with the feelings of a nobleman; and trusts that the saint, being a nobleman too, will be satisfied therewith.

After which it would appear to the wild king, probably, that this bishop was the very man that he wanted, the very opposite to himself and his wild riders; a man pure, calm, just, and brave; possessed, too, of boundless learning; who can read, write, cipher, and cast nativities; who has a whole room full of books and parchments, and a map of the whole world; who can talk Latin, and perhaps Greek, as well as one of those accursed Grendel's sons, a Roman lawyer, or a secretary from Ravenna; possessed, too, of boundless supernatural power:—would the bishop be so good as to help him in his dispute with the Count Boso, about their respective marches in such and such a forest? If the bishop could only settle that without more fighting, of course he should have his reward. He would confirm to the saint and his burg all the rights granted by Constantine the Kaiser; and give him moreover all the meadow land in such and such a place, with the mills and fisheries, on service of a dish of trout from the bishop and his successors, whenever he came that way: for the trout there were exceeding good, that he knew. And so a bargain would be struck, and

one of those curious compromises between the spiritual and temporal authorities take root, of which one may read at length in the pages of M. Guizot, or Sir James Stephen.

And after a few years, most probably, the king would express a wish to be baptized, at the instance of his queen who had been won over by the bishop, and had gone down into the font some years before; and he would bid his riders be baptized also; and they would obey, seeing that it could do them no harm, and might do them some good; and they would agree to live more or less according to the laws of God and common humanity; and so one more Christian state would be formed; one more living stone (as it was phrased in those days) built into the great temple of God which was called Christendom.

So the work was done. Can we devise any better method of doing it? If not, let us be content that it was done somehow, and believe that wisdom is justified of all her children.

We may object to the fact, that the dom-church and its organization grew up (as was the case in the vast majority of instances) round the body of a saint or martyr; we may smile at the notion of an invisible owner and protector of the soil: but we must not overlook the broad fact, that without that prestige the barbarians would never have been awed into humanity; without that prestige the place would have been swept off the face of the earth, till not one stone stood on another; and he who does not see what a disaster for humanity that would have been, must be ignorant that the civilisation of Europe is the child of the towns; and also that our Teutonic forefathers were by profession, destroyers of towns, and settlers apart from each other on country freeholds. Lonely barbarism would have been the fate of Europe, but for the monk who guarded the relics of the saint within the walled burg.

Let us pass on to another aspect of the monks; the monks as Hermits. All know what an important part they play in old romances and ballads. All are not aware that they played as important a part in actual history. Scattered through all wildernesses from the cliffs of the Hebrides to the Slavonian marches, they put forth a power, uniformly, it must be said, for good.

Every one knows how they appear in the old romances,—how some Sir Bertrand or other, wearied with the burden of his sins, stumbles on one of these *Einsiedlern*, settlers alone, and talks with him, and goes on a wiser and a better man. How he crawls, perhaps, out of some wild scuffle, “all-to-bebled,” and reeling to his saddlebow; and “ever he went through a waste land, and rocks rough and strait, so that it him seemed he must surely starve, and anon he heard a little bell, whereat he marvelled; and betwixt the water and the wood he was aware of a chapel, and an hermitage; and there a holy man said mass, for he was a priest, and a great leech, and cunning withal. And Sir Bertrand went

in to him and told him all his case—how he fought Sir Marculf for love of the fair Ellinore, and how the king bade part them, and how Marculf did him open shame at the wine-board, and how he went about to have slain him privily, but could not; and then how he went and wasted Marculf’s lands, house with byre, kine with corn, till a strong woman smote him over the head with a quernstone, and all-to-broke his brain-pan;” and so forth—the usual story of mad passion, drink, pride, revenge.

And there the holy man a-read him right godly doctrine, and shrived him, and gave him an oath upon the blessed Gospels, that fight he should not, save in his liege lord’s quarrel, for a year and a day. And there he abode till he was well healed, he and his horse.

Must not that wild fighting Bertrand have gone away from that place a wiser and a better man? Is it a matter to be regretted, or otherwise, that such men as the hermit were to be found in that forest, to mend Bertrand’s head and his morals, at the same time? Is it a matter to be regretted, or otherwise, that after twenty or thirty years more of fighting and quarrelling and drinking, this same Sir Bertrand—finding that on the whole the lust of the flesh, the lust of the eye, and the pride of life, were poor paymasters, and having very sufficient proof, in the ends of many a friend and foe, that the wages of sin are death—fell to religion likewise, and was a hermit in that same place, after the holy man was dead; and was made priest of that same chapel; and died in honour, having succoured many good knights, and wayfaring men?

One knows very well that it would not be right now; that it is not needed now. It is childish to repeat that, when the question is, was it right then—or, at least, as right as could be got at then? Was it needed then—or, at least, the nearest thing to that which was needed?

If it was, why should not wisdom be justified of all her children?

One hopes that she was; for certainly, if any men ever needed to be in the right, lest they should be of all men most miserable, it was these same old hermits. Praying and preaching continually, they lived on food which dogs would not eat, in dens in which dogs ought not to live. They had their reasons. Possibly they knew their own business best. Possibly also, they knew their neighbour’s business somewhat; they knew that such generations as they lived in could not be taught, save by some extravagant example of this kind, some caricature, as it were, of the doctrines which were to be enforced. Nothing less startling, perhaps, could have touched the dull hearts, have convinced the dull brains, of fierce, ignorant, and unreasoning men.

Ferocity, lawlessness, rapine, cruelty, and—when they were glutted and debauched by the spoils of the Roman empire—sensuality, were the evils which were making Europe uninhabitable for decent folk, and history—as Milton called it—a mere battle of

THE MONKS AND THE HEATHEN.

"Sturmi took him a trusty ass, and, axe in hand, rode away into the wild wood
singing his Psalms."

kites and crows. What less than the example of the hermit—especially when that hermit was a delicate and high-born woman—could have taught men the absolute superiority of soul to body, of spiritual to physical force, of spiritual to physical pleasure, and have said to them, not in vain words, but solid acts—“All that you follow is not the way of life. The very opposite to it is the way of life. The wages of sin are death; and you will find them so,—in this life the victims of your own passions, and of the foes whom your crimes arouse, and in life to come of hell for ever. But I tell you I have no mind to go to hell. I have a mind to go to heaven; and I know my mind right well. If the world is to be such as this, and the rulers thereof such as you, I will flee from you. I will not enter into the congregation of sinners, neither will I cast in my lot with the blood-thirsty. I will be alone with God and his universe. I will go to the mountain cave or to the ocean cliff, and there, while the salt wind whistles through my hair, I will be stronger than you, safer than you, richer than you, happier than you. Richer than you, for I shall have for my companion the beautiful vision of God, and of all things and beings God-like, fair, noble, just, and merciful. Stronger than you, because virtue will give me a power over the hearts of men such as your force cannot give you; and you will have to come to my lonely cell, and ask me to advise you, and teach you, and help you against the consequences of your own sins. Safer than you, because God in whom I trust will protect me: and if not, I have still the everlasting life of heaven, which this world cannot give or take away. So go your ways, fight and devour one another, the victims of your own lusts. I am minded to be a good man; and to be that, I will give up—as you have made all other methods impossible for me—all which seems to make life worth having.” Oh! instead of finding fault with such men; instead of, with vulturine beak, picking out the elements of Manichæism, of conceit, of discontent, of what not human frailty and ignorance, which may have been in them, let us honour the enormous moral force which enabled them so to bear witness that not the mortal animal, but the immortal spirit, is the MAN; and that when all which outward circumstance can give is cast away, the MAN still lives for ever, by God, and in God.

And they did teach that lesson. They were good, while other men were bad; and men saw the beauty of goodness, and felt the strength of it, and worshipped it in blind savage admiration. Read Rosweyde's *Vitæ Patrum Eremiticorum*, read the legends of the hermits of the German forests, read Colgan's *Lives of the Irish Saints*, and see whether, amid all fantastic, incredible, sometimes immoral myths, the goodness of life of some one or other is not the historic nucleus, round which the myths, and the worship of the saint, have crystallized and developed.

Take, for instance, the exquisite hymn of St. Bridget, which Colgan attributes to the sixth century: though it is probably much later, that has nothing to do with the argument:—

“Bridget, the victorious, she loved not the world;
She sat on it as a gull sits on the ocean;
She slept the sleep of a captive mother,
Mourning after her absent child.

She suffered not much from evil tongues;
She held the blessed faith of the Trinity;
Bridget, the mother of my Lord of Heaven,
The best among the sons of the Lord.

She was not querulous, nor malevolent;
She loved not the fierce wrangling of women;
She was not a biting serpent, or a liar;
She sold not the Son of God for that which passes
away.

She was not greedy of the goods of this life;
She gave away without gall, without slackness;
She was not rough to wayfaring men;
She handled gently the wretched lepers.

She built her a town in the plains (of Kildare);
And dead, she is the patroness of many peoples.”

One might comment much on this quotation. One might point out how St. Bridget is called the mother of the Lord, and by others, the Mary of the Irish, the “Automata cœli regina,” and seems to have been considered at times as an avatar or incarnation of the blessed Virgin. One might more than hint how that appellation, as well as the calling of Christ “the best of the sons of the Lord,” in an orthodox Catholic hymn, seems to point to the remnants of an older creed, possibly Buddhist, the transition whence towards Catholic Christianity was slow and imperfect. One might make merry over the fact that there are many Bridgets, some say eleven; even as there are three or four St. Patricks; and raise learned doubts as to whether such persons ever existed, after that Straussian method of pseudo-criticism which cometh not from above, from the Spirit of God, nor yet indeed from below, from the sound region of fact, but from within, out of the naughtiness of the heart, defiling a man. One might weaken, too, the effect of the hymn by going on with the rest of it, and making readers smile at its childish miracles and portents; but one would only do a foolish thing by turning the reader's mind away from the broad fact that St. Bridget, or various persons who got, in the lapse of time, massed together under the name of St. Bridget, were eminently *good women*.

It matters little whether these legends are historically correct. Their value lies in the moral of them. And as for their real historical correctness, the Straussian argument that no such persons existed, because lies are told of them, is, I hold, most irrational. The falsehood would not have been invented unless it had started in a truth. The high moral character ascribed to them would never

have been dreamed of by persons who had not seen living instances of that character. Man's imagination does not create; it only reproduces and recombines its own experience. It does so in dreams. It does so, as far as the moral character of the saint is concerned, in the legend; and if there had not been persons like St. Bridget in Ireland, the wild Irish could never have imagined them.

Therefore it matters little to a wise man, standing on the top of Croagh Patrick, the grandest mountain perhaps, with the grandest outlook, in these British Isles, as he looks on the wild Irish there on pattern days, up among the Atlantic clouds, crawling on bare and bleeding knees round St. Patrick's cell,—it matters little, I say, to the wise man, whether St. Patrick himself owned the ancient image which is worshipped on that mountain peak, or the ancient bell which till late years hung in the sanctuary,—such a strange oblong bell as the Irish saints carried with them to keep off demons—the magic bells which appear (as far as I am aware) in the legends of no country till you get to Tartary and the Buddhists;—such a bell as came (or did not come) down from heaven to St. Senan; such a bell as St. Fursey sent flying through the air to greet St. Cuanady at his devotions when he could not come himself; such a bell as another saint, wandering in the woods, rang till a stag came out of the covert, and carried his burden for him on his horns. It matters as little to the wise man whether that bell belonged to St. Patrick, as whether all these child's dreams are dreams. It matters little to him, too, whether St. Patrick did, or did not stand on that mountain peak, “in the spirit and power of Elias” (after whom it was long named), fasting, like Elias, forty days and forty nights, wrestling with the demons of the storm, and the snakes of the fen, and the Peishta-more (the monstrous Python of the lakes), which assembled at the magic ringing of his bell, till he conquered not by the brute force of a Hercules and Theseus, and the monster-killers of old Greece, but by the spiritual force of which (so the text was then applied) it is written, “This kind cometh not out but by prayer and fasting,” till he smote the evil things with “the golden rod of Jesus,” and they rolled over the cliff, in hideous rout, and perished in the Atlantic far below. But it matters much to a wise man that under all these symbols (not childish at all, but most grand, to the man who knows the grand place of which they are told), there is set forth the victory of a good and beneficent man over evil, whether of matter or of spirit. It matters much to him that that cell, that bell, that image are tokens that if not St. Patrick, some one else, at least, did live and worship on that mountain top, in remote primeval times, in a place in which we would not, perhaps could not, endure life a week. It matters much to him that the man who so dwelt there, gained

such a power over the minds of the heathen round him, that five millions of their Christian descendants worship him, and God on account of him, at this day.

St. Ita, again. It matters little that she did not—because she could not—perform the miracles imputed to her. It matters little whether she had or not—as I do not believe her to have had—a regularly organized convent of nuns in Ireland during the sixth century. It matters little if the story which follows is a mere invention of the nuns in some after-century, in order to make a good title for the lands which they held—a trick but too common in those days. But it matters much that she should have been such a person, that such a story as this, when told of her, should have gained belief:—How the tribes of Hy-Connell, hearing of her great holiness, came to her with their chiefs, and offered her all the land about her cell. But she, not wishing to be entangled with earthly cares, accepted but four acres round her cell, for a garden of herbs for her and her nuns. And the simple wild Irish were sad and angry, and said, “If thou wilt not take it alive, thou shalt take it when thou art dead. So they chose her then and there for their patroness, and she blest them with many blessings, which are fulfilled unto this day; and when she migrated to the Lord they gave her all the land, and her nuns hold it to this day, the land of Hy-Connell on the east Shannon bank, at the roots of Luachra mountain.”

What a picture! One hopes that it may be true, for the sake of its beauty and its pathos. The poor, savage, half-naked, and, I fear, on the authority of St. Jerome and others, now and then cannibal Celts, with their saffron scarfs, and skenes, and darts, and glibs of long hair hanging over their hypo-gorillaceous visages, coming to the prophet maiden, and asking her to take their land, for they could make no decent use of it themselves; and look after them, body and soul, for they could not look after themselves; and pray for them to her God, for they did not know how to pray to him themselves. If any man shall regret that such an event happened to any savages on this earth, I am, I confess, sorry for him.

St. Severinus, again (to take another hermit-saint, almost at random). None of us can believe that he made a dead corpse (Silvinus the priest, by name) sit up and talk with him on its road to burial. None of us need believe that he stopped the plague at Vienna by his prayers. None of us need attribute to anything but his sagacity the Divine revelations whereby he predicted the destruction of a town for its wickedness, and escaped thence, like Lot, alone; or by which he discovered, during the famine of Vienna, that a certain rich widow had much corn hidden in her cellars; but there are facts enough, credible and undoubted, concerning St. Severinus, the apostle of Austria, to make us trust that in him, too, wisdom was justified of all her children.

A reader may remark, among the few words which have been as yet said of St. Severinus, a destruction, a plague, and a famine. These words are a fair sample of St. Severinus's times, and of the circumstances into which he voluntarily threw himself. In about the middle of the fifth century there appeared in the dying Roman province of Noricum (Austria we now call it) a strange gentleman, eloquent and learned beyond all, and with the strangest power of melting and ruling the hearts of men. Who he is he will not tell, save that his name is Severinus, a right noble name without doubt. Gradually it oozes out that he has been in the far East, through long travels and strange dangers, through many cities and many lands; but he will tell nothing. He is the servant of God, come hither to try to be of use. He certainly could have come for no other reason, unless to buy slaves; for Austria was at that time the very highway of the nations, the centre of the human Mählstrom, in which Huns, Gepiden, Allmannen, Rugen, and a dozen wild tribes more, wrestled up and down round the starving and beleaguered Roman towns of that once fertile and happy province. A man who went there for his own pleasure, or even devotion, would have been as wise as one who had built himself last summer a villa on the Rappahannock, or retired for private meditation to the orchard of Hougoumont during the battle of Waterloo.

Nevertheless, there Severinus stayed till men began to appreciate him, and called him, and not unjustly, Saint. Why not? He preached, he taught, he succoured, he advised, he fed, he governed; he turned aside the raids of the wild German kings; he gained a divine power over their hearts; he taught them something of God and of Christ, something of justice and mercy; something of peace and unity among themselves; till his fame ran through all the Alps, and far away into the Hungarian marches, that there was a prophet of God arisen in the land; and before the unarmed man, fasting and praying in his solitary cell on the mountain above Vienna, ten thousand knights and champions trembled, who never had trembled at the sight of armed hosts.

Who would deny that man the name of saint? And who, if by that sagacity which comes from the combination of intellect and virtue, he sometimes seemed miraculously to foretell coming events, would deny him the name of prophet also? One prophecy of his at least stands on record which is worth mentioning, if not for its own intrinsic value, yet still as a specimen of the manners of the time.

Every one has heard of Attila: but every one may not have heard of Edecon, his secretary, of the sons of Odin, and the royal race of the Amals—the "spotless," the "heavenly" men—once king of one of the many German tribes which Attila had conquered and forced to join his victorious hosts. Neither, perhaps, has every one heard of

the great battle of Netad, the "prælium atrox, immane, multiplex, cui nil simile refert antiquitas," the battle which really (and not that of Chalons) decided the destinies of Europe. For then, after Attila's death, this vast horde of mingled nations parted into two. On one side were the Germans, determined to be once more free; on the other, Huns, and Slaves, and all the lower races which had conquered them for a while. The question was simple enough. Should the Teuton or the Tartar be henceforth the masters of the world? And there, on the plain of Netad, somewhere by Comorn, the heroes fought it out a whole day long; and the Teuton conquered, and became the master of Europe; and the foul Tartar fled back, through Russia, through Persia, through Tartary, away into the night and the unknown, from whence he had poured forth to ravage and destroy. What went with Edecon after that battle we know not: but he had two stalwart sons, Odoacer (Haud-y-wacker, "Hold you stout," or "Hold you steady," his war-cry, they say, in after years), and Hunwulf, "The wolf of the Huns," or the "Helper of the Huns," I know not which. Their father, as Attila's old secretary, had probably taken the wrong side; but he that as it may, their tribe was ruined, and the lads were outcasts; and they wandered away in rags to seek their fortunes at Rome or at Byzant, as many another adventurous German youth did in those frantic times.

And when they came to the Alps, they heard of the fame of St. Severinus, and must needs go see him in his cell, to get his blessing, or have their fortunes told—probably with no very clear notion of what they wanted of him.

So they came to St. Severinus's cell, and entered. But Haud-y-wacker was so tall and huge of limb that he could not stand upright. And the saint looked up upon the stooping giant, and discovered through all his rags that he was a royal Amal, not merely in blood, but in soul and power; and said to him, "Great thou art, and great thou shalt be, and rule over a great kingdom"—or punning words to that effect. And he blessed them, and sent them away. And the ragged giant went over the Alps, and became a mighty warrior and statesman, and the first Gothic king of Italy. Whereby all men knew that St. Severinus had the gift of prophecy.

One longs, nevertheless, to know what he said to the younger lad. For Hunwulf's destiny was higher than even his brother's, though in his descendants rather than in himself. For he went away to the Kaiser at Byzant, and fought in many wars, and went through many adventures, and at last found himself back again on German soil, as a duke in Schwabenland, and the ancestor of dukes, and electors, and kings; and his lineal representative at this moment is Victoria, Queen of these realms. One wishes, for his sake, that the saint's prophetic power had been far-sighted enough to foresee that.

St. Severinus is the type of the monk as prophet.

St. Columba may stand as the type of the missionary monk; the good man strengthened by lonely meditation; but using that strength not for selfish fanaticism but for the good of men, going forth unwillingly out of his beloved solitude, that he might save souls. Round him, too, cluster the usual myths. He drives away with the sign of the cross a monster which attacks him at a ford. He expels from a fountain the devils who smote with palsy and madness all who bathed therein. He sees by a prophetic spirit, he sitting in his cell in Ireland, a great Italian town destroyed by a volcano. His friends behold a column of light rising from his head as he celebrates mass. Yes; but they also tell of him, "that he was angelical in look, brilliant in speech, holy in work, clear in intellect, great in council." That he "never passed an hour without prayer, or a holy deed, or reading of the Scriptures (for these old monks had Bibles, and knew them by heart too, in spite of all that has been written to the contrary), that he was of so excellent a humility and charity, bathing his disciples' feet when they came home from labour, and carrying corn from the mill on his own back, that he fulfilled the precept of his Master, "He that will be the greatest among you, let him be as your servant."

They also tell of him (and this is fact and history) how he left his monastery of Derm Each (the field of oaks), which we call Derry, and went away at the risk of his life to preach to the wild Picts of Galloway, and founded the great monastery of Iona, and that succession of abbots from whom Christianity spread over the south of Scotland and north of England, under his great successor Aidan.

He, too, has his myths likewise. They tell of him how he stilled the sea-waves with holy oil; how he turned back on Penda and his Saxons the flames with which the heathen king and his Saxons were trying to burn down Bamborough walls. But they tell, too (and Bede heard it from those who had known Aidan in the flesh) of "his love of peace and charity, his purity and humility, his mind superior to avarice or pride, his authority, becoming a minister of Christ, in reproving the haughty and powerful, and his tenderness in relieving the afflicted, and defending the poor." Who, save one who "rejoiceth in evil, instead of rejoicing in the truth," will care to fix his eyes for a moment upon the fairy tales which surround such a story, as long as there shines out from among them clear and pure, in spite of all doctrinal errors, the grace of God, the likeness of Jesus Christ our Lord?

One sketch more; and an even more important one. Columba and Aidan were missionary monks. As time went on, monks became more than even missionaries. They became Colonizers as well. I know no better instance of that type (that I may still let facts speak for themselves) than St. Sturmi, founder whilome of the great abbey of Fulda in Germany.

His life is matter of history, written by one Eigils (sainted like himself), who was his disciple and his friend. Naturally told it is, and lovingly; but if I recollect right, without a single miracle or myth; the living contemporaneous picture of such a man, living in such a state of society, as we shall never (and happily need never) see again, but which is for that very reason worthy to be preserved, for a token that wisdom is justified of all her children.

It stands at length in Pertz's admirable *Monumenta Historica*, among many another like biography, and if I tell it here somewhat at length, readers must forgive me.

Every one has heard of little king Pepin, and many may have heard also how he was a mighty man of valour, and cut off a lion's head at one blow; and how he was a crafty statesman, and first consolidated the temporal power of the Popes, and helped them in that detestable crime of overthrowing the noble Lombard kingdom, which cost Italy centuries of slavery and shame, and which has to be expiated even yet, it would seem, by some fearful punishment.

But every one may not know that Pepin had great excuses—if not for helping to destroy the Lombards—yet still for supporting the power of the Popes. It seemed to him—and perhaps it was—the only practicable method of uniting the German tribes into one common people, and stopping the internecine wars by which they were tearing themselves to pieces. It seemed to him—and perhaps it was—the only practicable method for civilizing and Christianizing the still wild tribes, Frisians, Saxons, and Slavcs, who pressed upon the German marches, from the mouth of the Elbe to the very Alps. Be that as it may, he began the work; and his son Charlemagne finished it; somewhat well, and again somewhat ill—as most work, alas! is done on earth. Now in the days of little king Pepin there was a nobleman of Bavaria, and his wife, who had a son called Sturmi; and they brought him to St. Boniface, that he might make him a priest. And the child loved St. Boniface's noble English face, and went with him willingly, and was to him as a son. And who was St. Boniface? That is a long story. Suffice it that he was a man of Devon, brought up in a cloister at Exeter; and that he had crossed over into Frankensland, upon the lower Rhine, and become a missionary (ultramontane Papist though, I am sorry to say, he was) of the widest and loftiest aims; not merely a preacher and winner of souls, though that, it is said, in perfection; but a civilizer, a colonizer, a statesman. He, and many another noble Englishman and Scot (whether Irish or Caledonian) were working under the Frank kings to convert the heathens of the marches, and carry the Cross into the far East. They led lives of poverty and danger; they were martyred, half of them, as St. Boniface was at last. But they did their work; and doubtless they have

their reward. They did their best, according to their light. God grant that we, to whom so much more light has been given, may do our best likewise. Under this great genius was young Sturmi trained. Trained (as was perhaps needed for those who had to do such work in such a time) to have neither wife, nor child, nor home, nor penny in his purse: but to do all that he was bid, learn all that he could, and work for his living with his own hands. A life of bitter self-sacrifice. Such a life is not needed now. Possibly, nevertheless, it was needed then.

So St. Boniface took Sturmi about with him in his travels, and at last handed him over to Wigbert, the priest, to prepare him for the ministry. "Under whom," says his old chronicler, "the boy began to know the Psalms thoroughly, by heart; to understand the Holy Scriptures of Christ with spiritual sense; took care to learn most studiously the mysteries of the four Gospels, and to bury in his heart, by assiduous reading, the treasures of the Old and New Testament. For his meditation was in the Law of the Lord day and night; profound in understanding, shrewd of thought, prudent of speech, fair of face, sober of carriage, honourable in morals, spotless in life, by sweetness, humility, and alacrity, he drew to him the love of all."

He grows to be a man; and in due time he is ordained priest, "by the will and consent of all;" and he "began to preach the words of Christ earnestly to the people;" and his preaching wrought wonders among them.

Three years he preached in his Rhineland parish, winning love from all. But in the third year "a heavenly thought" came into his mind that he would turn hermit and dwell in the wild forest. And why? Who can tell? He may, likely enough, have found celibacy a fearful temptation for a young and eloquent man, and longed to flee from the sight of that which must not be his. And that, in his circumstances, was not a foolish wish. He may have wished to escape, if but once, from the noise and crowd of outward things, and be alone with God and Christ, and his own soul. And that was not a foolish wish. John Bunyan so longed, and found what he wanted in Bedford Jail, and set it down and printed it in a *Pilgrim's Progress*, which will live as long as man is man. George Fox longed for it, and made himself clothes of leather which would not wear out, and lived in a hollow tree, till he, too, set down the fruit of his solitude in a diary which will live likewise as long as man is man. Perhaps, again, young Sturmi longed to try for once in a way what he was worth upon God's earth; how much he could endure; what power he had of helping himself, what courage to live by his own wits, and God's mercy, on roots and fruits, as wild things live. And that was not a foolish wish. But at least, he longed to be a hermit; he kept his longing to himself, however, till St. Boniface, his

bishop, appeared; and then he told him all his heart.

And St. Boniface said: "Go; in the name of God;" and gave him two comrades, and sent him into "the wilderness which is called Buchonia, the Beech Forest, and find a place fit for the servants of the Lord to dwell in. For the Lord is able to provide his people a home in the desert."

So those three went into the wild forest. And "for three days they saw nought but earth and sky and mighty trees. And they went on, praying Christ that he would guide their feet into the way of peace." And on the third day they came to the place which is called Hersfelt (the hart's down?) and searched it round and prayed that Christ would bless the place for them to dwell in; and then they built themselves little huts of beech-bark, and abode there many days, serving God with holy fastings, and watchings, and prayers."

Is it not a strange story? so utterly unlike anything which we see now;—so utterly unlike anything which we ought to see now? And yet it may have been good in its time. It looks out on us from the dim ages, like the fossil bone of some old monster cropping out of a quarry. But the old monster was good in his place and time. God made him and had need of him. It may be that God made those three poor monks, and had need of them likewise.

As for their purposes being superstitious, we shall be better able to judge of that when we have seen what they were—what sort of a house they meant to build to God. As for their having self-interest in view, no doubt they thought that they should benefit their own souls in this life, and in the life to come. But one would hardly blame them for that, surely? One would not blame them as selfish and sordid if they had gone out on a commercial speculation? Why, then, if on a religious one? The merchant adventurer is often a noble type of man, and one to whom the world owes much, though his hands are not always clean, nor his eye single. The monk adventurer of the middle age is, perhaps, a still nobler type of man, and one to whom the world owes more, though his eye, too, was not always single, nor his hands clean.

As for selfishness, one must really bear in mind that men who walked away into that doleful *urwald* had need to pray very literally "that Christ would guide their feet into the way of peace;" and must have cared as much for their worldly interests as those who march up to the cannon's mouth. Their lives in that forest were not worth twenty-four hours' purchase, and they knew it. It is an ugly thing for an unarmed man, without a compass, to traverse the bush of Australia or New Zealand, where there are no wild beasts. But it was uglier still to start out under the dark roof of that primeval wood. Knights, when they rode it, went armed cap-à-pie, like Sintram through the dark valley, trusting in God and their good sword. Chapmen and merchants stole through it by a few

tracks in great companies, armed with bill and bow. Peasants ventured into it a few miles, to cut timber, and find pannage for their swine, and whispered wild legends of the ugly things therein—and sometimes, too, never came home. Away it stretched from the fair Rhineland, wave after wave of oak and alder, beech and pine, God alone knew how far, into the land of night and wonder, and the infinite unknown; full of elk and bison, bear and wolf, lynx and glutton, and perhaps of worse beasts still. Worse beasts, certainly, Sturm and his comrades would have met, if they had met them in human form. For there were waifs and strays of barbarism there, uglier far than any waif and stray of civilisation, border ruffian of the far west, buccaneer of the Tropic keys, Cimaroon of the Panama forests; men *verbiesterte*, turned into the likeness of beasts, wildfänger, hüner, ogres, wehr-wolves, strong thieves and outlaws, many of them possibly mere brutal maniacs; naked, living in caves and coverts, knowing no law but their own hunger, rage, and lust; feeding often on human flesh; and woe to the woman or child or unarmed man who fell into their ruthless clutch. Orson, and such like human brutes of the wilderness, serve now to amuse children in fairy tales; they were then ugly facts of flesh and blood. There were heathens there, too, in small colonies: heathen Saxons, cruelest of all the tribes; who worshipped at the Irmensul, and had an old blood-feud against the Franks; heathen Thuringer, who had murdered St. Kilian the Irishman at Wurzburg, and would surely murder them. Heathen Slaves, of different tribes, who had introduced into Europe the ugly custom of impaling their captives; and woe to the Christian priest who fell into any of their hands. To be knocked on the head before some ugly idol was the gentlest death which they were like to have. They would have called that martyrdom the gate of eternal bliss; but they were none the less brave men for going out to face it.

And beside all these, and worse than all these, there were the terrors of the unseen world; very real in those poor monks' eyes, though not in ours. There were Nixes in the streams, and Kobolds in the caves, and Tannerhäuser in the dark pine-glades, who hated the Christian man, and would lure him to his death. There were fair swan-maidens and elf-maidens; nay, dame Venus herself with all her rout of revellers, who would tempt him to sin, and having made him sell his soul, destroy both body and soul in hell. There was Satan and all the devils, too, plotting to stop the Christian man from building the house of the Lord, and preaching the gospel to the heathen; ready to call up storms, and floods, and forest fires, to hurl the crag down from the cliffs, or drop the rotting tree on their defenceless heads—all real and terrible in those poor monks' eyes, as they walked on, singing their psalms, and reading their Gospels, and praying to God to save them,

for they could not save themselves; and to guide them, for they knew not, like Abraham, whither they went; and to show them the place where they should build the house of the Lord, and preach righteousness, peace, and joy in the Holy Spirit to the heathen round. We talk still, thank heaven, of heroes, and understand what that great word should mean. But were not these poor monks heroes? Knights-errant of God, doing his work as they best knew how. We have a purer gospel than they: we understand our Bibles better. But if they had not done what they did, where would have been now at all our gospel, and our Bible? We cannot tell. It was a wise old saw of our forefathers—"Do not speak ill of the bridge which carries you over."

If Sturm had had a "holy longing" to get into the wild wood, now he had a "holy longing" to go back; and to find St. Boniface, and tell him what a pleasant place Hersfeld was, and the quality of the soil, and the direction of the watershed, and the meadows, and springs, and so forth, in a very practical way. And St. Boniface answered, that the place seemed good enough; but that he was afraid for them, on account of the savage heathen Saxons. They must go deeper into the forest, and then they would be safe. So he went back to his fellow-hermits, and they made to themselves a canoe; and went paddling up and down the Fulda stream, beneath the alder boughs, "trying the mouths of the mountain streams, and landing to survey the hills and ridges,"—pioneers of civilisation none the less because they pioneered in the name of Him who made earth and heaven: but they found nothing which they thought would suit the blessed St. Boniface, save that they stayed a little at the place which is called Ruochen-bah, "the rough brook," to see if it would suit; but it would not. So they went back to their birch huts to fast and pray once more.

St. Boniface sent for Sturm after awhile, probably to Maintz, to ask of his success; and Sturm threw himself on his face before him; and Boniface raised him up, and kissed him, and made him sit by his side—which was a mighty honour; for St. Boniface, the penniless monk, was at that moment one of the most powerful men of Europe; and he gave him a good dinner, of which, no doubt, he stood in need; and bade him keep up heart, and seek again for the place which God had surely prepared, and would reveal in his good time.

And this time Sturm, possibly wiser from experience, determined to go alone; but not on foot this time. So he took to him a trusty ass, and as much food as he could pack on it; and, axe in hand, rode away into the wild wood, singing his psalms. And every night, before he lay down to sleep, he cut boughs, and stuck them up for a ring fence round him and the ass, to the discomfiture of the wolves, which had, and have still, a great hankering after asses' flesh. It is a quaint picture,

no doubt; but let us respect it, while we smile at it—if we, too, be brave men.

Then one day he fell into a great peril. He came to the old road (a Roman one, I presume, for the Teutons, whether in England or elsewhere, never dreamed of making roads till three hundred years ago, but used the old Roman ones), which led out of the Thuringean land to Maintz. And at the ford over the Fulda he met a great multitude bathing, of Slavonian heathens, going to the fair at Maintz. And they smelt so strong, the foul miscreants, that Sturmi's donkey backed, and refused to face them; and Sturmi himself was much of the donkey's mind, for they began to mock him (possibly he nearly went over the donkey's head), and went about to hurt him. "But," says the chronicler, "the power of the Lord held them back."

Then he went on, right thankful at having escaped with his life, up and down, round and round, exploring and surveying—for what purpose we shall see hereafter. And at last he lost himself in the place which is called Aihen-loh, "the glade of oaks;" and at night-fall he heard the splash of water, and knew not whether man or wild beast made it. And not daring to call out, he tapped a tree-trunk with his axe (some backwoodsman's sign of those days, we may presume), and he was answered. And a forester came to him, leading his lord's horse; a man from the Wetterau, who knew the woods far and wide, and told him all that he wanted to know. And they slept side by side that night; and in the morning they blest each other, and each went his way.

Yes, there were not merely kings and wars, popes and councils, in those old days;—there were real human beings, just such as we might meet by the wayside any hour, with human hearts and histories within them. And we will be thankful if but one of them, now and then, starts up out of the darkness of twelve hundred years, like that good forester, and looks at us with human eyes, and goes his way again, blessing, and not unblest.

And now Sturmi knew all that he needed to know; and after awhile, following the counsel of the forester, he came to the blessed place, long ago prepared of the Lord. "And when he saw it, he was filled with immense joy, and went on exulting; for he felt that by the merits and prayers of the holy Bishop Boniface that place had been revealed to him. And he went about it, and about it, half the day; and the more he looked on it the more he gave God thanks;" and those who know Fulda say, that Sturmi had reason to give God thanks, and must have had a keen eye, moreover, for that which man needs for wealth and prosperity, in soil and water, meadow and wood. So he blessed the place, and signed it with the sign of the Cross (in token that it belonged thenceforth neither to devils nor fairies, but to his rightful Lord and Maker), and went back to his cell, and thence a

weary journey to St. Boniface, to tell him of the fair place which he had found at last.

And St. Boniface went his weary way, either to Paris or to Aix, to Pepin and Carloman, kings of the Franks; and begged of him a grant of the Aihen-loh, and all the land for four miles round, and had it. And the nobles about gave up to him their rights of venison, and vert, and pasture, and pannage of swine; and Sturmi and seven brethren set out thither, "in the year of our Lord 744, in the first month (April, presumably), in the twelfth day of the month, unto the place prepared of the Lord,"—that they might do what?

That they might build an abbey. Yes; but the question is, what building an abbey meant, not three hundred, nor five hundred, but eleven hundred years ago—for centuries are long matters, and men and their works change in them.

And then it meant this: Clearing the back woods for a Christian settlement; an industrial colony, in which every man was expected to spend his life in doing good—all and every good which he could for his fellow-men. Whatever talent he had he threw into the common stock; and worked, as he was found fit to work, at farming, gardening, carpentering, writing, doctoring, teaching in the schools, or preaching to the heathen round. In their common church they met to worship God; but also to ask for grace and strength to do their work, as Christianizers and civilizers of mankind. What Christianity and civilisation they knew (and they knew more than we are apt now to believe) they taught it freely; and therefore they were loved, and looked up to as superior beings, as modern missionaries, wherever they do their work even decently well, are looked up to now.

The time came when the monasteries utterly forgot the purpose of their own existence. As for the charges brought against them in the fifteenth and sixteenth centuries, they are, alas! not overstated. They became evil. Indeed there was almost a necessity in them that they should become evil; for like all human plans and systems, they contained in themselves more or less of original sin; and their original sins were many and heavy—idolatry (or at least in those early days, a strong tendency toward it, which afterwards took the grossest forms), forced celibacy, and overstrained fanaticism. These were three elements, which in every age and people have sooner or later ripened into the ugly fruit of immorality. And when the fruit was ripe, they and it fell together. They had done their work, and they went; like all things born in time, in time they died.

"The old order changed, giving place to the new;
And God fulfilled himself in many ways."

But in them, too, He surely fulfilled Himself, as far as their system was capable of carrying out the designs of His Providence. By them He was then Christianizing and civilizing Europe; and by them alone.

So because the work could be done in that way,

and (as far as men then, or now, can see) in no other way, Pepin and Carloman gave Boniface the glade of oaks, that they might clear the virgin forest, and extend cultivation, and win fresh souls to Christ, instead of fighting, like the kings of this world, for the land which was already cleared, and the people who were already Christian.

In two months' time they had cut down much of the forest; and then came St. Boniface himself to see them, and with him a great company of workmen, and chose a place for a church. And St. Boniface went up to the hill which is yet called Bishop's Mount, that he might read his Bible in peace, away from kings and courts, and the noise of the wicked world; and his workmen felled trees innumerable, and dug peat to burn lime withal; and then all went back again, and left the settlers to thrive and work.

And thrive and work they did, clearing more land, building their church, ploughing up their farm, drawing to them more and more heathen converts, more and more heathen school-children; and St. Boniface came to see them from time to time, whenever he could get a holiday, and spent happy days in prayer and study, with his pupil and friend. And ten years after, when St. Boniface was martyred at last by the Friesland heathens, and died, as he had lived, like an apostle of God, then all the folk of Maintz wanted to bring his corpse home to their town, because he had been Archbishop there. But he "appeared in a dream to a certain deacon, and said: 'Why delay ye to take me home to Fulda, to my rest in the wilderness which God hath prepared for me?'"

So St. Boniface sleeps at Fulda,—unless the French Republican armies dug up his bones, and scattered them, as they scattered holier things, to the winds of heaven. And all men came to worship at his tomb, after the fashion of those days. And Fulda became a noble abbey, with its dom-church, library, schools, workshops, farm-steads, almshouses, and all the appanages of such a place, in the days when monks were monks indeed. And Sturmî became a great man, and went through many troubles and slanders, and conquered in them all, because there was no fault found in him, as in Daniel of old; and died in a good old age, bewept by thousands, who, but for him, would have been heathens still. And the Aihen-loh became rich corn-land and garden, and Fulda an abbey borough and a principality, where men lived in peace under

mild rule, while the feudal princes quarrelled and fought outside; and a great literary centre, whose old records are now precious to the diggers among the bones of bygone times; and at last St. Sturmî and the Aihen-loh had so developed themselves, that the latest record of the Abbots of Fulda which I have seen is this, bearing date about 1710:—

"The arms of the most illustrious Lord and Prince, Abbot of Fulda, Archchancellor of the most Serene Empress, Primate of all Germany and Gaul, and Prince of the Holy Roman Empire." Developed, certainly: and not altogether in the right direction. For instead of the small beer, which they had promised St. Boniface to drink to the end of the world, the abbots of Fulda had the best wine in Germany, and the best table too, and—. But if prosperity made made fools of them, let us take care that it does not make fools of us likewise.

At least, to have cleared the timber off the Aihen-loh, and planted a Christian colony instead, was enough to make St. Sturmî hope that he had not read his Bible altogether in vain.

The motives with which this paper was written by one who has as little leaning toward the Roman Catholic religion as any man on earth, may be simply avowed now, if it has not been discovered already.

To make men know and love each other better. To make them by so doing justify God, and the providence of God, by believing that he knew best. To make them believe that he did know best, as to those early ages, as to the work which was to be done, and the men who were fit to do it. And especially, to make men see, as I believe they will, sooner or later, that in the case of these early monks, making allowance for superstition, vanity, ignorance, pious frauds, prurience, and mere hysterics, they did raise, not on paper, but in their own lives, sinful human nature to a higher form than it ever had taken among the nations to whom they preached. There had been far higher patterns before them in the days of the Apostles; there have been far higher patterns since. But instead of setting up our own petty conceptions of what might have been done, let us look fairly and lovingly at what was done; and trust that our Lord included them also when he said, that "Wisdom is justified of all her children."

CHARLES KINGSLEY.

CHARITIES IN THE BLACK FOREST.

It rained all night. It was raining in the morning. There was no doubt about it. Out of the window there was a leaden haze, flecked with the light of a dull, spiritless dawn. Rain was falling in the fountain, streaming past the panes, murmuring on the roof; a trickling, pattering, liquid sound that went up and down the silent street. Sir Francis Drake stood it out unmoved, like a brave old English mariner as he was; but the wreath on his brow was battered under his chin, and the garlands hung in drabbed tails down his back. The banners clung to their poles, the arch of evergreens was like a weeping willow, and the pretty rifle-festival of Offenburg had ended in a wetting. The town has a broad street, a good hotel, a copy of the *Times*, and a weakness for potatoes,—qualities of which the inexorable rail permitted the briefest enjoyment; and by the supposed time of sunrise we were bowling away from it at an easy twenty miles an hour. The carriage was crowded with a miscellaneous company; riflemen in tall Tyrolese hat and feather; farmers with broad-brims, long coats, great buttons, and gigantic collars; market-women with hair brushed straight back, and tied on the crown with broad knots of ribbon or lace, while the peasant girls preferred to fasten it with a two-edged silver knife; a student or two with inevitable spectacles and merry humour;—pleasant, honest faces, a shrewd, self-possessed, independent folk, who kept up the liveliest conversation, and passed the dullest jokes, entered with a cheery *Good morning all!* and left with the friendliest *Adieus*. Your Briton resigns himself to the rail like a martyr, prepares his mind for an accident, grimly suffers himself to be led along at express speed, builds up a wall of newspaper about him, or harrows his feelings with a sensation article. Talk would be frivolous and impertinent in such a temper, as indecent as gossip on the way to an execution. But your German travels among the gaieties of life; it is a pleasant episode: it is like seeing company, a sort of open club where everything is discussed and everybody welcome; a place for little courtesies and self-forgetfulness; and his frank smile is like a shake-hands all round.

The Black Forest was on one side, the Rhine upon the other. Geographically that was our position; actually it was in a drizzling mist of rain; by careful rubbing of one glass a ditch was occasionally visible; by occasional opening of the other, there was evidently a dull mass of trees piled up over the slopes of long hills, and with as much actual form as the shading round a sepia sketch. Some darker shadow would sometimes fly across our road, and some hand would point vaguely out to castle this or that, spectral ruins over which the rain and mist had flung themselves

for centuries, out of which the legends of the past stalked harmlessly into the busy sceptical present; knights in armour, princesses in misfortune, robber captains, emperors' daughters that were always in love with the wrong person, emperors' sons that were always in disguise, the lady's foot-page and the rubicund friar, gay cavalades to gayer tournaments, treasons and stratagems, and life and death, as they were wrought out before printing and gunpowder and autumn tourists.

At Freiburg we stopped, and those who care to explore the Forest will do the same. Like Heidelberg, it stands at the entrance of a valley, and for reasons of their own, the clouds make such places their special fortresses; pile themselves up in high blockade against the outer world; sink deeper and look denser than elsewhere; almost dip into the streets, and sweep the people off to cloudland. And so as we went round by dripping vineyards, and streets that murmured like water-courses, round by narrow lanes, and under spoutless eaves, crossing the gutters by plank bridges, and stumbling over children—young Bacchanals that must needs launch ships of vine-leaves, and as we came into the cathedral square, the light fretted spire not only touched the sky, but pierced it and shot up into it, till spire and clouds were mingled together. The rain had driven the apple-women into the shelter of the great portal, where, as heedless of proprieties as the carved virgins above them, they drove a lively trade and livelier gossip,—gossip that some untoward puff of wet did not help to bring into harmony with the situation. Incongruity seems to have fixed itself in this Romish worship: buildings of exquisite and solemn beauty piled over the ugliest and tawdriest of wax-dolls, arrangements of painted light, and aisles of pillars, and dim vaulted roofs, lofty heights, and shades of rich gloom, that call up a natural awe and reverence, but that are used for other arrangements of service that call up disgust; reverence and irreverence divided by a curtain at the door! There is no spiritual sense, no fitness, no impression of an inner life. Religion has exhausted itself in a beautiful form, and cannot fill it with the spirit, but shows off puppets of its own in the empty space, and strangers may be excused if they remember a cathedral only by its Holbein, or Raphael, or Rubens, its glass or its wood-carving. Yet Alban Stoltz lay on every bookstall, well-thumbed editions that had passed through the hands of many readers; and when Alban Stoltz preaches, there are "words of life from a Roman Catholic pulpit." Such men are themselves an incongruity, ethically as painful and far more puzzling than any other; speaking truth and content to be wrapped in the folds of error. But we may judge

them too hardly, forgetting the second nature of old habit; and Stoltz, at least, does preach Christ in a most striking and genuine way, and his writings are popular in Freiburg as elsewhere.

The inn window looked out upon the cathedral, and the cathedral filled up all the space with its noble lines marked out against the sky, and glowing through the sombre air by the ruddy colour of its red sandstone, and across it, and away to the left across the vision of vineyards, hung the rain-pall. Wet feet occasionally plashed over the pools outside; wet travellers came in, till the room was sprinkled with a wet company; a wet dog of enormous proportions went sniffing round their pockets, and thrusting his terrible nose under their hands. Mid-day it rained, and long after mid-day, and it was raining still, when we took our seats with a desperate alacrity in the omnibus for Todtnau. Steaming horses, a mist of wet over the windows, a straight watery road, and off to the right and left, fat, steaming meadow-land, backed by vast shadows that might be either hill or cloud. But in an hour it changed. The road wound up in long curves; the hill-sides narrowed in; the pine-woods grew into distinctness; the mad brook foamed among huge boulders close by the horses' hoofs; the ragged mist rose up a hundred feet; there was a long stretch of soft valley behind; gigantic masses of shadow darkened the view before; wild, picturesque saw-mills perched upon the stream; the six horses could only walk. We were fairly into the depths of the Forest. The brook sunk into a lonely glen, and sent back its hoarse murmur of companionship; the road went right up above our heads by a series of sharp zigzags, and the higher it rose the higher and darker rose the woody peaks above it, while the light wind moved among the low clouds, and showed great mountain shoulders with their shining cliffs and water-gullies and matted brushwood clinging to the rock and sombre rows of firs, rank above rank, or it opened chasms in the mist, through which the woods rolled back in interminable folds, or some green meadow flashed through the rain. Wooden crucifixes had dotted the way, beside an orchard, or leaning over a mill, against some quaint brown gable at the road-end of a straggling hamlet, or under the shelter of a lonely rock; of the homeliest and ugliest manufacture, repulsive, rotting away by sheer carelessness. But the last was left far behind, and the next was on the level crown of the hill, where the charcoal-burners moved about their fires like spectres in the darkening twilight. Then a quick canter down by bare fields; lights, wide apart, that leaped out of the darkness, then an irregular cluster, the clatter of hoofs through a village street, and the pleasant parlour of the *John Bull*. And still it rained.

Yet they reveal a certain true power. They associate religion with common life. It is a dedication of it to God in a clumsy, superstitious, perhaps to many repulsive way; an effort to realize what most men forget. That very irreverence of

the Romish worship may have its better side. It is a worship that endeavours to make God near, to realize him under visible forms and a real presence. But he is *made* near, treated as an idol, not realized as a personal being, already near, sharing the life, dwelling in the heart.

But in that cheery parlour there was little heed of weather. A clock hung against the wall; no vulgar, loud-ticking, showy time-server, but a very library clock that paced the hours with noiseless step, and would have been the pride of a city watchmaker; and near it stood a piano, excellently wrought, and that for tone might have held its own with a Collard—uncommon luxuries for a country inn, and in the Black Forest. But they were Forest made; for in watches and clocks, and intelligent craft of that sort, these foresters are eminent, and even great traders, and hide, in the depths of their brown woods, the very spirit, and enterprise, and shrewdness, and skill of our English manufacturers. For the rest, the room was as unpretending as could be. At one of the long tables sat some twenty villagers, under presidency of the host—a sort of choral union by which they pass the time in long evenings—for their spring, and summer, and autumn, are thrust into less than four months, and winter breaks off their communications with the world,—and they sung part songs and Suabian ballads with most excellent harmony, and played snatches of wild mountain music, and quietly went their ways at evening chimes—courteous, frank, and simple people, and left us to forget the dripping and gurgling of the rain in the absurd discomfort of a German bed. These Forest hamlets are marvelously picturesque with their scattered groups of houses, and deep projecting roofs and wooden galleries, and brown, old-world, comfortable look, and primitive ways. There is no poverty among them, no beggar-nuisance as in other places, and at Todtnau everybody seemed to own cattle; for in the morning the rustic square was filled with kids and goats at the blast of a horn, that brought them out with the suddenness of Roderick Dhu's men; and they had no sooner been despatched up the hills in charge of two or three young herds than the cows came trooping out of house doors, and stumping down wooden steps, and round from by-lanes, till the square was as full of them, and they were packed off under similar charge to the meadows below—a marshalling of the resources of the village that had a singular effect, and a system that could only be maintained by an honesty of man and intelligence of beast that are rare.

Down the winding road to Mambach is as pleasant a walk as can fill up an autumn morning; up the Mambach slopes and over the long crest of the great Todtmoos mountain, is, no doubt, even better. But while we could still hear the children's voices as they played round the Mambach doors, the inveterate mist rolled heavily down, and the

rain began to soak through the trees ; and out on the open moor, and through the long grass, and over the heavy clay roads, up the hill and down the hill, and into the valley of the Wehr, it rained with a pitiless patience. We remonstrated. It was not what we had come for. Rain could be had anywhere, and to quite the same extent, and there was nothing peculiar or exhilarating about it. It was rather in the way ; we could not see the next field ; the large drops sometimes missed the ground and stumbled against the face ; there was an unpleasant wetness about everything. But remonstrance was useless ; it had made up its mind to it, and at least a walk by the Wehr on a rainy day was a novelty. There were precipitous cliffs, with fringes of trees about the top and bottom, gigantic rocks that jutted out across the path, and assumed the most fantastic shapes, a torrent that brawled its very loudest, dense woods dyed with all the colours of autumn, and over all a dense misty shroud ; and we were down in the hollow, where there was scarce room for the road and the river, and from which the sides rose up like walls into invisible heights. There may be more. I would not do it an injustice, nor answer for what is visible in dry weather. But that is what we saw : miles of that. And it rained all the time, and all that evening, in the railway carriage and across the bridge at Basel, and it was raining when we went to sleep in the *Three Kings*, above the soft swift purling of the Rhine. Rolling hills and deep valleys and the wood that has crept over and round them all ; rivers between narrow strips of fresh pasture-land ; villages that nestle in among the lonely hills, and busy towns, where the din of the workshop contrasts strangely with the cincture of endless trees and the silence of the forest paths ; the brightest of green fields, sparkling like jewels, and hemmed in by great belts of pine and fir ; gorges where the sun scarcely shines, and pleasant dales that the sun seems never to have left ; charcoal-burners and wayfarers ; watchmakers and toymakers ; honest peasant men and women ; the quaintest of costumes ; these repeated over and again within every few miles ; these, and a universal brooding quiet ;—that is the impression of the Black Forest ; and a pleasanter place for a thorough bracing repose it is not easy to find. But of all this, and how it was seen under rainless skies, it would be almost impertinent to write, since Auerbach's charming Forest stories are in everybody's hands ; and no one can introduce us to such living Forest people, or show such exquisite Forest pictures, or bring its old legendary past into such happy contact with the present. There is a deeper interest, and less known ; missed by most tourists, and yet worth walking after through a whole week of rain ; and if any reader has been drawn away from his easy chair into the mists and misfortunes of wobegone pedestrians, it has been with good intention at the bottom.

As the Rhine flows towards Basel, and before it turns its back upon France, the Black Forest on the one side, and the Jura on the other, send out long spurs, and they leave just space enough for the haughty river, some level fields of beans, vineyards, and here and there an ancient town. On one of those northern spurs, and overlooking Basel, a chapel was built hundreds of years ago—how many hundreds is not positive, but there is a legend, that when the Lady Ursula was returning from Rome, three of the eleven thousand virgins in her train lingered at Basel, and one, by name Crischona, lived upon the hill, and founded a church ; and of that legend any one may believe as much as is convenient, and as the sacristan of St. Ursula, at Cologne, can tell him without laughing. But this is certain, that the hill is called St. Crischona, and that there is a chapel upon it, which twenty years ago was in ruins, and had fallen so low, that a neighbouring farmer made it a sty for his hogs. Here, in the year 1840, two men knelt in prayer ; and the chapel rose up out of the ruins ; the nettles and rank grass became a flower garden ; and the hogs were changed into fat cattle. It was no miracle, but a very simple matter. Mr. Spittler had a cherished purpose in his heart of training young men of the country-side for missionaries ; they would be pilgrim missionaries, wandering up and down among the heathen ; not resting, but in motion. They should not linger by any sweet spot of life, but journey onward, staff in hand, preaching Christ as they went. They should be found in every living throng, passing through it, and scattering glad news on every side ; in the crowds at a Hindoo sacrifice, through the ranks of the fire-worshippers, at the feast of the Ramadan, in the streets of Canton, on the prairie of the Red Indian, by the *kraal* of the Kaffirs,—solemn-voiced messengers of God, speeding over the earth, and crying, *Repent, for the kingdom of heaven is at hand*. He begged for the ruins of St. Crischona, and having freely got them, he went up with his architect, and prayed that God would guide him in his work. Part of the chapel was restored sufficiently to live in, and here he lived for some time alone. Basel is wealthy and generous, but it did not sympathize with him : men did not come in ; and still he waited. Then one joined him ; then three ; and soon they were six. The chapel was ceiled, and dormitories made of the upper storey. The dormitories were crowded ; a fresh building had to be undertaken, and the hill is now held by this Christian colony. A hundred and fifty have gone out from it ; and there are fifty there at present. They are young men, mostly peasants, and while they study they are not above peasant's work. There is a farm, that serves both for their support and training ; they manage all their household economy ; the last glimpse we had of them was singing—and their singing is worth hearing—over their washing-tubs. Their teachers live

with them, men of ability and Christian worth ; their education is not sacrificed to their work, but is thorough, and well adapted to their calling ; the tone of the place is manly, healthy, and earnest ; and the basis of their training, and the very formation of their house, is faith in the living God. The aim of the institution has scarcely yet been reached, but one branch of it realizes the character of the whole. It is proposed to establish such a chain of mission posts as will connect Jerusalem with the Cape of Good Hope. Missions already reach up as far as the Zambesi ; the mission at Rabba Mopia will form a link between the Kaffir stations and Abyssinia ; and from Jerusalem to Abyssinia Mr. Spittler proposes establishing twelve stations, each sufficiently strong to command the surrounding district, and sufficiently near the next to maintain easy communication, and these he calls the *Apostolic Way*. As means are provided, the stations are established, and already there are two, and prospect of a third. While it may be thought that there is something sentimental in this project, it is plain that missionary centres of this sort, each a link in a long chain, are the most effective of all ; that the isolation of a station is a source of weakness, and, perhaps, of ruin ; that, on the other hand, a station must be effective enough to bear being isolated at any juncture. There is need also for a comprehensive mission scheme, for developing mission effort with more system, and on a larger scale ; distributing the forces of our Christian soldiers through new provinces, placing them in the most effective positions, not only for single but united work, and waging the war on a scale commensurate with the object. Now that missions are no longer the experiments they were at the commencement of this century, unfamiliar and unsupported, it might be worth while and practicable not only to plant fresh stations, but to plant them in such a way that they shall be part of the mission system of a country or an entire continent. India might be so mapped out, that as each post was occupied, it would be a step towards completing the general India mission system ; and as towns outside of India were occupied, it might be in subjection to the wider system for Asia ; and each society might assume the vacant places as it was able. A chain of missions through the dry heart of Africa is a venturesome thought, fit to be conceived in a venturesome age like ours, and Christians will watch its progress with much eagerness and sympathy.

If climate and situation have any effect upon the mind, it might be supposed that St. Crischna with its width of prospect, had some influence in giving Mr. Spittler his larger views of missions, for the country lies under the eye, from the glittering peaks of the Bernese Alps, and almost a hundred miles of the valley of the Rhine, to Freiburg—as lovely and varied a view as one could have on a summer's day. Leaving this elevation, however,

and descending to the village of Riehen below, we meet Mr. Spittler again. Indeed, it would not be easy to avoid meeting him anywhere round Basel. There, opposite us, lies his Reformatory, deep among its vines. He intended it for wild lads who might have run off from home, gone to sea perhaps, or in some way cast off all parental restraint. He thought there might come a time when they would be softened, and anxious to return, when a kind word might break down their pride, and they would accept a refuge from the wild life that had deceived and wearied them. The first lad who came had been a sailor ; he proved diligent and serious ; the change in him was so marked, that he was soon transferred to the Mission House ; and from there he has gone out to a new station on the *Apostolic Way*. And though there has been no other story to match this, the Reformatory has succeeded, and its rooms are filled. Down below us also there is a large and picturesque building, one of the best institutions for the deaf and dumb in Germany ; and if you ask about it, you are informed it was raised by Mr. Spittler. Go to the Tract Society, and you are still in Mr. Spittler's domain. The great mission-house at Basel reckon him chief among its founders ; it was he almost as much as Zeller that founded Beuggen. For these last sixty years he has worked at every Christian work in Basel. He is one of the few surviving members of the old *Christian Society*, from which it may be said the modern missions of Germany have sprung. When Gossner was in early trouble, it was to Spittler that he came. When Zeller was bent upon saving the outcast children, it was to Spittler that he confided his plans. And now, in his old age, he is working still, and watching the works already begun as they grow and strengthen under unseen hands. And for the reason of that success, and the motive of that life, he has no answer but one, that it is of faith and prayer.

This, however, has been by way of interruption in our descent to Riehen, and our chief object there was to visit the Deaconesses, for whom it may be said, once for all, Mr. Spittler also is answerable. The house lies in an open garden, a quiet, simple, country house, with no pretensions, but perfectly neat and clean. Unlike Kaiserswerth, it is but a single house, and not the centre of a busy Christian colony. Everything about it is quiet ; the view of the soft hills and woods up the valley of the Wiese ; the meadows and still grave-yard opposite ; the flowers before the door, and what one might call the cheerful silence within. There are few Deaconesses ; the hospital is on the smallest scale ; the country air breathes through the rooms ; and sick-nursing is all that is attempted. Nothing can be simpler, less like an order, or even organization. But Riehen has an importance that cannot be gauged by size or numbers. It is yet in its infancy, moreover ; only ten years in existence, yet there have been from 70 to 80 deaconesses connected with it ; and during last year more than 200

patients passed through the hospital. The arrangements are almost identical with those at Kaiserswerth; there is the same tidiness in the rooms, the same attention to light and air, the same provision for sick children, the same regular medicine-room, the same love of flowers, the same homeliness; there is in the one as much as the other a calm Christian atmosphere, a careful, gentle, genial nursing. But the order is different. Riehen is under the presidency of a lady; there is no resident chaplain; no fixed term of service; there are scarcely any rules. It is a proof that the usefulness of the deaconess is not confined to any system, that the principle of associating Christian women in Christian service is independent of any special regulations, that it is capable of being adapted to the freest states of society. Nothing, indeed, can well be simpler than the Riehen foundation, and it must be remembered that this simplicity has been found sufficient to meet very varied and scattered work. Some of the Deaconesses are in the hospitals of Basel, others at Zurich and Schaffhausen; some are private nurses, and some tend the insane. And Riehen is the parent house, and its rules must serve, not only for itself, but for its various offshoots, sufficiently comprehensive and strict to maintain unity in spite of separation and difference of circumstances. What might be defective in system, however, is balanced by the carefulness of selection. Many of those who offer their services are at first rejected. Of the rest some prove unsuitable before the time of probation commences; and the probation itself, which commonly lasts a year, is a time of wise and loving scrutiny. It is felt to be no ordinary duty that is undertaken, but one that requires the highest devotedness and the power and clearness of a simple faith. "Deaconesses are servants of the Lord in works of merciful love, and the Deaconess Institution at Riehen presents an opportunity of hastening to the help of suffering humanity, and thereby furthering the kingdom of God on the earth;" but just because it is such, the intending Deaconess "must earnestly examine herself before God." "Natural kindliness and head-Christianity" are not enough: there must be "Christian knowledge united with the experience of a life in God." Those who pass this probation, and are recommended by the superintendent, are set apart at a solemn service, and receive a solemn charge.

The charge iterates with great emphasis the leading principles of their calling, its *willingness*, *obedience*, and *fidelity*. "Obedience," said Pastor Härter of Strasbourg, at the opening, "is the humility of love, willingness the joy of love, fidelity the steadfastness of love. A deaconess without humility is impossible,—a contradiction in terms. Deaconesses are not only an association but a corporation; a humble obedience holds it together. As members of the corporation, the sisters have their higher and lower functions, yet so that none shall hold herself above another." It is not the

obedience of a vow; the blind submission to a superior; nor obedience for merit's sake and because it is a glorious thing to crucify the self-will. It is simply so much intelligent obedience as may make order and help practicable; so much submission as one must render in a corporate body for the good of the whole. Nor is the fidelity an inviolable promise for the future. It is quite true that the calling of a deaconess is contemplated as permanent; that there is no desire that it should be lightly taken and as lightly thrown off—serve only to pass some idle days of life. It is in this respect simply on a level with other callings. It is understood that there are persons who may look to it as their life, deliberately prefer it to any other life; that it puts within their reach what they needed, a calling by which they can humbly serve God. The deaconess is set apart on the understanding that she has deliberately chosen her diaconate, that she does not anticipate resigning it. But there is no promise sought or given. She may withdraw by giving some months' notice. She may marry. There is no hindrance to such secessions; they will always be occurring; nor are they without great good. They spread the help and skill of the deaconess over a larger surface; as a Christian wife or mother she may aid in many ways wives and mothers of her acquaintance; and the fact of such secessions acts healthily back upon the deaconess, and prevents her becoming touched with the spirit of a mere order;—prevents anything approaching a conventual separation from the world. But the dedication is on the principle that the calling is steadfastly assumed, and will be steadfastly pursued. A very cheerful calling, to judge from the brightness and peaceful look of every thing, and every one at Riehen. Among her requirements, a deaconess is to be of those whose "natural disposition is lively, friendly, affectionate, and without any tendency to gloom or excitement." The spirit of the place is just such as to foster such a temper; her common work is just such as to require it. A gloomy nurse is an aggravation of sickness: a perpetual black draught. Yet how many martyrs suffer by such a simple cause; how many, as soon as they enter a sick-room, muffle the voice like a drum for the funeral march, lengthen the face, and speak gracious and friendly words with a solemnity that is appalling! Christian truth is joyful; Christian life is sunny. A Christian nurse should enter the room like a sunbeam, as noiseless and as cheerful. And much like the sunbeams do those gentle Riehen deaconesses go about their work, flitting softly through the rooms; and lighting up the faces of their patients as they pass;—true Christian women, who live for Christ, and freely use their privilege of nursing for winning others to the Saviour and his peace.

The last glimpse we had of Riehen was of a simple dress of black and white, moving over the garden-walk and the simple house among the flowers.

Behind lie the dark shadow of the woods, and the darker shadow of the past. There are charities of greater bulk and pretension, but there are few as interesting as those of the Black Forest; the growth of one man's effort, given indeed by God in answer to one man's prayer. And this spirit of prayer, this childlike dependence on God, and bold, hearty faith, characterize each. They are wisely and carefully conducted, so modestly, that few have heard of them; I have only mentioned one or two out of many. Yet from that quiet retirement a living power goes out that is felt in the back-

woods of America, and up the Nile, and away in Abyssinia; that betrays itself in movements affecting the future of the Church, that suggests the most effective means for large social reforms and healthy Christian work; and that power is nothing else but faith in the living God.

We turned reluctantly away up the road to Schandau—we, that is, he and I, for we were two. He was the best of companions, the pleasantest of travellers. May no worse fate ever befall him than a wetting in the Black Forest, and a day at St. Crischona!

NEEDLES AND PINS.

A PAGE FOR GIRLS.

NEEDLES AND PINS! Don't think this is a trifling subject. I have chosen it with the deliberate, strong conviction, that for you and me, and the most of us,

"Little things, on little wings,
Bear little souls to heaven."

Great events don't happen to us more than half-a-dozen times in our lives; then don't wait for them to practise what is pure and lovely, honest, and of good report. You hear often the commercial proverb, "Take care of the pence, and the pounds will take care of themselves." Nobler, and of still more vital consequence, is the charge,—take care of the little duties, the little pleasures, which occur in "the common round, the daily task," and the great heroisms, the blessed boons, will take care of themselves. It is the little foxes that destroy the promise of the vintage.

Needles and Pins bulk largely in your daily life, and often lead to important results; therefore you are not wise if you neglect them, nay, if you do not take them up and turn them to sweet and generous uses.

A case of family quarrel, bitter and inveterate, was reported to the writer, and, in the course of the tale, the speaker had to observe, wonderingly and sorrowfully, "and the cause of the quarrel was needles and pins—nothing more." Yes, so it is, our comfort, women's comfort especially, may be made or marred by Needles and Pins.

Think for yourself, what constituted your happiness at any special time and place? You can hardly tell, but it was a good deal mixed up with sunshine, fresh air, a pleasant path, a fine view, and cheerful or witty company—small influences all of them. And what produced your dissatisfaction on another occasion, and your subsequent aversion to recall the least particular of this other time and place? Clouds, close air, mud, smoke, disagreeable, dull society, and a headache on your own account. Of course, you cannot command sunshine and cheer when you will, but you can com-

mand many causes and effects which are almost equivalents.

You don't need to be fine ladies, or even to move among fine ladies, in order to be gentlewomen. You have only to follow St. Paul's injunction, "Be virtuous." You have only to read it in its deeper, finer readings of self-denial, forbearance, and charity, to rank not nominally but really, among the pleasantest girls and women in the land, so that it may be said of you, as it was said of another girl of whom it was noted in reservation, that she was neither beautiful, learned, nor witty,—

"Men at her side

Grew nobler, girls purer, till through the whole town
The children were gladder that pulled at her gown."

On to the end—

"She made the grass greener even here by her grave."

And what do you think creates this gracious power? What is it which makes you always pleasant and sweet? Needles and pins. Beginning with them, though not ending with them, beginning and progressing by them day after day.

I would ask you girls, plainly, how much annoyance do you cause your mothers by being troublesome or careless about trifles? You won't eat this, and you won't eat that, though it is perfectly wholesome, and you have no particular dislike to it, just because on the reverse side you have no particular liking for it, and it does not tickle your palate. You will neglect family meals, and so derange the economy of a whole house, and inconvenience or oppress its dependants; or else you will lie in bed in the mornings, and accomplish the same undesirable result, unless papa is particular, and frightens you by his frown or his sharp word. I have been struck by the human judiciousness which shines out in a reverent, simple, eloquent form of family prayers for the present day, in which the head of the house is made to petition for its members, power to resist sloth as well as the seven

deadly sins. I suppose when you do get up early you are apt to be cold and fault-finding and fractious. Do you know that Caroline Chisholm used to test the tempers of her female emigrants, by remarking which tempers were below zero before breakfast? You will squabble about which is to have the first reading of a book; the charge or the freedom from charge of a house; the turn to gad in public, or the turn to dawdle in private; the warmest seat on the hearth-rug; the gayest place at the window; the sweetest morsel of cake; the mellowest bite of peach or pear. Oh, big children! while your poor mother who has learnt self-forgetfulness (as it is hoped you will do one day), from the well-remembered hours she bore about your helplessness as babes and sucklings, is at her wit's end, like the old man and the ass, to please each and all of you. No wonder though you multiply her grey hairs, and shorten the years of her life by your folly. You have most of you, probably, read or heard something of the marvellous literary success of *Adam Bede*? Did you notice how significantly the wise author rendered Hetty fretful at the Squire's feast under the weight of the little pet of the rest? How significantly she made Dinah offend Mrs. Poyser's sense of justice, and win her reluctant admiration, by Dinah's propensity to eat her dinner from the made-up dish, the dish of scraps, the dish least in repute amidst the abundance at the farm-house table. Would you like to consider whether you are in the catalogue of the Hetties or the Dinahs, not in their rank growth, when they were awfully divided, as light from darkness, but in their small beginnings? The measure is before you.

'A faulty girl used to plead, in resistance of all kind remonstrances, against her hardily apportioning to herself a cold seat, or unpalatable walk or visit, "Let me do it. It is an act of domestic chivalry. This is what I call domestic chivalry." Surely you have some enthusiasm for that gallantry of the old knights and their modern representatives—the soldiers who bleed for you, the sailors who perish in your defence in the waste of waters. Though you can never vindicate it in your own persons, you can catch its shadow at an immense distance; it may be such a distance as may separate our work on earth from our work in heaven. You can be gallant girls and women by being easily served, temperate, long-suffering; and remember, every hardship, however slight, borne in a soldier's spirit, proves you as truly good soldiers of Jesus Christ as if you were very grey-headed brigadiers.

Avoid self-consciousness as much as you can; reflect that, having done your best, you are unprofitable servants to your master, and giddy, self-engrossing fellow-workers to your chosen partners in the field. You will be convinced of the lost truth when you and your friends are severed for a time. When you labour alone without the sweet face of your mother bending over you, or the warm hand of your sister clasping yours, or the bold eye of your brother flashing back encouragement upon you when there would be no sparkle in it for his own sake. Life is too short to have any of its dignity and sweetness wasted for Needles and Pins. Since Needles and Pins must play their pigmy part in our dramas, let them be converted, even in their insignificant bluntness and crookedness, into handy little tools for our lives' purposes.

Much of the peevishness and contention which ruin the relations of families, is the effect of the wasted energies and purposeless lives to which custom and the complications of society tend to reduce many women in the present day. But the more weariness, restlessness, and nervousness, are acknowledged to be the diseases of our era, the greater should be the necessity for cultivating betimes the antidotes,—the common graces, like common sense (in danger of becoming least common of any), humility, cheerfulness, and activity, wherewith to pick up and put in their proper places, and generally employ and improve the irksome needles and pins. Believe that the fairest face in a glass is that which flits aside to permit the image of another to be reflected there; the bravest adornment that which costs least care and pain to father and mother; the most delicately spiced morsel that which is eaten after abstinence, the soundest sleep that which is slept after fatigue. Be honourably, kindly obliging, and don't display the curious inconsistency of being eagerly attentive to strangers and slight acquaintances, and by perversity availing yourselves of your very familiarity with your friends and kindred, and their tried affection for you, to be gruffly, crustily disobliging to them. Remember they are entitled to the cream of your intellects and hearts. Copy your patterns, study your books, exchange your opinions, go a-walking, shopping, singing, dancing, in a liberal, tender fashion. Wait for the slow ones, you quick ones, without a grumble, unless it be a merry grumble, to serve as a frolic by the way; help the stupid, awkward performers, you who are naturally skilful and expert, without a sneer or snarl. Ay, be loyal, leal, in small things, if you would live and die to be noble in great ones.

SARAH TYTLER.

A PASTORAL

A SIMPLE shepherd I,
Unskilled to guard or tend
My flocks that wander slow,
But little prized by friend,
But little feared by foe.
Yet sweet and many are the songs I know.

In youth no gentle art
Was mine to learn or teach ;
As shepherds wont, my speech
Was rude, unapt to reach
The ear, or win the heart,
Till, where moist willows grew, a slender reed
I found, and fashioned fitly to my need.

Then from the sedgy brook,
Where yet its kindred shook,
A sigh so deep, so sweet, so piercing broke,
That ere I knew, a sigh
Went back in fond reply,
And on my lips a sudden song awoke.

With each warm tender thing
That thrust its head in spring,
From earth's dark breast, my spirit communed free :
A soul that loves and grieves
Would speak from out the leaves,
The clouds stole down the hill to talk with me.

And oft with unconfessed
Fond instinct, only guessed,
Through some quick pressure, all the silent air
The while I sang, would fill
With light, would throb and thrill
As if a mighty heart were beating there.

And while I sang, the swains
That listened, straight forgot
How fierce upon the plains
The sun, the shepherd's lot
How hard—their slender gains,
Their ceaseless, thankless toils, remembering not.

And while I sang, the maid
On tiptoe unafraid
Would steal at shut of eve, and linger long,
With parted lips and shy,
Sweet, unaverted eye,
Forgetting still the singer in the song.

I sang of war, of love,
Of gods that reign above
In bliss, of men that suffer, still I sang—
Of deeper pangs, of tears
More sweet that fell in years
Of broader flight, while yet our earth was young.

So sang I until song
Forsook me ; I would tell
How this my strain so well
Beloved, beloved, so long,
Fell from my lips, as falls the star,
As falls the leaf, to dwell
(If yet it lives) apart, afar
Like echo shut within a secret dell.

It was the summer prime
Of noon, the sleeping time
Of Pan, no leaflet stirred, yet from the ground,
Whereon I lay, the clear
Low breathing met mine ear
Of woods, rocks, vales, and hills in slumber bound.

And on the air a slow
Sweet shining now would grow,
And o'er the sunny spaces flit and fall,
As if beloved, and fair
Earth softly, unaware
Smiled 'neath the secret of her folded veil.

Beneath the beechen shade
The golden sunbeams strayed
In sleep, my flock slept round me, all was still ;
When from afar I caught
A flute's clear note, methought,
Some shepherd bids me to a contest of sweet skill.

It ceased, and at its close
A Voice in song arose,
So sword-like sweet, it seemed to cleave the thin
Warm air, and still, with soft
Delay, to question oft,
And still to woo, and evermore to win.

This was no ancient tale
Of flying nymph, or bold
Freehunter, this no old
Fond funeral wail
For Youth slow fading by a fountain's side ;
And yet a high lament
Through all its changes went,
It told of One that loved, it told of One that died.

It told of rude disgrace,
And of an anguished face
It told, methought ; and of a wounded Friend.
Of pain it told, and shame ;
Of love that overcame
Through simple skill of loving to the end.

A silence on the plain,
A silence on the hill,
To hear that song again,
I listen, listen still.
Oh, sweet to me, my vain
Old songs and stories free,
Thy-story, sad and plain,
Is now more sweet to me.

Take, Shepherd, take thy prize,
For who like thee can sing ?
No fleece of mingled dyes,
No apples fair, I bring ;
No smooth two-handled bowl,
Wrought with the claspng vine—
Take, take my heart and soul,
My songs, for they are thine !

Oh ! sing thy song again,
And these of mine may pass
As quick as summer rain
Dries on the thirsty grass.
Thou wouldst not do me wrong,
Thou wilt not silent be ;
Thy one, thy only song
Dear Shepherd, teach to me !

A PASTORAL.

THE WIDOW'S MITE.

BY ANTHONY TROLLOPE.

"But, I'm not a widow, and I haven't got two mites."

"My dear, you are a widow, and you have got two mites."

"I'll tell both of you something that will astonish you. I've made a calculation, and I find that if everybody in England would give up their Christmas dinner; that is, in Scotland and Ireland, too—"

"They never have any in Ireland, Bob."

"Hold your tongue till I've done, Charley. They do have Christmas dinners in Ireland. It's pretty nearly the only day that they do, and I don't count much upon them either. But if everybody gave up his special Christmas dinner, and dined as he does on other days, the saving would amount to two millions and a half."

Charley whistled.

"Two millions and a half is a large sum of money," said Mrs. Granger, the elder lady of the party.

"Those calculations never do any good," said the younger lady, who had declared herself not to be a widow.

"Those calculations do a great deal of good," continued Bob, carrying on his argument with continued warmth. "They show us what a great national effort would do."

"A little national effort I should call that," said Mrs. Granger. "But I should doubt the two millions and a half."

"Half a crown a head on thirty million people would do it. You are to include all the beer, wine, and whisky. But suppose you take off one-fifth for the babies and young girls, who don't drink."

"Thank you, Bob," said the younger lady, —Nora Field by name.

"And two more fifths for the poor, who haven't got the half-crown a head," said the elder lady.

"And you'd ruin the grocer and butcher," said Charley.

"And never get your half-crown after all," said Nora.

It need hardly be said that the subject under discussion was the best mode of abstracting from the pockets of the non-suffering British public a sufficiency of money to sustain the suffering portion during the period of the cotton famine. Mr. Granger was the rector of Plumstock, a parish in Cheshire, sufficiently near to the manufacturing districts to give to every incident of life at that time a colouring taken from the distress of the neighbourhood; but which had not itself ever depended on cotton,—for Plumstock boasted that it was purely agricultural. Mr. Granger was the chairman of a branch relief committee, which had

its centre in Liverpool; and the subject of the destitution, with the different modes by which it might be, should be, or should not be relieved, were constantly under discussion in the rectory. Mr. Granger himself was a practical man, somewhat hard in his manners, but by no means hard in his heart, who had in these times taken upon himself the business of alms-begging on a large scale. He declined to look at the matter in a political, statistical, or economical point of view, and answered all questions as to rates, rates in aid, loans, and the Consolidated Fund, with a touch of sarcasm, which showed the bent of his own mind.

"I've no doubt you'll have settled all that in the wisest possible way by the time that the war is over, and the river full of cotton again."

"Father," Bob replied, pointing across the Cheshire flats to the Mersey, "that river will never again be full of American cotton."

"It will be all the same for the present purpose, if it comes from India," said the rector, declining all present argument on the great American question. To collect alms was his immediate work, and he would do nothing else. Five-pound notes, sovereigns, half-crowns, shillings, and pence! In search of these he was urgent, we may almost say day and night, begging with a pertinacity which was disagreeable, but irresistible. The man who gave him five sovereigns, instantly became the mark for another petition. "When you have got your dinner, you have not done with the butcher for ever," he would say in answer to reproaches. "Of course, we must go on as long as this thing lasts." Then his friends and neighbours buttoned up their pockets; but Mr. Granger would extract coin from them even when buttoned.

The two young men who had taken part in the above argument were his sons. The elder, Charles, was at Oxford, but now in these Christmas days—for Christmas was close at hand—had come home. Bob, the second son, was in a merchant's house in Liverpool, intending to become, in the fulness of time, a British merchant prince. It had been hinted to him, however, more than once, that if he would talk a little less, and work a little harder, the path to his principedom would be quicker found than if his present habits were maintained. Nora Field was Mrs. Granger's niece. She was Miss Field, and certainly not a widow in the literal sense of the word; but she was about to become a bride a few weeks after Christmas. "It is spoil from the Amalekites," Mr. Granger had said, when she had paid in some contribution from her slender private stores to his treasury;—"spoil from the Amalekites, and therefore the more precious." He had called Nora Field's two sovereigns spoil from

the Amalekites, because she was about to marry an American.

Frederic Frew, or Frederic F. Frew, as he delighted to hear himself called, for he had been christened Franklin as well as Frederic,—and to an American it is always a point of honour that, at any rate, the initial of his second Christian name should be remembered by all men,—was a Pennsylvanian from Philadelphia; a strong Democrat, according to the politics of his own country, hating the Republicans, as the Tories used to hate the Whigs among us, before political feeling had become extinct; speaking against Lincoln the President, and Seward his minister, and the Fremonts, and Sumners, and Phillipses, and Beechers of the Republican party, fine hard racy words of powerful condemnation, such as used to be spoken against Earl Grey and his followers, but nevertheless as steady for the war as Lincoln, or Seward, or any Republican of them all;—as steady for the war, and as keen in his bitterness against England. His father had been a partner in a house of business, of which the chief station had been in Liverpool. That house had now closed its transactions, and young Frew was living and intended to live an easy idle life on the moderate fortune which had been left to him; but the circumstances of his family affairs had made it necessary for him to pass many months in Liverpool, and during that sojourn he had become engaged to Nora Field. He had travelled much, going everywhere with his eyes open, as Americans do. He knew many things, had read many books, and was decided in his opinion on most subjects. He was good-looking too, and well-mannered; was kindly-hearted, and capable of much generosity. But he was hard, keen in his intelligence, but not broad in his genius, thin and meagre in his aspirations,—not looking to or even desirous of anything great, but indulging a profound contempt for all that is very small. He was a well-instructed, but by no means learned man, who greatly despised those who were ignorant. I fear that he hated England in his heart; but he did not hate Nora Field, and was about to make her his wife in three or four weeks from the present time.

When Nora declared to her aunt that she was not a widow, and that she possessed no two mites, and when her aunt flatly contradicted her, stating that she was a widow, and did possess two mites, they had not intended to be understood by each other literally. It was an old dispute between them. "What the widow gave," said Nora, "she gave off her own poor back, and therefore was very cold. She gave it out of her own poor mouth, and was very hungry afterwards in consequence. I have given my two pounds, but I shall not be cold or hungry. I wish I was a widow with two mites; only, the question is whether I should not keep them for my own back after all, and thus gain nothing by the move."

"As to that," replied her aunt, "I cannot

speak. But the widowhood and two mites are there for us all, if we choose to make use of them."

"In these days," said Bob, "the widows with two mites should not be troubled at all. We can do it all without them if we go to work properly."

"If you had read your Bible properly, sir," said Mrs. Granger, "you would understand that the widows would not thank you for the exemption."

"I don't want the widows to thank me. I only want to live, and allow others to live, according to the existing circumstances of the world." It was manifest from Bob's tone that he regarded his mother as little better than an old fogey.

In January, Nora was to become Mrs. Frederic F. Frew, and be at once taken away to new worlds, new politics, and new loves and hatreds. Like a true, honest-hearted girl as she was, she had already become half an American in spirit. She was an old Union American, and as such was strong against the South; and in return for her fervour in that matter, her future husband consented to abstain from any present loud abuse of things English, and generously allowed her to defend her own country when it was abused. This was much as coming from an American. Let us hope that the same privilege may be accorded to her in her future home in Philadelphia. But in the meantime, during these last weeks of her girlhood, these cold, cruel weeks of desperate want, she strove vigorously to do what little might be in her power for the poor of the country she was leaving. All this want had been occasioned by the wretched rebels of the South. This was her theory. And she was right in much of this. Whether the Americans of the South are wretched or are rebels we will not say here; but of this there can be no doubt, that they have created all this misery which we are enduring. "But I have no way of making myself a widow," she said again. "Uncle Robert would not let me give away the cloak he gave me the other day."

"He would have to give you another," said Mrs. Granger.

"Exactly. It is not so easy, after all, to be a widow with two mites!"

Nora Field had no fortune of her own, nor was her uncle in a position to give her any. He was not a poor man; but, like many men who are not poor, he had hardly a pound of his own in the shape of ready money. To Nora and to her cousins, and to certain other first cousins of the same family, had been left, some eighteen months since, by a grandaunt, a hundred pounds apiece, and with this hundred pounds Nora was providing for herself her wedding *trousseau*. A hundred pounds do not go far in such provision, as some young married women who may read this will perhaps acknowledge; but Mr. Frederic F. Frew had been told all about it, and he was contented. Miss Field was fond of nice clothes, and had been tempted more than once to wish that her great-

aunt had left them all two hundred pounds apiece instead of one.

"If I were to cast in my wedding veil?" said Nora.

"That will be your husband's property," said her aunt.

"Ah, but before I'm married."

"Then why have it at all?"

"It is ordered, you know."

"Couldn't you bedizen yourself with one made of false lace?" said her uncle. "Frew would never find it out, and that would be a most satisfactory spoiling of the Amalekite."

"He isn't an Amalekite, uncle Robert. Or if he is, I'm another."

"Just so; and therefore false lace will be quite good enough for you. Molly"—Mrs. Granger's name was Molly—"I've promised to let them have the use of the great boiler in the back-kitchen once a week, and you are to furnish them with fuel."

"Oh, dear!" said Mrs. Granger, upon whose active charity this loan of her own kitchen boiler made a strain that was almost too severe. But she recovered herself in half a minute. "Very well, my dear. But you won't expect any dinner on that day."

"No; I shall expect no dinner; only some food in the rough. You may boil that in the copper too, if you like it."

"You know, my dear, you don't like anything boiled."

"As for that, Molly, I don't suppose any of them like it. They'd all prefer roast-mutton."

"The copper will be your two mites," whispered the niece.

"Only I have not thrown them in of my own accord," said Mrs. Granger.

Mr. Frew, who was living in Liverpool, always came over to Plumstock on Friday evening, and spent Saturday and Sunday with the rector and his family. For him those Saturdays were happy days, for Frederic F. Frew was a good lover. He liked to be with Nora, to walk with her, and to talk with her. He liked to show her that he loved her, and to make himself gracious and pleasant. I am not so sure that his coming was equally agreeable to Mr. Granger. Mr. Frew would talk about American politics, praising the feeling and spirit of his countrymen in the North; whereas Mr. Granger, when driven into the subject, was constrained to make a battle for the South. All his prejudices, and what he would have called his judgment, went with the South; and he was not ashamed of his opinion; but he disliked arguing with Frederic F. Frew. I fear it must be confessed that Frederic F. Frew was too strong for him in such arguments. Why it should be so I cannot say; but an American argues more closely on politics than does an Englishman. His convictions are not the truer on that account; very often the less true, as are the conclusions of a logician,

because he trusts to syllogisms which are often false, instead of to the experience of his life and daily workings of his mind. But though not more true in his political convictions than an Englishman, he is more unanswerable, and therefore Mr. Granger did not care to discuss the subject of the American war with Frederic F. Frew.

"It riles me," Frew said, as he sat after dinner in the Plumstock drawing-room on the Friday evening before Christmas day, "to hear your folks talking of our elections. They think the war will come to an end, and the rebels of the South have their own way, because the Democrats have carried their ticket."

"It will have that tendency," said the parson.

"Not an inch; any more than your carrying the Reform Bill or repealing the Corn Laws had a tendency to put down the throne. It's the same sort of argument. Your two parties were at daggers' drawn about the Reform Bill; but that did not cause you to split on all other matters."

"But the throne wasn't in question," said the parson.

"Nor is the war in question; not in that way. The most popular Democrat in the States at this moment is M'Clellan—"

"And they say no one is so anxious to see the war ended."

"Whoever says so slanders him. If you don't trust his deeds, look at his words."

"I believe in neither," said the parson.

"Then put him aside as a nobody. But you can't do that, for he is the man whom the largest party in the Northern States trusts most implicitly. The fact is, sir"—and Frederic F. Frew gave the proper twang to the last letter of the last word—"you, none of you here, understand our politics. You can't realize the blessings of a—"

"Molly, give me some tea," said the rector, in a loud voice. When matters went as far as this he did not care by what means he stopped the voice of his future relative.

"All I say is this," continued Frew, "you will find out your mistake if you trust to the Democratic elections to put an end to the war, and bring cotton back to Liverpool."

"And what is to put an end to the war?" asked Nora.

"Victory and union," said Frederic F. Frew.

"Exhaustion," said Charley from Oxford.

"Compromise," said Bobby from Liverpool.

"The Lord Almighty, when he shall have done his work," said the parson. "And, in the meantime, Molly, do you keep plenty of fire under the kitchen boiler?"

That was clearly the business of the present hour for all in Mr. Granger's part of the country;—we may say, indeed, for all on Mr. Granger's side of the water. It mattered little, then, in Lancashire, whether New York might have a Democratic or a Republican governor. The old cotton had been burned; the present crop could not be garnered;

the future crop—the crop which never would be future, could not get itself sown. Mr. Granger might be a slow politician, but he was a practical man, understanding the things immediately around him; and they all were aware—Frederic F. Frew with the rest of them—that he was right when he bade his wife keep the fire well hot beneath the kitchen boiler.

“Isn't it almost wicked to be married in such a time as this?” It was much later in the evening when Nora, still troubled in her mind about her widow's mite, whispered these words into her lover's ears. If she were to give up her lover for twelve months, would not that be a throwing in of something to the treasury from off her own back and out of her own mouth? But then this matter of her marriage had been so fully settled that she feared to think of disturbing it. He would never consent to such a postponement. And then the offering, to be of avail for her, must be taken from her own back, not from his; and Nora had an idea that in the making of such an offering as that suggested, Mr. Frederic F. Frew would conceive that he had contributed by far the greater part. Her uncle called him an Amalekite, and she doubted whether it would be just to spoil an Amalekite after such a fashion as that. Nevertheless, into his ears she whispered her little proposition.

“Wicked to get married!” said Frederic. “Not according to my idea of the Christian religion.”

“Oh! but you know what I mean;” and she gave his arm a slight caressing pinch. At this time her uncle had gone to his own room; her cousins had gone to their studies,—by which I believe they intended to signify the proper smoking of a pipe of tobacco in the rectory kitchen; and Mrs. Granger, seated in her easy-chair, had gone to her slumbers, dreaming of the amount of fuel with which that kitchen boiler must be supplied.

“I shall bring a breach of promise against you,” said Frederic, “if you don't appear in church with bridal array on Monday, the 12th of January, and pay the pounds into the war-treasury. That would be a spoiling of the Amalekite.” Then he got hold of the fingers which had pinched him.

“Of course I shan't put it off, unless you agree.”

“Of course you won't.”

“But, dear Fred, don't you think we ought?”

“No; certainly not. If I thought you were in earnest I would scold you.”

“I am in earnest—quite. You need not look in that way, for you know very well how truly I love you. You know I want to be your wife above all things.”

“Do you?” And then he began to insinuate his arm round her waist; but she got up and moved away, not as in anger at his caress, but as showing that the present moment was unfit for it.

“I do,” she said, “above all things. I love you so well that I could hardly bear to see you go away again without taking me with you. I could hardly bear it,—but I could bear it.”

“Could you? Then I couldn't. I'm a weaker vessel than you, and your strength must give way to my weakness.”

“I know I've no right to tax you,—if you really care about it.” Frederic F. Frew made no answer to this in words, but pursued her in her retreat from the sofa on which they had sat.

“Don't, Fred. I am so much in earnest. I wish I knew what I ought to do to throw in my two mites.”

“Not throw me over certainly, and break all the promises you have made for the last twelve months. You can't be in earnest. It's out of the question, you know.”

“Oh! I am in earnest.”

“I never heard of such a thing in my life. What good would it do? It wouldn't bring the cotton in. It wouldn't feed the poor. It wouldn't keep your aunt's boiler hot.”

“No; that it wouldn't,” said Mrs. Granger, starting up; “and coals are such a terrible price.” Then she went to sleep again, and ordered in large supplies in her dreams.

“But I should have done as much as the widow did. Indeed I should, Fred. Oh, dear!—to have to give you up! But I only meant for a year.”

“As you are so very fond of me”—

“Of course, I'm fond of you. Should I let you do like that if I was not?” At the moment of her speaking he had again got his arm round her waist.

“Then I'm too charitable to allow you to postpone your happiness for a day. We'll look at it in that way.”

“You won't understand me, or rather you do understand me, and pretend that you don't, which is very wrong.”

“I always was very wicked.”

“Then why don't you make yourself better? Do not you too wish to be a widow? You ought to wish it.”

“I should like to have an opportunity of trying married life first.”

“I won't stay any longer with you, sir, because you are scoffing. Aunt, I'm going to bed.” Then she returned again across the room, and whispered to her lover: “I'll tell you what, sir; I'll marry you on Monday the 12th of January, if you'll take me just as I am now: with a bonnet on, and a shawl over my dress: exactly as I walked out with you before dinner. When I made the promise, I never said anything about fine clothes.”

“You may come in an old red cloak, if you like it.”

“Very well; now mind I've got your consent. Good-night, sir. After all it will only be half a mite.” She had turned towards the door, and had her hand upon the lock; but she came back into the room, close up to him. “It will not be a quarter of a mite,” she said. “How can it be anything if I get you?” Then she kissed him, and hurried away out of the room, before he could again speak to her.

"What, what, what!" said Mrs. Granger, waking up. "So Nora has gone, has she?"

"Gone; yes, just this minute," said Frew, who had turned his face to the fire, so that the tear in his eyes might not be seen. As he took himself off to his bed, he swore to himself that Nora Field was a trump, and that he had done well in securing for himself such a wife; but it never occurred to him that she was in any way in earnest about her wedding-dress. She was a trump because she was so expressive in her love to himself, and because her eyes shone so brightly when she spoke eagerly on any matter; but as to her appearing at the altar in a red cloak, or, as was more probable, in her own customary thick woollen shawl, he never thought about it. Of course she would be married as other girls are married.

Nor had Nora thought of it till that moment in which she made the proposition to her lover. As she had said before, her veil was ordered, and so was her white silk dress. Her bonnet also had been ordered, with its bridal wreath, and the other things assorting therewith. A vast hole was to be made in her grandaunt's legacy for the payment of all this finery; but, as Mrs. Granger had said to her, in so spending it, she would best please her future husband. He had enough of his own, and would not care that she should provide herself with articles which he could afterwards give her, at the expense of that little smartness at his wedding which an American likes, at any rate, as well as an Englishman. Nora, with an honesty which some ladies may not admire, had asked her lover the question in the plainest language. "You will have to buy my things so much the sooner," she had said. "I'd buy them all to-morrow, only you'll not let me." "I should rather think not, Master Fred." Then she had gone off with her aunt, and ordered her wedding-clothes. But now as she prepared for bed after the conversation which has just been recorded, she began to think in earnest whether it would not be well to dispense with white silk and orange wreaths while so many were dispensing with—were forced to dispense with bread and fuel. Could she bedizen herself with finery from Liverpool, while her uncle was, as she well knew, refusing himself a set of new shirts which he wanted sorely, in order that he might send to the fund at Liverpool the money which they would cost him. He was throwing in his two mites daily, as was her aunt, who toiled unceasingly at woollen shawls and woollen stockings, so that she went on knitting even in her sleep. But she, Nora, since the earnestness of these bad days began, had done little or nothing. Her needle, indeed, had been very busy, but it had been busy in preparation for Mr. Frederic F. Frew's nuptials. Even Bob and Charley worked for the Relief Committee; but she had done nothing: nothing but given her two pounds. She had offered four, but her uncle, with a self-restraint never before or afterwards practised by him, had chucked her back two, saying that he would not be

too hard even upon an Amalekite. As she thought of the word, she asked herself whether it was not more incumbent on her, than on any one else, to do something in the way of self-sacrifice. She was now a Briton, but would shortly be an American. Should it be said of her that the mistress of her own countrywomen, the countrywomen whom she was leaving, did not wring her heart? It was not without a pang that she prepared to give up that nationality, which all its owners rank as the first in the world, and all who do not own it, rank, if not as the first, then as the second. Now it seemed to her as though she were deserting her own family in its distress, deserting her own ship in the time of its storm, and she was going over to those from whom this distress and this storm had come! Was it not needful that she should do something; that she should satisfy herself that she had been willing to suffer in the cause?

She would throw in her two mites if she only knew where to find them. "I could only do it in truth," she said to herself, as she rose from her prayers, "by throwing in him. I have got one very great treasure, but I have not got anything else that I care about. After all, it isn't so easy to be a widow with two mites." Then she sat down and thought about it. As to postponing her marriage, that she knew to be in truth quite out of the question. Even if she could bring herself to do it, everybody about her would say that she was mad, and Mr. Frederic F. Frew might not impossibly destroy himself with one of those pretty revolvers which he sometimes brought out from Liverpool for her to play with. But was it not practicable for her to give up her wedding-clothes? There would be considerable difficulty even in this. As to their having been ordered, that might be overcome by the sacrifice of some portion of the price. But then her aunt and even her uncle would oppose her; her cousins would cover her with ridicule—in the latter matter she might, however, achieve something of her widowhood;—and, after all, the loss would fall more upon F. F. Frew than upon herself. She really did not care for herself in what clothes she was married, so that she was made his wife. But as regarded him, might it not be disagreeable to him to stand before the altar with a dowdy creature in an old gown? And then there was one other consideration. Would it not seem that she was throwing in her two mites publicly before the eyes of all men, as a Pharisee might do it? Would there not be an ostentation in her widowhood? But as she continued to reflect, she cast this last thought behind her. It might be so said of her, but if such saying were untrue, if the offering were made in a widow's spirit, and not in the spirit of a Pharisee, would it not be cowardly to regard what men might say? Such false accusation would make some part of the two mites. "I'll go into Liverpool about it on Monday," she said to herself as she finally tucked the clothes around her.

Early in the following morning she was up and

out of her room, with the view of seeing her aunt before she came down to breakfast ; but the first person she met was her uncle. He accosted her in one of the passages. "What, Nora, this is early for you ! Are you going to have a morning lovers' walk with Frederic Franklin ?"

"Frederic Franklin, as you choose to call him, uncle, never comes out of his room much before breakfast time. And it's raining hard."

"Such a lover as he is ought not to mind rain."

"But I should mind it, very much. But, uncle, I want to speak to you, very seriously. I have been making up my mind about something."

"There's nothing wrong, is there, my dear ?"

"No ; there's nothing very wrong. It is not exactly about anything being wrong. I hardly know how to tell you what it is." And then she paused, and he could see by the light of the candle in his hand that she blushed.

"Hadn't you better speak to your aunt ?" said Mr. Granger.

"That's what I meant to do when I got up," said Nora ; "but as I have met you, if you don't mind—"

He assured her that he did not mind, and putting his hand upon her shoulder caressingly, promised her any assistance in his power. "I'm not afraid that you will ask anything I ought not to do for you."

Then she revealed to him her scheme, turning her face away from him as she spoke. "It will be so horrid," she said, "to have a great box of finery coming home when you are all giving up everything for the poor people. And if you don't think it would be wrong—"

"It can't be wrong," said her uncle. "It may be a question whether it would be wise."

"I mean wrong to him. If it was to be any other clergyman, I should be ashamed of it. But as you are to marry us—"

"I don't think you need mind about the clergyman."

"And of course I should tell the Foster girls."

"The Foster girls ?"

"Yes ; they are to be my bridesmaids, and I am nearly sure they have not bought anything new yet. Of course they would think it all very dowdy, but I don't care a bit about that. I should just tell them that we had all made up our minds that we couldn't afford wedding-clothes. That would be true ; wouldn't it ?"

"But the question is about that wild American."

"He isn't a wild American."

"Well, then ; about that tamed American. What will he say ?"

"He said I might come in an old cloak."

"You have told him, then ?"

"But I'm afraid he thought I was only joking. But, uncle, if you'll help me, I think I can bring him round."

"I daresay you can—to anything, just at present."

"I didn't at all mean that. Indeed, I'm sure I couldn't bring him round to putting off the marriage."

"No, no, no ; not to that ; to anything else."

"I know you are laughing at me, but I don't much mind being laughed at. I should save very nearly fifteen pounds, if not quite. Think of that."

"And you'd give it all to the soup-kitchen ?"

"I'd give it all to you for the distress."

Then her uncle spoke to her somewhat gravely. "You're a good girl, Nora ; a dear good girl. I think I understand your thoughts on this matter, and I love you for them. But I doubt whether there be any necessity for you to make this sacrifice. A marriage should be a gala festival according to the means of the people married, and the bridegroom has a right to expect that his bride shall come to him fairly arrayed, and bright with wedding trappings. I think we can do, my pet, without robbing you of your little braveries."

"Oh, as for that, of course you can do without me."

There was a little soreness in her tone ; not because she was feeling herself to be misunderstood, but because she knew that she could not explain herself further. She could not tell her uncle that the poor among the Jews might have been relieved without the contribution of those two mites, but that the widow would have lost all had she not so contributed. She had hardly arranged her thoughts as to the double blessing of charity, and certainly could not express them with reference to her own case ; but she felt the need of giving in this time of trouble something that she herself valued. She was right when she had said that it was hard to be a widow. How many among us, when we give, give from off our own backs, and from out of our own mouths ? Who can say that he has sacrificed a want of his own ; that he has abandoned a comfort ; that he has worn a thread-bare coat, when coats with their gloss on have been his customary wear ; that he has fared roughly on cold scraps, whereas a well-spread board has been his usual daily practice ? He who has done so, has thrown in his two mites, and for him will charity produce her double blessing.

Nora thought that it was not well in her uncle to tell her that he could do without her wedding-clothes. Of course he could do without them. But she soon threw those words behind her, and went back upon the words which had preceded them : "The bridegroom has a right to expect that the bride shall come to him fairly arrayed." After all, that must depend upon circumstances. Suppose the bride had no means of arraying herself fairly without getting into debt ; what would the bridegroom expect in that case ? "If he'll consent, you will ?" she said, as she prepared to leave her uncle.

"You'll drive him to offer to pay for the things himself."

"I daresay he will, and then he'll drive me to refuse. You may be quite sure of this, uncle, that whatever clothes I do wear, he will never see the bill of them;" and then that conference was ended.

"I've made that calculation again," said Bob at breakfast, "and I feel convinced that if an Act of Parliament could be passed restricting the consumption of food in Christmas week, the entire week, mind, to that of ordinary weeks, we should get two millions of money, and that those two millions would tide us over till the Indian cotton comes in. Of course I mean by food, butchers' meat, groceries, spirits, and wines. Only think, that by one measure, which would not entail any real disappointment on any one, the whole thing would be done."

"But the Act of Parliament wouldn't give us the money," said his father.

"Of course I don't really mean an Act of Parliament; that would be absurd. But the people might give up their Christmas dinners."

"A great many will, no doubt. Many of those most in earnest are pretty nearly giving up their daily dinners. Those who are indifferent will go on feasting the same as ever. You can't make a sacrifice obligatory."

"It would be no sacrifice if you did," said Nora, still thinking of her wedding-clothes.

"I doubt whether sacrifices ever do any real good," said Frederic F. Frew.

"Oh, Fred!" said Nora.

"We have rather high authority as to the benefit of self-denial," said the parson.

"A man who can't sacrifice himself must be selfish," said Bobby; "and we are all agreed to hate selfish people."

"And what about the widow's mite?" said Mrs. Granger.

"That's all very well, and you may knock me down with the Bible if you like, as you might do also if I talked about pre-Adamite formations. I believe every word of the Bible, but I do not believe that I understand it all thoroughly."

"You might understand it better if you studied it more," said the parson.

"Very likely. I won't be so uncourteous as to say the same thing of my elders. But now, about these sacrifices. You wouldn't wish to keep people in distress that you might benefit yourself by releasing them?"

"But the people in distress are there," said Nora.

"They oughtn't to be there; and as your self-sacrifices, after all, are very insufficient to prevent distress, there certainly seems to be a question open whether some other mode should not be tried. Give me the country in which the humanitarian principle is so exercised that no one shall be degraded by the receipt of charity. It seems to me that you like poor people here in England that you may gratify yourselves by giving them, not as much to eat as they want, but just enough to keep their skins

from falling off their bones. Charity may have its double blessing, but it may also have its double curse."

"Not charity, Mr. Frew," said Mrs. Granger.

"Look at your Lady Bountifuls."

"Of course it depends on the heart," continued the lady; "but charity, if it be charity"—

"I'll tell you what," said Frederic F. Frew, interrupting her. "In Philadelphia, which in some matters is the best organized city I know"—

"I'm going down to the village," said the parson, jumping up; "who is to come with me?" and he escaped out of the room before Frew had had an opportunity of saying a word further about Philadelphia.

"That's the way with your uncle always," said he, turning to Nora, almost in anger. "It certainly is the most conclusive argument I know—that of running away."

"Mr. Granger meant it to be conclusive," said the elder lady.

"But the pity is that it never convinces."

"Mr. Granger probably had no desire of convincing."

"Ah! Well, it does not signify," said Frew. "When a man has a pulpit of his own, why should he trouble himself to argue in any place where counter arguments must be met and sustained?"

Nora was almost angry with her lover, whom she regarded as stronger and more clever than any of her uncle's family, but tyrannical and sometimes overbearing in the use of his strength. One by one her aunt and cousin left the room, and she was left alone with him. He had taken up a newspaper as a refuge in his wrath, for in truth he did not like the manner in which his allusions to his own country were generally treated at the parsonage. There are Englishmen who think that every man differing with them is bound to bet with them on any point in dispute. "Then you decline to back your opinion," such men say when the bet is refused. The feeling of an American is the same as to those who are unwilling to argue with him. He considers that every intelligent being is bound to argue whenever matter of argument is offered to him; nor can he understand that any subject may be too sacred for argument. Frederic F. Frew, on the present occasion, was as a dog from whose very mouth a bone had been taken. He had given one or two loud, open growls, and now sat with his newspaper, showing his teeth as far as the spirit of the thing went. And it was in this humour that Nora found herself called upon to attack him on the question of her own proposed charity. She knew well that he could bark, even at her, if things went wrong with him. "But then he never bites," she said to herself. He had told her that she might come to her wedding in an old cloak if she pleased, but she had understood that there was nothing serious in this permission. Now, at this very moment, it was incumbent on her to open his eyes to the reality of her intention.

"Fred," she said, "are you reading that newspaper because you are angry with me?"

"I am reading the newspaper because I want to know what there is in it."

"You know all that now, just as well as if you had written it. Put it down, sir!" And she put her hand on to the top of the sheet. "If we are to be married in three weeks' time, I expect that you will be a little attentive to me now. You'll read as many papers as you like after that, no doubt."

"Upon my word, Nora, I think your uncle is the most unfair man I ever met in my life."

"Perhaps he thinks the same of you, and that will make it equal."

"He can't think the same of me. I defy him to think that I'm unfair. There's nothing so unfair as hitting a blow, and then running away when the time comes for receiving the counter-blow. It's what your Lord Chatham did, and he never ought to have been listened to in Parliament again."

"That's a long time ago," said Nora, who probably felt that her lover should not talk to her about Lord Chatham just three weeks before their marriage.

"I don't know that the time makes any difference."

"Ah;—but I have got something else that I want to speak about. And, Fred, you mustn't turn up your nose at what we are all doing here,—as to giving away things, I mean."

"I don't turn up my nose at it. Haven't I been begging of every American in Liverpool till I'm ashamed of myself?"

"I know you have been very good, and now you must be more good still,—good to me specially, I mean— That isn't being good. That's only being foolish." What little ceremony had led to this last assertion I need not perhaps explain. "Fred, I'm an Englishwoman to-day, but in a month's time I shall be an American."

"I hope so, Nora,—heart and soul."

"Yes, that is what I mean. Whatever is my husband's country must be mine. And you know how well I love your country; do you not? I never run away when you talk to me about Philadelphia,—do I? And you know how I admire all your institutions—my institutions, as they will be."

"Now, I know you're going to ask some very great favour."

"Yes, I am; and I don't mean to be refused, Master Fred. I'm to be an American almost to-morrow, but as yet I am an Englishwoman, and I am bound to do what little I can before I leave my country. Don't you think so?"

"I don't quite understand."

"Well, it's about my wedding-clothes. It does seem stupid talking about them, I know. But I want you to let me do without them altogether. Now you've got the plain truth. I want to give

uncle Robert the money for his soup-kitchen, and to be married just as I am now. I do not care one straw what any other creature in the world may say about it, so long as I do not displease you."

"I think it's nonsense, Nora."

"Oh, Fred, don't say so. I have set my heart upon it. I'll do anything for you afterwards. Indeed, for the matter of that, I'd do anything on earth for you, whether you agree or whether you do not. You know that."

"But, Nora, you wouldn't wish to make yourself appear foolish? How much money will you save?"

"Very nearly twenty pounds altogether."

"Let me give you twenty pounds, so that you may leave it with your uncle by way of your two mites, as you call it."

"No, no; certainly not. I might just as well send you the milliner's bill; might I not?"

"I don't see why you shouldn't do that."

"Ah, but I do. You wouldn't wish me to be guilty of the pretence of giving a thing away, and then doing it out of your pocket. I have no doubt that what you were saying about the evil of promiscuous charity is quite true." And then, as she flattered him with this wicked flattery, she looked up with her bright eyes into his face. "But now, as the things are, we must be charitable, or the people will die. I feel almost like a rat leaving a falling house, in going away at this time; and if you would postpone it—"

"Nora!"

"Then I must be like a rat; but I won't be a rat in a white silk gown. Come now, say that you agree. I never asked you for anything before."

"Everybody will think that you're mad, and that I'm mad, and that we are all mad together."

"Because I go to church in a merino dress? Well; if that makes madness, let us be mad. Oh, Fred, do not refuse me the first thing I've asked you! What difference will it make? Nobody will know it over in Philadelphia!"

"Then you are ashamed of it?"

"No; not ashamed. Why should I be ashamed? But one does not wish to have that sort of thing talked about by everybody."

"And you are so strong-minded, Nora, that you do not care about finery yourself?"

"Fred, that's ill-natured. You know very well what my feelings are. You are sharp enough to understand them without any further explanation. I do like finery; quite well enough, as you'll find out to your cost some day. And if ever you scold me for extravagance, I shall tell you about this."

"It's downright Quixotism."

"Quixotism leads to nothing, but this will lead to twenty pounds' worth of soup;—and to something else too."

When he pressed her to explain what that something else was, she declined to speak further on the subject. She could not tell him that the satisfaction she desired was that of giving up something,—of having made a sacrifice,—of having thrown into the treasury her two mites,—two mites off her own back, as she had said to her aunt, and out of her own mouth. He had taxed her with indifference to a woman's usual delight in gay plumage, and had taxed her most unjustly. "He ought to know," she said to herself, "that I should not take all this trouble about it, unless I did care for it." But, in truth, he did understand her motives thoroughly, and half approved them. He approved the spirit of self-abandonment, but disapproved the false political economy by which, according to his light, that spirit was accompanied. "After all," said he, "the widow would have done better to have invested her small capital in some useful trade."

"Oh, Fred,—but never mind now. I have your consent, and now I've only got to talk over my aunt." So saying, she left her lover to turn over in his mind the first principles of that large question of charity.

"The giving of pence and halfpence, of scraps of bread and supps of soup, is, after all, but the charity of a barbarous, half-civilized race. A dog would let another dog starve before he gave him a bone, and would see his starved fellow-dog die without a pang. We have just got beyond that, only beyond that, as long as we dole out supps of soup. But Charity, when it shall have made itself perfect, will have destroyed this little trade of giving, which makes the giver vain and the receiver humble. The Charity of the large-hearted is that which opens to every man the profit of his own industry; to every man and to every woman." Then having gratified himself with the enunciation of this fine theory, he allowed his mind to run away to a smaller subject, and began to think of his own wedding garments. If Nora insisted on carrying out this project of hers, in what guise must he appear on the occasion? He also had ordered new clothes. "It's just the sort of thing that they'll make a story of in Chestnut Street." Chestnut Street, as we all know, is the West End of Philadelphia.

When the morning came of the twelfth of January,—the morning that was to make Nora Field a married woman, she had carried her point; but she was not allowed to feel that she had carried it triumphantly. Her uncle had not forbidden her scheme, but had never encouraged it. Her lover had hardly spoken to her on the subject since the day on which she had explained to him her intention. "After all, it's a mere bagatelle," he had said; "I am not going to marry your clothes." One of her cousins, Bob, had approved; but he had coupled his approval with an intimation that something should be done to prevent any other woman

from wearing bridal wreaths for the next three months. Charley had condemned her altogether, pointing out that it was bad policy to feed the cotton spinners at the expense of the milliners. But the strongest opposition had come from her aunt and the Miss Fosters. Mrs. Granger, though her heart was in the battle, which her husband was fighting, could not endure to think that all the time-honoured ceremonies of her life should be abandoned. In spite of all that was going on around her, she had insisted on having mince-pies on the table on Christmas-day. True, there were not many of them, and they were small and flavourless. But the mince-pies were there, with whisky to burn with them instead of brandy, if any of the party chose to go through the ceremony. And to her the idea of a wedding without wedding-clothes was very grievous. It was she who had told Nora that she was a widow with two mites, or might make herself one, if she chose to encounter self-sacrifice. But in so saying she had by no means anticipated such a widowhood as this. "I really think, Nora, you might have one of those thinner silks, and you might do without a wreath; but you should have a veil,—indeed you should." But Nora was obstinate. Having overcome her future lord, and quieted her uncle, she was not at all prepared to yield to the mild remonstrances of her aunt. The two Miss Fosters were very much shocked, and for three days there was a disagreeable coolness between them and the Plumstock family. A friend's bridal is always an occasion for a new dress, and the Miss Fosters naturally felt that they were being robbed of their rights.

"Sensible girl," said old Foster, when he heard of it. "When you're married, if ever you are, I hope you'll do the same."

"Indeed we won't, papa," said the two Miss Fosters. But the coolness gradually subsided, and the two Miss Fosters consented to attend in their ordinary Sunday bonnets.

It had been decided that they should be married early, at eight o'clock; that they should then go to the parsonage for breakfast, and that the married couple should start for London immediately afterwards. They were to remain there for a week, and then return to Liverpool for one other remaining week before their final departure for America. "I should only have had them on for about an hour if I'd got them, and then it would have been almost dark," she said to her aunt.

"Perhaps it won't signify very much," her aunt replied. Then when the morning came, it seemed that the sacrifice had dwindled down to a very little thing. The two Miss Fosters had come to the parsonage over night, and as they sat up with the bride over a bed-room fire, had been good-natured enough to declare that they thought it would be very good fun.

"You won't have to get up in the cold to dress me," said Nora, "because I can do it all myself; that will be one comfort."

"Oh, we shouldn't have minded that; and as it is, of course, we'll turn you out nice. You'll wear one of your other new dresses; won't you?"

"Oh, I don't know; just what I'm to travel in. It isn't very old. Do you know after all I'm not sure that it isn't a great deal better."

"I suppose it will be the same thing in the end," said the younger Miss Foster.

"Of course it will," said the elder.

"And there won't be all that bother of changing my dress," said Nora.

Frederick F. Frew came out to Plumstock by an early train from Liverpool, bringing with him a countryman of his own as his friend on the occasion. It had been explained to the friend that he was to come in his usual habiliments.

"Oh, nonsense," said the friend, "I guess I'll see you turned off in a new waistcoat." But Frederick F. Frew had made it understood that an old waistcoat was imperative.

"It's something about the cotton, you know. They're all beside themselves here, as though there was never going to be a bit more in the country to eat. That's England all over. Never mind; do you come just as if you were going into your counting-house. Brown cotton gloves, with a hole in the thumbs, will be the thing, I should say."

There were candles on the table when they were all assembled in the parsonage drawing-room previous to the marriage. The two gentlemen were there first. Then came Mrs. Granger, who rather frightened Mr. Frew by kissing him, and telling him that she should always regard him as a son-in-law.

"Nora has always been like one of ourselves, you know," she said, apologizingly.

"And let me tell you, Master Frew," said the parson, "that you're a very lucky fellow to get her."

"I say, isn't it cold?" said Bob, coming in—"where are the girls?"

"Here are the girls," said Miss Foster, heading the procession of three which now entered the room, Nora, of course, being the last. Then Nora was kissed by everybody, including the strange American gentleman, who seemed to have made some mistake as to his privilege in the matter. But it all passed off very well, and I doubt if Nora knew who kissed her. It was very cold, and they were all wrapped close in their brown shawls and greatcoats, and the women looked very snug and comfortable in their ordinary winter bonnets.

"Come," said the parson, "we mustn't wait for Charley; he'll follow us to church." So the uncle took his niece on his arm, and the two Americans took the two bridesmaids, and Bob took his mother, and went along the beaten path over the snow to the church, and, as they got to the door, Charley rushed after them quite out of breath.

"I haven't even got a pair of gloves at all," he whispered to his mother.

"It doesn't matter; nobody's to know," said Mrs. Granger.

Nora by this time had forgotten the subject of her dress altogether, and it may be doubted if even the Misses Foster were as keenly alive to it as they thought they would have been. For myself, I think they all looked more comfortable on that cold winter morning without the finery which would have been customary than they could have done with it. It had seemed to them all beforehand that a marriage without veils and wreaths, without white gloves and new gay dresses, would be but a *triste* affair; but the idea passed away altogether when the occasion came. Mr. Granger and his wife and the two lads clustered round Nora as they made themselves ready for the ceremony, uttering words of warm love, and it seemed as though even the clerk and the servants took nothing amiss. Frederick F. Frew had met with a rebuff in the hall of the parsonage, in being forbidden to take his own bride under his own arm; but when the time for action came, he bore no malice, but went through his work manfully. On the whole, it was a pleasant wedding, homely, affectionate, full of much loving greeting; not without many sobs on the part of the bride and of Mrs. Granger, and some slight suspicion of an eagerly-removed tear in the parson's eye; but this, at any rate, was certain, that the wedding-clothes were not missed. When they all sat down to their breakfast in the parsonage dining-room, that little matter had come to be clean forgotten. No one knew, not even the Misses Foster, that there was anything at all extraordinary in their garb. Indeed, as to all gay apparel, we may say that we only miss it by comparison. It is very sad to be the wearer of the only frock-coat in company, to carry the one solitary black silk handkerchief at a dinner party. But I do not know but that a dozen men so arrayed do not seem to be as well dressed as though they had obeyed the latest rules of fashion as to their garments. One thing, however, had been made secure. That sum of twenty pounds, saved from the milliners, had been duly paid over into Mr. Granger's hands.

"It has been all very nice," said Mrs. Granger, still sobbing, when Nora went up stairs to tie on her bonnet before she started. "Only you are going!"

"Yes, I'm going now, aunt. Dear aunt! But, aunt, I have failed in one thing—absolutely failed."

"Failed in what, my darling?"

"There has been no widow's mite. It is not easy to be a widow with two mites."

"What you have given will be blessed to you, and blessed to those who will receive it."

"I hope it may; but I almost feel that I have been wrong in thinking of it so much. It has cost me nothing. I tell you, aunt, that it is not easy to be a widow with two mites."

When Mrs. Granger was alone with her husband after this, the two Miss Fosters having returned to Liverpool under the discreet protection of the two young Grangers, for they had positively refused to

travel with no other companion than the strange American—she told him all that Nora had said. “And who can tell us,” he replied, “that it was not the same with the widow herself? She threw in all that she had, but who can say that she suffered aught in consequence? It is my belief that

all that is given in a right spirit comes back instantly, in this world, with interest.”

“I wish my coals would come back,” said Mrs. Granger.

“Perhaps you have not given them in a right spirit, my dear.”

THE CURE OF OVER-ANXIETY.

THOUGHTS FOR THE BEGINNING OF A YEAR.

WHILE we live in the body, entire freedom from the burden of care is not to be obtained; and though such freedom may be coveted by the selfish, it cannot, in the nature of things, be desired or possessed by the loving; for care is but the thoughtfulness of love seeking the wellbeing of its object in the midst of evil or of danger which it feels powerless to avert.

God our Father does not forbid care, but carefulness; does not forbid us to be anxious, but to be over-anxious. He who invites us to “cast our care on him, for he careth for us” thereby sanctions care in us, while he relieves it by assuring us of the reality of his own care for us. What our Father commands is: “Be careful for nothing,”—that is, be not careful or over-anxious about anything—“but in everything, by prayer and supplication, with thanksgiving, let your requests be made known unto God.” And what he promises is, “The peace of God, which passeth all understanding, shall keep your hearts and minds through Christ Jesus.”

These words, which express the will of God as it is everywhere revealed in Christ Jesus, and in all he has commanded and promised, forbid over-anxiety about anything, whatever that may be. They exclude, therefore, anxious thoughts about spiritual as well as about temporal things, about the soul as about the body, about the highest interests which can affect our fellow-men and society as well as about the ordinary cares of every-day life. It is the blessed will of Him who knows and governs all, that we should never permit an over-anxious spirit at any time to oppress us, but rather that at all times, and in all circumstances, the peace of God should keep our mind and heart through Christ Jesus. Can it be that such a privilege as this is freely bestowed on care-worn, anxious men! and if so, can it be that we shall not seek to possess what is promised in the word of God, “who cannot lie”? It seems, indeed, impossible that mortal man should ever be able to enjoy so blessed a boon. And man by his unaided power could never do so. But what is impossible for man is possible for God. It is God only who can give his own peace, and sustain it in the heart.

But the question is at once suggested,—what is meant by carefulness or over-anxiety? or when does that degree of care which necessarily belongs to us as human beings pass into that which we need not and ought not to feel as children of God? We reply—that care becomes carefulness, and exceeds its just limit, when it destroys or disturbs our quiet rest and peace in God.

The more we reflect upon this painful state of spirit, which dries up the springs of life and weakens all its energies, the more we shall perceive that it springs out of a sense of loneliness and solitariness in our sorrow. We feel that no one can fully comprehend the secret of our anxiety, as if it were too peculiar or personal for others to understand, or too great to take into their hearts with sympathizing love; we feel unwilling to risk the painful experience of asking them to carry a burden which might be refused, and ourselves thereby left more lonely than before; or if we can, with full confidence in the love of human hearts, cast our care on them, we are forced to realize how utterly impossible it is for our dearest to be wholly one with us, even when they weep with us. But when any such thoughts as these extend to God himself,—when the atheism of unbelief takes possession of our spirit, and we think of Him no longer as our friend and Father, but as one who, like the ignorant or selfish of the earth, either knows us not, loves us not, or cares not for us, then verily does care grow into a great and terrible carefulness; and an otherwise noble and worthy anxiety increases into an over-anxiety wholly unbecoming a child whose father is God, whose brother is Jesus Christ, and whose indweller is the Holy Spirit of strength and comfort. All this miserable state comes from want of faith in God. For when faith, as the root of our life, decays, peace, as its beautiful flower and fruit, perishes; falling away from God, we fall back on our poor, blind, naked, and wretched selves, and what help can self give to self? It is the beggar asking alms of the beggar; the sick asking the sick to carry them to the pool of healing. It is building on sand, leaning on a broken reed, trusting to lying vanities, forsaking the fountain of living waters, and hewing out for our-

selves cisterns, broken cisterns, that can hold no water! And alas! we soon find how true this is in our own experience. As we depart from God, peace departs from us. The burden which we refuse to cast on Him begins to crush ourselves. As we forsake Him, the loving father and light of our life, we retire more and more into solitary confinement, within the dungeon of our own hearts, and there care is, day and night, chained to care, until it becomes a horror, a constant presence, an incubus and nightmare of carefulness and over-anxiety, ending, it may be, in despair.

But God, as we have said, never casts a soul that trusts Him into depths like those, though he may permit his children to fall into them, that so, learning what "an evil and a bitter thing" it is to "forsake the Lord their God," they may return to him in faith and love. He may permit us to sink into deep waters, that out of them we may cry again to him; even as our Lord permitted the apostle Peter to make the attempt of walking in his own strength upon the stormy sea, when the "stone" sank which through faith was yet to be a foundation-stone for support to the sorrowing Church; and peace came only with the prayer of faith, "Lord save me!" So must it be with us: as loss of faith in God is followed by loss of peace, so will faith restored be followed by restored peace.

Prayer is the chief means of our obtaining those unspeakable blessings of faith and peace. Hence the command and promise, "Be careful for nothing; but in everything, by prayer and supplication, with thanksgiving, let your requests be made known unto God." Prayer has been the means, in every age of the world, of obtaining deliverance from carefulness and of obtaining peace. The whole Bible history of God's dealings with men assumes the reality of prayer, because it assumes the existence of a personal God who careth for us. Why should we seek for further proof of this when we have the grandest fact in the history of the world to teach us how right and blessed it is?—and that is the example of Jesus Christ. We Christians believe that He revealed what God desired each man to be towards Him; and Jesus was to God, a Son who perfectly loved his Father, and as a Son he poured out his heart before him in prayer; he sought the guidance of his Father in prayer; comfort from Him in prayer; sympathy with his sorrows and joys in prayer; and so "being in agony, he prayed the more earnestly." Therefore let us in the spirit of Jesus, and trusting to the merits of His work, and the power of His endless life, "in everything make our requests known unto God, by prayer, supplication, and thanksgiving."

It is true, indeed, that effectual prayer implies the existence of some faith in God, so that it at first looks as if we must necessarily possess what we pray for. But let not this discourage any one from drawing near to God because his faith is weak, yea seem-

ingly dead. The degree of faith which any true prayer demands is very different from that which true prayer seeks to obtain, or which ultimately secures perfect peace. For the faith which is essential to any kind of prayer is almost essential to any degree of faith in God's being and government, since "he who cometh unto God must believe that he is, and that he is the rewarder of them who diligently seek him."

Now, prayer to God has a tendency from its very nature at once to lighten our burden of carefulness, even in so far as it is a devout recognition of our absolute dependence for life and breath and all things on Him who is "the Lord God omnipotent." If it be foolish to rebel against Him, because his power is irresistible, it is still more daring to do so because his grace is infinite.

For as we "continue in prayer," casting ourselves and all our burdens unreservedly upon the bare and mighty arm of Jehovah, we come to know and feel that He is nigh unto all who call upon him in truth,—the hearer and the answerer of prayer. Thus the hallowed intercourse of asking and receiving, and giving of thanks, increases our knowledge of God as being himself our life, and as "able to do exceeding abundantly above all we can ask or think;" while such knowledge again increases our faith and intensifies our peace. We rejoice in being able to leave all things in His hand, and to say, "Thy will be done," knowing that will to be right and loving. After such experience, we can say with the Psalmist, "I love the Lord, because he hath heard my voice and my supplications. Return unto thy rest, O my soul; for the Lord hath dealt bountifully with thee. For thou hast delivered my soul from death, mine eyes from tears, and my feet from falling."

The apostle further teaches us that "in everything we are to let our requests be made known to God." This open-heartedness towards our Father is essential to our peace as children. We may tell everything to him, for he knows the things we stand in need of. We must therefore never suppose that the causes of our anxiety are of too trifling a nature to be brought into the presence of the awful majesty of the King of Kings, and Lord of Lords; for as that anxiety can be no trifle to us which threatens ever to weaken our faith or disturb our peace in God, far less can it be a trifle to Him who alone can estimate the value of our spiritual hopes and gains. He who desires to give us peace, cannot be indifferent to our rejection or reception of so precious a boon, and cannot therefore be indifferent to what hinders our possession of it. Let us also beware of entertaining any mistaken views of God's greatness derived from the magnitude of his material works, as if they could remove him to an infinite distance from us. God's name is not "power" but "love;" love that guides his power and ever accompanies his presence. It is because of the greatness of his love that he can take into the em-

brace of his fatherly sympathies all his creatures, with all their wants. The God revealed in the Old is the God who is revealed in the New Testament; and therefore we have in the one as in the other, manifold instances of the greatness of His love evidenced in the minute care which He takes in the feeblest of his children. In no case is love subordinate to power, but in every case power is subordinate to love. See how the Psalmist praises God:—"Which made heaven and earth, the sea, and all that therein is; which keepeth truth for ever; which executeth judgment for the oppressed; which giveth food to the hungry. The Lord looseth the prisoners: the Lord openeth the eyes of the blind: the Lord raiseth them that are bowed down: the Lord loveth the righteous: the Lord preserveth the strangers; he relieveth the fatherless and widow: but the way of the wicked he turneth upside down." "He healeth the broken in heart, and bindeth up their wounds. He telleth the number of the stars: he calleth them all by their names. Great is our Lord, and of great power: his understanding is infinite. *The Lord lifteth up the meek: he casteth the wicked down to the ground.*" See again how the true greatness of God is represented by the Prophet:—"To whom then will ye liken me, or shall I be equal? saith the Holy One. Lift up your eyes on high, and behold who hath created these things, that bringeth out their host by number: he calleth them all by names, by the greatness of his might, for that he is strong in power; not one faileth. *Why sayest thou, O Jacob, and speakest, O Israel, My way is hid from the Lord, and my judgment is passed over from my God?*" What a glorious revelation is this, of Him who is at once great as a Creator and as a Father—great in power, but greater in love!

In Jesus Christ we behold the same kind of greatness; the greatness of love whose law is self-sacrifice and self-forgetfulness in order to supply the wants of its beloved objects. We read of Jesus on the last night of his life, when about to part from his disciples, when he knew that one was to deny him, another to betray him, and all to forsake him, yet even then, when realizing also his divine dignity as the Son of God,—we read that he revealed his glory to be the glory of love, which will think of others, and humble itself to the very lowest depths to lift them up:—for, "knowing that he came from God and went to God, and that God had given all things into his hand, he rose from supper, and girding himself with a towel, he washed the disciples' feet." There is no feature indeed of Christ's life so touching as the considerateness of his love, with reference to what we might call things of minor importance; as, for example, when he led his disciples to a desert place to "rest awhile, because there were so many coming and going that they had no leisure so much as to eat;" when he had compassion for the multitude who had nothing to eat, and whom he would not send away fasting lest they should

faint by the way; when he suffered even little children to be brought to him, and took them into his arms and blessed them; when he sent for Martha and Mary to meet him alone outside the town, to tell their sorrow; when he not only restored the son of the widow of Nain to life, but "gave him to his mother;" when amidst the tumult and in the darkness, he patiently healed the wound of Malchus; when, standing before his cruel judge, he turned and looked on Peter; when, praying on the cross, he remembered his mother, and provided a home for her; when, after his resurrection he said, "Go tell my disciples, and Peter, that I am risen from the dead;"—these are but drops of the dew of Hermon, sparks from the ever-shining sun of his inexhaustible and tender love, which thought of every one and of every thing that could affect their peace!

The more we know God and Jesus Christ whom he has sent, the more we shall see how in everything we may let our requests be made known to him in the full assurance of faith; that we have to do with one who knows everything, and to whom everything is of interest; who pities us as a father pities his children; and who in his Son, as manifest in the flesh, knows what our human wants, trials, and anxieties are:—"For we have not an High Priest which cannot be touched with the feeling of our infirmities, but was in all points tempted like as we are, yet without sin."

But while we thus seek peace with God through prayer, let us remember that he has not promised us peace by removing the cause of our anxiety. This was not the way in which Paul was answered when he prayed the Lord thrice to remove what was to him a constant and sharp care, the thorn in the flesh, the messenger of Satan. Nor did God so answer his own Son, when with strong supplications and tears he thrice repeated the same words: "If it be possible, remove this cup from me." Every true prayer is, nevertheless, heard and answered in the best way for us.

In connexion with prayer let it be further observed, that we are to let our requests be made known with *thanksgiving*. We are thus not only to pray to God, and to ask him for specific blessings, but likewise to thank him for those blessings which we have already received. Such a remembrance and acknowledgment of past mercies must necessarily react in several ways upon an anxious soul, and prepare it to receive the blessing of peace. Past mercies, considered in their variety, their number, and the long period during which they have been bestowed, will witness to the heart that our Lord has been indeed "the Lord God, merciful and gracious, long-suffering and slow to anger, abundant in goodness and in truth." Past mercies will recall our past ingratitude to their giver, our blindness to the hand, and our insensibility to the love which bestowed them, with such manifold abuses and per-

versions of them all, as cannot fail to quicken penitence in the soul, and give us an humble sense of our unworthiness to receive the least of his tender mercies. A remembrance of past mercies will also strengthen faith in God, and strengthen the hope of receiving future mercies, thereby lifting off the burden and dispelling the darkness of present carefulness. And thus the more we recall past comforts experienced in time of sorrow, past deliverances unexpectedly afforded in time of perplexity, past forbearance and compassion manifested in time of selfish indifference towards God and towards our neighbour, the more will our faith in God be strengthened, and deeper will the peace of God descend into our hearts.

Nor, in thanking God for what he has given in the past, ought we to forget his mercy in what he has withheld. Who can reflect upon his own history with any degree of wise thoughtfulness, and yet fail to observe the loving-kindness of God in having refused many an ignorant request, thwarted many a cherished hope, and hindered many a purpose which, at the time, seemed essential to his happiness and peace? We once thought, perhaps, that he had forgotten to be gracious; we now see that he remembered us in mercy. What once caused us so much anxiety, now fills us with deepest gratitude; and as we thank God, we take courage.

And not only are our thanks due for what is past, but also for what is promised, and this is more than can be conceived of. Surely the promises of perfect peace; of help in every time of need; of his counsel to guide us, his presence to go with us, his goodness and mercy to follow us while we live, and his own glory to crown us when we die;—these may well banish every care and relieve every anxiety. If in one word we can thank God for the unspeakable gift of Christ, this alone may well entitle us in everything to give thanks, for "all things are ours" if Christ is ours. "He who spared not his own Son, but delivered him up for us all, how shall he not with him also freely give us all things?"

Let us see now what the result will be if we thus seek the living God with our whole heart and mind. "The peace of God, which passeth all understanding, will keep our mind and heart through Christ Jesus."

By the peace of God is meant not only such rest of soul as God alone can impart by his Holy Spirit, but the same kind of peace which he himself possesses. It seems, indeed, presumptuous and irreverent to entertain such a thought as this, but unbelief has well-nigh destroyed our knowledge of the riches of God's love. Yet that love, with its unsearchable riches, remains the same. Now it is the purpose of the love of God, who has created man in his own image, to bring him again within the fold of that love to which he owes his origin. Perfect peace, even the peace of God, is a portion of this eternal inheritance, the earnest of

which we now enjoy. It was this peace of God which kept the mind and heart of Jesus Christ amidst what otherwise would have destroyed the one and broken the other; and it was this same kind of peace which he left as a legacy to his people when he said, "My peace I leave with you, my peace I give unto you."

But while God promises peace, he does not promise happiness. These two states of mind are very different. We may indeed be happy, or possess happiness in the sense of things happening which may be most pleasing to us; but deeper down than the happiness may be an empty and lonely heart without peace. On the other hand, there may be great and constant unhappiness, in the sense of all which happens to us bringing constant suffering to body and mind; but deeper down than all the suffering may be a calm heart, enjoying rest in God, and full of His peace. Mere happiness is the enjoyment of self in what we like, and may possibly be possessed in mere self; but peace is the enjoyment of God, and cannot be possessed without the knowledge and love of Him. Happiness may therefore exist without peace, and peace without happiness. But the one, from its origin, is uncertain and perishable; the other, from its author, is sure and indestructible. For as happiness depends upon outward circumstances, it must necessarily be as changeful as they; and liable to vary every hour—it may at any moment be extinguished. But the peace which depends solely for its existence and maintenance on the unchangeable God, is consequently eternal as His own. Happiness is like the rainbow with many colours, beautiful and brilliant; its magnificent arch appears to be firmly based upon the everlasting hills, and able to support the sky. Its form and beauty triumph for a time over the hurricane, while it reposes in peace upon the bosom of the dark thunder-cloud. Yet in a moment it vanishes. But Divine peace is like the sun, which, hidden, it may be, from the eye by the cloud and storm, is nevertheless reposing behind them all, in the serene heavens, and comes forth at last when the rainbow has passed away, to shine on, filling the world with its light and life.

Need we be surprised, then, by the fact, that many of God's people have had much unhappiness, in the sense that what happened to them gave them pain and sorrow? "They were slain; they had trial of cruel mockings and scourgings, yea, moreover, of bonds and imprisonment: they were stoned, they were sawn asunder, were tempted, were slain with the sword: they wandered about in sheep-skins and goat-skins; being destitute, afflicted, tormented: they wandered in deserts, and in mountains, and in dens and caves of the earth." But, in spite of all, they possessed the peace of God. Our blessed Lord, above all men, was the Man of sorrows. He was burdened in his soul every day with the weight of the sins of the world, every day carried his cross, and every day had a con-

stant care about the good of others ; while his life was ended amidst the agonies of Gethsemane and Calvary. And thus, just because he had perfect love and spotless holiness, it may be said with truth, that, while on earth, he never enjoyed one happy day. But every day he enjoyed perfect peace ! It is with the disciple as it was with the Master, even as he himself declared it would be : "In the world," said he, "ye shall have tribulation ; in me ye shall have peace."

But while those who enjoy this peace may be deprived of happiness, how many possess happiness who never enjoy this peace ! The utterly selfish may possess the enjoyment which is derived from the temporary gratification of their natural desires. They may have more than their heart can wish, and a full cup may be given them ; yet "there is no peace, saith my God, to the wicked." Herod the king was happy while celebrating his birthday, having all his wants supplied, and everything around him ministering to the lust of the eye, the lust of the flesh, and the pride of life ; but, in the dungeon down below, with the fierce executioner and the bloody sword, John the Baptist was not happy. Yet John possessed with the angels what Herod no more possessed than did the devils—"the peace of God, which passeth understanding."

Let this thought comfort every anxious one. It may be God's will that their fate in life shall be one of daily care, or, let us at once say, of much unhappiness. They may have to carry a weak, pained, or deformed body with them to the grave, or a mind peculiarly liable to depression. The sufferings of those dear to them arising from sickness, poverty, death, or worst of all from sin, may be laid upon them as a daily burden. To them the world must be a field of battle and of strife ; it may be a place of tribulation and the very shadow of death. Yet in no circumstances, however trying, ought they to be tortured by anxiety, as if God knew them not, and cared not for them. God has proclaimed peace on earth, and goodwill to men. He has provided peace for miserable, guilty sinners, through the atoning death of him who is our peace. The God of peace has brought him again from the dead, through the blood of the everlasting covenant, and he bestows peace upon all who believe in him ; for, being justified by faith, we have peace with God through our Lord Jesus Christ. The fruit of the Spirit is peace. Having thus grace, mercy, and peace freely granted to us by Father, Son, and Holy Ghost, let us at all times avail ourselves of the grace, accept the mercy, and enjoy the peace. This peace, like a mighty power coming from above, yet dwelling and acting from within, will fortify our thoughts, our feelings, and desires against every attempt on the part of over-anxiety to enter in as an enemy and take possession,—to torture us day and night. "Thou wilt keep him in perfect peace, whose soul is stayed on

thee, because he trusteth in thee." Oh, blessed promise to the weary and heavy-laden, to the careworn and the anxious ! With the peace of God possessing the heart, the storm outside may be blowing loudly, with thunderings and sweeping floods, yet within all is perfect peace, while prayer and thanksgiving ascend to the throne of God and the Lamb !

I beg my reader to peruse the Epistle* which has suggested these few thoughts of comfort to the careful and anxious. He will find abundant and touching evidence of the care from which a Christian may suffer, and of the deep peace of God which he may enjoy. It was written by Paul when a prisoner in Rome : when his condition was one implying no small degree of care. But how many other cares in addition to this great one are incidentally alluded to !—cares from false teachers who sought to "add affliction to his bonds" (Phil. i. 16) ; care as to whether he should depart and be with Christ, or remain with the church (ver. 23) ; care about the life of his beloved friend Epaphroditus, who was in mercy spared to him, lest he should have sorrow upon sorrow (ii. 27) ; care about his own growth in grace, and his attaining the prize (iii. 3) ; care about the sins of others, which made him write, "even weeping." Yet Paul, like his Divine Master, possessed all the while the peace of God. "I have learned," he says, "in whatsoever state I am, therewith to be content. I know both how to be abased, and I know how to abound : everywhere, and in all things, I am instructed both to be full and to be hungry, both to abound and to suffer need. I can do all things through Christ which strengtheneth me." He recognises also the existence of care in his beloved Philippians, when he exhorts them to be "in nothing terrified by their adversaries," adding, "For unto you it is given in behalf of Christ, not only to believe on him, but also to suffer for his sake : having the same conflict which ye saw in me, and now hear to be in me." He also commands them to have due care about their souls, to "work out their own salvation with fear and trembling ;" but not with carefulness, as if God did not care for them, seeing that He worked in them "to will and to do of his own good pleasure." He is glad also to acknowledge that, in regard to his temporal wants, "their care for him had flourished again." But he not only forbids all carefulness, all over-anxiety, he rather commands them to "Rejoice in the Lord alway ;" emphatically adding, "again I say, Rejoice ;" closing his exhortation with the cheering words : "Be careful for nothing : but in everything, by prayer and supplication, with thanksgiving, let your requests be made known unto God. And the peace of God, which passeth all under-

* Paul's Epistle to the Philippians.

standing, shall keep your hearts and minds through Christ Jesus."

As the sum of the whole, hear the words of our Lord :—"Therefore I say unto you, Take no thought for your life, what ye shall eat, or what ye shall drink ; nor yet for your body, what ye shall put on. Is not the life more than meat, and the body than raiment ? Behold the fowls of the air : for they sow not, neither do they reap, nor gather into barns ; yet your heavenly Father feedeth them. Are ye not much better than they ? Which of you, by taking thought, can add one cubit unto his stature ? And why take ye thought for raiment ? Consider the lilies of the field, how they grow ; they toil not, neither do they spin : and yet I say unto you, That even Solomon, in all his glory, was not arrayed like one of these. Wherefore, if God so clothe the grass of the field, which to-day is, and to-morrow is cast into the oven, shall he not much more clothe you, O ye of little faith ? Therefore take no thought, saying, What

shall we eat ? or, What shall we drink ? or, Where-withal shall we be clothed ? For after all these things do the Gentiles seek ; for your heavenly Father knoweth that ye have need of all these things. But seek ye first the kingdom of God, and his righteousness ; and all these things shall be added unto you. Take therefore no thought for the morrow : for the morrow shall take thought for the things of itself. Sufficient unto the day is the evil thereof. Ask, and it shall be given you ; seek, and ye shall find ; knock, and it shall be opened unto you : for every one that asketh, receiveth ; and he that seeketh, findeth ; and to him that knocketh, it shall be opened. Or what man is there of you, whom, if his son ask bread, will he give him a stone ? Or if he ask a fish, will he give him a serpent ? If ye then, being evil, know how to give good gifts unto your children, how much more shall your Father which is in heaven give good things to them that ask him ?"

N. MACLEOD.

A VISIT TO MONTENEGRO.

If war has its drawbacks, and revolutionary movements have their dangers, they at least have the advantage of instructing great masses of spectators in geography. During the last few years the British public has become wonderfully well informed with reference to certain portions of the globe, which would, under ordinary circumstances, have attracted but little of their notice. Sebastopol and Takoo, the Volturno and the Chickahominy, are now household words ; and although probably few have been able to follow those intricate operations upon places with unpronounceable names, which the Turks have lately been carrying on against the Montenegrins, there is a general impression that the scene of warfare is on the eastern shore of the Adriatic, and that Cetinye, the capital of the country, which it was rumoured some months since had been taken by the Turks, after its ruler had set fire to "the public buildings," is a city of some importance. But this is just the point where a little information fuller than a map, and more correct than a telegram can give us, may be of use. That Cetinye is the capital of Montenegro is true, but nothing short of a visit to it can convey an idea of its public buildings. It was a wild stormy morning, when hanging on by the tail of a ragged pony, I allowed him to drag me up the almost impracticable rock-cut steps which ascend from the lovely Bocca di Cattaro, along the rugged face of "the Black Mountain." Below was the sea winding in a narrow channel fifteen miles long, between frowning precipices, their sides furrowed with watercourses, down

which in places dashed white lines of foam ; above were black pine-forests and granite peaks. Where there is room for cultivation between the mountain base and the sea, vines and olives clothe its margin, and white villas reflect themselves in the clear water, but Cattaro itself has scarcely room to stand, and seems to flourish on as little soil as the fir-trees that cling to the rocks above it. We know at once when we have exchanged Austrian for Montenegrin territory by the state of the roads, or rather steps. These are no longer constructed with the view of facilitating the progress of the traveller, but rather of increasing the difficulties of the ascent. Now the path leads along a narrow ledge with a most uncomfortable-looking ravine on one side, and crags which project as if expressly designed to push you into it, on the other. Here a rock in the middle of the road would suggest an insurmountable difficulty to any animal but one accustomed to traverse it ; further on it is used as a convenient channel by an unceremonious stream which tumbles into it in a picturesque waterfall, and during a storm tumbles out of it again with a violence that the traveller finds it difficult to resist. Occasionally we meet strings of light-footed Montenegrins hopping rapidly from crag to crag, followed by no less sure-footed ponies with panniers, who monopolize the middle of the path, and expect us to pass on the outside, and not feel giddy ; ragged-looking women, carrying bundles of wood on their backs, follow painfully ; bare-footed and squalid, they contrast strongly in appearance with their liege lords, whose picturesque costume, manly

forms, and independent bearing, do not leave us in doubt as to which is "the better half." The Montenegrins being a warlike race, often do things like the Americans, "for a strategic purpose," and their object in rendering all access to their country as impracticable as possible, it is easy to divine. It is the excessive difficulty of communication, no less than the bravery of these mountaineers, which has enabled them to protract over so long a period hostilities with the Turks.

In three hours we have clambered up 5000 feet, and find ourselves on a high rocky plateau, with gigantic blocks of granite rising in grotesque masses on each side of the rugged path. The

scene is barren and wild in the extreme; except here and there a weather-beaten pine or a stunted juniper, there is nothing to relieve the monotony of grey crags. We surmount these serrated ridges only to find bigger rocks piled on each other beyond, and walls as regular as though built by some race of giants, hemming us in on both sides. Now and then we come upon a little isolated plot of potatoes or corn squeezed in among the rocks, but we may traverse miles without seeing as much soil as would suffice for a respectable kitchen garden.

After a little more scrambling we become curious to know where the habitations are, more especially as sufficient time has elapsed since our departure

from Cattaro to give us an appetite, and ultimately rest, with grateful feelings, at a small cottage not unlike a Highland bothy, while a gaunt female in tattered garments ministers to our wants by supplying us with eggs, and a substance more like pressed curds than cheese. Her husband, an athletic man bristling with swords and pistols, regards us with a sort of suspicious apathy, and seems by no means disposed to satisfy that thirst for information, for which, as conscientious travellers, we are distinguished. Three or four of his countrymen who have followed our little cortège out of curiosity, now collect round us, and lighting their long pipes smoke and stare in silence. We can scarcely

realize, as we gaze on this uncouth-looking group, that a few hours ago we left a civilized town, where a band was playing in public gardens to fashionable ladies sweeping the walks with their crinolines, or eating ices at little round tables with officers resplendent in the gaudy uniforms of the Austrian service. The rocks we had traversed did indeed interpose as mighty a barrier as though an ocean rolled between our night's quarters and our lunching place; and our curiosity to reach the capital was not lessened by our first experience of Montenegro.

At last we crossed a summit from which a magnificent view spread itself before us, until it

was lost in the hazy distance, and we were told that the whole territory of Montenegro was comprised in the intervening space, and that the glimmer of water indistinctly visible in a plain far away below us was the Lake of Scutari, while the blue outline beyond marked the mountains of Albania. Then we descended into a plain surrounded by a wall of rocks, and looked for the capital; for we were told that it was situated in its centre. In vain we inspected the area below us; beyond a few miserable cottages we could see nothing to answer our expectations, and were not a little astonished when we learnt that the assemblage of huts we were approaching was Cettinye itself. It was idle to examine the one little street, about a hundred yards long, of which the town is composed, for a house of refreshment. An inn was a "public building" which the authorities had forgotten to supply. A cottage was pointed out to us, which consisted apparently of a "but and a ben," and was the residence of no less a personage than the Prince's father, but we had not at that time the honour of his acquaintance, and his mansion did not look as if it contained a spare room. At last we found a Dalmatian couple, who were the only foreigners in the place, and offered to take us in for a consideration. They inhabited the most considerable building in the town, for it had two storeys, and we soon installed ourselves in a very dirty room, containing a suspicious-looking double bed, and sundry articles of Montenegrin wearing apparel; a large chest, and a choice collection of arms stacked in one corner, induced us to believe that the real tenants of the apartment had vacated in our favour, an hypothesis we speedily found to be correct, though we were far from imagining how distinguished were the individuals we had dispossessed. I happened to be sitting on the trunk, as chairs were scarce, when the handsomest Montenegrin I had seen, covered with gold and silver embroidery, and armed at all points, stalked majestically in, and politely asked me to rise. Indeed so much impressed was I with this warlike apparition, that I found little difficulty in assuming a conciliatory demeanour, and blandly offered him my seat. Instead, however, of sitting upon the trunk he proceeded to unlock it, and displayed to my astonished gaze rows of neatly packed money-bags. Some of these, containing gold and silver coins, he emptied with the utmost unconcern upon the table, whence they were swept by sundry attendants who had followed him into the room.

This late occupant of our chamber, who lent it so confidently to two entire strangers, seemed to possess more coin than I had supposed all Montenegro contained, and we were eager in our inquiries as to who he might be. Our surprise was somewhat increased, when we learnt that our visitor was no less a person than the Chancellor of the Exchequer, and that the royal treasury was represented by the unpretending box which contained the floating capital of the Principality.

It appeared that the big bed had been occupied until our arrival by the distinguished senator whom we now saw engaged in his financial duties, and his brother, a captain in the army, and we were indebted to them for the kindness with which they at once placed their own limited accommodation at our disposal. Soon the unusual news of the arrival of "distinguished foreigners" spread through the little village, and sundry of its inhabitants drop in and scrape acquaintance. Most of these have interesting feats of prowess to relate, and dwell for ever on the exploits they have achieved against the Turks. They wear different medals for these, and are all abundantly decorated. One stalwart warrior recounts how he and twenty-one comrades fought in a pass for fifteen days and nights against 8000 Turks, during which period they lost six of their number, but were ultimately reinforced, and drove back the enemy. Another, whose ragged clothes and haggard face bear witness to the truth of his story, informs us that he has only arrived the day before from an eighteen months' captivity in Turkey; and that he is utterly destitute, nor have his friends, who are as poor as himself, any means of supplying his wants; and he casts a languishing eye on the treasure-chest. All the while we are discussing a very indifferently-cooked dinner, and are conversing with these heroes in a variety of tongues. Generally we found Italian the most available, sometimes it was Turkish, and a few of the better educated spoke German, often a mixture of all three. They are frank and cordial, anxious to indoctrinate us into Montenegrin politics, and ready to afford us information. So few English, they say, ever come to their country, that they are flattered by the visit, and wish to make us enjoy it. As war is going on, many people are from home, and the country looks deserted in consequence. Except the officers and non-commissioned officers, the army receive no pay. Every man is in fact a soldier, and immediately after he has sown his crops he proceeds to the war, and fights until it is time to come back and reap them, when there is a general lull in operations until the harvest is laid in. The regular army consists of only 8000 men, who are always mobilized, and upon whom all the fighting falls at seed-time and harvest. Lately the women and children have taken part in the defence of the country. The Government of the country is chiefly carried on by a Senate, consisting of twelve persons, chosen by the Prince, who succeeds himself, not by hereditary right, but by the nomination of his predecessor. Thus the present Prince is the nephew of the late Danieli; his father, however, exercises practically the chief influence in the country, and in order to secure it to himself, is said to have had five of the leading men shot on the accession of his son.

The view from our window was often animated and picturesque in the extreme. In the middle of the street stood a large tree, under which warriors

collected and held solemn council. Each chief, as he moved about, was generally attended by a dozen or more stalwart followers, who lounged after their lords all day, and whose only occupation was evidently fighting.

Their short white kilts, bright-coloured jackets, slashed, and covered with gold and silver embroidery, and the handsome weapons, which formed a perfect *chevaux de frise* round their waists, gave them a wild, but at the same time, martial look. They seemed as rugged and impracticable as the mountains they defended, and conquest under such conditions would appear a difficult and in many respects a barren achievement.

A little distance from the village stands alone a Greek church, smaller probably than any parish church in Scotland, though it is the only place of worship which the capital contains. Here I attended a solemn funeral service one day, at which the whole of the royal family and leading members of the aristocracy were present. As the service was performed in Slavonic it was unintelligible to me, and the only function in which I could take part was to hold a taper, which I was obliged perpetually to light and blow out, following the example of my neighbours, each of whom was similarly occupied. As the chanting was very monotonous, the atmosphere very close, the wax, when it happened to fall on one's hand, very hot, and as the distinguished congregation stood during the whole ceremony, I was not a little relieved when it closed, and the royal party, male and female, put up their umbrellas, and rushed across a slushy green in the pelting rain to the palace, which is indeed the only civilized-looking tenement in the place, and is nicely furnished with some of the luxuries of civilisation. Near it, amidst overhanging crags of granite, stands another large building, with gloomy arches and deserted courts. This is used as a prison, an arsenal, or any other national purpose; here are confined Turks taken in war, and here are exhibited the trophies of the bloody field of Gahovo, immortalized in the annals of Montenegrin warfare, when some years ago five thousand of the mountaineers surprised and almost totally annihilated twelve thousand Turks, capturing all their arms, guns, and munitions of war, as a room full of rusty muskets and tattered flags testifies. There is not a single shop in this capital of Montenegro, as the inhabitants procure everything from Cattaro, but their wants are limited, and at Rjeka, a town about three hours and a half distant, there is a small bazaar; a few more hours from this town brings us to the banks of the Lake of Scutari, and on an island a few hundred yards from the shore we see waving a Turkish flag, and beneath it a Turkish sentry. This is the frontier post of Lessandra; to the east of it is visible through a telescope the line of forts which marks the usual scene of warfare, almost every foot of ground we tread is rendered famous by having once been the scene of some bloody encounter; from behind the rocks, which

form their natural defences, the highlanders wage a perpetual guerilla war upon their foe, picking off with their rifles their assailants, as they struggle to convey guns along paths fit only for a goat or a chamois.

The Lake of Scutari, which is in shape not unlike the Lake of Geneva, and about seventy miles long, is surrounded on all sides by mountains rising either abruptly from its margin, or in rear of a narrow plain which bounds its eastern shore. It is navigated by a steamer, and in half a day we have once more changed the social atmosphere. The transition from the civilisation of Cattaro to the wildness of Cetinye, is not more striking than that which now greets the eye as we wind along narrow lanes between high walls, jealously concealing each house, with an occasional veiled figure fitting along them. Here the familiar indications of Eastern life meet the eye at every turn. Turks in flowing robes are smoking apathetically, and muezzins are calling people to prayers; indeed, the place seems composed of mosques and graveyards. We pass along dull lifeless streets, and arrive at last at a fitting termination to them, where all the life seems to have been buried. The lanes are ill paved, with deep mud traps, very treacherous at night. When we get admittance at a small door in a stone wall, we probably find the mansion inside in keeping with the general air of dilapidation. There is a magnificent rock at the debouchure of a river from the lake, on the summit of which is a picturesque old castle, containing generally an equally picturesque old Pasha, and commanding always a magnificent view; and there is a filthy bazaar at the bottom roofed in from the sun, dirty, noisy, and crowded with a mixed Turkish and Albanian population, until sunset, when it is deserted and the inhabitants retire to the silent suburb.

Scutari is, however, by no means a good specimen of a Turkish town, and only strikes by contrast. It contains too large a Christian population, and during the carnival, there is sometimes an attempt at gaiety. Preceded by two men with long paper lanterns, and with trowsers tucked up to my knees, I splashed one night through the mud to take part in some festivities, where I hoped to meet some of the *elite* of Albanian society. Scrambling up a rickety wooden stair, I found myself in a room so full of tobacco-smoke, that I could only at first dimly discern the company seated round it. Strange sounds met my ear, which I discovered to proceed from a piano, twenty-four strings of which were broken, and a flute played by a travelled Albanian, who had once been to Paris, and was gorgeously attired in the costume of the country. No less than six ladies graced the entertainment with their presence, four of whom were in full Albanian attire, while two, fascinated by the attractions of crinoline, only retained the upper half of the national dress. There was a great preponderance of men, but I discovered afterwards that a closed gallery was full of native women, too shy

to take part in this semi-civilized performance, who gazed curiously at their more advanced compatriots; for dancing is a western importation, and Albanian women do not generally join in festive meetings, and are almost as little seen as if they were Mahometans. The Prince of a Latin tribe, whose usual place of abode was somewhere in the neighbouring mountains, looked wonderingly on at the proceedings which were conducted by some of the Italian and Levantine portion of the community. After we were tired of discordant music we had a game of "synagogue," which consisted in the whole company passing single cards to each other, and all shouting their names at the same time, which created a great deal of noise and laughter, though it was difficult to say wherein lay the point of the joke. Then a very ragged old woman handed round tea and lemonade, and the Albanian ladies were persuaded to stand up and dance for the first time in their lives. My partner wore a gold helmet, a crimson and gold-embroidered tunic, open-worked in front, loose white trowsers, tight at the ankle, and thick-embroidered stockings, with Turkish slippers: a pretty face, and a pair of large black eyes set off this picturesque costume. As she had never even seen a polka danced, it was not without much pressing that she was induced to kick off her slippers, and commence hopping about on her stocking-soles. Once off, however, she spun round vigorously, and peals of laughter from her friends in the gallery rewarded her efforts, while the ludicrous effect of a little woman running round one, in a short tunic,

baggy trowsers, and thick stockings, would have upset the gravity of the most sedate of partners. The exertion was becoming trying, when fortunately a mummer appeared in the costume of a dancing dervish with an illuminated foolscap on his head, and a long grey beard, leading in another closely veiled, and disguised as a Turkish woman; so we put them in the middle of a circle, and joining hands, danced frantically round them, until the ladies fell back exhausted, and refreshed themselves with the abundant use of tobacco, in a dense cloud of which I contrived to escape unobserved, and thus ended the last night of the Carnival at Scutari.

A few days after I found myself in another part of the country, the guest of a Turk, during the sacred season of the Ramadan, when neither eating, drinking, nor smoking, are allowed between sunrise and sunset. When night came, instead of boisterous merriment, how gravely we sat on the floor at a low table, and dipped our fingers into the same bowl, and then smoked tchibouks and drank coffee far on into the morning. For it is only natural that when the day offers so little enjoyment, as much as possible should be made of the night. And when at last I stretched myself on the floor on the softest of coverlets, I thought of the singular contrast which the observance of the Christian and Mahometan festival afforded, and wondered how it was that in both cases the religious instinct should err so widely, and in such opposite directions.

LAURENCE OLIPHANT.

ABOUT VOLCANOS AND EARTHQUAKES.

BY SIR JOHN HERSCHEL.

I PURPOSE in this paper to say something about volcanos and earthquakes. It is a subject I have thought a good deal about, and seen a little of, for though I have never been so fortunate as to have seen a volcano in eruption, or to have been shaken out of my bed by an earthquake, still I have climbed the cones of Vesuvius and Etna, hammer in hand and barometer on back, and have wandered over and geologized among, I believe, nearly all the principal scenes of extinct volcanic activity in Europe.

Every one knows that a volcano is a mountain that vomits out fire, and smoke, and cinders, and melted lava, and sulphur, and steam, and gases, and all kinds of horrible things; nay, even sometimes mud, and boiling water, and fishes; and everybody has heard or read of the earth opening, and swallowing up man and beast, and houses and churches, and closing on them with a snap, and smashing them to pieces, and then perhaps opening again; and casting them out with a flood of dirty water from some river or lake that had been gulped down with them. Now, all this, and much more, is literally true, and has happened over and over again; and when we have imagined it all, we will have formed a tolerably correct notion of some at least of these visitations. And perhaps some may have been tempted to ask why and how it is that God has permitted this fair earth to be visited with such destruction. It can hardly be for the sins of men, for when these things occur they involve alike the innocent and the guilty; and besides, the volcano and the earthquake were raging on this earth with as much, nay greater violence, thousands and thousands of years before man ever set his foot upon it. But perhaps, on the other hand, it may have occurred to some to ask themselves whether it is not just possible that these ugly affairs are sent among us for some beneficent purpose, or at all events that they may form part and parcel of some great scheme of providential arrangement which is at work for good, and not for ill. A ship sometimes strikes on a rock, and all on board perish; a railway train runs into another, or breaks down, and then wounds and contusions are the order of the day; but nobody doubts that navigation and railway communication are great blessings. None of the great natural provisions for producing good are exempt in their workings from producing occasional mischief. Storms disperse and dilute pestilential vapours, and lightnings decompose and destroy them; but both the one and the other often annihilate the works of man, and inflict upon him sudden death. Well, then, I think I shall be able to show that the volcano and the earthquake, dreadful as they are, as local and temporary visi-

tations, are in fact unavoidable (I had almost said necessary) incidents in a vast system of action to which we owe the very ground we stand upon, the very land we inhabit, without which neither man, beast, nor bird would have a place for their existence, and the world would be the habitation of nothing but fishes.

Now, to make this clear, I must go a little out of my way and say something about the first principles of geology. Geology does not pretend to go back to the creation of the world, or concern itself about its primitive state, but it does concern itself with the changes it sees going on in it now, and with the evidence of a long series of such changes it can produce in the most unmistakable features of the structure of our rocks and soil, and the way in which they lie one on the other. *As to what we see going on.*—We see everywhere, and along every coast-line, the sea warring against the land, and everywhere overcoming it, wearing and eating it down, and battering it to pieces, grinding those pieces to powder, carrying that powder away, and spreading it out over its own bottom, by the continued effect of the tides and currents. Look at our chalk cliffs, which once, no doubt, extended across the Channel to the similar cliffs on the French coast. What do we see? Precipices cut down to the sea-beach, constantly hammered by the waves and constantly crumbling, the beach itself made of the flints outstanding after the softer chalk has been ground down and washed away, themselves grinding one another under the same ceaseless discipline, first rounded into pebbles, then worn into sand, and then carried out farther and farther down the slope, to be replaced by fresh ones from the same source.

Well, the same thing is going on *everywhere, round every coast* of Europe, Asia, Africa, and America. Foot by foot or inch by inch, month by month or century by century, *down everything must go*. Time is as nothing in geology. And what the sea is doing the rivers are helping it to do. Look at the sand-banks at the mouth of the Thames. What are they but the materials of our island carried out to sea by the stream? The Ganges carries away from the soil of India, and delivers into the sea, as much solid substance *daily* as is contained in the great pyramid of Egypt. The Irawaddy sweeps off from Burmah 62 cubic feet of earth in every second of time on an average, and there are 86,400 seconds in every day, and 365 days in every year, and so on for the other rivers. What has become of all that great bed of chalk which once covered all the weald of Kent, and formed a continuous mass from Ramsgate and Dover to Beech Head, running inland to Ma-

damscourt Hill and Seven Oaks. All clean gone, and swept out into the bosom of the Atlantic, and there forming other chalk-beds. Now, geology assures us, on the most conclusive and undeniable evidence, that ALL our present land, all our continents and islands, have been formed in this way out of the ruins of former ones. The old ones which existed at the beginning of things have all perished, and what we now stand upon has most assuredly been, at one time or other, perhaps many times, the bottom of the sea.

Well, then, there is power enough at work, and it has been at work long enough, utterly to have cleared away and spread over the bed of the sea all our present existing continents and islands, had they been placed where they are at the creation of the world; and from this it follows, as clear as demonstration can make it, that without *some* process of renovation or restoration to act in antagonism to this destructive work of old Neptune, there would not now be remaining a foot of dry land for living thing to stand upon.

Now, what is this process of restoration! Let the volcano and the earthquake tell their tale. Let the earthquake tell how, within the memory of man—under the eyesight of eye-witnesses, one of whom (Mrs. Graham) has described the fact—the whole coast line of Chili, for 100 miles about Valparaiso, with the mighty chain of the Andes—mountains to which the Alps shrink into insignificance—was hoisted at one blow (in a single night, Nov. 19, A.D. 1822), from two to seven feet above its former level, leaving the beach below the old low water-mark high and dry, leaving the shell-fish sticking on the rocks out of reach of water, leaving the seaweed rotting in the air, or rather drying up to dust under the burning sun of a coast where rain never falls. The ancients had a fable of Titan hurled from heaven and buried under Etna, and by his struggles causing the earthquakes that desolated Sicily. But here we have an exhibition of Titanic forces on a far mightier scale. One of the Andes upheaved on this occasion was the gigantic mass of Aconcagua, which overlooks Valparaiso. To bring home to the mind the conception of such an effort, we must form a clear idea of what sort of mountain this is. It is nearly 24,000 feet in height. Chimborazo, the loftiest of the volcanic cones of the Andes, is lower by 2500 feet; and yet Etna, with Vesuvius at the top of it, and another Vesuvius piled on that, *would little more than surpass the midway height of the snow-covered portion of that cone*, which is one of the many chimneys by which the hidden fires of the Andes find vent. On the occasion I am speaking of, at least 10,000 square miles of country were estimated as having been upheaved, and the upheaval was not confined to the land, but extended far away to sea, which was proved by the soundings off Valparaiso, and along the coast, having been found considerably shallower than they were before the shock.

Again, in the year 1819, in an earthquake in India, in the district of Cutch, bordering on the Indus, a tract of country more than fifty miles long and sixteen broad, was suddenly raised ten feet above its former level. The raised portion still stands up above the unraised, like a long perpendicular wall, which is known by the name of the "Ullah Bund," or "God's Wall." And again, in 1538, in that convulsion which threw up the Monte Nuovo (New Mountain), a cone of ashes 450 feet high, in a single night, the whole coast of Pozzuoli, near Naples, was raised twenty feet above its former level, and remains so permanently upheaved to this day. And I could mention innumerable other instances of the same kind.*

This, then, is the manner in which the earthquake does its work; *and it is always at work*. Somewhere or other in the world, there is perhaps not a day, certainly not a month, without an earthquake. In those districts of South and Central America, where the great chain of volcanic cones is situated—Chimborazo, Cotopaxi, and a long list with names unmentionable, or at least unpronounceable—the inhabitants no more think of counting earthquake shocks than we do of counting showers of rain. Indeed, in some places along that coast, a shower is a greater rarity. Even in our own island, near Perth, a year seldom passes without a shock, happily, within the records of history, never powerful enough to do any mischief.

It is not everywhere that this process goes on by fits and starts. For instance, the northern gulfs, and borders of the Baltic Sea, are steadily shallowing, and the whole mass of Scandinavia, including Norway, Sweden, and Lapland, is rising out of the sea at the average rate of about two feet per century. But as this fact (which is perfectly well established by reference to ancient high and low water-marks) is not so evidently connected with the action of earthquakes, I shall not further refer to it just now. All that I want to show is, that there is a great cycle of changes going on, in which the earthquake and volcano act a very conspicuous part, *and that part a restorative and conservative one*, in opposition to the steadily destructive and levelling action of the ocean waters.

How this can happen, what can be the origin of such an enormous power thus occasionally exerting itself, will no doubt seem very marvellous—little short, indeed, of miraculous intervention—but the mystery, after all, is not quite so great as at first it seems. We are permitted to look a little way into these great secrets of nature; not far enough, indeed, to clear up every difficulty, but quite enough to penetrate us with admiration of that wonderful system of counterbalances and compensations, that adjustment of causes and consequences, by which, throughout all nature, evils are made to work their own cure, life to spring out of death,

* Not that earthquakes always *raise* the soil; there are plenty of instances of subsidence, etc.

and renovation to tread in the steps and efface the vestiges of decay.

The key to the whole affair is to be found in the central heat of the earth. This is no scientific dream, no theoretical notion, but a fact established by direct evidence up to a certain point, and standing out from plain facts as a matter of unavoidable conclusion in a hundred ways.

We all know that when we go into a cellar out of a summer sun, it feels *cool*, but when we go into it out of a wintry frost it is *warm*. The fact is, that a cellar, or a well, or any pit of a moderate depth, has always, day and night, summer and winter, the same degree of warmth, the same *temperature*, as it is called, and *that* always and everywhere is the same, or nearly the same, as the average warmth of the climate of the place. Forty or fifty feet deep in the ground, a thermometer here, in this spot,* would always mark the same degree, 49° that is, or seventeen degrees above the freezing point. Under the equator, at the same depth, it always stands at 84°, which is our *hot summer* heat, but which there is the average heat of the whole year. And this is so everywhere. Just at the surface, or a few inches below it, the ground is warm in the daytime, cool at night, at two or three feet deep the difference of day and night is hardly perceptible, but that of summer and winter is considerable. But at forty or fifty feet this difference also disappears, and you find a perfectly fixed, uniform degree of warmth, day and night, summer and winter, year after year.

But when we go deeper, as, for instance, down into mines or coal-pits, this one broad and general fact is always observed,—everywhere, in all countries, in all latitudes, in all climates, wherever there are mines, or deep subterranean caves,—the deeper you go, the hotter the earth is found to be. In one and the same mine, each particular depth has its own particular degree of heat, which never varies, but the lower always the hotter; and that not by a trifling, but what may well be called an astonishingly rapid rate of increase,—about a degree of the thermometer additional warmth for every 90 feet of additional depth, which is about 58° per mile!—so that, if we had a shaft sunk a mile deep, we should find a heat of 105°, which is much hotter than the hottest summer day ever experienced in England.

It is not everywhere, however, that it is worth while to sink a shaft to any great depth; but borings for water (in what are called Artesian wells) are often made to enormous depths, and the water always comes up hot; and the deeper the boring, the hotter the water. There is a very famous boring of this sort in Paris, at La Grenelle. The water rises from a depth of 1794 feet, and its temperature is 82° of our scale, which is almost that of the equator. And, again, at Salzwerth, in Oeynhausen, in Germany, in a boring for salt-

springs 2144 feet deep, the salt water comes up with a still higher heat, viz., 91°. Then, again, we have natural hot-water springs, which rise, it is true, from depths we have no means of ascertaining, but which, from the earliest recorded times, have always maintained the same heat. At Bath, for instance, the hottest well is 117° Fahr. On the Arkansas River, in the United States, is a spring of 180°, which is scalding hot; and that out of the neighbourhood of any volcano.

Now, only consider what sort of a conclusion this lands us in. This globe of ours is 8000 miles in diameter; a mile deep on its surface is a mere scratch. If a man had twenty greatcoats on, and I found under the first a warmth of 60° above the external air, I should expect to find 60° more under the second, and 60° more under the third, and so on; and, within all, *no man*, but a mass of red-hot iron. Just so with the outside crust of the earth. Every mile thick is such a greatcoat, and at 20 miles depth, according to this rate, the ground must be fully red-hot; and at no such very great depth beyond, either the whole must be melted, or only the most infusible and intractable kinds of material, such as our fire-clays and flints, would present some degree of solidity.

In short, what the icefloes and icebergs are to the polar seas, so we shall come to regard our continents and mountain ranges in relation to the ocean of melted matter beneath. I do not mean to say there is no solid central mass; there may be one, or there may not, and, upon the whole, I think it likely enough that there is—kept solid, in spite of the heat, by the enormous pressure; but that has nothing to do with my present argument. All that I contend for is this,—Grant me a sea of liquid fire, on which we are all floating, land and sea; for the bottom of the sea, anyhow, will not come nearly down to the lava level. The sea is probably nowhere more than five or six miles deep, which is far enough above that level to keep its bed from becoming red-hot.

Well, now, the land is perpetually wearing down, and the materials carried out to sea. The coat of heavier matter is thinning off towards the land, and thickening over all the bed of the sea. What must happen? If a ship floats even on her keel, transfer weight from the starboard to the larboard side, will she continue to float even? No, certainly. She will heel over to larboard. Many a good ship has gone to the bottom in this way. If the continents are lightened, they will rise; if the bed of the sea receives additional weight, it will sink. The bottom of the Pacific is sinking, in point of fact. Not that the Pacific is becoming *deeper*. This seems a paradox; but it is easily explained. The whole bed of the sea is in the act of being pressed down by the laying on of new solid substance over its bottom. The new bottom then is laid upon the old, and so the actual bed of the ocean remains at the same distance from the surface water. But what becomes of the islands? They form part

* At Hawkhurst in Kent.

and parcel of the old bottom ; and Dr. Darwin has shown, by the most curious and convincing proofs, that they *are sinking*, and *have been sinking for ages*, and are only kept above water—by what, think you ? By the labours of the coral insects, which always build up to the surface !

It is impossible but that this increase of pressure in some places and relief in others must be very unequal in their bearings. So that at some places or other this solid floating crust must be brought into a state of strain, and if there be a weak or a soft part, a crack will at last take place. When this happens, down goes the land on the heavy side, and up on the light side. Now this is exactly what took place in the earthquake which raised the Ullah Bund in Cutch. I have told you of a great crack down across the country, not far from the coast line ; the inland country rose ten feet, but much of the sea-coast, and probably a large tract in the bed of the Indian Ocean, sunk considerably below its former level. And just as you see when a crack takes place in ice, the water oozes up, so this kind of thing is always, or almost always followed by an upburst of the subterranean fiery matter. The earthquake of Cutch was terminated by the outbreak of a volcano at the town of Bhooi, which it destroyed.

Now where, following out this idea, should we naturally expect such cracks and outbreaks to happen ? Why, of course, along those lines where the relief of pressure on the land side is the greatest, and also its increase on the sea side ; that is to say, along or in the neighbourhood of the sea-coasts, where the destruction of the land is going on with most activity. Well, now, it is a remarkable fact in the history of volcanos, that there is hardly an instance of an active volcano at any considerable distance from the sea-coast. All the great volcanic chain of the Andes is close to the western coast line of America. Etna is close to the sea ; so is Vesuvius ; Teneriffe is very near the African coast ; Mount Erebus is on the edge of the great Antarctic continent. Out of 225 volcanos which are known to have been in actual eruption over the whole earth within the last 150 years, I remember only a single instance of one more than 320 miles from the sea, and even *that* is on the edge of the Caspian, the largest of all the inland seas—I mean Mount Demawend in Persia.

Suppose from this, or from any other cause, a crack to take place in the solid crust of the earth. Don't imagine that the melted matter below will simply ooze up quietly, as water does from under an ice-crack. No such thing. There is an element in the case we have not considered : Steam and condensed gases. We all know what happens when a crack takes place in a high-pressure steam-boiler, with what violence the contents escape, and what havoc takes place. Now there is no doubt that among the minerals of the subterranean world, there is water in abundance, and sulphur, and many other vaporizable substances,

all kept subdued and repressed by the enormous pressure. Let this pressure be relieved, and forth they rush, and the nearer they approach the surface the more they expand, and the greater is the explosive force they acquire, till at length, after more or fewer preparatory shocks, each accompanied with progressive weakening of the overlying strata, the surface finally breaks up, and forth rushes the imprisoned power, with all the awful violence of a volcanic eruption.

Certainly a volcano does seem to be a very bad neighbour ; and yet it does afford a compensation in the extraordinary richness of the volcanic soil, and the fertilizing quality of the ashes thrown out. The flanks of Somma (the exterior crater of Vesuvius) are covered with vineyards producing wonderful wine, and whoever has visited Naples, will not fail to be astonished at the productiveness of the volcanized territory as contrasted with the barrenness of the limestone rocks bordering on it. There you will see the amazing sight (as an English farmer would call it) of a triple crop growing at once on the same soil ; a vineyard, an orchard, and a corn-field all in one. A magnificent wheat crop, five or six feet high, overhung with clustering grape-vines swinging from one apple or pear tree to another in the most luxuriant festoons ! When I visited Somma, to see the country where the celebrated wine, the *Lacryma Christi*, is grown, it was the festival of the *Madonna del Arco* ; her church was crowded to suffocation with a hot and dusty assemblage of the peasantry. The fine impalpable volcanic dust was everywhere ; in your eyes, in your mouth, begriming every pore ; and there I saw what I shall never forget. Jammed among the crowd, I felt something jostling my legs ; looking down, and the crowd making way, I beheld a line of worshippers crawling on their hands and knees from the door of the church to the altar, licking the dusty pavement all the way with their tongues, positively applied to the ground and no mistake. No trifling dose of *Lacryma* would be required to wash down what they must have swallowed on that journey, and I have no doubt it was administered pretty copiously after the penance was over.

Now I come to consider the manner in which an earthquake is propagated from place to place ; how it travels, in short. It runs along the earth precisely in the same manner, and according to the same mechanical laws as a wave along the sea, or rather as the waves of sound run along the air, but quicker. The earthquake which destroyed Lisbon ran out from thence, as from a centre, in all directions, at a rate averaging about twenty miles per minute, as far as could be gathered from a comparison of the times of its occurrence at different places ; but there is little doubt that it must have been retarded by having to traverse all sorts of ground, for a blow or shock of any description is conveyed through the substance on which it is delivered with the rapidity of sound in that

substance. Perhaps it may be new to many to be told that sound is conveyed by water, by stone, by iron, and indeed by everything, and at a different rate for each. In air it travels at the rate of about 1140 feet per second, or about 12 miles in a minute. In water much faster, more than four times as fast (4700 feet). In iron ten times as fast (11,400 feet), or about 130 miles in a minute, so that a blow delivered endways at one end of an iron rod, 130 miles long, would only reach the other after the lapse of a minute, and a pull at one end of an iron wire of that length, would require a minute before it would be felt at the other. But the substance of the earth through which the shock is conveyed is not only far less elastic than iron, but it does not form a coherent, connected body; it is full of interruptions, cracks, loose materials, and all these tend to deaden and retard the shock, and putting together all the accounts of all the earthquakes that have been exactly observed, their rate of travel may be taken to vary from as low as 12 or 13 miles a minute to 70 or 80, but perhaps the low velocities arise from oblique waves.

The way, then, that we may conceive an earthquake to travel is this,—I shall take the case which is most common, when the motion of the ground to-and-fro is horizontal. *How far* each particular spot on the surface of the ground is actually pushed from its place there is no way of ascertaining, since all the surrounding objects receive the same impulse almost at the same instant of time, but there are many indications that it is often several yards. In the earthquake of Cutch, which I have mentioned, trees were seen to flog the ground with their branches, which proves that their stems must have been jerked suddenly away for some considerable distance and as suddenly pushed back; and the same conclusion follows from the sudden rise of the water of lakes on the side where the shock reaches them, and its fall on the opposite side; the bed of the lake has been jerked away for a certain distance from under the water and pulled back.

Now, suppose a row of sixty persons, standing a mile apart from each other, in a straight line, in the direction in which the shock travels, at a rate, we will suppose, of sixty miles per minute, and let the ground below the first get a sudden and violent shove, carrying it a yard in the direction of the next. Since this shock will not reach the next till after the lapse of one second of time, it is clear that the space between the two will be shortened by a yard, and the ground—that is to say, not the mere loose soil on the surface, but the whole mass of solid rock below, down to an unknown depth—compressed, or driven into a smaller space. It is this compression that carries the shock forwards. The elastic force of the rocky matter, like a coiled spring, acts both ways; it drives back the first man to his old place, and shoves the second a yard nearer to the third, and so on. Instead of men place a row of tall buildings, or columns, and they will tumble down in succession, the base flying

forwards, and leaving the tops behind to drop on the soil on the side *from* which the shock came. This is just what was seen to happen in Messina in the great Calabrian earthquake. As the shock ran along the ground, the houses of the Faro were seen to topple down in succession, beginning at one end and running on to the other, as if a succession of mines had been sprung. In the earthquake in Cutch, a sentinel standing at one end of a long straight line of wall, saw the wall bow forward and recover itself, not all at once, but with a swell like a wave running all along it with immense rapidity. In this case it is evident that the earthquake wave must have had its front oblique to the direction of the wall (just as an obliquely-held ruler runs along the edge of a page of paper while it advances, like a wave of the sea, perpendicularly to its own length).

In reference to extinct volcanos, I may just mention that any one who wishes to see some of the finest specimens in Europe may do so by making a couple of days' railway travel to Clermont, in the department of the Puy de Dôme in France. There he will find a magnificent series of volcanic cones, fields of ashes, streams of lavas, and basaltic terraces or platforms, proving the volcanic action to have been continued for countless ages before the present surface of the earth was formed; and all so clear that he who runs may read their lesson. There can there be seen a configuration of surface quite resembling what telescopes show in the most volcanic districts of the moon. Let not the reader be startled; half the moon's face is covered with craters of extinct volcanos.

Many of the lavas of Auvergne and the Puy de Dôme are basaltic; that is, consisting of columns placed close together; and some of the cones are quite complete, and covered with loose ashes and cinders, just as Vesuvius is at this hour.

In the study of these vast and awful phenomena we are brought in contact with those immense and rude powers of nature which seem to convey to the imagination the impress of brute force and lawless violence; but it is not so. Such an idea is not more derogatory to the wisdom and benevolence that prevails throughout all the scheme of creation than it is in itself erroneous. In their wildest paroxysms the rage of the volcano and the earthquake is subject to great and immutable laws: they feel the bridle and obey it. The volcano bellows forth its pent-up overplus of energy, and sinks into long and tranquil repose. The earthquake rolls away, and industry, that balm which nature knows how to shed over every wound, effaces its traces, and festoons its ruins with flowers. There is mighty and rough work to be accomplished, and it cannot be done by gentle means. It seems, no doubt, terrible, awful, perhaps harsh, that twenty or thirty thousand lives should be swept away in a moment by a sudden and unforeseen calamity; but we must remember that sooner or later every one of those lives must be called for,

and it is by no means the most sudden end that is the most afflictive. It is well too that we should contemplate occasionally, if it were only to teach us humility and submission, the immense energies which are everywhere at work in maintaining the system of nature we see going on so smoothly and tranquilly around us, and of which these furious outbreaks, after all, are but minute, and for the moment unbalanced surpluses in the great account. The energy requisite to overthrow a mountain is as a drop in the ocean compared with that which holds it in its place, and makes it a mountain. Chemistry tells us that the forces constantly in action to maintain four grains of zinc in its habitual

state, when only partially and sparingly let loose in the form of electricity, would supply the lightning of a considerable thunder-storm. And we learn from optical science that in even the smallest element of every material body, nay, even in *what we call* empty space, there are forces in perpetual action to which even such energies sink into insignificance. Yet, amid all this, nature holds her even course : the flowers blossom ; animals enjoy their brief span of existence ; and man has leisure and opportunity to contemplate and adore, secure of the watchful care which provides for his wellbeing at every instant that he is permitted to remain on earth.

CONCERNING THINGS WHICH CANNOT GO ON.

Of course, in the full meaning of the words, Ben Nevis is one of the Things that cannot Go On. And among these, too, we may reckon the Pyramids. Likewise the unchanging ocean : and all the everlasting hills, which cannot be removed, but stand fast for ever.

But it is not such things that I mean by the phrase : it is not such things that the phrase suggests to ordinary people. It is not things which are passing, indeed ; but passing so very slowly, and with so little sign as yet of their coming end, that to human sense they are standing still. I mean things which even we can discern have not the element of continuance in them : things which press it upon our attention as one of their most marked characteristics, that they have not the element of continuance in them. And you know there are such things. Things too good to last very long. Things too bad to be borne very long. Things which as you look at, you say to yourself, Ah, it is just a question of time ! We shall not have you long !

This, as it appears to me, my reader, is the essential quality which makes us class anything among the Things which cannot Go On : it is that the thing should not merely be passing away, or even passing away fast ; but that it shall bear on its very face, as the first thing that strikes us in looking at it, that it is so. There are passing things that have a sort of perennial look : things that will soon be gone, but that somehow do not press it upon us that they are going. If you had met Christopher North, in his days of affluent physical health, swinging along with his fishing-rod towards the Tweed, you might, if you had reflected, have thought that in truth all *that* could not go on. The day would come when that noble and loveable man would be very different : when he would creep along slowly, instead of tearing along with that springy pace : when he would no longer be able to thrash pugnacious gypsies, nor to outleap flying tailors : when he would not sit down at morning in his dusty study, and rush through the writing of an article

as he rushed through other things, impetuously, determinedly, and with marvellous speed, and hardly an intermission for rest : when mind and body, in brief, would be unstrung. But *that* was not what you thought of, in the sight of that prodigal strength and activity. At any rate, it was not the thought that came readiest. But when you see the deep colour on the cheek of a consumptive girl, and the too bright eye : when you see a man awfully overworking himself : when you see a human being wrought up to a frantic enthusiasm in some cause, good or bad : when you find a lady declaring that a recently acquired servant, or a new-found friend, is absolute perfection : when you see a church, crowded to discomfort, passages and all, by people who come to listen to its popular preacher : when you go to hear the popular preacher for yourself, and are interested and carried away by a sermon, evincing such elaborate preparation as no man, with the duty of a parish resting upon him, could possibly find time for in any single week,—and delivered with overwhelming vehemence of voice and gesture : when you hear of a parish in which a new-come clergyman has set a-going an amount of parochial machinery which it would need at least three and probably six clergymen to keep working : when you see a family, living a cat and dog life : when you see a poor fellow, crushed down by toil and anxiety, setting towards insanity : when you find a country gentleman, with fifteen hundred a year, spending five thousand : when you see a man submitting to an insufferable petty tyranny, and commanding himself by a great effort, repeated several times a day, so far as not just yet to let fly at the tyrant's head : when you hear of King Bomba gagging and murdering his subjects, amid the reprobation of civilized mankind : when you see the stoker of an American steamer sitting upon his safety-valve, and observe that the indicator shows a pressure of a hundred and fifty pounds on the square inch of his boiler : then, my friend, looking at such things as these, and beholding the end impending and the explosion

imminent, you would say that these are Things which cannot Go On.

And then, besides the fact that in the case of very many of the Things which cannot Go On, you can discern the cause at work that must soon bring them to an end; there is a further matter to be considered. Human beings are great believers in what may be called the doctrine of Average. That is a deep conviction, latent in the ordinary mind, and the result of all its experience, that anything very extreme cannot last. If you are sitting on a winter evening in a chamber of a country house which looks to the north-east: and if a tremendous batter of wind and sleet suddenly dashes against the windows with a noise loud enough to attract the attention of everybody; I am almost sure that the first thing that will be said, by somebody or other, in the first momentary lull in which it is possible to hear, will be, "Well, *that* cannot last long." We have in our minds, as regards all things moral and physical, some idea of what is the average state of matters: and whenever we find any very striking deviation from *that*, we feel assured that the deviation will be but temporary. When you are travelling by railway, even through a new and striking country, the first few miles enable you to judge what you may expect. The country may be very different indeed from that which you are accustomed to see, day by day: but still, a little observation of it enables you to strike an average, so to speak, of that country. And if you come suddenly to anything especially remarkable: to some enormously lofty viaduct, whence you look down upon the tops of tall trees and upon a foaming stream: or to some tunnel through a huge hill: or to some bridge of singular structure: or to some tract wonderfully wooded or wonderfully bare: you involuntarily judge that all this is something exceptional: that it cannot last long: that you will soon be through it, and back to the ordinary jog-trot way.

And now, my friend, let me recall to mind certain facts connected with the great order of Things which cannot Go On: and let us compare our experience with regard to these.

Have you a residence in the country, small or great? Have you ever had such a residence? If you have one, or ever have had one, I have no doubt at all but there is or was a little gravelled walk, which you were accustomed often to walk up and down. You walked there, thinking of things painful and things pleasant. And if nature and training made you the human being for a country life, you found that that little gravelled path could do you a great deal of good. When you went forth, somewhat worried by certain of the little cares which worry at the time but are so speedily forgotten, and walked up and down; you found that at each turn you took, the path, with its evergreens at either hand, and with here and there a little bay of green grass running into the thick masses of green boughs and leaves, gently pressed itself

upon your attention; a patient friend, content to wait your time. And in a little space, no matter whether in winter or in summer, the path with its belongings filled your mind with pleasant little thoughts and cares; and smoothed your forehead and quieted your nervous system. I am a great believer in grass and evergreens and gravelled walks. Was it not pleasant, when a bitter wind was blowing outside your little realm, to walk in the shelter of the yews and hollies, where the air felt so snug and calm: and now and then to look out beyond your gate, and catch the bitter East on your face, and then turn back again to the warm, sheltered walk! Beautiful in frost, beautiful in snow, beautiful in rain, beautiful in sunshine, are clumps of evergreens: the green grass: and cheerful and healthful to our whole moral nature is the gravelled walk that winds between!

But all this is by the way. It is not of gravelled walks in general that I am to speak: but of one special phenomenon concerning such walks; and bearing upon my proper subject. If you are walking up and down a path, let us say a hundred and fifty yards long, talking to a friend, or holding conversation with yourself; and if at each turn you take, you have to bend your head to pass under an overhanging bough: here is what will happen. To bend your head for once, will be no effort. You will do it instinctively, and never think about the matter. To stoop even six times, will not be much. But if you walk up and down for an hour, that constant evading of the overhanging bough will become intolerably irksome. For a little, it is nothing: but you cannot bear it if it is a thing that is to go on. Here is a fact in human nature. You can stand a very disagreeable and painful thing for once: or for a little while. But a very small annoyance, going on unceasingly, grows insufferable. No annoyance can possibly be slighter, than that a drop of cold water should fall upon your bare head. But you are aware that those ingenious persons, who have investigated the constitution of man with the design to discover the sensitive places where man can feel torture, have discovered what can be got out of that falling drop of water. Continue it for an hour; continue it for a day: and it turns to a refined agony. It is a thing which cannot go on long, without driving the sufferer mad. No one can say what the effect might be, of compelling a human being to spend a week, walking, through all his waking hours, in a path where he had to bend his head to escape a branch every minute or so. You, my reader, did not ascertain by experiment what would be the effect. However pretty the branch might be, beneath which you had to stoop, or round which you had to dodge, at every turn; that branch must go. And you cut away the blossoming apple-branch: you trained in another direction the spray of honeysuckle: you sawed off the green bough, beautiful with the soft beechen leaves. They had become things which you could not suffer to go on.

Have you ever been misled into living in your house, during any portion of the time in which it was being painted? If so, you remember how you had to walk up and down stairs on planks, very steep and slippery: how, at early morning, a sound pervaded the dwelling, caused by the rubbing your doors with stones, to the end of putting a smoother surface upon the doors: how your children had to abide in certain apartments under ground, to be beyond the reach of paint, and brushes, and walls still wet. The discomfort was extreme. You could not have made up your mind to go on through life, under the like conditions: but you bore it patiently, because it was not to go on. It was as when you shut your eyes, and squeeze through a thicket of brambles, encouraged by the hope of reaching the farther side. So when you are obliged to ask a man to dinner, with whom you have not an idea or sympathy in common. Suppressing the tendency to yawn, you force yourself to talk about things in which you have not the faintest interest: and you know better than to say a word upon the subjects for which you really care. You could not stand this: were it not that from time to time you furtively glance at the clock, and think that the time of deliverance is drawing near. And on the occasion of a washing-day, or a change of cook, you put up without a murmur with a dinner to which you could not daily subdue your heart. We can go on for a little space, carried by the impetus previously got, and by the hope of what lies before us. It is like the dead points in the working of a steam-engine. You probably know that many river steamboats have but a single engine: and that there are two points, each reached every few seconds, at which a single engine has no power at all. The paddle-wheels continue to turn, in virtue of the strong impetus already given them. Now, it is plain to every mind, that if the engine remained for any considerable period at the point where it is absolutely powerless, the machinery driven by the engine would stop. But in practice, the difficulty is very small: because it is but for a second or two that the engine remains in this state of paralysis. It does quite well for a little: but is a state that could not go on.

Any very extreme feeling, in a commonplace mind, is a thing not likely to go on long. Very extravagant likes and dislikes: very violent grief, such as people fancy must kill them: will, in most cases, endure not long. In short, anything that flies in the face of the laws which regulate the human mind: anything which is greatly opposed to Nature's love for the Average: cannot, in general, go on. I do not forget, that there are striking exceptions. There are people, who never quite get over some great grief or disappointment: there are people who form a fixed resolution, and hold by it all through life. I have seen more than one or two men and women, whose whole soul and energy were so devoted to some good work, that a stranger, witnessing their doings for a few days

and hearing their talk, would have said, "*That cannot last. It must soon burn itself out, zeal like that!*" But if you had made inquiry, you would have learned that all *that* had gone on unflagging, for ten, twenty, thirty years. There must have been sound and deep principle there at the first, to stand the wear of such a time: and you may well believe that the whole nature is now confirmed irretrievably in the old habit: you may well hope that the good Christian and philanthropist who has gone on for thirty years, will go on as long as he lives;—will go on for ever. But, as a general rule, I have no great faith in the stability of human character: and I have great faith in the law of Average. People will not go on very long, doing what is inconvenient for them to do. And I will back Time against most feelings and most resolutions in human hearts. It will beat them in the end. You are a clergyman, let us suppose. Your congregation are fond of your sermons. They have got into your way: and if so, they probably like to hear you preach, better than anybody else; unless it be the two or three very great men. A family, specially attached to you, moves from a house near the church, to another two or three miles away. They tell you, that nothing shall prevent their coming to their accustomed places every Sunday still: they would come, though the distance were twice as great. They are perfectly sincere. But your larger experience of such cases makes you well aware that time, and distance, and mud, and rain, and hot sunshine, will beat them. Coming to church over that inconvenient distance, is a thing that cannot go on. It is a thing that ought not to go on: and you make up your mind to the fact. You cannot vanquish the laws of Nature. You may make water run up hill, by laborious pumping. But you cannot go on pumping for ever: and whenever the water is left to its own nature, it will certainly run downhill. All such declarations as "I shall never forget you:" "I shall never cease to deplore your loss:" "I can never hold up my head again:" may be ethically true: but time will prove them logically false. The human being may be quite sincere in uttering them: but he will change his mind.

I do not mean to say that it is very pleasant to have to think thus: or that much good can come of dwelling too long upon the idea. It is a very chilling and sorrowful thing, to be reminded of all this in the hard, heartless way in which some old people like to drive the sad truth into the young. It is very fit and right that the girl of twenty, broken-hearted now because the young individual she is fond of is gone off to Australia, should believe that when he returns in five years he will find her unchanged; and should resent the remotest suggestion that by that time she will probably think and feel quite differently. It is fit and right that she should do all this, even though a prescient eye could discern that in two

years exactly she will be married to somebody else ; and married, too, not to some old hunk of great wealth whom her parents have badgered her into marrying against her will ; but (much worse for the man in Australia, who has meanwhile taken to drinking) married with all her heart to some fine young fellow, very suitable in age and all other respects. Yet, certain though the general principle may be, a wise and kind man or woman will not take much pleasure in imparting the sad lesson, taught by experience, to younger hearts. No good can come of doing so. Bide your time, my friend : and the laws of nature will prevail. Water will not long run up hill. But while the stream is quite happy and quite resolute in flowing up an incline of one in twenty, there is no good in standing by it, and in roaring out that in a little while it will get tired of *that*. Experience tells us several things, which are not quite to the credit of our race : and it is wrong to chill a hopeful and warm heart with these. We should be delighted to find that young heart falsifying them by its own history : let it do so if it can.

And it is chilling and irritating to be often reminded of the refrigerating power of Time upon all warm feelings and resolutions. I have known a young clergyman, appointed early in life to his first parish ; and entering upon his duty with tremendous zeal. I think a good man, however old, would rejoice at such a sight : would delightedly try to direct and counsel all that hearty energy, and to turn all that labour to the best account. And even if he thought within himself that possibly all this might not quite last, I don't think he would go and tell the young minister so. And the aged man would thankfully remember, that he has known instances in which all that *has* lasted ; and would hope that in this instance it might last again. But I have known a cynical, heartless, time-hardened old man (the uncle, in fact, of my friend Mr. Snarling), listen with a grin of mingled contempt and malignity to the narration of the young parson's doings ; and explain the whole phenomena by a general principle, inexpressibly galling and discouraging to the young parson. "Oh," says the cynical, heartless old individual, "new brooms sweep clean !" That was all. The whole thing was explained and settled. I should like to apply a new knout to the old individual, and see if it would cut smartly.

And then we are to remember, that though it be only a question of time with the existence of anything, *that* does not prove that the thing is of no value. A great part of all that we are enjoying, consists of Things which cannot Go On. And though the wear that there is in a thing be a great consideration in reckoning its worth ; and more especially, in the case of all Christian qualities, be the great test whether or not they are genuine ; yet things that are going, and going very fast, have their worth. And it is very fit that we should enjoy them while they last ; without unduly overclouding

our enjoyment of them by the recollection of their evanescence. "Why," said an eminent divine,— "why should we pet and pamper these bodies of ours, which are soon to be reduced to a state of mucilaginous fusion?" There was a plausibility about the question : and for about half a minute it tended to make you think, that it might be proper to leave off taking your daily bath, and brushing your nails and teeth : likewise that instead of patronizing your tailor any farther, it might be well to assume a horse-rug : and also that it might be unworthy to care for your dinner, and that for the future you should live on raw turnips. But of course, anything that revolts common sense, can never be a part of Christian doctrine or duty. And the natural reply to the rhetorical question I have quoted would of course be, that after these mortal frames are so fused, we shall wholly cease to care for them : but that meanwhile we shall suitably tend, feed, and clothe them, because it is comfortable to do so ; because it is God's manifest intention that we should do so : because great moral and spiritual advantage comes of our doing so : and because you have no more right to disparage and neglect your wonderful mortal frame, than any other talent or gift confided to you by God. Why should we neglect, or pretend to neglect, these bodies of ours, with which we are commanded to glorify God : which are bought with Christ's blood : which, even through the last lowliness of mortal dissolution, even when turned to dust again, are "still united to Christ : " and which are to rise again in glory and beauty, and be the redeemed soul's companion through eternity ? And it is a mere sophism to put the shortness of a thing's continuance, as a reason why it should not be cared for while it lasts. Of course, if it last but a short time, all the shorter will be the time through which we shall care for it. But let us make the best of things while they last : both as regards our care for them and our enjoyment of them.

That a thing will soon be done with : that the cloud will soon blow by : is a good reason for bearing patiently what is painful. But it is very needless to thrust in this consideration, to the end of spoiling the enjoyment of what is pleasant. I have seen people, when a little child, in a flutter of delighted anticipation, was going away to some little merrymaking, anxious to put down its unseemly happiness by severely impressing the fact, that in a very few hours all the pleasure would be over, and lessons would begin again. And I have seen, with considerable wrath, a cloud descend upon the little face at the unwelcome suggestion. What earthly good is to come of this piece of stupid, well-meant malignity ? It originates, doubtless, in that great fundamental belief in many narrow minds, that the more uncomfortable you are the likelier you are to be right ; and that God is angry when he sees people happy. Unquestionably, most of the little enjoyments of life are very transient. All pleasant social gatherings : all visits to cheerful

country houses : all holidays : are things which cannot go on. No doubt, that is true : but that is no reason why we should sulkily refuse to enjoy them while they last. There is no good end secured, by persisting in seeing " towers decayed as soon as built." It is right, always latently, and sometimes expressly, to remember that they must decay : but meanwhile, let us be thankful for their shelter and their beauty. Sit down, happily, on a July day, beneath the green shade of your beeches : do not needlessly strain what little imagination you have, to picture those branches leafless, and the winter wind and clouds racking overhead. Enjoy your parcel of new books when it comes, coming not often : cut the leaves peacefully, and welcome in each volume a new companion : then carefully decide the fit place on your shelves where to dispose the pleasant accession to your store : and do not worry yourself by the reflection that when you die, the little library you collected may perhaps be scattered ; and the old, friendly-looking volumes fall into no one knows whose hands : perhaps be set forth on out-door bookstalls ; or be exhibited on the top of a wall, with a sack put over them when it begins to rain, as in a place which I have seen. " What is the use of washing my hands," said a little boy in my hearing : " they will very soon be dirty again ! " Refuse, my reader, to accept the principle implied in the little boy's words : however specious it may seem. Whitewash your manse, if you be a Scotch minister, some time in April : paint your house in town, however speedily it may again grow black. Write your sermons diligently : write them on the very best paper you can get, and in a very distinct and careful hand : and pack them with attention in a due receptacle. It is, no doubt, only a question of time how long they will be needed, before the day of your departure shall make them no more than waste paper. Yet, though things which cannot go on, you may hope to get no small use out of them, to others and to yourself, before the time when the hand that travelled over the pages shall be cold with the last chill ; and the voice that spoke these words shall be hushed for ever. We know, obscurely, what we shall come to : and by God's grace we are content, and we hope to be prepared : but there is no need to overcast all life with the ceaseless anticipation of death. You may have read how John Hampden's grave was opened, at the earnest desire of an extremely fat nobleman who was his injudicious admirer. The poor wreck of humanity was there : and as the sexton said, " We propped him up with a shovel at his back, and I cut off a lock of his hair." I ho! with Abraham, who " buried his dead from his sight ; " I hold with Shakspeare, who desired that no one should disturb him in his lowly bed, till He shall awaken him whose right it is to do so. Yet I read no lesson of the vanity of Hampden's life, in that last sad picture of helplessness and humiliation. He had come to *that* : yet all this does

not show that his life was not a noble one while it lasted, though now it was done. He had his day : and he used it : whether well or ill let wiser men judge. And if it be right to say that he withstood tyranny, and helped to lay the foundation of his country's liberties, the whim of Lord Nugent and the propping up with the shovel can take nothing away from that.

You understand me, my friend. You know the kind of people who revenge themselves upon human beings who meanwhile seem happy, by suggesting the idea that it cannot last. You see Mr. A., delighted with his beautiful new church : you know how Miss B. thinks the man to whom she is to be married next week, the handsomest, wisest, and best of mankind : you behold the elation of Mr C. about that new pair of horses he has got : and if you be a malicious blockhead, you may greatly console yourself in the spectacle of the happiness of those individuals, by reflecting, and perhaps by saying, that it is all one of those things that cannot go on. Mr. A. will in a few months find no end of worry about that fine building : Miss B.'s husband, at present transfigured to her view, will settle into the very ordinary being he is : and Mr. C.'s horses will prove occasionally lame, and one of them a permanent roarer. Yet I think a wise man may say, I am aware I cannot go on very long ; yet I shall do my best in my little time. I look at the right hand which holds my pen. The pen will last but for a short space ; yet that is no reason why I should slight it now. The hand may go on longer. Yet, warm as it is now, and faithfully obeying my will as it has done through all those years, the day is coming when it must cease from its long labours. And, for myself, I am well content that it should be so. Let us not strive against the silent current, that bears us all away and away. Let us not quarrel with the reminders we meet on many country gravestones, addressed unto us who are living from the fathers who have gone before. Yet you will think of Charles Lamb. He said (but nobody can say when Elia meant what he said), " I conceive disgust at those impertinent and unbecoming familiarities, inscribed upon your ordinary tombstones. Every dead man must take upon himself to be lecturing me with his odious truism, that ' Such as he now is I must shortly be.' Not so shortly, friend, perhaps as thou imaginest. In the meantime I am alive. I move about. I am worth twenty of thee. Know thy betters ! "

You may look on somewhat farther, in a sweet country burying-place. Dear old church-yard, once so familiar : with the old oaks and the gliding river, and the purple hill looking over : where the true heart of Jeanie Deans has mouldered into dust : I wonder what you are looking like to-day ! Many a time have I sat, in the quiet summer day, on a flat stone : and looked at the green graves : and thought that they were Things that could not Go

On! *There* were the graves of my predecessors : the day would come when old people in the parish would talk, not unkindly, of the days, long ago, when some one was minister whose name is neither here nor there. But it was a much stranger thing to think, in that silent and solitary place, of the great stir and bustle there shall be in it some day! Here it has been for centuries : the green mossy stones and the little grassy undulations. But we know, from the best of all authority, that "the hour is coming" which shall make a total change. This quiet, this decay, this forgetfulness, are not to Go On!

We look round, my reader, on all our possessions, and all our friends : and we discern that there are the elements of change in all. "I am content to stand still," says Elia, "at the age to which I am arrived : I, and my friends : to be no younger, no richer, no handsomer : I do not want to be weaned by age ; or drop, like mellow fruit, into the grave." There are indeed moods of mind, in which all thoughtful men have possibly yielded to a like feeling : but I never heard but of one other man whose deliberate wish was just to go on in this round of life for ever. Yet, though content to be in the wise and kind hands in which we are, we feel it strange to find how all things are going. Your little children, my friend, are growing older : growing out of their pleasant and happy childhood : the old people round you are wrinkling up, and breaking down. And in your constitution, in your way of life, there are things which cannot go on. There is some little physical malady, always rather increasing : and you cannot always be enlarging the doses of the medicine that is to correct it, or the opiates which make you sleep. I confess, with sorrow, that when I see an extraordinarily tidy garden, or a man dressed with special trimness, I cannot help looking forward to a day when all that is to cease : when the man will be somewhat slovenly ; when the garden will be somewhat weedy. I think especially of the garden : and the garden which comes most home to me is the manse garden. It was a marvel of exquisite neatness and order : but a new minister comes, who does not care for gardening : and all that goes. And though rejoicing greatly to see a parish diligently worked, yet sometimes I behold the parochial machinery driven with such a pressure of steam, that I cannot but think it never will last. I have known men who never could calmly think : who lived in a hurry and a fever. There are places where it costs a constant effort, not always a successful effort, to avoid coming to such a life : but let us strive against it. Let us not have constant push, and excitement, and high pressure. I hate to feel a whirl around me, as of a huge cotton mill. Let us "study to be quiet!" And I have observed that clergymen who set that feverish machinery a-going,

generally find it expedient to get away from it as speedily as may be, so as to avoid the discredit of its breaking down in their hands : being well aware that it is a thing which cannot go on. We cannot always go on at a tearing gallop, with every nerve tense. Probably we are doing so, a great deal too much. If so, let us definitively moderate our pace, before the pace kills us.

"It's a long lane that has no turning," says the proverb, testifying to the depth of human belief in the Average : testifying to our latent conviction that anything very marked is not likely to go on. A great many people, very anxious and unhappy and disappointed, cherish some confused hope that surely all this has lasted so long, things must be going to mend. The night has been so long, that morning must be near : even though there be not the least appearance of the dawn as yet. If you have been a briefless barrister, or an unemployed physician, or an unbenevolent clergyman, for a pretty long time ; even though there be no apparent reason now, more than years since, why success should come, you are ready to think that surely it must be coming now, at last. It seems to be overdue, by the theory of Average. Yet it is by no means certain that there is a good time coming, because the bad time has lasted long. Still, it is sometimes so. I have known a man, very laborious, very unfortunate, with whom everything failed : and after some years of this, I have seen a sudden turn of fortune come. And with exactly the same merit and the same industry as before, I have beheld him succeed in all he attempted, and gain no small eminence and reputation. "It behoved him to dree his weird," as was said by Meg Merrilies : and then the good time came. If you are happy, my reader, I wish your happiness may last. And if you are meanwhile somewhat down and depressed, let us hope that all this may prove one of the Things which cannot Go On!

"Shall I go on?" said Sterne, telling a touching story, familiar to most of us : and he answered his question by adding "No." "It is good," said an eminent author, "to make an end of a thing which might go on for ever." And on the whole, probably this Essay had better stop. And at this genial season, of kind wishes and old remembrances, we may fitly enough consider that these New Year's days cannot very often return to any. All this habitude of being cannot very long go on. Yet, in our little span here, we may gain possessions which never will fail. It is not a question of Time, with that which grows for Eternity! God grant each of us, always more assuredly, that Better Part, which can Go On for ever!

ST. ELMO.

THE fresh and fragrant morning was abroad ;
 Over the lonely land the light of God
 Flung out a flood of full, rejoicing life,
 As to St. Elmo passed Cellano's wife,
 There is no morning where the captive dwells,
 O dark St. Elmo ! in thy dungeon cells,
 Where now the soldier-jailer leads the way,
 Down into darkness from the light of day.
 The bolts are drawn—there rushes forth an air
 As if the pest had been imprisoned there ;
 She trembles ; not the faltering of fear
 But of a long-sought joy at length brought near,
 There sits the prisoner !

But hope is dead
 Within him, and he hardly lifts his head,
 Until the words, "O husband !" met his ear,
 When—with a cry 'twas terrible to hear,
 Such years of anguish in its accents wailed—
 He sprang his chain's length, yet to reach her failed,
 Then with his hands, as if by shame assailed,
 His face he covered.

When he raised his head
 They were alone ; the bolts again had sped.

He was the first to speak : his cheek was dry
 While she wept wildly. "Darling, I can die,
 But cannot weep," he said ; "Why blind with
 tears
 Eyes that have wasted all those weary years
 With longing for these looks ?"

And now a light
 Bursts on the dungeon's long-enduring night ;
 A stone withdrawn lets in a flight of rays
 From a high grating ; now indeed they gaze
 Upon each other's faces, till again
 Silence is broken with a sob of pain.
 "O martyred husband ! See thy wasted hands,
 Almost escape the iron's cruel bands !
 How art thou changed ! Thy noble head grown
 grey ;
 Thy manhood wasted in this foul decay ;
 Am I too changed ? I should be changed too !
 I've grudged myself the light not shared by you ;
 Never breathed freely of the bounteous air
 Shut out from thy close prison ; tasted not
 The sweetness of aught sweet ; of all things fair
 Forgot the fairness in this one dark spot."

"Enough ! enough, beloved ! Each word now
 Must answer for a thousand. Tell me how
 Of Italy ? Our Friends ? Our Children ? Home ?
 And by what way of wonder thou hast come ?"

She answered, "Hush ! I shall not haste to go—
 The land hath peace, a prisoner's peace ! Yet glow
 The patriot fires, 'neath raked-up ashes deep,
 And our Volcano's treacherous silence keep,
 E'er he begins to mutter in his sleep,
 And not a vine-leaf trembles at his feet."

"Friends ! All thy noble friends who used to meet
 At our fair villa ;—in its fragrant groves
 To pace beneath the stars and tell their loves,
 All one, all Italy's—they share thy fate
 Or envy it in exile.

At the gate,
 I left our daughters, in thy father's arms,—
 Such as I was when first my childish charms
 Drew thy great heart toward me. And thy son,
 Thy loved Aurelio ! our little one,
 Cradled the year they took thee—he has been
 Three days in Heaven, or else I had not seen
 Thy face, beloved ! On my lap he lay
 One golden evening, dying with the day ;
 And at the hour when he was wont to say
 His evening prayer, he clasped his hands to pray :
 Deliverance from prison and from death
 That prayer besought for thee ! But his sweet
 breath

Failed at thy name. He smiled, and dying so,
 I kissed his darling lips and bade him go
 With that petition to Christ's thronèd feet.
 And well I know he reached the heavenly seat,
 For until then, in vain, to see thy face,
 I prayed to enter even this dreadful place."

"Deliverance," he groaned ; "Ay, it shall be
 When Death, the great Deliverer, sets me free :
 But yet when thou art gone and darkness falls,
 Since thou hast stood between me and these walls,
 Still on the blank thy features I shall trace,
 And their sweet light shall lighten all the place."

"To share thy prison was the price I paid
 To see thee for a moment." Then she said,
 "They knew not who demanded it that they
 Increased the boon by all they made me pay.
 Why groan, Filippo ?"

"Oh ! my noble wife,
 What torture ! When you shared my happy life
 Joy was twice joy when thine and mine made two,
 And twice must pierce the pang that falls on you.
 Our children call thee !"

"Stay, in pity cease ;
 The bond is made, and there is no release.
 And though each door should proffer me a way
 Back to all bliss, I would not choose but stay.
 And here what holy vigils we shall hold,
 What treasures hidden in our hearts unfold,
 No tyrant's hand can touch "

A dream of bliss
 Dawned, and they both were silent. Who is that
 That enters ? From each other's arms they start
 To hear the mocking mandate. They must part,
 Part, prisoners both, but not together ; doomed
 To drag despairing years apart entombed,
 Each suffering double anguish.

Let tyrants tremble ! Every mourning groan
 From these dark dungeons shook a tottering throne ;
 The HERO with his daring hundreds came,
 And at the shout of Garibaldi's name,
 Fell the dark walls of many a living tomb,
 And morning burst upon its midnight gloom.
 'Mong those who hailed that resurrection birth,
 And rose to freedom on Italian earth
 From dark St. Elmo into light and life,
 There passed Cellano and his noble wife.

ST. ELMO.

MEDITATIONS IN ADVENT.

BY THE DEAN OF CANTERBURY.

I.

It seems very difficult to conceive that the usual course of this world should ever be broken in upon by such an event as the coming of our Lord. It forms one of the most startling contrasts possible, to place side by side the common every-day thoughts of all of us about things around us, and the reality of the appearance of our Lord Jesus Christ in the midst of us. Of what is this a sign? On the one hand, do not let us press it further than is fair. I suppose something of the kind is the case with us about all very solemn things. We all know we must die; but a sentence of death, or the discovery of that fatal necessity imminent on us, would be to any of us a rude shock to our ordinary habits and thoughts. We all believe the holy articles of our faith; but there are times in the lives of us all, times of which we have no reason to be ashamed, when the mention of these solemn points of our belief would come in strangely and incongruously. So that I think we must not hold the fact with which we set out to be in itself a sign of irreligion. It is rather, perhaps, a necessity of our nature. God has so made us that we are necessarily taken hold of and possessed by the things about us. The things that are not seen are of infinitely more importance; but it is the things that are seen which are present and nearest us. We must make an effort to look at the one; the other we cannot help seeing. And so it is, that while God has constituted us beneficently in this respect, so that this tendency of our nature is good for us in the main,—good for our preservation in life, good for our enjoyment of life, good for our success in life—yet, like all our other natural tendencies and habits, it needs correcting, needs elevating, needs to be interfered with for the purposes of our best and highest life. For we are not, while in this present state, to be the slaves of outward things; and by far the greater part of our existence will be passed in another state than this, even an eternal one.

Thoughts like these, naturally arising out of the great subject of Advent, seem to lead us to shape our meditations thus:—The *difficulty* of realizing our Lord's coming, as necessarily belonging to our ordinary life in this world; and the *necessity* of realizing the Lord's coming, as belonging to the better part of our life here, and to our higher life hereafter. May God guide and bless us while we think on these two things.

"Yet a little while, and He that shall come will come." This is our belief. But *when?* and *how?* How many centuries have sped by since these words were written! How many more may drag on before they are fulfilled! Where in our own days, where in days future, can we assign a time

when we can realize the fact of His coming? Shall it be while earth is at peace, amidst the steady labours of the arts, and while man's thoughts are even and undistracted? Shall the merchant on the exchange, the student at his desk, the traveller on his journey, the mother in her family duties, the children in their school or at their play, be startled with the cry of His approach? So seem some places in Holy Scripture to teach us; and yet how difficult to imagine it! What do any of us expect less, than such a surprise to such employments? What seems more unlike God's ways of dealing with man during all these centuries, than that such a sudden crash should break in upon this settled order of things, which He has so far established, that it is our duty to Him to see it maintained, and to keep its place among ourselves? Well, but let us then take the other alternative. Shall that day come upon us amidst fierce wars and distresses, when men's passions are let loose, and their thoughts have lost balance? Shall the ears of the wild combatants in the battlefield be pierced by the shout of the archangel rising over the din of their conflict? Shall the lurid glare of burning homes usher in the conflagration of the heaven and the earth? Shall anguish and mourning be already upon mankind before that sign shall appear in heaven at which all the tribes of the earth shall mourn? This again seems not inconsistent with the testimony of Scripture in other places. But in that case, how difficult to imagine God's faithful people waiting and praying; how must their thoughts be distracted, and their Saviour put out of their sight by the dire necessities of the time! If the Christian prays against sudden death, if he dreads the passing from perhaps a light jest, or a trifling thought, or a festal moment, to the presence of his God, who would expect that the Church shall then, so to speak, be taken at a disadvantage, when fierce passions are raging even in bosoms whose law is forgiveness, and the ordinary means of grace are suspended? Again, if we put the alternative as to different times of our ordinary life, we shall find it equally difficult to give reality to our expectations of the Lord's coming. Hear what the poet sings of it:—

"At midnight, when mankind is rapt in peace,

And worldly fancy feeds on golden dreams:

To give more dread to man's most dreadful hour,

At midnight, 'tis presumed, this pomp will burst

From tenfold darkness: sudden as the spark

From smitten steel: from nitrous grain the blaze.

Man, starting from his couch, shall sleep no more!

The day is broke, which never more shall close!"

Now as to this,—we know that "that day will come as a thief in the night;" and to some it must, like

the thief, come in the night itself. But it is impossible to apply this to all mankind, seeing that night and day share our globe alike, and such a consideration entirely prevents any general application of such a description, or of any description of men's occupations, except on the largest scale, when it shall overtake them. They shall be "eating and drinking, marrying and giving in marriage, buying and selling, planting and building;" these shall be their general employments over the whole earth: on such things shall their thoughts be; but to give any detailed description of the circumstance as applicable to all men is, from the above reason, impossible. Then again, as to the *place* where the Lord shall come, how difficult it is to form any idea in our minds which may at all accord with the facts and laws of nature to which we find ourselves subjected! He shall come and be seen by all; by all at the same moment; so that the very conditions of our senses will be changed, the very foundations of the earth broken up, all present hindrances removed. All the channels of thought and perception must be different, before such a thing can be. And here we seem to have arrived at the true reason of the difficulty which we find in conceiving this matter,—that it does not belong to our present state or perceptions; we shall be changed before we are conscious of it; in that change, all incongruity will pass away; after it, all surprise will have vanished in its surpassing greatness. Our eyes will see the Lord, but not these eyes, whose vision is limited by so brief a space; not these, which find obstacles in matter intervening; not these, which weep earthly tears, and glance aside at earthly vanities. Our ears will hear the voice before which heaven and earth shall flee away; but not these earthly organs, ever hearing amiss, unable to distinguish the good from the vain. Our hearts shall beat high at the joy of our Lord's approach; yet not these feeble ones, the strongest of which would be arrested in its vital course by terror at the very adjuncts of his coming; but other and more blessed ones, even new hearts, able to welcome all his glory, and to respond to all his love. We shall be changed—through the grave or without the grave—all changed, so that earth will be different to us, time will be different, other men will be different, ourselves will be different; for He that sitteth on the Throne will have made all things new.

The difficulty, then, in conceiving the coming of the Lord is incident to our present state, belongs to the imperfection of our present faculties, and to their necessary connexion with the things of sense and of this world. We shall never lose it. As long as we are in this state, it will be a strange thing to us that the Lord should come and put an end to this state, and break up all the habits and associations of the world which lies about us.

Now this difficulty affects the unbeliever in one way, and the Christian in another. It con-

firms the unbeliever in his unbelief. "Where is the promise of his coming? for all things remain as they were from the beginning of the creation." This is the language of the unbeliever; in the days of St. Peter, and in our days. The stability of Nature and her laws, the difficulty of conceiving the Lord's coming in upon and interrupting the present order of things, is to them a reason for disbelieving altogether that He will come: for setting at nought the hopes of the Christian Church, and expecting that this world is to last for ever as it is.

On the Christian believer, the effect is very different. He, if he be wise, does not pretend in this matter to be differently situated from other men. Their difficulties are his difficulties. He can no more realize the dread and sudden event, than they can. Where it is to be, how it is to be, these are mysteries to him as to others. But what is his conclusion from these difficulties and mysteries? Is it this, that he should relax his hold on belief in the great fact itself; that he should let go his faith in him who hath promised, and cease to look and wait for the coming of the Lord? Nay, if I know anything of the ordinary course of the working of the Christian's thoughts, it is the direct reverse of this. The certainty of the event itself is beyond doubt. All Scripture is pledged to it; our Lord's own most sacred word is pledged to it again and again. If the assurance, "He that shall come will come," had never been written, it would yet have been virtually written over and over again, that He will come, and will not tarry. Here there can be no giving way. This at least is an article of his faith: and without believing this, he could not be the Christian which he is. What then is his inference from this difficulty on which we have been treating? from the fact, that is, that this solemn coming of his Lord is a matter not belonging to the state of time, not easily occurring to, nor grasped by, our present senses and faculties? What can it be but this,—that it needs so much the more to be thought upon, to be made matter of earnest meditation, to be surveyed in all its great bearings on his thoughts and desires, on his affections and determinations? Seeing these things are so, "What manner of men," as St. Peter asks, "ought we to be?" Seeing it is certain that this present state of things will come to a sudden end by the Advent of our Lord, how ought we to think of men and things around us; how to make our plans; how truly to enjoy life; how to deny ourselves; how to feel God's presence about and over us; how to war against sin and evil; how to perform the various duties of our stations for which we shall on that day be called to account? For this is another result of that of which we have been speaking: that our preparation for that day must rather consist in the things that are, than in those which are to be. Its events are great, and beyond our comprehension: strange, and removed out of our experience. If we were always to be

dwelling on them, ever speculating on them, we should be forsaking our line of practical good, and unfitting ourselves for God's work which lies in every man's path of life. Nay, the attempt would be vain; vain, as we saw, for any worthy comprehension which it would give us of that day; vain, for any imagined success in throwing off the realities of this state in which we are. For the *present*, which lies about a man, wraps him like a garment, and gives the form and semblance to all his thoughts and deeds; the age in which a man lives is the very flesh and blood of his personal being, and he can no more divest himself of it and be separate from it, than he can divest himself of those and be separate from them.

In our daily work then it is that we must prepare for Christ's coming: in the occupations of this day, for the account of that day: by living more purely, more truthfully, more charitably: living more in prayer, more in consciousness of God's presence, more in the cleansing power of the Lord's blessed Atonement, and by the guidance of his indwelling Spirit.

One thought may perhaps have been in some minds, as they have been reading these lines, and it is this, Will not the Lord's coming, to most of us, in all probability be the day of our own death? And would it not be more profitable to be preparing us for that, than to speak to us of an event which may be far distant, and probably will not come on the earth in our time at all? To this question there are two answers,—answers which ought to be ever impressed on a Christian's mind. First, the view of things proposed by the inquirer is not that taken in Holy Scripture, which is the rule and pattern of our teaching. There we do not hear anything of preparation for *death*. I doubt whether one text can be found in which we are exhorted to make such preparation, *as such*. But the constant note, the continually recurring exhortation is, to be prepared for the Lord's coming. So that if we would teach as God's Word teaches, as our blessed Lord and his Apostles taught, we cannot do as the inquirer would have us. Our second answer goes to the reason of the thing, and in fact gives the account and lays open the foundation of the former. He who is prepared for the Lord's coming is necessarily also prepared for his own death. The greater includes the less. He who so lives, so thinks, so speaks, so works, in his daily life, as to be ready for the sign of the Son of man in heaven, and the voice of the archangel and the trump of God, will not be found unready when the summons is heard in a softer tone, and comes with more previous warning. If he can meet the Lord amidst the flaming heavens and the gathering dead, he will not be loath to obey his call when its dread reality is tempered with all gentle and kindly alleviation—with the gradual approaches of sickness and infirmity, and the tender solaces of loving friends and watchful attendants. But, on the other hand,

he who has forgotten his Lord's coming, and has simply been careful about readiness for his own dismissal, will ever be too liable in the lesser thing to have neglected care for the greater; and he will also be well-nigh certain to have lowered his standard of attainment, and narrowed his sympathies, unworthily; in taking thought for himself, to have forgotten the great Body of which he is a member; in minding his own safety, to have forgotten the glory of his Lord—nay, his very Lord himself.

For—and with this thought we will draw to a close—there is nothing that so much takes a man out of himself; nothing that so much raises and widens his thoughts and sympathies; nothing that so much purifies and elevates his hopes, as this preparation for the coming of the Lord.

One word more. And it is on words occurring in a text already more than once referred to, "Yet a little while." I said it was not good to speculate, not good to give scope to the roving fancy, as to the great event, its manner, or its time. Still these words, "Yet a little while," should be impressed on every mind. Could we look at the future as we do on the past,—could we estimate the interval of time between the Lord's first and second coming, as we shall do when we look back on it from the eternal state,—how short it would seem! And how short it really is to Him who inhabiteth eternity! "Yet a little while,"—long perhaps to us, distracted with our petty interests, harassed with our unresting cares, biassed by our cherished prejudices; but in itself, and in our real lifetime, short indeed. And if but a little while, how much the more important! How full should it be of life's work, life's seed-time, life's decision!

Oh let us live it for God and for good; let us live it for the day which shall end it; let us live it as we shall wish we had done when we see the Son of man on his Throne, come to judge the world!

II.

Another train of thought which suggests itself to us in the season of Advent is this:—It is the plain and general testimony of Holy Scripture that at the last awful day every one of us shall be judged for, and called upon to give an account of, the deeds, words, and thoughts of this present state of time: "We must all be made manifest before the judgment-seat of Christ: that every one may receive the things done in his body, whether (it be) good or bad" (2 Cor. v. 10). And even so spoke the Preacher in the Old Testament: "God shall bring every work into judgment, with every secret thing, whether it be good or whether it be evil" (Eccles. xii. 14). And like the persuasion of that day itself being certain to come, so likewise is this belief accepted by every Christian.

Let us examine this in dependence on God's help. Let us see what difficulties lie about the

true understanding of this, as we then did with the other, and endeavour to deduce here also the true estimate and idea which we ought to form of that great final account, and the right and best way of preparing for it.

Now, if we minutely inquire what it is that we really believe, when we say that we shall give account before God of all the deeds, words, and thoughts of this state, we shall find that it is one of the most astonishing things imaginable. One may be very familiar with the words; and that which they express to us may have become a well-known and accustomed thing; but depend on it, there never was anything more difficult to imagine, or to give any conceivable account of. All the deeds, words, and thoughts, of our life on earth, why, where are they? Where are those of any assignable portion of that life? If the Judge is to carry conviction to the hearts of those who shall then be judged, they surely must be in possession at the time of the full consciousness of each act as having been performed by them, of each word as having been spoken, of each thought as having passed through their minds. Take but one example. Suppose the great Judge to arraign me in the matter of one day of my childhood, and I were charged thus: That at such a time in it, I disobeyed my parents; at such another time I showed envy, or malice, or selfishness, towards my fellows; at such another time I had high thoughts of myself, or rebellious thoughts against God; and suppose all this were to be to me only as a tale that is told, only as something said about another person, and not about myself, I might not, indeed I could not, doubt the assurance, nor deny the arraignment of an infallible Judge; but where, I ask, would be the conviction in my own breast that the Judge of all the earth had done right? Unless I could see and feel at that dread moment all the sinfulness of my then acts; in other words, unless I could put myself into the very circumstances which then surrounded me, how could I give account of, how could I render in myself a true verdict concerning those long past offences? I say, the very circumstances which then surrounded me. For the guilt of my disobedience on that alleged occasion would not appear in its true light, unless I saw and knew how that dear parent was striving to win me by kindness, how prayers were rising for me, and tears were shed over me, by one whose tender heart I was of set purpose wounding; my envy, and malice, and selfishness, would not be to me what it really was unless I could see those companions of my childhood again, and recall their fresh young faces, and the tone of voices long, long forgotten; and the exceeding sinfulness of my rebel risings against my God would not come up before me, unless I could again have in me that rich and full tide of exuberant blessedness with which the God of love endows our happy childhood, and which none of us has known since he was a child. And I have taken but one instance—one day or hour long passed away. Think,

then, how infinitely this difficulty must be multiplied, when it is not a day nor an hour, nor one frame of mind, nor one set of sins, but every hour of all days of this whole life.

And then, again, take the difficulty in this other light. What do we really know about those deeds, words, thoughts, that we can remember and recall? What, I mean, do we know of them in all their bearings, with all their extenuations, all their aggravations, all their consequences for good or for ill? At such a time, we spoke an unkind word, we depreciated a good act, we were wanting in reverence for holy things. And our word or our act was like a stone thrown on the pool, and a circle of unhappy influences spread out from it, and then another and then another, even till those were the worse for it who perhaps never heard of it or of us, until time and oblivion smoothed the ripples and effaced the remembrance. But all this who can recall? Who, indeed, even knows? And yet of all this, of every item of it, shall we have to give an account. As I sit and meditate on this, I find it one of the most difficult things possible to shape in any way before my imagination. Yet shape it somehow I must, if I would meditate on it profitably.

I see, then, by what we have already taken into account, that two necessities seem to have presented themselves, in order for that day's account to be a just and a complete account. To these we shall have, I believe, by and by, to add a third. But first let us look these fairly in the face, and thus approach that third; and when we have done this, let us inquire whether there is, as far as we can see, any reasonable prospect of these necessary things being done for us, in order to that day's account.

Well, then, our first necessity, in order that we may recognise at all the deeds, words, and thoughts then laid to our charge, is this, that we be at that day cognizant of them as our own. And let there be no mistake as to what this amounts to. It amounts to nothing less than the complete restoration to us of the remembrance of the whole of our lives day by day and hour by hour. Nothing short of this will answer the purpose. What I just now said of one day's sins and one day's events, must be done with regard to every day's sins and every day's events. All our past life must be spread out before us, delineated with far more accuracy than the most perfect map delineates to the traveller the country he has passed through. The delineation must be (for we need not shrink from applying the wonders of science and art to illustrate such a matter) less like a map drawn by common hands, than like a photograph of the way passed over—in which inspection may detect even the minutest plant by the wayside, and the microscope may even find the nest lodged in the cleft of the rock. It must be as complete as this; for if the minutest portion of that which compounded an action, that which prompted a word, that which constituted a thought, be beyond our reach on that day, so far the Great

Judge will not be in our minds and consciences justified when He shall speak, and clear when He shall judge. And we may well say, What a marvellous condition of our future judgment this is! How improbable, most would think; nay, some might even pronounce it impossible. That we should ever stand and look back over life, as a man would look on the wonderful sun-picture just now described; that we should be able to make each day and hour give up its acts and thoughts, which now seem to us as much perished and scattered as the elements of a decayed body which have passed into other bodies,—is not this a wonder passing wonder? Yet I seem to see that, if I have to give up a satisfactory final account of all my thoughts, words, and acts, I must be furnished with this and nothing short of this. But I must have more, very much more, as our former thoughts led us to see. I must have not only the restored memory of all I ever have known, but I must have the knowledge imparted to me of very much that I never have known at all. I shall want not only the forgotten dream restored, but also the interpretation of the dream furnished. Remember what was said about the unknown and untraced consequences of that which we think and do and say. Of all these undoubtedly is our responsibility made up, and by them will our account be swelled. And unless all this is present to me, as well as to my Great Judge, in that day, how is the full justice of my sentence to be comprehended by me? or, to put the blessed alternative suggested by the bright hopes of every Christian, how is the full measure of that wondrous grace of the Son of God to be seen by me, how that mighty mercy glorified which has buried my sins in its depths, and magnified itself in my utter unworthiness? So that this is our second necessity, in order for that final account to be what we believe it will be; not only must all memory be restored, but knowledge must be given far surpassing that which the keenest-sighted of men in this state ever attained to; knowledge of facts to which we never had access, of men's thoughts and words and deeds, and the complications of their private resolves, and their social intercourse, and actings upon themselves and upon one another. And if we ask, To what does this point? what is the least requirement that will satisfy this condition? I answer, and any thinking man might answer, Nothing less than the complete restoration of all that has been done in the state of time; the restoration not merely of each individual man's memory as to all that happened to himself, but of the universal memory of mankind as to all that ever happened to this world. Here, the history of the world is written by men in books; but what is written, even when we have set aside human fallibility, and the amount of the writer's own individual bias and misrepresentation, is but a very small portion of that which has really been done—only the barest outline, so to speak, with a figure here and there, of a picture

which should have been absolutely filled in with life, and crowded with action. There, God will have written the history of his own world; written it without a defect or omission, without a flaw or misrepresentation; and written it for all to read. If this be not so, how can those grander responsibilities ever be understood, which we all solemnly believe to exist? How shall the great moral account of nations and of churches ever be given in the sight and hearing of the universe, unless the bearings of human policy and the consequences of human delinquencies, on a larger scale than any individual account could take in, be open for all to see?

There seem, then, to be two requisites for the reality and the justice of our great final account: the full restoration of memory, and the opening of the book of knowledge, so that there has been nothing hid that shall not be known.

But now comes up before us the third condition, which I just now anticipated. Suppose both those others to be fulfilled, all memory restored, all knowledge of fact laid open, yet more even than these would be wanted. If I had them both, and yet were no fairer judge in my own case than I am now, I could not recognise in myself the justice of the Judge, nor could I glorify him, as I humbly believe I shall do, for his mercy. We have, in this present state, no clear views of justice at all. The rights and wrongs of men are measured by a standard altogether inadequate to their apportionment. And if this is so in the case of other men abstractedly, much more is it so of ourselves, much more is it so of other men, when they come into contact with ourselves. Probably no man yet ever passed a right judgment on an act of his own. Give way to ordinary vanity, and we are disposed to defend all our acts, and make them seem better; check ordinary vanity, and in the very pride of conscious self-abasement, we lash ourselves too severely, and vilify the past that we may congratulate ourselves on the present.

All this will need setting right, in order for that final account to be a true and a just one. We must see things as God sees them, before God's judgment of them will cause us to lay our hand on our mouth and own him to be right. We must look upon ourselves divested of selfishness, upon others without all that antagonism which we feel to them as obstacles to our self-esteem, in order to know and feel fully, that both we and they have our true meed at the hands of the Great Dispenser of all men's doom, if, as we know, in that day the first shall be last, and the last first. It is only thus that the first can subside into the last without bitter disappointment: only thus that they can see the last pass by them without envy and murmuring: only thus that the last can go up higher without losing their humility.

It seems, then, that the restoration to all men of a perfectly righteous standard of judging both

themselves and others, is another necessary condition, in order that that final account may be a reality for us, and produce its solemn effects; for bliss, and, we might have said, for woe also.

And now let us see whether we possess, in the present state of things, any however faint indications that these conditions are possible or probable for us.

First, as to the entire restoration of the individual memory. What is it to forget? What, but to have lost our mental grasp on something which once we held within it? If this grasp have been but recently lost, the fact escaped may generally be found with but little trouble. If some time have elapsed, more trouble is required; and not unfrequently no mental effort will serve to recall that which is gone from us. But is it therefore altogether gone? Can we confidently say this of anything that ever has been within the mind? What can seem more entirely passed away, than a trivial conversation of years back, to which no particular interest attached then, which we never had any reason for remembering, and of which we might fairly say, that it never would again be recalled? Yet shall some unexpected turn in a road, some unusual conjunction of natural objects, some affection of some one of our senses, where we never expected it, bring back to us every word which passed in that trifling conversation. Where was that all these years? Clearly it was ours, not gone from us, though eluding the grasp of conscious recollection. Who has not heard of the first language of those who have left a foreign land of their birth in infancy, long and entirely forgotten, returning again in all its fluency during the delirium of fever? Where was that, while it was forgotten? Feebleness of the frame and of the brain brings tendency to forget; old age renders the mental grasp less active, less retentive; but who can tell whether, when the soul escapes from the worn-out machine, it may not possess, at once and without effort, that plenitude of memory of which we are treating, as a requisite for an account being given of the things in the body? Of the probability of our second condition there might be even perhaps more reasonable doubt. That the whole record of time should be restored to the race of man, seems beyond all example or analogy. Yet even this may not be so. The divine inspiration by which the early historical books of Holy Scripture were written must at all events have been something of this kind. Matters unknown to the historian are related by his pen. Facts and precepts of which God alone was cognizant, are described by him. If we ask, how? The only Christian answer is, that God

put them into his mind: opened the eyes of his perception, so that these facts came to him not through the outward senses, but by direct revelation. Thus it was that St. Paul too, as he expressly tells us, received from the Lord the gospel history, which he himself had never witnessed; and we are led to expect something of this kind by that Apostle when he speaks of the blessed state as one where we shall know even as we are known; or as it should rather be as we have long been known by God. There is no antecedent improbability in this intuitive consciousness of all matter of fact being that in which our perfect knowledge there will differ from our imperfect and partial knowledge here.

In conceiving and expecting our third condition, the possession of a perfect and unerring standard of right and justice, there is far less difficulty. I say nothing of the progress of Christian life, and maturity of gifts of the Holy Spirit, because I am speaking of that which must be common to all men; which must exist in order to the full condemnation of the lost, as well as to the entire fruition of God on the part of the blessed. But I will recall to you things of which we have all heard, and which some at least have witnessed; how sometimes in an instant, in the presence of solemn realities, the veil which hid truth and justice drops off, and a man sees things as they are. When death is known to be approaching, the meanest man's words put on oracular truth; the unforgiven one is called to the bedside, and the justice of the long-rejected plea is allowed. When death has called away a parent or a friend, then first our own disobedience, then first our own ingratitude and unkindness, puts on its true appearance; and generally when it is too late to do good, we see the good one might have done. All this seems to show us, that in a man, down in the depths of a man, there does exist somewhere this true estimate which we want; and that it needs but the removal of all the obstacles which now stand in its way, the corruption of our flesh and the seduction of the world, for it to be universally seen and recognised.

It does not then appear impossible, it does not even seem improbable, that these three conditions of the reality and justice of the final account may be one day fulfilled in every one of us. There has not appeared to-day any reason why that solemn account may not in every case as completely condemn the sinner, and justify the servants of God, — why it may not, in the sight of men and angels, as entirely vindicate God's justice, and manifest forth his mercy, as any passage of Scripture assures us it will.

REMINISCENCES OF A HIGHLAND PARISH.

BY THE EDITOR.

CHAPTER I.

"There or westward away, where roads are unknown,
And the great peaks look abroad to the Westernmost
Islands."

THE Highlands of Scotland, like many greater things in the world, may be said to be unknown, yet well known. They are known to the thousands of summer tourists who, every year, and from every part of the civilized world, gaze on the romantic beauties of the Trossachs and Loch Lomond, skirt the Hebrides from the Firth of Clyde to Oban, trundle through the wild gorge of Glencoe, chatter among the ruins of Iona, scramble over the wonders of Staffa, sail along the magnificent line of lakes to Inverness, reach the sombre Coolins, and disturb the silence of Coruisk. Pedestrians also, with stick and knapsack, search the more solitary wildernesses and glens of the mainland, from the Grampians to Ross-shire and Caithness. Sportsmen, too, whether real or only make-believe, have their summer quarters in the Highlands dotted over every moor, scattered on hill-sides and beside clear streams, with all the irregularity of the boulders of the great northern drift, but furnished with most of the luxuries of an English home. All these strangers, it must be admitted, know something of the Highlands.

The tourists know the names of steamers, coaches, and hotels; and how they were cheated by boatmen, porters, or guides. They have a vague impression of misty mountains, stormy seas, heavy rain, difficult roads, crowded inns, unpronounceable Gaelic names, with brighter remembrances of landscapes whose grandeur they have probably never seen surpassed. Pedestrians can recall lonely and unfrequented paths across broken moorlands undulating far away, like brown shoreless seas, and through unploughed and untrodden valleys, where the bark of a shepherd's dog, and much more the sight of a shepherd's hut, were welcomed; and they cannot forget panoramas, from hill-tops or from rocky promontories, of lake and river, moor and forest, sea and island, sunshine and cloud, of lonely keeps and ruined homesteads, of infinite sheep-walks and silent glens which seemed to end in chaos—remembrances which will come to them like holy days of youth, to refresh and sanctify, and "hang about the beatings of the heart" amidst the din and fret of a city life. Sportsmen, too, in a sense, know the Highlands. They have waded up to the shoulders in Highland lakes, nothing visible but hat swathed with flies, and hand wielding the lithe rod and line. They have trod the banks and tried the pools of every famous stream, until the very salmon that are left know their features and their flies,

and tremble for their cunning temptations. Or, quitting lake and stream, they have sped with haste to stand upon the Twelfth, at dawn of day, upon the blooming heather. When they visit old shootings, they hail from afar the well-known hill-sides and familiar "ground." They can tell twenty miles off where the birds are scarce, or where, according to the state of the weather, they can be found. The whole scenery is associated in their memory with the braces that have been bagged, the stags which have been killed, or—oh, horrid memory!—missed, "when the herd was coming right towards us, and all from that blockhead Charlie, who *would* look if they were within shot." The keepers, and gillies, and beaters, and the whole tribe of expectants, are also well known, *as such*, and every furrowed face is to these sportsmen a very poem, an epic, a heroic ballad, a history of the past season of happiness and breezy hills, as well as a prophecy of the morrow which is hoped for with beating heart, that blames the night and urges on the morn.

There are others, too, who may be expected to know something of the Highlands. Low-country sheep-farmers, redolent of wool; English proprietors, who as summer visitants occupy the old house or castle of some extinct feudal chief; and antiquaries who have dipped into, or even studied profoundly, the civil and ecclesiastical antiquities of the land. Nevertheless, to each and all such the Highlands may be as unknown in their real life, as the scent of the wild bog myrtle is to the accomplished gentleman who has no sense of smell; or as a Gaelic boat-song in its words and spirit is to a Hindoo pundit.

Some of our readers may very naturally be disposed to ask, with a sneer of contempt, what precise loss any human being incurs from want of this knowledge? The opinion may be most reasonably held and expressed that the summer tourist, the wandering pedestrian, or the autumnal sportsman, have probably taken out of the Northern wilderness all that was worth bringing into the Southern Canaan of civilized life, and that as much gratitude, at least, is due for what is forgotten as for what is remembered.

Perhaps those readers may be right. And if so, then, for their own comfort as well as for ours, we ought to warn them that if they have been foolish enough to accompany us thus far, they should pity us, bid us farewell, and wish us a safe deliverance from the mountains.

Is there any one, let us ask, who reads those lines, and yet who dislikes peat-reek? any one who puts his fingers in his ears when he hears the bag-pipe—the real war-pipe—begin a real pibroch?

any one who dislikes the kilt, the Gaelic, the clans, and who does not believe in Ossian? any one who has a prejudice to the Mac, or who cannot comprehend why one Mac should prefer a Mac of his own clan to the Mac of any other clan? any one who smiles at the ignorance of a Highland parson who never reads the *Saturday Review* or the *Westminster*, who never heard about one in ten of the "schools of modern thought," and who believes, without any mental suffering, that two and two make four? any one who puts his glass to his eye during prayer in a Highland church, and looks at his fellow-traveller with a smile while the peasants sing their Psalms? any one who, when gazing on a Highland landscape, descants to his local admirers about some hackneyed Swiss scene they never saw, or enumerates a dozen Swiss *Horns*, the *Wetter Horn*, *Schreckhorn*, or any other horn which has penetrated into his brain? Forbid that any such terribly clever and well-informed cosmopolitans should "lose ten tickings of their watch" in reading these reminiscences!

One other class sometimes found in society, we would especially beseech to depart; we mean Highlanders ashamed of their country. Cockneys are bad enough, but they are sincere and honest in their idolatry of the Great Babylon. Young Oxonians or young barristers, even when they become slashing London critics, are more harmless than they themselves imagine, and after all inspire less awe than Ben Nevis, or than the celebrated agriculturist who proposed to decompose that mountain with acids, and to scatter the debris as a fertilizer over the Lochaber moss. But a Highlander born, who has been nurtured on oatmeal porridge and oatmeal cakes; who in his youth wore home-spun cloth, and was innocent of shoes and stockings; who blushed in his attempts to speak the English language; who never saw a nobler building for years than the little kirk in the glen, and who owes all that makes him tolerable in society to the Celtic blood which flows in spite of him through his veins;—for this man to be proud of his English accent, to sneer at the everlasting hills, the old kirk and its simple worship, and to despise the race which has never disgraced him—faugh! Peat-reek is frankincense in comparison with him; let him not be distracted by any of our reminiscences of the old country; leave us, we beseech of thee!

We ask nothow old or how young those are who remain with us; we care not what their theory of political economy or their school of modern philosophy may be; we are indifferent as to their evening employment, whether it be darning stockings, sitting idle round the wintry fire in the enjoyment of repose, or occupying, as invalids, their bed or chair. If only they are charitable souls, who hope all things and are not easily provoked; who would like a peep into forms of society, and to hear about people and customs differing in some degree from what they have hitherto been acquainted with; to have

an easy chat about a country less known, perhaps, to them than any other in Europe,—then shall we gladly unfold to them our reminiscences of a country and people worth knowing about and loving, and of a period in their history that is passing, if, indeed, it has not already passed away.

And now, by way of further preamble to our Reminiscences, let us take a bird's-eye view of the parish. It is not included, by Highland ecclesiastical statist, among what are called the large parishes. We have no idea of the number of square miles, of arable acres, or of waste land, which it contains; but science and the trigonometrical survey will, it is presumed, give those details in due time. When viewed as passing tourists view it, from the sea, it has nothing remarkable about it, and if it is pronounced by these same tourists to be uninteresting, and "just the sort of scenery one would like to pass when dining or sleeping," we won't censure the judgment. A castled promontory, a range of dark precipices supporting the upland pastures, and streaked with white waterfalls, that are lost in the cospice at their base, form a picture not very imposing when compared with "what one sees everywhere." A long ridge of hill rising some two thousand feet above the sea, its brown sides, up to a certain height, chequered with green stripes and patches of cultivation; brown heather-thatched cottages, with white walls; here and there a mansion, whose chimneys are seen above the trees which shelter it: these are its chief features along the seaboard of twenty miles. But how different is the whole scene when *one lands!* New beauties reveal themselves, and every object seems to change in size, appearance, and relative position. A rocky wall of wondrous beauty, the rampart of the old upraised beach which girdles Scotland, runs along the shore; the natural wild wood of ash, oak, and birch, with the hazel copse, clothe the lower hills and shelter the herds of wandering cattle; lonely sequestered bays are everywhere scooped out into beautiful harbours; points and promontories seem to grow out of the land, and huge dykes of whinstone fashion to themselves the most picturesque outlines; clear streams everywhere hasten on to the sea; small glens, perfect gems of beauty, open up their entrances into the wonders of endless waterfalls and deep dark pools, hemmed in by steep banks hanging with ivy, honeysuckle, rowan-trees, and ferns; while on the hill-sides such signs of culture and industry as scattered cottages, small farms, and shepherds' huts, give life to the whole scene.

But to view the parish in all its outward aspect, we must ascend to the top of —

"I name not its name, lest inquisitive tourist

Hunt it, and make it a lion, and get it at last into guide-books."

The upward path soon leaves the cultivated settlements, passes several streams, winds across tracts of moorland, and at last reaches the shielings

of Corrie Borrodale. One cannot imagine a sweeter spot than this in which to repose before attempting the proper ascent of the hill. A stream, clear as a diamond, and singing its hill song, takes a sweep, and folds within its embrace a bay of emerald grass, surrounded with blooming heather. Here and there appear small groups of ruins, mere gatherings of stones, to mark where man once built his temporary home. Before sheep-farming was introduced generally into the Highlands, about sixty or seventy years ago, the cattle ranged through the hills as high up as the grass grew, and it was necessary, during summer, to follow them thither, to milk them there, and make up stores of butter and cheese for winter use. This led to the building of those summer *châlets*, which were managed chiefly by women and herd-boys, but visited often, perhaps daily, by the mistress of the farm, who took the dairy under her special charge. Thus it is that when one rests in such a green oasis, his fancy again peoples the waste with the herd-lads "calling the cattle home," and with the blythe girls who milked the cattle; he sees again the life among the huts, and hears the milking-songs and innocent glee; and when awakened from his reverie by bleating sheep—the only living tenants of the pastures, he is not disposed to admit the present time to be an improvement on the past.

But let us up to that green spot beside the ravine; then to the left along the rocks, then to the right till past the deep "peat-bogs," and finally straight up to the Cairn. When we have taken breath, let us look around. This is the very high altar of the parish, and we maintain that all the glories which can be seen from a parish, rightfully belong to the parish itself, and are a part of its own rich inheritance.

Let us first look northward. Almost at our feet is a chain of small lakes, round whose green shores, unseen from the Cairn because immediately beneath it, a prosperous tenantry once lived, of whom no trace remains, except those patches of ruins which mark their once happy home-steads. Ruins there are, too, which show us that whatever defects the Church before the Reformation had accumulated, she excelled the Church of the present in the greater number and the greater beauty of her parish churches. There are few sights which more rebuke the vulgar Church parsimony of these later days, or which imbue us with more grateful and generous feelings towards the missionaries of an earlier and more difficult time, than the faith and love which reared so many chapels on distant islands, and so many beautiful and costly fabrics in savage wildernesses, among a people who were too rude to appreciate such works, or the spirit which originated them. These old Highland Church extensionists were not stimulated by party rivalry, public meetings, or newspaper articles. Their praise could not have been from men. How they got the means and money we know not, but this we believe, that

"They dreamt not of a perishable home
Who thus could build!"

But to our picture again. Opposite to the spectator, and rising abruptly from the valley, is a range of hills, broken into wild scours and clothed with copse; while beyond these, rise, ridge on ridge, like a mighty ocean sea, heaving in gigantic billows onward towards Ben Reshapol, until lost to sight beyond the head of Loch Shiel and among the braes of Lochaber. Sweeping the eye from the north, to the west, what a glorious spectacle! The chain of lakes beneath end in the lovely Loch Sunart, with its beauteous bays and wooded islets. Over its farther shore, belonging to that huge parish and huge word Ardnamurchan, and above picturesque hills, the more distant Hebrides rear their heads out of the ocean. Along the horizon southwards are seen, the Scur of Eigg lifting its gigantic pillar, the dark lines of Rum, and the islands of Canna, Coll, and Tiree, with gleams of the ocean between. The long dark moorland ascent by which we have reached the hill-top, now carries the eye down to the sea. That sea is a strait, worming itself for more than twenty miles between the mainland where we stand, and the island of Mull, which gathers up its hills into a cluster of noble peaks about its centre, with Bentealbh (Bentalve) and Benmore towering over all. A low isthmus right opposite, opens up an arm of the sea beyond Mull, with noble headlands, beneath which the man who would see Staffa aright should sail out to the ocean with no strangers save a Highland crew; for not from crowded steamer can he fully understand that pillared island and its cathedral cave. Let us take one other glance to the east—the eye following the Sound of Mull, and our panorama is completed. How nobly the Sound, dotted with vessels, opens up past Ardtornish and Duart Castles, ere it mingles with the broader waters that sweep in eddying tides past the Slate Isles, past Jura, Scarba, on to Islay, until they finally spread out into the roll and roar of the shoreless Atlantic. In that western distance may be seen some white smoke that marks Oban, and over it Ben Cruachan, the most beautiful of our western hills, accompanied by its grey companions, "the shepherds of Etive Glen."

We back this view from the highest hill in the parish for extent and varied beauty against any view in Europe! It is the Righi of Argyleshire; and given only, what, alas! is not easily obtained, a good day, good in transparency, good with "gorgeous cloudland," good with lights and shadows, the bright blue of the northern sky (more intense than the Italian), looking down and mingling with the sombre dark of the northern hills, dark even when relieved in autumn by the glow of the purple heather—given all this, and we know not where to find a more magnificent outlook over God's fair earth. No reminiscences of the outer world so haunt our memory as those so often

treasured up from that grey cairn ; and however frequently we have returned from beholding other and more famous scenes, this one has appeared like a first love, only more beautiful than them all.

As we descend from the hill, the minister—how oft has he gone with us there!—tells us stories worth hearing, and as he alone can tell them ; stories of a pastor's life, "from perils in the wilderness, and perils of waters, and perils of the sea ;" stories of character, such as the lonely hills and misty moors alone can mould ; stories of combats among the wild and primitive inhabitants of the olden time ; and stories, too, of the early invaders of the land from Denmark and Norway, sea-kings, or pirates rather, whose names yet linger where they fell in battle, as at Corrie *Borrodale*, Corrie *Lundie*, and Ess *Stangadal*.

But we have reached "the manse ;" and from

thence we must start with our "Reminiscences of a Highland Parish."

Note.—What chiefly induced me to undertake the light and pleasant task of recording in these pages my "Reminiscences of a Highland Parish," was the wish to please a revered father, who was the first-born of the old manse, whose early years were spent in "the parish," and whose name was associated with all that endeared both to my memory. His sudden death, but a few days ago, has changed the whole current of my thoughts. If it is possible for me now to write at all on the subject, the readers of *Good Words* must kindly pardon me should I indulge my own feelings by some records of a more personal kind in connexion with "the manse" than I had otherwise intended.

GOLDEN WORDS.

SOME words are played on golden strings,
Which I so highly rate,
I cannot bear for meaner things
Their sound to desecrate.

For every day they are not meet,
Or for a careless tone ;
They are for rarest, and most sweet,
And noblest use alone.

One word is POET : which is flung
So carelessly away,
When such as you and I have sung,
We hear it, day by day.

Men pay it for a tender phrase
Set in a cadenced rhyme :
I keep it as a crown of praise
To crown the kings of time.

And LOVE : the slightest feelings, stirred
By trivial fancy, seek
Expression in that golden word
They tarnish while they speak.

Nay, let the heart's slow, rare decree,
That word in reverence keep ;
Silence herself should only be
More sacred and more deep.

FOR EVER : men have grown at length
To use that word, to raise
Some feeble protest into strength,
Or turn some tender phrase.

It should be said in awe and fear
By true heart and strong will,
And burn more brightly year by year,
A starry witness still.

HONOUR : all trifling hearts are fond
Of that divine appeal,
And men, upon the slightest bond,
Set it as slighter seal.

That word should meet a noble foe
 Upon a noble field,
 And echo—like a deadly blow
 Turned by a silver shield.

Trust me, the worth of words is such
 They guard all noble things,
 And that this rash irreverent touch
 Has jarred some golden strings.

For what the lips have lightly said
 The heart will lightly hold,
 And things on which we daily tread
 Are lightly bought and sold.

The sun of every day will bleach
 The costliest purple hue,
 And so our common daily speech
 Discolours what was true.

But as you keep some thoughts apart
 In sacred honoured care,
 If in the silence of your heart,
 Their utterance too be rare ;

Then, while a thousand words repeat
 Unmeaning clamours all,
 Melodious golden echoes sweet
 Shall answer when you call.

ADELAIDE A. PROCTER.

ESSAYS FOR SUNDAY READING.

I.—CONVERSION IN PRIMITIVE AND IN MODERN TIMES.

BY JOHN CAIRD, D.D.

HAS the gospel lost its ancient power? Has the regenerating influence of the truth died away with the lapse of years? The same in form, though it be, as in the primitive times, are we now fallen upon evil days, in which the body alone remains, while the spirit and life are gone? The old rod is here, once wielded by the magician's hand. Has it lost its power to conjure? The ancient sword of the Spirit which in the great days of old wrought mighty work against the hosts of evil, still hangs in the Church's army, but we cannot now tell of thousands and tens of thousands as the trophies of its power on a single field. Shall we conclude that its edge is blunted or that the puny hands of modern men are too weak to wield it? We never witness now, or only at rare intervals, and with doubtful resemblance, any reproduction of the scenes of Pentecost. We never read in the transactions of modern churches any authentic narratives such as those with which the records of the Church's early history abounds,—of thousands converted by a single sermon; of the simultaneous movement of souls stirred and swept together as the multitudinous waves of the sea by the same wind of heaven; of whole communities and nations born in a day. Of old, a simple unlettered man, destitute of intellectual culture or rhetorical art, would pass from country to country, and wherever

he went, in hamlet and town and city, the hearts of men were strangely moved by his words. In our day the ablest and most cultivated minds, after long and laborious training, armed with all the influence which learning, eloquence, dialectic skill, can lend to human lips, will fail throughout the course of a long ministry to elicit any such marked authentication of their teaching. What then? Shall we conclude that the force of the truth has become spent, that the living, quickening power of the gospel has fled? Is Christianity an agent that loses, like a spring, its elasticity by use; a specific whose virtue evaporates by long exposure; a voice from heaven once pealing in thunder tones on a startled world, but whose echoes are falling now faint and ever fainter on the ear? Or if not, why are its effects so different? If the agent be unaltered, why are the phenomena by which its presence was manifested in other days seldom or never paralleled in our own? Human hearts are the same. Human needs are the same. Still souls are perishing, and need to be saved. Still souls are slumbering, and need to be roused ere they sleep the sleep that knows no waking. What then is different? What is wanting? Why can we only tell, as the highest result of ministerial effort, of cold formalities observed, and decorous proprieties maintained; at best, of one soul here,

and another there, at wide intervals, owning the power of the truth ?

Now, whilst the answer to such inquiries would undoubtedly involve much that is to the dishonour of the Church in modern times, yet the difference in question admits to some extent of a less unfavourable explanation. Whilst the diminished power of the truth must, in part at least, be ascribed to the colder spiritual atmosphere in which it acts—to the weaker faith and more languid energy of its preachers—to the greater secularity and indifference of its hearers ; yet on the other hand, it is not invariably to be concluded that the influence of the gospel is really less, simply because it is less palpable. The results of preaching may not be less important, though from the altered circumstances of the Church and of society, they are, of necessity, less striking and demonstrative. How far it is so, it will not be uninteresting or unprofitable to inquire. For, knowing how much of the admitted difference of results is to be set down to the altered conditions of the problem, we shall be able to form a more just estimate of what is to be ascribed to less venial causes. If it can be shown that the apparent number and the marked and striking character of conversions, cannot, from the nature of the case, be the same now as in another and different age, then we shall, to some extent at least, be saved from disappointment at the comparatively slight apparent results of Christian effort. We shall know what we have to look for, and we shall be taught to avoid the distortion of aim, the misdirection of effort which is implied in the craving for countable results. We shall cease to measure the success of the preaching of the gospel by external excitements and palpable conversions ; and we shall no longer be oppressed with a sense of failure because we do not witness in our day any literal reproduction of the incidents of an earlier age. To these ends, therefore, it will be useful to indicate one or two points of difference which must necessarily obtain betwixt conversions to Christianity in modern, and conversions to Christianity in apostolic times.

1. One most obvious point of difference is, that *then* conversion consisted in the *adopting of a new religion*, whilst *now* it consists, generally, in the *realizing of an old and familiar one*. Formerly, in other words, it was a new faith espoused, now it is only an old one quickened.

There may be, in reality, fewer conversions now than in the Church's earlier and brighter days ; but few or many, they are of necessity, in the great majority of cases, less palpable and appreciable. For when men became Christians *then*, they had openly to renounce one religion and adopt another—to pass at one step from Paganism or Judaism to Christianity : when men become Christians *now*, in most cases they simply pass from nominal to real Christianity. There is no external act of renunciation, no visible recanting an old, and professing of a new creed ; all

the difference is, that what was before a mere form becomes a reality, that old creeds are realized, old forms become instinct with the sap of reviving spiritual life. But it is plain that this last sort of conversion, though equally real and important, attracts much less notice than the former. Dig up a tree and transplant it from one soil to another, and every passer-by will be aware of the process. But what observer can note the moment when, through the blackened trunk and the dry and leafless branches of the tree that has stood bare and barren through many winter days, the first stirring of the new spring sap is taking place ? Let a man desert from the enemy's service and enlist in yours, and all can perceive and appreciate such an accession to the ranks the moment it occurs ; but though the gain in strength may be as great when a traitor who has long worn your country's uniform renounces his secret treachery, and becomes a loyal-hearted soldier and subject of the Queen ; this is a change which passes unobserved. So in the case before us. When a heathen was converted to Christianity, his whole life became revolutionized. It was a root-and-branch change, a transplantation to new ground, an open forswearing of the enemy's service and enlisting in the ranks of Christ. Unhallowed rites and ceremonies were no longer frequented ; sacrifices and festivals ceased to be observed ; habits of life were completely altered ; idolatrous customs and usages, which interpenetrated domestic and social existence, were renounced ; licentious excesses, formerly regarded as venial, if not committed under the very sanction of religion, were succeeded by a pure and strict morality ; from a despiser or persecutor of Christianity, the neophyte became an open and devoted follower of the Lord Jesus ; and, of course, a change so radical, so revolutionary, could not fail to be instantly observed by all to whom the convert was known. Every such conversion would count at once as an unmistakable accession to the Church's ranks. The power of the truth would receive in it a new authentication, and the Church could openly bless God for the salvation of another soul.

But, on the other hand, conversion in our day is in general a very different process. The same in essence, it is, in form, much less obtrusive. For it consists simply in a man's becoming a real and earnest believer in those truths of which he had already and perhaps all through life, been a formal and nominal believer. The whole mechanism and organization were here before, only they become now, for the first time, instinct with life. There was action and motion before, but they were the action and motion of an automaton ; now they are the same outwardly, but a soul has crept into the anatomical machine.

For what, I pray you, does any unconverted man in a Christian Church need in order to make him a true Christian ? Not, in most cases, new knowledge, but mainly the power to realize old and familiar knowledge ; not a new creed or form of belief, but

the making that creed a reality which has hitherto been but a form. We do not require to teach him the facts and doctrines of Christianity, or to convince him of their truth. He believes in them all; he assents to them all. They are all in his memory, in his head; what is wanted now is to get them into his heart. It is not more food the sick man wants, but the reviving of his appetite and digestive functions, that he may assimilate the food he has got. It is not more fuel the fire wants: pile coals on an expiring breathless fire, and you only put it out; but it wants kindling and draught to lay hold of and consume the fuel that is already there. So, in order to make a worldly man spiritual, a careless man a Christian, we do not need to ring the changes for ever on the old story, to repeat and reiterate, in order to inform his mind, the old news about death and judgment, sin and salvation, heaven and hell, God's wrath and God's love in Christ Jesus. Are there not hundreds of irreligious, worldly men in every Christian community who are most thoroughly conversant with the facts and doctrines of Christianity; who need no long-drawn proof to gain their assent to the historical truth of the gospel; who believe in the life, sacrifice, death, and resurrection of Christ, in the offered mercy and love of God through his dear Son, in the necessity of faith, repentance, and a holy life? Question them, and would not the answer be, "All this we steadfastly believe!" Yes; but what they do need is, that all this mass of torpid matter, this lumber of unprofitable dogma, should be vitalized. The form of religion is there already, but there is no breath in it; what is wanted is to breathe a soul into these ribs of death. And so if some worshipper in a Christian congregation should this day become a sincere and earnest Christian,—if God should bless the preaching of the truth to his conversion,—in all probability the whole change would be, that he now in the secret depths of his spirit begins for the first time to *feel* and *realize* what hitherto he had theoretically believed. His mind would be roused to lay hold, with the appropriating grasp of faith, with the vitalizing energy of trust, that truth as it is in Jesus, which formerly it had but intellectually trifled with. This would be conversion. But for a time at least it would be an unnoticed and secret thing. The changed demeanour, the softened aspect, the trembling lip, the tearful eye, some secret friend might note, but for the world there would be little or no difference. The old organization, the stem and branches of the winter tree are there all the same, and only God's eye perceives that the stirring sap of spring, betokening a glorious summer's fruit, has begun to rise within it. The follower of sin has become a soldier of Christ, but he wore the same guise and uniform before; and the Master's piercing gaze alone it is that can discern that the traitor-heart is gone, that a new heart and right spirit are there, and that the badge of the cross betokens one who has now the right to wear it.

2. As another difference between conversions in apostolic and in modern times, I may specify the greater *suddenness and swiftness of the process*, in most cases, in the early Church.

In so far as any mental or spiritual change can be outwardly observed, it will of course be more or less striking and notable in proportion to its rapidity. Gradual changes may be equally great, but spread over a long lapse of time, and advancing by gradations, each of which is by itself all but imperceptible, they attract comparatively little notice from superficial observers. If we were plunged by a single step from mid-winter into mid-summer;—one day a bleak, dreary, snow-clad waste, the next surrounded by beauty and fragrance and balmy warmth,—the transition would of course be much more impressive than the silent and gradual one of our actual experience. Or again, if in recovery from disease, there were no long intermediate stage of convalescence; but the patient whom we left at night a poor, worn, emaciated sufferer, with shattered nerves and utter prostration of physical energy, we found in the morning in the flush of health, animation in his look, and bounding elasticity in his step; here, again, the transformation could not fail to arrest the attention of the most careless spectator. And in like manner a moral change, which is not the slow and silent result of long processes of education, discipline, thought, reflection, conviction, brought about by the gradual converging influence of a thousand events, agencies, teachings of providence and of grace, but which, under some condensed and potent influence, transforms, as if at one stroke, selfishness into love, profligacy into purity, the raving moral maniac into a meek and childlike saint sitting at Jesus' feet,—this of necessity is a kind of conversion which is the most palpable, and which may attract universal notice, while the more gradual, but not less real change, passes unobserved.

Now, from various causes, moral and spiritual changes were in the early Church much more generally of a sudden, rapid, condensed character, than in our own and other times. There is nothing in the nature of things to prevent a rapid intensifying of man's spiritual history, so that the moral life of years might be condensed into hours. There is no necessary and constant ratio between thought and time, so that so many ideas, feelings, resolutions, mental acts and experiences, must take so many minutes, hours, or years, to go through. It is quite conceivable that the rate of thought might be so altered that the varied fortunes of a lifetime—with all its multitudinous experiences of joy, sorrow, hope, fear, love, hate, all its inquiries, studies, doubts, beliefs, convictions, errors—might be crowded into a few hours or minutes. And this of course may be as true of our religious and spiritual, as of our other mental experiences. The whole history of a soul, with all its stirrings of thought and awakenings of compunc-

tion, and conflicts of doubt and fear, its convictions of faith, its joy of trust, its aspirations, hopes, devout contemplations,—onwards from the first step in the path of holiness till it stands at the very gate of glory,—might be transacted in as many minutes as it ordinarily requires years to accomplish. The winter of the soul might be made glorious summer by the instantaneous outflashing, on its inner darkness and coldness, of the Sun of righteousness. One touch of the divine healer's hand, and with no long and weary interval of slow reviving moral health and strength, the soul in which the ravages of moral disease have been the most disastrous, might pass into the full maturity of life.

Now, whilst in all ordinary times the phenomena of the spiritual life are slowly developed, and character is a thing of very gradual formation, in the early days of the Church's history there was a marked intensification of spiritual life, and moral and religious transformations were often rapid and sudden. As the outward miracles of Christ might be said to condense natural processes,—as, for instance, the slow and long-protracted processes of husbandry and the cultivation of the vine, were abridged into a few moments when the loaves in the desert grew in Christ's hands into food for thousands, or the water passed into the form of wine; or, again, as the ordinary process of recovery was accelerated, when the lame or paralytic leapt and walked, or the fever-stricken arose in health at His omnific word;—so also, by his moral miracles, were the inner processes of man's ordinary spiritual experience condensed and abbreviated. And thus, not as now by the slow and sedulous labours of parental instruction and the discipline of early years, or by the gradual dawn of clearer conviction and a deeper moral feeling on the soul through the teaching of Scripture, but by agencies and influences almost instantaneous, were moral revolutions in the old time achieved. The persecutor fresh from the murder of Christ's first martyr, envenomed with bigotry, and hurrying on a mission of cruel hostility to the saints of God, is arrested on his progress, and in a few hours the mantle of a Christian apostle falls upon him. The foul and guilty woman listens to the words of incarnate Purity, and soon trembling, hoping, weeping, praying, she is at the feet of Jesus, and at the words, "Daughter, be of good cheer, thy sins be forgiven thee," undying love and devotion take possession of her soul. The malefactor nailed to the tree of shame, a wild, reckless, sin-stained wretch, listens to the dying words of Jesus, and in the course of a few brief hours passes from recklessness and vice into the home of eternal purity, the paradise of God. Now in these and all similar instances the rapidity of the change would arrest observation, and the contrast would furnish a ready criterion of its magnitude. At one glance the spectator could view both sides of a picture that was instantaneously reversed. The impression of

the dark and repulsive side would still be fresh on the eye, as the brighter one started into beauty before it, and all the marvel of the transition would therefore be seen and noted. "Is not this he who destroyed them who called on this name at Jerusalem? And they were amazed." "They heard only that he which persecuted us in times past, now preacheth the faith which once he destroyed, and they glorified God in me." On the other hand, even on the supposition that conversions, as numerous and as complete as these, were taking place around us, they would fail to attract the same attention. The spiritual transformation, on the whole of equal magnitude, might yet in each successive gradation be too minute to measure. The light of purity and love in many a once dark and godless soul may be shining as brightly now as in other days, but it has risen slowly, shining brighter and brighter to the perfect day, and multitudes fail to note it who might have been filled with awe and wonder had the moral transition been as if at one instant from midnight into noon.

3. One other point of difference which renders conversions to Christianity less marked in modern than in apostolic times, is that whereas *now conversions are generally isolated, formerly whole multitudes were often converted simultaneously.*

There are, as we know, many events which, befalling separately and at intervals, do not create the same impression as if they took place simultaneously. Births and deaths supply an obvious illustration of this. When, by some dreadful railway accident, or shipwreck, or other disaster, hundreds of hapless souls are hurried simultaneously into eternity, we are of course much more deeply affected by their deaths than if the same number of human beings died in succession, at intervals, and from ordinary causes. Or if each successive generation of men—instead of slipping away, now one, now another, the former generation overlapping its successor, so that some specimens of several generations are always with us—were, at stated periods, by some sudden and simultaneous catastrophe, swept away, and a new race arose in their vacant places, such an event, though in point of fact it would not in the least alter the universal lot of mortals, would render it much more obtrusively striking than according to the present order. And so also is it in the moral world. Here, too, the critical events in man's history, in the common order of God's government separate and isolated, sometimes come simultaneously to multitudes, and it is as if a whole generation of souls leapt together into life. In the ordinary routine of events, it is apart, and as solitary pilgrims that souls knock at heaven's door, and the wicket gate is wide enough to let them in; but there have been times in the Church's history when in joyful crowds they press on together, and it is as if the great golden gates of paradise must be flung wide open to receive them. Angels rejoice over one sinner that re-

penteth, but sometimes they have struck their harps to louder, more exulting strains, for nations born in a day.

Nor is it difficult to understand the reason of this—the causes why such events have occurred, and may, for aught we know, recur again, in the history of the Church. There are conditions of men's minds in which they are singularly liable to simultaneous movements and impressions. There are times when a single bold word will fire a thousand hearts, and, souls, in ordinary life insulated and unsusceptible, will thrill together as by a common electric shock of feeling. To some extent we see this fact illustrated in the power of the public speaker over a crowded and sympathetic auditory. Why is it that the same words, read in private with little or no emotion, have seemed so much more powerful, have touched our hearts and interested our minds so much more vividly, in public? It is because there is a new element at work in the latter case, which is wanting in the former; it is because the local contiguity of a crowd has elicited that strange element of physical and mental sympathy, and induced a highly electric state of the moral atmosphere. Again, there are times when the same influence is seen operating on a much wider scale,—when not through a congregation or a public assembly merely, but through a whole community or nation, a common thought or feeling spreads. Let men's minds be disciplined by circumstances affecting all alike into a common state of susceptibility, and over a whole country or community, emotion will fly like wildfire. Railway manias, a wild spirit of adventure or speculation, intoxicating half the nation with a common commercial drunkenness, social and commercial panics, a war fever passing over the land like an epidemic,—all these are instances of a social contagion affecting with instantaneous rapidity, all but simultaneously, whole multitudes of men with a common thought or feeling.

And so especially is it in religion. For here lies man's deepest nature; here are those springs of thought and emotion that rise from profoundest depths of his being; here those common organic susceptibilities which affect all men alike, and which, if you can reach them, touch our common nature to the quick. It was this diffused susceptibility of many minds, for example, that gave the leaders of the Reformation their power over the awakening nations. The world, unconsciously to itself, had grown sick of superstition. Ages of religious deception and unreality, of hollow formalities and bare-faced impositions, of ceremonial solemnities mocking man's wants, and when he cried for bread to feed his soul's hunger, offering him a stone, had awakened an irrepressible longing for something better, something real, something to tear away the veil between man and the God without whom he cannot live. And so when Luther rose, the world was waiting to receive him.

The mountain mass of superstition was everywhere undermined, the train was laid, all was ready for the catastrophe; and when one firm, brave hand applied the match, the subtle fire flew hither and thither at once, and the vast fabric, rent and shaken in a thousand places, came crashing down. And so especially was it in that age of the world to which our text relates. For then, indeed, if ever, men's hearts were everywhere in strange expectancy, weary of bondage, and waiting for their Deliverer. The fulness of the times had come. Old faiths had everywhere become effete, old moralities corrupt;—the Hebrew impatiently fretting and groaning under the yoke which yet he was impotent to throw off, yearning with passionate longing for the hope of Israel;—the Heathen, amidst the utter extinction of reverence, amidst the relaxing of social bonds, and the intense corruption of national and social life, unconsciously ready to respond to any voice that would rouse him to hope and aspiration after better things. And so when He came who is the world's glorious hope, and when His emissaries went hither and thither telling of redemption to the slave, of purity to the guilty, of immortal life and glory to wretched dying souls, there was as if a simultaneous cry of deliverance, a deep responsive "All hail!" that broke from hearts which God's Spirit had touched by the good news from heaven. It was not as now, when, in the cold damp atmosphere of worldliness, but few hearts—one here and another there—are ever touched and kindled by the truth. Conversions were then, as when in the autumn warmth and drought fire falls on Canadian wood or prairie. An hour ago, and all was dark: the spark fell, and all but simultaneously the whole forest for miles around has become one sheet of flame. It is evident that religious changes, when thus embracing masses of men, are, from the nature of the case, much more observable than when, as in the ordinary routine of the Church's life, they affect only individuals. Even if the souls reached by the heavenly influence be now equally numerous as at such epochs of simultaneous movement, yet will the result in the former case, of necessity, lack the impressiveness of the latter. As many dumb lips may now be opened at Christ's touch, but the voice of their gratitude uttered, each apart from the rest, is but as the repetition at wide intervals of a solitary cry: it lacks the obtrusive force and grandeur which belongs to the voices of a great host bursting forth in blended adoration to their common Redeemer and Lord.

Desisting from any further prosecution of this train of thought, the caution must be added, that to such considerations as have now been suggested too great weight should not be attached. It would be easy to derive from them a false comfort. They afford at best only a partial explanation of the diminished apparent power of the truth. Doubtless, the lessened influence is

not altogether in appearance only. In many respects "the former days" seem, only because they actually were, "better than these." No one can deny that there is in reality much spiritual dullness and coldness in modern society, and that, by our very familiarity with religion, its truths have lost somewhat of their original power to move us. It is not that the mighty motives and principles of religion have been deprived of their inherent efficacy. It is not that by any arbitrary decree the gracious influence has been withdrawn, which in the ancient days rendered the truth mighty to save. God's loving, life-giving Spirit does not act by fits and starts. In his Church it is not now a flood and now a drought,—the channels of gracious influence left at one time dry as a summer brook, and anon flooded like a river or as the waves of the sea. The good God is never fitful, never partial, never arbitrary. He willeth not the death of a sinner. He will have all men to be saved. His Spirit is always poured out, and always in infinite, overflowing abundance. God's helpful influence is as a

wind ever blowing, a stream ever flowing, a tide that is ever at the flood. The cause of failure is to be sought, not in Him, but in us. It lies not in the Agent, but in the subject, not in the giver but in the receiver. It is that at one time men catch and treasure the precious element, at another let it run to waste. The productive powers of the earth are as great in some far away undiscovered island, or in some rich American backwood, as in our peopled England; only in, the former there is no human hand to till the fertile earth and gather in its fruit. Age after age it has been running waste, lavishing its fertility in wild luxuriance of wood and gay profusion of ungathered fruits and flowers. And so the germinating, fertilizing influences of God's grace are ever acting upon us and around us,—breathing in the air and basking on the soil of man's spirit—ready, if the heart will but open to them, to quicken all its energies into life and beauty. On our guilty indolence, on our unreceptive hardness, must the blame rest, if any other region be fairer, or any other age have proved more fertile than our own.

NOTE TO ARTICLE ON COOKING DEPOTS IN DECEMBER PART.

"DEAR SIR,—I have perused the article upon the 'Glasgow Cooking Depôts,' which appeared in *Good Words*, and which gives a very correct sketch of the operations and extent of the scheme. I cannot, however, express to you the regret I feel that the writer should have so entirely misapprehended my own personal position and motives in originating the movement as to suppose it was 'to a certain extent a commercial speculation.'

"If it were merely a question of right or propriety, upon my part, to avail myself of the profits of this undertaking, should any arise, the impression conveyed by your article would be of comparatively little consequence. The question, however, is one simply of fact, as I determined from the very foundation of the scheme to conduct it purely for the public benefit, and have taken every opportunity of stating, in the most distinct manner, that should any profit arise it will be entirely devoted to benevolent objects. To carry out this resolution I have had my own intromissions carefully audited by two well-known gentlemen in the city, Messrs. Neil McNeill and William Melvin,—whose report I enclose, as published in the newspapers; and we have had recently under consideration the propriety of having the whole matter placed in the hands of trustees.

"You will thus see, at a glance, the position I am placed in with respect to those gentlemen in England with whom I have been in correspondence, with the view of founding similar institutions; and to whom I have given a full detail of the principles and workings of the scheme, and also my own personal position in the matter.

"It is quite true, as the writer says, that I have never urged my claims upon the gratitude of any one. On the contrary, I have always expressed my conviction, that such a movement, to be really useful, must fully maintain the independent feelings of the working-classes; and, to be permanent, must have the vital principle of being thoroughly self-supporting, which, I wish it to be widely known, the Glasgow Cooking Depôts are at present, and have every prospect of continuing to be.

"I cannot for a moment doubt the good feelings and intentions of the writer of the Article, both towards the movement and myself; and I can much less doubt that, with the above facts before you, you will do me the justice of correcting this misapprehension in the January Number of *Good Words*.

"I remain, dear Sir, yours truly,

"THOMAS CORBETT."

"DR. NORMAN MACLEOD, GLASGOW."

BY THE WRITER OF THE ARTICLE.

"When the Article on 'Cooking Depôts for Working People' was written, the writer was not aware that Mr. Corbett meant to give the whole of the profits for benevolent purposes. The additional information, therefore, contained in that gentleman's letter, whilst it is honourable to him, cannot but be gratifying to all who, either as readers or writers, take an interest in *Good Words* or good works.—L. J."

THE PARABLE OF THE VIRGINS

THE PARABLES

READ IN THE LIGHT OF THE PRESENT DAY.

BY THOMAS GUTHRIE, D.D.

II.—THE PARABLE OF THE TEN VIRGINS.

MATTHEW XXV. 1-13.

THIS parable is founded on a marriage scene. Though—as, for example, in wars, or in the Corinthian games—the Scriptures are not to be regarded as approving of all things which they may employ as figures, approbation and honour are bestowed on marriage by the lofty uses to which the sacred writers turn it. With prophets and apostles it shadows forth the holy, intimate, eternal union which is formed between God's beloved Son and his chosen people. Those who feel a Christian interest in the purity and happiness of society, will not regard that as a circumstance of no value. Such discredit as the Popish Church throws on marriage, by representing it as less holy and honourable than celibacy, and such impediments as pride and ambition throw in its way, should be denounced by those who, as Christian ministers, ought to be Christian moralists,—preaching to the times. One of their most evil features is the false standard of income and position which it is considered proper they who intend to marry should in the first place secure. This has led to the bitterest disappointments; to breach of vows; to broken hearts,—besides being the fruitful source of much crime, and furnishing the licentious with an apology for their immoralities. On this altar, human happiness, as well as the best interests of morality, are offered up in cruel sacrifice. A man's life, as Scripture saith, consisteth not in the abundance of the things which he possesseth,—a dinner of herbs where love is, is better than a stalled ox, and hatred therewith.

The institution which forms the basis of this parable is one of the two, belonging to innocence and Eden, which the Fall that shook the world and turned it, as an earthquake does a city, into a scene of ruins, left standing. These are the Sabbath and Marriage—the first forming the foundation on which religion, and the last that on which the social fabric, stands. And in looking back to the first marriage, I cannot but think that it was to make its tie more tender that God chose the singular plan he pursued in providing the man with a mate. No other way would have occurred to our fancy of making woman than that of another clay figure, modelled by God's hands in the female form, and inspired by his breath with life. In making her out of Adam, and from the part of his body lying nearest to the heart, while he lay in the mysterious sleep from which he woke to gaze on a beautiful form reposing by his side, God gave a

peculiar emphasis and power to the figure “they twain shall be one flesh,”—one in sympathy, in mind, in affections, and in interests; nothing but death afterwards to divide them.

Though thus a sacred, marriage was originally a simple, institution. God married the first couple that were husband and wife; but though it had the sanction, it was not till long ages afterwards that marriage was invested with the ceremonies of religion,—and priests were introduced on the scene. In none of the cases recorded in Scripture did the parties repair to a place of worship, or call on a minister of religion to tie the nuptial knot. Though such a custom might be proper, and did to some extent prevail even among the heathen, it derives no authority from the Word of God; and may, as existing among us, perhaps be traced to our early connexion with the Church of Rome. Animated by that insatiable ambition which, grasping at all power, has made her the enemy of the liberties of mankind, she seized on marriage, and, exalting this institution into a sacrament, turned it into a tool to serve her own selfish ends. Having persuaded mankind that there could be no holy or valid union without her sanction, she had, the thing she sought, the world at her feet,—and there not peasants only, but crowned kings humbly crouched, soliciting a liberty which God had already granted.

Long years, however, before this institution was invested with religious forms, it had been the custom to celebrate it with festivities,—a custom observed by none more than the Jews. For these joyous and festive habits they had the highest sanction. Our Lord accepted an invitation to a marriage scene, and honoured it by the performance of his first miracle; and, though we are to set our hearts on that world where they neither marry nor give in marriage, we should learn from the story of Cana to rejoice with them that do rejoice, as well as to weep with them that weep. It is not religion to turn away from scenes of harmless mirth; such as that on which Jesus put the seal of his approbation, and shed the sunshine of his presence.

It is the last act in the drama of such ceremonies as were observed in Cana of Galilee that this parable presents. The marriage has been celebrated. Accompanied by his bride, the bridegroom is about to return to his own house, their future home. The time, as is still the case in many eastern countries, is night; and the scene has

all the picturesque effect of a torchlight procession. While one band of maidens accompany her from her father's house, another wait near the bridegroom's to welcome them home. The hours wear on; eyes peer through the darkness to discover the gleams, and ears listen to catch the sound of the advancing party. By and by, lights sparkle in the distance; by and by, at first faintly heard, shouts and songs break the silence of the night; and now the cry rises, Behold, the bridegroom cometh; go ye out to meet him. All are roused—sleepers wakened, lamps trimmed, torches made to blaze with strong and lively flame; and forth from their places go, trooping, singing, rejoicing, the train of waiting maidens. Mingling with the advancing crowd, above whose heads sit the bridegroom and his bride, in gorgeoüs attire, their jewels flashing back the gleams of lamp and torch, they pass into the house. And now the door is shut. Those ready enter with the bridegroom; such as are unready are kept out, and to their knocking get no other answer but that of the parable, "I know you not." In considering this parable let us look at

THE BRIDEGROOM.

He represents our Lord Jesus Christ, the divine head and loving husband of that Church which is his bride, "the Lamb's wife,"—the union which faith forms between him and his people being represented as a marriage. It is one of love; for though a wealthy marriage to the bride, it is on her part as well as on his, one of endearment—We love him because he first loved us—They people shall be willing in the day of thy power. It is one which grim death shall never dissolve, and leave Christ's Church a mourning widow. It is one which holy prophets sung, and long ages prepared for. It is one which the Son, though stooping to the lowliest object, entered into with his Father's full consent. It is one in which heaven took a part, and angels were wedding-guests,—their harps lending the music and their wings the light. It is one over which all the hosts of heaven rejoiced in the fulness of generous love—I heard, says John, as it were the voice of a great multitude, and as the voice of many waters, and as the voice of many thunderings, saying Alleluiah: for the Lord God omnipotent reigneth. Let us be glad and rejoice, and give honour to him: for the marriage of the Lamb is come, and his wife hath made herself ready. May we know the truth of the words that follow, Blessed are they which are called unto the marriage supper of the Lamb!

The story of redeeming love, of this marriage, surpasses anything related in the pages of the wildest romances. These tell of a prince, who, enamoured of a humble maid, assumed a disguise; and doffing his crown and royal state for the dress of common life, left his palace, travelled far, faced danger, and fared hard, to win the heart of a peasant's daughter, and raise her from obscurity to

the position of a queen. Facts, as has been said, are more wonderful than fables. The journey which our divine lover took, was from heaven to earth; to win his bride, he exchanged the bosom of the eternal Father to lie, a feeble infant, on a woman's breast. Son of God, he left the throne of the universe, and assumed the guise of humanity, to be cradled in a manger and murdered on a cross.

Besides, in his people he found a bride, deep in debt, and paid it all; under sentence of death, and died in her room; a lost creature, clad in rags, and he took off his own royal robes to cover her. To wash her, he shed his blood; to win her, he shed his tears; finding her poor and miserable and naked, he endowed her with all his goods; heir of all things, everything that he possessed as his Father's Son, she was to enjoy and share with himself, for are not his people "heirs of God and joint heirs with Christ, if so be that we suffer with him, that we may be also glorified together."

Nor was his a love of yesterday—leaving its object to fear that, mushroom-like, its decay might be as rapid as its growth. Older than the hoary hills, it dates from a period when there were no depths, before the mountains were brought forth:

"He loved us from the first of time,
He loves us to the last."

Neither is his love, like man's, capable of coldness or of change; of diminution or decay. Whom he loveth, he loveth to the end. It is stronger than death. Many waters cannot quench it; and no time can cool it. With the fondness of a first love, it has the stability of an old one. What trials does it endure; what ingratitude; what coldness; what contempt! See how he stands at the door knocking, till his head is wet with dew, and his locks with the drops of night! nor counts that anything if he can but win you at the last! And never desisting from pressing his suit on any sinner, lover of our souls, he lingers by the door till another arrive—not with a suit but with a summons—Death himself come to beat it with a hand that brooks no delay, and takes no refusal.

And why should any refuse the suit of him who stands at their door—a lover, suitor, follower, crying, Behold, I stand at the door and knock—open to me? Setting their affections on unworthy objects, some have repelled addresses which offered them great wealth and high honours; better still, happiness as much as earth can afford. But none ever rejected such an offer as Jesus makes you in the offer of his heart and hand. They never had an opportunity. This the lover of whom it is said, He is the chiefest among ten thousand, he is altogether lovely, his person is the most beautiful, his heart is the kindest, and his bride shall be the happiest and richest the world ever saw—her home a heavenly palace, and her rank higher than any queen's. Happy are they who have yielded to his suit; and, joining hands with him, have become his in the bonds of the marriage covenant! With

the Lord for his shepherd, David felt certain that he could never want, and went down singing into the valley and shadow of death; but much more may we who, closing with Christ's offer, have given him our hands and received him into our hearts; for how much better does a bridegroom love his blooming bride than shepherd ever loved his sheep? "As the bridegroom rejoiceth over his bride, so shall thy God rejoice over thee."

THE VIRGINS.

Fair women in the prime and flower of life have formed a part, and not the least ornamental part, of nuptial scenes in all ages of the world; and we have still the representatives of the virgins of this parable in the bridesmaids of modern marriages. Ten is their number here. Why ten, and not five, or twenty? The key to this is similar to that which explains the frequent recurrence of seven in the Scriptures—seven golden sticks, seven stars in Christ's hand, seven vials, seven plagues, seven thunders; for as the number seven among the Jews denoted perfection, ten was the number that made a thing complete. A company was considered complete when there were ten present—we have Elkanah saying to his wife to comfort her when grieving because she was childless, Am I not better to thee than ten sons? and so also we have the angels of God reckoned as ten times ten thousand. Here, then, blooming like a bed of flowers, are a band of virgins; beauty in their looks; grace displayed in every movement; joy sparkling in their bright black eyes, and jewels, as they move their lamps to and fro, sparkling in their rich, oriental attire. Now they are watching through the evening hours; now, as the night wears on, slumber falls on their eyelids, and stretching themselves out, one after another, they drop off into sleep; now, roused by the cry of the Bridegroom's coming, all start to their feet to arrange their attire and trim their lamps; now, some revive the dying flames with oil, and others, looking with dismay on empty vessels, with urgency and tears beseech their companions to give them oil. Whom do these represent? Christ is the bridegroom; and the bridesmaids, these virgins, the foolish as well as the wise, who are they?

They stand here the representatives of the visible Church—of every church, and congregation of professing Christians—a picture this which should fill many of us with alarm, and set all to the task of examining the foundation of their hopes, in the view of death and judgment. The five wise virgins are those who are saved at last; the five foolish are those who are lost—and lost, though many of them, at one time, entertained no doubt whatever that they should be saved. They never so much as fancied that they would be shut out. Such a thought never damped their joy; nor disturbed their dreams, as they slept on with dying lamps beside them. Most alarming picture and solemn warning! These poor virgins do not, let

it be observed, represent the openly godless; the licentious; the profane; such as are manifestly the enemies, and not the friends of Christ. On the contrary, they could not be, in any plain sense, and were not regarded as, the enemies of the Bridegroom. They had not treated his invitation with contempt; nay, nor even with plain neglect. To some extent they had prepared for his coming; and, till the hour of trial came, they seemed as well prepared to meet the Bridegroom as any of their wise companions. I know nothing in the Bible which more than this parable, and little which so much, should so strongly and so solemnly enforce on us the advice, "Give all diligence to make your calling and election sure."

Unhappy virgins, to whom the Bridegroom brings such unlooked-for woe, who gaze with eyes of horror on your empty lamps, who, with such imploring looks and unavailing tears, entreat aid from your happy companions, who rush out into the darkness only to find the shops all closed, no oil to be bought at so late an hour, who hurry back, alas! to find the door shut—you do not represent hypocrites; or mere formal professors—such as never felt anything of the powers of the world to come; as were never alarmed; never moved by the truth; never thrown into any anxiety about their souls' salvation! Unhappy virgins, at one time all looked so promising—you watched for a while; you had lamps; you had more, you had oil in your lamps; and, though they did not endure, but, unfed, went out, they burned for a time!

Notwithstanding all this, they are lost—teaching us that it is not enough to make a fair appearance; to have been the subjects once of religious impressions; to have heard the Word of God gladly; to have felt some anxiety about our souls, and to have made some movements in the direction of salvation. We see in them how they who are near to the kingdom may yet never reach it—wrecked at the harbour-mouth, within hail of friends and sight of home. If such things are done in the green tree, what shall be done in the dry?

Let this case induce every man to prove his own work by such questions as these. Have I been converted? Do I know my heart to be changed? Have I something else to rest on as evidence of being in Christ than merely serious impressions, some occasional good thoughts, and fitful seasons of religious feelings—being well-inclined, to use a common expression? Have I oil not only in the lamp but in the vessel?—in other words, have I the grace of God in my heart?—the love that burns, the faith that endureth to the end? Not he whose light is blown out by every gust of temptation; nor he whose light, a mere lamp of profession, fails amid the trials of death, and, going out, leaves him to darkness and despair; but "he," says our Lord, "that shall endure unto the end, the same shall be saved."

THE SLEEP OF THE VIRGINS.

The scene is one of repose—no sounds but measured breathing; and by the lamps dimly burning, ten forms are seen stretched out in various attitudes, but all locked in the arms of sleep. How unlike sentinels; watchers; persons waiting a Bridegroom's arrival, and ready at any moment for the call to go forth to meet him—they sleep like infants who have nothing to do or care for; or like sons of toil at the close of day, when their day's work is done.

Were even the wise virgins right in yielding to sleep in such circumstances? They are not distinctly blamed; and so far as their own safety was concerned, they suffered no loss by it. With oil not in their lamps only, but in their vessels, being constantly prepared for the Bridegroom's coming, they might go to sleep—they had at least some excuse for sleeping. In one sense, their work was done; and so, in one sense, is ours, if, having received Christ and the grace of God into our hearts, we have made our calling and election sure.

Firstly, The sleep of the wise virgins may indicate that peace which they are invited and entitled to enjoy who have sound, scriptural, indubitable evidence in their hearts and lives, that justified by faith they are at peace with God—and so, as Paul says, may "be careful for nothing." If that is all which is meant by their sleep, let those, whom they represent, sleep on, and take their rest. The peace of God, which passeth all understanding, keep your hearts and minds through Jesus Christ! Never trouble yourselves about death—to you it is gain, and cannot come too suddenly, or too soon. He who lives in Christ is habitually prepared to die; and what more grace is needed for that hour, will come with it. "My God shall supply all your need."

But what is wisdom in some, is folly in others. He may sleep, rocked in the cradle of the billows, whose vessel rides at anchor; not he who is drifting broadside on to the roaring reef. He may sleep who pillows his head on a royal pardon; not he who, pallid and exhausted by the trial, a down-stricken and haggard wretch, enters a cell which he leaves not but for the scaffold, unless he obtain mercy. These foolish virgins ought never to have slept till, applying to the proper quarter, and, if necessary, selling their very jewels for oil, they stood prepared for the Bridegroom's coming. Nor should any rest, seeking their soul's salvation, having it for their first thought in the morning, and their last at night, till they have found it; and obtained a good hope that their sins have been washed away in the blood of the Lamb and Son of God—that God himself is now their Father, and heaven shall be hereafter their blessed home.

Secondly, By the sleeping as well of the wise as of the foolish, our Lord perhaps teaches, what the best will be readiest to admit, that even God's people are not so watchful as they should be; and

would be, were they constantly to live under the feeling that they know neither the day nor hour when the Son of Man cometh. Should he come this moment, who, in a sense, are ready to meet him? Are your faith and love, your humility and holiness in as lively exercise; are your thoughts, all your wishes, and imaginations; is the tone of your conversation, and the daily tenor of your life, such as you would wish them to be at the Bridegroom's coming? None will say so. Therefore, let us not sleep; nor, with so much to do, act as if we had nothing to do. O that we could enter on each day's duties, and close each day's work, as if we had possibly seen our last sunrise, or last sunset. That were not a frame of mind inconsistent with earthly enjoyments. No! How bright the sky, how sweet the song of birds, how beautiful the wayside flowers, how full of pleasure everything to that sun-browned man, who expects, in a few more hours, and after long years of exile, to find himself at home.

Besides, these virgins who lie there asleep, ignorant of their wants and insensible to their danger, what reasons do they form for the wise employing the precious hours otherwise than in slumber! It might have proved another night to them had the wise been wakeful. Had they shaken up the sleepers, pointed them to their empty vessels, pleaded with them, and entreated them, while there was time, to go and buy, the lost might have been saved—the door that shut them out might have shut them in. And what true Christian may not have his hands full of such Christ-like work? Among our acquaintances, the members, perhaps, of our families, are there not some who, careless of their souls, and with less appearance of religion than these foolish virgins, are not prepared for a dying hour? They would, I fear, be lost, were the Bridegroom to come now. May the idea of that, of seeing them shut out, hearing their plaintive cries, seeing them stand at the bar of judgment pictures of despair, wringing their hands in hell, saying to themselves, Oh, if my father, my mother, my brother, my sister, my friend, my minister had only warned me, and pleaded with me, I might never have been here,—haunt us, and lie so heavy on our consciences that we shall find no rest till we have implored them to seek a Saviour,—to flee from the wrath to come. Thus, going to the work in dependence on the Spirit of God, and with the tenderness, gentleness, modesty, and humility of true Christian love, have many who had neither genius nor intellect been wise to win souls to Christ.

THE SUDDENNESS OF THE BRIDEGROOM'S COMING.

Every stroke which our pulse beats, strikes the knell of a passing soul. There are sixty human lives go out every minute. But while that is the average number, death each day, like the tide, has its flow and ebb. As harmonizing with its gloomy scenes, night is the most common period for dying. She

throws her sable veil over the appalling features of life's last struggle. It is most frequently at what is called "the turn of the night" that, in those rooms whose lighted windows contrast with darkened streets, and within whose walls spectators watch through their tears the last throes of expiring nature, that the cry arises, Behold, the Bridegroom cometh! At that hour, the cry rose in Egypt when a startled nation woke—and there was not a house in which there was not one dead. So also often on the deep—at midnight, a shock, a crash; and springing from their beds, alarmed passengers rush on deck to see a strange ship vanishing like a phantom in the gloom, and their own, by a gaping wound that admits the sea, sinking into a sudden grave—there is a fearful cry, Behold, the Bridegroom cometh: they wake to hear it, and, sinking, hear no more. How loud and sudden that cry rose at midnight in the mighty tenement that a year ago shook this city by its fall, and buried in its ruins half a hundred corpses. They slept, nor woke, but to find themselves, to their astonishment, out of this world, and in another—standing before their Judge. How great their surprise; happy if not how great their dismay!

Nor does death surprise its victims only in such accidents. Foreseen by others, how unexpectedly does he often come to the person most concerned! Oh, the lying that is practised beside many deathbeds! All engaged in a conspiracy to deceive the victim, verily the tender mercies of the wicked are cruel. Everything serious forbidden; every hint of death forbidden; everything that could excite alarm forbidden,—a dying-chamber is turned into a stage for players, who wipe away their tears before they enter, and wear a lying

mask of ease and smiles and hopes, when hope herself is dead. Everybody sees the approach of death, yet not one is found kind and honest enough to speak of it. And they talk of spring who know that its flowers shall bloom on the victim's grave; they talk of journeys who know that these poor feet are journeying onwards to the tomb; they talk of dresses who know that that emaciated form shall wear no robe but the shroud of death,—the whole scene is like that old pageant of heathen worship, where they crowned the lambs with garlands, and led them to the slaughter with dances and music.

In various ways it belongs, if I may say so, to the chapter of accidents, whether our death may not be as sudden and unexpected as the coming of the Bridegroom here; or as the second advent in which our Lord shall appear with the surprise of a thief in the night. What may happen any day, it is certainly wise to be prepared for every day. So men make their wills; but so, alas, they don't mind their souls! This ye should have done, but not have left the other undone. If there is no lawyer, but, if you have any property to dispose of, and would not have your death the signal for quarrels and lawsuits and heart-burnings, will advise you to make a settlement, nor delay one day to do so; oh, how much more need to make your peace with God, and prepare your eternal rather than your temporal affairs for death,—to make it all up with him who is willing to forgive all, and is now tarrying on the road to give you time to get oil, and go forth with joy to the cry, Behold, the Bridegroom cometh! Seek Christ this day—this hour—this moment. On its decision may hang your irrevocable, fixed, eternal destiny. There is hope for you now; to-morrow, there may be none.

A VINDICATION OF BISHOP COLENZO.

. THE following "Letters to a Friend" were written on a first perusal of Bishop Colenso's book, doubtless with the charitable design of proving either that it was not written by the Bishop at all, or, that if written by him, was written, like the *Amber Witch*, to test the gullibility of scepticism. It may, perhaps, be plausibly said, that there is little in the shape of absolute proof, even now, to show that the first hypothesis may not be true. Few, it may be presumed, have seen the Bishop, or had oral testimony to his authorship of the book; while we have frequent proofs that even the most respectable publishers may unsuspectingly give to the world mss. under the name of authors who never wrote them. Still less is there any proof that, if written by the Bishop, it was written with any serious design to demolish the historic character of the Pentateuch. At all events, it seems clear that the alternative of the writer of the following "Letters" may be

logically argued. If the Pentateuch, which has so long imposed upon the world, and imposes on it still, be really not historic, it is not wonderful if some one has fathered this *brochure* on an obscure colonial bishop; on the other hand, if, in spite of the proofs of the enormous *à priori* improbability, not to say incredibility, of his being the author, he really is the author, people will be apt to imagine that whatever the difficulties which he may point out in the history of the Pentateuch, it may well be history notwithstanding.

LETTER I.

November 3, 1862.

MY DEAR FRIEND,—I have just risen from a first reading of the pages ascribed to Bishop Colenso. I cannot agree with our hopeful young nephew, Tom, that "Moses and his Pentateuch are smashed." The last two centuries have seen Moses so often demolished, and so often put together again, that

I am in no fear about him. I assure you, that if Colenso be the author, I am in much more alarm for the Bishop than for Moses; and fancy that it will be said of him as of another in a like case, "That he went out intending to commit murder, and committed suicide." Nor am I much afraid for that redoubtable doubter, young Tom. As I have seen Moses so often killed, yet rise to life once more, so I have seen many a young "Thomas Didymus" reclaimed from his doubts long before he had ended his third decade.

But, in fact, I have some doubts about the *authenticity* of the book. Certainly it contains little, if any, matter, which avowed, and therefore honest, infidels have not insisted on in justification of their infidelity. For aught that appears, there might not be a single argument adducible for the *other* side of the question; while every objection, nay, every quibble, is diligently sought out, petted, and made the most of. But more of this hereafter.

Meantime, I suggest another alternative. May not the Bishop have simulated scepticism, just to see how the shark-like voracity of infidelity would bolt any bait, even a gobbet of rancid pork, though the hook were ever so little disguised; or that he wrote it to see how far the *quasi*-liberalism of our day would go,—that fantastic liberalism which so often contends that a man may swear that he believes what he does *not* believe, and violate oaths and subscriptions with a safe conscience, on the plea that though he *voluntarily* binds himself, he *ought* not to be so bound! I fancy that either the one or the other of these theories is more probable than that a Bishop of the Church, still *remaining* such, should, in contravention of his ordination vows and in contempt of public decency, write such a book, or at least write it with a *serious* design. If he *is* serious, so far from "unfeignedly believing all the Canonical Books," he believes that five of them at least are collections of the most prodigious fables, and that whether fraud or fiction produced them, Christ and his apostles were alike *duped* by them!

You will say, perhaps, as to the *first* supposition, —that of *forging* Bishop Colenso's name,—“But is it possible that such an impudent imposture could remain undiscovered even for a moment?” Let me remind you, my friend, that if the Pentateuch has been imposing on all mankind for ages—upon Jews and Christians alike until now—we may well believe that a forger might for a moment cheat the world by a momentary assumption of the name of a bishop of no great notoriety, and perhaps six thousand miles away. There is, in fact, no comparison whatever between the magnitude of the two impostures, if imposture there be. If the Jews of all ages have been dupes on this point, and that so completely that there has not come down to us a whisper, an echo, a suspicion, of the truth; if they have been *thus* duped, though the Pentateuch bound upon their shoulders a yoke which “neither

they nor their fathers were ever able to bear,” and if *not* true, libels them in such a way as even common patriotism could hardly pardon, had it all been undoubted fact, instead of gross fiction; if their jealous and bitter enemies, the Samaritans, have all been duped in the same way; if Christ and his apostles shared in the universal delusion; if Christians of every name, age, and nation have been cheated too; if the great bulk of them, in spite of the innumerable volumes of subtle argument and contemptuous sarcasm which, during the last two centuries, have been written against the historic credibility of the Pentateuch, are cheated still,—can we wonder if this trumpety production of—so I will call him—some pseudo-Colenso, should for a moment be supposed a genuine work?

However, I do not contend that this *is* the true theory. It would be sufficient for my purpose, if the book be a piece of pure irony, like Whately's "Historic Doubts." As the good Archbishop was sometimes charged with "universal scepticism" for writing that pamphlet, so we must hope that, with as little reason, Colenso may be for a while charged with deliberately accusing the author of the Pentateuch with egregious falsehood or fiction, and the Jews, the Christians, and Christ himself, with being his dupes. If, on the other hand, it should be unhappily proved that the Bishop is indeed not only the author, but wrote the book with the *bonâ fide* purpose, or rather the *malâ fide* purpose—considering that he is *still* a bishop—of destroying the historic credibility of five "canonical books in which he unfeignedly believes;" if such a paradox should prove to be true, contrary to every appearance of probability; it is not easy to see why the Pentateuch may not *also* be true in spite of this writer's plausible objections. In either case, we can but reply as the physician did when he was told that, spite of *diagnosis* and *prognosis*, his patient was dead. "Why, then," said the unabashed doctor, "all I can say is that, on the principles of science, he *ought* not to have died."—
Yours truly,

VINDEX.

LETTER II.

November 5th, 1862.

MY DEAR FRIEND,—I do not know that I can do better than spend an hour or two of this day in stripping our modern Guy Fawkes, who, under an episcopal mask, is seeking to blow Moses and the Pentateuch into the air, of some of his disguises. I assure you the more I consider the matter, the more incredible it seems to me that the Bishop of Natal should seriously have written the book which bears his name; equally so, whether I look at the thing in a moral or an intellectual point of view. However, I will give a few of the reasons at least, for inclining to the more charitable, if not the more true hypothesis.

1. Is it credible—as I have already hinted—that a Christian pastor should seriously write a book against the historical truth of the Penta-

teach so exclusively made up of objections, that not even by accident is anything said on the affirmative side? Is it credible that he should stumble *only* on objections,—some of them as old as Celsus, many others touched by Bolingbroke and Voltaire, nearly all to be found in one or another of our infidel writers,—and urged, I must say, with much the same resolute captiousness and contempt of candour, which characterize the most unscrupulous and disingenuous of those writers? Is it credible, that while he eagerly takes up everything that looks like an objection, and exaggerates it to the utmost, he should also sedulously ignore or extenuate everything that may be said in solution of it? Is it credible, I say, that a bishop, still *remaining* such,—clinging in this shipwreck of faith to his mitre, though he has let his “ordination vows” go to the bottom,—should write a book containing little but the *matter*, and that expressed so much in the *manner*, of men who have hitherto so written for the very purpose of *vindicating their infidelity*, and who, as long as they deemed such arguments true, would have honestly deemed it infamy either to become or remain bishops in the Christian Church? I say, reasoning *à priori*, it is utterly incredible.

2. Is it credible that a man, educated as Bishop Colenso was, having had a liberal college training, having occupied a prominent position at college, having qualified himself to be a clergyman of the Church of England, having exercised the functions of one, having been appointed a missionary bishop, could have so slenderly considered some of the elementary difficulties of the Book he had gone 6000 miles to teach the heathen, as to surrender his faith ignominiously to the attacks of a Zulu savage? His ignorance, indeed, with such antecedents, would be astounding enough; but he tells us he was *not* altogether ignorant,—as how could he be, unless he had purposely shut his ears to all the din of the theological discussions which have been so rife in our age? He tells us that he had, as he imagined, competently acquainted himself with the solutions which had been offered of the difficulties in question, and upon the whole, was satisfied; yet, no sooner does he confront his Zulus, whom he is to instruct in the orthodox faith, than he is straightway instructed *out* of it! His position is really as grotesque as that of the soldier who cried to his comrades, “I’ve got a prisoner.” “Bring him along with you,” said they. “He won’t come,” said the other. “Come without him, then,” they rejoined. “But he won’t let me,” was the answer of this singular captor.

It does not seem, indeed, very credible that a Zulu, who once believed all the absurdities of his native superstitions, would be likely to be very inordinately startled by the difficulties of the Pentateuch; but be that as it may, that Bishop Colenso should be, not only staggered, but completely demolished by the native logic, on such elementary questions as that about the capacity of

Noah’s ark for its alleged cargo, does seem, to say the least, very improbable.

3. On the supposition that the “ghosts” of some of the difficulties he had formerly felt, and which he once thought “he had laid,” had revived, is it credible that he should satisfy himself that he might close his investigations *in one brief twelvemonth*; especially considering, that however ignorant he might be when he commenced them, he must have been soon aware, when he received the books for which he wrote, Ewald, Hengstenberg, Kurtz, etc., that the subjects had occupied, and were still occupying, the profoundest and acutest inquirers, in lifelong investigations? Of course, I do not mean to say there are not men who are such bundles of mere egotism and vanity, as to think they have settled in a trice what the deepest and most sagacious intellects still think disputable. But is this likely to be the case with a man who has achieved the reputation of Bishop Colenso? Or is it consistent with the gravity, calmness, and modesty which we should expect in a “spiritual guide?” Above all, is it credible that he should in hot haste publish the crude results of a hurried examination to the world, at the very moment he himself avows that he was fully aware that his book might and would painfully shock the faith, and trouble the heads, hearts, and consciences of thousands? I find it hard to believe it.

4. Is it conceivable that a Christian bishop should indulge in such effluence of talk as we find in the preface of this work, about the paramount claims of truth and the necessity of following it at all hazards, and yet fail to give the only *convincing* proof that all this was something more than rhetoric—by resigning his bishopric before publishing conclusions so diametrically opposed to the “declaration” in the ordination service: or that the only practical result of all his flaming professions should be a pettifogging attempt to prove that he can, at one and the same time, honourably affirm that he does *not* “unfeignedly believe all the canonical Scriptures of the Old and New Testaments,” and yet does not violate his declaration in the ordination service, that “he *does* believe all the canonical Scriptures of the Old and New Testaments;” in short, that he may keep his doubts,—or rather his *certainly* of the unverity of the Pentateuch,—and his bishopric at the same time? Can you believe that a Christian bishop volunteering such ostentatious professions of his love of truth and such heroic defiance of the consequences—bent on enlightening the world at whatever cost and peril to himself—should thus ignominiously subject himself to the suspicion of being the mere slave of a shifty and time-serving expediency? Looking at it in a merely intellectual point of view,—is it likely a man of so clear a head as stands on Bishop Colenso’s shoulders should have so muddled his brain as to imagine that if he does *not* believe all the canonical

Scriptures of the Old and New Testaments, but openly rejects at least *five* of them, he may adhere to the "declaration" that he *does* believe in them; or that any sophistry can prove that, so long as he is a bishop, he is not *bound* by that declaration? Or can we imagine him so far to have muddled himself as to believe that the conclusion to which he had it seems all but arrived,—“of the untenableness of his position,”—could be “materially affected by the recent decision in the Court of Arches?”* Even if that decision were ever *intended* to cover such wholesale rejections of the canonical books as this—which it never was—could he imagine that he was at liberty to say, in virtue of that decision, that he *did* believe all the canonical Scriptures of the Old and New Testaments, when he *did not*; or that he might say what his own conscience told him he could not, because another man told him he *could*? Is it conceivable that he could still further so muddle himself as to believe that the decision in question could alleviate “scruples on the point of the declaration in the ordination service,” while he still expressly admits that “the answer in the ordination service is *not* the only part of our formularies that will be generally understood, until explained by judicial authority, to involve implicit belief in the historical truth of the facts recorded in the Pentateuch?” (Page xxiv.)

And looking at the question *morally*,—can we believe that a Christian bishop has so muddled his *conscience*, as well as his *intellect*, as to believe in the above paradoxes; or the equal paradox that he is at liberty to *remain* in the Church on conditions, as he himself implies, on which no “youth of noble mind, with deep yearnings after truth” can *enter* it? that though such an ingenious youth, if he did not “believe unfeignedly all the canonical Scriptures of the Old and New Testaments,” could not make the declaration in the ordination service, yet the Bishop of Natal, having happily *made* it, though he no longer *believes* it, may safely take all the advantages of still *seeming* to believe it? nay, more, not only imply by his position that he still believes it, but give *effect* to that belief by ordaining others on the same terms, and by taking part himself in all the services and formularies of the Church,—solemnly reading “lessons,” in the name of God, ushered in with “Thus saith the Lord,” though he does not believe that the Lord has said anything of the kind, and re-

* Thus the pseudo-Colenso writes:—“For myself, if I cannot find the means of doing away with my present difficulties, I see not how I can retain my Episcopal office, in the discharge of which I must require from others a solemn declaration, that they ‘unfeignedly believe all the canonical Scriptures of the Old and New Testaments;’ which, with the evidence now before me, it is impossible wholly to believe in.”—Page xii. He adds in a note, “This was written before the recent decision of the Court of Arches, by which, of course, the above conclusion is materially affected.”

hearing in the ears of the people, as *sacred* truths, what he believes to be the monstrous exaggerations of Jewish vanity gone mad, or the drivel of superstition in its dotage? Is it conceivable that a bishop of the English Church should so far resemble Pascal’s Jesuit Fathers as to think that he may walk in forbidden paths with safety, because he knows “how to direct his intentions aright,” though novices and neophytes, not having the skill to sin without guilt, or walk barefoot on knives without cutting their feet, had better not take vows which they do not intend to keep?—
Yours truly,
VINDEK.

LETTER III.

November 11, 1862.

MY DEAR FRIEND,—I asked in my previous letter whether it was credible that one sincerely in search of truth, and above all a *Christian bishop*, should have written a book, in its entire matter, spirit, and tone, so suspiciously like some of the worst books of infidelity;—in the resolute suppression of *opposing* arguments, in the exclusive appeal to objections, in palpable distortion of facts, in evident reluctance to admit any, even the most reasonable, mitigations of a difficulty—in which, as much as in anything, the *animus* of a writer may be seen—in the captious pressing of the *literal* meaning, though it makes not only nonsense of Moses, but still greater nonsense of the critic himself; and I will add,—though I am ashamed to add,—in the attempt, in *some* places, to give a ludicrous and mocking air to what the author represents as the fair interpretation of the narrative. I assure you that, in several passages, the manner reminds me much more of Voltaire, in his virulent articles on the Old Testament in his “Philosophical Dictionary,” than that—I do not say of any Christian bishop—but of the more decorous advocates of infidelity.

Now to these charges you will probably say two things; first, that the “Preface” seems to contradict them; and, secondly, that I ought to justify my representation by some instances. I will endeavour to satisfy you on both points. As to the first: you will say, perhaps, “But is there not a noble devotion to truth expressed in the Preface? Is there not much said about reverence in approaching sacred subjects, a fear of shaking the faith of others, a solemn sense of responsibility?” etc. etc. There is; and I answer it is all confined to the preface. When I examine the book itself, all trace of these fine things has vanished. The professions of love of truth in the preface, I admit, lack nothing but the corresponding *practice*; which, depend upon it, would be found, if it were a bishop who wrote, first in vacating his bishopric before writing, and then writing, if he must write, with “reverence,” and “caution,” and “sense of responsibility,”—of all which I find not in the book one particle.

And these things, I say, make it inconceivable

that the book is the *serious*, though I admit it may be the *ironical*, work of a *bond fide* bishop. But you will ask, secondly, for some instances of alleged resemblance to the very manner of avowed and consistent infidelity. You shall have them in plenty, and the first shall alone be an instance of all I have charged, if it be not an example of the grossest ignorance,—and *that* cannot excuse the tone and manner. It is, in fact, hard to say whether the captiousness of this notable passage, its distortion or omission of facts, its *suppressio veri*, or its *suggestio falsi* be most conspicuous. I allude to the critic's grotesque description of the duties of the priest in the removal of the remains of the slaughtered victims outside the camp. Assuming his calculations of the dimensions of the camp to be about those of London, our critic says (p. 40), "In fact we have to imagine the priest having himself to carry on his back on foot, from St. Paul's to the outskirts of the metropolis, the skin, and flesh, and head, and legs, and inwards, and dung, even the whole bullock." It may be said that his ignorance here of the force of the Hebrew verb *Hiphil*, or his never having taken the pains to see *what* the Hebrew was or meant, has betrayed him into this ridiculous representation. But even if we suppose this, can you believe that a genuine bishop of the Church would be either so grossly ignorant or so grossly negligent in a matter of such importance, and allow himself thus unwittingly to play the buffoon, as the author does here, by so grossly burlesquing the meaning of Moses? Had he consulted the original, he could hardly fail to perceive that the mood in question is appropriate to the act, not of *doing*, but of *causing* a thing to be done. But in reality, even the English as it stands would not fairly suggest anything like the representation of this passage. As long as the usage holds, of enjoining on superiors what is to be done by their agents, or the maxim, *Qui facit per alium facit per se*, it does not follow that the priest was personally to perform these menial duties. Bishop Colenso himself knows far better than to interpret language as our pseudo-Colenso interprets it here. The Bishop uses human speech like any other "reasonable two-legged creature." Thus in his *Ten Weeks in Natal*, he tells us that Dr. Stanger was "one of the two who had brought out of that pestilential river (the Niger) the remnant of the ill-fated crew of the Albert;" and he would justly stare if any one had told him that he supposed "Dr. S. brought them to shore on his back!" Bishop Colenso would have said that he meant that Dr. S. took the means for bringing them out, by steering the vessel that did it.

But the passage swarms with other assumptions, which show the *animus* of the writer.

The critic knows very well that there was a large body of men—the Levites—whose express duty it was to assist in the service of the Tabernacle, and to perform its menial duties. Even these, however, might not be obliged to take the bullock's remains

"on their backs;" for it is evident that they had carts given them to convey the tabernacle, and, for aught we know, and as may be rationally supposed, other carts for other purposes. If they had carts at all, it is not likely that they would load their "backs" with the bullocks; but would prefer being "wagoners" to being "porters." But our critic who, like Shylock, is determined not to have anything but what "is set down in the bond," may perhaps say, as he is saying perpetually in like cases, "But there is nothing said about carts." Out of his own mouth he may be condemned; for is there anything said about "backs?"

In short, it is impossible to account for either the ignorance, the levity, the irreverence displayed in this grotesque parody, without supposing that somebody very different from a bishop penned it.—Yours truly,
VINDEX.

LETTER IV.

November 13, 1862.

MY DEAR FRIEND,—I do not think a more remarkable instance of a resolute captiousness is to be found anywhere than in the treatment of the stale and oft-repeated difficulty as to the rapid increase of the Israelites in Egypt. "There can be no doubt," remarks Davison in his Warburtonian Lectures, "that the providence of God in various ways favoured the rapid increase of the people of Israel during the term of their servitude in Egypt;" and we may safely infer that, if there be any truth in the history, they increased at the highest rate at which the natural law permits. At *this* rate or near it, many acute and learned men have affirmed that Jacob's family with their wives (perhaps 130 in all), might in the time allowed,—whichever of the two limits, 215 or 430 years be taken,—reach the population recorded to have left Egypt at the exodus. Without denying the *possibility* of this, I content myself with asserting the utter absurdity, if we fairly interpret the facts of the patriarchal history, of supposing that the immediate descendants of Jacob, those who came out of Jacob's "loins," with, at most, their wives, formed the whole of those who went down with him into Egypt. This critic says such is the story. "I assume, then," he says, "that it is absolutely undeniable that the narrative of the exodus distinctly involves the statement, that the sixty-six persons 'out of the loins of Jacob,' mentioned in Gen. xlv. and *no others*, went down with him into Egypt." But none of the passages he cites necessarily implies this, unless taken with a senseless literality; and it is obviously absurd viewed in relation to the whole history. He quotes again and again the passage, "Thy fathers *went down into Egypt* with threescore and ten persons; and now the Lord thy God hath made thee as the stars of heaven for multitude," Deut. x. 22. Yet it is expressly said, and this author admits, that their wives *also* went down,* and therefore it is absurd to *press* the lan-

* The *animus* of the writer is curiously shown in endeavouring to prove that the Israelites would have

guage,—as he always does however. The above-cited passage evidently means that whereas Jacob went down with but a very few descendants, he had now become a very great nation. But I contend that all the great facts of the patriarchal history show that those who went down to Egypt were in all probability not confined to Jacob's blood relations and lineal descendants.

Probably, we might say certainly, the true way of conceiving of the three patriarchs, is to look at them as resembling the chiefs of a tribe of Arab nomads, whose family and household consist of far more than their immediate descendants. God had greatly prospered the patriarchs; they were a sort of princes in the land. The chief men of the children of Heth said to Abraham, "Thou art a mighty prince among us." We are told that Abraham and Lot parted different ways because the land was too *strait* for them; which would be strange, indeed, if their families had consisted only of their immediate blood-relations, certainly not a score of persons in all. We are told, that Abraham had 318 male servants capable of bearing arms, and whom he had, by the express command of God, taken into the "covenant" by the rite of circumcision, and thus naturalized as a part of the Hebrew nation. When Jacob returned from his long sojourn with Laban, he who had gone out solitary, had become, as he says, "two bands;" he had not only "oxen, asses, and flocks," but "men-servants and women-servants." Other indications in many places of Scripture, compel us to infer, that the servants of the patriarchs were very numerous, as indeed their great pastoral wealth assures us they *must* have been. Again, are we to suppose that Simeon and Levi alone destroyed all the inhabitants of Shechem's city by their unaided prowess? Our critic will say, that the book *mentions* no other agent; just as we find historians telling us in a thousand places, that a pirate took this or that town, and put the inhabitants to the sword, without mentioning any of *his* agents; but none but an idiot would suppose that there *were* none. Again, Jacob, in addition to his own property, succeeded to the patrimony of Isaac, as Isaac had before inherited the wealth of Abraham. We are therefore, I think, *constrained* to believe, that those who went down into Egypt with Jacob, who were to take charge of their numerous flocks and herds in Goshen,—and who, as it appears, were to take charge of many of Pharaoh's cattle too,—were far more than Jacob's own issue, and probably instead of amounting only to seventy, amounted to many hundreds. The assignment of a whole province to

difficulty in intermarrying with the Egyptian women. It is not likely, he says, that the king, wishing to keep the Israelites depressed and few, would readily allow of such intermarriages; utterly forgetting, or *choosing* not to remember, that it was only at the close of the sojourn in Egypt, that the Egyptian monarch displayed any jealousy in the matter.

them (that of Goshen), seems to favour the same idea. For if they had been only seventy, a few moderate-sized farms, one would think, would have been amply sufficient for them.

The answer of Kurtz and others, therefore, who say that those who went down to Egypt must have been very numerous, is most reasonable. I have no hesitation in saying, that if I ever so much believed in the pseudo-Colenso's *general* conclusion as to the unhistoric character of the Pentateuch, I should be obliged to admit that every main *fact* in connexion with the patriarchal history points to the reasonableness of Kurtz's conclusion, and that nothing but a determination to magnify difficulties, can have blinded this writer to it. In his reply to Kurtz, he observes that twelve sacks of corn could go but a little way to sustain such a household for a twelvemonth. I reply, first, that it could go but a little way in supporting 70, or rather, including women, 130; and secondly, that to suppose it was *intended* to do so, is just one of those conjectures our critic ever disallows, when it is used to mitigate an objection, but indulges in *ad libitum* when he wants to magnify one. We have no proof that they *had* no more than twelve sacks, or that if they had *not*, they sought more than sufficient for sparing use in Jacob's own household, in the *strict* sense. It is not uncommon, even in these days, for people to live on wheat bread, though their inferiors and dependants seldom see it. That the famine was of bread, and not of food in general, is proved by the fact, that the herds and cattle remained.

I do not say that we can tell *how* the matter was, nor is it necessary that we should. I merely mean to say, that the pseudo-Colenso's difficulty is entirely of his own making, and that, meantime, the main facts which bear on the subject, and all the probabilities of the case, are in favour of Kurtz's conclusion.—Yours truly, VINDEX.

LETTER V.

November 15, 1862.

MY DEAR FRIEND,—There is one circumstance, which, if I might trust to internal evidence only, would alone be to me a *demonstration* that this book could not be the work of a Christian at all, much less of a Christian Bishop. Is it conceivable that any honest inquirer, solely anxious to ascertain whether the history of the Pentateuch was true or not, would have confined himself *exclusively* to objections; or imagined that, without computing the *positive* evidence on the other side, it was possible to decide the point? Everybody knows that there is no history in the world that may not be proved *unhistoric*, if only discrepancies, seeming contradictions, difficulties, and objections,—and in every history some will be found that are insurmountable,—be exclusively dwelt upon. There is no history whatever,—whether of ancient or of modern times, against which unanswerable topics of this description cannot be urged. In all such

cases, the merest tyro knows that the questions involved, depending as they do on *moral* evidence, can be decided only by asking, On which side is the preponderance of argument? Which way does the balance of evidence obviously incline? These are the questions always asked by common sense and common candour in every such case. Now, the remarkable feature of the present work is, that there might not be, for aught it tells us, one *single thing* to be said for the universal belief of so many nations, during so many ages, in the historical truth of the Pentateuch! Is it conceivable that the obvious and reasonable course mentioned above could have been missed by any fair advocate; by any one who was not *resolved* on proving a foregone conclusion, and supporting it by every species of logical chicanery? In no other way can I account for this purely *ex parte* statement. Is it likely that such *ex parte* statement, on *that* side, should have come from a Christian bishop? How is it, if he be really intent on truth, that he does not even advert to *one* of the many difficulties which, supposing the Pentateuch *not* historic, are far harder of solution than any of those by which he would prove it fabulous?—yes, far harder than any of the numerical problems he propounds, if we take into account, first, our possible ignorance in many cases of the numbers *originally* in the text; and secondly, do *not* leave out of account the writer's own utterly absurd exaggerations and distortions; if, again, we take into account our ignorance of many circumstances omitted by Moses, and do *not* leave out of account many other circumstances, which this writer has most gratuitously assumed.—I repeat, the problems we are called to solve, on the theory of the *unhistoric* character of the Pentateuch, are far more difficult than any of those which, by packing his evidence and begging his premises, this writer urges against it. Let me briefly point out two or three only,—all of which *must* be confronted as a necessary condition of coming to a true decision. How, then, shall we account for the intense, obstinate, and unanimous belief of the Jews for so many ages, and afterwards of their enemies, the Samaritans, in the historic character, nay, in the Mosaic authorship and inspiration of the Pentateuch? a belief never troubled by a shadow of doubt or suspicion, or contradicted by one echo of opposing testimony; a belief which, as we shall see by and by, they were ever palpably interested in throwing off, if *erroneous*, and yet which they would sooner die than surrender? This *fact* is in itself equally incomprehensible, if the Pentateuch be indeed unhistoric, at whatever date we fix its composition; whether we regard the document as preceding or contemporaneous with their national life and institutions, or (as some wise critics, but all of yesterday, pretend) composed very late in their history, or even after the return from the Babylonish captivity. If the former be supposed, and these monstrous fables were from the beginning foisted on the

nation as the true history of the events in which it originated, how can we account for its unanimously accepting them, and proceeding to mould the national life, laws, and manners upon them? Above all, how shall we account for this people's affirming they had seen marvels which everybody was appealed to as having *seen*, but which they knew had never been wrought; and on that egregious faith—or rather *lie*—proceeding to bend their necks to a burdensome yoke of laws and ceremonies, which, in the language of Peter, “neither they nor their fathers had been able to bear;” and then (to complete the thing) handing down through all coming ages, without one misgiving of heart, one faltering of doubt, one protesting whisper of conscience, this unanimous and stupendous lie? At the very least, how can we imagine a nation moulding its life, forming its institutions and manners, on what that whole nation knows, by the very appeal to it, to be a pure romance?

It is these very difficulties that principally inclined our modern critics to contend for the *late* composition of the Pentateuch. But if *that* theory be adopted, we are soon led to some similar difficulties, and equally insurmountable. For if this book was really a late composition,—long after the nation had a history of its own, and had got (no one can tell how) its institutions and its laws,—how came the Jews unanimously to endorse books in which that history is throughout so egregiously caricatured; in which common facts are everywhere exaggerated into the most monstrous fables? Five thousand at the Exodus, as this critic supposes, are turned into six hundred thousand, and everything else in similar proportion; that is, five parts out of about 600 may be supposed true! Above all, how came the Jews, at that time of day, to vouch for supernatural fictions of the most monstrous character so freely superfused over the whole book? How came the nation, at so late a period of their annals, to accept without a dissentient voice this document as their true history? how came they to be universally hoodwinked, so as not to perceive the juggle that was being passed upon them; or so universally wicked as to join without a murmur that has ever reached their posterity, in adopting, consecrating, and handing down the cheat? not one of them even for a moment relenting, in a momentary treason to this conspiracy of wickedness, so far as to express doubt or detestation of this prodigious and unanimous lie? How could they do it if they would, or how would they do it if they could?—I say *lie*,—for however this writer and many modern infidels may politely endeavour to show they by no means charge deliberate fraud on the compilers of the Pentateuch, it is utterly impossible, if the main facts of the Pentateuch have as little truth in them as this author supposes,—and the miracles, *à fortiori*, no truth at all,—to free either the writers of these documents, or the nation who accepted and vouched for them, from the most deliberate and enormous falsehood. But, lying or no

lying, the thing *itself* is infinitely more incredible than that Englishmen should all accept and unani- mously hand down to posterity without a trace of any disagreement, Ivanhoe and Kenilworth, as true episodes in our own history, and, what is more, get all future ages to believe it! This would be a *bagatelle* compared with the supposition of the whole Jewish nation, and even their bitter enemies the Samaritans, receiving, as no less than inspired truth, these impudent contradictions of their true history, and, when first published, of their very *senses* and *consciousness*, to boot! Again, how came this singular people to receive, not only as historically true, but as worthy of suffering martyrdom for, if called to it, records which, if not history, are but one long *libel* upon themselves? Would *this* make them more willing to toil to procure credit for that enduring and unanimous lie, by which alone these records could be effectually consigned to the veneration of posterity? Would not all patriotism, as well as everything else, lead them to denounce chronicles which are little else than chronicles of their shame? As well may we suppose Englishmen enamoured of the worst libels of the present New York press; adopting them as faithful, nay inspired, portraits of our national character; and handing them down to posterity as worthy of the profoundest veneration! It may be said, perhaps, that the assumed privilege of being "the favourites of heaven,"—no matter how they used or abused it,—might reconcile the Jews to being thus pilloried to all ages. I answer, first, that it is sadly evident that it was a *privilege*, which throughout their history the Jews were only too willing to forfeit; and, secondly, that though it might tickle national vanity to represent themselves as under God's immediate guidance, the pleasure would be more than balanced by the necessity of *also* saying that they ever spurned at that guidance, and repaid the Divine beneficence with the most flagitious ingratitude and wickedness. Such traits, had these records been either fraudulent or fictitious, or anything but truth, it is certain that patriotism would have softened or obliterated, before the nation would have received them. It might, perhaps, humour a man's vanity to tell how his father and grandfather had been prime ministers to some great monarch; but if he had to say at the same time that the one had embezzled the public property, and the other had been hanged for treason, he would be apt, I fancy, to exercise a wise silence about his pedigree. But

again: how shall we account upon such an hypothesis as that of this pseudo-Colenso, for the inimitable marks of sincerity, truth, nature, artlessness, honesty, which everywhere abound in the Pentateuch, and which have, in all ages, made not only Jews, but Christians, believe it to be history, and neither fiction nor forgery? How shall we account for those "undesigned coincidences,"—many of which are as striking as those which Paley has so ingeniously insisted on in his *Horæ Paulinæ*,—and of which Blunt has given us but a small *spicilegium* in his little work on this subject? How, above all, shall we account for the profound religious tone, the elevated morality, in these documents,—which, if not history, are a contexture of the most shameless and conscious violations of truth? How came the sublime doctrines of monotheism, and a purer and loftier moral code than the world had ever seen, to be given to the world in records, every page of which is stamped, if this theory be true, with the most enormous misrepresentations and the most extravagant fictions? How shall we account for the union of so much moral elevation and such unique hypocrisy; such pervading sense of the Divine presence, and protestations of speaking by God's authority, with such abandoned and unblushing wickedness? For, I repeat, there is no medium, in the nature of the thing, between supposing the documents historically true, and allowing that those who palmed them upon the world *as such*, and those who connived at and perpetuated the cheat, were among, not only the most stupidly gifted, but the most deliberately wicked of mankind.

These I say, are a few—and but a few—of the questions of external and internal evidence, which any one, really anxious to institute an inquiry into the historic truth of the Pentateuch, would have been certain to ask, and then carefully compare the result with the objections; that is, he would, like any one else engaged in such inquiries, have given the *positive* as well as *negative* side. He would have done so on the mere supposition that he was impartially investigating history; he could not *but* have done it had he had any reverence for the Pentateuch as containing, in *any* sense, a revelation from God. I conclude, therefore, that the writer of this book is probably a very different person from its reputed author.—

Yours truly,

VINDEX.

(To be continued.)

THE DIVINITY OF WORK.

ADDRESSED TO WORKING MEN. BY A WORKING MAN.

SOME of us may have thought of work as an evil. We have found this among the clauses of the original curse upon fallen man, "In the sweat of thy face shalt thou eat bread, till thou return unto the ground." And we may have hastened to the conclusion that but for sin there had been no labour; that before sin entered, toil was not; and that, when sin is finally purged, toil will cease with it and be no more. These inferences would be unfounded and erroneous. Little as we can understand of the state of man as he was created, before sin entered into the world, and death by sin; little as the Word of God itself tells, or perhaps could intelligibly or profitably tell, of that condition in soul and body so unlike and opposite to our own; there is just this written of him in his original uprightness, that "the Lord God took the man, and put him into the garden of Eden to dress it and to keep it." There was work, therefore, even then. And in the revelation, equally scanty and to us equally mysterious, of the things that shall be when sin and death shall be no more, there is nothing which implies that work will have no place in heaven. I nowhere read that toil, like death and hell, shall be cast into the lake of fire. I read, it is true, that pain shall be no longer, nor sorrow, nor crying; that God shall wipe away all tears from the eyes of His people, and that He himself will be with them, and be their God; but it is nowhere written—and we would thank Him for it—that the life of the blessed will be a life of inactivity, a life of passive enjoyment or of inert repose. If it is said that "the children of that world" shall be "equal unto the angels," yet we remember that it is one glorious characteristic of angels to "excel in strength," to "fulfil God's commandments, hearkening to the voice of His word." The angels themselves are "ministering spirits, sent forth to minister to them who shall be heirs of salvation;" and it will be one chief part of that salvation, when it is at last achieved and accomplished, that in heaven, as never below, "God's servants shall serve him."

Work, in itself, is not the curse of man. Work was before the Fall: work shall be after the restoration. No curse which could have been devised for human sin would have been so formidable as that of a compulsory idleness. If God had sought only punishment, this might have been its nature—a perpetual and an inevitable inactivity. But God, even in wrath remembering mercy, designed the curse of man to be remedial yet more than penal. And therefore He deprived him not of occupation. The punishment was, not that labour should cease, but that labour should become (1) more severe, and (2) less productive. Hitherto employment had not passed into toil, nor work

into pain: now "in the sweat of thy face," with effort more than moderate, and exertion more than healthy, "thou shalt" oftentimes have to "eat thy bread." Nor shall this excessive, this often painful toil, be always remunerative. "Cursed is the ground for thy sake; . . . thorns also and thistles shall it bring forth to thee." Labour shall too often be a disappointment: a man shall look for much, and bring in little. Excessive toil shall also oftentimes be fruitless toil. In these two respects a curse has fallen upon labour. Work itself is salutary, is honourable, is blessed; but painful work, and fruitless work, is a memento of our degradation, a consequence of our fall.

I address many who have had experience of the thing described. You work often to weariness. You work beyond the point of healthy fatigue. When work is ended, an overwrought brain forbids speedy or sweet repose. And you work sometimes in vain. All your labour fails to satisfy your employer, or fails to bring you in a just return. It is as though your very ground would bear only thorns and thistles. You say, It is all very well for the rich to talk of the blessedness of labour: for your part, you would willingly eat, drink, and take your ease. And others who read these pages are just entering upon a life of labour; and the prospect before them, little as they can see of it, looks already to them dull and monotonous. They too feel work burdensome: they too regard its fruits as inadequate and uninviting. And we also who speak of the blessing of work are not unaware of its accompanying drawbacks. We know that it is often excessive: we know that it is often disappointing. We do not deny that there is that in work which savours of the Fall and of the curse. We do not ask you to call the curse a blessing; but we ask you to bear the curse meekly, and not to disparage the blessing which lurks within it. In short, we would have you thankful for work, and submissive to toil. We would have you look forward to a work which shall be all pleasure, and patient meanwhile, by God's grace, of a work which is sometimes painful and never satisfying.

"Jesus answered them, My Father worketh hitherto, and I work." Toil may be human, but work is divine. Bear the one, and love the other.

Jesus had performed a great miracle of healing on the sabbath-day. For thirty-and-eight years a man had lain under a painful infirmity. At the word of Jesus he had risen in newness of life. "Behold, thou art made whole," Jesus could say to him: "sin no more, lest a worse thing come unto thee." A worse thing than eight-and-thirty years of disease and suffering! Out of this act of divine humanity the perverse ingenuity of the enemy could extract a cavil and a calumny. It

was the sabbath-day when the man was bidden to carry off his couch in sign of healing. The words above-written were the answer to this charge: "My Father worketh hitherto." Ill were it for the natural world, if the hand of the Creator were withdrawn from it for the sabbath; that ceaseless working, in preservation and in providence, is essential to the order of nature and to the very life of man. "My Father worketh hitherto," on six days and on the seventh; and ye yourselves owe life and being to that unwearied activity. "My Father worketh, and I work:" what things soever the Father doeth, these also doeth the Son likewise: and the ceaseless beneficence of God the Creator must have its counterpart below in the ceaseless beneficence of God the Redeemer. "The Son of man" must be Lord "even of the sabbath."

With the particular application of the words to works of mercy done upon the sabbath we are not now concerned. But the words themselves exhibit to us this marvellous feature in the life of God above, that it is a life of unwearied, of unintermitted, of incessant work. Once, indeed, God is said to have rested: "On the seventh day God rested from all his work which he had created and made." And He speaks of that rest as designed also for his people. He bids us take heed lest any of us should fail to enter into the rest which remaineth, in Him and with Him, for the people of God. But when we consider it, that rest itself must be a rest of action. Satisfaction in the thing made would have soon ended, if the hand of the Sustainer and the Upholder had not taken up the work of the Originator and the Creator. Do we imagine that the mighty fabric of nature and of animal life, like a clock wound up for its week, would have gone on without the perpetual sustentation of Him who first formed it? Is it in your own power to keep yourself in being for a single day, or to fix for your own lifetime to what point it shall go, and where it shall stop and find its limit? If you then cannot do that thing which is least, where is the wisdom of so speaking as if you could dispense with the agency to which you owe all things? A Creator implies an Upholder. If the world was not at first by chance, neither by chance is it now. If a Divine Person was necessary to its creation, so a Divine Person is necessary to its preservation.

And when we think what preservation means, we can at least humble ourselves under the sound of the Saviour's saying, "My Father worketh hitherto." By what other term can we express the agency of a God of nature, a God of providence, and a God of grace? It would lower rather than heighten the impression, if we were to presume to explain or to illustrate. Rather let us allow the three departments (as we understand them) of the Divine activity to press upon our minds in their vast extent, in their marvellous complexity. Nature, Providence, Grace,—what must He be who can carry on the machinery of any one of these?

Think of the administration of one empire such as our own; think of the variety of its interests; think of the intricacy of its business; think of the multitude of human minds and human lives devoted to its management; think of its trade and commerce, of its arts and sciences, of its fleets and armies, of its legislation and embassies, its home affairs and distant dependencies; and imagine, if you can, a single mind planning, and a single hand conducting, all these agencies. Yet what will this be to the charge of a universe, in which not our own country, but our own planet itself, is but a speck and an atom?

Or think of a single human life, with its growth, maturity, and decline, its varied fortunes, its joys and sorrows, its commonplace incidents and strange reverses, its amount of anxiety, of perplexity, of complication; and believe, as a Christian believes, that there is a thread running through it all, and a hand holding that clue and tracking that labyrinth, arranging everything with minute as well as general direction, and guiding everything to an end; and then extend your thought from one such life to many, and from many to thousands and to millions and to myriads; and remember that each one of these is seen as a whole, that no one obscures or outshines another; that, though each is at a different point in its progress from any other, yet there is no confusion, and no entanglement, and no mistake in the accurate management of any one. Will not the result of such a contemplation, feeble and inadequate as it must be in itself, at least be this, to make you bend low before God's footstool, even as the God of providence only, and to give you a more solemn impression of the words which say to us in Christ's name, "My Father worketh hitherto?"

Or think, once again, not of a single life but of a single soul; think of yourself in your spiritual being; think of the various operations of your own heart as they lie open in the sight of God; think of your varied experiences (if you be a Christian at all) of depression and hope, of deadness and liveliness, of repentance and resolution; think but of your prayers, of the things which you deprecate and which you ask for, of the subjects of interest and anxiety which you bring with you, yourself alone, before the throne of grace; and believe, as every Christian believes, that God is cognizant of all these things; that He is a God who heareth prayer, and knows what is the mind of His Spirit as He makes intercession, according to His will, not only for but in the saints; and then, once again, reflect upon the unnumbered human hearts, in this and every land, in which these processes of desire and supplication are daily realized and carried on; and remember that each one of these hearts has its own secrets and its own history, to which the answers of prayer must have a just and accurate relation, not to be confused or intermingled with any other; think of these things, possess your minds with them; and again I would ask, Do

they not show us what the work of God must be in heaven, and how truly our Lord might say of Him, in His one character as the God of grace, "My Father worketh hitherto, and I work?"

"And I work." Yes, the work of the Son is even as the work of the Father.

It was so when he was on earth. There are many ideas utterly incompatible and incongruous with the thought of our Lord Jesus Christ. Everything that is an imperfection, a moral infirmity, a questionable tendency, in man, is repugnant and abhorrent to our conception of him. But I will venture to say that no one defect is more absolutely inconceivable in his perfect character than that of idleness. Our Lord Jesus Christ was, above all men, diligent in business. He had a calling upon earth, and he followed it earnestly. In early years, yes, until the age of thirty years, he worked as a carpenter in a shop at Nazareth. His own hands contributed to the support of an earthly home and a human family. O the depth of that condescension! "Being in the form of God he made himself empty" of that glory, "and took upon him the form of a servant, and was made in the likeness of men;" yes, made in all points like as we are, save only sin! Who can complain, after this, of the humility of his position, or of the irksomeness of his work on earth? The Saviour, who was also the Creator, occupied a mean village dwelling, and wrought in a workshop with his own hands, during thirty precious years of that precious life. And when at last the fulness of the time was come, and he emerged from that profound obscurity to exercise the glorious office of the Prophet and the Revealer of God amongst men, was there any difference then in this particular? Was life then for him a period of greater ease or refinement or repose? Nay, it was a life without rest: when he rested at all, it was not so much for sleep as for prayer.

Read the record of a single day of that holy life, as it is preserved for us in the first chapter of the Evangelist St. Mark. It was a Sabbath-day; a day, to others, of relaxation and of intermitted toil. What was it to him? First there is the work, no light one, of teaching in the congregation. That teaching is broken in upon by a scene of excitement and terror; the outcry of a poor demoniac, who says, under the possession of an unclean spirit, "Let us alone: what have we to do with thee, thou Jesus of Nazareth?" and who, by the power of that almighty word, is instantly relieved, emancipated, comforted; restored to the government of reason and conscience, and to the peaceful occupations of a safe and useful life. As soon as he quits the synagogue, and enters into a house, new toils and new duties await him. There is a fever to be healed, and another life thus given back by the intervention of its Lord and Maker. Then, "at even, when the sun did set," and when others were thinking of that repose which belongs to the season, he, on the contrary, had to see "all

the city gathered together at the door," bringing to him "all manner of sickness and all manner of disease," to be separately inquired into, separately ministered to, separately healed and blessed. Long hours thus passed before rest could come. At last, we may suppose, he lay down to sleep. But the night which labour contracted at the one end, devotion shortened at the other. "In the morning, rising up a great while before day, he went out, and departed into a solitary place, and there prayed." Even thither he is pursued by the importunity of man. "Simon and they that were with him followed after him: and when they had found him, they said, All men seek for thee. And he said to them, Let us go into the next town, and preach there also: for therefore came I forth."

Or take another example, from a later chapter of the same Gospel, of the same unresting toil. For once Jesus had proposed to his apostles that they should seek repose. "Come ye yourselves apart into a desert place, and rest awhile." But the design was rudely frustrated. The people saw him departing, and while he crossed the water in a boat, crowds gathered from all the neighbouring towns, and, going round the head of the lake, arrived first in the desert for which he was bound. And thus, instead of a scene of calm retirement, he found the wilderness itself crowded with inhabitants, and that busy life was to recommence its weary round without respite or repose. "When he came forth" from the boat in which he had crossed, "he saw much people;" saw the shores, and the desert beyond, thronged with a great crowd of people, drawn together by various motives of curiosity and expectation; and, instead of receiving them with coldness or displeasure, instead of rebuking them for interfering with his purposed rest and seclusion, "He was moved with compassion toward them," felt nothing but pity, and showed nothing but tenderness, "because they were as sheep not having a shepherd;" as they spread themselves over the ridges of the desert hill-sides, they brought to his mind the idea of sheep straying without a shepherd, in danger of pitfalls or of beasts of prey, with no one to protect or rescue them; he saw in them not human bodies only, in a place shelterless and foodless, but human souls also, untended by any wise and loving care below; and therefore "he had compassion upon them," and showed that compassion in the truest and best of ways, "He began to teach them many things." He quietly resumed, without a word or look of impatience, his accustomed task of teaching, and spake to them, as they were able to hear it, the word of eternal life. And then, as the day waned towards eventide, and his lessons of divine truth were running on almost into the darkness, he began to think of the bodily hunger of his hearers, and by his creative hand, from five loaves and two fishes—all their little stock of available food—furnished forth an abundant meal for no less than five thousand guests. And when all this was over, all this long fatigue of

voice and hand—first the teaching, and then the feeding, of a thronging multitude of men—Did he then at last enjoy the repose of which he came in quest? Did he at last dismiss the crowd, and, gathering around him his twelve apostles, close the day in quietness and sympathy? No; he bade his disciples return without him to the opposite shore, and he himself departed into a mountain to pray. A day of labour, and then a night, not of sleep, but of prayer! Till about the fourth watch of the night he was thus engaged; and then he went to the disciples—storm-tossed in the midst of the sea—walking upon the water! And so, finally, the day of toil, and the night of prayer, and the morning of miracle, was but the prelude to an instant resumption of his unceasing, unresting toil. As soon as he left the ship, on his return, he was recognised by waiting thousands; people “ran through that whole region round about, and began to carry about in beds those that were sick, where they heard he was; and whithersoever he entered, into villages or cities or country, they laid the sick in the streets, and besought him that they might touch if it were but the border of his garment; and as many as touched him were made perfectly whole.”

These are but specimens of what the whole of life was to him. For him, as for us—yet far indeed beyond us—earth was a place of toil.

But what is Heaven to Him? Does He rest there? Yes, in that presence is the fulness of joy; at God’s right hand there are pleasures for evermore. But that joy, that pleasure, is not found in inactivity. The life of Christ in Heaven is a life of work. All that has been said of the Father has been said of Him; for is He not the doer of all the works of God? Are not He and the Father one? Is it not He who made the worlds? Is it not He who upholdeth all things by the word of his power? Is it not He who hears and answers prayer, and ministers to his people of his Spirit? Is it not He, above all, who ever maketh intercession for us, with a knowledge of want as minute as the power to relieve it is infinite?

Yes, it is not we only who have to work; our Saviour works, and our God works also. Week-day and Sunday, week by week, month by month, year by year, through years counted by the thousand, and then not exhausted, has God himself, the Father, and the Son, and the Spirit, set us the example of the work to which He calls us. Never

despise work as your reproach; never hate work as your curse. He who works not is contemptible; he who works not, high or low, rich or poor, has the mark of the curse—yea, of a curse which God never uttered—branded in fire upon his brow. Hand or head—there is that much of distinction and of difference—hand or head must work in all of us, or we are mere cumberers of the ground, fit neither for the land nor for the dunghill. And He who bids us work, works himself. God our Creator, Christ our Redeemer, the Holy Ghost our Sanctifier—the very names show that each one works yet more, far more, than we. Therefore, let us look upward, and let us look onward. A day is coming, when all of work that is bitter shall be done away, its over-toil, its scant reward. But work itself shall never end for the Christian. In the lake of fire there will be no work; only uselessness, only suffering, only self-torment and mutual torment; the torment of the remorseful, and the torment of the taunter. But in heaven there will be work, when once the Resurrection comes, when once the body is given back; work delightful and blessed; the work of unwearied praise, the work of unbounded knowledge, the work of indefatigable love. On earth work is our necessity; we can only shake it off through sin, we can only shake it off in misery. In heaven work will be our happiness; it will be the badge of the saved, the perpetual proof to us that we are redeemed, and rescued, and glorified. Let us so work now, that we may be permitted to work then; let each day’s business be duly consecrated by prayer before and by prayer after; let each day find each of us on our knees at morning and at evening; happier if, like the Psalmist, at noonday also. Let us take no work ever in hand on which we cannot ask for God’s blessing; let your employers find, that upon you rests the blessing of the faithful Joseph, “The Lord was with him, and that which he did the Lord made it to prosper.” This is the heritage of them that fear him. May it be ours! “Lord, thou hast been our refuge from one generation to another. So teach us to number our days, that we may apply our hearts unto wisdom. O satisfy us early with thy mercy, that we may rejoice and be glad all our days, and the glorious majesty of the Lord our God be upon us. Prosper thou the work of our hands upon us, O prosper thou our handywork.”

C. J. VAUGHAN.

FALLEN IN THE NIGHT!

BY THE AUTHOR OF "JOHN HALIFAX, GENTLEMAN."

It dressed itself in green leaves all the summer
long,

Was full of chattering starlings, loud with throistles'
song.

Children played beneath it, lovers sat and talked,
Solitary strollers looked up as they walked.

Oh, so fresh its branches! and its old trunk grey
Was so stately rooted, who forbode decay?

Even when winds had blown it yellow and almost
bare,

Softly dropped its chestnuts through the misty air;
Still its few leaves rustled with a faint delight,

And their tender colours charmed the sense of sight,
Filled the soul with beauty, and the heart with
peace,

Like sweet sounds departing—sweetest when they
cease.

Pelting, undermining, loosening, came the rain;
Through its topmost branches roared the hurricane;
Oft it strained and shivered till the night wore
past;

But in dusky daylight there the tree stood fast,
Though its birds had left it, and its leaves were
dead,

And its blossoms faded, and its fruit all shed.

Ay, and when last sunset came a wanderer by,
Watched it as aforesaid with a musing eye,
Still it wore its scant robes so pathetic gay,
Caught the sun's last glimmer, the new moon's
first ray;

And majestic, patient, stood amidst its peers
Waiting for the spring-times of uncounted years.

But the worm was busy, and the days were run;
Of its hundred sunsets this was the last one:
So in quiet midnight, with no eye to see,
None to smite in falling, fell the noble tree!

Says the early labourer, starting at the sight
With a sleepy wonder, "Fallen in the night!"
Says the schoolboy, leaping in a wild delight
Over trunk and branches, "Fallen in the night!"

O thou Tree, thou glory of His hand who made
Nothing ever vainly, thou hast Him obeyed!
Lived thy life, and perished when and how He
willed;—

Be all lamentation and all murmurs stilled.
To our last hour live we—fruitful, brave, upright,
'Twill be a good ending, "Fallen in the night!"

THE SPUR OR THE BRIDLE?

SOME THOUGHTS ON CRIME AND CRIMINALS.

BY J. HAMILTON FYFE.

COWPER, in a letter to his friend John Newton, relates a droll incident which he had witnessed at Olney. A young fellow, having been caught thieving, was ordered to be flogged through the town. As he performed this penal pilgrimage at the cart's tail, the ruddy stripes upon his back stirred the compassion, while the fortitude with which he bore them excited the admiration of the spectators. But it turned out that it was all an imposition on the public. The beadle, who was the executioner, wielded his whip with the utmost tenderness, and before every stroke, drew the lash through his left hand, which was filled with red ochre, so that when he applied it to the culprit's skin, it left an imprint like a bleeding gash. A constable, detecting the deceit, applied his cane in an earnest manner to the shoulders of the beadle, by way of exhorting him to do his duty. A country lass, pitying the pitiful beadle, assailed the pitiless constable. "Thus the beadle thrashed the thief, the constable the beadle, and the lady the constable, and the thief was the only person concerned who suffered nothing!"

Something of the same sort has just happened in

our own time, but on a grander scale. The punishment inflicted on our criminals proves to be, in many cases, as much a mockery as the streaks of paint on the back of the young thief of Olney, and while the police have thrown the blame on the jailers, not a few of the public have been disposed to censure the police. Into this round of recrimination we need not enter now. The recent panic was, in many respects, absurd, but there was assuredly some ground for it, in the rapid succession of highway robberies of a daring and brutal character which set in with the long nights and the fogs. After a brief season, however, the garotting epidemic has ceased, passing away as suddenly as it arrived, and in scarcely a single instance have the offenders escaped the clutches of the law. There has been a great deal of random, incoherent talk about this matter, and among other things it has been said that crime is on the increase in England. Now, that is a point concerning which it is very difficult to get at the exact truth. Social progress has been aptly compared to a flowing tide, which at some moments seems to recede, but, if watched sufficiently long, will be seen to be ever

advancing. Even if it were true that the reports for the last two years exhibit an increase of crimes, it might be questioned whether so limited a point of view justified a sweeping assertion that the moral tone of the people was deteriorating. But I cannot find that statistics bear out the alleged fact. It certainly appears that there has been an increase of convictions, but that may indicate only greater vigilance on the part of the police. Moreover, the increase is confined to one or two kinds of wrongdoing, while there is a marked diminution in the number of the criminal classes as a whole, who are reported to be at large, and in the houses of evil repute where they are known to assemble to concoct their plans or dispose of their booty. The great fallacy of the comparison which has been drawn between the last few years, during which tickets of leave have been granted in England, and the previous period during which the passes were limited to Australia, lies in the fact that reference has been made only to the state of this country. It should be remembered that upon the stoppage of transportation a very large diminution of crime, as much as 50 per cent., took place in New South Wales, although the population was multiplying at the rate of 40 per cent. As long as cargoes of crime were passing from one country to the other, we must, in order to deal fairly, take the condition of both into account. No one, surely, will say that it is enough for us at home to see that our own stock of criminals is kept down, without caring what happens elsewhere. This, however, is hardly a practical question. Whether crime be diminishing or not, we are equally bounden to do our utmost to prevent it. There are few subjects which have received so much attention from the wise and good in all ages. Yet the problem is still one of the darkest and most perplexing which we have to face. Although one cannot pretend to say anything new about it, it may be well, while it is attracting attention, to run over some of the leading ideas which should guide us in considering it.

Every year a chart is published, showing the localities in the United Kingdom where the greatest number of wrecks occur. There is, for instance, a long array of black crosses off the Mull of Cantire, another off the North Foreland, and so on. Could we obtain a similar map of criminal disasters, we should find, I suspect, that the rock of old associations would stand out on it conspicuously black with the register of the many good intentions and efforts to reform which had struck thereon and gone down into the deep, that the reef of ignorance would be marked as the cause of "great loss of life and property," and that the whirlpool of want would assume as dark a reputation for destruction as Corrieveckan or the Maelstrom.

Miss Nightingale tells us she has seen diseases—fever or small-pox, for instance—springing into existence before her eyes in squalid,

overcrowded homes, and passing, as the air became more impure or the inmates more numerous, into still more virulent and fatal types. With equal truth can we speak of the visible growth of crime. We have not far to go to study it. In all the great cities of the land there are hotbeds in which this foul malignant thing is raised as scientifically and systematically as the grapes or pines in any country-seat, or the azaleas and rhododendrons in any nursery-ground. Just as plainly as you see wheat growing up in the fields—first the blade, and then the ear, and then the full corn in the ear—can you watch the culture of the sucker-thief, the growth of the felon shoot, the blossoming of the prison flower, the ripening of the convict fruit, in one of those "Guilt Gardens" of which the Rev. Lord Sidney G. Osborne has lately drawn so terribly graphic a picture in the pages of the *Times*. The police can point out hundreds of such places in London and other large towns. Occasionally the reputation of the locality is so notorious and sustained, that it is stamped publicly upon it by such a name as "Devil's Acre," "Cracksman's Court," or "Ticket of Leave Row." Even to an unpractised eye there is something about one of these spots which distinguishes it from the haunts of honest poverty, no matter how wretched and reduced. In the latter there is always the bustle of some humble traffic, the hum of some petty industry. You rarely see a man there in the daytime, unless it be perhaps, the wan tailor or shoemaker, or some other drudge of the slop-master, who has come into the alley just for a mouthful of fresh air,—one could wish it were fresher for his sake,—or Mike, the hodman, who has had a bad fall from a scaffolding, and is off work for a day or two. Even the dirty, draggle-tailed women, whom one sees about, redeem somewhat of their unloveliness by the anxious industry with which they turn their creaking mangles, tend their dingy, fly-blown shops, or ply the needle in order to eke out the slender income which just keeps their little ones on this side starvation. And then at evening when the men appear, they come mud-bespattered from the trench or the embankment, grimy from the forge, carrying the tools of their craft, or wheeling their barrows if in the "coster" line. But in the true guilt-garden, you may hear now and then the sound of rioting, but never of work. The inhabitants come and go at all hours, but by fits and starts, and without any regularity. For the most part, they are languid through the day, and lively, like the bats, at night-fall. There is nothing in their dress to indicate their calling, and tools of any kind are never seen in their hands. No trace of commerce is apparent, except in the low gin-shops or beer-houses, where the "fencing masters" negotiate the disposal of plunder with the thieves. If you have been in such a place once you will scarcely seek to revisit it. Even in thought one cannot recall without a shudder that feeling of sickening horror, hopelessness, and dread,

"Children played beneath it, lovers sat and talked.
Solitary strollers looked up as they walked."

which comes over one at hearing the flow of blasphemy which is here the common tongue; and at seeing, on all sides, such multiplied images of depravity, foreheads so villainously low, small blinking eyes full of suspicion and low cunning, thick bull-necks and heavy jaws, bespeaking the passion and cruelty of the brute. Man, says an old maxim, is often a wolf to man. Here then is a crowded lair of these wolves. What are we to do with them? It is said, with very doubtful truth, that there is this much honour among these creatures, that they will not prey upon each other. I dare say not, when there are honest folk to be got at, who don't show so much fight, and afford better pickings. But suppose we could just lift up this precious community, set it down bodily, exactly as it stands, on some solitary island in the midst of the ocean, and leave it there, cut off from and out of sight and hearing of the rest of the world. Would it not be about the most awful and appropriate retribution which one could inflict on the men of crime, that they should sharpen their teeth against each other, and learn, by dire experience, to acknowledge as the essential basis of social existence the laws which they had hitherto defied?

But if humanity makes us shrink from planting such a colony to consume itself in the ends of the earth, ought not justice to second humanity in rebuking us for allowing these nurseries of crime to remain in the heart of our large towns? No amount of annual slaughter would have exterminated the wolves of old England, as long as they found cover in the woods; it was the disforestation of the country which annihilated them. All those who are best acquainted with the criminal classes declare that the organization which prevails amongst them is the great stronghold of crime. The whole brotherhood of each "Devil's Acre" work to one another's hands, incite one another to fresh enterprises of wickedness, shield one another from the police, and continually conspire to drag back into the slough any of their companions who have aspired to reform. But even the disastrous influence of such a college of sin upon its adult graduates sinks into insignificance in comparison with the evils which it works in perpetuating crime among their descendants, cursing unborn generations with the dread entail. Only think of childhood passed in such a place. Dare you, if you have children, dwell upon the thought? According to the Greek historian, it was a custom among a people of Scythia to celebrate the birth of a child with the same mournful solemnities with which the rest of the world usually accompany a funeral. Should there not be weeping and wailing when a child is born into one of these colonies of crime, when a new seedling sprouts in the garden of guilt? One year's seeding, says the farmer, takes seven years' weeding. Cannot we do anything to keep the seeds out of the soil? How is it that the law which is so stern with regard to refuse-

heaps and offal-pits has nothing to say against this moral midden? How is it that British charity, which is so manifold and lavish in its works, does not make a clearing of these jungles of sin and misery? Ay, and what can one say if it be true that men of good repute and supposed godliness do not scruple to pocket the rents of these hideous dens; that even a dean and chapter has no compunction in being landlord of a Devil's Acre? To think of checking crime while permitting the existence of such criminal breeding-grounds is, as Archbishop Whately puts it, like endeavouring to empty a lake by baling out the water, without stopping the rivers which flow into it.

The breaking up of these infamous haunts is, then, one way of preventing the growth of crime. An improved system of national education is, of course, another way. But there is a more fertile source of crime than ignorance, and that is, overcrowding of population, which means, in other words, scarcity of employment and dearth of food. For this, prudent emigration alone can provide a remedy; the excess of population must be enabled to seek fresh fields and pastures new in some other quarter of the globe.

And then, over and above these measures which belong to the community at large, there is the private individual action of each of us, which must be directed against the growth of that evil, which is sin in us, and leads to crime in others more unfortunate but perhaps not more sinful. We must not forget that crime is not the exclusive product of the criminal class, but the outcome of a general disease in the social body, which is expressed in its weaker parts, just as something wrong with the stomach causes a tumour to afflict the head, or the gout to settle in the toe. "There go I," William Bradford used to say, when he saw a malefactor, "but for the grace of God." And it would be well if each of us, when aghast at some sad spectacle of crime, would reflect that in the strange complex workings of humanity we may have contributed to its production. It is not difficult to conceive how secret faults in us, practised on the safe side of the law, may, by the force of example or the contagion of moral maladies, have developed crime in others. Could we but trace each thread in the tangled web of human relations, we might find reason to say with Lear: "Change places, and handy-dandy, which is the justice and which the thief?"

Well, then, how ought we to punish our criminals? "Sweep them into space," is the answer of one school of disciplinarians; "away with them, after the good old German fashion, to the deepest convenient peat-bog; there plunge them in, and drive an oaken frame down on them solemnly in the name of God and man." This mode of punishment trusts nothing to the criminal; its efficacy consists in depriving him absolutely of the power to offend again. From of old this method has been most in favour. In our country, down

to the beginning of the present century, criminals were treated with Draconic rigour. According to Hollinshed, every year of Henry VIII.'s reign saw two thousand persons perish by the hands of the executioner. Under Elizabeth, the number was reduced to four hundred a year, but the Government thought it necessary to assure Parliament that this did not arise from the leniency of the Crown. Even as late as 1817, we find that in the month of February there were a hundred prisoners under sentence of death in Newgate, and a few days later, the assizes left forty-six condemned to death at Lancaster, thirty-three at York, and twenty-seven at Chelmsford. Down to the reign of George IV., death was awarded indiscriminately as the penalty of almost every species of crime. The starving wretch who pilfered goods to the value of five shillings from a shop, and the hardened ruffian who robbed the mail, shooting the guard, and maiming several of the passengers into the bargain, were alike held to have forfeited their lives. When the perpetual application of the halter began to shock public feeling, the kindred remedy of transportation was resorted to. As far as the mother country was concerned, it was almost the same as if the convict had been put to death, for to his native land he scarcely ever returned. In those days, Botany Bay was, as it has been said, virtually another planet; "it was as if the moon had come alongside, and taken off our worst criminals to offend our eyes no more." Many died on the way out to the penal settlement, from the effects of a protracted voyage, in a small, over-crowded, ill-provisioned ship. Many succumbed under the hardships of the life of slavery to which they were subjected by the settlers. The chances of money-making in the colony, and the cost and difficulty of procuring a passage home, detained abroad most of the survivors who were released. This system decimated the criminal class at home: did it cure crime? No. It positively fostered it. The very rigour of the law defeated itself. The disproportion between the offence and the punishment elevated the criminal into a martyr, and gave crime a false air of heroism. Often the victims would not prosecute those who had wronged them, witnesses withheld evidence, juries acquitted in the face of the most glaring facts, and even judges conspired to defraud justice. The Government itself was afraid to execute the "bloody letter of the law" in a great many of the cases where convictions were obtained. Hence guilt became an exciting lottery, in which the criminal perilled a high stake, but had all the chances in his favour. At the same time, crime was diverted into its most noxious channels. The man who knew he could be hanged for shop-lifting, did not care whether he committed a murder as well, and accordingly bloodshed became the common, instead of, as now-a-days, the rare incident of robbery. It must be owned that these two systems—the wholesale executions of our grandfathers, and the wholesale transportation of

our fathers—had at least simplicity to recommend them. Whether the criminal was strangled or banished, he ceased to be troublesome at home. Only there was this defect in the latter plan, that, as no attempt was made to reform the transported convicts, it was only transferring the evil from the mother-country to the colony. And if Judge Heath was right in his premises that "there is no regenerating a felon in this life," he was certainly right in his conclusion, that "it was better to hang the malefactor at once, instead of transporting him to corrupt an infant state." It is doubtful whether transportation diminished crime in England; it is certain that it raised a crop of the most atrocious crimes in Australia. Even the colonists, who had at first thriven on the slave labour thus supplied to them, and drew long faces at news of increasing morality, and small jail-deliveries in their native land, at length revolted at the steady flow of villany which was pouring into the settlement.

As convicts could no longer be either hanged or transported, it was necessary to resort to some other mode of punishment. Then it was that a competition arose between those two great "systems" for the prevention of crime, the one by suppressing the courage, and the other by suppressing the will to commit it; the one appealing to the flesh, the other to the temper; the one symbolized by the Whip, and the other by the Bridle. Both are equally lawful; the only question is, Which is more effectual? Of the discipline of the whip we have had long experience. It has been flourished over the back of the criminal from time immemorial, but seems to have made little impression on his mind. In fact the whip, pure and simple, has been rather a mistake. It has hardened the criminal; it has not conquered crime. It has exasperated, but it has rarely deterred. The gradual disuse of scourgings at the cart-tail, pillorying, setting in the stocks, and other kindred ceremonies, is not only a mark of the growing refinement of the times, but an acknowledgment of the futility of punishment in such forms.

As to the bridle, it has been on trial only a few years, and has certainly been abused. Lenity to the criminal has been carried to a pernicious extreme. The old alderman's sarcasm about the Turkey carpet in Newgate has almost come true. The lodgings and good cheer provided for convicts at Portland are much superior to what nine-tenths of them can obtain when at large, and such as no labouring man dare aspire to. No one who is in the least acquainted with the life of the honest, struggling poor, who knows with what sad monotonous uniformity bread and tea serve for almost every meal from week's end to week's end, and how great a dainty a scrap of meat is on a Sunday, can read, without a burst of indignation, the dietary at Portland.* "When twelve o'clock comes in the works at

* Compare this with the Irish dietary. Class I.—Males: breakfast, eight ounces of meal stirabout, and

the Verne," says the *Times* correspondent, "the free labourer, who has done more quarrying than any two convicts that day, may be seen sitting down to his meal of bread and cheese, sometimes with a bit of dried fish, or a tin pot of coffee, the latter generally unsweetened. The convicts' dinner three days a week is as follows:—One pint of soup properly seasoned, thickened with barley, rice, carrots, and onions, and equal in nutriment to any ever placed on a gentleman's table; five-and-a-half ounces of cooked meat, free of bone; one pound of potatoes, and ten ounces of rich suet pudding. On three days a week the pudding is replaced with six ounces of bread, and on Sundays the meat is increased to six ounces. In addition to the dinner we have mentioned, the men in the third stage receive on Sundays two ounces of cheese, with three ounces of bread, and half-a-pint of beer after it; while the men in the fourth stage receive the same as to bread and cheese, and beer as the third, with the addition of a *treacle pudding* after dinner on Thursdays, baked mutton in lieu of beef on Thursdays and Fridays, and baked beef instead of boiled on Sundays and Mondays. Here, then, we begin by giving our convicts a daily dinner, such as, for nutriment, quality, and quantity, few labouring men can afford on Sundays, and we gradually raise the scale of luxuries till they dine at last on soup, baked beef, bread and cheese, and beer, and pudding."

Stone walls do not a prison make, nor iron bars a cage, when the interior is so snug and luxurious, and we need not wonder if minds, innocent and quiet as those of the inmates, take it for a hermitage; a soothing interval between the acts of a stormy life, during which they may lay up health and vigour for future "professional" exertions. *Æsop*, in one of his fables, tells us how he one day met a man, who having been bitten by a dog, was giving the animal bread dipped in his blood, under a superstitious belief that this would help to cure the wound. "Good heavens," cried *Æsop*, "if the dogs only find this out, they will all fall upon us in the hope of getting sops!" The fable has found an illustration in our own day. The "Prison Matron" who has recently published her memoirs, relates that dutiful convict daughters have been heard imploring their mothers, when on a visit, to do some act that may make them partners in the comforts of a prison life. Only the other day a body of paupers in a workhouse got up a riot in order to be promoted from the starvation charity of the Board of Guardians to the sumptuous entertainment of the jail.

But if, under the present system, the curb has

one half-pint of new milk; dinner, fourteen ounces of bread, and one pint of new milk. The women and children receive smaller quantities. The male convict (class 1), if engaged in exhausting labour, and certified by the doctor to require it, gets for breakfast nine and a half ounces of meal; and for dinner, one pound of bread, or its equivalent in potatoes.

been foolishly misused, it is not the less, when rightly applied, a valuable and potent influence. In the old Norse mythology, we are told that the gods for a long time could not manage to bind the Fenris wolf. First they tried steel, but he snapped it; then they brought mountains, but he spurned them with his heel. At length they slipped round his foot a limp band softer than silk or cobweb, and this held him. So soft and powerful are the bonds of kindness; only it is not every heart that yields to them. It is not every one who understands what is meant by returning good for evil, and heaping coals of fire on the head of one's enemy. Archbishop Lanfranc found this out to his cost once when he fell among thieves. He had heard that a pious man having had his horse stolen, presented also his whip and spurs to the robbers, who, touched by such generosity, declined the gift, and restored the steed. Lanfranc determined to follow the example, so he told his assailants that as they had taken his purse, they might as well take his clothes too. The Norman robbers, however, being practical, matter-of-fact men, received this suggestion literally, and having stripped the good man, went their way with his clothes as well as his money. The philanthropy of the modern convict system appeals in the great majority of cases to men and women equally unable to comprehend it. They must be prepared for it by preliminary discipline.

The truth is, that neither spur nor bridle is of much account by itself. The one is the complement of the other. When Mr. Rarey has a wild horse to tame, he begins by making the brute feel its helplessness in the hands of a superior power. In the same way the first stage of penal discipline must be such as shall convince the convict that society has a long arm and an iron grip, and possesses both the will and the power to make supremely unhappy whoever defies her laws. This is the time for the use of the whip; that is, for the infliction of suffering sufficiently severe to be anticipated with dread by any one with a criminal bias. By unanimous testimony, solitary imprisonment is the most effectual at this stage. When the felon passes from the bustling world into his desolate cell, he is blotted out for a time from the ranks of men. He loses his name, and answers to a number. His individuality is further suppressed by the prison uniform and shorn head. All his old habits and associations are suddenly snapped. His whole outward life is changed. And this can hardly fail to tell upon his inward life. Under the leaden pressure of the slow sad hours, the giddiest mind is driven to reflect. The tedium of enforced idleness becomes intolerable even to the sluggard. The gloom and dejection of this season of solitude and Lenten fare "cows" the most obdurate spirit. At the end of this period of "suspended animation," the bridle may be used with good effect. The convict should be allowed gradually to return to the round of active life; to taste

the luxury of labour, to enjoy association with other men, to resume his proper name and dress, to receive wages, and to exercise his growing freedom within certain limits. But at every stage he must be made to feel that the spur has been laid aside only because it is supposed he will answer peaceably to the bridle, and that it rests entirely with himself to determine, by his conduct, under which discipline he will be placed. This principle is systematically carried out in the Irish prisons; it is also recognised, but only in a dim, half-blind way, in England.

The greatest blunder of our criminal system has been to make "hard labour" a punishment. It is impracticable, because it cannot be enforced. You can't make a man work unless he chooses. Even if it could be enforced, it would still be absurd, because it would only be compelling a thief or a robber to do that which, had he not tried his fortune in the lottery of guilt, he would have had to do all the same in order to earn a livelihood. Over and above all this, the plan is positively mischievous, because it connects labour with degrading associations, and confirms convicts in that dislike to it which is the great source of crime. Instead of being imposed as a punishment, labour should be awarded as a privilege. It should be the distinctive badge of a convict's promotion. But then—

"Work without hope draws nectar in a sieve,
And hope without an object cannot live."

A stimulus must be given to labour by attaching a wage to it; while, in order to keep up the idea of punishment, and convince the convict that he has made a bad bargain, the wage must be kept much below that which honest labourers in the same line can earn. Whether the wage should be paid in money or kind; whether the convict should be allowed to reap any benefit from it at the time, or whether it should be saved up for him till his release, are mere matters of detail. The main thing is to make the convict feel that his own industry is the road back to freedom; that every stroke of his pick or spade takes a brick out of the prison wall; that every slab of rock he helps to quarry, is a stepping-stone to independence.

There is a growing feeling in favour of making prisons self-supporting. This result has been accomplished in the United States, in some parts of Germany, and even in our own country. In 1851, Portland Prison paid its own expenses, with a balance over; but, of course, the development of the "turkey-carpet" system has changed all that. There is, however, no reason why the same thing should not be done again. Now-a-days one is half shocked, half amused at the old Anglo-Saxon scale of fines for all sorts of crimes. You could have the blood of a king for 30,000 thrymsas, or about £150. For about half that sum, you could enjoy the luxury of assassinating a prince, and the life of a bishop or earl was valued at only a third. The murder of a serf was dirt cheap—only the price of a couple of axes or so; and the nose

or limb of an enemy could be taken on easy terms. Of course, no one would seek to revive this plan of commuting deeds of blood for money-payments; but I think there is a good deal to be said for the proposition, that when a man has committed an act of plunder, a pecuniary estimate should be formed of the loss which he has inflicted on his victim and on society, and that he should be sentenced to imprisonment, not for a certain term of years, but until he has wiped out the score against him by the fruits of his labour. What is called "poetical justice," has met with a good deal of ridicule. It deserved it when it took the guise of such punishments as Bentham suggested, for instance, that a forger should be exposed in public with his right hand apparently pierced by a large iron pen, and a slanderer with his tongue similarly transfixed by a dart. But the absurdity of these devices lay in their unreality; neither hand nor tongue were really to be injured, but were only to seem so. If, however, retribution be real, there is something in it much more impressive to vulgar minds when it assumes an appropriate, or, as the phrase is, a poetical form. An eye for an eye, a tooth for a tooth, is a deeply-rooted craving of our nature; and the punishment of robbery would be more striking if it entailed the restitution of the booty and compensation to society.

It is obvious that the restoration of the criminal to society must be gradual, and in this respect, as also in making labour a boon and not a penalty, the Irish system is vastly superior to the English. In the latter the convict passes from a state of strict discipline into unrestricted freedom, and the virtue of the ticket-of-leave is destroyed, because it is given almost as a matter of course, and because no means are taken to enforce the conditions upon which it is granted. Under the Irish system the convict has still two stages of discipline to pass through after he has reached the point at which Colonel Jebb turns him loose upon society. These two stages are that which is passed in movable encampments in the neighbourhood of any public works at which the services of the convicts are required, and that which is spent at large under the sanction of a ticket-of-leave, and under the surveillance of the police. It is to be hoped that before long the two systems will be assimilated in this respect.

We have now reached the most perplexing part of the convict question. What are we to do with the discharged prisoners? In the great majority of cases they come amongst us anxious to live by honest industry. In an over-stocked labour market this is a hopeless task. An employer who can pick and choose among a host of candidates of unquestioned probity when he has a vacancy in his office or workshop, will not receive a man with a tainted character. After a fruitless search for a situation the released convict too often finds his way back to his old haunts, meets with a cordial welcome from his old pals, in striking contrast

to the coldness with which every one else salutes him, and resumes his old life of crime. More than twenty years ago the attention of Thomas Wright of Manchester was drawn to this painful problem by an incident which occurred in the foundry where he was foreman. A steady, well-behaved workman was dismissed because he had been a convict. Mr. Wright interfered in his behalf, and got the consent of the firm to take him back again. But in the interval the man had gone away, and no trace of him could be obtained. After this Mr. Wright took a great interest in criminal reformation, visiting the prisoners in jail, reading and praying with them, and exerting himself to procure situations for them on their discharge. A humble workman with scanty means, a large family, and twelve hours of hard daily toil, this noble-hearted man devoted every minute he could spare from sleep, every sixpence he could save from the pressing wants of his home, to the relief of the unfortunate beings in whom he had learned to take so deep an interest. For nearly thirty years he has continued this good work, and has saved hundreds of discharged prisoners from relapsing into crime. Of late years he has been enabled, by a public subscription, to devote all his time to this important mission. In furtherance of the same object societies for the aid of discharged prisoners have also been established in London, Birmingham, Wakefield, Durham, and other places, and have effected a vast deal of good at the cost of a very little money. Private philanthropy may thus do something to procure employment at home for criminals who desire to reform; but it is clear that their best chance of well-doing lies, not in a densely peopled country like our own, where

“Every gate is thronged with suitors, all the markets overflow,”

but in a new land where population is scarce, labour in keen demand, and food cheap. Dirt, we are told, is matter in a wrong place. And so of crime it may be said that it is industry, intelligence, courage in a wrong sphere. Of late it has been rather a fashion to draw a comparison between our moral and our material refuse. “In former days,” says one writer, “we used to store our sewage in cesspools in our own back-yards, and allow it to poison the soil all around us: under a

wiser sanitary process we now run it into the drains, and send it into the sea.” Has not science taught us that this is wasteful and ridiculous excess, and that in running the sewage into the sea we are throwing away immense quantities of the most valuable ingredients of a fertile soil? And so with our “moral sewage.” We ought to deodorize, that is, reform it, and then apply it as a stimulant to the development of colonial progress. But, in doing so, we must take care that we do not send out a greater supply than the soil can absorb with safety; that we do not swamp the new country with the refuse of the old. This was the error we formerly committed in transporting to Australia. Let us steer clear of it now. The best way of doing so is give up transportation as a form of punishment, and to enable discharged convicts who have shown sincere signs of reformation, to go out as free men to a colony; but, of course, not without the knowledge and sanction of that colony. Justice, prudence, and humanity alike require that we should keep our worst criminals at home, where we are better able to maintain the large and costly machinery which is necessary for keeping them in check.

There will, of course, always be some among the criminal classes whom there appears to be no possibility of reforming; whom no amount of penal purgation will cleanse from those spots of crime, which, if they seem for a moment to be effaced, reappear as soon as they are exposed to the heat of old associations and temptations. While humanity shrinks from taking away the lives of such, the instinct of self-protection compels us to take away, at least, their power of doing harm. For these, therefore, it is difficult to devise any other treatment than consignment for life to a prison, over the gates of which should be inscribed: “Who enter here must leave all hope behind.” We have hospitals for incurables; something of the same sort is wanted for those whose moral maladies have been pronounced past hope of cure. Before, however, we pass that awful sentence on a fellow-man, we may well pause to consider whether he has had a fair chance of retrieving his position, and whether the obstinacy of his guilt is due to too much of the Spur, or too little of the Bridle.

POPULAR EPITHALAMIUM

MARRIAGE OF THE PRINCE OF WALES.

SHE COMES, across the waters spread the sails;

She comes, to play her brave, uncommon part ;
 The Princess who shall wear the name of Wales ;
 The Woman who shall win our England's heart.
 The Nation's heart up-leaps to meet her ;
 The Nation's voice rings out to greet her.

Our Lady cometh from the North,
 The tender and the true,
 Whose fire of darkest glow hath rarest worth ;
 Whose flowers can keep their dew ;
 And a look in its women's eyes is good
 As the first fresh breath of the salt sea-flood,
 Or the bonniest blink of its breezy blue :
 And from its dark Fiords, with sails unfurled,
 Came the mighty Norsemen,
 The men that moved the world.

They were the darlings and pride of the ocean,
 Rocked on her breast by a hundred storms ;
 Tossed up with joyfullest motherly motion ;
 Caught to her heart again—clasped in her arms.
 No Slaves of the Earth but Sea Kings, the rough rovers
 Took wings of the wind and flew over the foam.
 Yet, the old True-hearts, like faithfullest lovers,
 Came back with the sweeter sense of Home.

Come ! stir the Norse fire in us mightily !
 Come, conquering hearts as they the heaving sea.
 Come, wed the people with their Prince, and bless
 Them with your neighbouring nobleness.
 There's nothing like a Beauty of the Blood
 To set the fashion of a loftier good !

There's nothing like a true and womanly Wife
 To help a man, and make melodious life,
 For, she can hold his heartstrings in her hand,
 And play the tune her pleasure may command,
 And cause his climbing soul to grow in stature,
 Trying to reach the heights of her diviner nature.

Come in your beauty of promise ;
 Come in your girlish glee ;
 Let your sun-smile scatter from us
 The shadow of misery.
 Hearts in the dark have been aching,
 But now the Clouds are breaking.
 Come as come the swallows
 Over the brightening sea,
 And we know that Summer follows
 With the sunny days to be.
 Come and give us your merry good-morrow,
 The Joy-Bells shall ring, and the Joy-Birds sing ;
 Dumbly shall sit the Bird of Sorrow,
 Hiding his old head under his wing.

This world is but a newer paradise,
 To that glad spirit looking through the eyes
 Of Love, that sees all bright things dancing toward
 It, gaily coming of their own accord.
 For 'tis as though the lightsome heart should climb
 Up into the head, and look from heights sublime,
 And sing, and swing, as it would never drop—
 The merry reveller in the tall tree-top,
 Where Life is with such lofty gladness crowned,
 And all the Pleasures dance in starry ring around.

But may this love be true as hers who sees
 Ye, like a smiling future at her knees :

GOD has created man imperfect, & left him with many wants, as it were to stimulate each to individual exertion & to make all feel that it is only by united exertions & combined action that these imperfections can be supplied, & these wants satisfied.

This presupposes reliance & confidence in each other.

FIRST SPEECH OF
 H.R.H. THE PRINCE CONSORT,
 MAY. 1848.

JOHN LEIGHTON
 1848

The Wife who held God's gifts the richest wealth ;
 Our Queen of Home who gave us sweeter health ;
 The Widow in whose face we looked to see
 That great black cloud of our calamity
 On the side nearest heaven, and marked her rise
 In stature, calm to meet her sacrifice :
 As one with faith to feel Death's darkness brings
 Almighty Love on overshadowing wings.

True love is not the incense that will rise
 Up from the heart to dim a lover's eyes,
 But, such a light as gives the jewel-spark
 To meanest things it looks on in their dark,—
 A flood of heaven welling warm to bless
 And sanctify each grain of earthiness.
 True love will make true life, and glorify
 Ye very proudly in the nation's eye.
 Ah, Prince, a many hopes up-fold the wing
 Within the Marriage-nest to which ye bring
 Your Bride, the life ye live there will be rolled
 Through endless echoes. mirrored manifold.

We charge you, when you look on your young Wife,
 And watch the ascending brightness of new life
 In the sweet eyes that double the sweet soul,
 That ye forget not others' dearth and dole.

Just now, the wind it wails

As though the cold were crying
 Over the hills and over the dales,
 And sinking hearts know well what ails
 The sound of the wintry sighing :

It bears the moan of the dying ;
 Dying down in the starving Shires,
 Without food, and without fires.
 The bitter nights are cruel cold,

One cannot help but wake, and think
 Of the poor milk-lams of the human fold
 That have no milk to drink.

A Royal Worker to his grave went down
 A little year ago, without his crown.
 He dreamed the time would come when Rich and
 Poor

Might shake hands, and he strove to open a door,
 And tried to till the waste-land,—sought to see
 It glad in good, the stern world Poverty.

His was a heart that only beat to bless
 And heaved with double-breasted bounteousness
 Like any woman's. But, 'tis ever so ;
 He's gone where all our golden sunsets go ;
 Gone from us ! Yet his memory makes a light,
 Enriching life with tints of pictured bloom,
 Like firelight warm upon the walls of night,
 An inner glow against the outer gloom.
 Do thou but live, and work as Albert willed,
 And he shall smile in heaven to see his dream
 fulfilled.

Heroic deeds of toil are to be done,
 And lofty palms of peace are to be won.
 Life may be followed by a fame that rings
 With nobler music than the Battle sings,
 When Death, astride the black Guns, laughs to see
 That flashing out of souls, and grins triumphantly.

Love England, Prince ; whatever else ye be,
 Keep true to her, the glorious, great, and free !
 Bear high the banner of her peerless fame,
 And let the evil-doers fear her name.
 We joy to serve her, least of all the race ;
 Yours is the prize to fill her foremost place.

Like some great River, stretching forth before ye
 Through all the land, your widening way doth lie,
 Brimming and blessing as it rolls in glory,
 Broadening and brightening till it reach the sky.
 A splendid Vision ! the green corn looks gay ;
 The Bird of Happiness sings overhead :
 And may the sunny uplands far away
 To heaven lift up the Harvest ripe in evening red.

God's blessing on ye, may you walk together
 Like Strength and Sweetness through the merry
 May-weather ;

Wed in that sweet for ever of love's kiss,
 Like two rich notes made one in wedded bliss.
 And may you face the Winter, when 'tis here,
 With hearts that keep their May-dance all the year.
 May the life-leaves turn over as ye go,
 Quietly, with the softest breath of love ;
 And when the book is closed here below,
 May it be read with glistening eyes above !

A SUMMER IN THE PROVINCE OF NICE.

BY THE REV. PROFESSOR LEE.

WHILE the city of Nice is one of the best-known places in Europe, the province to which it gives its name, and of which it is the capital, is seldom visited, and is little known. So much is this the case, that, having been advised to spend the summer in the interior of the province, we found it impossible, even in the city of Nice itself, to obtain complete or even accurate information regarding the country and the climate. It may therefore prove interesting and useful to persons situated as we were three years ago—desiring to reach a good summer residence without a long and fatiguing journey—to learn what our experiences were during an abode of three months in that part of *Sardinia*, as it was then, of France with which it has since unhappily been incorporated, and of which it now forms the south-eastern frontier.

This ignorance of the Niçois themselves is explained by their singularly unacquisitive and *stay-at-home* character. The travels of even the wealthier classes among them seldom extend beyond their annual migrations from their country villas—which they universally let to strangers in winter—to *apartments*, often of a very humble character, in town, and back again, when the returning sun drives the wealthier visitors to cooler regions. In the middle of June, the heat and its accompaniment, the mosquito, having now rendered not only the town but the neighbourhood of Nice, intolerable, we set out on the great road to Turin, intending to halt at St. Dalmas; and if we found this place unsuitable, to proceed as far as the Grande Chartreuse, or whatever other place we might hear of that appeared favourable. After travelling ten or twelve miles, we began to ascend the lower ridges of the Maritime Alps. The country becomes beautiful, and the situation of some of the towns, as for example *Scarena*, is so picturesque and peculiar, that to see them would richly reward a tour. The tradition is that the towns were perched upon those almost inaccessible elevations, as a protection against the Saracens, by whom, in the middle ages, these parts of Western Italy were devastated. Certainly convenience had nothing to do with the selection of such sites, especially the grand convenience of obtaining water, the want of which has caused some of those old towns to be finally deserted within very recent times. The passing of those *cols*, of which there is a regular succession, formed a very difficult enterprise; but the splendour of the scenery when the summit was at last reached, always proved a rich reward. The road on the side of these *cols* zig-zags so much, that in some cases, as above *Sospello*, a distance of three miles, as the crow flies, requires one to travel twelve miles of

road; and looking from below, these roads, constructed with incredible labour, have the appearance of an enormous fortification, rising wall above wall for miles together. The road, in ascending the *Col di Tenda*, which is beyond St. Dalmas, makes no fewer than 82 turns; and it is amusing to watch the curious positions into which the surrounding mountains and valleys are successively thrown by those incessant turnings. It would be perhaps difficult to find anywhere a more splendid panorama than one beholds from the top of the *col* above *Giandola*; which is itself a singularly curious-looking and picturesque little place, unlike anything we have ever seen elsewhere. Surrounded with mountains to the south, west, and north, it stands upon the west bank of the *Roya*, now forming the boundary between France and Italy. This rapid river flows here under the nearly perpendicular face of a mountain, which rises to a great height on the east of the river and of the little village, as if nature had intended one little spot of earth at least to be secured from the possibility of being touched by that scourge of all living things, the east wind. *Giandola* is remarkable as being the point where one takes leave, without regret, of the mosquitos. We had much of their company, and suffered greatly from their attentions, the night we remained there—not to speak of other uninvited visitors; and we never met them again till, on our return three months' after, we slept, or tried to sleep, in the same place. Along with the virtues which the Italians have begun to display, all travellers will sincerely hope they may acquire that half-virtue of cleanliness, as Aristotle calls it, without which the others don't render man's abode quite *comfortable* upon the earth.

A small incident which occurred at *Giandola* brought to our minds a common saying everywhere, but which has no force in cold climates. We met a girl with a basket of fine figs, some of which we attempted to purchase, when her father came up, and insisted on our taking as many as we wanted, scouting the idea of any one taking money *for figs*. The proverb, "Not worth a fig," is evidently imported from the south. At *Giandola*, which, from its low and sheltered situation, is very warm, figs are abundant and excellent.

Taking leave of *Giandola* and the mosquitos together, the road follows the course of the *Roya* through a deep and wild ravine, which the torrent has cut for itself, and which presents striking and often very grand scenery all the way to St. Dalmas. The mountains go down in most places sheer into the river, so that the road is generally cut out of the rock, which in many places overhangs it; and here, though it looks more dangerous, it is indeed safer

than where there is sufficient space for the road between the river and the mountains, for upon these parts of the road rocks and avalanches of earth and stones frequently descend, rendering it often impassable, and always dangerous.

The Roya, which is very rapid, and carries down a great quantity of water, is dotted all through its course with logs of wood. These, as we afterwards learned, are on their way from the mountains around St. Dalmas to Ventimiglia, where the Roya falls into the sea. The timber is cut, and rolled into the stream, and though stranded hundreds of times in its passage, finds its way at last, by the help of floods and of gangs of peasants with long poles, to its ultimate destination. Besides the tediousness of this process, the timber is much injured by it, and, by the enormous friction during so long a time, is even greatly reduced in size.

The situation of St. Dalmas (properly St. Dalmas di Tenda) is striking and picturesque. The gorge here expands into a valley, surrounded with mountains, rugged and bare at their summits, cultivated wherever cultivation is possible, and in many places where, to foreign eyes, it appears impossible; and clothed towards their base with forests of magnificent chestnut trees, which we saw in all their glory. These grand productions of nature are, indeed, a feature of the landscape here, and add much, not only to its beauty, but to its agreeableness and salubrity. They formed our grand resource during the heat of summer. To them we retired as to our study, reading-room, club, drawing-room, and general refuge from the heat and glare of the sun,—to ruminate, peruse the newspapers, and discuss their contents, hold long communings, and sometimes keen debates, and sigh for our homes, which, like other blessings, we seldom value till we feel their loss. Many of these trees still retain marks of cannon-shot lodged in their trunks during the wars of the French Revolution, when this country was invaded by the armies of the Republic, and valiantly and obstinately defended. The final success of the French, as tradition says, was due to a traitor belonging to the neighbouring little town of Briga, who discovered to the invaders a pass, by which they were enabled to take the patriots in the rear. In contrast to the wild grandeur of the hills, the valley is covered with fields of the richest pasture, as intensely green as any which Devonshire or the Emerald Isle itself can show, and incomparably more productive; for every month during the summer they carry off a crop of grass from these meadows. This is owing to the abundance of water, unsparingly and skilfully applied to irrigation; so that, amid these wild mountain passes and secluded glens, a fertility is produced, the charm of which is heightened by contrast with the scenery around. No less than three torrents, at the bottom of as many gorges, meet in this valley, each of considerable volume, so that the

sound of rushing waters is never out of your ears by night or day, making you feel that you should be cool if you are not. In fact, so large a body of water, at a low temperature, constantly rushing down from the mountains has a considerable effect in cooling the atmosphere, as also in counteracting its extreme dryness. Nervous people, however, are apt to be afflicted with the unceasing roar of the torrents. St. Dalmas reminds one of some spots in the Highlands of Scotland; but the climate and the light, and the *feeling* which these produce, are quite a contrast; as are also the rich fertility and splendid vegetation in immediate proximity to the wild sublimity of nature.

These mountain sides and valleys exhibit the bold industry of the Piedmontese in a very striking light. Wherever soil exists or can be collected, stone terraces are built, on which grow grass (in shaded situations), chestnuts, olives, corn, potatoes, etc. The fruit of the chestnut is ground, and the pigs, donkeys, and mules consume it for the most part. In former times, it was commonly made into bread, and eaten by the people. This *terracing* of the hill-sides could only have been effected where labour was incredibly cheap. According to the opinion of a well-informed resident, the great mass of the work was done by men who did not receive for their toil more than threepence a day; and he thought, in most cases, the work would not have been worth doing at a dearer rate. It is amazing that men should ever have attempted to cultivate places so unpromising, consisting of such narrow strips of land, and many of them so lofty and inaccessible, and even so dangerous to approach. But they and their donkeys have learned to do marvels in the way of climbing; and hunger is a powerful stimulant to industry, daring, and ingenuity. From what has now been said, the reader will understand the curious contrast which presents itself according as one regards the country from the heights, or from the valley: in the one case, one sees nothing but gardens; in the other, nothing but a succession of stone walls; so that it is not easy to believe it is the same country one is looking at in the two cases. By the way, it may be not amiss to state, for the benefit of future travellers in such regions, that persons of *moderate weight*, and especially ladies, are almost always safer in climbing those mountain roads upon donkeys than on their own feet, provided the donkeys be good, *i.e.*, of *sufficient age and experience*; for, as a general rule, the older they are, they are the stronger and the safer. A lady of our party met with a rather bad accident going down on her feet a very steep and rough part of the path, over which she and her husband imagined it impossible that her donkey could carry her safely: however, the other donkeys, with their living burdens, all performed the feat with ease, while the poor unbelieving lady, though zealously assisted by her equally unbelieving husband, fell and received a painful injury.

ST. DALMAS AS A SUMMER RESIDENCE FOR
INVALIDS.

St. Dalmas di Tenda was, before the French Revolution, a convent of the Augustinians, dependent upon a greater establishment of the same name farther north. It is beautifully situated at the mouths of two of the glens or gorges which here unite their waters; and is square in form, as the houses of that order generally are, with a quadrangle in the centre, having piazzas on three sides. It is upon the whole in good repair, and was, at the time of our visit, clean and orderly. At the period of the French Revolution it was seized, like other ecclesiastical property, and sold. The grandfather of the present proprietor purchased it, with some appendages, for a very small sum, and it is now used in summer as a *pension* and hydropathic establishment, for which purpose it is admirably adapted, on account of the abundant supply of excellent water. The church of the convent is now used as a stable and hay-loft; the dormitories of the monks are now the sleeping chambers of the inmates of the Pension, or boarding-house. We enjoyed the distinction of occupying four apartments, *en suite*, on the south side, which are much more ornamental and comfortable than the rest, having belonged to the prior or abbot; and the refectory still serves the same use as of old, being the *salle-à-manger* of the establishment, in which good viands are washed down with excellent appetite and copious libations of cold water, the wine being generally unpopular, because of its too close affinity with vinegar. Experience, however, seems to prove that, mixed with water, it is the most wholesome beverage to be found in these regions to the *generality of people*. When we were there in 1859, the Pension was kept by M. Escoffier, the well-known restaurateur from Nice, who, with the efficient aid of his wife, managed matters very well upon the whole, and succeeded, as far perhaps as any one can, in satisfying such restless, exacting, and discontented people as the occupants of such places commonly are. Of all nations, we think the English a shade or two the worst in these respects. The walls and ceilings of this old convent are, like all houses in Italy, however humble, ornamented with frescoes tolerably executed. So common is the talent for this kind of work, and so cheap a luxury is it, that we were informed such ornamentation, and even better, is executed by artists who think themselves well paid with two or three shillings a day. This brought to our remembrance the remark of a very eminent Scotch artist, with whom, some years ago, we found ourselves alone, before dinner, in an elegant drawing-room in Edinburgh. "We are still barbarians," he said; "a white roof over our heads, and a splendid carpet beneath our feet!" No doubt this is a solecism in taste which the Italians have long escaped, though their climate may have suggested one-half of the lesson; but perhaps the thoughtful reader may

think it a parable which carries a deeper meaning. The climate of St. Dalmas is dry and bracing. The temperature, during the summer months, is wonderfully equable. From the middle of June till the 10th September, the thermometer never fell below 70° Fahr. during the day, nor ever rose above 80°, except two or three days in the end of July, when it rose in the heat of the day to 82° or 83°. We had no record of the lowest temperature during the night, as we had no self-registering thermometer; but our feelings assured us that the nights were always warm; a single sheet and a light cotton counterpane being all the bed-clothes that were supplied,—the latter being generally dispensed with. We felt it pleasant to sleep with our windows open,—though the natives do not approve of this practice, and its propriety in those climates may well be questioned. At sunset, of course, everybody kept within doors; an hour after, everybody went outside, when it was pleasant, and reckoned safe to stroll or sit as long as any one chose. Early in the morning, the eastern hills afford shade for those who choose to walk,—though even then it is warm; but by eight o'clock the sun is too powerful. Between ten and eleven A.M., the breeze begins to blow up the valley from the sea, and grows stronger till about two P.M., when it gradually dies away. This is the history of the weather during three months; without any observable variation, except on three days, which were exceptions, but which exactly resembled each other. On these, the only days, as far as memory serves, on which we saw clouds, a thick mist was discerned about eleven A.M., filling the narrow pass in the under part of the valley. This gradually travelled up the pass, and ascended the hills, till it covered all the heights surrounding: at the same hour, about half-past one P.M., on each occasion, a tremendous thunder-storm occurred, accompanied with such torrents of rain, that in a short time every place was flooded, and the Briga river, which was nearly dry before, descended with a stream probably a yard deep in front, and in an hour it ran at the speed of a mill-race six feet deep. Before four o'clock all was over, and by five o'clock, the sun was shining in all his splendour upon the glancing mountains, the drenched earth, and the roaring floods. Except on those three occasions, the weather was uniformly bright and warm; the heavens without a cloud, so that we soon took it as a matter of course, and nobody either spoke or apparently thought of the weather. Thus was cut off, by the hand of Providence, one of the staple articles of our British conversation. After July, the evening and morning became sensibly cooler; and in the last month of our sojourn, the afternoons were delightful; and driving and riding became a real luxury for those whose strength did not permit them to enjoy the greater luxury of walking. This last, however, is here a luxury, or even a possibility, only to such as have active limbs and

sound wind, as there is very little level ground, and the finest views are to be reached only by paths that are both rough and steep. For persons of light weight, the donkey is equal to anything; the mules are not more safe, and far less pleasant; indeed, they are seldom found good in this locality. A new road to Briga supplies the only level drive in the neighbourhood; that up the valley by Tenda, or down the gorge to Fontana, is more beautiful and picturesque.

We could not obtain accurate information as to the elevation of St. Dalmas. Probably it is nearly 2000 feet above the level of the Mediterranean. We shall not detain our readers with detailing the grounds of this conclusion, which, however, cannot be very far from the truth. Now that it is in possession of the French, the country will, no doubt, be soon accurately surveyed, and all such details will become accessible. Upon the whole, St. Dalmas furnishes a desirable summer residence for such invalids as are wishful to remain during summer within reach of the coast, and to whom a dry, bracing, and moderately warm climate is beneficial. That the country here is healthy upon the whole there cannot (we believe) be any doubt. The situation of the Pension, though pretty, is not the best that the locality affords; a noble one is only a furlong south upon a small hill in the chestnut forest. But the great objection to the present situation is the nearness and roar of the stream, and the nearness of irrigated meadows. A spirited capitalist, who should erect a large house in a proper situation at St. Dalmas, could hardly fail to meet with abundant encouragement, as supplying a want which is very frequently and painfully felt.

THE PEOPLE OF THE COUNTRY.

The people who inhabit this region are in many respects worthy of study. Their moral and social, no less than their physical features, are pretty distinctly marked. There can be little doubt that they are Celts by race; less mixed, perhaps, than anywhere else upon the Continent. What traces of this derivation their language may bear, we cannot say; but their features and general appearance so much resemble those of the Irish, that, meeting with a company of them anywhere in Great Britain, in the month of July or August, one would pronounce them Irish reapers without a moment's hesitation. Some of them look the very originals from which Erskine Nicol painted his highly characteristic pictures. Nor need we wonder at this; remembering that this country was included in Cisalpine Gaul, and was even in the classical Roman age inhabited by Celts. Their *patois*, which sounds bold and nervous, has evidently a great deal of Latin in it, as might be expected; and, besides, is said to be compounded of Celtic, Greek, Spanish, and Saracenic, with some French words. The common people do not understand Italian, and hardly a word of French; among

the upper classes both these languages, as well as the *patois*, are generally spoken, though, before the annexation, Italian was the fashionable language which the patriots also affected. Of course that is changed now. The priests, who perform the Mass in Latin, everywhere, in the country, employ the *patois* in preaching. In some respects, whatever their resemblance in others may be, they are a striking contrast to the Irish; they are never, even the poorest of them, seen in rags; their garments, often patched and clouted to the last extremity, with no squeamish regard to harmony of colours, are always whole; none of them appear to be idle; the women in their daily journeys to and from the fields, are always found knitting stockings as they walk; and though numbers are poor, beggary may be said to be unknown. These people are eminently industrious, indeed hard working; and their habits being simple and their wants few, they appear to be not ill off, according to their own standard. Indeed, we were told that there is a good deal of wealth among some of them; they are often what the Scotch call *bein* bodies. Their manner of life is very primitive. Their regular dwellings are always in small towns, the chief of which are Tenda and Briga, each about two miles distant from St. Dalmas; though they have lodges or sheds upon their fields among the mountains, where they occasionally remain. From their homes they go forth in the morning as soon as it is day—father, mother, children, mules, and donkeys, often including the cow, which supplies the family with milk. They remain at their work all day upon these mountain farms (for the whole country is mountainous), living upon bread, milk, sometimes a little olive-oil, or an onion; till the evening, when you see them returning home again, often a distance of several miles, much like a gipsy-camp, the cow leading the way, the mules or donkeys following laden with wood, hay, corn, or other produce, and the sunburnt and toil-worn human beings bringing up the rear, the mother carrying her baby, strapped in a cradle, upon her head; yet knitting with indomitable industry. A mode of life so primitive and simple strikes the imagination of a stranger.

The common dress of the men on holidays consists of a black hat with broad brim and red bow, blue waistcoat and knee breeches, white stockings and shirt: a jacket is added in cold weather, but in summer it is commonly carried over the shoulder, or left at home. The women wear a brown-coloured bodice, with a blue petticoat, and a kerchief over the head. On the whole, the costume of the women is neither beautiful nor picturesque, though it is convenient; and the large size of the feet, or at least of the shoes, both of men and women, gives them (perhaps to our sophisticated perceptions) an ungainly air. Every woman, they say in Italy, has at least three attractions—fine hair, fine eyes, and fine teeth. The last, however, disappear at an early age. The

natives of this country, especially the women, are martyrs to toothache; and it is rare to see a woman of five-and-twenty who does not want half her teeth.

The priests do not use the costume of their French brethren; they wear a black surtout reaching down to the knees, with black breeches and stockings, and a very large-brimmed hat, cocked on one side, which for ugliness cannot be surpassed. It is curious that almost all the priests we have seen in this country are tall, stately men, far above the average of the peasantry. Early toil stunts the growth of the latter. The priests go continually about among their flocks, and evidently live on very intimate terms with them. An English lady, long resident in this country, informed us that the people, those of them especially who are in more easy circumstances, have the same ambition to have one member of the family raised to the dignity of the priesthood, which the Scotch peasantry have long shown "to see their bairn wag his pow in a pu'pit."

We were anxious to form some estimate, approaching to correctness, of the intellectual, moral, and religious condition of this primitive and, as they proved to us, interesting people; but the *unknown tongue* presented a formidable difficulty. In some respects, indeed, their character needed no words to interpret or expound it: their quiet, and orderly, and decent habits, their sobriety and honesty, spoke to the eye, and needed no explanation or demonstration. In the Pension, where was a multitude of servants, no one locked up anything,—jewels, money, all were left open; and no one was aware that he lost anything. In the district, people did not lock their doors, and a great proportion of the houses had no locks. There are some people who occasionally take too much wine; but drunkenness, in the sense in which we use the word, may be said to be unknown; the climate and the nature of their potations render this almost impossible. The bulk of the adult peasantry are not educated,—that is, they cannot write or read; but the Sardinian Government, under the direction of Count Cavour, was exerting itself to promote education. For this purpose, free instruction was provided for those who could not afford to pay for it; and Government inspectors traversed the country to see that the teachers did their duty. In this and many other respects, the new political arrangements will prove a great loss to this country; for no government so much influenced by priests as the French is, can ever heartily promote popular education. It was interesting to observe in the churches that an elderly peasant never had a book, whereas all the children, and many of the younger men and women, had books and could read.

The people are very religious; they attend mass very regularly, and all the *men* confess twice a year. We went early in the morning, on the Feast of St. Peter, to the little town of Briga. It was a

high festival. We found the whole population arrayed in holiday attire, engaged in their religious ceremonies, before eight o'clock in the morning. A crowd was hearing mass in the large parish church; and in the adjoining church, or chapel, a numerous congregation was singing with great zeal and earnestness and tolerable execution some good music of great length,—a capital organ, very well played, occasionally bearing a part; the solo parts being sung by peasants who stood up voluntarily in the body of the church. What appeared curious was, that no priest was present during this long performance. In the parish church of Briga are some good old paintings, not well kept, and in need of cleaning. Upon the whole, the inhabitants seemed zealous in performing the offices of their religion. From all we could learn, the Piedmontese in general are sincere but not bigoted Romanists; the upper classes appeared to us much less inclined to Protestantism than opposed to Catholicism; they are to a man dissatisfied with the temporal power of the Pope, with the confessional, and the numbers of the monks and clergy. All we conversed with expressed the desire that the Church of Rome might be reformed; but none of them thought there was any probability of the Italians embracing the Protestant tenets. Some of the more ardent patriots hoped that the Court of Rome might prove impracticable, and so drive the Italians into absolute rebellion against the Church; but these aspirations seemed to be merely political.

A few days after the Festa di S. Pietro, a party of us went to Briga, when we were told we should see the whole population of the *Mandamento*, as well as of the town assembled. It was one of the numerous fêtes connected with the B. V. M. (if I remember rightly). The Sardinian government had abolished the great mass of the fête-days, which proved a serious inconvenience to industrial pursuits, leaving, however, a small number as days of recreation, of which this was one. There are now four days in the year, besides Sundays, on which the newspapers are not published; a significant indication that in Sardinia the king had supplanted the priest. We found, as we approached the town, the whole population turned out, all in their gala dresses; and in their relaxation, as well as in their toil, they appeared a comfortable, happy, and well-conditioned population. The juniors were eagerly occupied in dancing, which was of the most primitive description, and kept up with incredible perseverance, considering the heat; the music being as rustic as the dancing. It was the etiquette for each lad to promenade along the road with the partner he had just danced with. This is evidently the recognised opportunity of love-making; more safe and decorous than that secret *courting* over night which has so long and disastrously prevailed in some other countries. The older people looked on apparently with interest and pleasure, and one of the priests

passed through the crowd of merrymakers, and seemed as pleased as they were. This appeared to us a scene of very innocent mirth, without any mixture whatever of profaneness, indecency, or drunkenness. The younger members of our party went afterwards with the family of an Italian Count, who resides in summer in Briga, to a large hall near the market-place, which was the principal scene of dancing and merriment. The Count's family and the people appeared to be upon the most easy terms with each other, and nothing could exceed the good breeding and manly respectfulness with which the people behaved. Our party were filled with surprise and admiration, not without many reflections, on the contrast which would have been exhibited at an English or a Scotch fair; swearing, intemperance, and black-guardism, all were unknown among these primitive mountaineers. It was impossible not to feel both gratified with such a sight, and also painfully humbled. What we witnessed on this occasion, and indeed daily during our three months' sojourn at St. Dalmas, prepared us for what we learned from the best authority to which we could obtain access, or is to be found. The inhabitants of this town—and the same holds, though not so generally regarding the two others mentioned before—are a large proportion of them peasant proprietors, who cultivate with their own labour little mountain farms, which they have inherited from their ancestors, and which, while they preserve them above want, render it impossible that they should be either idle or rich, in our sense of the word. Industry, frugality, temperance, and forethought, thus become conditions of their very existence, and at last hereditary virtues. Accordingly, as was said before, there are no rags to be seen, and no beggars, and, what is more wonderful, there are no paupers. The following statements we found it hard to believe, though they were made by a gentleman resident in the country, a considerable proprietor, and, so far as we could judge, a man of accuracy, who also referred us to the magistrate of Briga, and by him the account was literally confirmed:—It is this, that in this Mandamento, containing upwards of four thousand souls, there have been but three illegitimate births within the last forty-one years; and that among the peasants, illicit intercourse may be said to be unknown; and that there is not a woman of loose character in the whole country, nor would be suf-

fered to live in it. Also, that in the Mandamento of St. Remo, upon the coast, containing a population of about 14,000 souls, there is no memory or record of a murder having ever been committed. This information we mentioned with incredulity to an intelligent physician resident at St. Remo, whom we met at St. Dalmas. He said he believed the information was perfectly correct.

Should more minute investigations prove that there is some exaggeration in these accounts—and notwithstanding our anxiety to reach the truth, we should not feel surprised to find that there is—still the general purity of the people's manners being remarkable to admit of such exaggerations being current and universally credited among themselves, as they undoubtedly are. The facts also are capable of an easy explanation. Their mode of life and their peculiar customs shelter them from many of the most powerful temptations to which young persons are exposed elsewhere. They are constantly employed as families, young and old together, apart from other families. The youth of both sexes spend their lives under the eye of their parents; even in their sports and amusements the older people and the priests are present and look on. They are very industrious; they are sparingly fed, and almost exclusively on vegetable diet; and they marry young. The parents also, though less learned in politics and in religious dogmas than some other populations, and though for the most part they are not able to read, and are little addicted to theological disputation, yet seem both to understand and practise some religious and moral duties better than others who have enjoyed greater advantages. They seem to take greater care of their children, and to exercise a far more vigilant inspection of their conduct than is common among the peasantry of other countries; who often abandon them, when they have reached the age of temptation, very much to their own guidance, and permit or perhaps encourage secret meetings over night, which not only result in immorality, but show that feelings of delicacy, if not of virtue, in these respects, are already well-nigh dead, both among old and young; till at last results appear which fill us with surprise and shame. Among the simple *paysans* of that secluded country, we could discover no trace of that depraved moral sense which teaches parents not to blush at their daughters' shame, or to call the loss of their virtue by the name of "a misfortune."

PETER BAREND'S: THE MAN WHO GAINED BY LOSING.

BY THE REV. JOHN DE LIEFDE.

THOUGH Eliphaz the Temanite was a miserable comforter, yet he was not an altogether incapable preacher. It was a true saying of his, *that God disappointeth the devices of the crafty, so that their hands cannot perform their enterprise*. At least, this was the experience of Peter Barends, the fore-

man of Mr. Kolman's large bedding and mattress manufactory.

Mr. Kolman's extensive premises were situated in one of the densely-populated suburbs of the metropolis. There also was situated Peter's snug little house, which looked as clean outside and in-

side as a Swiss toy under a glass shade. And no wonder, for his excellent, active, and indefatigable wife brushed and scrubbed the two parlours and the attic and the little cellar every day, and squirted a deluge of water upon the outside walls twice every week.

"When I am dead," she used to say, "I cannot help going to the dust; but as long as I live the dust shall not come to me." And Peter quite agreed with her there, and thought there was not a cleverer wife within ten miles round.

Nor was Mr. Kolman less pleased with Peter. He had enjoyed his honest and valuable service for upwards of twenty-one years. During that period the small six-windowed factory had grown into the gigantic edifice which lifts its five-storeyed frame as high above the surrounding houses as the elephant, with its uplifted trunk, must have figured above the beasts that crowded the ark of Noah. Everybody, from the first feather-cleaner down to the assistant-ticking-seamstress, agreed, that but for Peter's able and faithful management, the building would never have got beyond its old six windows. Nor did Mr. Kolman deny it altogether, though he always tried to make the people understand that Peter had acquired all his knowledge and ability under his mastership; which, of course, Peter, in his turn, never denied. His wife, however, would sometimes remark, that if Peter and his master had an equal share in the praise bestowed upon the excellent beds, it might be understood in this way: that whereas Peter made them during the day, up even till eleven o'clock at night, his master tried them during the night, up even till eleven o'clock in the day. If, however, Peter kept the works going till such a late hour at night, it was well known that he often remonstrated with his master about this disproportionate division of labour and rest; and the people were not unconscious that they were indebted to him for the higher wage which at length they received for their over-work. Thus, though he would sometimes give a well-deserved ear-box to a boy, or turn out a dirty-looking seamstress with the threat that he would throw a pail of water over her if she ventured to come again in that state, yet he was liked by his people as the beasts in the Zoological Gardens like the keeper who brings them their food. In fact, Mr. Kolman's works exhibited a remarkable similarity to a menagerie. There was the clumsy white bear, and the roaring lion, and the malignant tiger, and the irritable wild-dog, and the always-laughing monkey, and the never-smiling ospray. And all this tribe was kept in order by Peter. When he but lifted the latch of the door, the noisiest humming and babblement immediately changed to perfect silence, just as at a railway station the ear-deafening hissing of the engine at once ceases when the engineer turns the hauld.

There was one lamb, but only one lamb, in this human menagerie. Jane Moling, the ticking-seamstress, was a good, quiet, kind girl, and a zealous,

clever worker at the same time. Whatever came from her hands might be examined with a loup; no sewing-machine could sew more regular stitches. Yet Peter always felt puzzled with her. She was the only one among the crowd whom he felt a certain dread of. Whenever he entered the seaming-room in his usual rough, imperious manner, the look of that girl's eyes at once disarmed him. Especially when he allowed himself to strengthen his rebukes by an oath or two, or by threatening the people with the condemnation of God and the fire of hell if they did not work better,—at such times he felt ashamed of himself if his eyes met those of Jane, and he would leave the room with a blush.

"There is something queer about that Jane Moling," he one day said to the first seamstress, when paying her her wages. "I don't understand what it can be. Do you know anything about her, Mrs. Steen?"

"Ah! she is a saint, sir. She is one of the elect, you know. I mean in this way:"

With these words Mrs. Steen turned up the white of her eyes towards the ceiling, and drew down her face to something like three-quarters more than its usual length.

"Ah!" replied Peter, "that's it, is it? We poor sinners can't come up to that. But how do you know it is so?"

"I know, sir," answered Mrs. Steen, "she regularly attends the meeting of that Methodist preacher, Mr. Stalman, twice a week. I suppose you have heard of him? He turns the people regularly mad with his preaching. Many of them come three or four miles, and return home in the dead of night. Jane leaves her cottage at six, though the preacher does not commence till eight, and she returns about eleven, which is shameful conduct in a young girl, in my opinion, sir."

"Certainly it is, Mrs. Steen," replied Peter. "She had better keep at her work. She loses a shilling a week at any rate by her nonsense. I now understand why she earns less than she should do, for she is a clever and quick seamstress, and no mistake. However, she is old enough to mind her own business; but it is great folly in her; and if any other of the girls follow her example, I will put a stop to it at once. You may tell them that."

Mrs. Steen dropt her courtesy and went off.

"I wish," murmured Peter between his teeth, "I wish I could sew up that preacher in a mattress and send him to the South Seas. The natives would then have bed and breakfast in one parcel."

A few weeks after this conversation, Mrs. Steen one morning came up to Peter, and told him that Mr. Stalman was likely to hold a regular evening meeting in the neighbourhood.

"Do you know where it is to be?" asked Peter, somewhat in a voice of alarm.

"Yes, sir; it is to be at Govert the joiner's. He has a large shed, as you know. I am told he lets it at two shillings an evening."

"Very well. Has Mr. Kolman come down yet?"

"Yes; he is in the office. I saw him come up the yard a minute or two ago."

Away went Peter to the office.

"Sir, if you want the people not to stop work at six you must at once hire the joiner's shed near he bridge."

"The joiner's shed?" asked Mr. Kolman, rubbing his eyes. "You don't mean to try to join mattresses with nails, and to stuff them with shavings?"

"No, sir; but the Methodist preacher is about to hold evening meetings there, and you may be sure he will make a complete mess of the whole district and of our works."

"Confound the fellow!" cried Mr. Kolman. Of course we must steal a march upon him. But what are we to do with the shed?"

"I hear," replied Peter, "that the owner only lets it for two evenings in the week. It occurred to me we might as well adapt it as a sewing-school for the little girls. Mrs. Steen may easily spare a couple of evenings to give them a lesson. We'll get excellent seamstresses after some time by that means."

"Capital!" exclaimed Mr. Kolman. "That will shut the humbug out. But, I'll tell you what, Peter, hire the shed in your own name. Of course I will give you the money. You understand me. It must appear as a private affair of your own. You see it would not do for one of my standing in society to enter into an open war with that sort of common-class people."

That same day it was known throughout the whole neighbourhood that Peter Barends, the foreman, had overreached Mr. Stalman, and taken the joiner's shed. Mr. Stalman did not trouble himself to look after another place, for he knew that though poor Peter was the foreman, yet rich Mr. Kolman was the rearman. Besides, the district only contained small labourers' cottages; the joiner's shed was the only suitable room in the neighbourhood.

Matters now kept quiet for some time, and Peter enjoyed his success amazingly. He every now and then paid a visit to the little school, and so did his wife. Having no family of her own, she soon became a regular visitor, to talk with the little things, to tell them the stories of "Tom Thumb" and "Puss in Boots," and to treat them to apples or walnuts. She also taught them to sing songs, as,—

"There was a little devil,
His tail was two yards long," etc.;

or,—

"John gave his wife a beating,
She beat him in her turn," etc.

"How nice, Mrs. Barends!" Mrs. Steen would often remark. "You are a perfect schoolmistress, ma'am. Pity you have no children of your own. How nicely they would be trained!"

"Ay, Mrs. Steen," would she reply, "you see I have not forgotten the lessons I learnt at school. Poor little things! Let them have a little bit of

fun. It's a great deal better than that Methodist cant and bawling psalms, with faces drawn down to the third button-hole of the jacket."

"It is indeed, ma'am. And the girls at the factory all keep at their work, except Jane Moling, of course, the foolish creature."

"By the by, Mrs. Steen, where does that girl live? Is she the tall, slender person with the red chequered apron?"

"Not at all, ma'am. Why, don't you know her? She wears a white apron and a muslin bonnet. She lives next to the grocer's, over the bridge."

"Well, I think I must go and see her some day. I must know what there is under that going to the meeting, wet or dry. I'm sure there's a love story lying at the bottom."

Mrs. Barends was quite right there. It was a love story, but one of an infinitely higher nature than she conceived of.

But Mrs. Barends was too much engaged to think about such abstract things as love and faith and eternity and the like. True, she had no family to look after, nor had she to attend to her husband, for he was at his business all the day, and only peeped in at noon for his dinner, which was too plain to require much cooking or baking. Yet Mrs. Barends' time was so dreadfully taken up that she could not possibly think of looking even for one moment into her Bible, which, with gilded edges and silver clasp, neatly bound in brown morocco, was lying in the corner of the uppermost drawer of her chestnut bureau, bounded on one side by a carved ivory fan, and on its other side by a pair of gloves carefully spread out, so that thumbs and fingers perfectly covered one another. For there was so much to clean and to wipe and to wash and to rub and to scour and to brush every day, that even Sunday morning was often called into service to make up for what its preceding six sisters had left undone. "Doing one's duty and caring for one's household is religion, quite as much as church-going," she would often say. "It is better not to go to church and to mend one's stockings or to wash one's apron, than to go to worship with heels peeping through, or with an apron upon which the tea and the coffee pot have done their best to draw the map of the world." Besides, economy also was to be attended to. "Spending a farthing that might have been saved," she would observe, "was quite as much a sin as being drunk or beating one's neighbour. Many wives tell their husbands a great deal about their love and affection, and smoothe their hair and kiss their cheeks, but at the same time indulge in such extravagant expenditure as compels these husbands every day to perspire a pint more than was meant when it was said to them that they should earn their bread in the sweat of their brow." She, on the contrary, was of opinion that wives would show more true love if they kissed a little less and saved a little more, and instead of driving perspiration out of their husbands' skin, got a portion of

the inevitable sweat to moisten their own brow. She at least did not neglect carefully to inquire where the best coffee and the best butter could be got at the lowest price; and if she learnt that she could buy a pound of candles or a pound of soap at two miles' distance a farthing cheaper than next door, she at once put on her boots and walked all the way there and back, carrying home ten pounds of one article and twenty of another. Of course she did not like her neighbours to see her carrying parcels, as if she were a porter's wife, and consequently she generally set out on dark nights, when all cats are grey, and a piebald cow is just like a black one.

Mrs. Barends was one dark Saturday evening returning home from a distant grocer's, carrying a pot of treacle in one hand, and a bag of tea and coffee and sugar and several other articles in the other. Those articles, you must know, she had, with frowning and smiling, prevailed upon the grocer to give her so cheap, that she was sure she could bake two pancakes with bacon for her husband out of the saving, and buy a nice piece of lace for her bonnet besides. But under the influence of this blissful prospect, while prevailing upon the stubborn grocer to give her twenty pounds of coffee for eight shillings, since he refused to give her ten for four, she had increased the weight of the bag so much, that she was perfectly at a loss how to get home with it, and might as well have eaten the pancakes and bacon first to obtain strength for the labour. By dint of passing the pot into her right hand, and the bag into her left, and *vice versa* every now and then, and standing still every five minutes or so to draw breath, she had succeeded in gaining a lonely avenue, which formed the entrance to the suburb in which she resided. Here she seated herself on the grass.

The glimmer of a distant gas-lamp spread enough of light on the darkness to enable her to notice a female coming up the avenue in the direction of her house. Mrs. Barends lacked courage to call her to her assistance, as her dress seemed to betoken a respectable girl, to whom she could not offer a penny without insulting her. Yet trying to appeal to sympathy where she could not appeal to self-interest, she uttered a sort of painful cough to attract the stranger's attention. Nor did this measure prove fruitless. The girl, who otherwise would have passed her unnoticed, stopped, and casting an anxious look down to the spot where Mrs. Barends was sitting, soon discovered a well-dressed woman seated upon the grass.

"Can I be of any use to you, ma'am?" asked she in a kind voice, supposing that perhaps some indisposition had befallen the unknown woman.

"Thank you, dear Miss—yes, you may—if you would be kind enough—beg your pardon for asking—to carry this pot. I have to carry this bag besides, which is rather heavy, and, as you are going the same way, you would greatly oblige"—

"Oh, gladly, ma'am," rejoined the girl, at the same time stooping down and taking the bag. "Just let me take this. You appear to have carried it a long way already, and it is no matter to me."

Mrs. Barends tried to lay hold of the bag, and to persuade her to take the pot; but the girl, with gentle obstinacy, refused to let the bag go, and walking away a few steps, compelled its owner to rise and to join her with her pot.

"It is very kind of you, indeed," said Mrs. Barends, taking her place by her side, and walking along. "That nasty bag is so dreadfully heavy."

"Never mind," replied the girl; "I am but too happy to be of any service to you, ma'am, as I know from experience what a benefit it is, when carrying a heavy burden, to meet with anybody who is able and willing to take it off the shoulders."

"So you are accustomed to carrying?" answered Mrs. Barends, trying to make out, as far as the darkness permitted, what sort of girl was walking by her side. She did not look like a porter's daughter, though.

"Yes, I am," resumed the girl. "I know what it is, ma'am. I have for years been in the service of a hard master, who compelled me to carry a burden which was too heavy for me, and threatened to crush me to death. But, thank God, I am relieved of it now."

"Indeed!" answered Mrs. Barends, in a voice of curiosity. "I suppose you have now found employment with another master, who treats you better!"

"You are quite right," replied the girl joyfully. "My present Master is the kindest and most loving one can imagine. He never puts a burden upon one's shoulder without giving strength to carry it."

Mrs. Barends was silent. There was something enigmatical in the girl's last words.

"It may truly be said," continued the girl after a pause, "that my Master's 'yoke is easy, and his burden is light.' And since he has dealt so kindly with me, it is right that I should be kind to my neighbours, for his commandment is—'Bear ye one another's burdens.'"

[It may be as well to interpolate here, that by one of those coincidences which we are accustomed to call strange, but which are of common occurrence in life, this speaker had been listening for the last hour or more to an earnest discourse on the text: "Come unto me, all ye who labour," etc. Her mind was full of the subject; hence the turn which she naturally enough gives to the conversation.]

Though Mrs. Barends had not looked into her Bible for some years, yet she recollected enough of its phraseology to understand that the girl spoke of another Master than an earthly one, and meant a different burden from what she had understood. Thus, finding herself at once transferred into a sphere with which she was little familiar, and fearing lest the girl might carry her away to thoughts

which she did not want to think, she kept silent for a minute or two; then at once opening a fresh vein of conversation, she said—

"What a dark night this is! When you put your hand before you, you can hardly see it."

"Very dark, indeed," said the girl. "What a blessing it is to know that there is a sun to dispel it! Suppose we were continually to carry a heavy burden in darkness like this, ma'am, without any hope or certainty of a happy change, how wretched we should be!"

"I quite agree with you," answered Mrs. Barends; "but, thank God, I shall be home soon, and a new day will soon dawn."

"A great blessing that," resumed the girl; "but it is better still if we can say the same thing at the end of our life."

"The end of our life!" repeated Mrs. Barends, in a light tone. "Ah! that's far away yet, we hope. You are not much above twenty, I should guess, and I am not yet an old crone either."

"Yet I may die to-night, and so may you," answered the girl in a serious voice.

Mrs. Barends again kept silent, and again tried to turn the conversation into another channel; but not being able to catch a suitable opportunity, she walked along not unlike a spinster who keeps on treading her wheel while her thread is broken.

"Whenever I carry a heavy burden," the girl began again, after a pause, "I cannot help remembering that sweet invitation, 'Come unto me, all ye that labour and are heavy laden, and I will give you rest.' What an amiable Being he must be, ma'am, who thus addresses the weary!"

"Yes, indeed," answered Mrs. Barends, too polite to say nothing, and too timid to say more.

"How different His heart is from ours!" continued the girl. "He came to take our burden off our shoulders, and to lay it on his own—that very heavy burden of the Cross, with all the weight of its pain, and shame, and death. What an unspeakable love there must dwell in the heart of Him, ma'am, who, even for His enemies' sake, did all this!"

"You surprise me," replied Mrs. Barends, this time in a voice of concern. She could not help acknowledging that there was something attractive in the girl's words; for Mrs. Barends was a kind-hearted woman, wanting to be loved, and ready to love in her turn.

"I like your talk very much, Miss," said she. "You don't speak as many other people do, who always come forward with hell in one hand, and eternal punishment in the other. But you don't believe in such horrible things, I suppose? Do you?"

"So it is your opinion that there is nothing but a happy heaven in eternity?" asked the girl.

"Yes, I should think so," answered Mrs. Barends.

"Then, of course, you are quite sure you will be happy after death?"

"I hope so," answered Mrs. Barends, a little hesitatingly.

"But are you quite sure of it?" said the girl, putting stress upon the "sure."

"Sure! Quite sure!" repeated Mrs. Barends. "Why, I cannot say that. I don't think anybody is."

"But how is that possible, if you really believe that there is nothing but a happy heaven in eternity?" asked the girl.

Mrs. Barends, a little perplexed, replied, "Why, I don't know. You see, Miss, we have all of us our defects, and come short a great deal."

"True," answered the girl, "but that does not matter at all, ma'am, if there is only a happy heaven and nothing besides. According to your opinion there is no unhappy place at all. So you ought to be sure of your future happiness, it appears to me."

"Yes, I ought," replied Mrs. Barends, slowly, "but, candidly speaking, I am not."

"Dear ma'am," said the girl, in a kind but serious tone, "it appears to me that, if you examine the bottom of your heart, you will find that you, as well as I, believe in a place of unhappiness and pain. But for that, you could not be so uncertain about your future state."

While the girl was saying these words they had reached Mrs. Barends' home.

"This is the end of my walk," said Mrs. Barends, taking the bag from the girl's shoulder. "I thank you very much for your kindness, Miss. You have rendered a great service to me. Please to come to-morrow, and take a cup of coffee with us. You will be heartily welcome."

"Very gladly," replied the girl. "But as for acquaintanceship," added she, with a smile, "I'm glad to say that Mr. Barends and I have been acquaintances for many years past."

"Really!" exclaimed Mrs. Barends. "So you know my husband? And what is your name, if I may take leave to ask?"

"My name is Jane Moling. Good-bye, ma'am. Good-night."

"Why—Jane Moling!" cried Mrs. Barends, surprised as if the moon had dropt down at her feet. "Are you?"—But the girl was out of hearing.

Mrs. Barends did not sleep much that night. The words of Jane Moling had made a deeper impression upon her mind than she had shown. "Is that Jane Moling?" said she to herself; "Is that Jane, that fanatic Methodist! Why, I wish all the people round about were as amiable, as kind, as sensible, as decent. And is that her religion? Why, there is nothing horrible in it. She only spoke of love and salvation; salvation, of course, from a fearful danger, but salvation after all. And she herself appeared so perfectly happy, so calm, so sure of her peace. I hope she will come to-morrow. I must learn more about her and her religion. It will not do me any harm, at any rate."

And Jane Moling did come the next day, and she spoke to Peter and his wife; and the good girl pleased them so much that she had to come as often as she could. She showed them—her open Bible before her—a great many most important and delightful things which poor Peter never had heard of before, and which he now saw were quite unmistakably written in the “good Book.”

“We have been wrong altogether,” he said one day to his wife, “and Jane is right. I am sure we must walk in her way now, if we don’t want to ruin ourselves.”

“Well, Mrs. Steen, how are you getting on?” said Mr. Kolman one day as he was coming up the yard, and met the first seamstress. “Are matters going on well in the sewing-room?”

“Pretty well, sir,” answered Mrs. Steen, dropping a courtesy; “at least as well as could be expected.”

Here Mrs. Steen heaved a deep sigh, and cast down her eyes, as if some heavy weight were pressing upon her soul.

“What is the matter?” asked Mr. Kolman in a curious voice. “Can’t you manage the girls?”

“Oh yes, I can, sir, but it is not the same sort of thing now that it was before.”

“What do you mean?” asked Mr. Kolman.

“Why, sir, since nearly half the girls take to singing psalms during their work, all the fun and pleasure is away.”

“What! Do they sing psalms? How is that?”

“Why, sir, we shall soon be a set of Methodists altogether. Every morning, half-an-hour before the work begins, there is a prayer-meeting in the store-room, and Philip the feather-cleaner conducts it just like a minister.”

“What in all the world is up!” exclaimed Mr. Kolman. “Does Mr. Barends know it?”

“Pooh! Mr. Barends, sir; why, he is at the head of them. He has turned a regular Methodist.”

—“Not possible!”

“Yes it is, sir. He regularly attends Mr. Stalman, the Methodist preacher’s meetings, and so does his wife. And many of our people stay away after seven twice a week, as they of course go where Mr. Barends goes.”

“Confound them all!” muttered Mr. Kolman between his teeth.

He went to his office, and immediately ordered Peter to be called down.

“Is it true, Peter, that you have become a Methodist?”

“I have become a Christian, sir,” answered Peter in a calm voice.

“A Christian!” repeated Mr. Kolman, laughing.

“So you were not a Christian before?”

“In name I was, sir, but in nothing else. I did not love Christ; but I love Him now as my Saviour.”

“Indeed!” said Mr. Kolman sneeringly. “And

is it true that you hold prayer-meetings at the store-room every morning?”

“I beg your pardon, sir; I only attend them. I have not the talent of conducting such meetings, but Philip has.”

“Now I tell you,” said Mr. Kolman in an angry voice, “that I will not have this.”

“I can only say,” answered Peter, “that those meetings do not at all interfere with the work. They are held half-an-hour before it commences, and only those attend who wish it.”

“Well, but I won’t have it in my premises,” cried Mr. Kolman.

“But, dear sir”—

“Not a single word, I tell you. Henceforth there shall be nothing more of that sort of cant on my works. You understand?”

The next morning there was no prayer-meeting at the store-room, but there was one at the shed of Govert the joiner, who had no objection to allowing the use of his place for such a purpose.

Mr. Kolman bit his lips when hearing it. “Confound them,” muttered he; “I’ll match Peter some day; I shall.”

A few days later, Mrs. Barends went as usual to the school at the joiner’s to speak to the children, and, as usual, Jane Moling was with her. It was a crowded school now, for since Mrs. Barends, notwithstanding Mrs. Steen’s opposition, had introduced the practice of opening with prayer and singing, and of speaking to the children from the Bible, and of teaching them texts and hymns, all the mothers of the neighbourhood had sent their little girls, and it was a real luxury to see how happy the little things were. Prayer was just offered when the door was opened, and in came a gentleman in black with a white neck-tie.

“Ah! Mr. Stalman,” cried Mrs. Barends, “I am very glad you have come. You must see our work at this place.”

“I am quite delighted to see this good work going on,” said he to Mrs. Barends, “but the real object of my coming just now is to look at the room. You use it every Monday and Thursday. Do you think I might get it on Friday for an evening meeting?”

“Oh, readily!” said Mrs. Barends. “Govert will be glad to let it to you, I’m sure.”

“Then, what do you think the rent will be?” asked Mr. Stalman.

“Oh, never mind,” replied Mrs. Barends, “we shall settle that with Govert. If you will kindly come and preach, all will be right.”

Mr. Kolman was quite enraged when he heard the next week that the school was turned into a Methodist meeting-place; and he actually grew fierce when, some weeks later, he was informed that the meeting was crowded, and that a great number of his work-people absented themselves to be present.

“Peter,” he said one morning, “I won’t pay another farthing for that school.”

"I am sorry to hear it, sir. It is such a useful school. I wish you would come and see it."

"Come and see it!" cried Mr. Kolman. "I wish I hadn't been such a fool as to allow you to hire the place in your name. If it were hired in mine, you may rest assured I would take measures so that you should never see it again."

Peter told his wife what Mr. Kolman had said.

"Never mind, dear," said she, "we will be enabled, under Providence, to continue it, even if we stint ourselves for it."

It was soon known throughout the whole works that there was an open war between Mr. Kolman and the foreman. The report was generally believed that Mr. Barends would soon get his dismissal, as it was evident that matters could not possibly continue very long in that way. Indeed, Mr. Kolman would gladly have realized this prediction at once, but for two reasons. The one was the difficulty of finding a successor to a man of so much honesty and experience; the other was the absence of any reasonable ground for his dismissal. Though Mr. Kolman, with the unjust judge in the parable, might say within himself, "I fear not God;" yet he dared not go so far as to add, "I regard no man." Public opinion was everything to Mr. Kolman, and his obeisance to that idol was the main cause of his not turning Peter off at once.

The former of the two obstacles was removed sooner than Mr. Kolman had expected. Several applications came in from time to time, nearly all of them beginning with the formula:—"Sir,—Having been informed that you are in search of a foreman, I take the liberty," etc. Among these there was one which, upon further inquiry, seemed to contain everything that could be desired. The applicant was a young Belgian who, from his childhood, had been engaged in the bedding trade, and during three years superintended one of the largest concerns at Paris.

If the other difficulty could now be removed, Mr. Kolman would soon get rid of his "Methodistical nuisance." An opportunity was soon found, because eagerly sought for. The evil spirit, as well as the good, whispers to its followers: "Seek, and ye shall find."

Mr. Dorenbos, a small tradesman in the bedding and mattress line, had, about this time, accepted a lucrative contract with one of the shipping companies for the supply of a considerable number of mattresses and blankets within a certain date. He was a good man, who worked hard day and night to support his large family, and was highly thought of by his customers. Sickness in his household, however, had, during the last twelve months, caused a constant drain on his purse, so that he was not able to pay Mr. Kolman's last account. He rejoiced, therefore, at the prospect of making such a profit out of this contract as would enable him to settle Mr. Kolman's bill, and to have a little sum left for himself. He required some goods to be able to carry out the contract, and Peter, to

whom Mr. Kolman always left the business of settling with customers, had gladly granted an extension of credit, as he knew all the circumstances, and liked Mr. Dorenbos as an honest Christian. It so happened, however, that Mr. Kolman, learning from one of the members of the shipping company what a profitable order for goods Mr. Dorenbos had been favoured with, allowed jealousy and covetousness to creep into his heart. He resolved to endeavour to get the order for himself. So he immediately forbade Peter to supply poor Dorenbos, and at the same time ordered him to send that struggling man a threatening letter for the payment of his bill. Peter most earnestly besought him to abstain from such cruelty, asserting that he had already given his word to Mr. Dorenbos for the supply of his order. Upon Mr. Kolman's remaining obdurate, however, and, in an angry voice, requiring that his wishes should be at once carried out, Peter reminded him of the story of Ahab and Naboth, and entreated him not to heap this load of guilt upon his soul. But this was enough to make Mr. Kolman's anger run over. He scolded Peter for an impostor, who tried to enrich the "Methodist rabble" at his master's expense. This was too much for a man who for upwards of twenty-two years had served his master day and night as an honest and faithful servant, changing his master's humble cottage into a palace, his scanty dinner into a banquet, and his empty cellar into a store-house of the choicest wines. Indignation loosened his tongue. He told Mr. Kolman in a civil but decided tone, truths which made that man's bad conscience rebound and his knees tremble as a reed. Speechless from shame and wrath, the cowardly man stole himself away. But that same evening Peter received intimation from him in writing that he was not to return to the works any more—that he was dismissed at once and for ever. Next morning Mr. Dorenbos was alarmed beyond description, for, instead of the expected goods, he received a summons for payment within eight days.

The impression which Peter's misfortune produced upon the neighbours and work-people was very various. Many who, though disapproving his "extravagant religious opinions," liked him on account of his manly and honest character, cordially pitied him; while others rejoiced that that man "who deemed himself better than other people, and expected a private chair in heaven," at length had got "a cold bath to cool his hot imagination."

"Of course," said Mr. David Twinkelbank, the grocer, to Mrs. Snaterwell, who came for a half-penny worth of mustard and half-an-hour's length of gossip; "of course, ma'am, nothing short of that could be the end of it. I am not a prophet, you know, but this much I could foresee, when looking along my nose, that it must come to that with Peter Barends. I always knew Mr. Kolman as a man of order and rule. I have for years supplied coffee and chicory to his work-people, and he never failed to pay my account every Saturday. I

"INDIGNATION LOOSENED PETER'S TONGUE."

understand that a man like that cannot in the long run permit such a nuisance to continue in his premises as playing at church in his store-room, or singing psalms over a heap of feathers. Everything must have its place, and there must be a place for everything, according to my opinion, ma'am, and I think I am right; don't you think so, ma'am?"

"To be sure," Mrs. Snaterwell would reply; "to be sure, Mr. Twinkelbank. You have a wonderful talent for seeing things in the right light, sir. Those people always have their mouth full of the Lord their God, and of conversion, and all that sort of thing, which such simple people as myself and others know nothing about. I won't have you think, sir, that I don't care for religion. I was brought up in an orderly way, you must know. My father was a respectable man, and my mother was a decent woman, such as there are but few of now-a-days, sir. They always got me to say the Lord's Prayer before I went to bed. I had also to repeat the Ten Commandments every Sunday afternoon. So you see I am quite as well taught as anybody else, that everything, of course, must come from the highest Being in heaven. But such people as Barends and his friends think that we are only fit for fuel; and as for themselves, they think that even if the devil would rain fire upon them, the Almighty would turn it to water before it reached their heads. Now, what I want to see is, if that is true. Mr. Barends has got into a hot fire now. Whether the devil has kindled it, or somebody else, I won't say, but I am told that he has already carried nearly all his furniture to the Jews, and his clothes to the pawnbroker's; and if matters do not change soon, we'll be seeing him going about with a barrel-organ before him, and his wife behind him, singing psalms, with one eye turned upwards to heaven, and the other turned downwards to people's pockets."

So much for the gossip in the shops and at the doors of the houses where the talkative women used to group like the street dogs round a bone. There was some percentage of truth in this lump of slander and talebearing. Peter, indeed, had been compelled once or twice to sell a piece of furniture. Perhaps he might have prevented this predicament, had he followed up the advice which some of his neighbours gave him. Some wanted him to canvass the richest customers of his late master, to persuade them to favour him with their orders in a private way. Others suggested that he might apply to some capitalists to start an opposition bedding manufactory. Peter declined every such proposal. "My friends," he would say, "I am taught to love my enemies. But I feel I could not follow up your advices without hating Mr. Kolman."

The making of beds and mattresses being the only trade he was acquainted with, Peter began to take to that business as far as his means permitted. While he cleaned the feathers and the

hair, his wife sewed the ticking, and thus they were enabled to sell beds and mattresses from their window at a moderate price. Their profit, however, was very small—far less than was required to live comfortably upon. Meanwhile, Mrs. Barends continued to conduct her sewing-school at the joiner's, and Mr. Stalman's evening meetings were not less crowded than before.

Thus matters continued for a couple of years. Mr. Kolman was quite sure he had gained the day; Mr. Twinkelbank boasted of his correct prophecy; and Mrs. Snaterwell, taking for granted that the fire was not turned to water, looked out for the barrel-organ and the psalm-singing. Indeed, but for the paternal care of a loving God, poor Peter and his wife would have come to something like that. They often ate potatoes on one day, and potato-skins on the next. Sometimes they went to bed without a supper; sometimes they commenced their day's labour without a breakfast. Yet things were never so bad as to compel them to call in the assistance of other people. It is true Mrs. Barends often found a silver coin on the book shelf, wondering how it got there; and often, when entering her little kitchen, she was surprised to discover a heap of potatoes or apples, or a little bag of coffee in the chimney-corner; and it struck her that she always found those objects after a visit of Jane Moling. Her husband protested his innocence in the matter by declaring that he never had asked anything from Jane or anybody else; and as to herself, she was conscious of her having told her wants to none but her invisible Friend in heaven. At length, however, their position became so trying, that Mrs. Barends often was tempted to exclaim: "Hath God forgotten to be gracious!" Peter took ill, and thus the only source of their scanty income was entirely dried up. Every piece of dress or furniture not absolutely indispensable was sold or pawned, and when, after some weeks, the poor invalid recovered so far as to be able to walk from his bed to his chair, he found that there was room enough for exercise, since his little parlour was as void of furniture as his pocket was of money. In this dismal condition Peter was one day visited by a relative who managed a little farm in the country near the pretty village of D—, at about eighty miles' distance from the city. This relative invited Peter and his wife to stay with him for a few weeks. "Perhaps," he said, "you will find some employment in my neighbourhood, as there is an urgent demand for labourers just now." This proposal was too fair not to be accepted with gratitude. Indeed their friend's supposition soon proved well founded. In the rural districts there are a great many small jobs, which turn up every day and every hour, and for which it is difficult to find a suitable person, as everybody is engaged in his own pursuits. Peter, who had no business of his own, was favoured with the work which nobody else had time or inclination for. Sometimes he was employed as a messenger

to take an errand to the neighbouring town ; sometimes as a collector to gather subscriptions for some charitable object. The postmaster often required him as a letter-carrier, the tax-gatherer as a clerk, the farmer as an overseer of his labourers in the field. His wife, too, was often called in to help in cases of washing, nursing, etc. In short, Peter and his wife became the indispensable complements of social life in the district.

While they were thus spending their days far away from their friends in a remote and forgotten corner of the world, some events took place at Mr. Kolman's works which caused changes as great as they were unexpected in the state of that unhappy man's affairs. Mr. Maelinx, his new foreman, proved an able, honest, and active man, who, his shorter experience excepted, might fairly be called equal to his predecessor. But Mr. Maelinx's character was not at all similar to that of his master. He soon looked through the whole of that selfish man's plans and proceedings, and formed a very low estimate of him. His situation became a most unpleasant one, and he soon determined to make a change. Not being bound to Mr. Kolman by any ties or associations like his predecessor, he set about making arrangements for commencing business on his own account.

One can hardly picture to one's-self Mr. Kolman's amazement, when one morning his foreman gave notice to leave within three months ; nor can one imagine Mr. Kolman's alarm upon learning a few days later that a site for a large building was bought by his own servant. Before twelve months elapsed the new manufactory lifted up its lofty chimney even above that of the old one. The greater part of Mr. Kolman's work-people, glad to be able to exchange a bad master for a good one, went over to the new works ; and Mr. Dorenbos, who, since his ruin through Mr. Kolman's jealousy, had borne his heavy cross with patience, was appointed as foreman in Mr. Maelinx's establishment.

But among the few seamstresses who refused to join the new master was one whom Mr. Maelinx eagerly desired to engage, and to whom he in vain offered one of the most profitable situations. This obstinate person was Jane Moling. Her obstinacy proceeded not from any feeling of attachment to her master ; nor did it proceed from indifference with regard to a more prosperous position in life, for she had not forgotten her friends at D—. No, Jane was stirred by nobler principles. She had discovered that Mr. Maelinx entertained an affection towards her, which she felt she could not possibly return. It is true he had never spoken out his mind to her ; he had only now and then favoured her with a kind smile, a kind nodding of the head, a kind pressure of the hand upon her shoulder, when he entered the sewing-room to examine the seamstresses' labour. But she had observed that she was the only one of the girls whom he favoured with these tokens of his satisfaction ; and when she lifted up her eyes to his, she read enough in his

beaming looks to apprehend the flame that glowed in his bosom. And perhaps Mr. Maelinx read the same sort of thing in her eyes, notwithstanding the shy quickness with which she would cast them down. But Jane, through thick and thin, contended with herself that she felt nothing at all for Mr. Maelinx, handsome and winning as he was. At any rate, she could not possibly think of it, now that he had become a gentleman of high standing. So to protect herself from becoming his sweetheart, she refused to become his servant.

Mr. Maelinx thus finding himself deprived of every opportunity of meeting Jane, only loved her the more, the more he experienced her opposition. I am not in a position to delineate the course of this true love, but I can say that if it did not run smooth, it certainly ended well. Yes ; after some time, Jane Moling became the happy wife of the young and prosperous manufacturer. Many of Mr. Maelinx's friends frowned on the unequal match, but his customers continued to smile on his goods. "Whatever his wife may or may not be," they said, "his beds are downy and his mattresses soft, and that's all *we* have to care about."

Meanwhile, Mr. Kolman's business fell off rapidly. He had engaged three foremen successively, but all of them turned out unsuitable, and the last absconded with a large sum. Now the poor man remembered his faithful but ill-treated servant of old. He felt that Peter alone could rescue him, and however unpleasant the pill was he had to swallow, he resolved to apologize and to entreat Peter to return.

He took a place on the stage coach and proceeded to the village of D—. It was the afternoon when he reached the nearest station to the place. Having to walk a couple of miles, and not knowing the way, he took a guide. They had scarcely gone half a mile when a pretty large manufactory, which was in course of building, attracted his attention.

"What works are those ?" asked Mr. Kolman, stopping to take a sight of the erection.

"The bedding and mattress works of Mr. Peter Barends," replied the guide.

"Why, of Peter Barends !" exclaimed Mr. Kolman, quite amazed. "I thought he was a poor man, scarcely able to get daily bread."

"Yes, so he was," replied the guide, "but it seems he has rich friends who have money like water. At least, a nice house is already built for him a little way farther on. But here comes the architect, he will be able to tell all about it."

The architect kindly gave every information Mr. Kolman desired. He explained that Peter had got a share in Mr. Maelinx's business, and was about to start a second establishment for the firm at this place.

"I think I will not go farther," said Mr. Kolman to the guide. "I feel rather tired and unwell. Let us return to the inn, and I will pay you."

Indeed, Mr. Kolman felt far from well, and was soon prostrated on his bed. A few days later, Peter Barends and his wife were standing at the bedside of the dying man.

"Have you really forgiven me?" asked he with a feeble voice, casting a supplicating look at them.

"We have, we have, with all our heart," answered Peter, pressing his dying hand. "But can you also believe that God has forgiven you?"

"My sins are too great!" replied the invalid with a scarcely audible voice.

"Look to Jesus," said Mrs. Barends. "He is willing to save you even now."

"Jesus!" whispered he; and with this word on his lips, his eyes closed, and he breathed his last.

"Poor, poor man," said Peter, laying his hand upon the deceased's clammy forehead; "what a bitter cup sin gave you to swallow! Your boast of gaining the day has come to nothing here. May it be better yonder!"

Eliphaz the Temanite was a miserable comforter, but he was not an altogether incapable preacher. "God," he said, "disappointeth the devices of the crafty, so that their hands cannot perform their enterprise." And the truth of this saying has been confirmed by the experience of many a child of God, as well as by that of Peter Barends.

THE SONGS OF ISRAEL.

BY ARTHUR PENRHYN STANLEY, D.D., Regius Professor of Ecclesiastical History, and Canon of Christ Church, Oxford.

I. THE LAMENT OF DAVID OVER SAUL AND JONATHAN.

THERE are scattered throughout the Old Testament, songs, or fragments of songs, which can hardly be called Psalms. They rather correspond to what we should now call "ballads," "lays," "battle-songs," composed by the Hebrew poets at different periods of the national existence; and which, though belonging to secular occasions, have been incorporated, for our instruction, into the present Sacred Books.

Of these the most remarkable are (1) The Song against Amalek, Ex. xvii. 16; (2) The Songs of the Encampment, Num. x. 35, 36; (3) The Song of the Well, Num. xxi. 16, 17, 18; (4) The Songs of the Wars of Moab, Num. xxi. 14, 15, 27, 28, 29, 30; (5) The Song of the victory of Beth-horon, Josh. x. 12, 13, 14; (6) The Nuptial Song of Ruth, Ruth iv. 11, 12; (7) The Song of the Hebrew Women over Saul and David, 1 Sam. xviii. 6; (8) The Lament of David over Saul and Jonathan, 2 Sam. i. 18-27; (9) The Lament of David over Abner, 2 Sam. iii. 23, 24; (10) "The last words of David," 2 Sam. xxiii. 1-7; (11) The Fragments contained in Ps. lxxviii. 1, 7, 8, 12, 13, 14.

To these might also be added, although they are more regularly interwoven with the Sacred narrative, and are of a more solemn character, (1) The Blessing of Jacob, Gen. xlix. 1-28; (2) The Song of Moses and Miriam, Ex. xv. 1-19, 21; (3) The Song of Moses, Deut. xxxii. 1-43; (4) The Blessing of Moses, Deut. xxxiii. 1-29; (5) The Song of Deborah, Judges v. 1-31; (6) The Song of Hannah, 1 Sam. ii. 1-11; (7) The Song of David on his escape from all his enemies, 2 Sam. xxii. 1-51; (8) "The Lamentations of Jeremiah." Each of these has its own peculiar interest; and we may perhaps allude to them hereafter.

But we are now to speak of only one of these—the Lament of David over Saul and Jonathan—preserved to us by the author of the Books of Samuel. In the Book of Jasher—"the Book of

the Just," according to the most probable explanation of the word—he found a song, which he transferred to his own work. The Book of Jasher was still extant in his time. "Behold," he says, that is, "look, refer for yourselves;" "it is written in the Book of Jasher." That book is now lost; and we can only conjecture its contents from this and from one other allusion to it,—the poetical fragment which is quoted from it in the account of the battle of Beth-horon, in Joshua x. 12, 13, 14. From these two extracts, we may infer that it contained poetic remains of earlier times, relating, as the title would imply, to the "Just" or "Upright" of Israel.

Confining ourselves to that of which we are now to speak, there is enough said to tell us how the Lament was composed, and how it was preserved.

It was after the fatal battle of Gilboa, when David was reposing from the expedition against the Amalekites, in the extreme south of Palestine, that, on the morning of the third day, there came a messenger, with the marks of distress and dismay—dust and clay smeared over his face, and his clothes torn—to announce the tidings of the defeat, and to show the crown and the bracelet of the fallen King. There were only two in that great slaughter concerning whose fate David was eager to know the truth,—his enemy and his friend. "How knowest thou that Saul and Jonathan his son be dead?" When the news was fully established, he immediately went through all the signs of violent Eastern grief. He and his six hundred heroes sat, with their clothes rent, uttering the loud Oriental wail, observing the rigid Eastern fast, until the sunset of the fatal day released them. Then David roused himself to action. The first vent to his grief was in the stern exaction of the life of the unhappy messenger, according to the hard temper of those fierce times. The second vent was in the touching dirge, which, according to the tender spirit of the sweet Psalmist of Israel, he poured forth over the two departed chiefs.

"David lamented with this lamentation over Saul, and over Jonathan his son" (2 Sam. i. 17). It was a "lamentation" (the word is the same) like to that with which he lamented over the grave of Abner (2 Sam. iii. 23, 24), and with which Jeremiah lamented over the grave of Josiah (2 Chron. xxxv. 25). Such funeral dirges, it seems, were common. But of these two others, only a fragment of one, and of the other nothing has been left. It would appear that this one owes its preservation to a singular circumstance, which adds another stroke of pathos even to the dirge itself. Jonathan, for whom especially the lament was intended, was distinguished amongst the warriors of Israel as the mighty archer. The tribe of Benjamin, to which he belonged, was emphatically a tribe of archers (1 Chron. xii. 2), and amongst those Jonathan was chief. By his bow and his sling he won his first great victory at Michmash (1 Sam. xiv. 13). By his bow and arrow, he was always accompanied in his father's court, as Saul by his spear (1 Sam. xviii. 4; xx. 35). By his bow he was celebrated in the battles of Israel even to the fatal close (2 Sam. i. 22). To introduce this favourite weapon of his friend into his own less apt tribe of Judah, was David's tribute to Jonathan's memory. "Also he bade them teach the children of Judah the bow," or "the use of the bow;" and whilst they were so taught (so we must infer from the context), they sang "the song of the bow," the song which had been handed down to tell them how he had fallen, whose "bow never turned back from the slain." Whether we listen to the first burst of poetic grief from David's own lips, as he roused himself from his fast at Ziklag, and addressed the daughters of Israel who should have welcomed back the returning heroes, but now were to join in the funeral wail; or whether we hear the young artillerymen (if we may so call them) of the tribe of Judah reciting the verses of their royal kinsman over the fall of the founder of this branch of the military service, let us first read the words themselves, and then explain their full meaning:—

The wild roe, O Israel, on thy high places is slain:

How are the mighty fallen!

Tell ye it not in Gath: proclaim it not in the hamlets of Askelon;

Lest there be rejoicing for the daughters of the Philistines;

Lest there be triumph for the daughters of the uncircumcised.

Ye mountains of Gilboa, let there be no dew, nor rain upon you,

Nor fields of offerings:

For there was the shield of the mighty vilely cast away,
The shield of Saul, not anointed with oil.

From the blood of the slain, from the fat of the mighty,
The bow of Jonathan turned not back;
And the sword of Saul returned not empty.

* The order of the original words is kept as nearly as possible, and in a few places, the Authorized Version has been corrected according to the best modern scholars.

Saul and Jonathan were lovely and pleasant in their lives,

And in their death they were not divided.

Than eagles they were swifter, than lions more strong.

Ye daughters of Israel, weep over Saul,

Who clothed you in scarlet, with delight,

Who put ornaments of gold on your apparel.

How are the mighty fallen in the midst of the battle!

O Jonathan, on thy high places thou wast slain.

I am distressed for thee, my brother Jonathan:

Pleasant hast thou been to me exceedingly:

Wonderful was thy love to me, passing the love of women.

How are the mighty fallen,

And perished the weapons of war!

There is one burden that runs through the whole song: "How are the mighty—how are the heroes fallen!" But there is also a separate stanza or strophe given to each part of the disaster.

I. The first describes the battle itself, and its fatal consequences.

The King or his son (we cannot distinctly say which; perhaps David himself wished to leave it in doubt), is represented under the figure of the "gazelle" or "wild roe" of Israel (such at least seems the most probable rendering of the word, which in this place is translated in the Authorized Version "beauty," but which in 2 Sam. ii. 18 is translated "wild roe"). The stately, towering form of the King (1 Sam. x. 24), the activity of the Prince (1 Sam. xiv. 13), the swiftness of both (2 Sam. i. 23), would well agree with this emblem. Either, or both together, might well be represented as the gazelle of Israel, standing perched aloft on the cliff of the pomegranate tree (1 Sam. xiii. 2), or on the pointed crag of Michmash (1 Sam. xiv. 14), or on the rocks of En-gedi (1 Sam. xxiv. 1, 4). Asahel, (2 Sam. ii. 18), the adventurous Gadites (1 Chron. xii. 8), David himself (Ps. xviii. 33; xlii. 1), were in like manner compared to this fleet wanderer over the hills of Palestine. No wonder that King Saul and his son, the last relics of an age in which strength, activity, and beauty, more strongly than in later times, were regarded as the tokens of Divine favour, should be so designated.

This "Pride of Israel" had fallen (so it is pathetically described and twice repeated), on the high places of Israel. Not on the level plains where defeat from the chariots and horses of the enemy might have been expected, and had been before encountered, but on "the high places" where victory seemed the rightful prize of the mountain chiefs and indomitable infantry of the Israelitish host—on the heights of Gilboa, which stretches its bare ridge above the valley of Jezreel. On these bare heights King David prays that no rain or dew may now descend, so that their barrenness may seem to perpetuate the curse that had lighted upon them. No, nor even on the green strip of verdure which runs along the side of the hill, and on which per-

haps the last fatal encounter took place. On that green field, filled as it might seem to be with fruits and corn for offering, the Mourner hopes, in the bitterness of his soul that no blessing may ever descend.* For "there the shield" of the first King of Israel—"the shield or light buckler† which he always carried with him—was cast away in the battle,‡ as though it was a defiled, polluted thing, stained with blood, and begrimed with filth,—neither it nor its royal master was ever to shine again, as in former days, with the polish of the consecrated oil.§

And this defeat, so terrible and so disastrous, David, rival as he was to the fallen king, and himself sheltered under the friendly power of the Philistines, and at that very moment in their territory at Ziklag, entreats that it may "not be told or joyfully proclaimed," "neither in Gath," the capital, "nor yet" in the hamlets of the south, where his own settlement lay,—the rude villages|| which, though under the jurisdiction "of Ascalon," harboured the ancient aboriginal inhabitants, the Avites. "Let it not be told, lest the daughters of the Philistines,"—of those who are separated even from the Canaanites by their rejection of the ancient, sacred rite of circumcision,—should burst forth into the loud triumphant songs, with which, throughout the East at that time, the women received back their victorious chiefs.

II. In the second stanza, the Mourner fixes his attention entirely on the two heroes themselves. He thinks of them only as he had seen them in life. There was Jonathan, with the famous bow of his archer tribe, such as he had himself given to David as the pledge of his love. There was Saul, with the huge sword, which David had in vain assayed to gird on his own diminutive frame (1 Sam. xvii. 39), and on which the King had at last thrown himself in the despair of shame and defeat (1 Sam. xxxi. 4.) These mighty weapons up to this time had been never disgraced; they had never turned back from their work. The sharp arrows of Jonathan, the flashing sword of Saul had drunk their fill of "the blood of the slain," had sunk deep, as the dagger of Ehud, into the huge "fat" frames of their gigantic enemies. And not their warlike weapons, or their warlike deeds only, return upon the memory of David. He remembers them as they stood together in camp or field (1 Sam. xiii. 16,

* This meaning would be true, whether we take the words to signify "Let there be no fields of offering on the mountain," or "Let there be no dew on the fields of offering."

† So the word *magan* distinguishes it from the *Tzinneh* the larger shield, used only for protection of the whole person, and carried by the armour-bearer.

‡ This is the force of the words "vilely cast away."

§ This would be the meaning whether we take the words "not anointed with oil" to apply to the shield or to Saul.

|| The word used is "Hazerim," the same that is used to describe the habitations of the Avites in Deut. ii. 23.

22), or sat at the royal table (1 Sam. xx. 25), whilst they still were in kindly intercourse with him. The same words describe them both—"lovely and pleasant;" "swifter" in their rapid movements than the eagles which wheeled round the mountain-tops; "stronger" in their giant strength than the lions which lurked in the mountain caves. Each was bound to each in the firmest love: "My father will do nothing great or small, but he will show it unto me" (1 Sam. xx. 2). To Jonathan, if to any one, the wild frenzy of Saul was amenable: "Saul hearkened unto the voice of Jonathan" (1 Sam. xix. 6). He cast his lot with his father's decline, not with his friend's rise, "and in death they were not divided." Side by side their corpses lay on Mount Gilboa, and shared the same cruel fate (1 Sam. xxxi. 2, 8).

III. The third and fourth stanzas divide the stream of sorrow, which, down to this point, has been united. In the third, the Mourner turns away from himself to the Israelite maidens, such as had in former days celebrated the thousands slain by Saul, and the ten thousands slain by David (2 Sam. xviii.), and bids them break into a funeral wail over the depth of their disaster. They, like the mother and ladies of Siserah (Judges v. 29, 30), like Deborah herself, like the great company of the Hebrew women who tarried at home to divide the spoil (Ps. lxxviii. 11, 12), had been wont to expect the return of Saul, laden with the rich apparel so grateful to all Orientals, especially Oriental women. He had brought for them "scarlet or crimson robes," and "ornaments of gold to be worked upon their robes," such as formed the pride of Israelite beauty. "Thou clothest thyself with crimson" (the same word), "thou deckest thee with ornaments of gold" (Jer. iv. 30). These will now all cease, for Saul is dead. He has "fallen in the midst of the battle."

IV. The fourth stanza is the climax of the whole. There the national, general sorrow merges itself in the lament of the Friend for his friend. "The soul of Jonathan was knit with the soul of David; and Jonathan loved him as his own soul" (1 Sam. xviii. 1).

"On those high places," which were "his" and Israel's own, "Jonathan was slain." The heart of the Mourner was pressed, constrained, narrowed with grief, for the death, he will not say, of a friend, but of "a brother." Again he repeats that word of endearment which before had been used in common for both. "Pleasant;" the delightful epithet of a beloved maiden (Cant. vii. 6), of a beautiful place (Gen. xlix. 18); the word which Naomi could not bear to hear, because it reminded her of happier days—"Call me not Naomi ('pleasant'), but Mara" (Ruth i. 20, 21),—this was what Jonathan was to David in the intensest degree—"exceedingly." And in that love which he had borne towards him there was something "separate from all beside," "miraculous, like a special work of God" (this is the force

of the world), more singular, undivided, and devoted even than the love of women—even of Michal, of Abinoam, of Abigail. And once again he utters the burden of his lament: "How are the heroes fallen! how vanished are they that alone could carry on this mortal conflict!"

We have said thus much to enable our readers to enter into every word of the Lament. We would now ask them to read it over once again, and then consider the general reflections which it suggests.

1. It is, as we noticed at the outset, an example, if anything can be, of a Lay, a Ballad, a Dirge, a Battle-song, such as we meet in our own early literature. The compiler, whoever he was, that snatched this inestimable fragment from oblivion, was the precursor, by direct anticipation, of Bishop Percy, when he collected the Reliques of Ancient English Poetry, of Walter Scott, when he treasured up the remains of his own Border Minstrelsy. In the sacredness which we attach to this first known attempt to recover and preserve these and like remnants of the past, we may fairly claim a blessing on those who, in our own times, and in humbler fields, have achieved the same charitable and excellent work. It is a war-song which sums up the national feelings of every age over the graves of its departed warriors. Over the tomb of the Cid, near Burgos in Spain, there is written what every one feels to be the most appropriate of all inscriptions. It is the last verse of David's lament: "Quomodo cecidere robusti et periere arma belli." And if Sir Philip Sidney could say that he "never could hear the old song of Percy and Douglas, that he found not his heart moved more than with a trumpet," so we, as we read this sacred dirge of Saul and Jonathan, may well feel our hearts moved more than with a trumpet, because with the notes of the trumpet are mingled strains from the harp of the sweet Psalmist of Israel, more moving even than the lament over the fall of Douglas.

2. It is an example of pure poetic inspiration. We can hardly call it "religious poetry;" it is not a "psalm" or "hymn;" the name of God never occurs in it. But it shows us that such secular poetry is not unlawful, is not unworthy of being treasured up in the Sacred Books which "were written aforetime for our instruction." It is a good instance of the judgment which we ought to form of poetical language, whether in the Bible or out of it, and of the mistakes into which we fall if we measure it by the common rules of prose. That pathetic curse which David invoked on the mountains of Gilboa, was by the simple pilgrims who first visited Palestine understood as if it was common prose; and accordingly when the Crusaders passed by Mount Gilboa, they were surprised to find that there was dew and rain to be found where the Royal Prophet had declared that there should be none. In this instance we are able to see the ground of their mistake. But it is one which we are often liable to commit, sometimes in our inter-

pretation of the Bible, sometimes in our interpretation of one another's conduct. Let us take warning, by the nonsense into which the old pilgrims would, by such a mode of misunderstanding, have turned this beautiful song, to beware of similar misapprehensions elsewhere. Poetry is poetry, and prose is prose. Each must be valued, honoured, and interpreted, both in the Bible and in human character, by the light of its own sphere, and by the measure of its own requirements.

3. It is an example of the long perpetuation of a devoted attachment. In this age of hurry and confusion, the memory of the dead, of former times, of past friendships and love, is thrust aside in the eager competition of the present; and we are wont to regard with impatience any attempt to keep before our eyes and thoughts the recollections of the dead past, which has come and gone. But now and then, even in modern times, that long unbroken devotion still may be found. One such instance is the volume devoted by our chief living poet—"To the memory" ("*In Memoriam*") of his lost early friend. Other instances in other spheres will occur to every one. It is a satisfaction to reflect that such a poem, "*In Memoriam*," was this of David over Jonathan. It was to David, as to those who have mourned like David, his one expression of consolation on the night of the dreadful tidings. He still went about his great public duties as if nothing had befallen him. He was still the wise king, the active soldier, the sweet Psalmist of his people, full of cheering strains of faith and hope. But he never lost the memory of the faithful friend and counsellor of his youth. He perpetuated the recollection of his love and of his grief in the institution, if we may so say, of "teaching the use of the bow," which he founded to commemorate the princely archer of the first royal tribe. By those young soldiers of Judah, the "*Song of the Bow*," "*The Lament over Jonathan*," was learned and sung from generation to generation, till by this means it was landed safe at last in the sacred historical books of the Kings of Judah, where it will remain enshrined for ever as the memorial of the friendship of David and Jonathan.

4. There is one more lesson, of a wider and deeper character, to be learned from this lament. Saul had died by his own hand, in wild and black despair. By theologians it has often been asserted that his soul was lost for ever. Such is not the verdict of the man after God's own heart. He, who had been hunted by Saul like a partridge on the mountains, who had known him in his dark moods of madness and hatred, he pronounces no judgment upon the fate of his enemy; he recurs not to the misdeeds of Saul's life, or the misery of his death; he dwells only on the noble and heroic qualities of better and happier days. Two things we may learn from this. First, it is strongly characteristic of David's chivalrous and generous temper. There is none of the bitterness of the

persecuted against the persecutor, such as has disfigured the records of confessors and martyrs from the first ages down to our own Scottish Covenanters. There is none of the disparagement of predecessors by successors, which creeps out even in many a good heart and noble mind of every time. He makes the best and not the worst of his enemy, and perpetuates that "best" in a record which will last as long as the Bible itself. And, secondly, it is a sanction of the general instinct of humanity which says, "*De mortuis nil nisi bonum*;" "Speak of the dead only that which is good." When the human soul passes into the other world, we feel that we may fairly and safely leave it to the judgment of Him who judges not

as we judge. We need not pronounce indiscriminate and fulsome eulogies over the dead. But, if we follow the example of David, we may, at least for the moment, be silent respecting the faults which can now no longer be corrected; we may look on the redeeming qualities which even in the worst of men are cheering and instructive; we may express that charitable hope with which the funeral services of Christendom commit the remains of the departed to the grave, and commend their spirits into the hands of an All-wise and All-gracious Father, in the assurance that He knows what is the best for them and for us. "I hid my face from thee for a moment; but with everlasting kindness will I have mercy on thee."

EXPERIMENTS WITH THE TROPHY TELESCOPE OF THE FIRST EXHIBITION.

I.—ITS EARLIEST APPEARANCE.

It was not only the giant size of the telescope itself, the evident perfection of its mechanical fittings, and the colossal massiveness of the iron pillar supporting them,—but it was also, the free and unimpeded manner in which that entire astronomical structure stood forth in the midst of the long, long nave of the British portion of the ever-memorable Crystal Palace of Hyde Park, the International Exhibition of 1851,—which pleased us so much at the time. By virtue, indeed, of such comparative isolation it came that we were enabled to walk around and about its base; and gaze upwards, now from one direction and now from another, not only at the well-turned limbs, as it were, of the instrument,—but at the picturesquely composing angles which were made by the axes of motion, on which it was mounted, with the vertical and horizontal lines of the building. The *polar* axis at the angle of the pole of the sky, at some happy place, yet unknown, where the instrument was destined to be erected; and the *declination*, or cross, axis at right angles thereto; assuming, as viewed from different positions, many varying inclinations; but pictorially effective all of them, and suggestive too, as those angles of slope of the great pyramid of Gizeh itself, on which the learned world has already spent so much lucubration.

But all that was in the happy days of the Palace of 1851, when every one was pleased, everything went right, all faults of management were condoned, and the only real difficulty was—how to dispose of the surplus profits. We did, indeed, rather complain to a friend of the darkness and dinginess of the so-called "courts" under the galleries; and the trouble of seeking out in their mazes, and then studying in their crowded confusion, some striking speciality of industrial art; but our friend immediately corrected us, though in the kindly frame of mind so prevalent at that golden period. "It is quite true," said he, "that there is more satisfaction in looking at the separate

objects in the open nave; and that it would have been desirable, therefore, to have had more navespace in the building, or more objects arranged in that prominent manner; but then you must remember that this is the first Crystal Palace ever erected; and without doubt, all those improvements you suggest, will be duly attended to on a second occasion."

Well, eleven years passed away; the second Exhibition building reared its domes of glass; and then the failings, if really any, of the first Exhibition were cured with a vengeance: at least so far as that separate and independent exhibition of special objects in the nave, might be concerned: for they were now exceedingly multiplied; and, when so placed, called "trophies;" so that on the opening day, when the nations poured in to behold, lo, it was trophies here, and trophies there, and trophies everywhere! The trophies were indeed so numerous in the intended open, nave-like space, that they filled it up; and objects, in themselves often of small size or little import, were heaped up in mere brute number and mass, by "trophy-architects," until they formed almost hills, and were actual impediments to vision and progress.

So then it was seen that the trophy-notion, in the second Exhibition, had been carried too far; and all the public was delighted when the Royal Commissioners ordered the greater part of these accumulations to be removed altogether, or reduced to more moderate proportions. Some persons even ventured to hint, that both the nomenclature and intention of the exhibitors in those cases were essentially wrong; and entirely at variance with that grand spirit of religious humility and thankfulness in which the whole Exhibition project had been conceived in the mind of the great Prince who was gone, and who had inscribed so many of his sentiments on the walls of the building. "A trophy," said they, "is a monument of victory, a collection of the arms of the vanquished, a reminder of death-strug-

gles against injustice and oppression, tyranny, and the sword of evil-doers; the term 'trophy,' therefore, can never properly typify the gifts of God, through bountiful nature, to man. By the grace of God, man is what he is, and finds himself in a world stored with elements unnumbered, lying ready almost to his hand; and when he, man, weak man, the orphan of the universe but the well-cared-for child of God, has gathered of such gifts manifold, and exhibits the products to his fellow-men, there should be no pride of the warrior, no idea of spoils rent from the hand of an oppressive enemy in savage conflict, no boasting sense of his own power."

Yet despite this philosophy, the word *trophy* remains; and despite the order to dismantle, many great telescopes were found rearing their huge forms on high, up to the very close of the Exhibition. They, however, could not be reduced; size, and a presence of every part uniting to form one grand and united whole, being a necessary feature of any efficient astronomical instrument; or of any at all calculated to be of real service in promoting the advanced astronomy of the present day. Hence, it was in no vaunting style that *they* were exhibited there. Symbols, rather, they might be considered to stand, of the continual prosecution by man of that sublime science of the stars; the oldest of the sciences, and yet enjoying a perpetual youth; and still, even in these latter times, rewarding those who cultivate it in a meek and humble, but earnest and inquiring, spirit, with as many discoveries as fell to the lot of the first explorers in the earlier days of Egyptians or Greeks.

In such case, though, no doubt those telescopes of the second Exhibition should have been regarded, then and there, only as hopeful for what they might yield in the future; not as triumphant reminders of the past. For their useful history has still to be written, or rather, to be entered on: and whenever that actual time of trial, or career of work, does begin, we may be sure that it will find them removed far from the pomps and glitter, or the fashion and turmoil of the splendid, but unquiet, and over-turmed scene where they have been figuring so long.

Such certainly has been the fate of that other great telescope, the trophy—as we have attempted to describe it, before the word came into use for such a purpose—of the first Exhibition. We had seen the noble instrument there, and admired it amidst the din of a more than Babylonian city; but we have lately seen it again, and admired it far more, in the quiet retirement of a country abode; and amid all the comparative solitude which alike befits the study of science, and is friendly to man's confession of his own weakness, and the greatness and glory of God.

II.—ITS SECOND LOCATION.

In the north of Scotland there is a river, a rapid river, which gathers strength from a hundred hills,

and then with impetuous force rushes along over a rocky bed, and spreads in a broad clear tide to the sea; through a valley which for ages has been famous for its soldiers and for song. On its banks are hanging woods of larch and the graceful indigenous birch-tree with its silver stems; heather and wild roses combine together to form the underwood; the rowan-tree, too, there glows again with its scarlet berries, and venerable old oaks are found in the dark dells; while ever and anon comes wafted on the wind the sound of the river below, eternally contending with its rocks. Occasionally these woodland wilds are varied by breadths of improved agriculture, or by the modernized castles, in which now dwell peacefully enough, the descendants of rival chieftains of old; ever mindful of, but not rancorous over, their traditions of the past. Away back from the river roll gentle slopes and purple-tinted undulations, from whose windings might again start up, at the call, and for the defence, of their native land, the sturdy peasantry, whose cottages are there concealed and secure; while round and about on almost every side in the far distance the blue granite mountains, capped with mist, close in the scene; and assist with their lasting presence in forming the minds of the inhabitants, to energy, to indomitable resolve, and to appreciation of the high, the great, the solemn, the mysterious, and the good.

There also, after noble, though peaceful, services performed for his country in foreign climes—after no less than forty-four years continued residence in Bengal—has returned one of the sons of the valley, rich in years and honours; in the peace of a religious and philosophic mind, and the calm of a well-spent life. And no sooner was he returned to the dearly-remembered scene, with official duties no longer harassing him, than he determined again to prosecute that study of the starry heavens, which he had already commenced with much success, though inferior instrumental means, in the brilliant climate of India. At his maturer order, therefore, it was, and to subserve his future astronomical pursuits on the old patrimonial estate, that that giant telescope, the trophy *now*, it may fairly be claimed, of the Exhibition of 1851, had grown into existence; for, though then hardly known to scientific circles, he understood the majesty of the science he was approaching; and, though all untitled amidst a rich landed aristocracy, there was no one whose ideas were more thoroughly grand, and worthy of all that one is inclined to respect among the leaders of men.

Some mere ordinary people, such as inspectors of roads and conservators of bridges, made objections to the ponderous masses of cast-iron which formed the supporting pier of the great telescope, being brought down from the "world's fair" in the south to their quiet regions, on wagons of uncouth build and most portentous weight; but our friend, as firm in a good cause as modest before society, was not to be deterred from his purpose. They threat-

ened, that he would have to accept the responsibility of each bridge in the line of traction, breaking down under the unaccustomed load. He did accept it all; but not one bridge broke down; and, piece by piece, each part of the telescope arrived in safety on his ancestral hill. Then and there, on a soft green lawn, with protecting trees around, a white-stone building, with a revolving roof and opening sky-shutters, of excellent construction, was soon erected for the instrument's domicile; and the whole assumed the well-known form, though on a scale never seen before or since in Scotland, of an "extra-meridian observatory." That is, an observatory containing a large telescope mounted "parallactically;" or, with its principal axis parallel to that of the earth, so as to be capable of following its diurnal motion, as reflected in the paths described by the orbs of heaven; and expressly intended to allow of the most accurate measures, as well as the best telescopic views, of stars, large and small, and even those quite invisible to the naked eye, being obtained.

These large parallactic, or, as they are sometimes called, equatorial telescopes, are a comparatively new feature in practical astronomy, and a remarkable convenience to amateurs. In the more ancient method of mounting optic tubes, on axes either vertical or horizontal, and still more if they are confined to the plane of the meridian, a vast number of most inconvenient obstacles are thrown in the way of the would-be observer. He wishes, perhaps, only to learn something about the nature of the stars; and he finds, as soon as he has got them into the field of the telescope, that they are continually slipping away from him,—by reason of the earth's motion on its axis carrying the telescope's line of direction away from the star. And even if he overcomes this difficulty, and actually makes it subservient to his purposes, as in the transit instrument, and "right ascension" observations, where the very motion of the stars in the act of thus slipping away is made to register their places in the sky,—he only meets with a further set of difficulties, of a very similar nature in principle, but of a higher order.

The earth's axis, for instance, about which its daily revolution is performed, instead of remaining absolutely constant in direction, is always undergoing a minute series of disturbances, which affect apparently the places of all the stars; giving rise to the phenomena known as precession of the equinoxes, and solar and lunar nutation: and requiring, that the quantities of them be exactly calculated and applied to every observation, before any deduction be attempted as to the real nature and movements of any one star in the whole heaven. In fact, when meridian astronomy is pursued to any degree of exactness, its every step is so strewn with difficult calculations, that most amateurs withdraw in dismay; for that was not the sort of occupation which they wanted at all.

Most conveniently to them, therefore, appears

the modern equatorial, an instrument carrying as large a telescope as the owner can afford, and furnished generally with an *object-glass*, rather than a *speculum of metal* as in reflecting telescopes. But with this further and capital feature, viz., that whereas the axes being parallactic and at right angles thereto, admit of the application to them of circles, graduated similarly with the astronomical circles of reference in the heavens,—the telescope can, by these circles, be first pointed easily and accurately to the place of any star as recorded in the catalogues; and then, by means of a little piece of machinery usually known as an "equatorial driving clock,"—can be kept slowly turning round at the same rate as the earth itself, but just in the opposite direction, so as to eliminate that difficulty of the moving terrestrial platform of the observer, and enable him to contemplate the stars at perfect relative rest. Seated then at the end of his telescope, and adjusting his eye insensibly to the extremely slow movement of the eye-piece (for it is only once round in a small circle in the course of twenty-four hours), he can remain there and gaze uninterruptedly for half an hour or an hour at a time; untroubled by the movements in "semi-diurnal arcs;" and unpuzzled by corrections for aberration of light, or nutation of the earth's axis; and thinking only, and ascertaining too by actual micrometrical measure, if need so require, how much "one star differeth from another in glory."

This differential method of observing with equatorials may indeed be considered to be founded on whatever is excellent and practical in the old-fashioned, yet still adhered to, method of arranging the principal stars in constellations. Often and often has modern science rebelled against the fishes and uncouth bears, the winding snakes and monstrous dogs with which the shepherds of old filled the nocturnal sky; but whenever she has since attempted to arrange the stars into groups or regions bounded by definite, scientifically conceived lines and arcs of circles,—these lines and circles were found to be endued with slow, celestial movements upon the stars; causing thereby the bright star of one such scientific section in one age, to pass into and belong to another section after the lapse of perhaps only a moderate number of years. But the ancient constellations, depending on no such earth-drawn lines, but resting only on the mutual configuration of the stars *amongst each other*, know of no sensible change or alteration to the naked eye, even after ages of ages; and speaking generally, we still see every constellation with the same brightest star, and the same outlying fainter ones now, that it had in the days of the Chaldeans, and even of the patriarch Job himself. Hence, then, at least so far as the principal visible stars are concerned, modern astronomers have not been able to shake themselves free of those ancient constellational names; and for this good reason, that they have not been able to invent any better or any more able to maintain themselves through time.

Yet though to the ordinary spectator, hardly any change relatively to one another, occurs amongst the stars, which such a person therefore calls fixed—and we are excluding now sun, moon, and planets from the question—yet, to a powerful telescope, the scene appears far different, especially if it (the telescope) be mounted, as above, “equatorially.” For, precisely by eliminating with extreme exactness all the *apparent* movements, large and small, caused by the phenomena of the earth

in its rotation upon its axis and orbit around the sun—do the very small *proper* movements, or real changes amongst the stars themselves, become more conspicuously manifest. And as our trophy telescope of 1851 has an object-glass of no less than eleven inches in diameter; of exquisite quality, so as to enable very high magnifying powers to be employed; and furnished with all instrumental appliances to render those optical qualities effective,—let us see what it can show us amongst the stars in our day: as well

amongst the oldest and those which have been fondly and wistfully gazed at by man, ever since he was first placed by his great Creator on earth,—as amongst the newer discoveries of recent times. Seeing too, that we have at the present moment before us, three weeks of observations made with this instrument during last September, we shall be able to bring our “Good Words” news from the sidereal heavens, down to a very late date indeed.

III.—THE EMPLOYMENT OF IT FOR ITS ULTIMATE OBJECTS.

Now we do trust, before entering upon this third section of our subject, that none of our readers can deem the looking through a large telescope for astronomical purposes, to be either an easy or a trifling occupation; or a means whereby, without any trouble, you can instantly make important astronomical discoveries. You may indeed look

into the greatest telescope that ever was made, and yet not see anything that strikes you as particularly different from what you have seen elsewhere, if you look in merely in a cursory manner, and without trying hard to study what you see there, with your mind as well as your eyes. For, a known star visible to the naked eye will of course appear, in such an instrument, much *brighter* than in a smaller one; but that by itself would constitute no discovery. And again, many small stars may and will appear in

It's earliest appearance.

such a telescope, which no human eye unassisted could ever appreciate, but that would be no proof that yours was the first human eye which had observed them telescopically. While, even if it were so, another and another single small star added to the almost infinite number of small stars already recognised in the sky, and where all that is wanting to discover myriads more is simply increase of telescopic power, would be an addition to knowledge which few persons would thank us for; and not even astronomers be much interested to hear about.

"What then would astronomers care for, as a discovery," do you ask? Why, thereto we reply, that, true to the derivation of his name, an astronomer would prize exceedingly any steps towards ascertaining the laws to which the stars are subject; those laws of force and motion, light, heat, and electricity, which the omnipotent Creator of the universe has set them to obey; and which they follow implicitly in letter and spirit, and in the very essence of perfect obedience, with every infinitesimal particle of

their being. Now the nature of those laws is only to be gathered from the results of their action; and these results, though always absolutely true and consistent, may nevertheless be barely if at all visible to us, by reason of the transcending distance from us at which they are enacted in their stellar spheres. Hence, then, why astronomers are always labouring to employ both the highest magnifying power on their telescopes; and, even more important still, the most accurate means

of "micrometer" measurement, so that they may become aware of the first symptom of any real visible change amongst any of the stars; and then, having discovered that, to watch the course such changes may pursue from year to year and from generation to generation; gradually making out their order; and finally, perhaps, in a reverent spirit approximating to their cause, and learning to look through Nature up to Nature's God.

Let us then, on this understanding, begin with some of the simpler stellar observations, by turn-

ing the telescope to that bright orb "Vega," or "a Lyrae;" the second brightest orb of the northern hemisphere, and rising in our latitudes so nearly to the very zenith, that we see it in this country in its fullest earthly effulgence. What does the telescope show? It shows a star extraordinarily brilliant, but yet very small. There is a hard intense little knot, as it were, of bright light in the middle, and all around are rays and rings of tremulous splendour, like a diamond glory,

these large surroundings are, however, merely the disturbances or imperfections of the atmosphere and telescope, acting on that central little disc of concentrated light; for there lies the whole star. That disc is perhaps only one second in breadth; but the greater part even of that, as to size, is a spurious enlargement of the telescope; for not the best ever made by man, can concentrate the excessive brilliancy and abundance of the rays emitted by the star, and showered into the object-glass like

Its second location.

a faint sheet of sunshine, into the really small point only from which they appear to emanate. And whereas this star *a Lyrae*, is one of the very few whose distance from the earth has been measured (of which we may have something more to say on another occasion), we can compute with certainty, though the distance be something exceeding great,* that our sun, stupendous in actual

* About 860,000 times the earth's distance from the sun; and that being 95,000,000 of miles, the whole

size though it be (or, 800,000 miles in diameter), yet, if removed to the same distance, would offer an angular breadth of only *two thousandths* of a second; and, as it has also been demonstrated by refined observation and calculation, our noble sun would then afford only one-eighth part of the light which is now shed by a Lyræ. Plainly, then, this star is a sun also, and even more than a sun, in size and brilliance; while every observation that is made on other stars tells that they also, if not always intrinsically quite so large or bright, yet invariably bear in those respects far more analogy to our sun, than to the earth or any other planet that we are acquainted with.

Telescopically however only, and as they, at their immense distances, appear to us here, have we to deal with the stars now; and as such, one of the leading features to be observed by any man who may be placed for the time at the end of the telescope, is, if they are "single" or "double;" the term double implying, that the telescope often discloses that which no naked eye could ever have found out, viz., that there is another, and generally a smaller, star more or less close, and sometimes exceedingly close, to the large star. When such "duplicitly" has been ascertained, the next step is to discover whether it be an *optical* double star; i. e., merely seen in the same direction through the transparent realms of space, but with one of the orbs situated really so far beyond the other, as to be practically out of all reach of its attraction and influence; or, a *physical* double star, where the two component stars are at the same distance from the earth; are really, as well as apparently, close together; and so acting and reacting on each other by mutual gravitation and original impulse, as to become a *binary* system, with a slow revolution of each orb, probably in many years, round their common centre of gravity, much as with a satellite circulating round a planet.

Now a Lyræ has one of these companion stars; an exceedingly small star too, which it requires a

a Lyræ, an Optical Double Star.

good telescope to show at all; but happily the "trophy" of 1851 shows it so well, as to allow of

amounts to so many, that light, travelling at the rate of 192,000 miles in a second of time, would take thirteen years to accomplish the distance.

good micrometer measures being taken, of the exact apparent distance at which the small star is at present from the large one, and the direction, as seen from the earth, in September 1862. These measures, therefore, having been made, computed, and compared with the results of previous observers, as the Herschels, the Struves, and other great astronomers, confirm and extend their ideas of this being an *optical* double star only; and a case where one of the components, the large star, is endowed with a certain anomalous motion of its own, relative to all other stars, whereby it is found to alter its distance every year by about half a second from its apparently little, and really excessively distant, optical companion; and to be travelling along in nearly a straight line: the apparent straightness being, however, merely an indication of the vastness of the radius of the curve which the star must be describing about some unknown controlling centre.

The bright star in the constellation of the eagle, "a Aquilæ," is another similar optical double star, where the principal member is also influenced by "proper motion;" and where the trophy telescope proved that movement to be still ceaselessly at work, in its microscopic quantity, but changeless direction; symptomatic of the greatness of its cycle of years and path. Altogether, out of twenty-nine double stars observed, four of them were found similar in character to the above, but with different amounts and directions of the "proper" movement; amounts always so small that many thousands of years must occur before the arrangement of the stars in any constellation is by them altered to a casual beholder; but always so well certified to a good telescopic observer, and proved so sure, so measured, and so constant that they may well raise man's highest speculations as to their cause. Especially so, when our own sun has been proved to be in motion also amongst the stars, a star amongst the stars; and part of the apparent movements, therefore, observed in the closer of these, may be only the relative effects of our own change of place, as we are carried along with the sun through the starry universe at a rate, it is believed, of 422,000 miles per day.

Again, when we came to examine further, our observations of the twenty-nine double stars with the "trophy" telescope,—some of them proved to be *physical* double stars, the class first discovered and proved to exist by Sir William Herschel. In these, the modern observation compared with those more ancient, showed a telescopic amount of movement in the interval, of one star relatively to the other; but instead of being in nearly a straight line, as in the former examples, it was in a small curve of one star round the other.

In such case, the distance hardly varies, only the direction in which the one star bears from the other, technically called the "position angle," at different epochs; and there are cases in which, since their first discovery by that colossal observer,

Sir William, the small star has moved round more than once, through a whole revolution. Generally, only a few degrees of this change can be perceived after an interval of many years; and thus we found it with that conspicuous example of the class, " α Geminorum."

This fine bright star, the northern of the two Twins, and known also as "Castor," though to the naked eye a single star of about the second magnitude, yet appears most conspicuously in every telescope of anything more than very moderate power,

α Geminorum, a Physical Double Star.

to be composed of two members, *i. e.*, of two stars of nearly equal magnitude, and very close together compared with the instances just described. Each star is of about the third magnitude, and their distance asunder nearly five seconds at this present time; forming, as Sir John Herschel has written years ago, "the largest and finest of all the double stars in our hemisphere, and that whose unequivocal angular motion first impressed on my father's mind a full conviction of the reality of his long-cherished views on the subject of binary stars."

That angular motion in the "position angle," is certainly very remarkable, for while the distance apart of the two stars has barely altered,—their direction, which was, according to Sir William Herschel, 293° in the year 1784, had decreased to 273° in 1814, according to the Russian astronomer Struve; to 270° in 1817, according to Sir John Herschel; to 255° in 1837, according to Admiral Smyth; and to 241° in last September, according to our trophy-telescope in its country retreat. And upon these numbers is now being founded a calculation, not only to ascertain how long one star takes to revolve about the other, but the exact form of the orbit; and whether it is performed under the same influence of gravitation which retains the earth in its path round the sun, and causes a stone, let fall from our hand, to pass through sixteen feet in the first second of time.

Again, some of these *physical* double stars have their orbits laid out so nearly in the plane of view in which we see them, that their truly circular motions are converted into backward and forward movements almost in a straight line; and when that is the case, there is very little change of that element of the direction, or "angle of position," except when they, the two stars, are just passing

each other. Other pairs, again, are found to move in very eccentric orbits, almost like those of comets: and then a very similar effect to what we have just described, but for a different reason, may take place. For when the small star is in the more distant part of its orbit (and the reader will bear in mind that all these distances, great and small, are comprised within a little portion of space quite invisible to the naked eye, and dependent entirely on telescopic magnifying power to make them at all evident to us) it, the small star, moves very slowly; but as it approaches its primary its speed accelerates; and at last, when it is just in the act of turning the corner, as it were—or, as with comets, rushing round through their perihelion passage, with all the energy accumulated in their long descent from their aphelion—then the so-called "fixed star" of the vulgar, shows a rapidity of change which is indeed most startling, and instructive too to the attentive mind.

The star, or more strictly the two neighbouring stars, known as " 70 Ophiuchi," is a good example of one of the *physical* double stars with a very eccentric orbit. Its position-angle in last September was found 108° ; agreeing very well with the continued decrease noted by former observers, as 122° in 1842, and 136° in 1831; but then its distance was found only six seconds; whereas in 1842 it had been almost seven, and had been regularly increasing there up to, from five seconds in 1830, and three seconds in 1804. What was the reason, then, of this apparent discordance in one element only, of the star's description by observation? Could the trophy-telescope have erred by so much as a single second, in the distance apart of two little stars? No! we were sure that was impossible; and then examining the orbit of the star, as computed approximately some years ago by eminent astronomers, found that the greatest distance of the one star from the other was expected, or should have been reached, in 1847; and that ever since then, it should have been approaching its primary, now too, with even a sensibly accelerated rate. But its utmost velocity is reserved for its nearest approach, or the *periastral* passage, which is to occur about 1887; and then will be the time to make crucial observations on the actual facts, which shall test to the uttermost the best of human theories. Whence we may fairly expect that, little as this comparatively small star-group (one of the stars is of the fourth magnitude, the other of the seventh) is known at present to the world at large, it will be exciting immense interest a few years hence, and form the interesting central point towards which the optic axes of all astronomers' telescopes will be converging month after month, and night after night.

Thus far we have dealt only with the *movements* of the stars, as influenced by gravitation, or other attractive and mechanical agents to motion; but there is far more in them than that alone to study. Their light at once tells us this; and

when we turn to our own earth, and see how intimately every form of life, and even every elemental motion, as of the winds of the air and the waves of the sea, the evaporation of water and the descent of rain, everything, in fact, which is necessary to the existence of organized beings, depends entirely on the sun, and on the exact amount of light and heat which he throws out for the time being; when we further look to the sun with telescopes, and note the ceaseless activity of the heat-throes on his surface, each one of which produces its corresponding effect on the climate of the earth; and when we further find that these variations of the sun's intensity of light and heat, although apparently at each moment the result of small accidents and chance explosions, are yet amenable to laws and cycles; some of a few regularly recurring years; but some, of ages yet untold, and leading irresistibly to dire extremities of cold and heat that at present we entirely wot not of,—we can but come to the inevitable conclusion that the abode of man, as well as man himself, is fearfully and wonderfully made.

But the fearfulness of the Christian man on such an occasion is that which partakes of reverence, of admiration, of adoration, and of love for the God who has created all, and is in all, and through all: a God who has manifested his surpassing regard for man, in that he sent down his Son from heaven to become the Saviour of even a rebellious race.

The devout physical inquirer, therefore, will not have any of that sinful fear which seeks safety in flight, but will rather draw near, if so be that he may be permitted to behold more of the manifold works of God. To such an one, consequently, the periodical and secular changes of the sun's lustre form an object of interest rather than of dread; and he will even follow them in their resemblances or contrarieties through all the other suns, our stars, of the sky,—seeking still, through those slow steps but sure, viz., the gathering of facts, to arrive at their governing laws; for those laws he knows were the production of infinite wisdom.

Now, it is precisely by studying the innumerable instances of more or less variability of light amongst the stars, that we may arrive more speedily at a knowledge of the laws or ranges of the variations which may pervade the phenomena of our own sun; for amongst the stars are to be found here and there, in time as well as in space, cases of such rapid and intense change, that the cycles of our own sun, which occupy probably myriads of years, seem there condensed into a few months, and occasionally even days; allowing thereby the whole beginning, end, and duration of the luminous phenomenon to be watched by one telescope and one observer, over and over again. Most curious are some of the results which then disclose themselves; especially as certain of them are of an entirely different order to what the observer had expected to find.

Thus there is a well-known star, by designation "o Ceti," which may often be seen as a large star of the second magnitude, exceedingly conspicuous therefore to the naked eye; yet five months after, so far as mere optical examination with good telescopes can show, its place knows it no more, and it is gone as completely as though it had been blotted out of creation! When this phenomenon was first witnessed and recognised, by Fabricius in 1596, the mental effect must have been startling; and equally so, but in a more grateful manner, when, after another five months, the star reappeared. What could be the reason of all this, was then asked by mankind.

The first hypothesis, of a motion of the star to and from the earth in an elongated orbit, was soon disproved by observation and calculation; so the next one suggested, that this distant sun might be a body of an irregular figure or varied surface, and that by revolving slowly on its axis, and therefore showing us sometimes one side and sometimes another, would appear thereby to us, though not to all nature, or in actual fact, to vary in brightness. But then, if that had been the true explanation, the intervals between every successive maximum of light should have always remained sensibly equal; for there is nothing known, mechanical or physical, so extraordinarily uniform as the continued rate of rotation of a heavy body isolated in ethereal space. The intervals of o Ceti's changes are, however, not only not equal, but they show rates of regularly recurring accelerations for certain periods, and of retardations in others, that pretty plainly point to the revolution of a large dark planet round that distant sun, and in an elliptical orbit, in perfect accordance with the laws of our planetary revolutions in our own solar system.

Others, again, of the variable stars are not to be so explained, and do indicate an actual increase and decrease of the total light shed out by them. Few, indeed, of the stars, when questioned closely, are found to be quite constant in this respect. So at least our trophy telescope seemed to indicate; and continued observation is at present our sole resource for information.

Seeing, then, how the skies teem every day with new phenomena, and we are elsewhere informed that they show forth the glory of God, let us hope that men will not pass them idly by, like the beasts that perish; but that, amongst many others, the huge telescopes, somewhat vainly and of a certainty rather prematurely exhibited as "trophies" at the *second* Exhibition, may,—like our present example from the *first* World's Fair,—be adopted by noble men with pious and earnest souls; and be similarly found, when the third Exhibition shall have arrived, in some retired corner of the land, steadily employed in learning and teaching the laws of the starry heavens.

C. PIAZZI SMYTH.

THE FEMALE DIACONATE IN THE EARLY CHURCH.

BY J. M. LUDLOW.

MUCH has been written and said of late years on the subject of "Deaconesses," of "Sisterhoods," in the Protestant Churches. The "Blue Flag of Kaiserswerth" has had its history recorded ere this in the pages of *Good Words*. There is a growing knowledge of the fact that "Deaconesses" formed part of the economy of the early Church; that "sisterhoods" have done much of the good that has been done by the Church of Rome. Yet few people perhaps have asked themselves whether the female diaconate of the early Church, the Sisterhood of the Roman Catholic, the Deaconesses' Institute of the Protestant, represent the same or different ideas; in what they agree, in what they differ; what may be the outcome of each. The subject is one which has long been of deep interest to me; and perhaps the following pages, taken from notes gathered many years since, may at this time prove to be of some interest.

"I commend unto you Phœbe our sister, which is a servant of the church which is at Cenchrea" (Rom. xvi. 1). If the Greek word here translated "servant," had been rendered as in the 6th chapter of Acts, the 3d of the 1st Epistle to Timothy, and in many other passages of the apostolical writings, the verse would have run thus: "I commend unto you Phœbe our sister, which is a *deacon* of the church which is at Cenchrea." Reserving therefore all questions as respects the functions of the persons whom the word designates, but adhering to the form which is nearest to the Greek, we may say that undeniably there is mention of female "deacons" in the New Testament. The deacon Phœbe must moreover have been a person of some consideration. St. Paul begins with her name the list of his personal recommendations or salutations to the Roman Church, and recommends her at greater length than any other person. "That ye receive her in the Lord, as becometh saints, and that ye assist her in whatsoever business she hath need of you: for she hath been a succourer of many, and of myself also." Evidently this "servant of the church," this "succourer" of apostles, could have been no mere pew-opener, no filler of a purely menial office.

Turn now to the 3d chapter of St. Paul's Epistle to Timothy, where the apostle gives successively those noble pictures of the Christian bishop, of the Christian deacon. "A bishop," he says, "must be blameless, the husband of one wife, vigilant, sober, of good behaviour, given to hospitality, apt to teach; not given to wine, no striker, not greedy of filthy lucre; . . . one that ruleth well his own house, having his children in subjection with all gravity." Proceeding next to the deacons: "Likewise must the deacons be grave, not double-tongued, not given to much wine, not greedy of filthy lucre.

. . . Even so must *their wives*" (so says our translation) "be grave, not slanderers, sober, faithful in all things. Let the deacons be the husbands of one wife, ruling their children and their own house."

Many no doubt will have been struck by the circumstance, that whilst the deacons' wives are mentioned in the above passage, there is no parallel injunction as to the wives of bishops, although the former are treated obviously as married men and fathers of families, in precisely similar terms; whereas if the example of a deacon's wife be of sufficient moment to deserve a special apostolic exhortation, that of a bishop's wife must need it far more. Accordingly, Calvin and some others have held that the word rendered "their wives" means the wives of the bishops as well as of the deacons,—an interpretation which would itself do violence to our text, and which certainly accuses St. Paul of hasty and slovenly writing. For, if he had meant this, surely he would more naturally have inserted the verse at the end of the whole exhortation, after the present ver. 13, than have "thrown in"—to use an expression of Chrysostom's in a comment to be presently referred to—something about bishops' as well as deacons' wives at once in a passage referring to deacons, both before and after. This interpretation, at all events, seems to have been entirely foreign to the early church. Two meanings only appear to have been put upon the passage till the Reformation: one which referred it to women generally; the other, which referred it to the female diaconate.

Both these senses rest indeed upon the literal text. It will be observed that the word "their," in ver. 11, is printed in italics, indicating insertion at the hands of our translators. The Greek word, on the other hand, translated "wives," signifies primarily "women." Literally, therefore, the verse might run thus: "Even so must *women* be grave, not slanderers, sober, faithful in all things." Accordingly, the Latin Vulgate translates by the equivalent for "women," not for "wives;" our own Wycliffe following in its wake, and writing, "also *st* bihoveth *wymmen* to be chast," etc. Upon this construction Chrysostom, in his homilies on this epistle (the 11th), observes as follows:—"Some say that this is spoken of women generally; but it is not so. For why should he have thrown in something about women amongst the things which he has been saying? But he speaks of those that have the dignity of the diaconate." If, therefore, "*women-deacons*" are meant, the sense is plain. Just as the men-deacons must be grave, not double-tongued, etc., even so must the women-deacons be grave, not slanderous, etc. Thus, to sum up the argument, if the wives of the deacons be intended,

the omission of all mention of bishops' wives seems unaccountable; if the wives of bishops and deacons alike are meant, the reference to the former is strangely thrown in amidst injunctions specially referring to the diaconal office; if women generally, the injunction is thrown in still more strangely; but if "women-deacons" be really meant, instead of either an unaccountable omission or an illogical insertion, we have a command strictly sufficient, strictly logical, and in strict accordance, as I shall presently show, with the facts of Church history.*

One great cause of the obscurity in which the history of the female diaconate has been involved has been the existence in the early Church, from the apostolic age, of another class of women in later times frequently confounded with female deacons. "Honour widows that are widows indeed," says St. Paul (1 Tim. v. 3, *et seq.*); "but if any widow have children or nephews, let them learn first to show piety at home, and to requite their parents, for that is good and acceptable before God. Now she that is a widow indeed, and desolate, trusteth in God, and continueth in supplications and prayers night and day. . . . Let not a widow be taken into the number under threescore years old, having been the wife of one man, well reported of for good works; if she have brought up children, if she have lodged strangers, if she have washed the saints' feet, if she have relieved the afflicted, if she have diligently followed every good work. . . . If any man or woman that believeth hath widows, let them relieve them, and let not the church be charged, that it may relieve them that are widows indeed."

What does the picture here given amount to? Surely it is that of the *almswomen* of the primitive Church; persons free from all family ties ("if any widow have children or nephews"), and at the same time destitute of all family support ("she that is a widow indeed, and desolate" . . . "if any man or woman that believeth hath widows, let them relieve them"), who, after a life of Christian usefulness ("well reported of for good works," etc.), were thought worthy of being provided for by the Church ("let not the church be charged, that it may relieve them that are widows indeed") in their old age ("let not a widow be taken into the number under threescore years"), being released from all duties of active benevolence ("she that is a widow indeed . . . continueth in supplications and prayers night and day"). Now, the details of this picture are very much the reverse of what is implied in the word *deacon*, *i.e.*, man or maid-ser-

vant. As the primary function of the deacon was one of a purely ministerial nature, to "serve tables"—and let it be remembered that the very necessity for the office arose from the neglect of the Greek "widows" in the "daily ministrations" (the original Greek word is "diaconate")—so we may at once assume that the female deacon's duties must have been active ones. We can hardly suppose, for instance, that a widow of sixty, such as St. Paul describes, would, like the deacon Phoebe, have undertaken a long journey under all the difficulties of ancient navigation, charged, if a tradition accepted by our translators speaks true, with the care of the epistle in which she is mentioned. And shall we be far from the truth if, judging from St. Paul's commendation of Phoebe, we conjecture that the female deacon was what the widow had been, a bringer-up of children, a lodger of strangers, a reliever of the afflicted, a diligent follower of every good work? If so, it would easily follow that aged female deacons would be adopted into the class of widows; that women who had actively ministered to the Church during the working-time of their lives should in turn be ministered to by the Church in their old days, and allowed to devote themselves to prayer and contemplation. And thus the two ideas might in time run into one.

Not only the Church widows, however, but a class of persons dating from a scarcely later age, and who may be considered to have grown up out of a forced application of 1 Cor. vii. 25, the Church virgins, as well as the female elders or presbyters of some schismatical churches, and a class of "sister-women," a mere corruption of later days, have more or less been confounded with the female deacons at some time or other by the views or practice of particular churches, and the so-called labours of commentators; and the history of the true female diaconate has to be disentangled from a mass of misconceptions and misapplications of texts, wilful, stupid, or ignorant, filling the pages of the best books of reference, repeated without inquiry from author to author, till they seem to borrow something of the weight of each, almost incredible to any one who has not traced passage after passage to its source. And I here warn any student who should wish to examine the subject for himself, never to allow the most appalling array of modern names, with or without Latin endings, to have any influence with him against one single text of Scripture, or of an early authority.

Let us now turn to a work of which many varying judgments have been held by men of learning and weight—for some a clumsy forgery, for others a precious and genuine relic—the so-called "Apostolical Canons" or "Constitutions." Observe that, if they be forgeries, they are forgeries of an early age, and as such, possessed of real historical value. For every literary forgery must bear the impress of the time at which it was got up; it must look backward always, never forward;

* Several modern critics, especially German, infer from Tit. ii. 3, the existence of a class of female presbyters, invested with a sort of magisterial functions,—a class of persons of which some traces, indeed, are to be found later in schismatical bodies, but never in the Church. I cannot say how strongly I feel that our translators are upon this point entirely in the right, and that the apostle has simply in view a contrast of age between "aged men" and "aged women" on the one hand and "young men" and "young women" on the other.

some vestiges of past reality must linger in it, and by those vestiges we may often complete a subsisting fragment of reality itself. Now, in the "Apostolical Constitutions," the female Deacon or Deaconess, the Widow, the Virgin, all come before us as distinct types; the first as invested with an office; the second as the object of affectionate regard and support; the third of religious commendation. Of the Deaconess (as I shall call her henceforth) it is provided, that she shall be "a pure virgin," or otherwise "a widow once married, faithful and worthy;" a very natural provision, since the cares of a family would prevent a married woman from concentrating her whole energies on her diaconal functions. At service, whilst the "door-keeper" was to stand and watch at the men's entrance to the church, the deaconess was in like manner to stand at the women's entrance (a function which indeed, in a constitution of the eighth and latest book, is ascribed to the sub-deacon), and was, moreover, to act in the same manner as the male deacon with respect to placing females in the congregation, whether poor or rich. She was also to fulfil the duties of a male deacon in those cases where "a man-deacon cannot be sent to some houses towards women on account of unbelievers," *i.e.*, to prevent scandal. Lastly, her most important offices were those relating to the baptizing of women, the necessity for which has been obviated in later times by the discontinuance of the practice of baptism by immersion, or the practice of immersion under a form which the early Church would not have recognised as valid. It is even provided that "no woman shall approach the deacon or the bishop without the deaconess." And it is said generally, in a constitution concerning the deacons, that "the woman" (an expression strongly recalling 1 Tim. ii. 11, and affording additional ground for construing it as relating to the deaconesses) "should be zealous to serve women;" whilst "to both pertain messages, journeys to foreign parts, ministrations, services." The traditional journey of Phœbe to Rome with St. Paul's Epistle would thus be strictly within the limits of her functions.

Towards fulfilling these duties, the deaconess is represented as receiving an ordination from the bishop, under a simple and beautiful form of service attributed to the Apostle Bartholomew:—

"Touching the deaconess, I Bartholomew do thus ordain: O bishop, thou shalt lay on her thy hands, in the presence of the presbytery, of the deacons, and of the deaconesses, and thou shalt say:—

"O everlasting God, Father of our Lord Jesus Christ, Creator of man and woman, who didst fill with Thy Spirit Mary and Deborah, and Hannah and Hulda: who didst not disdain to cause Thine only-begotten Son to be born of a woman; who didst admit into the tabernacle of the testimony and into the temple the women guardians of Thy holy gates: Thyself look down even now upon

Thy servant now admitted into the diaconate, and give to her Thy Holy Spirit, and cleanse her from all pollution of the flesh and spirit, that she may worthily fulfil Thy work thus intrusted to her, to Thy glory, and to the praise of Thy Christ, with whom to Thee be glory and worship, and to the Holy Spirit, for ever and ever. Amen."

Some may feel shocked at the idea of the ordination of a woman, of the Holy Ghost being invoked upon her. A distinction has even been made by some Protestant, as well as Romish writers, between the imposition of hands as a ceremonial benediction and a real ordination. The original word certainly affords not the slightest ground for such a distinction, which other writers, like Bingham, wholly repudiate. But it seems to me that the laying on of hands upon a deaconess was eminently characteristic of the faith of early times. It was because men felt still that the Holy Ghost alone could give power to do any work to God's glory, that they deemed themselves constrained to ask such power of Him, in setting a woman to do church work. Nor did such ordination in the least interfere with any needful distinctions of office. "The deaconess," it is said, "does not give the blessing, nor does she fulfil any of the functions of the presbyters or of the deacons, beyond the guarding of doors, and the supplying the place of the presbyters in the baptizing of women." In other words, she was ordained not to preach, not to bless, exactly as others were ordained to preach and to bless. From other provisions, it may be seen that the deaconess ranked after the presbyter and deacon, and at least on a par with, if not before, the sub-deacon. Very different is the language of these Constitutions respecting widows, of whom it is said expressly in one place: "The widows should be grave, obedient to the bishops, to the presbyters, and to the deacons, and also to the deaconesses;" and it is specifically stated, in a constitution attributed to Lebbeus son of Thaddeus, that "the widow is not ordained." Of the Church virgin (who is, however, now treated as having dedicated *herself*, not as having been dedicated by others—as in 1 Cor. vii.—to Christ) it is specifically stated that she is "not ordained." The contrast between the ordained deaconess and the non-ordained widows and virgins, illustrates well the typical, universal character which belongs to the offices of the Christian Church. Deaconesses were ordained, because the Diaconate was the type of that universal duty of serving one another, which our Lord so specially inculcated in the washing of His disciples' feet. Widows were not ordained, because widowhood and virginity are not offices, but mere conditions of life; because they have nothing of a universal character, but are merely exceptional in their nature. The teachings of the Apostolical Constitutions on this subject, I must say, appear to me quite in accordance with the view now perhaps most generally entertained.

that they represent the condition of the Greek Church at some period of the second century.*

Except in the Apostolical Constitutions, up to the latter end of the fourth century, there is little of real moment, less of real interest, to be found in Eastern Church writers respecting our subject, although *Hermas*, as once mentioned by Principal Tulloch in *Good Words*, indicates the existence of women who seem to have had authority over the widows and orphans. The epistles falsely attributed to Ignatius, whilst referring to the deaconesses as "keepers of the holy gates," bear witness of their later date, by the far greater prominence they give to virgins,—treating them as "priestesses of Christ,"—holding them up to veneration,—and confounding them, according to one text at least, with the widows. Not to speak of a doubtful passage in Clement of Alexandria, writing towards the end of the second or beginning of the third century, Origen, an Egyptian writer of slightly later date (184-253), in commenting on Phœbe and her mission, speaks of the ministry of women in the Church as both existing and necessary.

If we turn now to the Western Church,—a remarkable passage from the letters of the Younger Pliny, writing for advice to Trajan, how to deal with the Christians, shows that it was upon two deaconesses that the elegant letter-writer—the Chesterfield of antiquity—sought to prove by torture the truth of those strange confessions of the Christians, "that they were wont on a stated day to meet before dawn, and repeat among themselves in alternate measure a song addressed to Christ, as to a God; and by their vow to bind themselves, not to the committing of any crime, but against theft, and robbery, and adultery, and breach of faith, and denial of trust, after which it was their custom to depart, and again to meet for the purpose of taking food." In the Latin Church, however, the distinction between the deaconess and the church-widow, and between the latter and the church-virgin, appears to have become early obliterated. Neander, indeed, shows well that the more stringent separation of the sexes in the Eastern Church created a more permanent necessity there for the peculiar services of the deaconess, whilst more exalted notions of priestly privileges tended in the West to impart a something offensive to her position as a recognised member of the ordained clergy. Tertullian (150-226, or there-

abouts) supplies us with the first Western instance of growing confusions; inveighing indeed against that between the widow and the virgin, but in terms which indicate the presence in his mind of a feeling that the widow, whilst receiving maintenance from the Church, is one engaged in the active duties of religion, and holding a place of actual honour. Another passage of his, however, which has been relied on as a staple authority for the identity of the two characters of deaconess and widow, if interpreted by earlier records, will be found, on the contrary, to bear an exactly opposite construction.

A century later, a canon of the Nicene Council (326) bears witness to the existence of an ordained female diaconate amongst the Paulianist heretics, and by implication also in the Church itself, although it has been strangely interpreted to forbid altogether the ordination of deaconesses. A canon of the Council of Laodicea (360 to 370) has been still more strongly pressed into this service, although it only forbids the appointment of female elders in the Church. In the Fourth Synod or Council of Carthage (whose canons have been considered to be, in fact, a collection of those of many African Councils) we find, again, passages which have been used, without the slightest testing of their weight, as authorities in treating of the female diaconate, whilst in fact they only show us widows and consecrated virgins invested with some of the functions of the deaconess. By the end of the fourth and beginning of the fifth century, however, references to the female diaconate, and notices of individual deaconesses, become frequent in the writings of the leading Greek fathers.

Theodoret tells of a deaconess in the time of Julian, how she "evangelized" the son of a heathen priest, encouraged him to stand fast under persecution, sheltered him from his father's wrath. He subsequently gives a chapter to the story of "Publia the deaconess, and her godly boldness;" who "being with the choir of the perpetual virgins," and "the Emperor chancing one day to pass, they began more lustily with one accord to sing forth, deeming the wretch worthy of all contempt and ridicule; and chiefly they sang those psalms which deride the impotence of idols. . . . The Emperor, hearing these songs, and being thereby stung to the quick, bade them be silent while he passed. But she, holding cheap his commands, filled the choir with greater boldness, and again, as he passed by, bade them sing, 'Let God arise, and let his enemies be scattered.' When he, bitterly wroth, bade the mistress of the choir be brought before him, . . . and showing neither pity for her grey hairs, nor respect for her virtue, ordered one of his guards to strike her on both cheeks, covering his hands with her blood. But she, taking this shame for sovran honour, withdrew into her cell, and still continually pursued him with her spiritual songs," as David was wont to still the evil spirit of Saul, adds the author; av

* I have not space here to dwell on the confused and discrepant passages on the same subject which are to be found in another collection of "Apostolical Constitutions," to which the late Baron Bunsen, in his *Hippolytus*, has ascribed a higher authority than to the Greek—the Coptic, edited and translated a few years since by Archdeacon Tattam. My own opinion, I must say, is that the Coptic collection, in its present shape, whatever early fragments may be imbedded in it, is, on the contrary, later than the Greek. The passages in question show at least that the Coptic Church, like the Greek, deemed the appointment of ministering women an essential feature in the organization of the Church.

odd comparison, seeing that, by his own account, *Publia* irritated *Julian's* evil passions instead of soothing them. The function of the deaconess, as head of the church-virgins, is referred to in other contemporary authorities.

Not to dwell on *Epiphanius*, who in two separate passages sets forth specifically (in general accordance with the Apostolical Constitutions) the institution and certain of the principal functions of the deaconesses, taking at the same time occasion to point out that the Church "never established elderesses or priestesses," the history of *Chrysostom* is essentially interwoven with that of the female diaconate, through the names of several deaconesses, his devoted followers.

Olympias, the most prominent of all, was an orphan of good birth, who had been married when young, but whose husband had died twenty months after, and whom the emperor *Theodosius* had sought in vain to marry a second time to one of his own kinsmen. She was, when still young in widowhood, ordained a deaconess. Her unbounded liberalities drew upon her the reproof of *Chrysostom*, who exhorted her to moderate her alms; and this counsel is assigned as one of the motives of the deep hatred borne to *Chrysostom* by the greedy priesthood of the metropolis. Of her stanch adherence to *Chrysostom* on his expulsion from the episcopate, her "manly" conduct under persecution, as well as of that of the deaconess *Pertadia*, who "knew nothing but the Church and her room," details will be found in *Sozomen*. The relation of *Chrysostom* to *Olympias* was peculiarly intimate, so that she looked after his daily food when he was in Constantinople. Eighteen of his letters are addressed to "My Lady the Deaconess *Olympias*, most worthy and beloved of God."

After saying that he will not dwell on her almsgiving, "whereof thou holdest the sceptres, and didst bind on the crown of old," he proceeds: "For who should tell thy varied, manifold, and many-sided endurance, and what speech should be sufficient for us, what measure for our history, if one should enumerate thy sufferings from thy earliest age until now: those from members of thy household, those from strangers, those from friends, those from enemies, those from persons connected with thee by blood, those from persons in nowise connected with thee, those from men in power, those from the prosperous, those from the rulers, those from the common people, those from men reckoned in the clergy. . . . But if one should turn also to the other forms of this virtue, and should go through no more thy sufferings received from others, but those which thou hast contrived for thyself,—what stone, what iron, what adamant shall he not find conquered by thee? For having received a flesh so tender and delicate, and nourished up in all kinds of luxury, thou hast so conquered it by various sufferings, that it lies no better than slain, and thou hast brought upon thyself such a swarm of diseases as to confound the physician's

skill, and the power of medicine, . . . and to live in perpetual fellowship with pain.

"For thy self-control as respects the table, and thy continence, and thy steadfastness in night-watchings, if any should choose to set it forth at length, how many words will he need! Rather we must seek out some other much greater name for these virtues. For we call that man continent and self-controlled, when he is pressed by some desire and conquers it; but thou hast not what thou mayest conquer; for having blown from the first with great vehemence upon the flesh, thou hast extinguished all its desires. . . . Insensibility alone remains to thee. . . . Thou hast taught thy stomach to be content with so much food and drink as not to perish. . . . That desire being quenched, the desire to sleep was quenched with it; for food is the nourishment of sleep. And indeed thou didst also destroy sleep in another way, having from the beginning done violence to thy nature, and spending whole nights without sleep; latterly, by constant custom, making a nature of the habit. For as sleep is natural to others, so is watching to thee. . . . But if any should examine the time, and how these things took place in unripe age, and the want of teachers, and the many that laid stumbling-blocks, and that from an ungodly house thou hast come now of thyself to the truth in thy soul, and that thine was a woman's body, and one delicate through the nobility and luxury of thy ancestors, how many seas of wonders will he find opening out at every point! . . . Willingly would I tarry over these words, and sail over a boundless sea, or seas rather, following the many-branched tracks of each virtue of thine, whereof each track should bring forth a sea again, if I were to dwell on thy patience, and thy humility, and thy many-shaped almsgiving, which has stretched to the very ends of the world, and on thy charity, that hath outdone ten thousand furnaces, and on thy boundless prudence, full of grace, and surpassing the measures of nature. . . . But I will endeavour to show the lion by his claw, by saying a few words of thy dress, of the garments that hang simply and at haphazard around thee. This indeed seems a lesser achievement than others; but if any should view it diligently, he will find it very great, and needing a philosophic soul, which tramples upon all the things of life, and takes flight to the very heaven. . . . For I do not only marvel at the unspeakable coarseness of thy attire, surpassing that of the very beggars, but above all at the shapelessness, the carelessness of thy garments, of thy shoes, of thy walk; all which things are virtue's colours."

He then says that his object has not been to praise, but to console her, in order that, "ceasing to consider this man's sin and that man's fault, thou mayest bear in mind perpetually the struggles of thy endurance, thy patience, thy abstinence, thy prayers, thy holy night-long watches, thy continence, thine almsgiving, thy hospitality, thy mani-

fold and difficult and frequent trials. Reflect how from thy first age until the present day, thou hast not ceased to feed Christ when a-hungred, to give Him drink when thirsty, to clothe Him when naked, to take Him in when a stranger, to visit Him when sick, to go unto Him when bound. . . . Be proud, and rejoice in the hope of these crowns and of these rewards."

I do not wish to soften one line of this most painful picture, which might be developed to almost any extent, as the "sea" of Chrysostom's panegyric, to use his own favourite image, flowed again and again. The days are gone when Phoebe travelled forth from land to land in charge of an apostle's letters. The days are gone when the deaconess went from house to house, carrying the good tidings into the seclusion of the women's apartments. The demon of ascetic self-righteousness has entered in, and is fostered by the preachings even of one of the greatest men, the most exemplary prelates of the age. The deaconesses, we are told, do not "depart from the Church." Profuse in almsgiving they may be, but how little can they be effectual "succourers of many," when by their austerities they ruin their health, when it is one of the features of Chrysostom's panegyric of Olympias, that she has brought upon her such a swarm of diseases as to defy all means of cure? No wonder that Epiphanius, Chrysostom's contemporary, mainly dwells upon that one duty of theirs, of assisting in the baptizing of women. Such easy, stay-at-home functions were the only ones now fit for them. No wonder that he adds a third to the classes from which the deaconesses are to be selected. They are to be, he says, either continent, by which he means virgin-wives, once-married, or once-married widows, or perpetual virgins. The Apostolical Constitutions know of no such monstrosity as voluntary virgin-wives. They do not say that the "pure virgins" who may be made deaconesses are to be perpetual ones.

There has grown up, moreover, a real analogy of character, if not of position, between the deaconess and the apostolical widow. I say the apostolical widow; not by any means the person known by that name in the age of Chrysostom, one of whose achievements was the reform of the Church-widows, and from whose writings it is palpable that this class, instead of having been raised to the level of the deaconesses, had, on the contrary, fallen far below its own original station; that the respectable almswoman had degenerated into the clamorous prayer; nay, that the still greater abuse had crept in of allowing the young and well-to-do to usurp the place of the aged and the destitute. The true pattern at this period of the apostolical widow, continuing in supplications and prayers day and night, was obviously exhibited by deaconesses such as Olympias or Pertadia. Nothing was more natural than that the laity at least should confound the two, and should endeavour to impose upon the

latter all the restrictions—as to age for instance—which St. Paul laid down for the former. A struggle for this purpose now takes place between the State and the Church; the State (in the Theodosian Code, 438) seeking to subject the institution to the disabilities of actual monachism. On the other hand, a canon of the Convent of Chalcedon, almost contemporary with the promulgation of the Theodosian Code (451), enacts, that "the deaconess shall not be ordained before her 40th year, and this with the utmost deliberation; but if, receiving the imposition of hands, and remaining some time in the ministry, she gives herself over to marriage, doing despite to the grace of God, let her be accursed, together with her paramour." By the time of Justinian, the State, after endeavouring for awhile to split the difference (at 50) as to the age of ordination of the deaconess, finally gives in. The distinction between widows and deaconesses is recognised; the number of deaconesses in the church of St. Sophia is fixed by law (80, to 100 male deacons). If the deaconess leave the ministry to enter into marriage, or choose any other mode of life, she is made subject to the penalty of death, as well as her husband or seducer, with confiscation of property for both. These are but a few instances out of many which occur in Justinian's legislation referring to the institution.

At this period, therefore (first half of the sixth century), the office of deaconess in the Eastern Church has become purely sacerdotal, forming a sort of connecting link between the secular and the regular clergy. She is even included, in the heading of one law, under a name (*sanctimonialis*) which in later days is synonymous with "nun." So nearly does her condition approach to that of actual monachism, that the punishment, as we have seen, for the marriage of a deaconess is death against both parties, the legislator not being ashamed to quote as an authority the Pagan one of the Vestal Virgins,—though indeed the repeated provisions on this head seem to show that there was considerable difficulty in enforcing these ascetic rules on the deaconesses. There are now, moreover, two classes of deaconesses, those residing in convents or asceteries (the "skeets" of contemporary Russia), and those attached to churches and living alone. The former must obviously have become almost identified with the nuns among whom they lived; the latter alone could have answered in some wise still to the old Church deaconess, "servant" of the Church.

From this period I am aware of but two or three scattered notices as to the female diaconate in the East. The last occurs in Balsamon, a writer of the twelfth century, as quoted by Suicèr, who treats the office as nearly extinct. No deaconesses, he says, are now ordained, though some of the "ascetes" may be improperly so termed. And the way in which he speaks of them shows that the institution had become lost and stifled in female monachism. "As virgins," he writes,

"they were received by the Church, and guarded according to the command of the bishop, as consecrated to God, except that they wore the garb of the laity, . . . and at forty years old they received ordination as deaconesses, being found qualified in all respects." Among the Jacobites, however, the institution seems to have lingered till a still later period.

If we turn now back from the Eastern to the Western Church, a curious feature presents itself. Ignored by the great Latin Fathers of the fourth and fifth centuries—Jerome, for instance—who yet treat widows, as unmistakably as Chrysostom himself, as objects of charity only, the female diaconate, confounded with Church widowship, suddenly makes its appearance under its own name in the decrees of Gaulish Councils of the fifth and sixth centuries, but invariably to be denounced and prohibited. Thus the Synod of Orange, 441; the Synod of Epaône, 517, absolutely forbid the ordination of "widows who are called deaconesses," says the latter. The Synod of Orleans, 533, enacts the excommunication of "any woman who, having received hitherto the blessing of the diaconate against the interdicts of the canons, shall have married again;" a text which shows that, in spite of previous prohibitions, the practice of ordaining deaconesses still existed. The explanation of this prominence in Gaul of the female diaconate in the fifth century I take to be this. Southern Gaul was always one of the great battle-fields between Eastern and Western feelings. Massilia-Marseilles was an old Greek colony; the relations between "the Province" and Greece, intimate in the days of Caesar, were intimate still in the early days of the Christian Church. Irenæus, one of the earliest Greek fathers, was Bishop of Lyons in the second century. New relations were opened between the two countries in the fifth century, through the settlement in Provence of the Basilian monks, and the foundation of the great monasteries of Southern Gaul. Now the fifth century, as we have seen, was, in point of honour, the golden age of the female diaconate in the Eastern Church; and it would be almost unaccountable if, amidst the new tide of Greek influence brought in at this period into Southern Gaul, the female diaconate, in its then half-monastic state, should not have been sought to be revived or re-introduced.

At any rate, it is about this period, and even later than the last interdiction of the female diaconate, that we meet with the most interesting incident connected with it to be found in the annals of the Western Church. It occurs in the story of St. Radegund, a Thuringian princess, wife of the Merovingian Chlothar I. of Neustria, forming the fifth narrative in that most delightful of histories, most truthful of tale-books, Augustin Thierry's *Narratives of Merovingian Times*. After a long period of domestic wretchedness by the side of a brutal husband, and after seeing at last her

only surviving brother, a hostage at Chlothar's court, put to death by his orders, the queen fled to St. Médard, bishop of Noyon. As he was in his church officiating at the altar, "Most holy priest," she cried, "I must leave the world, and change my garments; I entreat thee, most holy priest, do thou consecrate me to the Lord." The bishop hesitated. He was called upon "to dissolve a royal marriage, contracted according to the Salic law, and in conformity with Germanic customs, which the Church, while detesting them, was yet constrained to tolerate. . . . The Frankish lords and warriors who had followed the queen began to surround him, and to cry aloud, with threatening gestures, 'Beware how thou givest the veil to a woman who is married to the king! priest, refrain from robbing the prince of his solemnly-wedded queen!' The most furious among them, throwing hands upon him, dragged him violently from the altar-steps into the nave of the church, whilst the queen, affrighted with the tumult, was seeking with her women a refuge in the vestry. But here, collecting herself, . . . she threw a nun's dress over her regal garments, and thus disguised, proceeded towards the sanctuary where St. Médard was sitting. . . . 'If thou shouldst delay consecrating me,' said she with a firm voice, 'and shouldst fear men more than God, thou wilt have to render thy account, and the Shepherd shall require of thee the soul of His sheep.' . . . He ceased to hesitate, and of his own authority dissolved Radegund's marriage, by consecrating her a deaconess through the laying on of hands. The Frankish lords and vassals, carried away in their turn by the same feelings, durst no more take forcibly back to the royal residence one who in their eyes bore from henceforth the twofold character of a queen and of a woman consecrated to God's service." She subsequently formed a sort of free convent, where the pleasures of literary society, even with men, were combined with devotional exercises and good works. The above narrative points us to a startling fact, which has no parallel in Eastern annals, that ordination to the female diaconate in the West was by this time considered equivalent to divorce.

In spite of all prohibitions, indeed, the idea of a female diaconate seems to have lingered nearly as long, within a century or two, in the West as in the East. The canons of the Council of Worms in the ninth century repeat an earlier canon against the re-marriage of deaconesses. In the Roman Ordinal, and other rituals in use about the ninth century, will be found, it is said, a service for the ordination of a deaconess. This is especially to be remarked, as otherwise, in some of the latest mentions of deaconesses, the word might be taken to be used, as Bingham shows it to have been by one Gaulish Council, in the sense of wife of a deacon. The extinction of the office in the West must thus have nearly coincided with that great victory of the Romish system in the eleventh century, when

God's order of the family was finally expelled from the ministry of His Church. Still, a French author, writing on the Councils of the Church a few years before the outbreak of the great French Revolution, notices some vestiges of the office then yet subsisting in France.

There is surely a lesson for us in this history. Of what the female diaconate did, we know little. But knowing so little, it is sufficiently wonderful that we should find traces of its existence, both in the East and West, for from nine to twelve centuries—about two-thirds, in fact, of the Christian era. This strange obscure persistency indicates, either that it did far more work than is recorded of it, and lived thereby, or that its title to existence was in itself so unquestionable that even its own impotency barely sufficed to extinguish it.

Why did it perish? Evidently through the growth in the Church of the false ascetic principle, and in particular of the practice of religious celibacy, to which, according to its original constitution, it must have been a serious obstacle, by which it suffered itself to be overlaid. The scope of the female diaconate in the primitive Church was, as we have seen, to afford a full development to female energies for religious purposes; to associate women, as far as possible, in rank and practices with men, while preserving to each sex its distinct sphere of activity; to the one the supremacy of the head, to the other that of the heart; to the one power, to the other influence; to the one the office of public preaching, exhortation, relief, to the other that of private exhortation, consolation, helpfulness; yet each acting under the inspiration of that Holy Spirit who was invoked alike over the head of deacon and deaconess at their ordination. True in this was the Church to the laws of man's being, as displayed progressively throughout Holy Scripture, from Genesis to Revelation. By a pre-ordained and eternal marriage, man and woman must be one, in order to fulfil the great destinies of humanity. Genesis shows us how it is not good for man to be alone, how woman is made a help-meet for him. The New Testament discovers to us the deep spiritual ground of this

relation, by showing us Christ as the Holy Bridegroom of his hallowed Bride the Church. History confirms the lesson from age to age, from country to country, by showing how, if you deprive either sex of its free action, of its free influence over the other, the result is national sterility; the man a savage, the woman a fool. Restore Eastern women to their rights, and the whole Eastern world will rise up new-born.

Now, there is one most subtle way of sterilizing that eternal wedding. It is, without wholly debasing either sex in the other's eyes, to teach them to live apart, think apart, love apart, for the greater glory of God and of themselves,—as if they were different species of one genus, the union of which could produce nothing but hybrids. Where thus marriage assumes in the eyes of the candidate for superhuman sanctity the shape of a fleshly pollution,—where woman ceases to be man's earthly help-meet,—where it becomes good for man to live alone,—the familiar mingling of the sexes in the active ministrations of religion, unfettered and untrammelled, is impossible. The deaconess should be free as the deacon himself to leave her home at any time for those ministrations; she should be in constant communication with her brethren of the clergy. But place her under a vow of celibacy, every fellow-man becomes to her a tempter whom she must flee from. Hence the high walls of the nunnery, in which eventually we find her confined; hence the vanishing away of her office itself into monachism.

The details above given are sufficient, I think, to show that there is a wide difference between the Deaconesses' Institute of our days and what is recorded of the early female diaconate. That was essentially individual; and the only analogy to it lies in the "parish-deaconess," who goes forth from Kaiserswerth, or elsewhere, to devote herself to a particular congregation; although even she is far from holding that position as a member of the clergy (*cleros*) which is assigned to her by the records of Church history.

In the gap between the two lies the "sisterhood" of later times.

"THE PASSION FLOWERS OF LIFE"

THE PASSION-FLOWERS OF LIFE.

THE setting sun was sinking fast
Behind the heath-clad moor,
And as he fell, his rays he threw
Upon a cottage door.

An *old, old* man sat in the porch,
His grey head moving round,
For eighty years had round it wreathed
Their coronal of snow.

A grandeur to his aged locks
By the bright sun was given,
Shedding a halo on his head
As if 'twere ripe for heaven.

Upon his knee, by boisterous play,
To slumber deep beguiled,
There slept a flower of God's own land,—
A darling little child:

A little tiny velvet hand
Within his own was pressed ;

A little tiny golden head
Lay nestling on his breast.

The old, old man with trembling lip
A blessing breathed of love ;
And sure am I that old man's prayer
Recorded stands above.

Though "Time the Reaper" on his brow
His silver stamp had set ;
And heaven called one link of gold
Bound earth to heaven yet.

Of gold ! yes, even *angels* bow
Before that influence mild,
God's dearest, purest gift to man,
A loving little child.

And thus the buds of childhood's love
Amid our daily strife,
Bloom ever in their tenderness,
The Passion-flowers of Life !

ASTLEY H. BALDWIN.

ON THE HISTORY OF EARTHQUAKES AND VOLCANOS.

BY SIR JOHN HERSCHEL, BART.

THE first great earthquake of which any very distinct knowledge has reached us is that which occurred in the year 63 after our Saviour, which produced great destruction in the neighbourhood of Vesuvius, and shattered the cities of Pompeii and Herculaneum upon the Bay of Naples, though it did not destroy them. This earthquake is chiefly remarkable as having been the forerunner and the warning (if that warning could have been understood) of the first eruption of Vesuvius on record, which followed sixteen years afterwards in the year 79. Before that time none of the ancients had any notion of its being a volcano, though Pompeii itself is paved with its lava. The crater was probably filled, or at least the bottom occupied by a lake ; and we read of it as the stronghold of the rebel chief Spartacus, who, when lured there by the Roman army, escaped with his followers by clambering up the steep sides by the help of the wild vines that festooned them. The ground since the first earthquake in 63 had often been shaken by slight shocks, when at length, in August 79, they became more numerous and violent, and, on the night preceding the eruption, so tremendous as to threaten everything with destruction. A morning of comparative repose succeeded, and the terrified inhabitants of those devoted towns no doubt breathed more freely, and hoped the worst was over ; when, about one o'clock in the afternoon, the Elder Pliny, who was stationed in command of the Roman fleet at Misenum in full view of Vesuvius, beheld a huge

black cloud rising from the mountain, which, "rising slowly always higher," at last spread out aloft like the head of one of those picturesque flat-topped pines which form such an ornament of the Italian landscape. The meaning of such a phenomenon was to Pliny and to every one a mystery. We know now too well what it imports, and they were not long left in doubt. From that cloud descended stones, ashes, and pumice ; and the cloud itself lowered down upon the surrounding country, involving land and sea in profound darkness, pierced by flashes of fire more vivid than lightning. These, with the volumes of ashes that began to encumber the soil, and which covered the sea with floating pumice-stone, the constant heaving of the ground, and the sudden recoil of the sea, form a picture which is wonderfully well described by the Younger Pliny. His uncle, animated by an eager desire to know what was going on, and to afford aid to the inhabitants of the towns, made sail for the nearest point of the coast and landed ; but was instantly enveloped in the dense sulphureous vapour that swept down from the mountain, and perished miserably.

It does not seem that any *lava* flowed on that occasion. Pompeii was buried under the ashes ; Herculaneum by a torrent of mud, probably the contents of the crater, ejected at the first explosion. This was most fortunate. We owe to it the preservation of some of the most wonderful remains of antiquity. For it is not yet much more than a century ago that, in digging a well at

Portici near Naples, the Theatre of Herculaneum was discovered, some sixty feet under ground,—then houses, baths, statues, and, most interesting of all, a library, full of books, and those books still legible, and among them the writings of some ancient authors which had never before been met with, but which have now been read, copied, and published, while hundreds and hundreds, I am sorry to say, still remain unopened. Pompeii was not buried so deep; the walls of some of the buildings appeared among the modern vineyards, and led to excavations, which were easy, the ashes being light and loose. And there you now may walk through the streets, enter the houses, and find the skeletons of their inmates, some in the very act of trying to escape. Nothing can be more strange and striking.

Since that time Vesuvius has been frequently but very irregularly in eruption. The next after Pompeii was in the year 202, under Severus; and in 472 occurred an eruption so tremendous that all Europe was covered by the ashes, and even Constantinople thrown into alarm. This may seem to savour of the marvellous, but before I have done, I hope to show that it is not beyond what we know of the power of existing volcanos.

I shall not, of course, occupy attention with a history of Vesuvius, but pass at once to the eruption of 1779,—one of the most interesting on record, from the excellent account given of it by Sir William Hamilton, who was then resident at Naples as our Minister, and watched it throughout with the eye of an artist as well as the scrutiny of a philosopher.

In 1767, there had been a considerable eruption, during which Pliny's account of the great pine-like, flat-topped, spreading mass of smoke had been superbly seen, extending over the Island of Capri, which is twenty-eight miles from Vesuvius. The showers of ashes, the lava currents, the lightnings, thunderings, and earthquakes were very dreadful; but they were at once brought to a close when the mob insisted that the head of St. Januarius should be brought out and shown to the mountain, and when this was done, all the uproar ceased on the instant, and Vesuvius became as quiet as a lamb!!

He did not continue so, however, and it would have been well for Naples if the good Saint's head could have been permanently fixed in some conspicuous place in sight of the hill—for from that time till the year 1779 it never was quiet. In the spring of that year it began to pour out lava; and on one occasion, when Sir William Hamilton approached too near, the running stream was on the point of surrounding him, and the sulphureous vapour cut off his retreat, so that his only mode of escape was to walk across the lava, which, to his astonishment, and, no doubt, to his great joy, he found accompanied with no difficulty, and with no more inconvenience than what proceeded from the radiation of heat, on his legs and feet from the scoræ and cinders with which the external crust of the lava

was loaded, and which in great measure intercepted and confined the glowing heat of the ignited mass below.

In such cases, and when cooled down to a certain point, the motion of the lava-stream is slow and creeping; rather rolling over itself than flowing like a river, the top becoming the bottom, owing to the toughness of the half-congealed crust. When it issues, however, from any accessible vent, it is described as perfectly liquid, of an intense white heat, and spouting or welling forth with extreme rapidity. So Sir Humphry Davy described it in an eruption at which he was present; and so Sir William Hamilton, in the eruption we are now concerned with, saw it, "bubbling up violently" from one of its fountains on the slope of the volcano, "with a hissing and crackling noise, like that of an artificial firework, and forming, by the continual splashing up of the vitrified matter, a sort of dome or arch over the crevice from which it issued," which was all, internally, "red-hot like a heated oven."

However, as time went on, this quiet mode of getting rid of its contents would no longer suffice, and the usual symptoms of more violent action—rumbling noises and explosions within the mountain, puffs of smoke from its crater, and jets of red-hot stones and ashes—continued till the end of July, when they increased to such a degree as to exhibit at night the most beautiful firework imaginable. The eruption came to its climax from the 5th to the 10th of August, on the former of which days, after the ejection of an enormous volume of white clouds, piled like bales of the whitest cotton, in a mass exceeding four times the height and size of the mountain itself, the lava began to overflow the rim of the crater, and stream in torrents down the steep slope of the cone. This was continued till the 8th, when the great mass of the lava would seem to have been evacuated, and no longer repressing by its weight the free discharge of the imprisoned gases, allowed what remained to be ejected in fountains of fire, carried up to an immense height in the air. The description of one of these I must give in the picturesque and vivid words of Sir William Hamilton himself. "About nine o'clock," he says, on Sunday the 8th of August, "there was a loud report, which shook the houses at Portici and its neighbourhood to such a degree, as to alarm the inhabitants and drive them out into the streets. Many windows were broken, and as I have since seen, walls cracked by the concussion of the air from that explosion. . . . In one instant a fountain of liquid transparent fire began to rise, and gradually increasing, arrived at so amazing a height, as to strike every one who beheld it with the most awful astonishment. I shall scarcely be credited when I assure you that, to the best of my judgment, the height of this stupendous column of fire could not be less than three times that of Vesuvius itself, which, you know, rises perpendicularly near 3700 feet above the level

of the sea." (The height by my own measurement in 1824 is 3920 feet.) "Puffs of smoke, as black as can possibly be imagined, succeeded one another hastily, and accompanied the red-hot, transparent, and liquid lava, interrupting its splendid brightness here and there by patches of the darkest hue. Within these puffs of smoke at the very moment of their emission from the crater, I could perceive a bright but pale electrical fire playing about in zigzag lines. The liquid lava, mixed with scoriæ and stones, after having mounted, I verily believe at least 10,000 feet, falling perpendicularly on Vesuvius, covered its whole cone, part of that of Somma, and the valley between them. The falling matter being nearly as vivid and inflamed as that which was continually issuing fresh from the crater, formed with it one complete body of fire, which could not be less than two miles and a half in breadth, and of the extraordinary height above mentioned, casting a heat to the distance of at least six miles around it. The brushwood of the mountain of Somma was soon in a flame, which being of a different tint from the deep red of the matter thrown out from the volcano, and from the silvery blue of the electrical fire, still added to the contrast of this most extraordinary scene. After the column of fire had continued in full force for near half an hour, the eruption ceased at once, and Vesuvius remained sullen and silent."

The lightnings here described arose evidently in part from the chemical activity of gaseous decompositions going forward, in part to the friction of steam, and in part from the still more intense friction of the dust, stones, and ashes encountering one another in the air, in analogy to the electric manifestations which accompany the dust storms in India.

To give an idea of the state of the inhabitants of the country when an explosion is going on, I will make one other extract:—"The mountain of Somma, at the foot of which Ottaiano is situated, hides Vesuvius from its sight, so that till the eruption became considerable it was not visible to them. On Sunday night, when the noise increased, and the fire began to appear above the mountain of Somma, many of the inhabitants of the town flew to the churches, and others were preparing to quit the town, when a sudden violent report was heard, soon after which they found themselves involved in a thick cloud of smoke and minute ashes: a horrid clashing noise was heard in the air, and presently fell a deluge of stones and large scoriæ, some of which scoriæ were of the diameter of seven or eight feet, and must have weighed more than one hundred pounds before they were broken by their falls, as some of the fragments of them which I picked up in the streets, still weighed upwards of sixty pounds. When these large vitrified masses either struck against each other in the air or fell on the ground they broke in many pieces, and covered a large space around them with vivid sparks of fire, which communicated their heat to everything

that was combustible. In an instant the town and country about it was on fire in many parts; for in the vineyards there were several straw-huts, which had been erected for the watchmen of the grapes, all of which were burnt. A great magazine of wood in the heart of the town was all in a blaze, and had there been much wind, the flames must have spread universally, and all the inhabitants would have infallibly been burnt in their houses, for it was impossible for them to stir out. Some who attempted it with pillows, tables, chairs, tops of wine casks, etc., on their heads, were either knocked down or driven back to their close quarters, under arches and in the cellars of the houses. Many were wounded, but only two persons have died of the wounds they received from this dreadful volcanic shower. To add to the horror of the scene, incessant volcanic lightning was writhing about the black cloud that surrounded them, and the sulphureous smell and heat would scarcely allow them to draw their breath."

The next volcano I shall introduce is *Ætna*, the grandest of all our European volcanos. I ascended it in 1824, and found its height by a very careful barometric measurement to be 10,772 feet above the sea, which, by the way, agrees within some eight or ten feet with Admiral Smyth's measurement.

The scenery of *Ætna* is on the grandest scale. Ascending from Catania you skirt the stream of lava which destroyed a large part of that city in 1669, and which ran into the sea, forming a jetty or breakwater that now gives Catania what it never had before, the advantage of a harbour. There it lies as hard, rugged, barren, and fresh-looking as if it had flowed but yesterday. In many places it is full of huge caverns, great air-bubbles, into which one may ride on horseback (at least large enough) and which communicate, in a succession of horrible vaults, where one might wander and lose one's-self without hopes of escape. Higher up, near Nicolosi, is the spot from which that lava flowed. It is marked by two volcanic cones, each of them a considerable mountain, called the *Monti Rossi*, rising 300 feet above the slope of the hill, and which were thrown up on that occasion. Indeed one of the most remarkable features of *Ætna* is that of its flanks bristling over with innumerable smaller volcanos. For the height is so great that the lava now scarcely ever rises to the top of the crater, for before that its immense weight breaks through at the sides. In one of the eruptions that happened in the early part of this century, I forget the date, but I think it was in 1819, and which was described to me on the spot by an eye-witness—the Old Man of the Mountain, Mario Gemellaro—the side of *Ætna* was rent by a great fissure or crack, beginning near the top, and throwing out jets of lava from openings fourteen or fifteen in number all the way down so as to form a row of fiery fountains, rising from different levels, and all

ascending nearly to the same height, and thereby proving them all to have originated in the great internal cistern as it were, the crater being filled up to the top level.

From the summit of *Ætna* extends a view of extraordinary magnificence. The whole of Sicily lies at your feet, and far beyond it are seen a string of lesser volcanos, the Lipari Islands, between Sicily and the Italian coast, one of which, *Stromboli*, is always in eruption, unceasingly throwing up ashes, smoke, and liquid fire.

But I must not linger on the summit of *Ætna*. We will now take a flight thence, all across Europe, to Iceland—a wonderful land of frost and fire. It is full of volcanos, one of which, *HECLA*, has been twenty-two times in eruption within the last 800 years. Besides *Hecla*, there are five others, from which in the same period twenty eruptions have burst forth, making about one every twenty years. The most formidable of these was that which happened in 1783, a year also memorable as that of the terrible earthquake in Calabria. In May of that year, a bluish fog was observed over the mountain called *Skaptar Jokul*, and the neighbourhood was shaken by earthquakes. After a while a great pillar of smoke was observed to ascend from it, which darkened the whole surrounding district, and which descended in a whirlwind of ashes. On the 10th of May, innumerable fountains of fire were seen shooting up through the ice and snow which covered the mountain; and the principal river, called the *Skapta*, after rolling down a flood of foul and poisonous water, disappeared. Two days after a torrent of lava poured down into the bed which the river had deserted. The river had run in a deep ravine, 600 feet deep and 200 broad. This the lava entirely filled; and not only so, but it overflowed over the surrounding country, and ran into a great lake, from which it instantly expelled the water in an explosion of steam. When the lake was fairly filled, the lava again overflowed and divided into two streams, one of which covered some ancient lava fields; the other re-entered the bed of the *Shapta* lower down, and presented the astounding sight of a cataract of liquid fire pouring over what was formerly the waterfall of *Stapafoss*. This was the greatest eruption on record in Europe. It lasted in its violence till the end of August, and closed with a violent earthquake; but for nearly the whole year a canopy of cinder-laden cloud hung over the island; the *Faroe* Islands, nay even *Shetland* and the *Orkneys*, were deluged with the ashes, and volcanic dust and a preternatural smoke which obscured the sun, covered all Europe as far as the Alps, over which it could not rise. I have little doubt that the great Fire-ball of August 18, 1783, which traversed all England and the Continent, from the North Sea to Rome, by far the greatest ever known (for it was more than half a mile in diameter) was somehow connected with the electric excitement of the upper atmosphere pro-

duced by this enormous discharge of smoke and ashes. The destruction of life in Iceland was frightful: 9000 men, 11,000 cattle, 28,000 horses, and 190,000 sheep perished; mostly by suffocation. The lava ejected has been computed to have amounted in volume to more than twenty cubic miles.

We shall now proceed to still more remote regions, and describe, in as few words as may be, two immense eruptions,—one in Mexico in the year 1759, the other in the island of *Sumbawa* in the Eastern Archipelago, in 1815.

I ought to mention, by way of preliminary, that almost the whole line of coast of South and Central America, from Mexico southwards as far as *Valparaiso*—that is to say, nearly the whole chain of the *Andes*—is one mass of volcanos. In Mexico and Central America, there are two and twenty, and in *Quito*, *Peru*, and *Chili*, six and twenty more, in activity; and nearly as many more extinct ones, any one of which may at any moment break out afresh. This does not prevent the country from being inhabited, fertile, and well cultivated. Well, in a district of Mexico celebrated for the growth of the finest cotton, between two streams called *Cuitimba* and *San Pedro*, which furnished water for irrigation, lay the farm and homestead of *Don Pedro de Jurullo*, one of the richest and most fertile properties in that country. He was a thriving man, and lived in comfort as a large proprietor, little expecting the mischief that was to befall him. In June 1759, however, a subterranean noise was heard in this peaceful region. Hollow sounds of the most alarming nature were succeeded by frequent earthquakes, succeeding one another for fifty or sixty days; but they died away, and in the beginning of September everything seemed to have returned to its usual state of tranquillity. Suddenly, on the night of the 28th of September, the horrible noises recommenced. All the inhabitants fled in terror; and the whole tract of ground, from three to four square miles in extent, rose up in the form of a bladder to a height of upwards of 500 feet! Flames broke forth over a surface of more than half a square league, and through a thick cloud of ashes illuminated by this ghastly light, the refugees, who had ascended a mountain at some distance, could see the ground as if softened by the heat, and swelling and sinking like an agitated sea. Vast rents opened in the earth, into which the two rivers I mentioned precipitated themselves, but so far from quenching the fires, only seemed to make them more furious. Finally, the whole plain became covered with an immense torrent of boiling mud, out of which sprang thousands of little volcanic cones called *Hornitos*, or ovens. But the most astonishing part of the whole was the opening of a chasm vomiting out fire, and red-hot stones, and ashes, which accumulated so as to form “a range of six large mountain masses, one of which is upwards of 1600 feet in height above

the old level, and which is now known as the volcano of Jorullo. It is continually burning; and for a whole year continued to throw up an immense quantity of ashes, lava, and fragments of rock. The roofs of houses at the town or village of Queretaro, upwards of 140 miles distant, were covered with the ashes. The two rivers have again appeared, issuing at some distance from among the hornitos, but no longer as sources of wealth and fertility, for they are scalding hot, or at least were so when Baron Humboldt visited them several years after the event. The ground even then retained a violent heat, and the hornitos were pouring forth columns of steam twenty or thirty feet high, with a rumbling noise like that of a steam-boiler.

The Island of Sumbawa is one of that curious line of islands which links on Australia to the south-easterly corner of Asia. It forms, with one or two smaller volcanic islands a prolongation of Java, at that time, in 1815, a British possession, and under the government of Sir Stamford Raffles, to whom we owe the account of the eruption, and who took a great deal of pains to ascertain all the particulars. Java itself, I should observe, is one rookery of volcanos, and so are all the adjoining islands in that long crescent-shaped line I refer to.

On the Island of Sumbawa is the volcano of Tomboro, which broke out into eruption on the 5th of April in that year; and I can hardly do better than quote the account of it in Sir Stamford Raffles' own words:—

“Almost every one,” says this writer, “is acquainted with the intermitting convulsions of Etna and Vesuvius as they appear in the descriptions of the poet, and the authentic accounts of the naturalist; but the most extraordinary of them can bear no comparison, in point of duration and force, with that of Mount Tomboro in the island of Sumbawa. This eruption extended perceptible evidences of its existence over the whole of the Molucca Islands, over Java, a considerable portion of the Celebes, Sumatra, and Borneo, to a circumference of 1000 statute miles from its centre” (i.e., to 1000 miles' distance), “by tremulous motions and the report of explosions. In a short time the whole mountain near the Sang'ir appeared like a body of liquid fire, extending itself in every direction. The fire and columns of flame continued to rage with unabated fury, until the darkness, caused by the quantity of falling matter, obscured it at about eight P.M. Stones at this time fell very thick at Sang'ir, some of them as large as two fists, but generally not larger than walnuts. Between nine and ten P.M., ashes began to fall, and soon after a violent whirlwind ensued, which blew down nearly every house of Sang'ir, carrying the roofs and light parts away with it. In the port of Sang'ir, adjoining Sumbawa, its effects were much more violent, tearing up by the roots the largest trees, and carrying them into the air, together with men, horses, cattle, and whatsoever came

within its influence. This will account for the immense number of floating trees seen at sea. The sea rose nearly twelve feet higher than it had ever been known to do before, and completely spoiled the only small spots of rice land in Sang'ir, sweeping away houses and everything within its reach. The whirlwind lasted about an hour. No explosions were heard till the whirlwind had ceased at about eleven A.M. From midnight till the evening of the 11th, they continued without intermission; after that time their violence moderated, and they were heard only at intervals; but the explosions did not cease entirely until the 15th of July. Of all the villages round Tomboro, Tempo, containing about forty inhabitants, is the only one remaining. In Pekaté no vestige of a house is left; twenty-six of the people, who were at Sumbawa at the time, are the whole of the population who have escaped. From the best inquiries, there were certainly not fewer than 12,000 individuals in Tomboro and Pekaté at the time of the eruption, of whom five or six survive. The trees and herbage of every description, along the whole of the north and west of the peninsula, have been completely destroyed, with the exception of a high point of land near the spot where the village of Tomboro stood. At Sang'ir, it is added, the famine occasioned by this event was so extreme, that one of the rajah's own daughters died of starvation.”

I have seen it computed that the quantity of ashes and lava vomited forth in this awful eruption would have formed three mountains the size of Mont Blanc, the highest of the Alps; and if spread over the surface of Germany, would have covered the whole of it two feet deep! The ashes did actually cover the whole island of Tombock, more than 100 miles distant, to that depth, and 44,000 persons there perished by starvation, from the total destruction of all vegetation.

The mountain Kirauiah in the Island of Owyhee, one of the Sandwich Isles, exhibits the remarkable phenomenon of a lake of molten and very liquid lava *always* filling the bottom of the crater, and always in a state of terrific ebullition, rolling to and fro its fiery surge and flaming billows—yet with this it is content, for it would seem that at least for a long time past there has been no violent outbreak so as to make what is generally understood by a volcanic eruption. Volcanic eruptions are almost always preceded by earthquakes, by which the beds of rock, that overlie and keep down the struggling powers beneath, are dislocated and cracked, till at last they give way, and the strain is immediately relieved. It is chiefly when this does not happen, when the force below is sufficient to heave up and shake the earth, but not to burst open the crust, and give vent to the lava and gases, that the most destructive effects are produced. The great earthquake of November 1, 1755, which destroyed Lisbon, was an instance of this kind, and was one of the greatest, if not the very greatest on

record ; for the concussion extended over all Spain and Portugal—indeed over all Europe, and even into Scotland—over North Africa, where in one town in Morocco 8000 or 10,000 people perished. Nay, its effects extended even across the Atlantic to Madeira, where it was very violent, and to the West Indies. The most striking feature about this earthquake was its extreme suddenness. All was going on quite as usual in Lisbon the morning of that memorable day, the weather fine and clear, and nothing whatever to give the population of that great capital the least suspicion of mischief. All at once, at twenty minutes before ten A.M., a noise was heard like the rumbling of carriages under ground ; it increased rapidly and became a succession of deafening explosions like the loudest cannon. Then a shock, which, as described by one writing from the spot, seemed to last but the tenth part of a minute, and down came tumbling palaces, churches, theatres, and every large public edifice, and about a third or a fourth part of the dwelling-houses. More shocks followed in rapid succession, and in six minutes from the commencement 60,000 persons were crushed in the ruins ! Here are the simple but expressive words of one J. Latham, who writes to his uncle in London. "I was on the river with one of my customers going to a village three miles off. Presently the boat made a noise as if on the shore or landing, though then in the middle of the water. I asked my companion if he knew what was the matter. He stared at me, and looking at Lisbon, we saw the houses falling, which made him say, 'God bless us, it is an earthquake !' About four or five minutes after the boat made a noise as before, and we saw the houses tumble down on both sides of the river." They then landed and made for a hill ; thence they beheld the sea (which had at first receded and laid a great tract dry) come rolling in, in a vast mountain wave fifty or sixty feet high, on the land, and sweeping all before it. Three thousand people had taken refuge on a new stone quay or jetty just completed at great expense. In an instant it was turned topsy-turvy ; and the whole quay, and every person on it, with all the vessels moored to it, disappeared, and not a vestige of them ever appeared again. Where that quay stood, was afterwards found a depth of 100 fathoms (600 feet) water. It happened to be a religious festival, and most of the population were assembled in the churches, which fell and crushed them. That no horror might be wanting, fires broke out in innumerable houses where the wood-work had fallen on the fires, and much that the earthquake had spared was destroyed by fire. And then too broke forth that worst of all scourges, a lawless ruffian-like mob who plundered, burned, and murdered in the midst of all that desolation and horror. The huge wave I have spoken of swept the whole coast of Spain and Portugal. Its swell and fall was ten or twelve feet at Madeira. It swept quite across the Atlantic, and broke on

the shores of the West Indies. Every lake and firth in England and Scotland was dashed for a moment out of its bed, the water not partaking of the sudden *shove* given to the land, just as when you splash a flat saucerful of water, the water dashes over on the side *from* which the shock is given.

One of the most curious incidents in this earthquake was its effect on ships far out at sea, which would lead us to suppose that the immediate impulse was in the nature of a violent blow or thrust upwards, under the bed of the ocean. Thus it is recorded that this upward shock was so sudden and violent on a ship, at that time forty leagues from Cape St. Vincent, that the sailors on deck were tossed up into the air to a height of eighteen inches. A British ship eleven miles from land near the Philippine Islands in 1796 was struck upwards from below with such force as to unship and split up the main-mast.

The same kind of upward bounding movement took place at Riobamba in Quito in the great earthquake of February 4, 1797, which was connected with an eruption of the volcano of Tunguragua. That earthquake extended in its greatest intensity over an oval space of 120 miles from south to north, and 60 from east to west, within which space every town and village was levelled with the ground ; but the total extent of surface shaken was upwards of 500 miles in one direction (from Puna to Popayan), and 400 in the other. Quero, Riobamba, and several other towns, were buried under fallen mountains, and in a very few minutes 30,000 persons were destroyed. At Riobamba, however, after the earthquake, a great number of corpses were found to have been tossed across a river, and scattered over the side of a sloping hill on the other side.

The frequency of these South American earthquakes is not more extraordinary than the duration of the shocks. Humboldt relates that on one occasion, when travelling on mule-back with his companion Bonpland, they were obliged to dismount in a dense forest, and throw themselves on the ground, the earth being shaken uninterruptedly for upwards of a quarter of an hour with such violence that they could not keep their legs.

One of the most circumstantially described earthquakes on record is that which happened in Calabria on the 5th of February 1783, I should say began then, for it may be said to have lasted four years. In the year 1783, for instance, 949 shocks took place, of which 501 were great ones, and in 1784, 151 shocks were felt, 98 of which were violent. The centre of action seemed to be under the towns of Monteleone and Oppido. In a circle twenty-two miles in radius round Oppido every town and village was destroyed within two minutes by the first shock, and within one of 70 miles' radius all were seriously shaken and much damage done. The whole of Calabria was affected, and even across the sea Messina was shaken, and a great part of Sicily.

There is no end of the capricious and out-of-the-way accidents and movements recorded in this Calabrian earthquake. The ground undulated like a ship at sea, people became actually sea-sick, and to give an idea of the undulation (just as it happens at sea), the scud of the clouds before the wind seemed to be fitfully arrested during the pitching movement when it took place in the same direction, and to redouble its speed in the reverse movement. At Oppido many houses were swallowed up bodily. Loose objects were tossed up several yards into the air. The flagstones in some places were found after a severe shock all turned bottom upwards. Great fissures opened in the earth, and at Terra Nova a mass of rock 200 feet high and 400 in diameter travelled four miles down a ravine. All landmarks were removed, and the land itself, in some instances, with trees and hedges growing on it, carried bodily away and set down in another place. Altogether about 40,000 people perished by the earthquakes, and some 20,000 more of the epidemic diseases produced by want and the effluvia of the dead bodies.

Volcanoes occasionally break forth at the bottom of the sea, and, when this is the case, the result is usually the production of a new island. This, in many cases, disappears soon after its formation, being composed of loose and incoherent materials, which easily yield to the destructive power of the waves. Such was the case with the Island of Sabrina, thrown up, in 1811, off St. Michaels, in the Azores, which disappeared almost as soon as formed, and in that of Pantellaria, on the Sicilian coast, which resisted longer, but was gradually washed into a shoal, and at length has, we believe, completely disappeared. In numerous other instances, the cones of cinders and scorïæ, once raised, have become compacted and bound together by the effusion of lava, hardening into solid stone, and thus, becoming habitual volcanic vents, they continue to increase in height and diameter, and assume the importance of permanent volcanic islands. Such has been, doubtless, the history of those numerous insular volcanoes which dot the ocean in so many parts of the world, such as Teneriffe, the Azores, Ascension, St. Helena, Tristan d'Aumbra, etc. In some cases the process has been witnessed from its commencement, as in that of two islands which arose in the Aleutian group, connecting Kamtschatka with North America, the one in 1796, the other in 1814, and which both attained the elevation of 3000 feet.

Besides these evident instances of eruptive action, there is every reason to believe that enormous floods of lava have been, at various remote periods in the earth's history, poured forth at the bottom of seas so deep as to repress, by the mere weight of water, all outbreak of steam, gas, or ashes; and reposing perhaps for ages in a liquid state, protected from the cooling action of the water on their upper surface by a thick crust of congealed stony matter, to have assumed a perfect level, and, at

length, by slow cooling, taken on that peculiar columnar structure which we see produced in miniature in starch by the contraction or shrinkage, and consequent splitting, of the material in drying; and resulting in those picturesque and singular landscape-features called basaltic colonnades, when brought up to day by sudden or gradual upheaval, and broken into cliffs and terraces by the action of waves, torrents, or weather. Those grand specimens of such colonnades which Britain possesses in the Giant's Causeway of Antrim, and the Cave of Fingal in Staffa, for instance, are no doubt extreme outstanding portions of such a vast submarine lava-flood which at some inconceivably remote epoch occupied the whole intermediate space, affording the same kind of evidence of a former connexion of the coasts of Scotland and Ireland as do the opposing chalk cliffs of Dover and Boulogne of the ancient connexion of France with Britain. Here and there a small basaltic island, such as that of Rathlin, remains to attest this former continuity, and to recall to the contemplative mind that sublime antagonism between sudden violence and persevering effort, which the study of geology impresses in every form of repetition.

There exists a very general impression that earthquakes are preceded and ushered in by some kind of preternatural, and, as it were, expectant calm in the elements, as if to make the confusion and desolation they create the more impressive. The records of such visitations which we possess, however striking some particular cases of this kind may appear, by no means bear out this as a general fact, or go to indicate any particular phase of weather as preferentially accompanying their occurrence. This does not prevent, however, certain conjunctures of atmospheric or other circumstances from exercising a determining influence on the times of their occurrence. According to the view we have taken of their origin (viz., the displacement of pressure, resulting in a state of strain in the strata at certain points, gradually increasing to the maximum they can bear without disruption), it is the last ounce which breaks the camel's back. Great barometrical fluctuation, accumulating atmospheric pressure for a time over the sea, and relieving it over the land; an unusually high tide, aided by long-continued and powerful winds, heaping up the water; nay, even the tidal action of the sun and moon on the *solid* portion of the earth's crust,—all these causes, for the moment combining, may very well suffice to determine the instant of fracture, when the balance between the opposing forces is on the eve of subversion. The last-mentioned cause may need a few words of explanation. The action of the sun and moon, though it cannot produce a tide in the solid crust of the earth, *tends* to do so, and, were it fluid, *would* produce it. It therefore, in point of fact, does bring the solid portions of the earth's surface into a state alternately of strain and compression. The effective part of their force, in the present case, is not that which

aids to *lift* or to *press* the superficial matter (for *that*, acting alike on the continents and on the bed of the sea, would have no influence), but that which tends to produce lateral displacement; or what geometers call the *tangential force*. This of necessity brings the whole ring of the earth's surface, which at any instant has the acting luminary on its

horizon, into a state of strain; and the whole area over which it is nearly vertical, into one of compression. We leave this point to be further followed out, but we cannot forbear remarking, that the great volcanic chains of the world have, in point of fact, a direction which this cause of disruption would tend rather to favour than to contravene.

REMINISCENCES OF A HIGHLAND PARISH.

BY THE EDITOR.

CHAPTER II.—THE MANSE.

"SAY, ye far-travelled clouds, far-seeing hills—

Among the happiest-looking homes of men
Scatter'd all Britain over, through deep glen,
On airy uplands, and by forest-rills,
And o'er wide plains, whereon the sky distils
Her lark's loved warblings—does aught meet your
ken

More fit to animate the Poet's pen,
Aught that more surely by its aspect fills
Pure minds with sinless envy, than the abode
Of the good Priest: who, faithful through all hours
To his high charge, and truly serving God,
Has yet a heart and hand for trees and flowers,
Enjoys the walks his predecessors trod,
Nor covets lineal rights in lands and towers?"

WORDSWORTH.

THERE lived in the Island of Skye, more than a century ago, a small farmer or "gentleman tacksman." Some of his admirably-written letters are now before me; but I know little of his history beyond the fact revealed in his correspondence, and preserved in the affectionate traditions of his descendants, that he was "a good man," and the first within the district where he lived who introduced the worship of God in his family.

One great object of his ambition was to give his sons the best education that could be obtained for them, and in particular to train his first-born for the ministry of the Established Church of Scotland. His wishes were fully realized, for the noble institution of the parochial school provided in the remotest districts of Scotland teaching of a very high order, and produced admirable classical scholars—such as even Dr. Johnson talks of with respect.

Besides the schools, there was an excellent custom then existing among the tenantry in Skye, of associating themselves to obtain a good tutor for their sons. The tutor resided alternately at different farms, and the boys from the other farms in the neighbourhood came daily to him. In this way the burden of supporting the teacher, and the difficulties of travelling on the part of the boys, were divided among the several families in the district. In autumn the tutor, accompanied by his more advanced pupils, journeyed on foot to Aberdeen to attend the University. He superintended their studies during the winter, and returned in spring

with them to their Highland homes to pursue the same routine. The then Laird of Macleod was one who took a pride in being surrounded by a tenantry who possessed so much culture. It was his custom to introduce all the sons of his tenants who were studying in Aberdeen to their respective professors, and to entertain both professors and students in his house. On one such occasion, when a professor remarked with surprise, "Why, sir, these are all gentlemen!" Macleod replied, "Gentlemen I found them, as gentlemen I wish to see them educated, and as gentlemen I hope to leave them behind me."*

The "gentleman tacksman's" eldest son acted as a tutor for some time, and then became minister of "the Highland Parish." It was said of him that "a finer-looking or prettier man never left his native island." He was upwards of six feet in height, with a noble countenance which age only made nobler. He was accompanied from Skye by a servant-lad, whom he had known from his boyhood, called "Ruari Beg," or little Rory. Rory was rather a contrast to his master in outward appearance. One eye was blind, but the other seemed to have robbed the sight from its extinguished neighbour to intensify its own. That grey eye gleamed and scintillated with the peculiar sagacity and reflection which one sees in the eye of a Skye terrier, but with such intervals of feeling as human love of the most genuine kind could alone have expressed. One leg, too, was slightly shorter than the other, and the manner in which Rory rose on the longer or sunk on the shorter, and the frequency or rapidity with which those alternate ups and downs in his life were practised, became a telegraph of Rory's thoughts when no words, out of respect to his master, were spoken. "So you don't agree with me, Rory?" "What's wrong?" "You think it dangerous to put to sea to-day?" "Yes; the mountain-pass also would be dangerous? Exactly so. Then we must con-

* "At dinner I expressed to Macleod the joy which I had in seeing him on such cordial feelings with his clan. 'Government,' said he, 'has deprived us of our ancient power; but it cannot deprive us of our domestic satisfactions. I would rather drink punch in one of their houses (meaning the houses of the people), than be enabled by their hardships to have claret in my own.'" —Boswell's *Life of Johnson*, vol. iv. p. 275.

sider what is to be done." These were the sort of remarks which a series of slow or rapid movements of Rory's limbs often drew forth from his master, though no other token was afforded of his inner doubt or opposition. A better boatman, a truer genius at the helm, never took a tiller in his hand; a more enduring traveller never "gaed ower the moor among the heather;" a better singer of a boat-song never cheered the rowers, nor kept them as one man to their stroke; a more devoted, loyal, and affectionate "minister's man" and friend never lived than Rory—first called "Little Rory," but as long as I can remember, "Old Rory." But more of him anon. The minister and his servant arrived in the Highland Parish nearly ninety years ago, almost total strangers to its inhabitants, and alone they entered the manse to see what it was like.

I ought to inform my readers in the south, some of whom—can they pardon the suspicion if it is unjust?—are more ignorant of Scotland and its Church than they are of France or Italy and the Church of Rome,—I ought to inform them that the Presbyterian Church is established in Scotland, and that the landed proprietors in each parish are bound by law to build and keep in repair a church, suitable school, and parsonage or "manse," and also to secure a portion of land, or "glebe," for the minister. Both the manses and churches have of late years immensely improved in Scotland, so that in many cases they are now far superior to those in some of the rural parishes of England. Much still remains to be accomplished in this department of architecture and taste! Yet even at the time I speak of, the manse was in its structure rather above than below the houses occupied by the ordinary gentry, with the exception of "the big house" of the Laird. It has been succeeded by one more worthy of the times; but the old manse was nevertheless respectable, as the accompanying sketch of it showeth. [See p. 152.]

The glebe was the glory of the manse! It was the largest in the county, consisting of about sixty acres, and containing a wonderful combination of Highland beauty. It was bounded on one side by a "burn," whose torrent rushed far down between lofty steep banks clothed with natural wood, ash, birch, hazel, oak, and rowan-tree, and poured its dark moss-water over a series of falls, and through deep pools, "with beaded bubbles winking at the brim." It was never tracked along its margin by any human being, except herd-boys and their companions, who swam the pools and clambered up the banks, holding by the roots of trees, starting the kingfisher from his rock, or the wild cat from his den. On the other side of the glebe was the sea, with here a sandy beach, and there steep rocks and deep water; small grey islets beyond; with many birds, curlews, cranes, divers, and gulls of all sorts, giving life to the rocks and shore. Along the margin of the sea

there stretched such a flat of green grass as suggested the name which it bore, of "the Duke of Argyle's walk." And pacing along that green margin at evening, what sounds and wild cries were heard of piping sea-birds, chafing waves, the roll of oars, and the song from fishing-boats, which told of their return home. The green terrace-walk which fringed the sea, was but the outer border of a flat that was hemmed in by the low precipice of the old up-raised beach of Scotland. Higher still was a second storey of green fields and emerald pastures, broken by a lovely rocky knoll, called Fingal's hill, whose grey head, rising out of green grass, bent towards the burn, and looked down into its own image reflected in the deep pools which slept at its feet. On that upper table-land, and beside a clear stream, stood the manse and garden sheltered by trees. Beyond the glebe began the dark moor, which swept higher and higher, until crowned by the mountain-top of which I have already spoken, which looked away to the Western Islands and to the peaks of Skye.*

The minister, like most of his brethren, soon took to himself a wife, the daughter of a neighbouring "gentleman tacksman," and the granddaughter of a minister, well born, and well bred; and never did man find a help more meet for him. In that manse they both lived for nearly fifty years, and his wife bore him sixteen children; yet neither father nor mother could ever lay their hand on a child of theirs and say, "We wish this one had not been." They were all a source of unmingled joy to them.

A small farm was added to the glebe, for it was

* I must here correct two mistakes which have crept into Chapter I. The first is in the motto, in which the fine Homeric hexameters of Clough have been misprinted. They should read thus:—

"There, westward away, where roads are unknown †
Loch Nevish,
And the great peaks look abroad over Skye to the
westernmost islands."

The other mistake is the transference of a paragraph about the many churches built by our ecclesiastical ancestors as contrasted with the large parishes and poorer churches of more modern times. The said paragraph, instead of having been introduced where the large size of "the Highland parish" is alluded to, was by some inadvertence brought into the description of the view from the mountain top—from which no ruins of churches can be seen. Since writing this paper, I have been struck by a sarcastic and pithy remark in Dr. Johnson's tour:—"It has been, for many years, popular to talk of the lazy devotion of the Romish clergy, and the sleepy laziness of men that erected churches. We may indulge our superiority with a new triumph by comparing it with the fervid activity of those who suffer them to fall." A great change has happily come over the Highlands since the time when those words were written, a period when, as the Doctor informs us, there were some parishes in the far north without churches—for what reason we know not—and the people assembled in private houses for worship. No such cases can be found now.

found that the machinery required to work sixty acres of arable and pasture land could work more with the same expense. Besides, John Duke of Argyle made it a rule at that time to give farms at less than their value to the ministers on his estates; and why, therefore, should not our minister, with his sensible, active, thrifty wife, and growing sons and daughters, have a small one, and thus secure for his large household abundance of food, including milk and butter, cheese, potatoes, meal, with the excellent addition of mutton, and sometimes beef too? And the good man did not attend to his parish worse when his living was thus bettered; nor was he less cheerful or earnest in duty when in his house "there was bread enough and to spare."

The manse and glebe of that Highland parish were a colony which ever preached sermons, on week days as well as on Sundays, of industry and frugality, of a courteous hospitality and a bountiful charity, and the domestic peace, contentment, and cheerfulness of a holy Christian home. Several cottages were built by the minister and clustered in sheltered nooks near his dwelling. One or two were inhabited by labourers and shepherds; another by the weaver, who made all the carpets, blankets, plaids, and finer webs of linen and woollen cloths required for the household; and another by old Jenny, the hen-wife, herself like an old hen, waddling about and *chucking* among her numerous family of poultry. Old Rory, with his wife and family, was located near the shore, to attend at spare hours to fishing, as well as to be ready with the boat for the use of the minister in his pastoral work. Two or three cottages besides these were inhabited by objects of charity, whose claims upon the family it was difficult to trace. An old sailor had settled down in one, but no person could tell anything about him, except that he had been born in Skye, had served in the navy, had fought at the Nile, had no end of stories for winter evenings, and spinned yarns about the wars and "foreign parts." He had come long ago in distress to the manse, from whence he had passed after a time into the cottage, and there lived a dependant on the family until he died twenty years afterwards. A poor decayed gentlewoman, connected with one of the old families of the county, and a tenth cousin of the minister's wife, had also cast herself in her utter loneliness, like a broken wave, on the glebe. She had only intended to remain a few days—she did not like to be troublesome—but she knew how she could rely on a blood relation, and she found it hard to leave, for whither could she go? And those who had taken her in never thought of bidding this sister "depart in peace, saying Be ye clothed;" and so she became a neighbour to the sailor, and was always called "Mrs." Stewart, and was treated with the utmost delicacy and respect, being fed, clothed, and warmed in her cottage with the best which the manse could

afford; and when she died, she was dressed in a shroud fit for a lady, and tall candles, made for the occasion according to the old custom, were kept lighted round her body. Her funeral was becoming the gentle blood that flowed in her veins; and no one was glad in their heart when she departed, but they sincerely wept, and thanked God she had lived in plenty and had died in peace.

Within the manse the large family of sons and daughters managed, somehow or other, to accommodate not only themselves, but to find permanent room also for a tutor and governess; and such a thing as turning any one away from want of room was never dreamt of. When hospitality demanded such a small sacrifice, the boys would all go to the barn, and the girls to the chairs and sofas of parlour and dining-room, with fun and laughter, joke and song, rather than not make the friend or stranger welcome. And seldom was the house without either. The "kitchen end," or lower house, with all its indoor crannies of closets and lofts, and outdoor additions of cottages, barns, and stables, was a little world of its own, to which wandering pipers, parish fools, the parish post, beggars, with all sorts of odd-and-end characters came, and where they ate, drank, and rested. As a matter of course, the "upper house" had its own set of guests to attend to. The traveller by sea, whom adverse winds and tides drove into the harbour for refuge; or the traveller by land; or any minister passing that way; or friends on a visit; or, lastly and but rarely, some foreign "Sassanach" from the Lowlands of Scotland or England, who dared then to explore the unknown and remote Highlands as one now does Montenegro or the Ural Mountains—all these found a hearty reception.

One of the most welcome visitors was the pack-man. His arrival was eagerly longed for by all, except the minister, who trembled for his small purse in presence of the prolific pack. For this same pack often required a horse for its conveyance. It contained a choice selection of everything which a family was likely to require from the lowland shops. The haberdasher and linen-draper, the watchmaker and jeweller, the cutler and hair-dresser, with sundry other crafts in the useful and fancy line, were all fully represented in the endless repositories of the pack. What a solemn affair was the opening up of that peripatetic warehouse! It took a few days to gratify the inhabitants of manse and glebe, and to enable them to decide how their money should be invested. The boys held sundry councils about knives, and the men about razors, silk handkerchiefs, or, it may be, about the final choice of a silver watch. The servants were in nervous agitation about some bit of dress. Ribbons, like rainbows, were unrolled; prints held up in graceful folds before the light; cheap shawls were displayed on the back of some handsome lass, who served as a model. There never was seen such new fashions or such cheap bargains! And then how "dear

papa" was coaxed by mamma; and mamma again by her daughters. Everything was so beautiful, so tempting, and was discovered to be so necessary! All this time the packman, who was often of the stamp of him whom Wordsworth has made illustrious, was treated as a friend; while the news, gathered on his travels, was as welcome to the minister as his goods were to his family. No one in the upper house was so vulgar as to screw him down, but felt it due to his respectability to give him his own price, which, in justice to those worthy old merchants, I should state was always reasonable.

The manse was the grand centre to which all the inhabitants of the parish gravitated for help and comfort. Medicines for the sick were weighed out from the chest yearly replenished in Glasgow. They were not given in Homœopathic doses, for Highlanders, accustomed to things on a large scale, would have had no faith in globules, and faith was half their cure. Common sense and common medicines were found helpful to health. The poor, as a matter of course, visited the manse, not for an order on public charity, but for aid from private charity, and it was never refused in *kind*, such as meal, wool, or potatoes. As there were no lawyers in the parish, lawsuits were adjusted in the manse; and so were marriages not a few. The distressed came there for comfort, and the perplexed for advice; and there was always something material as well as spiritual to share with them all. No one went away empty in body or soul. Yet the barrel of meal was never empty, nor the cruise of oil extinguished. A "wise" neighbour once remarked, "that minister with his large family will ruin himself, and if he dies they will be beggars." Yet there has never been a beggar among them to the fourth generation. No "saying" was more common in the mouth of this servant than the saying of his Master, "It is more blessed to give than to receive."

One characteristic of that manse life was its constant cheerfulness. One cottager could play the bagpipe, another the violin. The minister was an excellent performer on the violin, and a dance in the evening by his children was his delight. If strangers were present, so much the better. He had not an atom of that proud fanaticism which connects virtue with suffering, as suffering, apart from its cause.*

Here is an extract from a letter written by the minister in his old age, some fifty years ago, which gives a very beautiful picture of the secluded manse

* A minister in a remote island parish once informed me that, "on religious grounds," he had broken the only fiddle in the island! His notion of religion, we fear, is not rare among his brethren in the far west and north. We are informed by Mr. Campbell, in his admirable volumes on the Tales of the Highlands, that the old songs and tales are also being put under the clerical ban in some districts, as being too secular and profane for their pious inhabitants. What next? Are the singing-birds to be shot by the kirk-sessions?

and its ongoing. It is written at the beginning of a new year, in reply to one which he had received from his first-born son, then a minister of the Church:—

"What you say about the beginning of another year is quite true. But, after all, may not the same observations apply equally well to every new day? Ought not daily mercies to be acknowledged, and God's favour and protection asked for every new day? and are we not as ignorant of what a new day as of what a new year may bring forth? There is nothing in nature to make this day in itself more worthy of attention than any other. The sun rises and sets on it as on other days, and the sea ebbs and flows. Some come into the world and some leave it, as they did yesterday and will do to-morrow. On what day may not one say I am a year older than I was this day last year? Still I must own that the first of the year speaks to me in a more commanding and serious language than any other common day; and the great clock of time, which announced the first hour of this year, did not strike unnoticed by us.

"The sound was too loud to be unheard, and too solemn to pass away unheeded. '*Non obtusa adio gestamus Pectora boni.*' We in the manse did not mark the day by any unreasonable merriment. We were alone, and did eat and drink with our usual innocent and cheerful moderation. I began the year by gathering all in the house and on the glebe to prayer. Our souls were stirred up to bless and to praise the Lord: for what more reasonable, what more delightful duty than to show forth our gratitude and thankfulness to that great and bountiful God from whom we have our years, and days, and all our comforts and enjoyments. Our lives have been spared till now; our state and conditions in life have been blessed; our temporal concerns have been favoured; the blessing of God co-operated with our honest industry; our spiritual advantages have been great and numberless; we have had the means of grace and the hope of glory; in a word, we have had all that was requisite for the good of our body and soul; and shall not our souls and all that is within us, all our powers and faculties, be stirred up to bless and praise his name!

"But to return. This pleasant duty being gone through, refreshments were brought in, and had any of your clergy seen the crowd (say thirty, great and small, besides the family of the manse) they would pity the man who, under God, had to support them all! This little congregation being dismissed, they went to enjoy themselves. They entertained each other by turns. In the evening, I gave them one end of the house, while they danced and sang with great glee and good manners till near day. We enjoyed ourselves in a different manner in the other end. Had you popped in unnoticed, you would see us all grave, quiet, and studious. You would see your father reading *The Seasons*; your mother, *Porteous' Lectures*; your

sister Anne, The Lady of the Lake; and Archy, Tom Thumb!

"Your wee son was a new and great treat to you in those bonny days of rational mirth and joy, but not a whit more so than you were to me at his time of life, nor can he be more so during the years to come. May the young gentleman long live to bless and comfort you! May he be to you what you have been and are to me! I am the last that can honestly recommend to you not to allow him get too strong a hold of your heart, or rather not to allow yourself *doat too much* upon him. This

was a peculiar weakness of my own, and of which I had cause more than once to repent with much grief and sore affliction. But your mother's creed always was (*and truly she has acted up to it*) to enjoy and delight in the blessings of the Almighty while they were spared to her with a thankful and grateful heart, and to part with them when it was the will of the gracious Giver to remove them, with humble submission and meek resignation."

We will have something more to say in a coming chapter about this pastor and his work in the parish.

THE MANSE.

CHAPTER III.—THE BOYS OF THE MANSE AND THEIR EDUCATION.

"Life went a-maying
With Nature, Hope, and Poesy
When I was young!
When I was young?—Ah! woful when?"

COLERIDGE.

THE old minister had no money to leave his boys when he died, and so he wisely determined to give them, while he lived, the treasure of the best education in his power. The first thing necessary for the accomplishment of his object, was to obtain a good tutor, and a good tutor was not difficult to get.

James, as we shall call the tutor of the manse boys, was a laborious student, with a most creditable amount of knowledge of the elements of Greek and Latin. When at college he was

obliged to live in the top storey of a high house in a murky street, breathing an atmosphere of smoke, fog, and gas; cribled in a hot, close room; feeding on ill-cooked meat (fortunately in small quantities); drinking "coffee" half water, half chicory; sitting up long after midnight writing essays or manufacturing exercises, until at last dyspepsia depressed his spirits and blanched his visage except where it was coloured by a hectic flush, which deepened after a fit of coughing. When he returned home after having carried off prizes in the Greek or Latin classes, what cared his mother for all these honours? No doubt she was "proud o' oor James," but yet she could hardly know her boy, he had become so pale, so haggard, and so unlike "himsel'." What a blessing for James to get off to the Highlands! He there breathed such air, and drank such water as made him

wonder at the bounty of creation without taxation. He climbed the hills and dived into the glens, and rolled himself on the heather; visited old castles, learned to fish, and perhaps to shoot, shutting both eyes at first when he pulled the trigger. He began to write verses, and to fall in love with one or all of the young ladies. That was the sort of life which Tom Campbell the poet passed when sojourning in the West Highlands; ay, for a time in this very parish too, where the lovely spot is yet pointed out as the scene of his solitary musings. James had a great delight not only in imparting the rudiments of language, but also in opening up various high roads and outlying fields of knowledge. The intellectual exercise braced himself, and delighted his pupils.

If ever "muscular Christianity" was taught to the rising generation, the Highland manse of these days was its gymnasium. After school hours, and on "play-days" and Saturdays, there was no want of employment calculated to develop physical energy. The glebe and farm made a constant demand for labour which it was joy to the boys to afford. Every season brought its own appropriate and interesting work. But sheep-clipping, the reaping and ingathering of the crops, with now and then the extra glory of a country market for the purchase and sale of cattle; with tents, games, gingerbread, horse jockeys, and English cattle dealers,—these were their great annual feasts.

The grander branches of education were fishing, sailing, shooting—game-laws being then unknown—and also what was called "hunting." The fishing I speak of was not with line and fly on river or lake, though that was in abundance; but it was sea-fishing with rod and white fly for "Saith" and mackerel in their season. It was delightful towards evening to pull for miles to the fishing-ground in company with other boats. A race was sure to be kept up both going and returning, while songs arose from all hands and from every boat, intensifying the energy of the rowers. Then there was the excitement of getting among a great play of fish, which made the water foam for half a mile round, and attracted flocks of screaming birds who seemed mad with gluttony, while six or seven rods had all at the same time their lines tight, and their ends bent to cracking with the sport, keeping every fisher hard at work pulling in the fine lithe creatures, until the bottom of the boat was filled with scores. Sometimes the sport was so good as to induce a number of boats' crews to remain all night on a distant island, which had only a few sheep, and a tiny spring of water. The boats were made fast on the lee side, and their crews landed to wait for daybreak. Then began the fun and frolic!—"sky-larking," as the sailors call it, among the rocks—pelting one another with clods and wrack, or any harmless substance which could be collected for the battle, amidst shouts of laughter, until they were wearied, and lay down to sleep in a sheltered

nook, and all was silent but the beating wave, the "eerie" cries of birds, and the splash of some sea-monster in pursuit of its prey. What glorious reminiscences have I, too, of those scenes, and specially of early morn, as watched from those green islands! It seems to me as if I had never beheld a true sunrise since; yet how many have I witnessed! I left the sleeping crews, and ascended the top of the rock, immediately before day-break, and what a sight it was, to behold the golden crowns which the sun placed on the brows of the mountain-monarchs who first did him homage; what heavenly dawns of light on peak and scaur, contrasted with the darkness of the lower valleys; what gems of glory in the eastern sky, changing the cold, grey clouds of early morning into bars of gold and radiant gems of beauty; and what a flood of light suddenly burst upon the dancing waves, as the sun rose above the horizon, and revealed the silent sails of passing ships; and what delight to see and hear the first break of the fish on the waters! With what pleasure I descended, and gave the cheer which made every sleeper awake, and scramble to their boats, and in a few minutes resume the work of hauling in our dozens! Then home with a will for breakfast—each striving to be first on the sandy shore!

Fishing at night with the drag-net was a sport which cannot be omitted in recording the enjoyments of the manse-boys. The spot selected was a rocky bay, or embouchure of a small stream. The night was generally dark and calm. The pleasure of the occupation was made up of the pull, often a long one, within the shadow of the rocky shore, with the calm sea reflecting the stars in the sky, and then the slow approach, with gently-moving oars, towards the beach, in order not to disturb the fish; the wading up to the middle to draw in the net when it had encircled its prey; and the excitement as it was brought into shallow water, the fish shining with their phosphoric light; until, at last, a grand haul of salmon-trout, flounders, small cod, and lythe, lay wallowing in the folds of the net upon the sandy beach.

Those fishing excursions, full of incident as they were, did not fully test or develop the powers of the boys. But others were afforded capable of doing so. It was their delight to accompany their father on any boating-journey which the discharge of his pastoral duties required. In favourable weather, they had often to manage the boat themselves without any assistance. When the sky was gloomy, old Rory took the command. Such of my readers as have had the happiness—or the horror, as their respective tastes may determine—to have sailed among the Hebrides in an open boat, will be disposed to admit that it is a rare school for disciplining its pupils when patient and conscientious to habits of endurance, foresight, courage, decision, and calm self-possession. The minister's boat was about eighteen feet keel, undecked, and rigged fore and aft. There were few days in

which the little "Row" would not venture out, with Rory at the helm; and with no other person would his master divide the honour of being the most famous steersman in those waters. But to navigate her across the wild seas of that stormy coast demanded "a fine hand" which could only be acquired after years of constant practice, such as a rider for the Derby prides in, or a whipper-in during a long run across a stiff country. If Rory would have made a poor jockey, what jockey would have steered the "Row" in a gale of wind? I can assure the reader it was a solemn business, and solemnly was it gone about! What care in seeing the ropes in order; the sails reefed; the boys in their right place at the fore and stern sheets; and everything made snug. And what a sight it was to see that old man when the storm was fiercest, with his one eye, under its shaggy grey brow, looking to windward, sharp, calm, and luminous as a spark; his hand clutching the tiller—never speaking a word, and displeased if any other broke the silence, except the minister who sat beside him, assigning this post of honour as a great favour to Rory, during the trying hour. That hour was generally when wind and tide met, and "gurlly grew the sea," whose green waves rose with crested heads, hanging against the cloud-rack, and sometimes concealing the land; while black sudden squalls, rushing down from the glens, struck the foaming billows in fury, and smote the boat, threatening, with a sharp scream, to tear the tiny sail in tatters, break the mast, or blow out of the water the small dark speck that carried the manse treasures. There was one moment of peculiar difficulty and concentrated danger when the hand of a master was needed to save them. The boat has entered the worst part of the tideway. How ugly it looks! Three seas higher than the rest are coming; and you can see the squall blowing their white crests into smoke. In a few minutes they will be down on the "Row." "Look out, Ruari!" whispers the minister. "Stand by the sheets!" cries Rory to the boys, who, seated on the ballast, gaze on him like statues, watching his face, and eagerly listening in silence. "Ready!" is their only reply. Down come the seas rolling, rising, breaking; falling, rising again, and looking higher and fiercer than ever. The tide is running like a race-horse, and the gale meets it; and these three seas appear now to rise like huge pyramids of green water, dashing their foam up into the sky. The first may be encountered and overcome, for the boat has good way upon her; but the others will rapidly follow up the thundering charge and shock, and a single false movement of the helm by a hair's-breadth will bring down a cataract like Niagara that would shake a frigate, and sink the "Row" into the depths like a stone. The boat meets the first wave, and rises dry over it. "Slack out the main sheet, quick, and hold hard; there—steady!" commands Rory in a low firm voice, and the huge back

of the second wave is seen breaking to leeward. "Haul in, boys, and belay!" Quick as lightning the little craft, having again gathered way, is up in the teeth of the wind, and soon is spinning over the third topper, not a drop of water having come over the lee gunwale. "Nobly done, Rory!" exclaims the minister, as he looks back to the fierce tideway which they have passed. Rory smiles with satisfaction at his own skill, and quietly remarks of the big waves, "They have *their* road, and I have mine!" "Hurrah for the old boat!" exclaims one of the boys. Rory repeats his favourite aphorism—yet never taking his eye off the sea and sky—"Depend on it, my lads, it is not boats that drown the men, but men the boats!" I take it that the old "Row" was no bad school for boys who had to battle with the storms and tides of life. I have heard one of those boys tell, when old and greyheaded, and after having encountered many a life storm, how much he had owed to those habits of mind which had been strengthened by his sea life with old Rory.

The "hunting" I have alluded to as affording another branch of out-door schooling, was very different from what goes under that sporting term in the south. It was confined chiefly to wild cats and otters. The animals employed in this work were terriers. The two terriers of the manse were "Gasgach" or "Hero," and "Cuilag" or "Fly." They differed very considerably in character: Gasgach was a large terrier with wiry black and grey hairs; Cuilag was of a dusky brown, and so small that she could be carried in the pocket of a shooting jacket. Gasgach presumed not to enter the parlour, or to mingle with genteel society; Cuilag always did so, and lay upon the hearth-rug, where she basked and reposed in state. Gasgach was a sagacious, prudent, honest police sergeant, who watched the house day and night, and kept the farm-dogs in awe, and at their respective posts. He was also a wonderful detective of all beggars, rats, fumarts, wild cats, and vermin of every kind, smelling afar off the battle with man or beast. Cuilag was full of *reticence*, and seemed to think of nothing or do nothing until *seriously* wanted; and then indomitable courage started from every hair in her body. Both had seen constant service since their puppyhood, and were covered with honourable scars from the nose to the tip of the tail; each cut being the record of a battle, and the subject of a story by the boys.

The otters in the parish were both numerous, large, and fierce. There was one famous den called "Clachoran," or the otter's stone, composed of huge rocks, from which the sea wholly receded during spring-tides. Then was the time to search for its inhabitants. This was done by the terriers driving the otter out, that he might be shot while making his way across a few yards of stone and tangle to the sea. I have known nine killed in this one den during a single year. But sometimes the otter occupied a den a few hundred yards

inland, where a desperate fight ensued between him and the dogs. Long before the den was reached, the dogs became nervous and impatient, whining, and glancing up to the face of their master, and, with anxious look, springing up and licking his hands. To let them off until quite close to the den was sure to destroy the sport, as the otter would, on hearing them bark, make at once for the sea. Gasgach could, without difficulty, be kept in the rear, but little Cuilag, conscious of her moral weakness to resist temptation, begged to be carried. Though she made no struggle to escape, yet she trembled with eagerness, as, with cocked ears and low cry, she looked out for the spot where she and Gasgach would be set at liberty. That spot reached—what a hurry-scurry, as off they rushed to the den, and sprang in! Gasgach's short bark was a certain sign that the enemy was there; it was the first shot in the battle. If Cuilag followed, the battle had begun. One of the last great battles fought by Cuilag was in that inland den. On gazing down between two rocks which below met at an angle, there, amidst fierce barkings and the muffled sound of a fierce combat, Cuilag's head and the head of a huge otter, were seen alternately appearing, as the one tried to seize the throat, and the other to inflict a wound on his little antagonist. At last Cuilag made a spring, and seized hold of the otter about the nose or lip. A shepherd who was present, fearing the dog would be cut to pieces, since the den was too narrow to admit Gasgach (who seemed half apoplectic with passion and inability to force his way in), managed, by a great effort, to get hold of the otter's tail, and to drag him upwards through a hole like a chimney. The shepherd was terrified that the otter, when it got its head out, would turn upon him and bite him,—and such a bite as those beautiful teeth can give!—but to his astonishment, the brute appeared with Cuilag hanging to the upper lip. Both being flung on the grass, Gasgach came to the rescue, and very soon, with some aid from the boys, the animal of fish and fur was killed and brought in triumph to the manse.

There is a true story about Cuilag which is worth recording. The minister, accompanied by Cuilag, went to visit a friend, who lived sixty miles off in a direct line from the manse. To reach him he had to cross several wild hills, and five arms of the sea or freshwater lochs stretching for miles. The dog, on arriving at her destination, took her place, according to custom, on the friend's hearthrug, from which, however, she was ignominiously driven by a servant, and sent to the kitchen. She disappeared, and left no trace of her whereabouts. One evening, about a fortnight afterwards, little Cuilag entered the manse parlour, worn down to a skeleton, her paws cut and swollen, and she hardly able to crawl to her master, or to express her joy at meeting all her dear old friends once more. Strange to say, she was accompanied into the room by Gasgach, who, after frolicking

about, seemed to apologize for the liberty he took, and bolted out to bark over the glebe, and tell the other dogs who had gathered round what had happened. How did Cuilag discover the way home since she had never visited that part of the country before? How did she go round the right ends of the lochs, which had been all crossed by boat on their journey, and then recover her track, travelling twice or thrice sixty miles? How did she live? These were questions which no one could answer, seeing Cuilag was silent. She never, however, recovered that two weeks' wilderness journey. Her speed was ever after less swift, and her gripe less firm.

The games of the boys were all athletic,—throwing the hammer, putting the stone, leaping, and the like. Perhaps the most favourite game was the "shinty," called *hockey*, I believe, in England. This is played by any number of persons, 100 often engaging in it. Each has a stick bent at the end, and made short or long, as it is to be used by one or both hands. The largest and smoothest field that can be found is selected for the game. The combat lies in the attempt of each party to knock a small wooden ball beyond a certain boundary in his opponent's ground. The ball is struck by any one on either side who can get at it. Few games are more exciting, or demand more physical exertion than a good shinty match.

I have said nothing regarding a matter of more importance than anything touched upon in this chapter, and that is the *religious* education of the manse boys. But there was nothing so peculiar about it as to demand special notice. It was very real and genuine; and perhaps its most distinguishing feature was, that instead of its being confined to "tasks," and hard, dry, starched Sundays only, it was spread over all the week, and consisted chiefly in developing the domestic affections by a frank, loving, sympathizing intercourse between parents and children; by making home happy to the "bairns;" by training them up wisely and with *tact*, to reverence *truth*,—truth in word, deed, and manner; and to practise *unselfishness* and courteous considerateness towards the wants and feelings of others. These and many other minor lessons were never separated from Jesus Christ, the source of all life. They were taught to know him as the Saviour, through whose atonement their sins were pardoned, and through whose grace alone, obtained daily in prayer, they could be made like himself. The teaching was *real*, and was felt by the boys to be like sunshine on dew, warming, refreshing, and quickening their young hearts; and not like a something forced into the mind, with which it had no sympathy, as a leaden ball is rammed down into a gun-barrel. Once I heard an elderly Highland gentleman say that the first impression he ever received of the reality of religion was in connexion with the first death which occurred among the manse boys.

Need I add, in conclusion, that the manse

was a perfect paradise for a boy during his holidays! Oh, let no anxious mother interfere at such times with loving grandmother and loving aunts or uncles! No doubt there is a danger that the boy may be "spoilt." In spite of the Latin or Greek lesson which his grandpapa or the tutor delights to give him in the morning, his excellent parents write to say that "too much idleness may injure him." Not a bit! The boy is drinking in love with every drink of warm milk given him by the Highland dairymaid, and with every look, and kiss, and gentle hug given him by his dear grannie or aunts. Education, if it is worth anything, *draws out* as much as it puts in; and this sort of education will strengthen his brain and brace his nerves for the work of the town grammar-school, to which he must soon return. "It does not do to pamper him too much, it may make him selfish," also write his parents. Quite true as an educational axiom; but his grandmother denies—bless her for it, dear, good woman!—that giving him milk or cream *ad libitum*, with "scones"

and cheese at all hours, is pampering him. And his aunts take him on their knee, and fondle him, and tell him stories, and sit beside him when he is in bed, and sing songs to him; and there is not a herd or shepherd but wishes to make him happy; and old Rory has him always beside him in the boat, and gives him the helm, and, in spite of the old hand holding the tiller behind the young one, persuades his "darling," as he calls him, that it is he, the boy, who steers the boat. Oh! sunshine of youth, let it shine on! Let love flow out fresh and full, unchecked by any rule but what love creates; pour thyself down without stint into the young heart; make his days of boyhood happy, for other days must come of labour and of sorrow, when the memory of those dear eyes, and clasping hands, and sweet caressings, will, next to the love of God from whence they flow, save the man from losing faith in the human heart, help to deliver him from the curse of selfishness, and be an Eden in his memory when driven forth into the wilderness of life!

ESSAYS FOR SUNDAY READING.

II.—COVETOUSNESS A MISDIRECTED WORSHIP.

BY JOHN CAIRD, D.D.

THE prevalence of error is often to be traced to the latent love of truth, and in sinful excess may not seldom be discerned the aberration of a nature by its original structure designed for good. In almost all wide-spread misbelief careful reflection will discover a disguised or distorted basis of truth, and in men's darling vices the counterfeit of pure and noble objects of desire to which their fascination is to be ascribed. For just as forged money could never gain currency if men set no value on the genuine coin, and as spurious wares impose on the undiscerning only because of the desire for those things of which they are the worthless imitation, so falsehood and sin would have no universal attraction, even for man's fallen nature, if they bore no deceitful semblance of that truth and goodness from which he has wandered. The popularity of the false is thus often a silent homage to the true, and the avidity of desire for evil an unconscious tribute to the beauty and nobleness of good. The best way, therefore, to expose any popular error, is to extricate the latent truth which it pretends to be; and the true way to disengage our affection from any sinful object of desire is—not to declaim against it, and denounce all sorts of penalties against him who persists in his devotion to it—but rather to seek out and place side by side with it that true and genuine good, the admiration due to which it has borrowed. Confront the fictitious with the true, the caricature with the reality; set beside the base and showy jewel the pearl of great price, or by the meretricious, painted face of vice unveil the sweet, calm, holy form of goodness

beaming with heavenly beauty upon us, and you have taken the sure way to divest evil of its charms. Provide, in other words, the true satisfaction for man's deep and universal desires, and he will turn with distaste from that which only pretends to please. Let him find at last the substance after which he has been blindly groping, and he will grasp no more at shadows.

Now it is this thought which lends peculiar force to certain expressions of Scripture with reference to the vice of covetousness. The expressions to which we refer are to be found in such passages as the following:—"Lo, this is the man that made not God his strength; but trusted in the abundance of his riches."¹ "Ye cannot serve God and mammon."² "Nor trust in uncertain riches, but in the living God."³ "Covetousness, which is idolatry."⁴ "No covetous man, who is an idolater, hath any inheritance in the kingdom of God."⁵ In these, and other passages which might be adduced, two states of mind, two affections of man's nature, are contrasted, viz., devotion to money, and devotion to God. And the idea which runs through them all seems to be that the latter of these stands to the former in the relation of the genuine to the counterfeit, the true to the fictitious, the reality to the unsubstantial but showy and imposing imitation. In the restless and insatiable craving for wealth there may be detected, it seems to be intimated, the aberration of a nature that was made

for God, and is still unconsciously seeking after him. The passionate self-surrender with which so many give themselves to the pursuit of riches, is but the diseased action of a being formed for self-sacrifice to an infinite object, of which riches is the base, indeed, and miserable, yet, in many respects, most deceptive imitation. The love of money, if we may so express the thought, is but the love of God run wild. If money did not present to the heart's deep yet unconscious longings and aspirations some shadow or substance of that of which it is in quest, it would not call forth such an ardour and intensity of devotion. But it does make believe to give what can truly be found in God alone. And it is because it does so; because it presents a false copy of infinitude to the soul that it becomes the object of a morbid craving, an attachment extravagantly disproportionate to its real worth. Let me try, in further prosecution of this train of thought, to indicate one or two features in which this illusive resemblance between money and God, as objects of human desire and devotion, may be traced, and then to show that it is an illusive resemblance, a likeness fatal to all who are beguiled by it.

I. The soul of man was made for God, and can never find true rest or happiness till it confide itself to Him. But in its restless pursuit of happiness, it often mistakes the true object of which it is in quest; and there are qualities common to that Divine object and riches which, unconsciously to the mind itself, constitute the attraction of the latter. There are superficial similarities which secretly persuade the heart, that that divinity of which it is in search it will find in wealth. What are these? If we try to think how money is like God, may it not be said to possess a certain shadowy semblance of His omnipotence; a strange mimicry of His omnipresence, His boundless beneficence, His providence, His power over the future, His capacity, not only to procure for us an endless variety of blessings, to give us all that our hearts can desire, but also to become, in and for Himself, apart from all that He can give or get for us, an object of independent delight; so that it is happiness to possess Him, to enjoy Him, to make Him our portion, to know and feel that He is ours.

Take, for a moment, any of these qualities or attributes, and you will see that the resemblance of which we speak is not a fanciful one. There is in money, for instance, a shadow of the Divine *omnipotence*. Weak and helpless in God's world, as man feels himself to be, his unconscious longing is for some power of succour and defence in which to confide. I want, in my conscious helplessness, something to stand between me and danger—some presence ever near me to which I can repair, in want for sustenance, in weakness for strength, in danger for protection. I require some Being or Power that will give me calmness, reliance, security, and make me feel that I have at hand a friend in need,—that whatever betide me, I have a solace

for my sorrows, a secure rock and refuge amidst the fluctuations of circumstance, and the unknown cares and troubles and emergencies of life.

Now, for this deep and universal craving, there is no true response but in Him, who is the One omnipotent Friend, the rock and refuge of his people in all generations. But the heart that has turned away from Him finds in Money a strange semblance of His omnipotence. Whether for the supply of present needs, or as a provision against future emergencies, does not Money seem to many a mind that which can give it a solid sense of security? With a mimic almightiness and omnipresence it rules the world. Make it your friend, and it will summon from every region of the globe whatever can contribute to your use and enjoyment. At its all-potent touch your board will be spread, your person clothed, your senses gratified, your eye fed with beauty, your ear ravished with melody, your mind furnished with the richest results of human thought. At its bidding, the earth will yield the fruits that grow upon its surface, and the minerals that are hidden in its depths; the East will send you its silks and spices, the South the produce of its vineyards, and the West of its plantations. It will command the lower creatures to give their strength and their fleetness to minister to man's uses, and their beauty to his pleasure, and their very life to his support. Men, too, at its resistless summons, will hasten to work for you; and not only those around you, but thousands whom you have never seen, in every land and clime under heaven, will contribute, for your gratification, the highest products of their toil. Day and night, for you, the husbandman and the artisan, on the field, in the quarry, at the mill, and the loom, and the anvil, and the manufactory, will labour on; for you the sailor will risk his life on the sea, and the soldier on the field of battle, and the miner in the bowels of the earth. For you, at the omnific word of this all-controlling master, the rarest powers of the most gifted minds will be exerted. The most curious contrivances, the most exquisite inventions, will be placed at your service. For you the poet will sing, and the artist paint, and the historian and philosopher and scholar will produce the long results of thought and toil. The lawyer will give you the sharpest of his wits and the profoundest of his learning, the physician exert all the skill which, by study and observation of the human frame, he has gained, to mitigate your ailments or cure your diseases; and even the divine, for you, will ransack the treasures of sacred lore, and the preacher, for your instruction, preach his best. What wonder that a power that can achieve all this, borrows, to man's fallen imagination, the very sceptre of Omnipotence, and that the heart that knows no other Divinity, confides in it as a God! And add to this, that not only does money seem to exert an almost universal dominion over the present, but that it possesses a mysterious power, to the worldly imagination, to

secure it against the chances and changes of the future. It represents, by its silent presence, to him who has amassed a fortune, the supplies of long years to come. It is his security against a thousand evils with which the future may be fraught. It contains in it the virtual promise, that, as long as life shall last, his wants shall be satisfied, his pleasures provided, his difficulties smoothed, and if not his sorrows and trials averted, yet a thousand solacements procured to lighten them. It places in fancy its votary above the fear of coming ills, and enables him to look calmly around, and say, "I need fear no evil." What wonder then, I repeat, that that which can do all this comes to be regarded with an almost slavish dependence; that it gathers round it the feelings of abject homage and respect, and that the irreligious mind yields to it the very sentiments of trust and confidence due from man to his God!

Another attribute of Divinity which money may be said to borrow, is the *capacity to become an object of desire and delight in and for itself*. That which is the object of man's worship must constitute, in itself, the Supreme Good of the soul. It must be contemplated, not as a means but as an end, not as the condition of achieving some ulterior gain or advantage, but as containing in itself all the gain we seek, and capable, in the mere fact of possessing it, of bestowing perfect satisfaction on the possessor. The highest experience of the devout heart is to rest in God as its final portion and joy. To seek an interest in God's favour merely because the divine patronage is necessary to our safety and happiness, is not true religion, but only religious selfishness; and he who loves God only for His gifts, loves really the gifts, not God. Let him have the benefits, and he could do without the Bestower. Whilst, therefore, there may have been, in the experience of many a pious mind, a preparatory discipline of gratitude or fear, an earlier stage of its moral history in which God was regarded chiefly as the Dispenser of favours, or the Deliverer from penalties; yet then only does the soul reach that attitude towards God which can be rightly designated religious, when all self-regardful thoughts and feelings are eliminated, and God Himself becomes the desire and delight of the heart. When hope and fear are lost in love, when it is perfect bliss simply to love and to be loved by God, and the sincere utterance of the heart is, "Whom have I in heaven but thee, and there is none on earth I desire besides thee,"—then only does the object of worship become our Supreme Good—our God.

Now, in this respect too, may it not be said that Money is the counterfeit of Deity, and covetousness a distorted faith? It is true, indeed, that money is but the conventional representative of other objects of desire, and may be prized simply because we look at the things we like through money,—caring not for the medium, save for the sake of that which by its aid we contemplate beyond it. The love of money is always at first,

often never more than, the love of meat and drink and dress, of the pleasures of the table, of luxurious living, of power, of applause, of books or art—of that, in short, which meets some natural desire or propensity. But, as we all know, money may become, and often does become, more than this. Intercepting the feelings of which it has been the medium, it begins to be loved, not as a means, but as an end. The heart learns more and more to rest in it, all ulterior objects forgotten. All the scattered rays of desire, to which it was for a while transparent, become concentrated on it. All the streams of passion, the inclinations, wishes, hopes, delights, that went forth formerly to their proper objects, now flow into this channel, and lend their combined force to the intensity of this one passion. The heart, ever craving after that for which, by its original structure, it was made,—some one object to which all its manifold energies may be devoted, and in which it may find satisfaction and rest, learns more and more to rest in money as its end. The sense of possession is its bliss, and all the bliss it seeks. To have money, to know and feel that it is mine, to commune with it, think about it, plan how to get more of it, and enjoy the success of getting it; to be content never to part from it, or give it up for the sake of anything that could be exchanged for it,—this becomes the sovereign good, the happiness, the heaven of many a human spirit. There have been those who, if they could give expression to their unconscious feelings, might almost travesty the language of devotion, and say of wealth, "What have I on earth but thee, and there is no heaven that I desire besides thee!" And though it may be true that the cases are rare in which the passion of covetousness reaches this height of extravagance, yet, in as far as any man approximates to this state of thought and feeling, in so far as he is wandering, objectless desires fastening on Money as the Divinity they are in search of, and he is transferring to money that confidence which is due to God alone.

I will only adduce one other quality of the divine object of trust which money mimics—His *infinitude*.

That which constitutes the highest good of man, the object of his profoundest desire and delight, must be not only good independently, but also good inexhaustibly. We cannot rest in that which is limited. To be satisfied with what he has got, is not possible for man. Weariness soon creeps over the familiar joy; and if it is to continue to attract us, it must grow with the desire it gratifies; it must expand with the ever-expanding appetite. If you could leave out from a man's mental structure the elements of hope, of aspiration, of imagination, then might he find rest for his soul in that which is bounded, without one sigh of satiety, without the consciousness of one wistful glance into the future and the ideal. But it is not so. God has not made us for that which is finite. We cannot stop. We cannot allay the heart's

quenchless thirst. The eye cannot be satisfied with seeing, nor the ear with hearing. Gazing on the most glorious scenes of this world's loveliness, listening to the strains of its most voluptuous melody, surrounded by every element of material and temporal happiness, the unconscious cry of the heart is—"More, more still, more than that; I am not satisfied, I am not at rest!" Only in the contemplation of that Beauty which eye hath not seen, in hearkening with ever-growing, ever-gratified yearning to that Melody which ear hath not heard, in beholding in beatific vision that Mind from the depths of which ever new and more ravishing revelations of unearthly splendour are breaking on the pure in heart—only, in one word, in the enjoyment of God, is there rest for that nature which has in it the boundlessness of its object.

Now, it is just because it puts on a faint mimicry of this illimitableness, that wealth presents to many a hapless mind so potent, so resistless an attraction. The desire for money grows with what it feeds upon. When once it has taken firm hold of a man's nature, it is its notorious characteristic to be ever unsatisfied with past acquisitions, ever conceiving and contriving how to get more. And ever at each fresh accession there seems to open up and stretch away before the imagination an endless possibility of future gain. Men may talk of the irrationality of such a passion. Its folly may point the homily of the moralist and the epigram of the poet; it may be the theme of a thousand formal denunciations and warnings from the pulpit;—still covetousness laughs at them all. It will not yield to satire or solemnity. It will not be dislodged by human reasoning. Nothing but the entrance into the heart of that holy love,—that high, pure and heavenly principle of which it is the mocking make-believe, can ever extrude it, forasmuch as it borrows in man's heart the strength and intensity of that boundless devotion that is due to God alone.

II. Such, then, are some out of many points in which this shadowy resemblance between money and God as objects of desire and dependence may be traced. That it is a shadowy and deceptive resemblance, and that the trust in riches, therefore, is a misplaced devotion, it will need few words to show. In this, as in many of our commonest experiences, we do not know our own meaning. The lover of money does not understand himself; he is not reflectively conscious of what it is which he is in quest of. There is a deep, inextinguishable need of God within him; but, as often happens, the desire becomes creative. It fastens upon an object beneath itself, gilds it with imaginary beauty and attractiveness; and then the mind fancies that it sees in the object those qualities with which its own wistful imagination has endowed it. The wish becomes father to the thought. The faint outline is filled up by the busy, eager, shaping fancy, till it attains a visionary completeness; and often it is only the bitter experience of disappoint-

ment—of wasted affections, misplaced confidence, and ruined hopes—that at length undeceives us.

And such must ever be the final disenchantment of him who unconsciously idealizes wealth into the Supreme Good of the soul; who fashions, in other words, money into a mimic God. For, whatever semblance of divinity it may assume, money lacks all those elements that are necessary to constitute any object the Supreme Good of man. It is *material* and *outward*, and nothing can be the final joy and rest of the soul which is not inward and spiritual; it is *limited*, and the Supreme Good of man must be inexhaustible; it is *perishable*; and that can only be our highest object of reliance—our God, which abideth for ever.

Not in the *outward* can man rest. That which constitutes the first, last joy and satisfaction of a human spirit, must be Spirit too. You can no more satisfy the soul's hunger with that which is material than the bodily appetite with that which is mental. Fine thoughts will not feed starving bodies, nor flowing fancies quench a raging thirst. And neither will money, or any material good, allay the craving of a spirit for the bread and water of life. Weigh thought in scales, measure the height of desires and hopes by square and compass, test by the thermometer the intensity of love, sound by line and plummet the depths of a human heart,—then will you be able by material satisfaction to fill the void in a spirit that is crying out for God, for the living God. Money can do much. It can avert and alleviate many ills, procure innumerable and unmistakable enjoyments. Declamation against wealth and luxury is often little better than sounding commonplace. But, all mere conventional moralizing apart, there are few whom sad experience has not taught that there are ills, and these the heaviest that can befall us, which money cannot cure; and one lesson which, sooner or later, most men learn is that the real happiness of life is altogether independent of it. Money cannot always avert even temporal calamities, and there are deep inward woes which it can do nothing to heal. Pain and disease often baffle all the expedients which wealth can purchase; and still more impossible is it for money to minister to a mind diseased. Stretched upon the bed of hopeless sickness, tortured by constitutional and incurable maladies, what would many a possessor of wealth not gladly surrender for the peace of health, one hour of which countless treasures could not buy? Money cannot delay the rapid course of life, nor arrest the progress of decay. It cannot restore the buoyancy of youth to the old, nor buy back fair fame to the dishonoured, nor bring again around the bereaved and lonely the forms and faces that smile on him no more. And for the deeper ills of the spirit,—the sense of guilt, the anguish of remorse, the self-tormenting power of an awakened conscience, or, again, the wretchedness of an impure or selfish, or unquiet and ill-regulated mind, for the pangs of jealousy or envy,

of ungratified hatred or balked revenge—for all these, and similar ills, the most fatal to man's happiness, the world's wealth were all in vain to compensate. Money, with all its fancied omnipotence, fails to reach the seat of man's deepest joys and sorrows. Invoked by its most abject worshippers, like Baal of old, it hears not, interposes not, in the hour of their sorest need. Trust in it, and it proves, when wanted most, a weak and treacherous divinity. The other two elements necessary to constitute any being or object the supreme good of man, are, as I have said, *inexhaustibleness* and *perpetuity*. It is obvious, to speak only of the latter, that that cannot be man's trust and rest, man's highest Good, the duration of which is not co-extensive with his own. The joy on which I mainly depend must not only reach the deepest region of my nature, but it must last. Nothing that does not abide can be a god to man. The very sweetness of any source of delight would make it the spring of the direst ill, if it fostered the craving in us for a while, and then, when it became necessary to our happiness, suddenly ceased to flow. Better no staff than one that breaks when our weakness needs most its support. Better no lamp than one that burns only in the daylight, and goes out as the shadows fall fast and thick around us. Better no protector than one in whom we have learned to confide, and who deserts us as the foe draws near. But that which renders the condition of him who lives for money the most pitiable, is just this, that he is learning more and more to identify his happiness with that which cannot last, with that which will belie his confidence in the hour of his greatest need. Money, and the pleasures, comforts, luxuries which money can procure, are good and desirable enough in themselves. It were the grossest affectation to pretend to despise them. But give your whole heart to them, make them your chief delight, live for them till they become necessary to your happiness, and they are indeed the things which, if they render life dear, render also death terrible. The fall from wealth to poverty is often a dreadful calamity in this world. Poverty is no such ill to the born pauper as to him to whom life-long habit has rendered those things necessities which to others are luxuries and rare indulgences. Penal servitude, whatever it may be to the felon in low life, is an incalculably more terrible punishment when it falls, as sometimes it does, on the man whose life has been one of affluence and ease. And so, hard though it be at the best to part with sweet life, it is hardest of all to him whom death tears from all he loves and cares for in the universe—from the softness and ease and sunny brightness of a rich man's lot on earth—and sends out, in darkness and loneliness, to meet his fate. It is godless wealth, even more than guilt, that makes men cowards in the face of death. Let money be the great good of life, the divinity to whom you offer up the de-

votion of your heart and the labour of your hand, and it is a god who may reward your devotion for a while with no slight or stinted returns. The joys of appetite and sense, rich and graceful attire, the pleasures of the table, gaiety, good fellowship, a luxurious home, walls resplendent with the rarest products of art, and rooms crowded with articles of *vertu*, a position of influence in the community, the attention of equals, the obsequious respect of inferiors—these and the like are the boons which often on its votary this god bestows. But, alas! his gifts are fatal, disastrous benefactions, if they foster in their possessor an effeminate attachment to life, if they make the sensuous pleasantness of a soft, bright, sunny existence all too dear to us, if they shut out from our view that awful other world to which we haste.

Yield then your heart's love, the reliance of your deepest nature, not to money or any finite object. God, and God alone, is sufficient for the happiness of the spirit which in His own image He has made. He is the supreme and all satisfying Good. He is not only the possessor of the resources of the universe, but He is, in Himself, better than all His gifts. He contains in Himself all that is necessary to our happiness in time and eternity. While all besides is outward and limited and perishable, He is spiritual, infinite, enduring for ever. He has access to the inmost recesses of the human heart. He can hold immediate communion with us, not as when hand touches hand, but by the ineffable fellowship of spirit with spirit. He can come into contact with the soul, and by His blessed presence with it, calm all its perturbations, heal all its wounds, cleanse away all its stains of guilt, let in the sweet light of hope on its darkness, and infuse into its weakness the very strength of Omnipotence. Possessed of Him the believer can say, "My mind to me a kingdom is." Stript of all else the world holds dear, in Him the soul has that which can compensate for every privation—in outer darkness, an inner sunshine; in poverty, a hidden treasure of priceless wealth; in pain, a secret bliss that makes even suffering sweet; in death, a life that can never die. While life lasts, His love alone can enable us to extract the deepest enjoyment out of its blessings; and in the hour when life and all its possessions pass from us, when the rich man is as the poorest, and the loftiest reduced to the level of the lowest, when deaf becomes the ear to all earthly voices, and dark the eye to the dearest earthly faces, when humanity is reduced to utter loneliness, and nakedness, and weakness,—oh, thrice happy he who can say, "Perish all else, God is with me still! I go, I know not whither, into regions and worlds unknown; but this I know, that neither life, nor death, nor angels, nor principalities, nor powers, nor things present, nor things to come, nor height, nor depth, nor any other creature, shall be able to separate me from the love of God which is in Jesus Christ, my Lord."

THE PRODIGAL SON.

THE PARABLES

READ IN THE LIGHT OF THE PRESENT DAY.

BY THOMAS GUTHRIE, D.D.

III.—THE PARABLE OF THE PRODIGAL SON.

LUKE XV. 11-32.

YEARS ago, a traveller found himself in a fishing town, where he intended to pass the night. The sun had gone down on a sea of glass; but, as the night fell, the wind began to moan, and ere long a glaring flash and rattling peal announced the storm that broke out over sea and land with tremendous fury. By and bye, the voices of men and women were heard in the streets—mingling with the roar of the tempest. There was none to answer his call; and surprised to find himself the only tenant of the inn, he sallied forth to join the crowd, which, seized with a terrible alarm, and consisting chiefly of old men, women, mothers, and little children, was hurrying to the shore. Their fathers, children, husbands, brothers, had gone off to the fishing; and must now be running for the haven through that black night and roaring sea. There, drenched with rain and the salt spray, clinging to wall, rock, and each other, a crowd was gathered, over which, as they stood, some looking seaward, and some in silent prayer to heaven, a blazing fire, kindled at the pier-end, threw fitful and ruddy gleams. Another light, gleaming like a star over the waves, with which it rose and sank, shone from a life-boat that gallant hands had rowed out to the tail of a reef, between which and the pier the boats must run to make the harbour's mouth. Could they live in such a sea? If they did, could they, guided by these lights, dash through between the shore on this side and the reef on that? Some hoping, some despairing, but all straining their eyes to pierce the gloom, two hours of terrible suspense drag on; at length a faint cheer is raised, as, dimly seen, the headmost boat is descried running for the harbour. They hold their breath—prayers are on their lips, and lives are in that helmsman's hand. Lying on the rudder, he steers her aright. She clears the point of danger; and, as the forms of the boat's crew flash by in the gleam of the pine-wood fire, there is a scream—a voice cries, "It is he! it is he! he's safe!"—and a woman, who had caught sight of her husband in the boat, fell fainting, for very joy, into an old man's arms.

No wonder the stranger, careless of the tempest, mingled with that eager crowd; for, where such a scene was transacting, and men's lives were in the greatest jeopardy, and human bosoms were agitated by as great a tumult as roared above in

the stormy skies, and in the waves of that foaming sea, who could sit to enjoy the comforts of a bright fireside and curtained room? Where men's lives, their souls, or great interests are in danger, nothing is so exciting as to watch the uncertain issue; or more gratifying than to see life saved—the dead alive, the lost found. To such stirring sights men and women crowd; to such tales old age, as well as childhood, turns with ear intent.

To this, in part, the parable of the Prodigal, with its strong lights and shadows, of the wickedness of the son, and the father's kindness, forgiveness, and touching joy over one who had been lost and was found, owes the universal interest with which it is read; and the garland with which men have agreed to crown it as, both for the beauty of its story, and the importance of its truths, the finest of all the parables.

THE OCCASION OF THE PARABLE.

The sceptre shall not depart from Judah, nor a lawgiver from between his feet, until Shiloh come—so said the dying Jacob. In accordance with that old prophecy, the Jewish State, at Christ's advent, merged into the Roman Empire; and was, in consequence, taxed to maintain a foreign, a heathen government. The parties employed in raising this public revenue, and who were therefore called publicans, were obnoxious to every pious and patriotic Jew. Some were heathens; and such as were not, being regarded as traitors, were held in double abhorrence—the very beggars refused their charity. With few exceptions, no man of character would accept the office. Excluded from the ranks of respectable society, the publicans acquired the habits of the dregs amongst which they sank; and associated in fact, as well as in common speech, with fallen women, they became notorious for their vices.

Orpheus is said to have drawn savage beasts around him by the charms of music; but our Lord so charmed the world by his preaching, that he drew to him, in publicans and sinners, multitudes more brutal than the beasts. Finding in him a Jew who did not hate but love them, despise but pity them, trample them beneath his feet but stooped to raise them, as if each was a diamond sparkling in the mud, they gathered

in crowds to hear him, and listen to one who offered mercy, and held out the flag of hope even to publicans and sinners. The Pharisee, as he swept in full sail to the Temple to thank God that he was not as these, dreading their touch, said, Stand aside; I am holier than thou! Not so Jesus Christ—abhorrent to his holy nature as was their impiety and impurity! Passing like a sunbeam through the foulest atmosphere without pollution, touching pitch and not defiled, breathing infected air but proof against contagion, he rather sought than shunned the company of publicans and sinners. Where should he be found, who came to save, but in the thick of the lost? The selfish, bigoted, narrow-minded Jew, who would have none saved but himself, took offence at this: This man, they said, "receiveth sinners and eateth with them;" and, by way of reproach, they called him "a friend of publicans and sinners."

We accept the picture. Each time heaven's gate is thrown open, he receiveth a sinner; and what keeps our hopes alive, and in the solemn prospect of death or judgment inspires us with any degree of fortitude, but that we shall fall into the hands of him who is "the friend of sinners?" These Pharisees did not understand Jesus Christ any more than vice understands virtue, or blindness colours. Ignorant of his mission, they could not comprehend how one who was holy should rather seek than avoid the lost and reprobate. And it was to reveal the riches of gospel grace, God's purpose of mercy, and the delight he has in converting and saving the greatest sinners, that, with the other parables of this chapter, Jesus told the story of the prodigal.

Regarding the son here as a type of man, and the father as a type of God; as he is seen in his Son and set forth in the gospel, let us now study these, the two prominent figures in this beautiful parable—beginning with the Prodigal.

HIS CONDUCT.

In the case of entailed estates, and in every case where a man in our country dies without leaving a will, the heritable property, according to what is called feudal law, belongs to the eldest son. By the udal law, as in Norway, the whole estate is divided equally among the members of the family. The Jewish law, as appears by the book of Deuteronomy, held a middle course between these two. If a man had two sons, as was the case here, his goods were divided into three parts—two of them falling to the eldest; but to his effects as thus divided, the children did not succeed till the father died.

Tired waiting in his father's death for an event which some sons have hastened, and impatient to possess the means of indulging vices into which we have seen others leave a father's grave to plunge, carelessly scattering what he had too carefully gathered, this youth requests, or rather demands, such share of the property as would by

law fall to him at the father's death. Fancy this father's case yours; your feelings at such unnatural and insolent conduct! What a shock to him to find that in his son's heart all home affections were dead, and that he himself was no longer regarded with love, or his grey hairs with respect! The father's presence, and the virtuous habits of a pious home, have become an irksome restraint. This youth would be his own master—rid of his father's strict, pious, and old-fashioned ways of keeping God's law and day; and so, type of man whose heart sin has estranged from God, so soon as his request is granted, he turns his back on home, and takes his departure to a far country.

The father did not compel his son to remain; nor does God us, or indeed any of his creatures. In Eden he left our first parents to the freedom of their own will. There man sought to be independent of God; and here, in the condition of the prodigal, we have a picture of the misery into which sin, having estranged us from our heavenly Father, has plunged its wretched votaries. Devoured by harlots, the portion was soon spent. Want followed on the heels of waste. Driven by hard necessity to become a swineherd, he accepted the meanest, and to a Jew the most degrading employment. A stranger in a strange land; cast away as an orange when men have sucked it; turned off, as I have seen a poor, ragged wretch, from the drinking-shop where he had wasted his means; neglected by old associates; laughed at as a fool by many, and pitied by none, he is reduced to the direst extremity. None offering him better fare, he tries to satisfy his hunger with swine-husks. Type of the sinner who departs from God, and a beacon to such as feel irksome under the restraints of a pious home, he seeks happiness to find only misery—ambitious of an unhallowed liberty, he sinks into the condition of the basest slave.

HIS CHANGE OF MIND.

The words, "He came to himself," here employed to describe the change on the prodigal, imply that he had been beside himself—acting the part of a madman or a fool.

He had the best of fathers; and was not he a fool to leave him?—as if among these vile women and boon companions there were any to love him as his father had done! In a home where he had rings and robes, servants to attend and fatted calves to feed him, music and dancing, when he was sad, to cheer him, was not he a fool to leave it?—as if in a far country, and in the haunts of vice, he would find any place like home. When, from the last height that commanded a view of home, he looked back, casting a lingering look behind, was not he a fool, as he suppressed the rising of old affections, and the fancy that he heard the voice of his dead mother calling him back, to dash the tear from his eye, and rush, like a war-horse plunging into the battle, headlong on a course of dissipation—blind

to the wretchedness which ever terminates a career of vice ?

"The path of transgressors is hard"—to this, God, using his sufferings for the purpose, was pleased to open his eyes. Saved beside the swine-troughs, his sorest misery, as in other cases, proved his greatest mercy. Left to chew the cud of bitter reflection, sitting where all his bones through his rags did look and stare on him, the past, with its sin and folly, rose up before his eyes. Oh, what a fool he had been ! He was convinced of that ; and of this also, that to remain there was to die—that it were better to return, and cast himself on his father's pity ; better to be his servant than the drudge and slave he was ; better to go and unburden his conscience, and acknowledge his wickedness, though he should die at his father's feet. Feeling thus, humbled and penitent, prepared to accept thankfully the smallest favour, and if he is forgiven to be content even with a servant's place, he is now like a maniac restored to reason ; as is said, "He came to himself." Happy all of whom the same can be said !

Sin is represented here as a madness ; and who acts so contrary to sound reason, his own interests, and the reality of things, as a sinner ? Transport yourself to such scenes as Hogarth painted. Here is a man in a damp, dark cell, seated on a heap of straw, and chained like a wild beast to the wall. Does he weep ? Is he haunted by recollections of a happy home ? Does he, as you look through the bars, entreat you to take pity on him, to loose his fetters, and let him go free ? No. He smiles, sings, laughs—the straw is a throne ; this bare cell, a palace ; these rough keepers, obsequious courtiers ; and he himself, a monarch, the happiest of mortals, an object of envy to crowned kings. Strange and sad delusion ! Yet, is that man not more beside himself who, with a soul formed for the purest enjoyments, delights in the lowest pleasures ; who, content with this poor world, rejects the heaven in his offer ; who, surest sign of insanity, hates in a heavenly Father and his Saviour, those who love him ; who, in love with sin, hugs his chains ; lying under the wrath of God, is merry ; sings, and dances on the thin crust that, ever and anon breaking beneath the feet of others, is all that separates him from an abyss of fire ? The spectacle recalls the words of Solomon : "I said of laughter, it is madness ; of mirth, what doth it ?" Happy, such as, through the Spirit of God, working by whatever means, have come to themselves, like the prodigal ; and are seated, like the maniac who dwelt among the tombs, at the feet of Jesus, clothed and in their right mind !

HIS DISTRESS.

"I perish, he said, with hunger. Dreadful fate !—a death attended with pangs that have turned the softest hearts to stone, and even women into savage beasts. Maddened by hunger, the mother has forgot her sucking child, that she should not

have compassion on the fruit of her womb. But how much worse the condition of him of whom the wretched prodigal is a type ? The pleasures of sin can never satisfy the cravings of an immortal soul—far less save it. The pangs of the body, besides, come to an end ; in the grave, that poor, emaciated form hungers no more, and thirsts no more, and shivers no more—but the wrath of God abideth for ever. "Their worm dieth not, and their fire is not quenched." Awful words !—made more awful by the circumstance that they came from the lips of a tender and compassionate Redeemer ; and were by him repeated thrice—hammered, if I may say so, into the mind, as a nail is driven to the head by successive blows. Besides, if a man is dying of hunger, he feels it, or of thirst, he feels it ; but the misery of a sinner is not to know his misery. Here the type of the prodigal fails. I offer a man the bread of life, and he tells me he is not hungry ; living water, and he puts aside the cup, saying, I am not thirsty ; I find him stricken down with a mortal disease, but, on bringing a physician to his bed-side, he bids us go, and not disturb him, but leave him to sleep, for he feels no pain. Insensibility to pain is his worst symptom, fatal proof that mortification has begun, and that, unless it can be arrested, all is over—you may go, make his coffin, and dig him a grave. But let sensibility return, so that on pressure being applied to the seat of disease, he shrinks and shrieks out with pain ; alarmed and ignorant, his attendants may imagine that now his last hour is come, but the man of skill knows better. There is life in that cry—it proves that the tide has turned, that he shall live. Sign as blessed, when brought to a sense of his sins, a man feels himself perishing ; cries with Peter, sinking among the waves of Galilee, I perish ; with the prodigal, sitting by the swine-troughs, I perish ; with the jailer, at midnight in the prison, What shall I do to be saved ? Have we ever felt thus ? A most important question ! For unless we have felt ourselves lost, we have not yet been saved, and have yet to be converted. Happy such as are so ! And as to those who are still far from God, let them arise, with the prodigal, and go to their Father. He waits for them. I promise them the kindest welcome—in his heart there is love, and in his house "bread enough, and to spare."

HIS BELIEF.

"I perish ! cried the poor prodigal. Why should I ? Behind yonder blue hills, away in the dim distance, lies my father's house—a house of many mansions and such full supplies that the servants, even the hired servants, have bread enough, and to spare.

Is there in Jesus Christ a provision as ample for our wants—for the wants of every humble, returning, believing penitent ? I might reply by asking, who ever sat at God's table without finding not only bread enough, but to spare ? Go back to the days

when Israel was in the wilderness. The camp is astir with early dawn. Men, women, and little children troop forth, in the grey morning, to gather the manna that, type of the blessings of salvation, has dropped from bountiful skies on the desert sands. And, when these millions are supplied, there is bread to spare, more meat than mouths—the sun, shooting up, shines on the gleanings of the harvest, as on the hoar-frost of a grassy lawn. Or look at another feast, where five thousand guests are met on a mountain-side, with its green sward for their carpet, the azure sky for a canopy, the twelve apostles for attendants, and Jesus Christ for their host, and master of the feast! In three loaves and some small fishes, the provision does not look Godlike—the counterpart of the desert's daily banquet. The disciples are ashamed; the guests astonished. But our Lord stands up unabashed, and calm in conscious power up to the blue heavens he turns his eyes; and, his voice sounding clear over silent thousands, he asks a blessing on the scanty meal. Again there is bread enough, and to spare—and these few loaves and fishes, after feeding five thousand hungry guests, fill twelve baskets with their fragments.

In their divine fulness, the desert manna, the mountain fare, were substantial symbols of the mercy, pardon, peace, holiness, and happiness stored up in Christ. Yes. We also can say, there is enough and to spare—for my needs, grace enough; for my sorrows, comfort enough; for my nakedness, raiment enough, and to spare; in that fountain filled from Immanuel's veins, blood enough to wash away my sins, and the sins of the whole world, would the world come to Jesus—but listen to the voice of babes, as they sweetly sing—

"Come to Jesus, come to Jesus;
He will save you, he will save you
Just now.

"O believe him, O believe him,
O believe him, O believe him,
Just now."

HIS RESOLUTION.

I will arise, said the prodigal, and go to my father, and say unto him, Father, I have sinned against heaven and before thee! He might well say so. I can detect in him no redeeming trait but one. When he had brought himself to poverty, he had—the fruit of early training—too much honour to beg, and too much honesty to steal, and independence enough to be willing to earn his own bread by stooping to the humblest employment. Better a hard bed, humble fare, and rags that are our own, than to live preying on others, or shining with borrowed splendour!

View it, however, in what light you may, his conduct had been atrociously bad. He preferred the company of harlots to his father's society, and songs of lewd revelry to the melody of his father's worship; a thorn in the old man's side, he had well nigh broken his loving heart, and brought

down his grey hairs with sorrow to the grave. There are more dreadful sights than that which filled Jacob with horror when, spreading out the blood-stained garment, Joseph's brothers said, Is this thy son's coat, or no? A dissipated son is a greater trial than a dead one; and more bitter the tears shed over the wreck of such an one's character than those which bedew the coffin where his dead brother lies. Such were the tears this father shed, as with many a bitter thought and agonizing prayer he followed the wanderer, whose name he never mentioned but in secret to his God.

Remove the prodigal, and setting Conscience on the bench, let us take his place! As sinners against our heavenly Father, who is not as bad as he? Be not offended, or mistake my meaning! We may never have proved thorns in a father's flesh, cost his eye one tear, or a mother's heart a groan—giving them occasion to wish that, lifted from a cradle to a coffin, we had been buried in an early grave. Still, no prodigal ever sinned against an earthly, as we have done against our heavenly Father.

I can measure parental love—how broad, and long, and strong, and deep it is. It is a sea—a deep sea, which mothers and fathers only can fathom. But the love displayed on yonder hill and bloody cross where God's own Son is perishing for us, nor man nor angel has a line to measure. The circumference of the earth, the altitude of the sun, the distance of the planets—these have been determined; but the height, depth, breadth, and length of the love of God passeth knowledge. Such is the Father against whom all of us have sinned, a thousand and a thousand times! Walk the shore when ocean sleeps in the summer calm, or, lashed into fury by the winter tempest, is thundering on her sands; and when you have numbered the drops of her waves, the sands on her sounding beach, you have numbered God's mercies and your own sins. Well, therefore, may we go to him with the contrition of the prodigal in our hearts, and his confession on our lips—Father, I have sinned against heaven and in thy sight. The Spirit of God helping us thus to go to God, be assured that the father, who, seeing his son afar off, ran to meet him, fell on his neck, and kissed him, was but an image of Him, who, not sparing his own Son, but giving him up to death, that we might live, invites and now waits your coming.

THE FATHER.

The representations of God the Father in the most splendid paintings of the ancient masters are worse than in bad taste. His Son assumed the human form; and far short as the highest art comes of expressing the love and mildness and majesty that beamed in the face of Jesus, we are not offended by its efforts. Though they may not satisfy, they do not shock us. But to set forth

the invisible God, in the character of the "Ancient of Days" as an old man, or even in the noblest aspects of humanity, is an irreverence—offensive and revolting.

Yet there have been representations of our heavenly Father more revolting. He has suffered less injustice from painters than from preachers. Thundering out the terrors of the law, armed with bolts of vengeance, and scowling down from pulpits, they have stood there as unlike as possible to him who wept over Jerusalem, and when he saw the multitudes had compassion on them. By representing God in dark and gloomy colours, with an expression on his countenance of stern severity, and as more prone to punish than to pardon, the preacher's offence is greater than the painter's. He may quench a sinner's hopes, extinguish the light that is dawning on a darkened soul, and repel a poor prodigal whose steps are turning homeward to his father's house. A physician who kills the patient he should have cured, such a man is practically the enemy of souls; to use Paul's words, he destroys him for whom Christ died.

To such false and forbidding representations of the Father, what a contrast, the beautiful, most touching, affecting, winning portrait which we have here, from one who knows him well—from the hand of his own Son. This picture might kindle hope in the bosom of despair. Some have been afraid to present God in such a gracious light, lest men, taking encouragement to plunge headlong into sin, should, like this prodigal, depart from the living God. Depart from the living God? Ah, that is not to do! Like lost sheep we have all gone astray—all departed from him. But for one person who, abusing the grace of God, takes occasion from this parable to go on in sin, with the intention, when the worst comes to the worst, of returning to the arms of an indulgent Father, thousands have been saved by it from sinking into despair, and plunging into deeper guilt. Inspiring them with hope, it has raised many a poor wretch from the swine-troughs, and brought them home. Followers of the prodigal, they have gone in to sit down in the kingdom of heaven—the angels who rejoiced over them, now rejoicing with them. In contemplating this picture, see

HOW THE FATHER RECEIVED HIS SON.

When he was yet a great way off, it is said, his father saw him. How did that happen? I knew a sailor's widow who had parted with her husband after some brief, bright days of marriage. He went to sea and never came back; his ship, probably foundering with all her crew, was never more heard of. When the time expired for her return, but no ship came, this woman would repair to a rocky headland, and, looking out, watch every sail on the wide ocean in the hope, as some ever and anon made for the harbour, that each was his—bringing the lost one home. And at night, on

her lone bed, she used to lie awake, listening to the footsteps of belated travellers, fancying that she recognised his step—but only, as the sound passed her door, to weep over her disappointment; and long after hope had died in the breasts of others, on rocky cliff or lonely bed she waited his coming who never never came home.

Such love, I can fancy, often led this father's steps to some rising ground, where, others knowing his purpose but appearing not to notice him, he repaired; and, with a heart yearning for his son, turned his eyes in the direction the prodigal went off, hoping to see him return. One day when on his watch-post, he descries a new object in the distance. He watches it. It moves; it advances; it is not a beast, prowling lion, or hungry wolf; it is a man; it may be his son. His heart beats quick. One long, earnest, steadfast gaze, and, joy of joys, happy hour, often prayed for and come at last, the keen eye of love recognises it—it is the prodigal come back! Painfully, for he was footsore and weary; slowly, for he bent under a load of guilt; sadly, for the scene around reminded him of departed joys and blighted innocence, his mother mouldering in her grave, and his father with grey hairs he had almost, perhaps, brought down to his; tremblingly, for he was in doubt of his reception—with head hung down, and slow, halting, hesitating step, the prodigal comes on. Like one agitated by contending emotions, uncertain how to act, with what measure of indulgence to temper severity, does the father wait his son's approach? No. He does not stand on his dignity; nor say, Let him make the first advances, and ask forgiveness. His one thought is, This is my son, my poor son; his one feeling a gush of love; his only impulse to throw his arms around his child, and clasp him to a bosom that has never ceased to love and hope for his return. As soon, therefore, as the wanderer is recognised, on flying feet the old man runs to meet him; and ere the son has time to speak a word, the father has him in his arms, presses him to his bosom, and, covering his cheek with passionate kisses, lifts up his voice and weeps for joy.

And this is God! the God whom we preach, as he is drawn by the hand and seen in the face of Him whom he sent to seek and save us, to bring us back, to open a way of reconciliation—the God whose Spirit inspires us with our first feeble desires to return—the God who, unwilling that any should perish, invites and waits our coming. "Therefore," like that father, often looking out for his son, "will the Lord wait, that he may be gracious unto you, and therefore," as was fulfilled by Jesus on his cross, "will he be exalted, that he may have mercy upon you. Blessed are all they that wait for him: The people shall dwell in Zion; thou shalt weep no more. He will be very gracious unto thee at the voice of thy cry: when he shall hear it, he will answer thee."

HOW HIS FATHER TREATED THE PRODIGAL.

"The king kissed Absalom"—an act that here as there expressed more than mere affection. As in David's palace, where Absalom was brought back after years of banishment, and his crimes were forgiven by a father who, all the time his face was turned from his wicked son, had, as Joab perceived and the Bible says, his heart toward him, the kiss here is a sign of reconciliation—a pledge that the past is all forgiven. Forgiven, but deeply penitent; sorrowful, yet rejoicing; happy with his father, but more than ever vexed with himself that he should have wronged and injured him, the prodigal is conducted home. The tidings spread like wild-fire; the house is moved; the servants hurry to the scene; and the joyful father issues orders that teach them, and reassure his son, that the long-lost one is to be reinstated in all the privileges which his crimes had forfeited.

Bring forth the fairest robe and put it on him, says the father. It is done, and the rags of the swine-herd stript off, the best robe in the house is thrown over his naked shoulders, and flows in rich beauty to his bleeding feet; and there now he stands—a beautiful type of the investiture of a sinner in the righteousness and imputed merits of the Saviour—that best robe in God's own house, a garment

"Fairer than ever angel wore."

Put a ring, says the father next, on his finger. And what to him was an unexpected honour, is to us, since rings were used of old as seals, a type of those graces whereby the Holy Spirit seals believers unto the day of redemption. That ring, as the diamond on its golden hoop flashes with many colours, may have other meanings; signifying here the espousals between Christ and his Church, it may be the token of her marriage, the passport of those who are blessed to go in to the marriage-supper of the Lamb. Put shoes on his feet, says the father next,—a command that indicates more than a tender regard for him, whose bare, bleeding feet touch his father's heart. In these days, the servants and slaves wore no shoes, and were thus distinguished from the members of the family. The naked foot was a sign of servitude. This order, meant for more than his son's comfort and a covering to those way-worn feet, was therefore tantamount to a declaration from the father's lips that the prodigal was not to be regarded as a servant, but as a son; that to him belonged all the privileges and possessions of sonship; that he who had never lost his place in the father's heart, was now to resume it at his table and in his house.

Nor is this all—"Kill the fatted calf, and let us eat and be merry: for this my son was dead and is alive again; he was lost, and is found." He shall be feasted. As these hollow eyes and sunken cheeks and wasted form bear witness, he has starved long; but he shall be filled now. So the

board is spread, the wine-cup circles, joy abounds, pleasure beams from every face, music shakes the air, and dancers' feet the floor; and there is more joy in that house over the lost one than over the one that was never lost. Poor prodigal! he needed it—"Give strong drink unto him that is ready to perish, and wine unto those that be of heavy hearts." Thus some of the greatest sinners, on being converted, have experienced a joy and peace and sense of divine love with which others were never blessed—even as a poor child, that has been brought down to the gates of death, receives the richest food, the sweetest cordials, and the tenderest nursing; hence the prayer which God delights to answer—

"According as the days have been
Wherein we grief have had,
And years wherein we ill have seen,
So do thou make us glad."

And this is God, Christ's Father and ours! Who, says David, shall not fear thee, O Lord! How may we, as we contemplate this picture, alter the words, saying, Who will not love thee, O Lord?—all the more when we remember, that while it cost that father nothing to save and receive his son, we were bought with a price. With what a price! The story of redemption is written in blood; God having sent his only begotten and beloved Son to the far country, to become a bondsman to set us free—to suffer and to die for us. Ring and robe, feast and fatted calf, the sound of music, and the sight of dancers, as the scene swims before the prodigal's eyes, convey to him the happy assurance of a father's love; yet how far inferior that evidence to the bleeding form that hung and groaned and died on Calvary! Love beyond parables and all images to express, God so loved the world, that he gave his only begotten Son, that whosoever believeth in him might not perish, but have everlasting life!

HOW HIS FATHER REJOICED OVER THE PRODIGAL.

In Iceland are some springs called Geysers. Hot, and rising from basin-shaped fountains, they present very remarkable appearances. Like the tides of ocean, they have their ebb and flow. The water now flies from the spectator; and shunning the light, leaves its basin to bury itself in the bowels of the earth—nor gives any intimation of its existence but an occasional groan, a low, deep moaning. At the flow, which alternates with the ebb, it rises in its funnel, overflows its margin, and, with noises like salvos of artillery, sends up, amid clouds of snow-white vapour, a flashing, liquid column as high as a hundred feet.

So act the passions of joy and sorrow. Grief retires from observation. Hiding herself, she conceals rather than proclaims the sorrows that she feeds on; and as the stricken deer leaves the herd, the bereaved court retirement that they may weep in secret over their bleeding wounds. It is otherwise with joy. The Greek, on making a discovery,

of which he had long been in pursuit, was so transported, as to rush naked into the street, and, leading the people to believe him mad, cry, Eureka, Eureka—I have found it, I have found it! Joy must have vent. A fountain which not only flows but overflows, it bursts up and out, seeking to communicate its own happiness to others.

Thus some have been moved to proclaim their conversion, and tell others of the peace which they enjoyed in believing. 'Come all ye that fear the Lord, says the Psalmist, and I will tell what he hath done for my soul; and it is just as natural for a heart full of happiness and God's love to do that, as for a thrush, perched in a summer evening on the top of a cherry-tree, to pour out the joy that fills its little breast in strains of melody. It is the great President Edwards, I think, who relates how, on one occasion, he had such a sense of God's love, that he could hardly resist telling it to the woods, the flowers beneath his feet, and the skies above his head. No wonder, therefore, that when the pure and powerful joys of salvation are poured into a heart which sin had weakened, and never satisfied, the new wine should burst the old bottle,—flowing forth in what seems to those who know no better, but ostentation and parade. It is not so. Out of the fulness of the heart the mouth speaketh.

In this parable, so true in all its parts to Nature, this feature of joy stands beautifully out. To these servants the father had never told his grief; but now the prodigal is come back, and his heart is bursting with joy, he tells them of it. He cannot conceal it; he does not seek to conceal it. He says, let us eat and be merry—I am so happy myself, I wish all others to be happy. Banish all care; drop your toils; let the shepherd come from the hill, the ploughman from the furrow, the herd from the pastures, the meanest servant come; and all wearing smiles and joining in the song, hold holiday with my heart. My son that was dead is alive again; that was lost, is found. And this happiest of fathers rejoicing over the returned prodigal, blotting out of memory all his offences, doating on him, drawing him to his side, clasping him in his arms, ever and anon bending on him looks of deepest love, pleading his cause with his unamiable brother, saying, It was meet that we should be merry,—is Christ's picture of his Father!—so he rejoices over every repenting, returning sinner.

Who that elder brother stands for, it is not so easy to settle—whether for Jews jealous of the Gentiles receiving an equal share with them of the blessings of grace; or, still more likely, for the Pharisees, who, proud of their ceremonial righteousness, regarded themselves as injured by the favour shown to publicans and sinners. Proud and boastful, heartless, selfish and sulky, he makes an excellent background to the picture—bringing out

into striking prominence the kindness of the father's heart. That is man's heart—turned by sin and selfishness into a stone; this is God's. Is there no kind Christian father or mother, did they, on a wild winter night, when the heavens were black with drift, and flocks were perishing on the hill, and ships were sinking in the sea, and travellers were lost on the pathless moor, hear a prodigal child knocking at their door, and with wailing, sinking, dying voice, crying, Open and let me in! but would rise—ay, would spring to the call? They know how ready God is to receive every poor sinner to his mercy, and poor penitent to his bosom. He rejoices in his ransomed; let them rejoice in him! Rejoice in the Lord, says Paul, always, and again I say, rejoice. The sun that shines on you shall set, and summer streams shall freeze, and deepest wells go dry—but not his love. His love is a stream that never freezes, a fountain that never fails, a sun that never sets in night, a shield that never breaks in fight; whom he loveth, he loveth to the end.

Are any alarmed lest such a picture of God as we have attempted to draw from this parable, should lead penitents to think lightly of sin? There is no ground for alarm. God forgives offences; but the forgiven never forget them. Does the prodigal forget his sins so soon as they are forgiven—freely, readily, kindly forgiven? No. On the contrary, though now, assured of his father's love, he drops out all mention of a servant's place, he confesses and deplors his sins—does that when he knows them to be forgiven. A sense of God's kindness is the spring of deepest sorrow; and the repentance that succeeds forgiveness is truer and deeper than any which precedes it. Therefore when God says, "I will establish with thee an everlasting covenant," he adds, "then shalt thou remember thy ways, and be ashamed." It was when Jesus, whom Peter had denied, turned a look of love and pity on him, that Simon, pierced to the heart, went out to weep bitterly. The repentance that needeth not to be repented of, has its truest emblem in the rivers that, lending flowers and emerald verdure to their banks, wind through the valleys of the Alps. It is not when stern winter howls, but in spring, and the sweet summertime, when birds are singing, and flowers are breathing odours, and the sun, from azure skies, pours down his beams on the icy bosoms of the mountains, that the rivers, fed by melted snows, rising and overflowing all their banks, roll their mightiest torrents to the lakes. And so it is when a sense of God's love, and peace, and forgiveness is poured into our hearts, that they thaw, and soften, and melt into streams of fullest sorrow. "They shall look on him whom they have pierced; and mourn as one mourneth for an only son, and be in bitterness, as one is in bitterness for a first-born."

CONCERNING RESIGNATION.

You know how a little child of three or four years old kicks and howls if it do not get its own way. You know how quietly a grown-up man takes it, when ordinary things fall out otherwise than he wished. A letter, a newspaper, a magazine, does not arrive by the post on the morning on which it had been particularly wished for, and counted on with certainty. The day proves rainy, when a fine day was specially desirable. The grown-up man is disappointed: but he soon gets reconciled to the existing state of facts. He did not much expect that things would turn out as he wished them. Yes: there is nothing like the habit of being disappointed, to make a man resigned when disappointment comes, and to enable him to take it quietly. And a habit of practical resignation grows upon most men, as they advance through life.

You have often seen a poor beggar, most probably an old man, with some lingering remains of respectability in his faded appearance, half ask an alms of a passer-by: and you have seen him, at a word of repulse, or even on finding no notice taken of his request, meekly turn away: too beaten and sick at heart for energy: drilled into a dreary resignation by the long custom of finding everything go against him in this world. You may have known a poor cripple, who sits all day by the side of the pavement of a certain street, with a little bundle of tracts in his hand, watching those who pass by, in the hope that they may give him something. I wonder, indeed, how the police suffer him to be there: for though ostensibly selling the tracts, he is really begging. Hundreds of times in the long day, he must see people approaching; and hope that they may spare him a halfpenny; and find ninety-nine out of each hundred pass without noticing him. It must be a hard school of Resignation. Disappointments without number have subdued that poor creature into bearing one disappointment more with scarce an appreciable stir of heart. But on the other hand, kings, great nobles, and the like, have been known, even to the close of life, to violently curse and swear if things went against them; going the length of stamping and blaspheming even at rain and wind, and branches of trees and plashes of mud, which were of course guiltless of any design of giving offence to these eminent individuals. There was a great monarch, who when any little cross-accident befell him, was wont to fling himself upon the floor; and there to kick and scream and tear his hair. And around him, meanwhile, stood his awe-stricken attendants: all doubtless ready to assure him that there was something noble and graceful in his kicking and screaming: and that no human being had ever before with such dignity and magnanimity torn his hair. My friend Mr. Smith tells me that in his early youth he had a (very slight) acquaintance with a great Prince, of

elevated rank and of vast estates. That great Prince came very early to his greatness; and no one had ever ventured, since he could remember, to tell him he had ever said or done wrong. Accordingly, the Prince had never learned to control himself; nor grown accustomed to bear quietly what he did not like. And when any one, in conversation, related to him something which he disapproved, he used to start from his chair, and rush up and down the apartment, furiously flapping his hands together, till he had thus blown off the steam produced by the irritation of his nervous system. That Prince was a good man: and so aware was he of his infirmity, that when in these fits of passion, he never suffered himself to say a single word: being aware that he might say what he would afterwards regret. And though he could not wholly restrain himself, the entire wrath he felt passed off in flapping. And after flapping for a few minutes, he sat down again, a reasonable man once more. All honour to him! For my friend Smith tells me that that Prince was surrounded by toadies, who were ready to praise everything he might do; even to his flapping. And in particular, there was one humble retainer, who whenever his master flapped, was wont to hold up his hands in an ecstasy of admiration: exclaiming, "It is the flapping of a god, and not of a man!"

Now all this lack of Resignation on the part of princes and kings comes of the fact, that they are so far like children, that they have not become accustomed to be resisted; and to be obliged to forego what they would like. Resignation comes by the habit of being disappointed; and of finding things go against you. It is, in the case of ordinary human beings, just what they expect. Of course, you remember the adage: "Blessed is he who expecteth nothing, for he shall not be disappointed." I have a good deal to say about that adage. Reasonableness of expectation is a great and good thing: despondency is a thing to be discouraged and put down as far as may be. But meanwhile let me say, that the corollary drawn from that dismal beatitude seems to me unfounded in fact. I should say just the contrary. I should say, "Blessed is he who expecteth nothing, for he will very likely be disappointed." You know, my reader, whether things do not generally happen the opposite way from that which you expected. Did you ever try to keep off an evil you dreaded, by interposing this buffer? Did you ever think you might perhaps prevent a trouble from coming, by constantly anticipating it: keeping meanwhile an under-thought that things rarely happened as you anticipate them: and thus that your anticipation of the thing might possibly keep it away? Of course you have: for you are a human being. And in all common cases, a watch might

as well think to keep a skilful watchmaker in ignorance of the way in which its movements are produced, as a human being think to prevent another human being from knowing exactly how he will think and feel in given circumstances. We have watched the working of our own watches far too closely and long, my friends, to have the least difficulty in understanding the great principles upon which the watches of other men go. I cannot look inside your breast, my reader : and see the machinery that is working there : I mean the machinery of thought and feeling. But I know exactly how it works, nevertheless : for I have long watched a machinery precisely like it.

There are a great many people in this world who feel that things are all wrong : that they have missed stays in life : that they are beaten : and yet who don't much mind. They are indurated by long use. They do not try to disguise from themselves the facts. There are some men who diligently try to disguise the facts : and who in some measure succeed in doing so. I have known a self-sufficient and disagreeable clergyman who had a church in a large city. Five-sixths of the seats in the church were quite empty : yet the clergyman often talked of what a good congregation he had, with a confidence which would have deceived any one who had not seen it. I have known a church where it was agony to any one with an ear to listen to the noise produced when the people were singing : yet the clergyman often talked of what splendid music he had. I have known an entirely briefless barrister, whose friends gave out that the sole reason why he had no briefs was that he did not want any. I have known students who did not get the prizes for which they competed : but who declared that the reason of their failure was, that though they competed for the prizes, they did not wish to get them. I have known a fast young woman, after many engagements made and broken, marry as the last resort a brainless and penniless blackguard : yet all her family talk in big terms of what a delightful connexion she was making. Now, where all that self-deception is genuine, let us be glad to see it : and let us not, like Mr. Snarling, take a spiteful pleasure in undeceiving those who are so happy to be deceived. In most cases, indeed, such trickery deceives nobody. But where it truly deceives those who practise it, even if it deceive nobody else, you see there is no true Resignation. A man who has made a mess of life, has no need to be resigned, if he fancies he has succeeded splendidly. But I look with great interest, and often with deep respect, at the man or woman who feels that life has been a failure : a failure, that is, as regards *this* world : and yet who is quite resigned. Yes : whether it be the unsoured old maid, sweet-tempered, sympathetic in others' joys, God's kind angel in the house of sorrow : or the unappreciated genius, quiet, subdued, pleased to meet even one who understands him amid a community which

does not : or the kind-hearted clever man to whom eminent success has come too late, when those were gone whom it would have made happy : I reverence and love, more than I can express, the beautiful natures I have known thus subdued and resigned !

Yes : human beings get indurated. When you come to know well the history of a great many people, you will find that it is wonderful what they have passed through. Most people have suffered a very great deal, since they came into this world. Yet, in their appearance, there is no particular trace of it all. You would not guess, from looking at them, how hard and how various their lot has been. I once knew a woman, rather more than middle-aged. I knew her well, and saw her almost every day, for several years, before I learned that the homely Scotchwoman had seen distant lands, and had passed through very strange ups and downs, before she settled into the quiet orderly life in which I knew her. Yet when spoken to kindly, by one who expressed surprise that all these trials had left so little trace, the inward feeling, commonly suppressed, burst bitterly out : and she exclaimed, "It's a wonder that I'm living at all !" And it is a wonder that a great many people are living, and looking so cheerful and so well as they do : when you think what fiery passion, what crushing sorrow, what terrible losses, what bitter disappointments, what hard and protracted work, they have gone through. Doubtless, great good comes of it. All wisdom, all experience, comes of suffering. I should not care much for the counsel of the man whose life had been one long sunshiny holiday. There is greater depth in the philosophy of Mr. Dickens, than a great portion of his readers discern. You are ready to smile at the singular way in which Captain Cuttle commended his friend Jack Bunsby as a man of extraordinary wisdom ; whose advice on any point was of inestimable value. "Here's a man," said Captain Cuttle, "who has been more beaten about the head than any other living man !" I hail the words as the recognition of a great principle. To Mr. Bunsby, it befell in a literal sense : but we have all been (in a moral sense) a good deal beaten about both the head and the heart before we grew good for much. Out of the travail of his nature : out of the sorrowful history of his past life : the poet or the moralist draws the deep thought and feeling which find so straight a way to the hearts of other men. Do you think Mr. Tennyson would ever have been the great poet he is, if he had not passed through that season of great grief which has left its noble record in *In Memoriam* ? And a youthful preacher, of vivid imagination and keen feeling, little fettered by anything in the nature of good taste, may by strong statements and a fiery manner draw a mob of unthinking hearers : but thoughtful men and women will not find anything in all *that*, that awakens the response of their inner nature in its truest

depths : they must have religious instruction into which real experience has been transfused : and the worth of the instruction will be in direct proportion to the amount of real experience which is embodied in it. And after all, it is better to be wise and good, than to be gay and happy ; if we must choose between the two things : and it is worth while to be severely beaten about the head, if *that* is the condition on which alone we can gain true wisdom. True wisdom is cheap at almost any price. But it does not follow at all that you will be happy (in the vulgar sense) in direct proportion as you are wise. I suppose most middle-aged people, when they receive the ordinary kind wish at New-year's time of a Happy New-Year, feel that *happy* is not quite the word : and feel *that*, too, though well aware that they have abundant reason for gratitude to a kind Providence. It is not *here* that we shall ever be happy : that is, completely and perfectly happy. Something will always be coming to worry and distress. And a hundred sad possibilities hang over us : some of them only too certainly and quickly drawing near. Yet people are content, in a kind of way. They have learnt the great lesson of Resignation.

There are many worthy people who would be quite fevered and flurried by good-fortune, if it were to come to any very great degree. It would injure their heart. As for bad fortune, they can stand it nicely. They have been accustomed to it so long. I have known a very hard-wrought man, who had passed, rather early in life, through very heavy and protracted trials. I have heard him say, that if any malicious enemy wished to kill him, the course would be to make sure that tidings of some signal piece of prosperity should arrive by post on each of six or seven successive days. It would quite un hinge and unsettle him, he said. His heart would go : his nervous system would break down. People to whom pieces of good-luck come rare and small, have a great curiosity to know how a man feels when he is suddenly told that he has drawn one of the greatest prizes in the lottery of life. The kind of feeling, of course, will depend entirely on the kind of man. Yet very great prizes, in the way of dignity and duty, do for the most part fall to men who in some measure deserve them : or who at least are not conspicuously undeserving of them and unfit for them. So that it is almost impossible that the great news should elicit merely some unworthy explosion of gratified self-conceit. The feeling would in almost every case be deeper, and worthier. One would like to be sitting at breakfast with a truly good man, when the letter from the Prime Minister comes in, offering him the Archbishopric of Canterbury. One would like to see how he would take it. Quietly, I have no doubt. Long preparation has fitted the man who reaches that position for taking it quietly. A recent Chancellor publicly stated how *he* felt when offered the

Great Seal. His first feeling, that good man said, was of gratification that he had fairly reached the highest reward of the profession to which he had given his life : but the feeling which speedily supplanted *that*, was an overwhelming sense of his responsibility and a grave doubt as to his qualifications. I have always believed, and sometimes said, that good-fortune ; not so great or so sudden as to injure one's nerves or heart : but kindly and equable ; has a most wholesome effect upon human character. I believe that the happier a man is, the better and kinder he will be. The greater part of unamiability, ill-temper, impatience, bitterness, and uncharitableness, comes out of unhappiness. It is because a man is so miserable, that he is such a sour, suspicious, fractious, petted creature. I was amused, this morning, to read in the newspaper an account of a very small incident which befell the new Primate of England on his journey back to London after being enthroned at Canterbury. The reporter of that small incident takes occasion to record that the Archbishop had quite charmed his travelling companions in the railway carriage by the geniality and kindness of his manner. I have no doubt he did. I am sure he is a truly good Christian man. But think of what a splendid training for producing geniality and kindness he has been going through for a great number of years. Think of the moral influences which have been bearing on him for the last few weeks. We should all be kindly and genial if we had the same chance of being so. But if Dr. Longley had a living of a hundred pounds a year : a fretful ailing wife : a number of half-fed and half-educated little children : a dirty miserable house : a bleak country round : and a set of wrongheaded and insolent parishioners to keep straight : I venture to say he would have looked, and been, a very different man, in that railway carriage running up to London. Instead of the genial smiles that delighted his fellow-travellers (according to the newspaper story), his face would have been sour and his speech would have been snappish : he would have leant back in the corner of a second-class carriage, sadly calculating the cost of his journey ; and how part of it might be saved by going without any dinner. Oh, if I found a four-leaved shamrock, I would undertake to make a mighty deal of certain people I know ! I would put an end to their weary schemings to make the ends meet. I would cut off all those wretched cares which jar miserably on the shaken nerves. I know the burst of thankfulness and joy that would come, if some dismal load, never to be cast off, were taken away. And I would take it off. I would clear up the horrible muddle. I would make them happy : and in doing *that*, I know that I should make them good !

But I have sought the four-leaved shamrock for a long time, and never have found it : and so I am growing subdued to the conviction that I never

will. Let us go back to the matter of Resignation; and think a little longer about *that*.

Resignation, in any human being, means that things are not as you would wish; and yet that you are content. Who has all he wishes? There are many houses in this world in which Resignation is the best thing that can be felt, any more. The bitter blow has fallen: the break has been made: the empty chair is left (perhaps a very little chair): and never more, while Time goes on, can things be as they were fondly wished and hoped. Resignation would need to be cultivated by human beings: for, all round us, there is a multitude of things very different from what we would wish. Not in your house, not in your family, not in your street, not in your parish, not in your country, and least of all in yourself; can you have things as you would wish. And you have your choice of two alternatives. You must either fret yourself into a nervous fever; or you must cultivate the habit of Resignation. And very often, Resignation does not mean that you are at all reconciled to a thing; but just that you feel you can do nothing to mend it. Some friend, to whom you are really attached, and whom you often see, vexes and worries you by some silly and disagreeable habit: some habit which it is impossible you should ever like, or ever even overlook: yet you try to make up your mind to it; because it cannot be helped; and you would rather submit to it than lose your friend. You hate the East wind: it withers and pinches you, in body and soul: yet you cannot live in a certain beautiful city without feeling the East wind many days in the year. And that city's advantages and attractions are so many and great, that no sane man, with sound lungs, would abandon the city merely to escape the East wind. Yet though resigned to the East wind, you are anything but reconciled to it.

Resignation is not always a good thing. Sometimes it is a very bad thing. You should never be resigned to things continuing wrong, when you may rise and set them right. I daresay, in the Romish Church, there were good men before Luther, who were keenly alive to the errors and evils that had crept into it: but who, in despair of making things better, tried sadly to fix their thoughts upon other subjects: who took to illuminating missals, or constructing systems of logic, or cultivating vegetables in the garden of the monastery, or improving the music in the chapel: quietly resigned to evils they judged irremediable. Great reformers have not been resigned men. Luther was not resigned: Howard was not resigned: Powell Buxton was not resigned: George Stephenson was not resigned. And there is hardly a nobler sight, than that of a man who determines that he will not make up his mind to the continuance of some great evil: who determines that he will give his life to battling with that evil to the last: who determines that either that evil shall extinguish

him, or he shall extinguish it! I reverence the strong, sanguine mind, that resolves to work a revolution to better things; and that is not afraid to hope it *can* work a revolution! And perhaps, my reader, we should both reverence it all the more that we find in ourselves very little like it. It is a curious thing, and a sad thing, to remark in how many people there is too much resignation. It kills out energy. It is a weak, fretful, unhappy thing. People are reconciled, in a sad sort of way, to the fashion in which things go on. You have seen a poor, slatternly mother, in a wayside cottage, who has observed her little children carrying in the road before it, in the way of passing carriages; angrily ordering the little things to come away from their dangerous and dirty play: yet when the children disobey her, and remain where they were, just saying no more; making no farther effort. You have known a master tell his man-servant to do something about stable or garden: yet when the servant does not do it, taking no notice: seeing that he has been disobeyed, yet wearily resigned: feeling that there is no use in always fighting. And I do not speak of the not unfrequent cases in which the master, after giving his orders, comes to discover that it is best they should not be carried out, and is very glad to see them disregarded: I mean when he is dissatisfied that what he has directed is not done, and wishes that it were done, and feels worried by the whole affair: yet is so devoid of energy as to rest in a fretful resignation. Sometimes there is a sort of sense as if one had discharged his conscience by making a weak effort in the direction of doing a thing: an effort which had not the slightest chance of being successful. When I was a little boy, many years since, I used to think this: and I was led to thinking it by remarking a singular characteristic in the conduct of a school companion. In those days, if you were chasing some other boy who had injured or offended you, with the design of retaliation; if you found you could not catch him, by reason of his superior speed; you would have recourse to the following expedient. If your companion was within a little space of you, though a space you felt you could not make less: you would suddenly stick out one of your feet, which would hook round his: and he, stumbling over it, would fall. I trust I am not suggesting a mischievous and dangerous trick to any boy of the present generation. Indeed, I have the firmest belief that existing boys know all we used to know, and possibly more. All this is by way of rendering intelligible what I have to say of my old companion. He was not a good runner. And when another boy gave him a sudden flick with a knotted handkerchief, or the like; he had little chance of catching that other boy. Yet I have often seen him, when chasing another, before finally abandoning the pursuit, stick out his foot in the regular way, though the boy he was chasing was yards beyond his reach. Often did the present writer meditate on that phenomenon, in the days

of his boyhood. It appeared curious that it should afford some comfort to the evaded pursuer, to make an offer at upsetting the escaping youth,—an offer which could not possibly be successful. But very often, in after life, have I beheld in the conduct of grown up men and women, the moral likeness of that futile sticking out of the foot. I have beheld human beings who lived in houses always untidy and disorderly: or whose affairs were in a horrible confusion and entanglement: who now and then seemed roused to a feeling that this would not do: who querulously bemoaned their miserable lot; and made some faint and futile attempt to set things right: attempts which never had a chance to succeed, and which ended in nothing. Yet it seemed somehow to pacify the querulous heart. I have known a clergyman in a parish with a bad population, seem suddenly to waken up to a conviction that he must do something to mend matters: and set agoing some weak little machinery, which could produce no appreciable result, and which came to a stop in a few weeks. Yet that faint offer appeared to discharge the claims of conscience: and after it the clergyman remained long time in a comatose state of unhealthy Resignation. But it is a miserable and a wrong kind of Resignation which dwells in that man, who sinks down, beaten and hopeless, in the presence of a recognised evil. Such a man may be, in a sense, resigned: but he cannot possibly be content.

If you should ever, when you have reached middle age, turn over the diary or the letters you wrote in the hopeful though foolish days when you were eighteen or twenty, you will be aware how quietly and gradually the lesson of Resignation has been taught you. You would have got into a terrible state of excitement if any one had told you then that you would have to forego your most cherished hopes and wishes of that time: and it would have tried you even more severely to be assured that, in not many years, you would not care a single straw for the things and the persons who were then uppermost in your mind and heart. What an entirely new set of friends and interests is that which now surrounds you: and how completely the old ones are gone! Gone, like the sunsets you remember in the summers of your childhood: gone, like the primroses that grew in the woods where you wandered as a boy. Said my friend Smith to me, a few days ago: "You remember Miss Jones, and all about that? I met her yesterday, after ten years. She is a fat, middle-aged, ordinary-looking woman. What a terrific fool I was!" Smith spoke to me in the confidence of friendship: yet I think he was a little mortified at the heartiness with which I agreed with him on the subject of his former folly. He had got over it completely: and in seeing that he was (at a certain period) a fool, he had come to discern that of which his friends had always been aware. Of course, early interests do not always die out. You remember Dr. Chalmers: and the

ridiculous exhibition about the wretched little likeness of an early sweetheart, not seen for forty years, and long since in her grave. You remember the singular way in which he signified his remembrance of her, in his famous and honoured age. I don't mean the crying: nor the walking up and down the garden walk calling her by fine names. I mean the taking out his card: not his *carte*; you could understand *that*: but his visiting-card bearing his name; and sticking it behind the portrait with two wafers. Probably it pleased him to do so: and assuredly it did harm to no one else. And we have all heard of the like things. Early affections are sometimes, doubtless, cherished in the memory of the old. But still, more material interests come in: and the old affection is crowded out of its old place in the heart. And so, those comparatively fanciful disappointments sit lightly. The romance is gone. The mid-day sun beats down: and *there* lies the dusty way. When the cantankerous and unamiable mother of Christopher North stopped his marriage with a person at least as respectable as herself, on the ground that the person was not good enough, we are told that the future professor nearly went mad; and that he never quite got over it. But really, judging from his writings and his biography, he bore up under it, after a little, wonderfully well.

But looking back to the days which the old yellow letters bring back, you will think to yourself, Where are the hopes and anticipations of that time? You expected to be a great man, no doubt. Well, you know you are not. You are a small man: and never will be anything else: yet you are quite resigned. If there be an argument which stirs me to indignation at its futility; and to wonder that any mortal ever regarded it as of the slightest force: it is that which is set out in the famous soliloquy in *Cato*, as to the Immortality of the Soul. Will any sane man say, that if in this world you wish for a thing very much, and anticipate it very clearly and confidently, you are therefore sure to get it? If that were so, many a little schoolboy would end by driving his carriage and four, who ends by driving no carriage at all. I have heard of a man whose private papers were found after his death all written over with his signature as he expected it would be when he became Lord Chancellor. Let us say his peerage was to be as Lord Smith. There it was, SMITH, C., SMITH, C., written in every conceivable fashion: so that the signature, when needed, might be easy and imposing. That man had very vividly anticipated the woollen sack, the gold robe, and all the rest. It need hardly be said he attained none of these. The famous argument, you know of course, is that man has a great longing to be immortal; and that therefore he is sure to be immortal. Rubbish! It is not true that any longing after immortality exists in the heart of a hundredth portion of the race. And if it were true, it would prove immortality no more, than the manifold signatures

of SMITH, C., proved that Smith was indeed to be Chancellor. No: we cling to the doctrine of a Future Life: we could not live without it: but we believe it, not because of undefined longings within ourselves, not because of reviving plants and flowers, not because of the chrysalis and the butterfly: but because "our Saviour, Jesus Christ, hath abolished death, and brought life and immortality to light through the gospel!"

There is something very curious, and very touching, in thinking how clear and distinct, and how often recurring, were our early anticipations of things that were never to be. In this world, the fact is for the most part the opposite of what it should be to give force to Plato's (or Cato's) argument: the thing you vividly anticipate is the thing that is least likely to come. The thing you don't much care for: the thing you don't expect: is the likeliest. And even if the event prove what you anticipated; the circumstances, and the feeling of it, will be quite different from what you anticipated. A certain little girl three years old was told that in a little while she was to go with her parents to a certain city, a hundred miles off: a city which may be called Altenburg as well as anything else. It was a great delight to her to anticipate that journey, and to anticipate it very circumstantially. It was a delight to her to sit down at evening on her father's knee: and to tell him all about how it would be in going to Altenburg. It was always the same thing. Always, first, how sandwiches would be made: how they would all get into the carriage (which would come round to the door), and drive away to a certain railway station: how they would get their tickets; and the train would come up; and they would all get into a carriage together, and lean back in corners, and eat the sandwiches, and look out of the windows: and so on. But when the journey was actually made, every single circumstance in

the little girl's anticipations proved wrong. Of course, they were not intentionally made wrong. Her parents would have carried out to the letter, if they could, what the little thing had so clearly pictured and so often repeated. But it proved to be needful to go by an entirely different way and in an entirely different fashion. All those little details, dwelt on so much, and with so much interest, were things never to be. It is even so with the anticipations of larger and older children. How distinctly, how fully, my friend, we have pictured out to our minds a mode of life, a home and the country round it, and the multitude of little things which make up the habitude of being: which we long since resigned ourselves to knowing could never prove realities! No doubt, it is all right and well. Even St. Paul, with all his gift of prophecy, was not allowed to foresee what was to happen to himself. You know how he wrote that he would do a certain thing, "as soon as I shall see how it will go with me!"

But our times are in the Best Hand. And the one thing about our lot, my reader, that we may think of with perfect contentment, is that they are so. I know nothing more admirable in spirit, and few things more charmingly expressed, than that little poem by Mrs. Waring which sets out that comfortable thought. You know it, of course. You should have it in your memory; and let it be one of the first things your children learn by heart. It may well come next after *O God of Bethel*: it breathes the self-same tone. And let me close these thoughts with one of its verses:

There are briars besetting every path,
Which call for patient care:
There is a cross in every lot,
And an earnest need for prayer:
But a lowly heart that leans on Thee,
Is happy anywhere!

A. K. H. B.

THE NIGHT-WALK OVER THE MILL STREAM.

BY THE AUTHOR OF "EAST LYNNE."

I.—THE LADY KATHERINE'S WISH.

THE red light of the setting sun shone full on the windows of a farm-house, standing amidst its own lands; shone into a chamber which faced the west. On the bed lay the mistress of the house, suffering from some sudden attack, which caused intense inward agony.

A woman-servant, who had been standing at the window, turned round, her face brightening with satisfaction. "There, there, don't take on so, missis! He is coming in at the gate. It will be all right now."

The moans from the bed ceased; but, nevertheless, a more troubled expression arose to the face, lying there. It was as though the bodily pain had given place to mental.

The servant left the room. A couple of minutes, and she returned, showing in a gentleman. A tall, fine, gentlemanly man of thirty years, with a pleasing countenance. His large, earnest grey eyes were bent with sympathy on the bed, as he advanced to it, and took the patient's hand.

"Nancy says you have been ill these several days past, Mrs. Key," he said. "Why did you not send for me before?"

"I was ashamed to send for you now," she murmured. "I feel ashamed to see you, Mr. Olliver. Indeed it has not been our fault. We would have found the money to pay you if it had been in our power."

His lips parted with a sweet smile, reassuring in its brightness. Her husband, who was a hard-

working farmer, had fallen into misfortunes ; had been obliged to wipe off his debts with a sponge. A heavy account, long due to Mr. Olliver for medicine and attendance, had been thus cancelled. They were not willing debtors, and Mrs. Key felt it keenly ; felt, as she had thus expressed it, ashamed to see him once more at her bedside.

"Were I never paid in any coin but money," he said in a gentle tone, "I should deem myself poorly remunerated. The pleasure of alleviating suffering, looking for no recompense, is one of the green spots in the desert of a doctor's life. And now tell me what is the matter," he continued, drawing a chair to the bedside. "It is the old enemy in the side, I presume?"

"Yes ; but worse than I have ever experienced it. I never had an attack such as this. As Nancy has told you, I have been suffering for some days past ; but this morning the pain grew into agony. I thought I should have died with it."

"You have been fretting lately, I fear," observed Mr. Olliver.

"True," she answered. "How am I to help it?"

How, indeed ! The surgeon knew, as well as she did, that for the suffering brought on by trouble there is no help. Half the world have a daily fight with it. He prescribed his remedies, said he would send some medicine immediately, and sat chatting soothingly for a few minutes. None, save the sick, know the comfort a sympathizing doctor brings to the bedside. By the time he rose to go, Mrs. Key felt better.

"I shall not be able to see you to-morrow, or for a week or ten days subsequent to it. You know why," he added, a smile illumining his features. "But you will receive every attention from Mr. Hill. And I will come up again this evening."

"No, sir, not again. Do not take the trouble to come again. I could not think of it. I shall do well now."

"We will see," he answered, leaving it an open question, as he shook her hand to depart.

The sun had sunk beneath the horizon when he quitted the house, but clouds of purple and crimson lingered in the sky. It was a fine, clear evening at the end of October ; clearer and finer than they had had it latterly. Before him at a short distance lay the village of Hilton-Coombe, and Mr. Olliver hesitated which way he should return to it. By the roadway, bearing to the right, it would take him about twenty minutes to get to his own residence in it ; if he cut across the fields opposite to him, and crossed the mill stream, he might gain it in little more than ten. But it was the crossing of this mill stream which caused him to hesitate, for the floods had been out lately—as the phraseology ran in the neighbourhood—and the path might be dangerous.

Being pressed for time, he turned to it. A stream, narrow in that part, and only to be crossed by an unprotected wooden bridge. It was little more,

in fact, than a plank, and two persons could not stand abreast on it. Mr. Olliver found the water very high, nearly reaching to it ; but he had a steady eye and step, and traversed it in safety. Immediately before him, at only a field's distance, was the church of Hilton-Coombe, its large graveyard surrounding it, and its spire stretching up against the sky. As he gazed at it, a soft colour flushed his face, akin to that in the crimson sky ; a quicker motion arose in his beating heart ; for in that church on the morrow, the last day of October, he would receive the hand of one who was dearer to him than his own life. It would be his wedding-day.

The field path took him direct to the little gate of the churchyard. Passing through it, he crossed the path which wound round by the church door, and emerged on the high road. The village lay on his right, and he turned to it. It was a large village, containing a great many gentlemen's houses, and but a small proportion of poor.

The first house he came to was the rectory. It was not close to the church ; one side of the churchyard, and a field in which the rector kept his cows, intervened. A low house it was, old-fashioned and commodious, built of greystone, lying back from the road, and half-hidden from the gaze of passers-by, by the trees crowding its garden. Mr. Olliver cast an eager glance to it in spite of the trees : it might be, that he should catch a glimpse of a beloved face at one of its windows, many of which were bright with firelight. The only daughter of that rectory, Annis Dudley, was she who would become on the morrow Annis Olliver.

He did not see her, and he walked on with a fleet foot. Under an engagement to dine there that evening, he was hastening home first to despatch medicines to Mrs. Key, and to make some slight alteration in his dress. A carriage passed him and drew up to the rectory gate. He turned and looked after it, for he had no doubt it contained Miss Bellassys.

It did contain Miss Bellassys, a little lady with grey hair, who walked lame as she traversed the winding path through the garden to the rectory door. A fair girl came hastening into the hall to meet her ; one with a gentle face and a soft dark eye. She wore a shaded silk dress of a delicate colour, quiet and lady-like as she was.

"Can this be Annis ?" asked the visitor. "My dear child, you have grown into a woman !"

Annis blushed and smiled. "It is six years since you saw me, Aunt Ruth, and I am twenty-one."

"Ay, time flies. I wish I could come to you less rarely, but you know how I am chained to home. I put off coming now until the last moment. My dear Katherine !"

The servant had thrown open the door of a drawing-room on the right of the hall, and the last words were addressed to a lady who was sitting by

its fire. She was middle-aged now, but must have been handsome in her day; she would have been more so now, but for the coldness of her blue eyes, and the haughty cast of her aquiline features. She wore a rich dress of blue watered silk, and gold ornaments.

"Mamma, it is Aunt Ruth."

The two ladies met and clasped hands. They were first cousins. The rector's wife was the first to speak. "Never to come to us until this evening, Ruth! You might almost as well not have come at all. Jacob, where is your master?"

The servant, who had been closing the door, opened it again. "I think he is in his room, my lady."

"Inform him that Miss Bellassys is here."

But before Jacob could depart, he found himself put aside by his master, the Reverend William Dudley, a man of simple manners, and a calm, good face. A stranger need not have been told that he and Annis were father and daughter; the likeness between them would have proclaimed it.

"And so you are going to lose Annis!" exclaimed Miss Bellassys, sadness mingling with her tone.

A strangely frigid expression settled on the face of Lady Katherine Dudley. She made no rejoinder; it appeared that she would not make one.

"Not quite to lose her," said the rector cheerfully, a happy light shining in his soft dark eyes, so like his daughter's. "It might have been worse, Ruth; she goes away from us but a stone's-throw."

"But is it a desirable connexion for Annis?" doubtfully resumed Miss Bellassys.

"Wait until you see him," said Mr. Dudley. But the Lady Katherine formed her lips into a "No," and lifted her head with a defiant gesture.

For the approaching union with Mr. Olliver did not give pleasure to Lady Katherine Dudley. She had married the rector of Hilton-Coombe in early life, when she was plain Miss Bellassys, plain in station, poor in pocket, and she had deemed it an excellent settlement. But through the death of several intervening heirs, her father succeeded to an earldom and she to a title, and then she began to find the quiet rectory of Hilton-Coombe, with its five hundred a year, all told, somewhat unsuited to her degree. For herself, she could not change it; no money had accrued to her with her title; she must continue to live the quiet life, and not escape from it, and she was content enough to do so, but she began to cherish dreams of ambition for her only child. Annis should marry well; should soar into the rank to which, as her daughter, she was entitled; should become noble and wealthy. Great dreams! cherished by many a mother, and by many found to be vain ones: as they were so found by Lady Katherine Dudley. For Annis marred the whole scheme by falling in love with the plain village surgeon, Thomas Olliver.

It may be a question, though, whether Mr. Olliver did not fall first in love with her. However it may have been, the mischief was done. The rector viewed it favourably. He knew the man's worth. He knew that his practice was a lucrative one; that he could keep Annis just as comfortably as she had been kept; and dreams of greatness for her did not trouble him. He gave his consent heartily to the marriage. Lady Katherine did not refuse hers, but she made it into a grievance, and very much enjoyed dilating upon it. She had been given all her life to make things into grievances and dilate upon them; so much so, that the effect upon the rector's mind had worn away. To use a familiar phrase, her grumblings went in at one ear and out at the other; but she sometimes said things in her hasty spirit for which even she would be sorry afterwards. She despised Annis's want of taste almost as much as she deplored it. That dashing young officer of dragoons, and her relative, the Honourable Captain Bellassys, had come on a visit to Hilton-Coombe rectory, and before he left it he laid himself and his two thousand a year patrimony at the feet of Annis. Annis only shook her head at him: he was not Thomas Olliver. Little wonder that my lady was put out by a taste so plebeian!

"Child!" said Miss Bellassys, as she stood in the bedroom to which she had been shown, and clasped the hands of Annis in hers, "do you love him, this Thomas Olliver?"

The hot crimson rushed to Annis's cheeks, and the tears glistened on her eyelashes. But, save a smile which hovered on her lips, there came no other answer. It was not needed.

"I see," said Miss Bellassys. "And your father says he is good,—worthy,—noble. May God bless the union!"

Mr. Olliver was in the drawing-room when they returned to it. He had but then entered, and was bending over Lady Katherine, whose hand he had taken in greeting. Lady Katherine had a pleasanter look upon her face as it was raised to him. In spite of her prejudices against his position, she liked the *man*; and could she have forgotten that outer, far-away, high-sounding place, called the great world, she might have been fully content with Thomas Olliver.

Miss Bellassys scanned him keenly. She was a reader of character in the human countenance. He turned to her with a frank smile, and her heart went bounding out to him, for Annis's sake. A good, noble face; one that could not belie itself. Had Annis been her daughter, she would have given her to him fearlessly, although all the honourables in the peerage had been arrayed against it.

The dinner was announced. The rector crossed the hall with Miss Bellassys, Mr. Olliver took Lady Katherine. Annis walked alone, and Mr. Olliver whispered something to her as they sat down, which called forth a smile. They were dining

alone, but several friends were expected to drop in later in the evening. The conversation naturally fell upon the wedding and its preparations, and an allusion was made to the decorating of the church, which Miss Bellassys did not understand. She said she did not.

"Nor anybody else," cried the rector, half crossly, half lovingly, as he glanced at Annis. "Perhaps that young lady will explain it to you, Ruth."

She lifted her bright cheeks to her father. "Papa, it is not my fault. It was not my proposal that it should be done."

"Of course not," said Mr. Dudley. "It was nobody's fault, was it? The fact is, Ruth,"—turning to his guest,—“they have wormed a consent out of me to allow the church to be set off with evergreens for this grand ceremony to-morrow."

"Set off in what manner?" asked Miss Bellassys.

"Oh, you must ask them about that. They are to be strewn up the path, I believe, that my young lady's shoes, there, may not come in contact with the stones. Are you afraid of your boots, Mr. Olliver?"

"No, sir."

"The placing evergreens in the church has my full approbation," spoke Lady Katherine with emphasis, from her seat at the table's head. "As Annis is to be married, I deem it well that the attendant circumstances should be of distinctive mark: as befits her position as my daughter. The evergreens will not hurt the church, Mr. Dudley."

"My dear, I did not say they would. They can be there if you like: I conclude they will be there. I only think they will look a little foolish. Mr. Olliver I believe to be perfectly innocent in the matter; but for Annis—she no doubt considers the branches and boughs indispensable adjuncts to the binding of the ceremony."

Annis laughed, and slightly shook her head as she glanced at Mr. Dudley. In point of fact, the evergreens had been settled without her knowledge. Some young ladies of Hilton-Coombe (who would have the pleasure of walking over the evergreens themselves as bridesmaids) had suggested it to Lady Katherine, and she had caught at it.

"They are to be placed in the church this evening, Aunt Ruth," said Annis. "We are going down presently, a good many of us; and old John will be there with a truck load."

"Who is old John?" asked Miss Bellassys.

"Papa's clerk. Have you forgotten him? He will be seventy-seven next January, but is hale and hearty as ever."

"And old John is like a child with a new toy over this evergreen business," returned the rector. "He has been stripping the best shrubs in my garden this afternoon before my face. 'You'll spoil them, John,' I said to him. 'Eh, sir, what

of that?' said he. 'It is for Miss Annis's wedding.' You are in his good books," added Mr. Dudley, looking at the surgeon.

Mr. Olliver laughed. "Am I, sir? I am glad to hear it. Better be in people's good books than in their bad ones."

"Pray, are you going to assist at this rush strewing?"

"Oh, papa! *rush* strewing!" interposed Annis. But she looked at Mr. Olliver somewhat anxiously for his answer.

"I cannot," he replied to the rector. "I have to go as far as the Brook farm. Mrs. Key is very ill."

Annis glanced round at him timidly, and a shade of disappointment was perceptible in her voice as she spoke. "You will be in again this evening?"

"Of course. I have but to go to the Brook farm. By the time your party returns from the church, I daresay I shall be home again."

"How are the Keys doing now?" inquired Lady Katherine of Mr. Olliver.

"Not very great things, I fear," he replied. "I am sure it is anxiety that makes her ill. It brings on the old complaint in her side."

Barely was the cloth removed when Mr. Olliver asked if they would excuse him. He would prefer to go to Mrs. Key's at once: he might have medicine to send down after his return, he said, possibly some few other things to do at home, and the sooner he got off, the sooner he should be at liberty to come back to the rectory. Mr. Dudley rose at the same time. He wished to call on a parishioner at the other end of the village, and would walk so far with him.

They went out. Lady Katherine turned to the fire with a pettish movement. "You see what you must expect, Annis, in this marriage. A doctor cannot sit even to his meals."

"How much I like him!" warmly exclaimed Miss Bellassys. "If he cannot boast of rank, Katherine, he can boast of something better. He is a true gentleman."

"Annis! Annis!" impulsively interrupted Lady Katherine. "Do run after your papa. Ask him if he will call in at Jones's. It will save my sending, and the servants are so busy to-night."

Annis ran off as impulsively as her mother spoke. She caught them in the dark winding path, midway between the house and the gate.

"Call at Jones's?" repeated the rector, as she delivered the message. "What for?"

"To remind them to send in time, I suppose, papa," replied Annis. "I don't know what else mamma means."

"I had better ask and make sure," said he to himself. "Wait an instant for me, Mr. Olliver."

Annis did not turn to the house with her papa; she walked slowly by Mr. Olliver's side to the entrance-gate, and they stood there together. The moon was very bright, showing out the features of

the landscape all clear and distinct; the tinkling of a sheep-bell, near, was heard on the quiet air. Mr. Olliver drew Annis to his side, and stood with his arm round her.

"How beautiful the night is!" she exclaimed. "So calm and peaceful."

"May it be an earnest of the peace of our future, Annis," he earnestly said. And her heart responded, Amen.

The steps of the rector were heard leaving the house again. Mr. Olliver bent his face upon hers.

"I will say good-bye to you now, my darling."

"Not good-bye! not good-bye!" she hastily answered, some feeling, which she could not account for, then or afterwards, seeming to rise up against the words. Could it be a foreshadowing of evil? "It sounds as if you were never coming back again."

"What am I to say?" he rejoined in a laughing mood. "Borrow a phrase from our continental neighbours, and say *au revoir*?"

Annis appeared unusually serious. "Are you obliged to go to Mrs. Key's to-night, Thomas?"

"Not perhaps obliged; but I wish to do so. I shall soon be back again."

No, not obliged. But the very fact of his not having been paid by Mrs. Key, rendered the surgeon more anxious to give her every attention. Of a benevolent, generous nature, refined and considerate, he would rather have slighted all his rich patients put together than poor Mrs. Key. He had not been paid for his past attendance; he did not suppose he should be paid for the present; but in his creed that was no reason why he should refuse his services.

Mr. Dudley linked his arm within his, and they walked through the village together. About midway in it was situated the house of the surgeon; a handsome residence, the surgery being detached. "I must call in for one moment," said Mr. Olliver, as they came to it.

The rector entered with him. Mr. Olliver's business was to ascertain whether any message had come for him, demanding him professionally. Mr. Hill, his qualified assistant, who was in the surgery, replied that there had been none.

"I shall soon be back, then," he observed to the rector, as they continued their way towards the end of the village. There they parted; and Mr. Olliver branched off on the road leading to the Brook farm.

Meanwhile, Annis had re-entered the dining-room. And she found her mother's mood changed. When in the actual company of Mr. Olliver, whom she really liked, Lady Katherine was apt to forget her prejudices: it was as though the presence of the man imparted its own charm. But no sooner had he departed than the charm was broken, and up came the prejudices again.

It happened that Miss Bellassys had laid on the table a copy of the *Morning Post* newspaper for that day, and Lady Katherine took it up. The

first paragraph her eye rested on was a glowing account of a "Marriage in high life," the young lady being a connexion of the Bellassys family. It was quite enough for Lady Katherine Dudley.

She flung the newspaper on the table as Annis entered, and turned to her angrily: "You might have done as well had you chosen," she cried in a bitter tone.

Annis was surprised. "Dear mamma, what is the matter?" she asked, wonderingly.

"The matter! Read that."

She pushed the journal towards Annis, and the latter ran her eyes over the indicated part. Then she looked up brightly, a smile upon her face.

"I am very glad not to do as well as that, mamma. I should make a poor wife for a nobleman. Better as it is."

"Yes, better," added Miss Bellassys emphatically. "A man whose days are spent in the fulfilment of duties, in the benefiting his fellow-creatures, is more to be honoured than one who leads a useless life. You may wish now, Katherine, that Annis had married differently, but you will not wish it long. As we draw nearer to the other world, the great truth impresses itself more and more forcibly upon us, that it is not what we are in the scale of rank that will help us on the road to heaven; but what we do with the time, the talents, the opportunities bestowed upon us by God. The day will come, rely upon it, when you will have no other wish than that she had chosen Mr. Olliver."

"I wish he was dead!" was the intemperate rejoinder of Lady Katherine.

Annis glanced up with a shiver. Accustomed, though she was, to her mother's thoughtless remarks; knowing, as she did, that they meant nothing, and that Lady Katherine was generally the first to feel sorry for them, the words yet seemed to strike on her heart with a chill.

II.—DECORATING THE CHURCH.

Merry tongues, merry laughter resounded on the night air. A gay party, most of them gleeful girls, stood in the porch of the church. The clerk, old John, had forgotten to get the keys from the rectory, and he was now gone for them. A load of evergreens in a truck rested outside, and the bright leaves of the laurel quite shone in the moonlight.

Two of the young ladies, Georgina and Mary Balme, were more impatient than the rest. Intimate at the rectory almost as Annis herself was, loving her much, this wedding was a great event to them. They might not have entered into its preparations so blithely, had they been going to lose Annis; had she chosen to marry that young dragoon officer, for instance, and thereby have abandoned Hilton-Coombe for a distant home. But she was going to remain amongst them, to be their friend as she had been, and they aided the wedding on with all their hearts.

One of them went beyond the porch to watch for the clerk's return. It was Georgina. "Annis, don't you think old John's getting beyond his work?" she asked.

"Not at all," replied Annis. "Papa was saying only to-day how strong and well he kept."

"At any rate, one would think his memory was failing. It must be very stupid of him to forget the keys."

"He may have thought that I should bring them," returned Annis. "In fact, I ought to have done so. The forgetfulness lies with me."

"Here he is," interrupted Mary Balme. "I can hear his footsteps. Now, who will do the most work?"

Old John came up, opened the doors, and went forward to light one or two of the lamps in the church. To do this, he had to get a match from near the vestry. The outer door of the edifice opened to a somewhat large vestibule—if the word may be applied to a consecrated building. It was square, and paved with stone. On the right hand, a door in the wall led to the belfry; on the left, a similar door opened to a small room, little better in fact than a passage, which, in its turn, opened to the vestry. The folding-doors opposite the entrance led at once into the church. It was an old-fashioned, low church, with high windows, and a smell of damp.

They were not long over their work. The boughs had been prepared beforehand, only small branches, fit for strewing on the floor, having been brought into the church. "I wish we might decorate it elaborately, as we do for Christmas," earnestly exclaimed Mary Balme.

"Mr. Dudley said he would not agree to it," returned Georgina. "I asked him."

"I know. He calls this nonsense that we are doing now. Annis, what a nice lady that is in your drawing-room!"

"It is Miss Bellassys, mamma's cousin. You have heard me talk of my Aunt Ruth?"

"Is she your aunt?"

"No. But I learned to call her Aunt Ruth when I was a little girl, and I shall never leave it off now. She is so good, so kind. Her days are spent nursing a relative, who is a confirmed invalid. Indeed, Aunt Ruth is little better than an invalid herself. She suffers from some chronic complaint, which causes her to walk lame."

"Old John, shall we put some laurustinus round your desk?"

"Better not, Miss Georgina; I should only have to take it off afore the rector saw it."

Georgina Balme laughed. They rather liked to tease old John. But he was used to them.

"I wonder if we may go up into the organ-loft and play a psalm?"

"Can't," responded John. "It's locked, and I haven't brought the key."

"Just like you, old John!" said Mary Balme.

"I cannot think, for my part, why you keep the

places inside the church locked up so! Are you afraid of thieves getting in?"

"There'd not be much to steal if they did get in," was old John's reply. "It's my habit to keep the places locked, Miss; it's better that they should be kept so. When I am gone, and the rector gets a new clerk in my place, he may do as he likes—the new one may; but I am not a-going to leave them open. I suppose I can take out the barrow now?"

As the work was finished, there was no reason why he should not take it out. Throwing into it a few stray evergreens that remained over, he wheeled it outside, and left it at the churchyard gate. Then he returned to the church, and waited their departure.

But they were in no hurry to depart; and old John got tired, and sat down on a chair in the side aisle. Full of light-hearted happiness, this night visit to the church bore charms for them from its very novelty, and they forgot old John.

"We must go," said Annis at length. "Remember we have friends with us to-night."

They turned to depart. Georgina Balme was the first to go through the green baize doors. But she turned speedily back again; she had remembered old John. "Oh, there he is!" she said. "I thought perhaps he had gone to sleep."

Old John was putting out the lights, and when he came forth, they were standing in a cluster in the space I have called the vestibule, between the belfry and the vestry doors. One of the young ladies was proposing, amid some laughter, that they should hang a chain of evergreens from one door to the other. Of course, she spoke it only in joke, but it served to detain them again. Old John went forward, and stood with the outer door in his hand, ready to lock it as soon as they should come forth, which they speedily did in a body; and he turned the keys, and took them out of the lock.

"I will carry them home for you, John," said Annis, as they hastened down the path. "You need not come on purpose to the rectory."

"The master told me I was to stop for supper to-night, Miss Annis, when I took in the keys."

"Oh, that is all right, then," returned Annis, gladly. And they made the best of their way to the rectory, while old John threw the keys into the truck and followed them, wheeling it along.

Annis cast her glance round the drawing-room when they entered it: but she did not see Mr. Olliver. In point of fact, she had scarcely expected to see him; for, had he returned, he would be sure to have come to the church to meet her; but, nevertheless, the not seeing him called up a feeling of disappointment. Colonel Balme was talking to the rector; Mrs. Balme sat near Miss Bellassys; and Lady Katherine stood apart, reading a note which had just been delivered to her. The note contained an apology from a family who were to have joined them for the evening; very

old friends; the Lawrensons. One of the daughters had been poorly all day with cold and fever, and appeared to be growing so much worse, that they did not like to quit her. A line of request was added that Mr. Olliver would call in to see her at once; they evidently took it for granted that he was at the rectory.

"I wondered what caused them to be so late," exclaimed Lady Katherine, as she turned to the room, and made known the news. "Is Mr. Olliver back?"

"Not yet," said the rector. "I thought he would have been here before this. He has not been with you, I suppose?" he added, turning to the group just arrived from the church.

No, he had not been with them.

The evening went on; went on so long without any appearance of Mr. Olliver, that Annis's heart sunk within her. It would soon be too late for him to come; the time was drawing on for their guests to depart, for the rectory to close its doors on visitors; and then she should not see him again that night! No very great disappointment, you may think, considering that on the morrow they would be joined together beyond fear of separation; but it may be that you cannot understand the feelings of one, who loves as did Annis Dudley. She supposed he had heard in some way of Miss Lawrenson's illness, had gone to see her, and was detained.

At the moment that this supposition was running through her mind, the door opened, and Mr. Lawrenson appeared at it. He was a man of good property, residing a little beyond the church. He stood looking into the room, but did not attempt to enter. The rector saw him, and went forward.

"No, thank you, Mr. Dudley; I am not fit to come in. Look at my dress. I only want Olliver. Janey gets worse and worse; we cannot think what can be the matter with her. It is too bad of Olliver not to come up. Of course we know what night it is, and can make allowances for him; but he might just come and give her a look."

"He is not here," said the rector.

"Not here! Is he out anywhere, then?"

"I am much surprised that he is not here," answered Mr. Dudley. "He went to see Mrs. Key, but that is some hours ago; I thought he would have been back long and long before this. I conclude he has been called out somewhere."

"I'll go down to his house, then. Many thanks, Lady Katherine; I can't stay. Janey? Well, we begin to think now that it is an attack of inflammation on the chest. Mrs. Lawrenson was very sorry not to come, but she could not leave her. I am looking after—"

"If you please, sir, Mr. Hill is asking to see you."

The interruption came from Jacob, a many-years' servant in the rectory. He was not accustomed to stand upon ceremony, and had bustling

up to his master with the message, paying little heed to the courtesy due to his master's guests.

"Mr. Hill?" repeated the rector.

"Yes, sir. He asked for Mr. Olliver. I told him Mr. Olliver had not been here since he went out with you after dinner, and then he said he would see you. He—"

"I beg your pardon, Mr. Dudley—only one word," interposed Mr. Hill, coming forward. "Can you inform me where I shall find Mr. Olliver? I thought he was here."

"The very question; the very request I have been just making, Hill," observed Mr. Lawrenson, as he shook hands with the doctor. "I want to find Olliver on my own score."

They both looked at Mr. Dudley. "Olliver has not been back here," he said. "I parted with him just after we left the surgery," added the rector to Mr. Hill. "He went on down to the Brook Farm, and I have not seen him since."

Mr. Hill looked puzzled. "I cannot think where he can be," he presently said. "Mr. Key is waiting at the surgery for certain medicinal remedies, which Mr. Olliver was to have sent down, and did not. Mrs. Key is worse to-night."

"Perhaps Mr. Olliver is staying there?" cried the rector.

"No; you do not understand," dissented Mr. Hill. "Mr. Olliver, when he got there to-night, found her so much worse, that he remained some time. He said—so Key tells me—that he would have remained longer, but that he wished to hasten home to send down some medicines which might prove a relief. But he never did come home. And Key, finding the things did not arrive, came up for them. I thought to be sure Mr. Olliver was here."

"He would not neglect the sending out of remedies to one in need of them, even to come here," remarked Mr. Dudley.

"Very true," answered the surgeon. "It would not be like him to do it. But what could I think! Where can he be?"

"I'm sure I don't know where he can be. It is very strange. Annis"—calling out to his daughter—"did Mr. Olliver—"

The rector's words died away. Leaning her head round the drawing-room door, was Annis, with a face so scared, so white, that it startled her father. She came forward into the hall, and stood with them.

"There's nothing to be alarmed at, child," said the clergyman, placing his hand kindly on her shoulder. "Why do you look so frightened? I was about to ask you if you know of any place where Mr. Olliver is likely to have gone?"

"No," said Annis; "no. He was going to Mrs. Key's only, and he told me he should be back very shortly."

She put her handkerchief up to her face, as if she would hide its excessive pallor. A strange dread had taken possession of her; a dread as

yet vague and undefined, pointing to nothing tangible.

"He must have called in upon some other patient," remarked the rector.

"I do not think so," said Mr. Hill. "By Key's account, his wife must be dangerously sick, and the medicines which Mr. Olliver was to send were of vital importance to her. Rely upon it, he would have come straight home the first thing, and sent them, whoever else may have wanted him."

"Then what can have become of him?" cried Mr. Dudley.

"That's what I am thinking of," was the assistant-surgeon's rejoinder.

"What I am thinking of is, what are the patients to do who are wanting him?" interposed Mr. Lawrenson. A somewhat choleric man, he thought Mr. Olliver was doing a very unjustifiable thing in stopping away, wherever it might be that he was stopping. "You must come up to Janey, Hill; that's all."

"Certainly. I will attend with pleasure after I have been to Mrs. Key's," was the surgeon's reply. "I must go there first."

"But why?" asked Mr. Lawrenson, some sharpness in his tone.

"From what Key says, I gather that his wife must be in danger. I cannot tell what to prescribe, unless I see her, and I fear there's no time to be lost. There we have been in the surgery, I and Key, waiting and waiting for Mr. Olliver to come in. It is so much good time lost."

"Well, you will come up as soon as you have been there, then?" rejoined Mr. Lawrenson, feeling that he could not, with propriety, hold out for the first visit.

"Instantly. I can cut across the fields from the Brook Farm. It will not take me many minutes to get to you that way. It may be, that I shall find Mr. Olliver in the surgery now, as I go back; in which case he will no doubt attend. As I suppose you would prefer him to do."

"I don't much mind," replied Mr. Lawrenson. "Only, I hope, whichever of you it is, will be as quick as possible. I think I will walk with you as far as Olliver's."

"I will go, too," said Mr. Dudley. "The fact is, I want to see Mr. Olliver. There are one or two little matters connected with to-morrow's arrangements which remain yet unsettled. They were left until to-night."

The conversation had attracted most of them into the hall. Colonel and Mrs. Balme and Lady Katherine stood in a sort of wonder: of wonder that any fuss should be made about so simple a matter as the absence of Mr. Olliver. The not entering when expected, must be looked for in a medical man. One thing must be said for them: they had not a sick child waiting for Mr. Olliver's attendance.

"The affair is easily explainable," remarked the Colonel, in a slighting tone, as if in reproof of the

commotion. "Mr. Olliver must have met a messenger on his return from Key's, bringing him word of urgent need of his services somewhere. He will turn up presently."

This view was taken up and adopted. They appeared to forget that Mr. Hill, who might be supposed to know best, had given his decided opinion against it.

Adopted by all but Annis. The vague dread, she knew not of what, remained upon her, and the colour would not come into her face, or the light to her eye. Mr. Dudley drew her aside.

"Child! why are you looking like this?"

"Papa, I don't know," she answered, with a shiver; "I feel frightened, but I cannot tell at what. It is so strange where he can be."

"Not very strange, Annis. Remember how many times Mr. Olliver has been detained out before, when we have been expecting him. Detained for hours."

"Yes, I know, papa," she said, trying to hide the trembling of her lips. "I am sorry to be so foolish, but I cannot help it."

"You little goose!" he said, bending to kiss her. "What would you have done, pray, had your mamma's wishes been followed, and we had given Mr. Olliver his *congé*?"

A half smile flitted over her lips, and the tears glistened on her eyelashes as she lifted them. Mr. Dudley laughed at her; and followed Mr. Hill and Mr. Lawrenson, who were half-way down the garden.

Mr. Olliver's house reached, they found he had not arrived. The farmer was still sitting in the surgery. They questioned him as to the precise time that Mr. Olliver had quitted his house, but he could not tell; he had not been home until afterwards.

Nothing could be done, except that Mr. Hill should proceed at once on the visit to Mrs. Key. He took with him the medicines which he thought might prove efficacious, though he could not be sure until he saw her. Mr. Lawrenson said he would walk with him; it may be, that he deemed himself surer of securing the visit to his daughter, did he keep in the surgeon's company. The rector went also; he could not bear to carry home uncertainty to Annis.

"There goes eleven!" exclaimed Mr. Key, as the church clock struck the hour, and its echoes came borne on the air in the still night. "And I left home before nine. I wonder how the wife is!"

They rang at the gate when they reached the Brook Farm, and Nancy came out with her key to unlock it. Her mistress was not worse, she said; a little better, in fact; but impatient for the medicines. Mr. Hill and the farmer hastened in; the rector and Mr. Lawrenson, declining the invitation to enter, preferred to wait outside. Mr. Dudley detained the servant to question her.

Mr. Olliver had found her mistress worse, she

"What a blessed sight you'll be for Miss Annis!" said John, unromantically."

said ; in dreadful pain. It was the old complaint in her side, but a very bad attack, and he seemed to think there was danger. He stopped at the house the best part of an hour, she thought, and put on the hot fomentations himself. They seemed to relieve her mistress a very little, but not so much as Mr. Olliver thought they ought, and he then said he would hasten home and send down some other remedies.

"And I suppose he came off towards home?" observed Mr. Lawrenson; a doubt crossing him whether the doctor might not have had some other visit to pay farther on.

"That he did," was Nancy's answer. "I came here to lock the gate after him, sir, and I watched him away. A sharp pace he stepped out at, too. Did master say, sir, that he had not got home yet?"

"No, he has not got home," testily returned Mr. Lawrenson. "And there are patients waiting for him; half a hundred for all I know."

A pause ensued. Nancy was leaning on the gate. "Sure he can't have gone and fell into the mill stream!" she exclaimed.

"The mill stream!" repeated Mr. Dudley. "Did he go *that* way?"

"Yes, he did," said Nancy. "He crossed the road, sir, and got over the stile. I thought to myself it was a nasty way to take at night, with the waters so high as they have been, and that unsafe bridge: but I supposed he was in a hurry to get down the things for my missis."

Had any foreshadowing of evil crossed hitherto the clergyman's mind, as it had that of Annis? Perhaps not. But the dread rose up tumultuously now. He said a word to Mr. Lawrenson.

"It can't be," replied that gentleman. "It's impossible. Such a thing was never heard of."

Mr. Hill was not very long before he came out, and they crossed the road and the stile; the way taken, according to Nancy, by Mr. Olliver. Not that *they* had any intention of attempting the unsafe way. A detour to the left, before they came to the bridge, would take them to a lane which led close to Mr. Lawrenson's house. As if by common consent, however, they bore on towards the bridge. Clear and cold looked the water in the moonlight, as it coursed on towards the mill-dam. Everything around was perfectly still; and there was certainly no trace of Mr. Olliver having fallen into it. But what trace would there be, allowing that such a calamity had happened? The ground rose on the other side above this wretched bridge, and the banks were muddy.

"Psha!" cried Mr. Lawrenson, who was the first to speak as they were taking their survey. "An active, sure-stepping man, as Olliver is, would not be likely to lose his footing by night any more than by day. For the matter of that, the night's nearly as light as day," he added, glancing up at the bright moon.

Mr. Dudley extended his hand, and pointed to

the bank on the other side. "Does it not look as though somebody had slipped there?" he said. "To my eyes—but they are not so young as they were—it seems that two feet, or two knees, had been sliding downwards."

"It looks exactly like it," said Mr. Hill, bending his face forward. "Some one evidently has slipped. I should say, in attempting to step up the bank after crossing the bridge, must have slipped backwards."

"But they'd not slip into the water; they'd slip on to the bridge," observed Mr. Lawrenson. "There'd be no danger in that."

"True. And it is not obliged to have been Mr. Olliver. The only danger in crossing this bridge lies in its unprotected sides," added the doctor. "And I know none with a steadier eye and foot than Mr. Olliver. Who's this?"

Footsteps were approaching, and they turned to the sound. It proved to be the miller's servant-boy, Ben, who was returning to the mill from some errand on which he had been sent. He looked considerably surprised to see those gentlemen there, watching, as it seemed, the water.

"Is anything the matter?" he asked, touching his cap to Mr. Dudley.

"Not exactly, Ben," replied Mr. Dudley. "At least, we hope not. You have heard no commotion here to-night, I suppose, as if—as if—anybody had fallen into the water?"

But, in truth, the rector almost blushed when he had put the question. It seemed so improbable a fear when spoken openly; almost an absurd fear; not unlike a far-fetched incident in some wild romance. Ben, the boy, met it unromantically enough.

"Who *has* fell in?" asked he.

"The fact is, Ben, we were looking for Mr. Olliver," interposed Mr. Lawrenson, somewhat bluntly. He came over this bridge, as is supposed, from the Brook Farm to-night, and nobody has seen him since. But he is not likely to have fallen in."

Ben advanced to the very edge of the bank, and stood looking into the water; for what purpose, he alone knew. "Not he," cried he presently; "Dr. Olliver could cross over there with his eyes shut, he could. He goes over it often enough. Why, I saw him cross over it this afternoon with my own eyes, I did. I couldn't do it safer nor he."

There was nothing to be gained by lingering, and they turned on their road, saying good-night to Ben. Leaving the church and churchyard on the right, they gained the high road of Hilton-Coombe. There they shook hands and separated. Mr. Lawrenson and the doctor turned to the left, Mr. Dudley to the right.

A short way, and he passed the church and churchyard, the gravestones looking white and cold in the moonlight. Would that proposed ceremony take place in it on the morrow?—or *had* anything happened to him, who was to hold—it may be said

—the most prominent part in it? If so—poor Annis! poor Annis!

She—Annis—came forward to meet him in the hall as he entered, eager inquiry in her eye—not on her lip: her agitation was too great. The question on Mr. Dudley's tongue had been, "Has he come in yet?" But somehow he could not put it.

"They think he must have been called suddenly to see some other patient on his return from Mrs. Key's, Annis," said the rector, quietly. He knew not what better to say.

"Then, you have not found him?" And the words seemed to come forth with a burst—the burst of pent-up emotion.

"Not yet, child. We might find him if we knew where to look for him."

"Oh, papa!" she uttered, raising her streaming eyes to his, "perhaps he will never be found again!"

"A good thing that she can cry," thought the rector. "My dear," he said, gravely and kindly, as he laid his hand upon her head, "we are told not to anticipate evil."

"I cannot help it," she murmured; "I wish I could. I never felt as I am feeling to-night."

"It is nervousness, child; nothing else. Try and shake it off."

Their guests were gone then, and Lady Katherine and Miss Bellassys were in the drawing-room alone. They could not by any means admit the fear; they could not see cause for any fear. Lady Katherine was not of excitable mind; she was particularly unimaginative. Mr. Olliver was detained out with some patient, was all she said. Neither could Miss Bellassys view the thing in an apprehensive light. It must be remembered that they knew nothing of his having crossed the stream; in fact, Miss Bellassys, nearly a stranger to the locality, was not aware of there being any stream to cross.

"You must be tired, Ruth," said Lady Katherine. "It is past bed-time. Are the candles there, Annis?"

"Oh, mamma, we cannot go to bed yet!" exclaimed Annis, clasping her hands. "Pray sit up a little longer!"

Lady Katherine, who had a book in her hand, turning over its leaves, put it down and stared at her. "What can you possibly mean, Annis? Do you know that you are making yourself highly ridiculous?"

Annis gave no reply. She was seated at the back of the room, but they could see that her lips were twitching, and her fingers trembling on her lap.

Miss Bellassys turned to her, and spoke. "You cannot *really* be fearing that any untoward thing has happened to Mr. Olliver, Annis?"

"It is nervousness, I tell her," said Mr. Dudley. "She is feeling nervous to-night; naturally, perhaps. I suppose she cannot help it."

"But—good gracious! I never heard of such

a thing!" remonstrated Lady Katherine. "Why, if anything had happened to Mr. Olliver—in the light you seem to insinuate, Annis—there could be no wedding! What would become of all the preparations?—the servants will be up half the night yet. What would become of the breakfast?"

Very pertinent questions. The breakfast and the preparations were clearly good reasons why the bridegroom should appear. Poor Annis lifted her white face.

"But where can he be?" she could only re-iterate.

"Where?" angrily rejoined Lady Katherine, "where should he be, but with his sick? I hope now you see the disadvantages of marrying a doctor."

Mr. Dudley rose. It cannot be denied that he was growing uneasy himself: but the feeling may have been caught from Annis. He went through the hall, out at the porch, and walked towards the gate; some idea of watching for Mr. Hill on his road home from Mr. Lawrenson's, inducing the movement. It might be a relief further to discuss the probabilities and the improbabilities with the assistant-surgeon.

He was barely in time. Mr. Hill was striding past with long steps. The rector arrested him.

"Miss Lawrenson is not very ill," cried he. "It is a violent cold on the chest, nothing more. Is Mr. Olliver back yet?"

"No, he is not," replied the rector. "Do you know, I am beginning to—"

The rector stopped. Some one had come stealing up behind him. It was Annis, unable in her restlessness to be still. "Papa, why have you come out?" she asked. And then she saw Mr. Hill standing there.

"This foolish child is fearful that something may have happened," said the rector. "Lady Katherine argues that he can only be with his sick patients."

"There is no real fear, Miss Dudley," observed Mr. Hill to her in a kind tone. "It is strange where he can be, I do not deny it; but, depend upon it, it will turn out all right."

With a hasty farewell he walked on. Mr. Dudley remained at the gate a few minutes, and then turned slowly up the garden path, his arm round his daughter. Not a word was spoken between them. Annis felt sick with suspense; and Mr. Dudley probably deemed that any attempt to cheer her would but be a mockery.

Scarcely had Annis gained the drawing-room, and Mr. Dudley was yet in the middle of the hall, when there arose a sound as of hasty footsteps outside; and a gentle knocking—a knocking as if the knock did not want to make itself heard too much—came to the door. The rector turned and opened it. There stood Mr. Hill, and with him the miller's boy, Ben. The rector's eyes fell on the latter, and a rush of dread came bounding to his heart.

They were holding out a cane. A small cane

with a silver top, which belonged to Mr. Olliver: he had carried it with him when he went forth that night. Both began to speak at once, in a subdued tone; but the words reached Annis's ears in the distance, and seemed to blister them.

There could no longer be any doubt of Mr. Olliver's fate—that he was drowned in the stream. The miller's son had picked up the cane floating on it, some hours before. It had gone floating down towards the mill just about the time that he must have attempted to cross the bridge.

"What do they say?—*what?*" uttered Lady Katherine, who caught but imperfectly the sounds of the commotion. "What is that, about Mr. Olliver?"

Annis turned to her; her livid face a sight in its rigid stillness. Now that the blow had fallen, she was unnaturally calm; but it seemed the calm of a broken heart.

"He is dead, mamma," she quietly said. "You have got your wish."

And the Lady Katherine Dudley, as she gathered in the full sense of the words, shrieked out aloud and fell backward. For the first time in her life she had fainted away.

III.—OLD JOHN'S FRIGHT.

"Oh, my dear child, I did not mean it, I did not mean it! Forgive me, Annis! forgive me!"

What a night it had been! How she had got through it, Annis knew not. Not a soul in the house had been to bed. Lady Katherine had been kept in her chamber by sedatives; and now she had come forth from it to throw herself at the feet of her daughter.

Annis leaned forward and kissed her; she strove to raise her. The same unnatural calm was still in her white face, in her bearing, the same meek stillness in her quiet voice. Lady Katherine would not be raised.

"Annis, I loved him; I did indeed. It was all my folly, my temper, speaking against him. At the time I spoke it, I knew it was false, for I *did* like him."

"Yes, yes, dear mamma. *Pray* get up."

"I did not mean what I said," she shuddered. "If I did say I wished him dead, it—it—could not have brought the death upon him. I did not really wish it. I said it in my fractious spirit. Annis, love, I would give all I am worth to bring him back to life. Why, why did he attempt to cross that dangerous stream?"

Give all she was worth to bring him back to life? How many of us pour forth the same un-availing wish, for evil done, or said, or rendered, to those who are gone! And we can only prostrate ourselves in the dust, as Lady Katherine did, and wail out our repentance in vain.

All was arrested. The preparations, which had been so much thought of, were stopped midway, and the servants stood in dismay over the half-laid tables; uncertain whether to finish them, or

to remove what was already on them, or to leave them incomplete. What was to become of the wedding breakfast? the meats, the fowls, the game, the sweets? What was to become of the grand wedding-cake? Trivial doubts and dilemmas, you will say; by the side of that awful news which had come; but they concerned the servants, and were by them indulged in.

"What comfort can I speak to you, my poor child?" asked Miss Bellassys, getting Annis to herself, and sheltering her aching head upon her bosom.

"None just yet, Aunt Ruth," was the subdued answer. "I do not know that I could bear it."

"But, my dear child, this apathy, this absence of emotion is unnatural," urged Miss Bellassys, who was fearing from it she knew not what of consequences. "Better that you should give way, and weep."

"I can't," said Annis: "my eyes burn so."

Was she going out of her mind? Miss Bellassys felt her own pulses quicken at the fear. "My dear," she gravely said, "you must bear up for your father and mother's sake. You are all they have."

"Oh, yes! I shall bear up. I shall not die. I may get better, Aunt Ruth, when the years have gone on."

"The *years!*" ejaculated Miss Bellassys, aghast at the word.

"It will take me a long while," she simply answered. "You cannot tell what he was to me."

Miss Bellassys leaned her head upon her hand, and looked at Annis, her eyes, her tone full of solemn meaning. "Do you know, Annis, that I believe there arises in all our lives some one especial period, above all others, when we have most need of God?—when, but for God's sheltering hand, we might lie down under our grievous weight of sorrow, and die? Such a time is this, for you."

"Yes," answered Annis, speaking with somewhat less of apathy.

"But God *is* with us, my child. He is with you, be assured, and will bear you up through this dreadful trial. Put your whole trust in Him."

"I will, I will," she said, with energy, a revulsion of feeling coming over her. And she burst into a flood of distressing tears.

Miss Bellassys left her. She thought it might be better that the grief should have full vent. Outside the door stood Lady Katherine, listening to the sounds of distress.

"Oh, Ruth, what shall I do?" she cried, in anguish. "We cannot comfort her. We cannot bring him back to life! That wicked wish will haunt me to my dying day."

"Your consolation must be that you did not mean it," murmured Miss Bellassys, knowing not what else to say. "It was spoken impulsively; without thought: we are all too apt so to speak."

"No, I did not mean it, I did not mean it," bewailed Lady Katherine, wringing her hands. "God

knows I did not. And yet—how shall I dare ask forgiveness of Him?"

If any lingering doubt, suggesting a glimmer of hope, had remained in the mind of the rector during the night, the morning dispelled it. A hundred times during those long hours had the argument presented itself to his reason: Mr. Olliver might have dropped this cane, might have gone off afterwards to see some patient, and would be home again in the morning. But the morning broke, and brought him not. With the first glimmer of dawn Hilton-Coombe was astir, for the calamity touched its inhabitants in no measured degree. Apart from the distressing character of the accident,—and it would have been distressing happening no matter to whom,—Mr. Olliver was a favourite with all. In himself, as in his professional capacity, he enjoyed the esteem, the respect, it may be said the admiration of Hilton-Coombe. The banks of the stream were crowded. People flocked down thither, seeking traces of the accident. The marks, discerned by Mr. Dudley the previous night, imparting the idea that some one had slipped, in stepping up the bank after crossing the bridge, and had slid back again, were examined with anxious curiosity. The marks were quite deep in the mud, but sufficiently clear: in fact, the mud seemed much disturbed, as though some one had completely fallen there. The miller's son told the tale of his finding the cane over and over again; no sooner had one set of listeners heard it, than they were replaced by another. He had gone on the stream in his punt, in pursuance of something required in his business, when he saw the cane come floating down towards him. He picked it up, and when he went indoors, carried it with him. Some hours afterwards, when Ben entered, he mentioned that Mr. Olliver was supposed to be missing, and it then flashed over the mind of both that this was Mr. Olliver's cane; they recognised it, now the clue was given. "You had better run with it at once to the rectory," the young man said to Ben. All this gossip was retailed over again and again; and preparations were made for dragging the stream.

The morning went on. At ten o'clock old John came to the rectory for the church keys. Mr. Dudley went out to him, looking pale and ill. The loss of Mr. Olliver, whom he so greatly liked and esteemed, and the rending of his daughter's happiness, were indeed heavy trials to him.

"What do you want the keys for, John?" he asked.

"The church was to be opened at ten o'clock, ready for the wedding," was old John's sapient response.

"But there can be no wedding. What are you thinking of?"

Old John deliberated. "And them green things that we put in the church last night? I might as well go and clear 'em away, sir."

A strangely keen pang shot across Mr. Dudley's

heart. The evergreens which had been placed there for so different a purpose, to be swept away ignominiously now! Somehow he could not bear to order it.

"Not just yet, John; not just yet. There's plenty of time."

"Very well, sir. But he is certain to be dead, poor gentleman. If he was in life, he'd be here fast enough for his own wedding."

"I know he is dead—that there is no hope," wailed the rector. "But—don't sweep the boughs away yet. These windows overlook the church-yard, and it will bring the calamity all the more forcibly home to—to Lady Katherine."

The clerk took his departure. Presently a crowd came up the stream and sought the rector. The drags had been plied, but they had brought forth nothing. Still there could not be a doubt of Mr. Olliver's fate: his non-appearance to fulfil the contract of his marriage proved it. Would Mr. Dudley order the death-bell to be tolled for him?

Oh, no! not then. How could they, the rectory's inmates, bear the sound of the death-bell, ringing out at the very hour that, if all had gone right, those other bells, the joyous ones, would have rung out? "My daughter could not bear it," he said to them.

"True, true," they answered, struck with compunction for their want of thought. "Poor Miss Dudley! What a wedding-day! what a wedding-day!"

The day dragged itself on, and the shades of evening began to fall. The rectory that day had been like a fair, people tramping in and out of it. Hilton-Coombe made the calamity its own, and pressed its friendly sympathy, its lamentings on the rectory in person. Had testimony been needed by Mr. Dudley and Lady Katherine of the worth of their intended son-in-law, of the estimation in which he was held, that day would have supplied it. Many a case of benevolence, exercised in his professional capacity, of considerate kindness to the poor, which otherwise would never have been held up to the light, was poured forth then. "What a good man we have lost," breathed Lady Katherine, as she wiped the dew of remorse from her troubled face.

"How do you feel, my child?" whispered the rector, approaching the sofa where Annis sat so still and quiet, her head bent in the dusk of the evening.

She turned and laid it upon his arm, not speaking.

"Remember our Father's promise," he continued, bending his lips on her cold cheek. "As thy day is, so shall thy strength be."

"Yes, yes, papa," she breathed. "It is His strength which is keeping me up, not mine."

That troublesome old John again! The rector was called out to him. "Them boughs, sir? Be they not to be got out of the church to-night? It'll never do to let 'em stop in for service to-morrow. The folks would do nothing but stare at 'em."

"For service to-morrow?" mechanically repeated Mr. Dudley.

"It will be the 1st of November, sir; All Saints' Day."

In his great trouble, the rector had positively forgotten the fact. For once in his life the coming day, marked in the Church calendar, had slipped his memory. "To be sure, to be sure," he cried. "Clear the evergreens out at once, John. It is dusk now, and you may escape spectators."

Old John took the keys, and made the best of his way to the church. He had barely entered it, when a sharp knocking came sounding right in his face, inside the vestry door.

"Lawk a mercy!" ejaculated he, startled half out of his senses.

The knocking came again, sharper than before. It may be that a thought of ghosts crossed John's mind, causing him to hesitate; to doubt whether he should not run out of the church, bellowing, and alarm the neighbourhood. But ghosts don't knock, or speak either; and this one was calling out, in unmistakably stentorian tones, "Let me out! Open the door!"

The vestry door—it has, however, been explained, that though called the vestry door, it was only the door of a small place leading to the vestry—opened from the outside alone. The clerk turned the latch, and—saw Mr. Olliver.

"Heaven be good to us!" he repeated. "Then—are—you—not at the bottom of the mill-stream, sir?"

"I hope not," replied Mr. Olliver. "Am I supposed to be there, John?"

"Well, yes," said John. "The drags have been at work all day; but they haven't fished you up yet."

He sat down on a gravestone to overget his astonishment, and stared at Mr. Olliver. That gentleman did not present a very reputable appearance, inasmuch as the front of his black evening suit was a mass of mud, which had dried on.

"Have you been in there all this time, sir?"

"Yes, I have; since you quitted the church last night, after decorating it."

The story was soon told. It was a very simple one. In passing over the bridge the previous night, Mr. Olliver by some means let fall his cane. Making a spring to catch it, he fell down upon the muddy bank, hands and knees and clothes, and slid downwards in the slippery mud. The cane went floating along the stream, and Mr. Olliver was a sight to be seen in his state of mud. There was no time to look after the cane; poor Mrs. Key was in urgent need of her medicines, and he hastened on by the path leading through the churchyard. The lights and voices in the church attracted him to enter; he knew what they were doing, that merry group, and he intended to treat himself to a secret peep. But, at the same moment, the inner doors opened; Georgina Balme came forth; and Mr. Olliver, not caring to be seen

in his muddy attire, slipped inside the open door of the vestry passage. There he waited until the coast should be clear again; and there he got—shut in. Old John closed the door in passing it; and it was only by the silence that supervened that Mr. Olliver awoke at length to the unpleasant fact that he was fast, and the church empty. He tried the vestry door, but that was also fast—thanks to the clerk's habit of locking every place up; he shouted and knocked, but without much hope of being heard. In fact, there was no probability that he could be heard; the passage was an inner passage, and any noise made in it would not be likely to penetrate outside. And there he had remained, with the best patience he could call up.

"I should think you are hungry, sir," cried John, unromantically. "What a blessed sight you'll be for Miss Annis!"

She—Annis—was still sitting on the sofa as her father had left her, alone in the room. Mr. Olliver went in quietly; he had gone straight up from the church, in spite of his muddy clothes.

"Annis!"

She started up at the voice, her eyes staring fitfully. Did she think it his ghost,—as perhaps old John had thought? But there was no time to give way to fear, for Mr. Olliver caught her to him, and sheltered her on his bosom.

"I am not dead, my darling. I hear you have been fearing it." And Annis burst into delicious tears.

The news spread through the house, and everybody in it came flocking in. Mr. Olliver thought his hand would have been shaken off. Lady Katherine seized hold of him, and—gave him a hearty kiss.

"This past night and day have taught me to appreciate you, Mr. Olliver, if I never did before. I shall give her to you with all my whole heart."

He laughed with pleasure, and grasped Lady Katherine's hand in his. "Does anybody know how Mrs. Key is?" he inquired.

"Better. She—"

A joyous peal of ringing bells burst out from the church, hard by. The clerk, on his own responsibility, had set some ringers to work. But he had not remained with them, for there was his happy old face peeping into the room, and singling out the rector.

"About them evergreens, sir? Be they to be cleared out now, or to be left for to-morrow morning?"

Mr. Dudley turned his eyes on Mr. Olliver, on his daughter's blushing face, and read the signs.

"You may as well let them be, John," said he. "I suppose a marriage celebrated on All Saints Day will stand good?"

"I expect it will," replied John. And he went to help the ringers.

"How merciful has God been to me this night!" was the concluding thought of Lady Katherine Dudley.

A VISIT TO THE TAIPIINGS.

IN the early part of June 1861, I found myself unavoidably detained for some weeks at Shanghai, and was glad to avail myself of the kind invitation of Captain Dew, of H. M. S. "Encounter," to accompany him on a trip, one object of which was to visit a city recently captured by the rebels, with the view of communicating with their chief, another to explore the country in the neighbourhood of Ningpo, and ascertain the rebel position in that district. For some time past rumours had been current in Shanghai of the proximity of these "troublesome insects," as the rebels are styled in mandarin phraseology, and now the capture of the town of Chapoo seemed to warrant the conclusion that an advance on Ningpo was in prospect, as the wealth of that city, and the immunity from rebel attacks which it had enjoyed hitherto, rendered it a tempting prize. Here had numbers of the inhabitants of the surrounding country found a refuge, whatever was saved from the sack of Hangchow, the capital of the province, now in possession of the rebels, and one of the richest cities in the empire, had been placed in Ningpo for security, and the gradual approach of the rebels from different quarters, but all converging upon this rich centre, filled the inhabitants with alarm. It was not, however, to protect the accumulated wealth of the province, or to inspire confidence merely into the minds of its possessors, that an English man-of-war was sent there; the European community, though not large, would be exposed to the utmost danger in the event of the occupation of the city, and it was considered advisable to inform the rebels that the capture by them of a port open to foreign trade, would be regarded by us as an act of hostility towards foreigners.

The most accessible rebel chief, under the circumstances, was the gentleman who had first captured, and now commanded at Chapoo, and that once important mercantile emporium was our destination in the first instance. Situated on the Bay of Hangchow, and connected with that city, of which it was the port, by the Grand Canal, it derived its importance partly from that circumstance, and partly from the fact of the Grand Canal debouching at this point into the sea, so that it was the southern terminus of that vast traffic which in former times traversed the great internal artery of the empire, and fed Pekin itself. For many years past the navigation of the Grand Canal has been completely destroyed, and the only commercial privilege which still invested Chapoo with some importance, was its limited trade with Japan. This was the only point upon the Chinese coast with which the exclusive islanders permitted traffic, and that only in the most restricted sense. Seven junks annually sailed from Chapoo to Nagasaki, where they were put under the strictest surveil-

lance, their crews jealously watched, and not, unless under very exceptional circumstances, allowed to land. As soon as the cargoes, consisting usually of sugar, had been landed, the junks reloaded with edible seaweed, and other Japanese produce, and returned to Chapoo, not to revisit the Empire of the Sun until the following year. This traffic has now come to an end; but even under any circumstances the opening of Shanghai and Ningpo to foreign trade must have been a death-blow to the commercial prosperity of Chapoo.

Rounding a projecting promontory in the grey dawn of morning, the first indication we received of our proximity to Chapoo was rather significant than encouraging. Here and there a swollen and disfigured Chinaman floated face downwards on the yellow waters of the Yang-tse, and reminded me of those horrible sights so familiar to dwellers on the banks of the Hoogly; but these were the evidences of rebel cruelty, not of a religious observance, and the rotting carcases which once or twice grazed our bows were those of an innocent peasantry who had fallen victims to Taiping ferocity. The city of Chapoo is situated upon a plain, but immediately to its right rise two hills, three or four hundred feet high, one of which is crowned with a small fort, its walls now gay with the flaunting banners of the rebel host. We dropped anchor immediately opposite this fort, which was within range of our guns, but the shallowness of the water did not permit of too near an approach to the shore. Instantly a great commotion was visible among the rebels; the unusual apparition of an English frigate and gun-boat filled them with consternation. A crowd assembled at the principal gateway, heads appeared peeping over the walls, messengers passed to and fro between the fort and the town; their doubt as to the object of our visit being only equalled by our uncertainty as to the nature of our reception. Former experience had warned us that a flag of truce was not to be relied on in our intercourse with these gentry. The last time I had had the honour of communicating with them under the shadow of a white table-cloth, we were received by a salvo of artillery, which killed and wounded three of our number, and involved a brisk action of an hour and a half; and not a fortnight before, Captain Dew had been fired at when proceeding, under a flag of truce, in his gig, to deliver a letter stuck in the fork of a bamboo, and had been obliged to retreat under a heavy fire, with his mission unaccomplished. In fact, opening communication with a rebel chief was an operation by no means unattended with danger. So the decks were cleared, the guns run out, and in a few moments we were prepared to meet the rebels on their own terms.

Captain Dew and Mr. Alabaster, the interpreter, with a white flag prominently displayed, got into the boat and pulled ashore, while we anxiously watched his proceedings through our telescopes; and Mr. Cornwall, the first lieutenant, since unfortunately killed at the capture of Ningpo, kept the guns accurately trained upon a crowd of rebels so as to be able to resent, with a broadside, any treachery to the captain.

Meantime the Taipings seemed to watch our proceedings with no less interest and curiosity; and as Captain Dew, attended only by Mr. Alabaster, and the coxswain, bearing the flag of truce, began to scale the hill, a number of warriors, carrying gingalls, matchlocks, and flags in bright-coloured garments, came vapouring out after the usual manner of warlike Chinamen, and apparently in no very amicable mood. Steadily the three Englishmen clambered up the hill, while the rebels seemed uncertain whether to fire at them or not. Anxiously we strained our eyes through our telescopes. Every man was at his place at the guns. We could see the rebel nearest Captain Dew blowing the fusee of his matchlock, and the coxswain deprecatingly waving his flag, and more rebels with warlike attitudes closing round; but still they did not fire. Then we saw Captain Dew extend his hand to the man with the matchlock and the fusee. Was he begging for mercy? No! he had seized the lighted fusee; he was lighting his cigar with it. The rebels were probably as much astonished as ourselves by the coolness of this proceeding; at all events, it produced the desired effect of restoring confidence; and in a few minutes more Captain Dew had disappeared within the gateway, and we saw him no more. Shortly after, the boat came back with a message inviting a small party of us on shore.

Three years had elapsed since I had explored the suburb of Chapoo, then composed of crowded, busy lanes, now a mass of blackened ruins, deserted save by a mangy cur or two. Then I had stood on the summit of the hill from which the rebel flags were now waving, and looked over a boundless plain of yellow crops, soon to be gathered in by an industrious and peaceful population; now, far as eye could reach on every side, the crops had again ripened, but the country was deserted. Not a wreath of blue smoke curled heavenward through all the broad landscape. The food of thousands was rotting where it grew, and thousands who had abandoned their homesteads were dying for want of it. Death at the hands of the rebels, or death by starvation, had been the only alternatives of this wretched peasantry, and they chose the latter. There is probably, at the best of times, more poverty and abject misery in China than in any other country on the face of the globe; and it was heart-rending to think that the teeming produce of thousands of acres of this rich alluvial land would relieve none of it. How little could those who had hopefully planted in the early

spring have foreseen such a catastrophe! How many years will suffice to repair the injuries of days! Stumbling over the blackened embers of burnt houses, picking our way through brickbats and miscellaneous rubbish as best we might, with here and there a human bone or a tattered garment protruding, to tell of deeds of violence, we passed through the demolished suburb, without meeting a soul or seeing a single house in a state of preservation. On approaching the city walls, the scene was very different. They were swarming with workmen. Those of the peasantry who had not escaped or been killed were impressed by the rebels into their service, and were now working hard at the fortifications. Men, women, and children were crawling up and down the steep inclines with baskets full of earth, excavating, pulling down, or building up. The rebels themselves, with long matted hair (for a pigtail is an abomination to a rebel), countenances brutalized by long familiarity with scenes of blood, and garments of the brightest colours, made free use of sticks as they urged the wretched labourers to the work. They regarded us with ill-favoured glances, and, though not venturing to offer opposition, allowed us to scramble to the top of the walls as best we might, by means of slippery ladders and steps cut in the muddy bank of the surrounding moat, which we traversed on a single plank. More working parties were engaged on the top of the walls, and the conquerors were evidently determined that no future army should take the city as easily as they had done themselves.

At last we found a man to pilot us along the ruined and deserted streets to the Yamun or public building in which the chief held his court; a small, half-ruined collection of rooms and courts, all crowded with filthy Taipings, who did not abstain from pressing after us into the chamber in which the great man received us. Dressed in a long robe of yellow, with a handkerchief round his head, and a valuable pearl in it, he differed in no respect from the ordinary type of low caste Chinaman. His manners were rude and unpolished, and his evident desire was to impress upon our minds his own importance, and the perfect indifference with which he regarded the foreigner. He offered us tea and chairs, but had no more idea of good breeding, according to the Chinese standard, than if he had been a New York rowdy. A fortnight had scarcely elapsed since he had taken the city, and he was still elated by his recent success. In reply to my inquiry of the number of persons slaughtered, he said that he had no accurate idea, but that his men had been employed for two whole days, from sunrise to sunset, in putting the population of the city to death. "But," I said, "I suppose you spared the women?" "Oh, no," he answered, "we killed them all." "And how many did you lose?" "Four or five of my men were killed."

The atmosphere, moral and physical, was too

pestilential to remain in this ruffian's company longer than necessary, and while Captain Dew was concluding the interview, I amused myself buying jade ornaments, and other articles which the rebels had looted. Some of these men produced bags with plundered jewellery and women's ornaments, but I saw nothing of great value, though the prices asked proved that money was abundant among them, and that they had sacked the unfortunate city of Chapoo to no small advantage. The sickening stench, the prevalence of cutaneous diseases, and the impudent familiarity with which they crowded round one, induced me to curtail my researches into their stolen property. Indeed, every now and then, the idea of one's utterly helpless condition, two miles away from the ship, in the midst of a horde of savages, who lived on murder and rapine, and regarded all foreigners as their natural enemies, obtruded itself rather disagreeably. On our way back to the ship by another route, we passed the place of public punishment. There was standing a crucifix, upon which a man had been recently crucified, and two wretched victims were undergoing the punishment of the Kung, which consisted in their sitting with their heads passed through the centre of a large board. Except the rebel host, numbered by their leader at 5000 men, and the country people pressed into service on the fortifications, the city was totally deserted. A month before it had contained a population estimated at nearly 100,000. It is part of the rebel policy to commit the most awful atrocities wherever they go, as by this means they inspire so much terror beforehand, that at the very first rumour of their approach, the whole country is abandoned by the terrified peasantry; and the imperial troops, infected by the universal panic, too often lose heart, desert their posts, and the cities fall an easy prey into the hands of the rebels.

During the first years of the rebellion in China, delusions prevailed in this country with reference to the religious tenets of the Taipings, which have fortunately been long since dispelled. We received vague rumours of a sect of Christian propagandists, whose chief object was to overturn the existing system of philosophy and superstition, and substitute in its stead a pure and ennobling creed. The natural effect of this impression was to create in our minds a strong feeling of sympathy in their favour; and witnessing as they did constant instances of cruelty and misrule on the part of the Government, a large section of the British community in China watched with interest the progress of the rebellion throughout the provinces. A closer acquaintance with the Taipings proved how utterly erroneous had been the impressions conceived of their mission. Their leader, a man of low origin, who had picked up the outlines of the Christian scheme, grafted them upon a miserable and blasphemous fabrication of his own, and arrogating to himself a divine origin and supernatural

powers, succeeded to some extent at first in imposing upon the credulity of his followers. I doubt, however, whether a single Taiping believes anything now. In various conversations which I have had with individuals on the subject, I have not found one who could give any definite idea of his creed, beyond the fact that they offered some prayer before eating. The religious publications of the Taipings are absurd incomprehensible effusions, embodying no grand sentiments, transparently the productions of ignorant and uneducated men who have mixed up texts of the Bible with their own puerile composition. There is an absence of that fanaticism among them which has always distinguished religious propagandists. However erroneous their creeds, some persons are always to be found who are sincere and enthusiastic. So far from there being a proselytizing spirit among the Taipings, they demand from those they spare nothing but work. No Chinaman who has been a captive knows more of their religion when he leaves them, than he did at first. Religious instruction is unknown among them; nor, so far as I could learn, do they ever meet for worship. I am willing to believe that in the earlier stages of the rebellion some honesty of political purpose may have animated some of the chiefs; and such at that period was the weakness and corruption of the existing Government, that had the movement been conducted by wise and patriotic men, it would have achieved without difficulty the overthrow of the dynasty. If there were any nobler aspirations connected with it than those of plunder, they were soon extinguished, the country-people who would at that time gladly have accorded their sympathies to the founders of a new dynasty, found themselves the victims of the most frightful persecution. The scum of a population of four hundred millions rallied round standards which waved them on to murder and rapine. The Taipings soon became as destitute of political as of religious principle. The chiefs quarrelled among themselves. The original objects of the movement, if it ever had any, were forgotten amid internal dissensions, but still, like vultures flocking to a carcase, crowds of ruffians poured in to join them, and the would-be founders of the Taiping dynasty degenerated into robber-chiefs, whose only difficulty now was to find subsistence for their hosts. Like locust-swarms they move over the face of the country; the new creed and the new dynasty, which at first gave a semblance of dignity to the movement, are things of the past. If ever there were men of respectability or intelligence to be found among them, they have been all extinguished. The chiefs are coolies, their followers outcasts, who were enemies to society from the first. Moving in vast numbers, they crush all opposition by the impetuosity of the rush with which they sweep over a fresh country with fire and sword, carrying desolation before them. The captive women they divide among themselves;

the men are put into the front rank, and sacrificed whenever fighting becomes necessary. I have looked over a country where heavy clouds of smoke, ascending from burning homesteads, hung over it like a pall, and I have seen a whole population, men, women, and children, abandoning all they held dear, and flying, panic-stricken, from the destruction that was overtaking them. When they have entirely exhausted the resources of one tract of country, they move on to another. The great terror they inspire, the large masses in which they move, and a certain reckless daring engendered by their lawless life, almost always insure success: large towns are deserted before they are attacked, flight, not defence, is the instinct alike of people and of troops; the mandarins and chief authorities lead the way, and there is a general *sauve qui peut*. At the end of a year or so, the country is exhausted, the rebels move elsewhere, and the Government, with a great flourish of trumpets at having ejected them, resumes possession of the desolated waste.

We may always be sure that wherever there are rebels there are a certain number of Imperial troops swaggering in the neighbourhood, who have not the slightest intention, however, of risking their skins. Thus, on our return to the ship, a fleet of sixteen Imperial war-junks, which had been lying for some time past in a secure nook on the coast, sailed bravely up, and informed us that they would be delighted to co-operate in the capture of the town, if we would lead off. This proposal Captain Dew of course declined, and the Imperial fleet returned to their anchorage, to draw their pay and write magniloquent descriptions of imaginary combats with the rebels, not unlike those we have been in the habit of receiving occasionally from another quarter.

At mid-day on the following day, we were anchored beneath the walls of Ningpo, and, as on the occasion of my former sojourn in that city I had neglected to visit an interesting monastery in the neighbourhood, we hired a couple of native boats, stocked them with the necessary provender, and started one night, after dinner, on our trip. These boats or sampans as they are called, are covered in, and we can manage to make very comfortable beds by spreading mattresses on the floor. Our rest, however, is not destined to be undisturbed; first we have to get from the river, through a Chinese lock, into the canal. The process consists of winding the boat, by means of a windlass, up an inclined plane to the required height,—a less exciting proceeding than going down on the return voyage, when we plump into the river with a rush. Having safely accomplished this feat, our nerves receive sundry shocks as we bump against other boats in the dark, or run against the buttresses of narrow bridges. However, with the dawn of day, our troubles come to an end, only, however, to be renewed in another form; for now comes the difficulty of finding moun-

tain chairs and bearers. These are most primitive contrivances, and consist of two wooden boards, like the seats of a swing, suspended between two bamboos, and carried by two men. The little village at which we stop is considerably agitated by our pertinacity in insisting upon these being forthcoming; but after all we do not avail ourselves very readily of this mode of conveyance, for the air is fresh, the scenery charming, and we walk briskly along the paved causeway between fields of rice and groves of bamboos, now and then obtaining, from the tops of the hills, lovely views over the country stretching below. At the end of a six-mile walk we reached Tien-tung, where we found a picturesque rambling building, with some pretensions to architecture, nestling among hills, embowered amid shady groves of lofty trees, filled with greasy monks, who set a room apart for our accommodation, instructed us in the mysteries of Bhuddist monastic life, and showed no indisposition to receive remuneration for their services. Except in the solemn grandeur of its woods, and the beauty of its situation, Tien-tung offered no feature of interest to the visitor familiar with similar institutions, which are to be seen to greater perfection in the sacred island of Pootoo, and I anticipated more excitement from an expedition projected to the town of Yu-yao, said to be in possession of the rebels, and distant by river about thirty miles from Ningpo.

Our return voyage, which occupied a night, was unmarked by any incident; and on the following day we proceeded to make the arrangements necessary to carry out the expedition. As the navigation of the river was intricate and little known, the "Encounter" was followed by the "Kestrel;" and we soon excited the curiosity of the people on the shores, who had not seen a devil ship pass their retired hamlets for twenty years. The French Admiral, since killed in operations against the rebels near Shanghai, accompanied us in one of his own gun-boats, and we followed the windings of the little known river until the hills closed in upon it, and charming valleys opened up on either side, their slopes clothed with the graceful feathering bamboo. Here the depth of water did not suffice for the further progress of the "Encounter," and we proceeded the remaining distance in a gun-boat.

Yu-yao is distant from Ningpo about thirty-five miles, and was the furthest point reached by our troops in 1841; since that time it has been rarely visited by foreigners, and the arrival of two gun-boats produced some commotion among the inhabitants. We were glad to learn that the reports of rebel proximity were false, and the chief authority, although he admitted his inability to defend the place, did not seem to anticipate an attack. Yu-yao is a small, somewhat dilapidated-looking town, and owes its importance chiefly to its position as a good base from which to operate against Ningpo. It was

useless to warn the Chinese authorities to prepare for rebel attacks; nothing could rouse them from their apathy short of the appearance of the Taipings, when they invariably deserted their posts, without attempting to defend them. In vain did we impress upon the Prefect of Ningpo, on our return to that city, the importance of having ammunition as well as guns. In vain did we point out to him that guns which were not mounted, or had their vents plugged up, or their trunnions broken off, were useless. It was a thankless task to show him portions of the wall which wanted repair, to recommend him to drill his troops, and have the walls permanently manned. He shrugged his shoulders and sipped tea, and the result was, that in a very short time after our visit, Yu-yao and Ningpo were both in the hands of the rebels, who perpetrated the greatest cruelties on the inhabitants, enriched themselves by wholesale plundering, until at last their conduct towards foreigners compelled Captain Dew to take the city by storm, and drive them out of it.

Of all the dashing achievements which have

signalized our naval operations in China, nothing has happened more brilliant than this exploit. With the assistance of only two gun-boats, besides his own ship's crew, Captain Dew did not hesitate to storm the city walls, though defended by thousands of rebels, and succeeded, after a short but bloody struggle against odds almost overwhelming, in putting them to flight, and handing the place over once more to the Chinese authorities. The task of protecting their cities for them, and covering the incapacity of their own officials, will, however, no longer fall upon our Government. The Chinese Government has lately determined to maintain, at their own expense, an efficient fleet, to be officered by foreigners. It is very flattering to Captain Sherard Osborn, whose experience in the exploration of Chinese rivers is so well known, that the Government of Peking should have selected him for the command of this force; and there can be no doubt that, with the means thus placed at his disposal, he will very soon rid the country of a scourge, the terrible nature of which can only be realized by those who have witnessed its disastrous effects.

LAURENCE OLIPHANT.

EXTRACT FROM THE PRIVATE MEMOIRS OF A PERSON IN A PUBLIC SITUATION.

On looking back at what I have written, and observing how large a proportion of those I have had occasion to mention, I have been obliged to speak of with reprobation or contempt, it occurs to me to ask myself, how is this? Is it that the world is really so much worse than most people think? Or that I look at it with a jaundiced eye?

On reflection, I am satisfied that it is merely this, that I have been much concerned in important *public* transactions; and that it is in these that a man can render himself so much more, and more easily, conspicuous by knavery or folly, or misconduct of some kind, than by good conduct. "The wheel that's weak is apt to creak." As long as matters go on smoothly and rightly, they attract little or no notice, and furnish, as is proverbial, so little matter for history, that fifty years of peace and prosperity will not occupy so many pages as five of wars and troubles. As soon as anything goes wrong, our attention is called to it; and there is hardly any one so contemptible in ability, or even in situation, that has it not in his power to cause something to go wrong. Ordinary men, if they do their duty well, attract no notice except among their personal intimates. It is only here and there a man possessing very extraordinary powers—and that, too, combined with peculiar opportunities—that can gain any *distinction* among men by doing *good*. "Inventas aut qui vitam excoluere per artes, quique sui memores alios fecere merendo." But on the other hand, almost everybody has both capacity and opportunities for doing *mischief*. "Dead *flies* cause the

precious ointment to stink." A ploughman who lives a life of peaceful and honest industry is never heard of beyond his own hamlet; but arson or murder may cause him to be talked about over great part of the kingdom. And there is many a quiet and highly useful clergyman labouring modestly in his own parish, whom one would never have occasion to mention in any record of public affairs; but two or three mischievous fanatics or demagogues, without having superior ability, or even labouring harder, may fill many a page of history.

It is not, therefore, to be inferred from what I have written, either that knaves and fools are much more abundant than men of worth and sense; nor yet again, that I think worse of mankind than others do; but that I have been engaged in a multitude of *public* transactions, in which none but men of very superior powers, and not always they, could *distinguish* themselves for *good*; while, for mischief, almost every one has capacity and opportunities. As for those who take what is considered as a more good-humoured view of the world, and seldom find fault with any one, as far as my observation goes, I should say that most of them *think far worse* of mankind than I do. At first sight this is a paradox; but if any one examines closely, he will find that it is so. He will find that the majority of those who are pretty well satisfied with men as they find them, do in reality disbelieve the existence of such a thing as an honest man; I mean, of what really deserves to be called so. They censure none but

the most atrocious monsters ; not from believing that the generality of men are upright, exempt from selfishness, baseness, and mendacity, but from believing that *all*, without exception, are as base as themselves ; unless, perhaps, it be a few half-crazy enthusiasts. And they are in a sort of good humour with most part of the world, not from finding men good, but from having made up their minds to expect them to be bad. "*Bad*," indeed, *they* do not call them, because they feel no disgust at any but most extraordinary wickedness ; but they have made up their minds that all men are what *I* should call utterly worthless ; and having divided (as Miss Edgeworth expresses it) "all mankind into knaves and fools, when they meet with an honest man, they don't know what to make of him." Now he who from his own consciousness is certain that there is at least *one* honest man in the world, will feel all but certain that there must be more. He will speak, indeed, in stronger terms of censure than the other, of those who act in a way that he would be ashamed of and shocked at in himself, and which, to the others, seems quite natural and allowable ; but on the other hand, if any one does act uprightly, he will give him credit for it, and not attribute his conduct (as the other will be sure to do), either to hypocrisy or to unaccountable whim—to a secret motive, or to none at all.

So that, as I said, he who at the first glance appears to think the more favourably of mankind,

thinks in reality the *less* favourably, since he abstains from complaining of or blaming them, not from thinking them good, but from having no strong disapprobation of what is bad, and no hope of anything better.

Most important is it, especially for young people, to be fully aware of this distinction. Else they naturally divide men into those who are disposed to think well of men in general, and those disposed to think ill ; and besides other sources of confusion, will usually form a judgment the very reverse of the right, from not thinking at all of the *different senses* in which men are said to *think well*, or to *think ill* of others. Take, as specimens, such men as A and B. Of these, A might in a certain sense be said to think better of mankind than B did, because many who would excite strong moral disapprobation in B, would excite none, or next to none, in A. But then B considered that there *were* many men capable of a much more high-principled conduct than A had ever conceived as possible, or could ever be brought to believe in.

In short, one must make the distinction which sounds very subtle, but is in truth great and important, between one who believes many men to be what *he* thinks bad, and one who believes them to be what is *in reality* bad ; between one who approves, or does not greatly disapprove, the generality, according to his own standard, and one who thinks them such as we *should* approve.

A PLEA FOR THE QUEEN'S ENGLISH.

BY THE DEAN OF CANTERBURY.

I AM going to say a few words on behalf of the QUEEN'S ENGLISH. I may be mistaken, but I do not feel as if it had always loyal treatment in our day ; and I cannot help thinking, that many of those who maltreat it need but to have a few simple things pointed out to them, which are apt to escape notice, in order to their mending their ways.

But I must begin by explaining what I mean by the term. It is one rather familiar and conventional, than strictly accurate. The Queen (God bless her !) is, of course, no more the proprietor of the English language than you or I. Nor does she, nor do the Lords and Commons in Parliament assembled, possess one particle of right to make or unmake a word in the language. But we use the phrase, the Queen's English, in another sense ; one not without example in some similar phrases. We speak of the *Queen's highway*, not meaning that Her Majesty is *possessed* of that portion of road, but that it is a high road of the land, as distinguished from by-roads and private roads, open to all of common right, and the general property of our country. And so it is with the *Queen's English*. It is this land's great highway

of thought and speech ; and as the Sovereign in this realm is the person round whom all our common interests gather, the source of our civil duties and centre of our civil rights, so the *Queen's English* is not an unmeaning phrase, but one which may serve to teach us some profitable lessons with regard to our language, and its use and abuse.

I called our common English tongue the highway of thought and speech ; and it may not be amiss to carry on this similitude further. The Queen's highway, now so broad and smooth, was once a mere track over an unenclosed country. It was levelled, hardened, widened, by very slow degrees. Of all this trouble, the passer-by sees no trace now. He bowls along it with ease in a vehicle, which a few centuries ago would have been broken to pieces in a deep rut, or come to grief in a bottomless swamp. I warrant there were no Croydon baskets in the day when Henry II. and his train came to do penance from Southampton up that narrow, hollow, rough pilgrim's road leading over Harbledown Hill to Canterbury.

Now just so is it with our English language—our Queen's English. There was a day when it was as rough as the primitive inhabitants. Cen-

tures have laboured at levelling, hardening, widening it. For language wants all these processes as well as roads do. In order to become a good highway for thought and speech, it must not have great prominent awkward points, over which the mind and the tongue may stumble; its words must not be too weak to carry the weight of our thoughts, nor its fences too narrow to admit their extension. And it is by processes of this kind in the course of centuries, that our English tongue has been ever adapted more and more to our continually increasing wants. It has never been found too rough, too unsubstantial, too limited, for the requirements of English thought. It has become for us, in our days, a level, firm, broad highway, over which all thought and all speech can travel smoothly and safely. Along it the lawyer and the parliamentary agent may drive their heavy waggons, clogged with a thousand pieces of cumbrous, antiquated machinery, and no wonder, when they charge freightage, not by the weight of the load, but by the number of revolutions of the wheels. Along it the poet and novelist may drive their airy tandems, dependent for their success on the dust which they raise, and through which their varnished equipages glitter. On the same road divines, licensed and unlicensed, ply once a week or more, with omnibus or carrier's cart, promising to carry their passengers far further than the road itself extends, just as the coaches out of London used to astonish our boyish eyes by the Havre de Grace and Paris inscribed on them. And along this same Queen's highway ploughs ever the most busy crowd of foot-passengers—the talkers of the market, of society, of the family. Words, words, words, good and bad, loud and soft, long and short; millions in the hour, innumerable in the day, unimaginable in the year: what then in the life; what in the history of a nation; what in that of the world? And not one of these is ever forgotten. There is a book where they are all set down. What a history, it has been well said, is this earth's atmosphere, seeing that all words spoken, from Adam's first till now, are still vibrating on its sensitive and unresting medium.

But it is not so much of the great highway itself of Queen's English that I would now speak, as of some of the laws of the road; the by-rules, to compare small things with great, which hang up framed at the various stations that all may read them.

And in doing this I must own I feel some little difficulty. The things of which I have to speak are for the most part insulated and unconnected; so that I fear there will not be even the appearance of connexion between the various parts of my essay. And again, it must be confessed that they are not of a very interesting kind. I shall have to speak of such dull things as parts of speech, and numbers, and genders; the obscurity, or the conventional and licensed violation, of rules of

grammar, and the pronunciation and spelling of words. And I really don't wish to be dull; so please, dear reader, to try and not think me so.

And again, please not to think the things of which I am going to speak to be of a trifling character. The language of a people is no trifle. The national mind is reflected in the national speech. If the way in which men express their thoughts is slipshod and mean, it will be very difficult for their thoughts themselves to escape being the same. If it is high-flown and bombastic, a character for national simplicity and truthfulness, we may be sure, cannot be long maintained. That nation must be (and it has ever been so in history) not far from rapid decline, and from being degraded from its former glory. Every important feature in a people's language is reflected in its character and history. Look, to take one familiar example, at the process of deterioration which our Queen's English has undergone at the hands of the Americans. Look at those phrases which so amuse us in their speech and books; at their reckless exaggeration, and contempt for congruity; and then compare the character and history of the nation—its blunted sense of moral obligation and duty to man; its open disregard of conventional right where aggrandizement is to be obtained, and, I may now say, its reckless and fruitless maintenance of the most cruel and unprincipled war in the history of the world. Such examples as this (and they are as many as the number of the nations and their tongues), may serve to show that language is no trifle. Then, again, carefulness about minute accuracies of inflexion and grammar may appear to some very contemptible. But it would be just as easy to give examples in refutation of this idea. Two strike me, of widely different kinds. Some years ago a set of poems was published at Bristol, purporting to have been written in very early times by a poet named Rowley. Literary controversies ran high about them; many persons believed in their genuineness; some do even now. But the imposture, which was not easy to detect at the time, has been now completely unmasked by the aid of a little word of three letters. The writer uses "*is*" as the possessive case of the pronoun "*it*" of the neuter gender. Now, this possessive "*is*" was never used in the early periods of our language; nor, indeed, as late down as Elizabeth. It never occurs in the English version of the Bible; "*his*" or "*her*" being always used instead. "They came unto the iron gate that leadeth unto the city; which opened to them of *his* own accord" (Acts xii. 10). "Of beaten work made he the candlestick; his shaft, and his branch, his bowls, his knops, and his flowers, were of the same" (Ex. xxxvii. 17). "The tree of life which yielded her fruit every month" (Rev. xxii. 2). It is said also only to occur three times in Shakspeare, and once in "Paradise Lost." The reason, I suppose, being, that possession, indicated by the possessive case "*is*," seemed to imply a certain life or personality,

which things neuter could hardly be thought of as having.

The other example is one familiar to you, of a more solemn character. When St. Peter was stoutly denying all knowledge of his suffering Master, they that stood by said to him, "Surely thou art one of them; for thou art a Galilean, and thy speech agreeth thereto." So that the fact of a provincial pronunciation was made use of to bring about the repentance of an erring apostle.

I have just spoken of a reluctance to attribute personality to things without life. I will introduce the body of my essay by noticing the further reluctance which we in modern Europe have to giving any prominence to the personality of single individuals in social intercourse. In all our modern languages, some way is devised of getting rid of the "thou" in addressing persons in ordinary society. We in England have, indeed, done even more in this way than our neighbours. In France and in Germany, those intimate and dear are addressed with "thou" and "thee;" but in England, we have banished these singular pronouns altogether from social life, and reserve them entirely for our addresses in prayer to Him who is the highest Personality. I mention this, not in order to bring forward so well known a fact, but as leading to one of the remarks which I have to make. As we shrink from this individual personality in intercourse, so do we on some occasions in the grammar of sentences. And the examples of this will just serve to show how the tendencies of a nation's mind will sometimes overbear, and rightly so, the strict rules of grammar. In common talk, the pronouns "I," "he," "she," are freely used. But when the form of the context throws these pronouns into unusual prominence, we shrink, I suppose, from making so much of ourselves or one another as the use of them in the nominative case would imply. Was there ever one of us who, when asked, "Who's there?" did not first, and most naturally, reply, "It's me." And though reproved, and it may be even corrected as a child, for the mistake, which of us is there that does not continually fall into it, if it be one, again and again? Now look at the sentence as it should stand grammatically. "He said unto them, It is I; be not afraid." Who does not feel that here there is a majesty and prominence given by the nominative pronoun, which makes the assurance what it was to the disciples; what God grant it may be to us in our hour of need? But from this very prominence it is that we shrink in ordinary social talk. We shelter ourselves in the accusative case "me," which, though ungrammatical, yet is acquiesced in, as better suiting the feeling of the mind. We all remember, and have recently had recalled to us in the *Times*, the story of George III. reading Paley's fable about a pigeon, and exclaiming "Why, that's me!" The king was just as right in his expression of the interpretation,

as he was in the interpretation itself. He could not have said, "Why, that's I."

And this is so not only in the case where we are speaking of ourselves. Few persons can manage such a sentence as "I found that it was she," or "Do you think it is he?" although, in strict propriety, both these ought to be said. Most persons, who are not pedants, will find themselves saying, in defiance of grammar, like the monks in the Ingoldsby legend, "I found that it was her." But now let us pass to an ungrammatical way of speaking of somewhat the same kind, which is *not justified*, and ought never to be used. Some people are fond of saying "whom," where "who" is required. "The man whom I thought was the person" is clearly wrong, because, in this sentence, the relative ought to be the nominative case to the verb "was;" "The man who I thought was the person." If the form of the sentence were changed to "The man whom I thought to be the person," all would be right. The question, in our English version, which our Lord asks of the apostles, in Matt. xvi., "Whom do men say that I, the Son of man, am?" is perhaps hardly correctly expressed in grammar. We should say it ought to have been "who."

We often find persons using superfluous conjunctions or prepositions in their usual talk. Two cases are more frequent than others. One is the use of *but* after the verb *to doubt*. "I do not doubt *but* that he will come," is often found in print, and heard in conversation. The "*but*" is wholly unnecessary, and a vulgarism. "I do not doubt that he will come," expresses precisely the same thing, and should always be used. The same may be said of the expression *on to*. "The cat jumped *on to* the chair;" the *to* being wholly unneeded, and never used by any careful writer or speaker.

From the use of superfluous prepositions we may pass to the use of the prepositions themselves. The preposition "*of*" is sometimes hardly dealt with.

When I read in an article in the *Times*, on a late annexation, "What can the Emperor possibly want of these provinces of Savoy?" I saw at once that the writer must be a native of the midland counties where your friends complain that you have not "*called of them of a long time*." Now, in this case, it is not the expression, but the sense meant to be conveyed by it, that is objectionable. "What can the Emperor want of the provinces?" is very good English, if we mean "What request has he to make of these provinces?" But if we mean, as the *Times'* writer evidently did, "What does he *want with* the provinces?" *i.e.*, "What need has he of them?" then it is a vulgarism.

There is a peculiar use of prepositions which is allowable in moderation, but must not be too often resorted to. It is the placing them at the end of a sentence, as I have just done in the words "resorted to;" as is done in the command, "Let not

your good be evil spoken of ;" and continually in our common discourse and writing. The account to be given of this is, that the preposition which the verb usually takes after it is regarded as forming a part of the word itself. To *speak of*, to *resort to*, are hardly verbs and prepositions, but form in each case almost one word. But let us go on. "Where do you come from?" is the only way of putting that inquiry. "Whence come you?" is of course pedantic, though strictly accurate. "Where are you going to?" is exactly like the other question, but here we usually drop the "to," merely because the adverb of rest "where," has come to be used for the adverb of motion "whither," and therefore the "to" is not wanted. If a man chooses, as West-country men mostly do, to say "Where are you going to?" he does not violate propriety, though he does violate custom. But let us go farther still. *Going to* has not only a local, it has also a mental meaning, being equivalent to *intending* in the mind. And this usage rests on exactly the same basis as the other. The "to" of the infinitive mood is precisely the same preposition as the "to" of motion towards a place. "Were you going to do it?" simply means "Were you in your mental intention approaching the doing of it?" And the proper conversational answer to such a question is, "I was going to," or "I was not going to," as the case may be; not "I was going," or "I was not going," inasmuch as the mere verb *to go* does not express any mental intention. I know, in saying this, that I am at variance with the rules taught at very respectable institutions for enabling young ladies to talk unlike their elders; but this I cannot help; and I fear I shall repeat the offence more than once before my essay is done.

This kind of colloquial abbreviation of the infinitive comprehends several more phrases in common use, and often similarly objected to, as *e.g.* "ought to," and "ought not to," "neglect to," etc., some of them not very elegant, but all quite unobjectionable on the score of grammar. These abbreviations are very common in the West of England, and are there carried further than any reason will allow.

In many cases of this kind we have a choice whether the preposition shall precede or follow the object of the sentence. Thus I may say "*the man to whom I had written*," or "*the man whom I had written to*." In this particular instance, the former is the more elegant, and would usually be said: but this is not always so; *e.g.*, "*You're the man I wanted to have some talk with*," would always be said, not "*You're the man with whom I wanted to have some talk*," which would sound stilted and pedantic.

We will now pass on to another matter—the use of *singulars* and *plurals*. It is a general rule, that when a verb has two or more nominative cases to which it belongs, it must be in the plural number. But let us take care what we mean by

this in each case. When I say, John and James are here, I mean "John is here, and James is here;" but when I say, "*the evening and the morning were the first day*," I do not mean "the evening was the first day, and the morning was the first day," but I mean "*the evening and the morning together made up the first day*." So that here is an important difference. I may use a plural verb when it is true of both its nouns separately, and also when it is only true of them taken together. Now, how is this in another example? Am I to say "*two and two are four*," or "*two and two is four*?" Clearly I cannot say *are* in the first explanation, for it cannot be true that two is four and two is four. But how on the second? Here as clearly I may be grammatically correct in saying "two and two are four," if, that is, I understand something for the two and the four to apply to: two apples and two apples make (*are*) four apples. But when I assert the thing merely as an arithmetical truth, *with no apples*, I do not see how "*are*" can be right. I am saying that the sum of two numbers, which I express by *two and two*, is, makes up, another number, *four*; and in all abstract cases, where we merely speak of numbers, the verb is better singular: two and two "*is*" four, not "*are*."

The last case was a somewhat doubtful one. But the following, arising out of it, is not so:—We sometimes hear children made to say, "twice one *are* two." For this there is no justification whatever. It is a plain violation of the first rules of grammar; "*twice one*" not being plural at all, but *strictly singular*. Similarly, "three times three *are* nine" is clearly wrong, and all such expressions; what we want to say being simply this, that three taken three times makes up, *is* equal to, nine. You may as well say, "nine are three times three," as "three times three are nine."

A word or two about the use of adverbs. I have heard young ladies, fresh from school, observe how *sweetly* a flower smells, how *nicely* such an one looks, and the like. Now all such expressions are wrong. These verbs, *to smell*, *to look*, as here used, are neuter verbs, not indicating an action, but merely a quality or state. *To smell sweetly*, rightly interpreted, could be applied only to a person who was performing the act of smelling, and did it with peculiar grace; *to look nicely*, could only be said as distinguishing one person who did so, from another whose gaze was anything but nice. The Queen's English requires us to say, "How sweet the flower smells;" "How nice such an one looks."

It is impossible that an essay of this kind can be complete or systematic. I only bring forward some things which I believe might be set right, if people would but think about them. Plenty more might be said about grammar; plenty that would astonish some teachers of it. I may say something of this another time. But I pass on now to *spelling*, on which I have one or two remarks to make.

The first shall be, on the trick now so universal across the Atlantic, and becoming in some quarters common among us in England, of leaving out the "u" in the termination "our;" writing *honor*, *favor*, *neighbor*, *Savior*, etc. Now the objection to this is not only that it makes very ugly words, totally unlike anything in the English language before, but that it obliterates all trace of the derivation and history of the word. It is true that *honor* and *favor* are derived originally from Latin words spelt exactly the same; but it is also true that we did not get them direct from the Latin, but through the French forms, which ended in "eur." Sometimes words come through as many as three steps before they reach us—

“*Twos Greek at first; that Greek was Latin made:
That Latin, French; that French to English straid.*”

The omission of the "u" is an approach to that wretched attempt to destroy all the historic interest of our language, which is known by the name of *phonetic spelling*; concerning which we became rather alarmed some years ago, when we used to see on our reading-room tables a journal published by these people, called the *Phonetic News*, but from its way of spelling looking like *frantic nuts*. The whole thing has now, I believe, disappeared, and gone into the limbo of abortive schemes; the knacker's yard of used-up hobbies.

But to return. The late Archdeacon Hare, in an article on English Orthography in the *Philological Museum*, some years ago, expressed a hope that "such abominations as *honor* and *favor* would henceforth be confined to the cards of the great vulgar." There we still see them, and in books printed in America; and while we are quite contented to leave our fashionable friends in such company, I hope we may none of us be tempted to join it.

There seems to be considerable doubt in the public mind how to spell the two words *ecstasy* and *apostasy*. The former of these especially is a puzzle to our compositors and journalists. Is it to be extasy, extacy, eostacy, or ecstasy? The question is at once decided for us by the Greek root of the word. This is *ekstasis* (ἐκστασις), a standing, or position, out of, or beside, one's-self. The same is the case with *apostasy*, ἀποστασις, a standing off or away from a man's former position.

Lay and *lie* seem not yet to be settled. Few things are more absurd than the confusion of these two words. To "*lay*" is a verb active transitive; a hen *lays* eggs. To "*lie*" is a verb neuter; a sluggard *lies* in bed. Whenever the verb *lay* occurs, something must be supplied after it; the proper rejoinder to "Sir, there it lays," would be "*lays what?*" The reason of the confusion has been, that the past tense of the neuter verb "*lie*" is "*lay*," looking very like part of the active verb, "*I lay in bed this morning.*" But this, again, is perverted into *laid*, which belongs to the other verb. I have observed that Eton men, for some reason

or other, are especially liable to confuse these two verbs.

There seems to be some doubt occasionally felt about the apostrophe which marks the genitive case singular. One not uncommonly sees outside an inn, that "*fly's*" and "*gig's*" are to be let. In a country town blessed with more than one railway, I have seen an omnibus with "RAILWAY STATION'S" painted in emblazonry on its side.

I have observed that Mr. Charles Dickens speaks in one of his works of "shutting too." Now it is true that "*to*" and "*too*" are originally the same word; in German, *zu* expresses them both; but it is also true that usage with us has appropriated "*too*" for the adverb of addition or excess, and "*to*" for the preposition; and that in the expression "shutting *to*," it is the preposition, and not the adverb, that is used; that *to* which the door is shut being omitted, and the preposition thus getting the adverbial sense of *close* or *home*.

Sanitary and *sanatory* are but just beginning to be rightly understood. *Sanitary*, from *sanitas*, Latin for soundness or health, means, appertaining to *health*; *sanatory*, from *sano*, to cure, means appertaining to *healing* or *curing*. "The town is in such a bad sanitary condition, that some sanatory measures must be undertaken."

I have noticed, that the unfortunate title of the ancient Egyptian kings hardly ever escapes misspelling. That title is Pharaoh, not Pharoah. Yet a leading article in the *Times*, not long since, was full of PHAROAH, printed, as proper names in leading articles are, in conspicuous capitals. Nay, even more than this: on my first visit to the South Kensington Museum, an institution admirably calculated to teach the people, I found a conspicuous notice with the same misspelling in it. I gave a memorandum of it to the attendant, and whether it has been corrected or not I cannot say.

I pass from spelling to pronunciation. And, first and foremost, let me notice that worst of all faults, the leaving out where it ought to be, and putting in where it ought not to be, the aspirate. This is a vulgarism not confined to this or that province of England, nor especially prevalent in one county or another, but common throughout England to persons of low breeding and inferior education, principally to the inhabitants of towns. Nothing so surely stamps a man as below the mark in intelligence, self-respect, and energy, as this unfortunate habit: in intelligence, because if he were but moderately keen in perception, he would see how it marks him; in self-respect and energy, because if he had these, he would long ago have set to work and cured it. Hundreds of stories are current about the absurd consequences of this vulgarism. You perhaps have heard of the barber who, while operating on a gentleman, expressed his opinion, that, after all, the cholera was in the *hair*. "Then," observed the customer, "you ought to be very careful what brushes you use." "Oh, sir," replied the

barber, laughing, "I didn't mean the *air* of the *ed*, but the *hair* of the *hatmosphere*."

As I write these lines, which I do while waiting in a refreshment-room at Reading, between a Great Western and a South-Eastern train, I hear one of two commercial gentlemen, from a neighbouring table, telling his friend that "his *ed* used to *hake* ready to burst."

The following incident happened at the house of friends of my own. They had asked to dinner some acquaintances who were not perfect in their aspirates. On their making their appearance, somewhat late, imagine the consternation of my relative, on receiving from the lady an apology, that she was very sorry they were after their time, but they had had some *ale* by the way! The well-known infirmity suggested the charitable explanation, that it was a storm, and not a tippie, which had detained them.

I have known cases where it has been thoroughly eradicated, at the cost, it is true, of considerable pains and diligence. But there are certain words with regard to which the bad habit lingers in persons not otherwise liable to it. We still sometimes, even in good society, hear "*ospital*," "*erb*," and "*umble*,"—all of them very offensive, but the last of them by far the worst, especially when heard from an officiating clergyman. The English Prayer-book has at once settled the pronunciation of this word for us, by causing us to give to God our "*humble and hearty thanks*" in the general thanksgiving. *Umble* and *hearty* no man can pronounce without a pain in his throat; and "*umblanarty*" he certainly never was meant to say; *humble* and *hearty* is the only pronunciation which will suit the alliterative style of the prayer, which has in it not only with our *lips*, but in our *lives*. If it be urged that we have "*an humble* and contrite heart," I answer so have we "*the strength of an horse*;" but no one supposes that we were meant to say "*a nose*." The following are even more decisive: "*holy and humble men of heart*;" "*thy humble servants*," not *thine*. And the question is again settled in our times, by the satire of Dickens in David Copperfield: "I am well aware that I am the umblest person going, said Uriah Heep, modestly, let the other be who he may. My mother is likewise a very umble person. We live in a numble abode, Master Copperfield, but have much to be thankful for. My father's former calling was umble; he was a sexton."

While treating of the pronunciation of those who minister in public, two other words occur to me which are very commonly mangled by our clergy. One of these is "*covetous*," and its substantive, "*covetousness*." I hope some who read these lines will be induced to leave off pronouncing them "*covetious*," and "*covetiousness*." I can assure them, that when they do thus call them, one, at least, of their hearers has his appreciation of their teaching disturbed.

The other hint I would venture to give them is,

that the mysterious concluding book of Scripture is the *Revelation* of St. John, not the *Revelations*. I imagine this very common mistake must have arisen from our being accustomed to speak of the *Lamentations* of Jeremiah, in which case the word is *plural*.

I cannot abstain from saying a few words on that fertile source of mistakes among our clergy, the mispronunciation of Scripture proper names. This, let me remind them, is quite inexcusable. It shows a disregard and absence of pains in a matter, about the least part of which no pains ought to be spared. To take it on no other ground, is it justifiable in them to allow themselves to offend by their ignorance or carelessness the ears of the most intelligent of their hearers? This was not the spirit of one who said he would not eat meat while the world lasted, if it scandalized his neighbour. But this is not all. When I hear a man flounder about among St. Paul's salutations, calling half of them wrongly, I know that that man does not know his Bible. The same carelessness is sure to show itself in misappropriation of texts, wrong understanding of obsolete phrases; and the like. The man who talks of Aristobulus in the Lesson, is as likely as not to preach from St. Paul's "I know nothing by myself," to show us that the Apostle wanted divine teaching, and not to be aware that he meant he was not conscious of any fault.

Three Sundays ago, Jan. 18, we had the crucial chapter, Rom. xvi, for the evening lesson. A friend writes to me from a distant city in Italy:—"In the afternoon a stranger officiated; but as he saluted Assyncritus and Patrobas, I knew what to expect in the sermon, and so it was." Another writes from London, that he was on that day at a fashionable London church, and heard Epenetus and Patrobas introduced to the congregation. A clergyman in the West of England found on his breakfast-table one Monday morning a note from his congregation to this effect:—

"Last night you said (your words did pain us),
'Ye know the household of Stephānas.'
Stephānas is the man we know,
And may we hope you'll call him so."

A friend of mine heard the following in a London church, and, strange to say, from a schoolmaster:—"Trophimus have I left at Milētum sick." But it perhaps may be said to me, with the beautiful inconsequence of the logic of the present day, Is a man a perfect Christian minister, because he knows how to pronounce these names? To which I fearlessly answer, No, by no means; but he is, at all events, as near to it as if he did not know how to pronounce them. Really, my friend, you put me in mind of a redoubtable preacher who used to hold forth at Cambridge, in the chapel which was afterwards Robert Hall's, and now is the debating-room of the Union Society. His name was Stittle, and the tradition of him and his sayings was yet a living thing when I went up as an

undergraduate in 1828. His wont was to rail at the studies of the University; and in doing so on one occasion, after having wound himself up to the requisite pitch of fervour, he exclaimed, in a voice of thunder, "D'ye think *Powl* knew Greek?"

From pronunciation we will come to punctuation, or stopping. I remember when I was young in printing, once correcting the punctuation of a proof-sheet, and complaining of the liberties which had been taken with my manuscript. The publisher quietly answered me that *punctuation was always left to the compositors*. And a precious mess they make of it. The great enemies to understanding anything printed in our language are the *commas*. And these are inserted by the compositors without the slightest compunction on every possible occasion. Many words are by rule always hitched off with two commas; one before and one behind; *nursed*, as the Omnibus Company would call it. "*Too*" is one of these words; "*however*," another; *also*, another; the sense in almost every such case being disturbed, if not destroyed, by the process. I remember beginning a sentence with—"However true this may be." When it came in proof, the inevitable comma was after the *however*, thus of course making nonsense of my unfortunate sentence. I have some satisfaction in reflecting, that, in the course of editing the Greek text, I believe I have destroyed more than a thousand commas, which prevented the text being properly understood. One very provoking case is that where two adjectives come together, belonging to the same noun-substantive. Thus, in printing *a nice young man*, a comma is placed after *nice*, giving, you will observe, a very different sense from that intended: bringing before us the fact that a man is both *nice* and *young*, whereas the original sentence introduced to us a young man that was *nice*.

Thus too in the expression *a great black dog*; printed without commas, everybody knows what we mean; but this would be printed "a great, black dog." Take again the case where meaning is intensified by adjectives being repeated—as in "*the wide wide world*," "*the deep deep sea*." Such expressions you almost invariably find printed "*the wide, wide world*," "*the deep, deep sea*," thereby making them, if judged by any rule at all, absolute nonsense.

Still, though too many commas are bad, too few are not without inconvenience also. I saw the other day a notice of "the Society for Promoting the Observance of the Lord's-day which was founded in 1831," giving the notice that the *day*, not the *society*, was founded in that year. Had the date been 1631, instead of 18, an awkward interpretation might have been possible.

While I am upon stops, a word is necessary concerning notes of admiration. A note of admiration consists, as we know, of a point with an upright line suspended over it, strongly suggestive of a

gentleman jumping off the ground with amazement. These *shrieks*, as they have been called, are scattered up and down the page by compositors without any mercy. If one has written the words "*O sir*," as they ought to be written, viz., with the plain capital "*O*" and no stop, and then a comma after "*Sir*," our friend the compositor is sure to write "*Oh*" with a shriek (!) and to put another shriek after "*Sir*." Use, in writing, as few as possible of these nuisances. They always make the sense weaker, where you can possibly do without them. The only case I know of, where they are really necessary, is where the language is pure exclamation, as in *How beautiful is night!* or, *O that I might find him!*

But I now come, from the by-rules and details of the use of the language, to a more important part of my essay: to speak of an abuse far more serious than those hitherto spoken of; even the tampering with and deteriorating the language itself. I believe it to have been in connexion with an abuse of this kind that the term the King's English was first devised. We know that it is a crime to clip the King's coin; and the phrase in which we first find the term which forms the subject of our essay, is, "*clipping the King's English*." So that it is not improbable that the analogy between debasing language and debasing coin first led to it.

Now in this case the charge is twofold; that of clipping, and that of beating out and thinning down the Queen's English. And it is wonderful how far these, especially the latter, have proceeded in our days. It may be well to remind you, that our English comes mainly from two sources; rather, perhaps, that its parent stock, the British, has been cut down, and grafted with the new scions which form the present tree:—the Saxon, through our Saxon invaders; and the Latin, through our Norman invaders. Of these two, the Saxon was, of course, the earlier, and it forms the staple of the language. Almost all its older and simpler ideas, both for things and acts, are expressed by Saxon words. But as time went on, new wants arose, new arts were introduced, new ideas needed words to express them; and these were taken from the stores of the classic languages, either direct, or more often through the French. You remember that Gurth and Wamba complain, in *Ivanhoe*, that the farm-animals, as long as they had the toil of tending them, were called by the Saxon and British names, *ox*, *sheep*, *calf*, *pig*; but when they were cooked and brought to table, their invaders and lords enjoyed them under the Norman and Latin names of *beef*, *mutton*, *veal*, and *porc*. This is characteristic enough; but it lets us, in a few words, into an important truth. Even so the language grew up; its nerve, and vigour, and honesty, and manliness, and toil, mainly brought down to us in native Saxon terms, while all its vehicles of abstract thought and science, and all its combinations of new requirements on

the world went on, were clothed in a Latin garb. To this latter class belong all those larger words in *-ation* and *-ations*, its words compounded with *ex* and *in* and *super*, and the like. It would be mere folly in a man to attempt to confine himself to one or other of these two main branches of the language in his writing or his talk: they are inseparable; welded together, and overlapping each other, in almost every sentence which we use. But short of exclusive use of one or the other, there is a very great difference in respect of the *amount* of use between writers and speakers. He is ever the most effective writer and speaker, who knows how to build the great body of his discourse out of his native Saxon; availing himself indeed of those other terms without stint, as he needs them, but not letting them give the character and complexion to the whole. But unfortunately all the tendency of the lower kind of writers of modern English is the other way. The language, as known and read by thousands of Englishmen and Englishwomen, is undergoing a sad and rapid process of deterioration. Its fine manly Saxon is getting diluted into long Latin words not carrying half the meaning. This is mainly owing to the vitiated and pretentious style which passes current in our newspapers. The writers in our journals seem to think that a fact must never be related in print in the same terms in which it would be told by word of mouth. The greatest offenders in this point are the country journals, and, as might be expected, just in proportion to their want of real ability. Next to them comes the London penny press; indeed, it is hardly a whit better; and highest in the scale, but still by no means free from this fault, the regular London press,—its articles being for the most part written by men of education and talent in the various political circles. Since I have been thinking of this essay, I have paid some attention to the newspapers, with a view to cull from them examples of the fault which I am blaming. Their main offence, the head and front of their offending, is the insisting on calling common things by uncommon names; changing our ordinary short Saxon nouns and verbs for long words derived from the Latin. And when it is stated that this is very generally done by men quite ignorant of the derivation and strict meaning of the words they use, we may imagine what delightful confusion is thus introduced into our language. A Latin word which really has a meaning of its own, and might be a very useful one if confined to that meaning, does duty for something which is far wider than its own meaning; and thereby to common English hearers loses its own proper force, besides utterly confusing their notions about the thing which its new use intended to represent. Our journals seem indeed determined to banish our common Saxon words altogether. You never read in them of a *man*, or a *woman*, or a *child*. A man is an "*individual*," or a "*person*," or a "*party*;"

a woman is a "*female*," or if unmarried, a "*young person*," which expression in the newspapers is always of the feminine gender; a child is a "*juvenile*," and children *en masse* are expressed by that most odious term, "*the rising generation*." As to the former words, it is certainly curious enough that the same debasing of our language should choose, in order to avoid the good honest Saxon "*man*," two words, "*individual*" and "*party*," one of which expresses a man's *unity*, and the other belongs to man *associated*. And why should a woman be degraded from her position as a rational being, and be expressed by a word which might belong to any animal tribe, and which, in our version of the Bible, is never used except of animals, or of the abstract, the sex in general? Why not call a man a "*male*," if a woman is to be a "*female*?" The word *party* for a man is especially offensive. Strange to say, the use is not altogether modern. It occurs in the English version of the apocryphal book of Tobit, vi. 7, "If an evil spirit trouble any, one must make a smoke thereof before the man or the woman, and the party shall be no more vexed." I once heard a venerable dignitary pointed out by a railway porter as "*an old party in a shovel*." Curious is the idea raised in one's mind by hearing of "*a short party going over the bridge*."

These writers never allow us to *go* anywhere, we always *proceed*. A man was going home, is set down "an individual was proceeding to his residence." We never *eat*, but always *partake*, even though we happen to eat up the whole of the thing mentioned. In court, counsel asks a witness, "Did you have anything to eat there?" "Yes." "What was it?" "A bun." Now go to the report in the paper, and you'll be sure to find that "witness confessed to having partaken of a bun," as if some one else shared it with him. We never hear of a *place*; it is always a *locality*. Nothing is ever *placed*, but always *located*. "Most of the people of the place" would be a terrible vulgarity to these gentlemen; it must be "*the majority of the residents in the locality*." Then no one lives in *rooms*, but always in "*apartments*." "*Good lodgings*" would be far too meagre; so we have "*eligible apartments*." No man ever *shows* any feeling, but always "*evinces*" it. This "*evince*," by the way, is one of the most odious words in all this catalogue of vulgarities, for such they really are. Everybody "*evinces*" everything. No one *asks*, but "*evinces a desire*." No one is hurt, but "*evinces a sense of suffering*." No one thanks another, but "*evinces gratitude*." I remember, when the French band of the "Guides" were in this country, reading in the *Illustrated News*, that as they *proceeded*, of course, along the streets of the *metropolis* (we never read of London in polite journals), they were *vehemently* (everybody does everything vehemently) cheered by the assembled *populace* (that is the genteel name for the people). And what do you suppose the Frenchmen did in

return? Of course, something very different from what Englishmen would have done under similar circumstances. But did they toss up their caps, and cry, *Vive l'Angleterre?* The *Illustrated News* did not condescend to enter into such details; all it told us was that they "*evinced a reciprocity!*" Again, we never *begin* anything in the newspapers now, but always *commence*. I read lately in a Taunton paper, that a horse "*commenced kicking.*" And the printers seem to think it quite wrong to violate this rule. Repeatedly, in drawing-up handbills for charity sermons, I have written, as I always do, "Divine service will *begin* at so and so;" but almost always it has been altered to "*commence*;" and once I remember the bill being sent back after proof, with a "*query, commence?*" written against the word. But even *commence* is not so bad as "*take the initiative,*" which is the newspaper phrase for the other more active meaning of the verb to *begin*.

Another horrible word, which is fast getting into our language through the provincial press, is to *eventuate*. If they want to say that a man spent his money till he was ruined, they tell us that *his unprecedented extravagance eventuated* in the total dispersion of his property.

"*Avocation*" is another monster patronized by these writers. Now, *avocation*, which of itself is an innocent word enough, means the being called *away* from something. We might say, "He could not do it, having *avocations* elsewhere." But in our newspapers, *avocation* means a man's calling in life. If a shoemaker at his work is struck by lightning, we read that *while pursuing his avocation, the electric fluid penetrated the unhappy man's person.*"

"*Persuasion*" is another word very commonly and very curiously used by them. We all know that *persuasion* means the fact of being *persuaded*, by argument or by example. But in the newspapers, it means a *sect* or *way of belief*. And strangely enough, it is most generally used of that very sect and way of belief whose characteristic is this, that they refuse to be persuaded. We constantly read of the "*Hebrew persuasion,*" or the "*Jewish persuasion.*" I expect soon to see the term widened still more, and a man of colour described as "*an individual of the negro persuasion.*"

But to be more serious. Not only our rights of conscience, but even our sorrows are invaded by this terrible diluted English. A man does not *lose his mother* now in the papers: he *sustains* (this I saw in a country paper) *bereavement of his maternal relative.*" By the way, this verb to *sustain* is doing just now a great deal of work not its own. It means, you know, to endure, to bear up under; *to sustain* a bereavement, does not properly mean merely to undergo or suffer a loss, but to *behave* bravely under it. In the newspapers, however, "*sustain*" comes in for the happening to men of all the ills and accidents possible. Men never

break their legs, but they always "*sustain a fracture*" of them; a phrase which suggests to one the idea of the poor man with both hands holding up the broken limb to keep it straight.

Akin to *sustain* is the verb to *experience*, now so constantly found in our newspapers. No one *feels*, but *experiences a sensation*. Now, in good English, *experience* is a substantive, *not a verb at all*. But even if it is to be held that the modern slipshod dialect has naturalized it, let us have it at least confined to its proper meaning, which is not simply to *feel*, but to have *personal knowledge of by trial*. Another such verb is to "*accord,*" which is used for "*award,*" or "*adjudge.*" "*The prize was accorded,*" we read, "*to so and so.*" If a lecturer is applauded at the end of his task, we are told that "*a complete ovation was accorded him.*"

Entail is another poor injured verb. Nothing ever *leads* to anything as a consequence, or brings it about, but it always *entails* it. This smells strong of the lawyer's clerk; as does another word which we sometimes find in our newspapers, *in its entirety* instead of *all or the whole*.

"*Open up,*" again, is a very favourite newspaper expression. What it means, more than *open* would mean, I never could discover. But whenever we are to understand that a communication is to be opened between two places, it is invariably made use of: e.g. a new line of railway is to open up the communication between the garrisons of Chatham, Canterbury, and Dover.

"*Desirability*" is a terrible word. I found it the other day, I think, in a leading article in the *Times*.

Reliable is hardly legitimate. We do not *rely* a man, we *rely upon* a man; so that *reliable* does duty for *rely-upon-able*.

Allude to is used in a new sense by the press, and not only by them, but also by the great Government offices for the procrastination of business. If I have to complain to the Post-Office that a letter legibly directed to me at Canterbury has been mis-sent to Caermarthen, I get a regular red-tape reply, beginning "The letter alluded to by you." Now I did not *allude* to the letter at all; I mentioned it as plainly as I could.

There are hundreds of other words belonging to this turbid stream of muddy English which is threatening to destroy the clearness and wholesomeness of our native tongue. I cannot, however, instance any more of them, but will only give you one or two more examples of this kind of writing.

I send a sentence to a paper to the following effect:—"When I came to the spot, I met a man running towards me with his hands held up." Next day I read, "When the very rev. gentleman arrived in close proximity to the scene of action, he encountered an individual proceeding at a rapid pace in the opposite direction, having both his hands elevated in an excited manner."

This is fiction; but the following are truth.

In a Somersetshire paper I saw that a man had had his legs burned by sitting for warmth, and falling asleep, on the top of a lime-kiln. The lime was called the "*seething mass*" (to "*seethe*" means to *boil*, and "*sad*," or "*sodden*," is its passive participle); and it was said he would soon have been a *calcined corpse*, which, I take it, would have been an unheard-of chemical phenomenon.

In the same paper I read the following elegant sentence:—"Our prognostications as regards the spirit of the young men here to join the Stogursey rifle-corps proves correct." The same paper, in commenting on the Hopley case, speaks through a whole leading article of *corporeal* punishment. I may mention that, in this case, the accused person figures throughout, as so often in provincial papers, as a "demon incarnate," and "a fiend in human shape."

In travelling up from Somersetshire, I find the directors of the Great Western Railway thus posting up the want of a schoolmaster at their board: "£5 reward. Whereas the windows of the carriages, etc. Whoever will give *information as shall lead to conviction*, shall receive the above reward;" as being used for *which*: "*the man as told me.*"

The South-Eastern directors seem to want the schoolmaster also. On the back of the tickets for the fast trains, we read the following precious piece of English grammar:—"This ticket is not transferable, only available for the station named thereon." This implying, of course, that using it for the station named on it, is *part of the process* of transferring it to some other person.

On a certain railway the following intelligible notice appears:—"Hereafter, when trains moving in an opposite direction are approaching each other on separate lines, conductors and engineers will be required to bring their respective trains to a dead halt before the point of meeting, and be very careful not to proceed till each train has passed the other."

In the *Morning Chronicle's* account of Lord Macaulay's funeral occurred the following sentence:—"When placed upon the ropes over the grave, and while being gradually lowered into the earth, the organ again pealed forth." Here, of course, on any possible grammatical understanding of the words, it was the *organ* which was placed over the grave, and was being lowered into the earth. Akin to this was the following notice, sent to my house the other day by a jeweller:—"The brooches would have been sent before, but have been unwell."

In a leading article of the *Times*, not long since, was this beautiful piece of slipshod English:—

"The atrocities of the middle passage, which called into action the Wilberforces and Clarksons of the last generation, were not so fully proved, and were certainly not more harrowing in their circumstances, than are the iniquities perpetrated upon the wretched Chinese."

Here we see faults enough, besides the wretched

violations of grammar. For instance, the "*Clarksons*" and "*Wilberforces*." What in the world are these plurals? Were there two tribes, one of each of these names, who distinguished themselves for philanthropic zeal? Why not say, Clarkson and Wilberforce? or, if more than two are meant, why not say, *men like C. and W.*? These writers are constantly doing something like this, when they speak of great men in the singular number. They can't content themselves with saying that the see of Canterbury has been held by Anselm, Cramer, Laud, and Tillotson, but they must say, that it has been held by an Anselm, a Laud, a Cranmer, and a Tillotson; that Cambridge has educated a Bacon, a Newton, a Milton. If gentlemen of certain significant names should ever attain eminence in one place or county, the sentence would read rather oddly: "it has enjoyed the honour of producing a Tailor, a Butler, a Groom, a Gardener, a Smith; and has attained celebrity in the persons of a Bull, a Fox, a Lamb, and a Crow."

Sometimes the editors of our papers fall, from their ignorance, into absurd mistakes about the words which they mean to use. In a country journal, not long since, I read that a jury might be "*immersed*" in a heavy fine; the meaning being, of course, that they might be "*amerced*." We were informed, not long since, in the *Evening Star*, London penny paper, that the Pope went to the "*basilisk*" of St. Peter's; meaning "*basilica*," the Roman name for seven of their largest churches.

But it is time that this essay drew to an end. And if I must conclude it with some advice to my readers, it shall be that which may be inferred from these examples, and from the way in which I have been dealing with them. Be simple, be unaffected, be honest in your speaking and writing. Never use a long word where a short will do. Call a spade a spade, not a *well-known oblong instrument of manual husbandry*; let home be *home*, not a *residence*; a place a *place*, not a *locality*; and so of the rest. Where a short word will do, you always lose by using a long one. You lose in clearness; you lose in honest expression of your meaning; and, in the estimation of all men who are qualified to judge, you lose in reputation for ability. The only true way to shine, even in this false world, is to be modest and unassuming. Falsehood may be a very thick crust, but in the course of time, truth will find a place to break through. Elegance of language may not be in the power of all of us; but simplicity and straightforwardness are. Write much as you would speak; speak as you think. If with your inferiors, speak no coarser than usual; if with your superiors, no finer. Be what you say; and, within the rules of prudence, say what you are.

Avoid all oddity of expression. No one ever was a gainer by singularity in words, or in pronunciation. The truly wise man will so speak, that no one may observe how he speaks. A man may show great knowledge of chemistry by carry-

THE NORSE PRINCESS.

ing about bladders of strange gases to breathe ; but he will enjoy better health, and find more time for business, who lives on the common air. When I hear a person use a queer expression, or pronounce a name in reading differently from his neighbours, it always goes down, in my estimate of him, with a *minus sign* before it ; stands on the side of deficit, not of credit.

Avoid, likewise, all *slang* words. There is no greater nuisance in society than a talker of slang. It is only fit (when innocent, which it seldom is) for raw schoolboys, and one-term freshmen, to astonish their sisters with. Talk as sensible men talk : use the easiest words in their commonest meaning. Let the sense conveyed, not the vehicle in which it is conveyed, be your object of attention.

Once more, avoid in conversation all singularity of accuracy. One of the bores of society is the talker who is always setting you right ; who, when you report from the paper that 10,000 men fell in some battle, tells you it was 9970 ; who, when you describe your walk as two miles out

and back, assures you it wanted half a furlong of it. Truth does not consist in minute accuracy of detail, but in conveying a right impression ; and there are vague ways of speaking, that are truer than strict fact would be. When the Psalmist said, "Rivers of waters run down mine eyes, because men keep not thy law," he did not state the fact, but he stated a truth deeper than fact, and truer.

Talk to please, not yourself, but your neighbour to his edification. What a real pleasure it is to sit by a cheerful, unassuming, sensible talker ; one who gives you an even share in the conversation and in his attention ; one who leaves on your memory his facts and his opinions, not himself who uttered them, not the words in which they were uttered.

All are not gentlemen by birth ; but all may be gentlemen in openness, in modesty of language, in attracting no man's attention by singularities, and giving no man offence by forwardness ; for it is this, in matter of speech and style, which is the sure mark of good taste and good breeding.

THE NORSE PRINCESS.

UPON a ruin by the desert shore,
I sat one Autumn day of utter peace,
Watching a lustrous stream of vapour pour
O'er Blaavin, fleece on fleece.
The blue firth stretched in front without a sail,
Huge boulders on the shore were wrecked and
strown ;
Behind arose, storm-bleached and lichen-pale,
Buttress, sheer wall of stone.
And, sitting on the Norseman's broken stair,
While thro' the shining vapour downward rolled
A ledge of Blaavin gleamed out wet and bare,
I heard this story told.
Within a far-off legendary Time,
These walls were by the Princess Hilda built ;
Her lord lay stretched in battle ere his prime,
With sword red to the hilt.
Leaving his eyes, beneath the sweeter brows
Of Hilda, in a child, whose loosened speech
Prattled of sword, spear, buckler, idle rows
Of galleys on the beach.
The years built up a giant broad and grave,
With folid locks, and eyes that looked men
through :
A passion for the long lift of the wave
From roaming sires he drew.
Amongst the craggy islands did he rove ;
He like the eagle took and rent his prey :
Oft deep with battle-spoil his galleys clove
Homeward their joyous way,
He towering full-armed in the van with spear
Outstretched, and hair blown backwards like
a flame,
While to the setting sun his oarsmen rear
The glory of his name.
Once when the sea his battle-galleys crossed,
His mother, sickening, turned from weary light

And faced death, as the Norse-land clenched with
frost
Faces the polar night.
At length his masts come raking through the mist,
He pours upon the beach his wild-eyed bands—
The fierce, fond, dying woman turned and kissed
His orphan-making hands,
And leant her head against his mighty breast
In pure content, well knowing so to live
One single hour was all that death could wrest
Away, or life could give.
And murmured, while her dying fingers took
Farewell of cheek and brow, then fondly drowned
Themselves in tawny hair, "I cannot brook
To sleep here underground.
"My women through my chambers weep and wail :
I would not waste one tear-drop tho' I could.
When they brought home that lordly length of mail,
With bold blood stained and glued,
"I wept out all my tears. Amongst my kind
I cannot sleep—so on a mountain's head,
Right in the pathway of the northern wind,
See thou and make my bed.
"The north wind blowing on that lonely place
Will comfort me. Kiss me, my Torquil ! I
Feel the big hot tears splashing on my face.
How easy 'tis to die !"
The farewell-taking arms around him set
Clung closer, and a feeble mouth was raised,
Seeking for his in darkness—ere they met
The eyeballs fixed and glazed.
Dearer that kiss by pain and death forestalled
Than ever yet touched lip ! Beside the bed
The Norseman knelt till sunset,—then he called
The dressers of the dead.

They, gazing on her face, were daunted more
 Than when she, living, flashed indignant fires ;
 For, in the gathering gloom, the features wore
 A look that was her sire's.

And upward to a sea-o'er-staring peak,
 With lamentation was the Princess borne,
 And, looking northward, left with evening meek
 And fiery-bosomed morn.

In this wise went the story, full of breaks ;
 And brooding on the subtle sense of death
 That sighs through all our happy days, that shakes
 All raptures of our breath,
 Methought I saw that ancient woman bow'd
 By sorrow in her sea-mew'd home,—and still
 The radiant billows of autumnal cloud
 Flowed on the monstrous hill.

ALEXANDER SMITH.

THOUGHTS ON DIVINE CHASTISEMENT.

BY THE EDITOR.

CHASTISEMENT is in a peculiar sense the portion of God's children : " For whom the Lord loveth he chasteneth, and scourgeth every son whom he receiveth. If ye endure chastening, God dealeth with you as with sons : for what son is he whom the father chasteneth not ? But if ye be without chastisement, whereof all are partakers, then are ye bastards, and not sons." We propose, therefore, to suggest a few thoughts on the nature of chastisement, to enable us the better to understand the " ways " of our heavenly Father, so that, when affliction is sent to us, we may not " think it strange concerning the fiery trial which tries us, as though some strange thing happened to us."

At the outset, we must distinguish between the chastisements sent by God, and those punishments attached to sin, which we may bring upon ourselves. When a man wilfully thrusts his hand into the fire, the pain which he endures in consequence of his folly is punishment brought upon himself, according to the appointment of the Divine Lawgiver ; it is not chastisement sent by God, as a Father to a loving child. So, too, the bodily and mental pain of the drunkard, the glutton, or the sensualist ; the poverty of the spendthrift ; the sufferings of this man from his inconsiderate rashness, or of that from his sloth or selfishness ;—all are penalties righteously inflicted for the breach of law.

We may also except from the chastisements sent by God to His children, those sufferings which arise necessarily out of our very condition as human beings,—such as weariness and fatigue from the labours of mind and body ; the infirmities of advancing years ; the death of friends in old age, etc. These and suchlike sufferings belong to the family of man, and are in no way peculiar to our education as the children of God. Yet even in regard to such penal and natural sufferings, as these may be called ; we should never look upon mechanical laws as their sole cause, to the exclusion of a personal God. For surely it never was the purpose of God that the regular and orderly method of His working should take the place of Himself in men's hearts. Our Saviour adduces, as an evidence of God's love, and as an example to quicken our love to all, those very mercies of God which are most common, and which come daily with the regularity of fixed

law. " But I say unto you, Love your enemies, bless them that curse you, do good to them that hate you, and pray for them that despitefully use you, and persecute you ; that ye may be the children of your Father which is in heaven ; for he maketh his sun to rise on the evil and on the good, and sendeth rain on the just and on the unjust." Moreover, God has so arranged his universe, that all outward events, whatever these may be, must conduce to the inward good and peace of those who love Him. For this love, like a Divine chemistry, converts everything into food to nourish its own holy and immortal life. It is thus that what God has appointed as the punishment of some particular sin, the Spirit of God working through faith and love in us will make the means of deepening repentance for all sin ; and the sufferings which come to us as children of men, will be sanctified for our growth as children of God. True penitence will make punishment minister to piety, and true piety will convert the sufferings of nature into the nourishment of grace.

But there are sufferings which can be traced to no particular sin on our part ; which are not a portion of our inheritance as men ; which may be said to come directly from the hand of God ; which are independent of our will, and have not in any way been brought about by us, and which we cannot fail to recognise as chastisements properly so called. These are not to be discovered by such accurate definition, as to exclude all mistakes. It is not by such methods that we can know God or His ways. The true child alone will discern the Father. The heart of love alone, by a divine instinct, will " feel after him, and find him, though he be not far from any one of us." " The secret of the Lord is with them that fear him." " Whoso is wise, and will observe these things, even they shall understand the loving-kindness of the Lord."

Chastisement may have reference to our own individual good. This is the case when it is sent " for our profit, that we might be partakers of his holiness ;" and that it might produce in us " the peaceable fruits of righteousness." It may accordingly be sent in order to reveal the existence, and also to help the cure of some evil, such as the idolatry of the creature, impatience, self-will, inordinate love of the world, vanity, pride, selfishness, unruly fleshly appetites, and the like ; or to

strengthen some grace, by calling it into more vigorous exercise. Or God may, by such correction, bring back a child who had departed from his Father's house. By some sharp trial the afflicted may be made to "consider their ways," "in their affliction to seek God early," and to know "that it is an evil and a bitter thing to forsake the Lord their God," and at last to confess, "Before I was afflicted I went astray, but now have I kept thy word." And have not the children of God always found this to be true in their own blessed experience? Who of them have been able to say that unbroken prosperity taught them weanedness from the world; the excellence and satisfying nature of the life in the Spirit; the riches of the grace of God in sustaining the soul; the reality of the life and presence of Jesus Christ; and His power to fill every want of the spirit, even with the fulness of God? Who, in short, have thus learned that spiritual-mindedness which finds its rest and good in God, and is, in itself, life and peace? Yet, thousands and millions in the Church of God have been taught these and similar precious lessons in the school of chastisement, and have acknowledged, with thanksgiving, "It was good for me that I was afflicted!" And if you, mourners, find it so, is it not true that "God dealth with you as with sons?" Ah! how good it is in our Father to overturn the house built on the sand, that he might make us build on the Rock of ages! Surely it is the same loving Lord who gives and who also takes away! Yet, in truth, when the Lord "takes," it is in order that he may "give" some blessing which otherwise we could not possess. When he removes some idol, it is ever for our profit, and to enrich us by making us "partakers of his holiness."

Chastisement may have special reference to the good of others. This Christian relative may be brought into affliction, and laid upon a bed of lingering pain, in order "that others seeing their light shine" in this darkness, and beholding "their good works" of faith, patience, cheerful acceptance of God's will, and perfect peace, may be led to see the reality of the Divine life in humanity, and themselves thereby led to "glorify God in the day of visitation." A suffering saint is an unspeakable gift to a family, and a most impressive teacher to all who are privileged to behold his holy character, like a setting sun, becoming more bright and glorious from the very clouds which gather round it. Oh, how often has the light which has beamed from an eye darkening to the world, pierced the heart that never before saw the beauty of holiness! How often has the life of love, breathing in holy words from dying lips, been the means of awakening life in souls hitherto dead in trespasses and sins! There is sometimes a more impressive eloquence in their silence than in words of loftiest speech. And thus the Lord may be heard in the still, small voice of the sufferer, when He is unheeded in the storm which overturns thrones, and in the fire which consumes

kingdoms! Verily it is out of the darkness of sorrow that the most of this world's light has streamed, and out of this death that much of its life has sprung!

How resigned, yea, how rejoiced ought we to be when it is "given us, not only to believe, but to suffer for Christ's sake;" how deeply impressed with a sense of the value of the talent of affliction thus committed to us; and with what a humble spirit should we pray to Him who calls us to suffer for the good of others and for His own glory, that He may enable us to do so in the patient, meek, loving, and peaceful spirit of His own Son!

Chastisement is sometimes sent to prevent evil. For example, after Paul was carried to the third heavens, and "had abundance of revelations," the Lord sent "a thorn in the flesh, a messenger of Satan, to buffet him." Wherefore? Not to cure, but to prevent evil: "*Lest*," he says, "I should be exalted above measure." And this principle of our Lord's dealings towards us will explain many a dispensation of his Providence which is at present dark and mysterious, because no explanation of it can be as yet discovered. Never, therefore, perhaps until the day of the revelation of Jesus Christ, shall we know what God has thus *prevented* by affliction. He alone sees the precipice, and casts to the ground this child of His who was rushing towards it, or disables him by some severe blow from approaching the dangerous spot by a single step. Why, we in vain inquire, was this babe taken away at the very moment when it was filling the hearts of loving parents with new joy? Perhaps, we suggest, to preserve it safe in heaven; perhaps to lead the sheep into the fold after their lamb; or perhaps lest some worse thing than death, even sin, should prove its ruin. But in vain we ask what the greater danger was, or what the coming evils were, which suffering or death prevented. Why, again we ask, has this noble and valued life been taken away? Why has this young man or woman been removed when budding life seemed about to burst forth into flowers and fruit, and to be crowned with gladness? Why has this husband or wife been suddenly snatched from the family which so fondly clung around them, leaning on them as their staff, looking up to them as their guide, and living upon them as the source of their sweetest earthly life? Why has all this been? and why have a thousand other thorns in the flesh which no prayers can remove been permitted to lacerate so long and so painfully? We say that "we cannot account for it." Yet all may have been sent to *prevent* evil, and "*lest*,"—lest what? God alone knoweth! But he *does* know!

Chastisement may also be sent to reveal to principalities and powers the glory of God as seen in suffering and triumphing humanity. One of the grandest truths revealed in Scripture is the fact of God's having "created all things by Jesus Christ, to the intent that now unto principalities and powers

in heavenly places might be known by the Church the manifold wisdom of God!" The Church of Christ on earth, in its every true member, and during every period of its eventful history, is thus a mirror of life, in which the heavenly hosts see God's wisdom reflected. The apostle Paul knew that he was suffering in the presence of the world of spirits: "We are a spectacle," he says, "to angels!" And thus a poor suffering saint—a Lazarus in sores—may be the teacher of principalities and powers in heavenly places. For as each saint has something peculiar in his trials which distinguishes him, in some respects, from all others, so must each present to the angels some new features of the grace of God manifested in him through suffering. The afflictions of Job, for example, while they were made the means of blessing his own soul at the time, and of strengthening the faith and patience of millions in every age and clime, are represented to us as having had reference to principalities and powers; and as having, to the confusion of Satan, and to the joy of the holy angels, furnished an undying testimony of the power and victory of faith. And so the afflictions of saints now may have more reference to the lookers-on in the unseen world than we, as yet, can at all know or understand. But even the very possibility of our being thus tried in the presence of such a cloud of witnesses, should make us act in a manner worthy of our high calling!

But whatever end God may desire to see accomplished in us and by us through his fatherly chastisements, this end is never overlooked,—that the sufferer should know God himself. This is the richest blessing which He can himself bestow upon any creature, for, as our Lord hath said, "This is life eternal, to know thee, the only living and true God, and Jesus Christ, whom thou hast sent." And what precious knowledge do we obtain of God in affliction, when, in our utter prostration and weakness, we are cast on His mighty arm for strength, and find it sufficient for us; when, unable to do our own will, we are compelled to submit to God's will as supreme, to acquiesce in it, to choose it as good, and to know it more and more as holy, loving, and righteous; when, with our crushing burdens, we are driven to Him as our only help, and find in Him perfect rest; and when He opens up in the parched desert a well that refreshes us, or makes a way of escape out of difficulty when we could see none, or delivers us from danger that seemed inevitable! Oh, how does all this experience of the power, the wisdom, the sympathy, and peace of our God increase our knowledge of Him! We thus grow into deeper fellowship also with the Son, from sharing his experience of a Father's love amidst trial, so that, while carrying about the dying of the Lord Jesus, the life of Jesus is thereby more enjoyed by ourselves, and manifested to others.

We desire to impress upon those in trial the duty and advantage of meeting God in their

trials, and considering patiently and seriously why he is thus visiting them with chastisement. Let us ask, for example, Are our sufferings brought on ourselves by any indulged sin?—If so, let us acknowledge his righteousness, and repent. Are they designed to cure some evil which is known to the conscience, or to strengthen some grace which we know to be sinfully defective?—Let us accept the lesson, and resolve to practise it, saying, "Thy will be done!" But if we should not be able for the time to see the reason of God's dealing with us,—should "clouds and darkness be around his throne," and "his path be in the great deep,"—then must we repose upon his knowledge of us, his love to us, and his unerring wisdom in arranging our lot, and believe "that what we know not now we shall know hereafter." The wheels of God's providence do not all revolve in the same time. Some revolve in a few days. It was so in Abraham's case, when called to sacrifice his son: all was dark until the third day. It was so with Martha and Mary, from the time they sent for Jesus to remove their sorrows, until he raised up their brother from the tomb. Some wheels, again, take many years to complete their revolution. It was thus in the history of Joseph; and in that of his father Jacob, who was for many years in great darkness as to why the Lord had contended with him. How long, too, was Job in vain searching for God on the right hand and on the left, when as yet he did not see "the end of the Lord, that the Lord is very pitiful and of tender mercy." And besides these perplexities, there are "wheels within wheels,"—complex and various interests to be considered by God; and wheels, too, revolving throughout vast cycles, "so high that they are dreadful!" All this should humble us with reverential awe before the throne of him who alone sees all things in their beginnings and endings, and who carries on a government of men, families, and nations, from age to age. But never, never, should we give way to the ignorant and unbelieving fear, that God is leading us by other than "a right way," because it is a long way, a rough way, a roundabout way; or because we see no end to it. Jacob thus sadly misapprehended God's dealings with himself and family. "Joseph is not!" he exclaimed,—yet Joseph *was*. Simeon is not!—yet he too *was*, and was with Joseph. "And will ye take Benjamin away?" Yes!—but only to restore him again amidst the joy of a united family! "All these things are against me!" O frail and short-sighted man! how untrue—all are for thee! Jacob did not see this at the time, though he saw it soon afterwards; but God saw it from the first, and Jacob should have trusted him in the darkness.

Oh, let us *never* lose our trust; heaven and earth may pass away, but we shall never be put to shame! "Let those who suffer according to his will, commit the keeping of their souls to him in well-doing, as to a faithful Creator."

A VINDICATION OF BISHOP COLENSO.

LETTER VI.

Nov. 18, 1862.

MY DEAR FRIEND,—Pray do not ask me to write more than my object requires. That object is not formally to refute the book, which, as a most grotesque caricature of all the conditions of fair historic investigation, sufficiently refutes itself. My aim is to show you how much more easy I find it to believe in the historic credibility of the Pentateuch, or even that Moses was its author, than that a Bishop, still *remaining* such, should write a work which speaks of six of his "Canonical Books" much as Bolingbroke spoke of them a century ago, and avow much the same system of Deism as that of Tindal; or that he should borrow with creeping servility, every contemptible quibble from ancient and modern scepticism against the said "Canonical Books," and forget to borrow a single argument for them! In showing this, I do indeed, as I imagine, *also* refute the principal arguments of the book itself, if indeed it be not an insult to logic to apply the term "arguments" to such quibbles as, for the most part, compose it.

And the more I look at the thing, the more incomprehensible the Colensian authorship appears. Take, for example, the account of the "Passover." In order to prove that the events of Exodus are impossible, the writer represents the narrative as asserting that the command to celebrate the Passover, its celebration, the summons to depart from Egypt, and the actual departure, all took place on the same night; and then argues that it was utterly impossible that the people could be apprised of these things, organize the movements necessary to carry them out, and actually carry them out in so brief a space of time,—about twelve hours in all! But how is it that he forgets, or rather mentions only to cut it out of the text altogether, the detailed statement in Ex. xii. 1-11, that Moses had full instructions given to him, and the people through him, nearly a fortnight before? that they were told that on the tenth of the month, they were to select a lamb, and "to keep it up" till the fourteenth of the month?—why is the detailed account to go for nothing? Just because the writer says, "there seems some contrariety in the story, from the words used in chap. xii. 12, 'For I will pass through the land of Egypt *this night*.' This," he says, "makes the story perplexing and contradictory;" and so he summarily rejects the fuller and explicit narrative, that he may make it really "perplexing and contradictory." There is, in reality, no contrariety at all; for "*this night*" evidently refers, as any ordinary reader would see, to the night of which the preceding narrative of the coming passover is speaking, not of the night of the passover itself. All the verbs, both before and after, are in the future tense, not the present.

And if he will be so senselessly literal, he must see that "*this night*" can no more be, as he says, the next coming night, than it can mean a night of next week; and still less can "*this night*" of the 12th verse, if spoken of present time, mean "*this day*" of the 14th verse; unless he is pleased (which he often is) to turn light into darkness! But now, even if there were some slight difficulty in the interpretation of a single particle, which would be most natural to any honest critic?—to suppose that there might be some error of interpretation, or even some error in the *transcription* of the said particle (and no one pretends that there have been *no* errors of the text), or to take his knife and cut out a whole paragraph of the original document, for the very purpose of giving some semblance of plausibility to his objections? Why should he give exclusive weight to one side, though but a doubtful construction of a single word told for it, and ignore a whole paragraph which, in the most express terms, told against it? There is but one answer that I can give;—that the writer was determined beforehand that the 'Exodus' should *not* be historic; and therefore did, as he is continually doing,—chuse to reject the stronger evidence, and to take up with any quibble in preference to it; and so he sticks by his—particle! I confess I am utterly astonished at the effrontery of this criticism, and feel that it is absolutely indecent to suppose that a bishop could act thus for any purpose, but *lest* of all for the purpose of proving, *per fas et nefas*, or rather *per nefas* only, the canonical books which his vows still bind him unfeignedly to believe, a tissue of incredible fictions! I could as soon believe that one of the right reverend bench had been indicted for "cutting and maiming," as that he would thus "cut and maim" an ancient document in so shameless a way, and for so shameless a purpose.

We have a similar instance of effrontery—or if not, of such incredible carelessness, as to make all arguments of such a writer, about the *accuracy* of any document, altogether laughable,—in his very *first* quotation; I mean that from which he would fain prove that the sons of Pharez (Hezron and Hamul) are plainly said to have been born in Canaan, though they must have been born in Egypt. Taking this for granted, he infers that the chronology utterly forbids the supposition, inasmuch as, if Judah was only forty-two when he went into Egypt, it is incredible that Pharez should have been old enough to have these sons. Into the difficulty in question, on the theory that Hezron and Hamul *were* born in Canaan, I do not enter. The question is *sub judice*, and awaits, like many other minute difficulties, further investigation. Some say that we do not know sufficient of the chronology to determine Judah's age; others, that Hezron and Hamul,

being considered the substitutes of Judah's dead sons (Er and Onan), though born in Egypt, are given as their *representatives*. Into all this, I say, I do not enter: a fair critic, really intent on truth, would say, "Let us further investigate the question, but let us not prejudge it." But observe:—

This critic not only assumes, as usual, that *his* view of the question is absolutely certain, and, as usual, *against* the history, but, that this may be made more apparent, he misquotes the passage. As it really stands, the words in question have all the appearance of being a parenthetical clause, intended to supplement the information respecting the family of Judah. So regarded, it by no means follows, that the sacred writer intended to incorporate Hezron and Hamul with those who went down into Egypt with Jacob at all; and this critic, in citing it, or rather mis-citing it, has altered the construction by leaving out a verb, and thus assimilated the expression to that *one* formula, which is applied throughout the chapter to the sons of Jacob and their descendants, who are *expressly said* to have gone with him into Egypt. The language of the authorized version (closely following the Hebrew) is: "And the sons of Levi; Gershon, Kohath, and Merari. And the sons of Judah; Er, and Onan, and Shelah, and Pharez, and Zarah: but Er and Onan died in the land of Canaan. And the sons of Pharez were Hezron and Hamul. And the sons of Issachar; Tola, and Phuvah, and Job, and Shimron" (Gen. xli. 11-13). Now you will observe that "the sons of Pharez *WERE*" is a different formula from that employed in all the other enumerations. Our critic, however, for reasons best known to himself, omits all that could make it appear a *parenthetical* clause, and quotes thus, p. 17: "And the sons of Judah, Er and Onan, and Shelah, and Pharez, and Zarah; but Er and Onan died in the land of Canaan: and the sons of Pharez, Hezron and Hamul;" and then says—"It appears to me to be certain that the writer here means to say, that Hezron and Hamul were *born in the land of Canaan*;" that is, after having himself destroyed all *appearance* of its being possible to mean something different!*

I hesitate to call this a deliberate falsification of the document, but I know not how otherwise to account for it. The writer could not have taken it from the Hebrew, for the verb he has omitted

* The hypercriticism of the writer is still farther shown by his adding, that Hezron and Hamul were clearly designed to be reckoned "among the seventy persons (including Jacob himself and *Joseph and his two sons*) who came into Egypt with Jacob." Yet he knows perfectly well that the historian never disguises the fact, that he did not mean to say that Joseph and his two sons came down with Jacob, or that the two last were born in Canaan at all! Why, with this open declaration on the historian's part that he is not to be interpreted with this absurd literality, does our critic pretend that it is certain that Hezron and Hamul are to be supposed born in Canaan?

stares him in the face; he could not have copied it from the authorized version; for not only must there have been the change of the construction and omission of the verb, but a total change of punctuation.

If it be a deliberate falsification, I ask you whether it is credible that Dr. Colenso could be guilty of it. Is it not much as if one were asked to believe that the Archbishop of Canterbury had been summoned on a charge of petty larceny? And if it be accounted for by supposing such a resolute *animus* against the Pentateuch that the critic could not even see the words before him, and that his obliquity of mind extended even to his vision, is this bitter partiality on *that* side likely to be the fault of a Christian Bishop, who would naturally see as few difficulties as he could in his "canonical books,"—to a belief in which, while a bishop, he still pledges himself?

Or, to take it on the most charitable ground, and impute it to mere blundering, can you easily suppose that a man of Dr. Colenso's reputation, and writing on so grave and perilous an argument, would thus himself egregiously blunder in his very *first* quotation from a book, the monstrous blunders of which he is about to prove? Certainly, he may easily prove them, if he first makes them; and *this* part of the Pentateuch, at all events, as it stands in the new version of the pseudo-Colenso, is inaccurate enough!

In my next, I will consider his notable hypothesis of the *current* views of inspiration.—I am, yours ever,

VINDEX.

LETTER VII.

November 21, 1862.

MY DEAR FRIEND,—I cannot think it at all likely that a bishop, in these days especially, would jumble together in hopeless confusion, as this critic does, the questions of the *inspiration* and the *historic credibility* of a book; and still less, that he would strain, to the very uttermost, the imputed *popular* views on the former subject, for the very purpose of proving that a book is not only *not inspired*, but is no history at all. This he does by assuming that he may, for the purpose of his argument (but contrary, as I maintain, to the general belief of the Christians of our day), take for granted the indisputable integrity of the text, *as we now have it*; its integrity even as regards numerals; and so bar all possibility of mitigating any of the difficulties which it is his delight to magnify and multiply to the uttermost, by supposing, in some cases, minute errors there.

In so doing he does gross injustice to the argument; and, no less, to the views of almost every one of us who maintain the historic character of the Pentateuch.

I say I can hardly imagine a Christian bishop, at least in our day, acting thus, for the very purpose of *aggravating* difficulties. I can easily imagine

many a Christian bishop drawing very carefully the line of distinction between the questions of plenary inspiration and historic credibility; and showing that, in Tacitus or Gibbon, for example, every part might be true, though not one word was inspired; that even the admission of *some* amount of error in the author himself, would not destroy or appreciably diminish the historic validity of his work; and that where the errors (for errors of that kind there must always be) originate in the accidents of time and the conditions of transmission, they cannot affect the historic credibility of the work at all. I say I can imagine many a Christian bishop carefully defining his terms and weighing his propositions on all these subjects, and his care and caution would be well bestowed.

But I can hardly imagine a bishop's ignorantly jumbling all these subjects together, and then exaggerating the popular views of inspiration, for the very purpose, apparently, of inferring that no difficulty whatever can be supposed soluble by referring it to an error in the text; and that in urging an objection against the historic credibility, he may always rely practically on the inflexibility of the text as we have it.

I repeat, that the critic in all this, does gross injustice to the Pentateuch, and not less to the views generally entertained on the subject of its historic credibility by Christians in general—not one in a million of whom would deny that, whatever the *original* inspiration, or infallibility, or historic credibility of the book, there are and must be many minor errors in the text *as we now have it*, and that, therefore, to urge objections, as if there were *no* such errors, against the historic character of the Pentateuch, is to argue most fallaciously.

I say he does injustice to the views entertained by Christians generally, and I say so for this reason: that I do not know the man,—and I confidently challenge him to find one in a million,—who would be prepared to deny either of the two following propositions:—1. That without supernatural aid, the special miraculous intervention of God, exerted through all ages on the successive copyists of the Pentateuch, many minute errors, by the very laws of transmission, *must* have crept in. 2. That there is not the slightest reason to believe (but demonstration to the contrary) that God has wrought these numberless miracles on the heads and fingers of successive transcribers in all ages, to *prevent* such errors from creeping in. I venture to say that I have allowed him a liberal proportion in conjecturing that he might possibly find one in a million who would deny either of these propositions; and yet, unless he does so, he admits that not only *may* there be, but there *must* be, many minute errors in the text of the Pentateuch *as we have it*, and consequently objections which no more affect its historic credibility than similar errors affect that of any other history. I rather think that not even that solitary witness to the alleged *popular* conceptions of the absolute accuracy of

every syllable in the Bible on whose testimony he lays such stress, would deny the above propositions; for it is doubtless, not of the Bible *as we have it*, that he means that he can assert this absolute accuracy, but as he conceives its text *originally* stood. If any one be prepared to plead for this indefeasible text of either Testament *as we have it*, when we know that there are some thousands of various readings in the Old, and as many thousands in the New, I do not know him, and never yet heard of him.

If, therefore, almost every Christian is prepared to admit that there are, and must be, many minute errors, because variations, in the text, but without dreaming that the historic character of the Book (or even its *original* inspiration) is thereby affected any more than the credibility of other histories would be affected by any similar errors, this writer is throughout libelling their views. And they especially contend that the class of imputed errors which he loves to pet, may be often suspected to be in the text; that is, errors in the *numerals*; from the ease with which *such* errors find their way into all documents; and more particularly into Hebrew, owing to the facility with which several letters, from their close resemblance, may be mistaken for one another. And if, in remote times, not only *words* expressed the numerals (as in the present text), but the letters themselves (being numerals) were used for the notation, many errors,—without perpetual miracle,—would be inevitable.

It may at first sight seem to a sciolist that if there *be* errors,—no matter what the cause,—the argument for the truth, the historic truth of the Pentateuch, is equally affected. Not at all; and for these plain reasons:—1. That he who always reasons on the assumed original accuracy of the text, measures the historic validity of the work by what may be but the error of copyists and printers; while those who contend for that historic validity can consistently assert that, in spite of a certain amount of such error, the historic value of the work is not appreciably diminished at all, far less that every such error can be pleaded against its historic credibility.

2. Everything in the question of the historical value of a work depends on the sources and the limits of its imputed errors; and the one will also determine the other. If the errors be the results of time and transcription, we know by the whole history of literature that they will exist indeed, but fall within very narrow limits; and in no serious degree impair our fullest confidence in the integrity and substantial identity of an ancient writing. A great panic was once felt about the direful consequences of admitting thousands of various readings in the Greek Testament, and of attempting a revision of the text founded on more accurate collation; but it is now seen very clearly by everybody, that all these readings put together do not, as Griesbach truly says, affect the essential

integrity of the text, any more than similar errors affect the text of Plato or Cicero. And the same principles we apply to every *other* ancient work. But if we *take for granted* that all these errors, still more if they be grave errors, are the result of the ignorance, conceit, exaggeration, or fraud of the original writer, it destroys all confidence in him, even where we cannot trace error. Now this critic's eminent want of candour consists in practically arguing as if this admission of inevitable errors, founded on the errors of transcription, and, above all, in relation to the *numerals*, cannot be applied to the investigation of difficulties. He says it cannot be applied to *all* cases, and this everybody will concede; his injustice consists in taking for granted that it can be applied to none; in always assuming that, in the *cases he takes*, he may treat the numbers in the text as those which, without a doubt, originally stood there; and that they therefore imply the original untrustworthiness of the history.

Some cases there are, in which it is impossible not to suspect error in the numbers, arising from the causes above assigned; but they will no more prove the unhistoric character of the Pentateuch in the estimate of any fair reasoner, than similar difficulties will infer the fictitious character of Thucydides or Tacitus. Some of the difficulties connected with numbers, however, are happily neither errors of transcription, nor of the original writer, but simply made by this critic himself; as when he represents, for example, that the Pentateuch absolutely declares that all who came *out of* Egypt were exclusively the descendants of the seventy persons who went down with Jacob. And so in some other instances, which I will point out in a future letter.

This disposition to take for granted the infallibility of his own data,—this habitual determination to see *no* doubts in any of his premisses, where so many have seen them, argues, indeed, the utter want of critical impartiality; but the *direction* of that *no-doubt*—its ever pointing *one* way, that is, to conclusions against the credibility of the “canonical books,” never by any accident for it—is hardly less than proof positive to me, that the writer is no more a genuine Christian bishop than Tom Paine was.

While the admission of possible minute errors in the text (as in a *numeral*, for example) serves completely to neutralize many of the misrepresentations and exaggerations which our critic finds on the supposition that the text is always *indefectible*, and is a sufficient answer, therefore, to many of his arguments; of course, neither that nor anything else can avail, if the hundredth part of the errors he finds, or rather makes, were really the errors of the original writers: the *residuum* of truth that remains becomes infinitesimal. All the supernatural and miraculous narrative must, of course, be at once surrendered; for though this author is pleased to allow that he

finds no difficulty *in the abstract*, in receiving miracles, supposing the testimony which vouches for them historically credible,—can anybody suppose that testimony in this case worth a button, when it is everywhere represented affirming as facts about as true as the “Arabian Nights?” Who can trust those who report *miraculous* accounts, when we find them thus travestying the commonest facts of ordinary life? It is as though we were asked to accept a bill for £10,000 for one whom we could not trust with five farthings! Certain it is, that if any history of Greece or Rome, France or England, were chargeable with anything like the errors which this critic imputes to the Pentateuch, the whole would fall at once into the region of fable. As to supposing it of any value, as this critic still pretends, as a revelation of the highest conceptions of morality and religion, one would as soon think of going to the fables of Pilpay. If we are to go anywhere for them, let us not go to a book which solemnly declares, in every form of adoration and appeal to Deity, that its facts are true, while nearly all are false. And, indeed, why should we go *anywhere*? Is not every man, according to this writer, his own oracle? What need can we have of a Bible, or even of his admired “RAM?”—Yours truly,

VINDEX.

LETTER VIII.

Nov. 29, 1862.

MY DEAR FRIEND,—The whole force of one large class of “incredibilities” in the Pentateuch which this critic has discovered, depends on the following postulates, every one of which is expressly contradicted in the history. Their futility, indeed, it hardly needed history to prove, since the nature of the case, and all human experience in every analogous case, would be sufficient to explode them. They are these:—

1. That the Levitical legislation was intended to apply in every part, to the life in the wilderness,—which it plainly was *not*; nay, much that possibly *might* have been complied with, was, as a *matter of fact*, clearly dispensed with.
2. That even when it was *impossible* to comply with it, that *impossibility* (which has always hitherto been supposed to operate as a complete release from obligation to any law, human or divine, and by the maxims of all lawgivers from Solon to Justinian), is still somehow *not* to be supposed to operate as a release, in the case of the unfortunate Israelites.
3. That *all* the Jews, without exception, would obey the law, when it was possible to obey it; though where any one could get such a notion of the Jews from their history, it is hard to say; but certainly not from the *Pentateuch*! Indeed, it would be a little *de trop* to expect it of any people.

Can you now imagine a *bishop* eagerly burdening his “canonical books” with such gratuitous difficulties as these? Yet so it is with the pseudo-

Colenso ; and a great many of his prime difficulties vanish at once, when we deny these postulates.

As to the *first* : we plainly see that not only was not the rigid observance of every punctilio of the Jewish law imperative in the wilderness, but that one of their most *essential* rites—that which was, in fact, the sign and seal of the covenant (though, for aught we can see, far more easy of observance in the wilderness than many *other* rites), was neglected altogether. I refer, of course, to the rite of “circumcision,” the practice of which, as we see by the book of Joshua, had been suspended.

It is also generally allowed that the Passover had been intermitted ; but as it was probably from *impossibility* of keeping it, that will be better considered in connexion with the second of the above postulates.

The testimony given in Deuteronomy to a general laxity in many parts of the ritual during their sojourn in the wilderness, confirms this representation, and gives the natural explanation. Let us hear it in full, for the very language ought to be a sufficient answer to many of this writer’s sophisms :—“Ye shall not do after all the things that we do here this day, every man whatsoever is right in his own eyes. For ye are not as yet come to the rest and to the inheritance which the Lord your God giveth you. But when ye go over Jordan, and dwell in the land which the Lord your God giveth you to inherit, and when he giveth you rest from all your enemies round about, so that ye dwell in safety ; then there shall be a place which the Lord your God shall choose to cause his name to dwell there : thither shall ye bring all that I command you ; your burnt-offerings, and your sacrifices, your tithes, and the heave-offering of your hand, and all your choice vows which ye vow unto the Lord. And ye shall rejoice before the Lord your God, ye, and your sons, and your daughters, and your men-servants, and your maid-servants, and the Levite that is within your gates ; forasmuch as he hath no part nor inheritance with you.”—(Deut. xii. 8-12.)

Further, we are expressly told that many enactments of the law, as we see also by the nature of the thing, were prospective, and could only refer, as they are plainly said to do, to the settled abodes of Canaan. The formula, too, This or that shall ye “do when ye come into the land,” is of frequent occurrence.

Again : even if there were no such intimations in the history, common-sense would conclude it must be so from the nature of the case ; partly because the system itself was gradually propounded, and must have required time to inure the people to it ; for no system can be fully administered while it is projecting, just as no house can be inhabited while it is building ; partly because its very promulgation was an affair of years ; and partly, again, because by the very supposition, the system was given while the nation was in the

act of migration,—*en route*. Many portions were intended no doubt for present, though *partial* observance, and so far as circumstances would admit ; but signal difficulty of conforming to the ritual,—as in the case of circumcision,—seems to have given indemnity, as we might be sure that with any *reasonable* lawgiver, it would.

But now for the second postulate. Our critic cries :—“Many of the laws were in the wilderness *impossible* to be obeyed.” Very well ; that is the easiest case of all : then they would *not* be obeyed, and nobody would be to blame for it. Necessity not only dispenses with *ceremony*, or any number of ceremonies, but with the *Decalogue* itself.

No law is more binding than that of “loving our neighbour as ourselves,” and *showing* it ; but if the good Samaritan has neither the “ass,” nor the “wine and oil,” nor the “twopence,” the will is at once taken for the deed. Much more in the matter of mere ritual. May we not suppose as much in the case of the law of Moses ? or rather of Him who loves “mercy rather than sacrifice ?”

What can be plainer than that, if, as our critic justly argues, it would be *impossible* to comply with many of the laws in the wilderness,—though intended for observance in future time, and in the permanent abodes of Canaan,—such impossibility was, *per se*, a sufficient excuse for not observing them ? All this we should reasonably expect from any legislator in his senses. And this granted, at once vanish many of the stupendous yet utterly absurd difficulties which our pseudo-Colenso has conjured up ; unless, indeed, the reader choose to suppose Moses, or rather God, harder and more inexorable than the Egyptian taskmasters themselves.

How, he asks, how, in the name of wonder, could the Israelites in the desert procure the 264 pigeons *per diem*, or 90,000 annually ? or, if they were offered, how could *three* priests (here, by the way, he assumes there were *but* three, of which more anon) eat them ? Why, as he insists with arithmetical accuracy, it is 88 per day ! Well, if the pigeons were not to be had, it is certain that the people could not offer them, and would have abundant reason for *not* offering them ; and there is an end of *that* difficulty : and as three priests could not eat them, sure enough, so they would happily *not* have them to eat ; and that rids us of another difficulty. Or does this writer really mean to say, that the Jewish legislator was so much worse than Draco, as to punish disobedience when it was impossible to obey ? or worse than the tyrant from whom Israel had just escaped,—who, at all events, did not demand bricks without *clay*, though he did “without straw.” Would Moses, or He whom Moses represented, demand that pigeons were to be offered whether pigeons were to be had or not ? HE, who expressly says that his equitable prin-

ciple is to exact obedience only where it is possible to pay it; and who has told us, that "a man is accepted according to what he hath"—pigeons or what not—"and not according to what he hath not."

When the mayor of a French town apologized to Henry iv. for not firing a salute in his honour, by saying that "he had no artillery," it was at once accepted as a release from all obligation in the matter; and though the mayor, who seems to have been as stolid as our critic, is said to have wished to give nineteen other good reasons for the omission, his majesty was pleased to be content with this one. According to our pseudo-Colenso, God is not half so reasonable as Henry iv.—If the critic had been Henry iv., he would doubtless have demanded the salute, though there was no artillery; or at least the remaining nineteen reasons for the omission!

Similar observations apply to the assumptions (they are nothing more) that the Israelites must, according to the story, have had, *throughout* their sojourn in the desert, prodigious herds of cattle to supply the imagined continual demands of sacrifice. If they had, he argues, how could such multitudes of cattle be fed? and if they had not, how could they complete the toll of victims? Who, but a man determined to make out a case, could fail to see that the one difficulty answers the other? If they had not cattle for all the sacrifices, all the sacrifices were not offered; if they had all the cattle, then all the cattle must have been somehow fed. In the former case, as before, the involuntary *défaillance* would, from the nature of the thing, meet with the usual indulgence.

I think it highly probable that the Israelites had but little cattle after the first year, till after the conquest of Midian; that is, till they approached the end of their pilgrimage. Everything shows that between the passover in the second year in the wilderness of Sinai, and that on the cessation of the manna, that is, during thirty-eight years of their wanderings, the passover was intermitted, and perhaps many other rites involving sacrifice; on which a few more words presently. Certainly, few allusions to cattle are to be found after the first year or so, till the closing years of the pilgrimage in the desert. It appears they had much cattle when they set out; they had much towards the end of their desert sojourn when they had "spoiled the Midianites;" and they had doubtless *some* cattle during the whole period, but there is no proof that they had many. Now, it is curious that during the interval in question, and after the manna began to fall, little mention is made of cattle; which could hardly have failed to be otherwise had they existed in any considerable numbers, so as to be the prodigious encumbrance our critic's interpretation supposes. Possibly, as the passover demands in Egypt would seriously diminish the reproductive power of the flocks (as this very critic suggests *must* have been

the case), so the only recorded passover in the wilderness (that at Sinai) may have very opportunely (not to say designedly) operated in the same direction, and made their *stock* in something like proportion to their scanty pasturage.

As to the intermission of the passover, that is generally admitted; and both that, and the probable suspension of many of the sacrifices, may be argued from a number of "undesigned coincidences" in the Pentateuch, which I commend to the diligent attention of some future editor of Blunt's admirable little work. Everything would seem to point to this conclusion. For example, if they had but scanty flocks, we need not wonder that no observance of the passover is mentioned; the passover would drop from *necessity*, and no one could be blamed for it, on the principle already laid down. Another like cause would seem to *necessitate* the intermission; they were commanded to keep the passover with *unleavened bread*; now, as long as the manna fell, they had no bread. In harmony with all this, there is, as I have said, no allusion to a passover during the fall of manna; and when we next hear of it, it is in connexion with the cessation of manna and the resumption of corn bread. (Joshua v. 10-12.) At the same period, the avowedly intermitted rite of *circumcision* was restored. And *that* again would seem to intimate the previous suspension of the passover, because, by *express law*, only the males who were circumcised were permitted to partake of it. This last rite was expressly laid down to be an essential preliminary to a participation in the other. Again, the intense longing for "*flesh*," as a new variety of diet, after they began to "loathe the manna," would also seem to indicate that the people had then no large herds of cattle with them. "But now our soul is dried away," said the people; "there is *nothing at all, besides this manna, before our eyes*." Numb. xi. 6. These and other allusions, all of them casual, picked up here and there, dropped "undesignedly" in the midst of other matter, but of course all the more striking on that account, favour the twofold concession, that during the period in question, the cattle of the Israelites were few, and that the passover, and probably many of the rites involving sacrifice, were omitted. By the way, if few herds and no corn necessitated the omission of the passover, must they not have diminished many other offerings? How many imperatively required meal and wine and oil! And I apprehend the "shewbread," too, was not made of manna.

It would not, perhaps, be very extravagant to suspect that the suspension of many of the rites was not only necessitated by the privations of the strictly penal sojourn in the desert—an abnormal condition, into which their rebellion alone plunged them,—but was designed also as a part of the punishment of that contumacious generation, whose carcasses "fell in the wilderness." It may well be suspected, at any rate, that it was not among *them*

that the Mosaic dispensation was to be administered in all its completeness and splendour.

But be this as it may, everything in the history—express declarations, obvious facts, necessary inferences, oblique allusions—all show that the Levitical dispensation not only never was carried into effect, but was not even intended to be carried into effect more than partially, in the desert. Yet the contrary is the theory of our critic, and his very chiefest objections vanish with it.

I have mentioned above, his assumption that there were but *three* priests. It is an assumption, and nothing more. It does not follow because no others are mentioned, that there were none. It is only by accident that the son of Eleazar is mentioned; but Ithamar may have had sons too. At any rate, the grandsons of Aaron would be quite old enough to have sons of an age to enter upon the priest's office long before the close of the forty years. Certainly there were more than three when the people passed over Jordan and approached Jericho, for we find there were seven,—and the language suggests that there might be more than seven,—who were employed to “blow the trumpets” at the siege of that city. It is precarious to conjecture merely from the silence of a writer.

But even if the priests, technically so called, were limited to *three* at first (though we are certain from the fact just mentioned that at the later period there were more), the difficulty is entirely an arbitrary one, and may be effectually met by the very considerations by which this critic manages to answer, unwittingly, his own objections. If, as he so unanswerably proves, there was no pasture for more than a few sheep and oxen in the wilderness, the priests' principal functions nearly ceased of necessity, just as *circumcision* did, without any one being blamable or being blamed for it; so that the three priests may really, for aught we know, have had a rather easy time of it, instead of being overwhelmed with the superhuman toil which our critic loads them with. On the other hand, even if there were a million of cattle and ten millions of pigeons, and only three priests at one time, then, on the same principle as before, namely, that God expects nobody to perform impossibilities, the said priests would no more be called to eat, each, *eighty pigeons per diem* in this case, than the people to *provide* them if they were not to be had. The sacrificial services, like the rite of *circumcision itself*, would be in that case suspended.

And, lastly, if the services that were not permitted were beyond the power of the three priests to perform, we may be certain that, as in all like cases,—I do not say of *Divine*, but of merely human administration,—extra-official help would supply a deficiency of the proper functionaries; and as in the Chronicles we find, for that very reason, that the Levites, on certain occasions, helped the priests, so it may well have been the case at an earlier period. The critic says, indeed,

that we do not *read* of any such arrangement at that time; and with other solutions of the difficulty, we do not need it. I would only remark, on this point, that when an author is *silent*, we need not fill up the gaps (if we must or *will* conjecture), by supposing something which makes him an idiot, and is foreign to all the analogies in the administration of all laws, human and divine; least of all in interpreting a system purporting to be enjoined by Him who expressly avows that He loves “mercy better than sacrifice,” and prefers the “spirit” to the “letter.”—But, in truth, we do not need the solution. With the Levites to perform all the menial duties of the tabernacle; with its other duties limited by the necessary circumstances of the life in the wilderness, as plainly indicated in the narrative; and, lastly, *waiting* proof that the priests were only three,—I am not alarmed by our critic's statement of the prodigious labours of these overtaken functionaries, and am quite *certain* that, if, as he suggests, it was *impossible* for the people to get the 90,000 “turtle-doves or young pigeons” *per annum*, they were not obliged to offer them.

Lastly, as another postulate,—a necessary condition of the full complement of his difficulties,—our critic implies that all the exactions of the law, however various and troublesome, would, when possible, be sure to be most conscientiously paid by the Israelites; rather a modest demand on behalf of that very generation who were, at that moment, suffering the capital penalty of uttermost ingratitude and rebellion! We shall next have him supposing that the laws of England, even to the very least minutiae, are all conscientiously observed by our “tickets-of-leave.” If he asks, as on one or two occasions he does, whether we can suppose the Israelites could refuse to obey the voice of God himself, I must answer, first, that the history teaches us that they *did*; and, secondly (as Warburton said to Bolingbroke, when he urged a like objection), that we need not wonder at it, since all men in all ages have been doing the same, and that in the case of laws which they not only *confess* to be Divine, but infinitely more momentous than any laws of ritual can be.

And now, is it easy to suppose that a genuine Bishop would feel such spite against his own “canonical books,” as to insist on these perfectly gratuitous postulates for the very purpose of making them appear incredible; and, above all, blindly insist on difficulties, even when they actually destroy and neutralize one another? So few pigeons, if any, to be got, and yet the priests having to eat so many! However, it is well when an objector is blind enough to take this course. He is like the poor woman at “Crocodilep,” in Southey's ballad, who killed the young “Prince Crocodiles,” by thrusting

“The head of one into the throat of another,
And made each Prince Crocodile choke his brother.”

Yours truly,

VINDEX.

LETTER IX.

Dec. 4, 1862.

MY DEAR FRIEND,—How shall I characterize the unexampled absurdity of this writer in pressing popular language to death, for the purpose of making difficulties where no mortal else would feel any? Can you imagine that, for this object, a Bishop of the Church would insist on interpreting the Bible as we may be certain neither he nor any one else would interpret any other book? Instances of his more than Voltairian intrepidity, in inventing objections in this way, you have in his Chapters iv. and v. For the former;—in Lev. viii. 1-4, on the consecration of Aaron, it is thus written:—"And Jehovah spake unto Moses, saying, Gather thou all the congregation together at the door of the tabernacle of the congregation. And Moses did as Jehovah commanded him. And the assembly was gathered unto the door of the tabernacle of the congregation." The congregation, then, assembled at the door of the tabernacle; and he wants to know if we are really to suppose that the whole 600,000 grown-up men were there? He *does* seem to think, indeed, that the whole 2,400,000 might be fairly (if he were not somewhat indulgent), demanded in the expression; and, indeed, on his principle of *literal accuracy*, I do not think he ought to let Moses off with less than meaning to include every sucking-child among them! However, to take the assembly at *only* the 600,000 and odd "adults in the prime of life." In accordance with the third most modest postulate of which I have already spoken, he is bent on "supposing that all the congregation of adult males had given due heed to the Divine summons, and had hastened to take their stand, side by side, as closely as possible, in front, not only of the *door*, but of the whole *end* of the tabernacle in which the door was." Generous concession again of more space than might be granted! And, first of all, he proves that, if they were at the door of the tabernacle, that must mean that they were *within* the court; and as this court, by his own precise measurement, could not be more than 1692 square yards, he asks, and surely with reason, how could 600,000 men stand within it? He might have dispensed with all this, if he had but chosen to remember that not one of the 600,000, except the Priests and Levites, were permitted to enter it at all, on pain of death. To be sure, it would *still* be on pain of death, if the whole 600,000 were crammed into it, for the "Black Hole" of Calcutta would be infinite space to it. I say he has *chosen* to forget the above restriction; for, in another mood, he seems to remember it too well (p. 123), and to make the prohibition extend, not only to the people in general, but *also* to the Levites; that is, he lets into the court those who were forbidden to go, and shuts out those who were *not* forbidden; but, of course, for the purpose of proving the Pentateuch fabulous, all is lawful! Well, supposing the court "tabooed" (I will

also suppose the curtains, which surrounded it, raised for the sake of enabling the folks to see the ceremony), our author then proves that if the crowd stood abreast, not only the width of the *doors* of the tabernacle, but even the width of the whole *end* of it, they would extend twenty miles; and if the whole width of the *court*, no less than four miles! He then innocently wants to know whether all could have heard Moses' words, or been intelligent spectators of the ceremony? Why, no; the farthest ranks, I think you will grant, could not even have seen Moses, unless they had good telescopes, of which, as our critic might say, the Pentateuch says nothing. But was ever anything more absurd? When a community is invited to become spectators of a public transaction, and it passes in the name of the community in virtue of those who *are* there, is any one so ridiculous as to suppose that every soul that was invited, or that even *might* have attended, *has* attended?

When it is said that the county of Kent met on Penenden Heath, does any one argue that it is false, for not a hundredth-part of the population was there? And so in a thousand cases. Multitudes would as usual be absent from really good and sufficient reasons, and multitudes of people more, because indolence and other causes told them there were good and sufficient reasons; many more, doubtless, because they did not choose to go. Our author, to be sure, takes it for granted that the Israelites were so unlike all other people, or rather, so unlike *themselves*, that there was not a soul of the 600,000 who would neglect so plain a summons of duty! As if all mankind do not often neglect what they themselves own to be the unequivocal voice of God speaking within them.

Not only would the business be transacted, as usual, by those who were present, and who were representatives of the rest, but, for aught we know, their "elders" and "captains of hundreds and thousands" might be the commissioned representatives of the rest, and the language would still be perfectly in accordance with common speech.

But how does our author triumph (Chap. v.) when Moses and Joshua are said to have addressed *all* the congregation—the *whole* congregation! What can "*all*" and "*whole*" mean less than all the men, women, and children,—sucking babes into the bargain?

Now, as he truly says, even the "cries of the babies in arms in an assembly as large as that of London," would have drowned the voice of any speaker. I should think so. The only absurdity in the thing is that any one should be absurd enough to suppose the author of the Pentateuch (who was at least no fool), to mean any such absurdities.

"All the world knows that;" "All the world is gone after him;" "Peter the Hermit precipitated all Europe on Asia," says one historian; "All London flocked forth in a paroxysm of returning loyalty," says another; "All Paris was crowded into the Champs de Mar," says a third. No sooner

is anything of the sort said, than a critic of the pseudo-Colenso type asks whether it can possibly be true, that all the lying-in women and new-born babes were included? because if not, the statement is not historic. Whether we can even suppose all the hospitals and prisons emptied on the occasion? Whether it can be seriously meant that all the houses were absolutely deserted, and not a kitchen-fire smoking, or a joint of mutton cooking, on that memorable day? It is a pity our author did not consult a concordance to see how many more absurdities he might have made out of this popular use of "all," and the like words, in the course of the Pentateuch. Thus we are told, that "all Israel stoned Achan." It would have been interesting to learn from our mathematical pedant, how many cubic feet of rough masonry were thus piled about poor Achan by the entire 2,400,000; getting his average somewhere between the pebble (thrown, of course, by proxy) contributed by the new-born infant, and the "lump of a two-year old" (as Miss Edgeworth's Irish witness would say), thrown by the stalwart arm of one of "the mighty men of valour!" Very superfluous was it for the historian to add, "And they raised over him a great heap of stones unto this day." If they did so, after pitching 2,400,000 stones into him, at him, and on him, it was certainly a work of supererogation.

But to return to Joshua's instructions to the whole congregation. Not only would most persons suppose the conditions of the narrative satisfied, if "the heads of tribes," "the elders of the people," "captains of hundreds, and captains of thousands," if, in short, a large assembly, represented the nation, and communicated the words of Joshua by the regular means organized for that purpose; but not only so, I say, but the reader may see, that we have in other passages an easy key to the true and natural interpretation of the terms thus strangely tortured and wrested. Thus we are told, Ex. xix. 3-8: "And Moses went up unto God, and the Lord called unto him out of the mountain, saying, Thus shalt thou say to the house of Jacob, and tell the children of Israel; ye have seen what I did unto the Egyptians, and how I bare you on eagles' wings, and brought you unto myself. Now, therefore, if ye will obey my voice indeed, and keep my covenant, then ye shall be a peculiar treasure unto me above all people; for all the earth is mine. . . . These are the words which thou shalt speak unto the children of Israel. And Moses came, and called for the elders of the people, and laid before their faces all these words which the Lord commanded him. And all the people answered together, and said, All that the Lord hath spoken we will do. And Moses returned the words of the people unto the Lord."

"The journey to London," says Macaulay, speaking of the restoration of Charles II., "was a continued triumph. The whole road from Rochester was bordered by booths and tents, and looked like an interminable fair. Everywhere flags

were flying, bells and music sounding, wine and ale flowing in rivers to the health of him whose return was the return of peace, of law, and of freedom." What havoc would such a critic as the pseudo-Colenso make of such language! "Thirty miles of booths!" he would say; "Wine and ale flowing in rivers! Who can believe it?"

It is a great comfort that the critic has at present left the sublime poetry of the Hebrews (with one slight exception, perhaps, which I may notice in another letter) untouched; he has not brought his tailor's measure, with its tenths of inches marked off, to see whether those great bards habited their thoughts in a sufficiently precise and close-fitting dress. "The sound of a shaken leaf shall chase them," says the Pentateuch, in the briefest and sublimest image which can express the uttermost effect of panic terror. Such a critic as this would say that he really could not credit it; for if it were true, a moderate-sized oak, judiciously planted on a gusty autumn day, would rout the largest army ever brought into the field!

In truth, the mode of interpreting ordinary human language indulged in by this critic, would, if it were at all common, deserve to be considered a sort of disease: it should be called "Delirium Arithmeticum" or "Mania Pernumerans." If men were commonly pestered with it, it would be misery to open one's mouth. To interpret speech, with no power of taking the meaning from popular usage, from the context, from conditions founded on the supposition that we have imaginations as well as the noble faculty of counting our fingers, bespeaks a man devoid of common sense. If language were used as this critic would seem to require Moses to use it, not only would all natural freedom of style be destroyed; not only would it necessitate a most strained, and after all, vain attempt at absolute and literal precision, compared with which an Act of Parliament would be eloquence; not only would it destroy all trope and metaphor, and the beauties of figurative language generally; but to talk at all, would be an intolerable nuisance. Hardly a phrase could come out of our mouths, of which we should not be expected to give an exact limitation, in order to satisfy some soulless and brainless Aristarch, and prevent his concluding that we were as great idiots as himself.

In short, there is no end of the absurdities which may be fastened on anything spoken by man in the ordinary language of men, if the "delirium arithmeticum" but once take possession of the critic. He will be as much at a loss as Peter Simple, who, when the coachman touched his hat and said, "Please remember the coachman, Sir," replied, "Remember you! Certainly I will try, if it will give you any pleasure." "The lad's a fool," very naturally muttered the coachman. Some suppose that the extreme form of this bondage to the "letter" is now and then an effect of too exclusive devotion to the mathematics. If so, it is the hardest thing one can say of the mathematics. But if it

were a genuine effect of the study (which I do not believe), I should be disposed to alter the old proverb, and, instead of saying "There is no fool like an old fool," say "There is no fool like a mathematical fool."—Believe me, yours truly,

INDEX.

LETTER X.

Dec. 8, 1862.

MY DEAR FRIEND,—I see that many of the periodicals have noticed the book ascribed to Bishop Colenso; but I cannot say that the way in which they do it, at all convinces me that *he* wrote it, or any Christian at all. You will observe that all of them, that have the slightest proclivity to scepticism, are shouting, "Io Triumphe!" and the more loudly, the stronger those proclivities are. On the other hand, all that reverence the Bible are full of indignation that a Christian bishop should have written such a book. If they were as charitable as I am, they would have considered those very phenomena an indication that it was not written by a Christian bishop. When did a Conservative candidate catch none but the Radical votes? But I proceed with my own reasons for doubting; and amongst the strongest is the singular disingenuousness (I really should be sorry to suppose any *ordinary* sceptic, much less a Christian bishop, guilty of it) in the account of the Exodus itself. The wildest possible license both of *suppression* and *invention* of facts is there indulged in, in order to give an impression of the utter impossibility of that event. Our critic not only supposes that the "passover" is represented as originally instituted, the lamb got, cooked, and eaten on the very night of the Exodus itself, but that in that same night the people (2,400,000) called in all their flocks and herds (2,000,000) from the whole country, mustered at Rameses, and journeyed the next morning over the arid and stony track to Succoth; and that the story even requires that we believe that "infants and young children" performed this same feat—"twenty miles a day on foot!" (page 47.)

Now, on the hardihood with which he has expunged from the text the full directions for the passover, given nearly a fortnight before, in order that he may more deeply colour this fiction of midnight confusion, I have already commented. But even passing by that, his account is as complete a fancy piece as ever a novelist indulged in. Supposing any truth in the history at all, is it possible to imagine that the Israelites knew nothing of their coming deliverance till the night of the Exodus itself? Must they not have been living in instant expectation of it for weeks? Does not the third chapter of Exodus expressly commission Moses to tell the people that the day of liberation drew nigh? Does not the sixth chapter renew that commission? Could they witness in stupid indifference successive judgments, ever increasing in severity, which were not only to make the Egyptians *willing to let them go*, but

eager to *thrust them out altogether*? If these plagues really took place according to the history, were they without significance, so that when the last plague fell, the people were all comfortably asleep, and roused as suddenly as the Bishop of Natal (such is the judicious parallel of this critic) in a midnight rumour of an utterly unexpected raid of Zulus? Our critic may say, perhaps, that he does not believe Exodus vi.; does not believe that ever the plagues occurred; hardly believes a word of the history; and, I have no doubt, he would speak most truly. Very well; let him say so then; but let him not argue that a narrative, as it stands, is inconsistent and incredible by just taking his pen and scoring out statements that *make* it consistent, and then filling up the gaps *ad libitum* with any whimsies of his own, which shall make it seem otherwise. Yet this is just what is done in the present case. His description is all a bubble blown out of the simple words, "And the children of Israel journeyed from Rameses to Succoth, about six hundred thousand on foot, that were men, besides children. And a mixed multitude went up also with them; and flocks and herds, even very much cattle." While our critic has invented all imaginable details, which may in any way tend to render the story incredible, the simple narrative itself tells us next to nothing, except the fact; and this is supplemented as he pleases. With characteristic effrontery, he rebukes Kurtz for supposing that there may have been pauses between Rameses and Succoth. Has our critic any more right to say there were *none*? The simple truth is that the history leaves us wholly to conjecture in this matter; and our critic has certainly abused this privilege to the utmost. But then, that these purely gratuitous conjectures should always tell *against* the veracity of the Pentateuch, never in what may explain or diminish a difficulty, is what I cannot reconcile with the character of the reputed author. The fact is, that, for aught we know, the Israelites may have been several days about their journey to Succoth; we do not know that they *all* mustered, men and cattle, at Rameses, or in what lines of direction, or in what proportions, or at what intervals between different detachments, they fell into the march; still less that all was compressed into one day's work. One thing at all events is certain,—*our critic proves too much*. If his objections, on the score of confusion, inconvenience, and distress, the presence of the "sick, aged, infirm," and so on, is to be taken for a demonstration that the thing could not be, it is certain that many an event of authentic history,—the extensive deportation of ancient nations under the great oriental monarchies, Scythian and Mongolian migrations, the migration of the Helvetii, so particularly described by Caesar,—may also be pronounced impossible. It is not to be forgotten, indeed, that if there be any truth in the narrative at all, the Israelites were under miraculous guidance and pro-

tection; a fact which our critic always forgets, or more properly speaking, would, I daresay, deny; but even apart from that, it is little except his own fancy which makes the Exodus more difficult than many of the great migrations of history just referred to; for all of them must have been cumbered with sick, lying-in women, and sucking babies, more than enough. That it was, doubtless, attended with many incidental straits and hardships, we may well believe. Does the Bible say it was without them? Does not the narrative imply it? Did not the people, under the pressure of hunger and thirst, often look back with ungrateful regrets to the bondage they had left? Were they not willing to barter their liberty and all its privileges, if they could but have got back to the leeks and garlic and full flesh-pots of Egypt?

Our author asks, what did they do with the sick, lying-in women and children?

It is sufficient for us to say we do not know; we only know, *first*, that the story has not a syllable about their travelling twenty miles on foot, as he foolishly says it *requires* us to believe; *secondly*, that whatever the means of transport for such as required it, the difficulty would be no more insuperable than similar obstacles in the way of other migrations; and, *thirdly*, that no migrating nation, probably, had half the facilities for such a movement, if there be any truth in the history at all—such a *vis à tergo*—as the Israelites had on that occasion. After such a series of plagues, and such a crushing calamity to conclude them, the Egyptians would be willing to give not only “jewels and ornaments,” but anything on earth, to get rid of such guests; and probably never had so welcome a sight as their backs. Horses, mules, wag-gons—the whole power of the kingdom at such a moment would have been at the disposal of the exiles, if necessary. I pretend not to say *how* the details of the Exodus were managed; for the history is silent. I only say that, taking the relations between the two nations to be what the narrative represents them, such a mode of supplementing the silence of the narrative as that just suggested, is infinitely more probable than our critic’s whimsical inventions, of the people all being roused at a moment’s notice, and lying-in women and children going twenty miles on foot! The former goes on what only were *likely* to be, but *must* have been the feelings of the Egyptians. The Israelites could not be in so much haste to go, as the Egyptians, that they should be gone; “For we be all dead men,” said they. By the way, I wonder our critic did not take that literally, and prove that the history says that the Egyptians spoke after they were all dead! But I must notice one example of the kind in this connexion.

“Having done all this,” he says, speaking of the prodigious toils he has crowded into the passover night, “they were started again from Rameses that very same day, and marched on to Succoth, not leaving a single sick or infirm person, a single

woman in childbirth, or even a ‘single hoof’ behind them” (page 62). Thus, as usual, he takes an eloquent metonymy, in which Moses expresses the demands of Jehovah to Pharaoh, “Our cattle also shall go with us: *There shall not a hoof be left behind*,” in strict literality; and would doubtless think the whole history invalidated, if he could but find that a single Israelitish cow had gone astray!

In short, I think our pseudo-Colenso’s “new version” of the incidents of the Exodus, one of the most remarkable efforts of disingenuous perversion of a narrative I ever read. I cannot think that a bishop of the church—whose whole tendencies and bias *must* be, if only in respect for his position and ordination vows, in favour of retaining as *much* of the narrative as possible—would thus go out of his way, and with evident *empressement*, not only to interpret, but supplement, the history uniformly in the sense least favourable to his sacred books.—Believe me, yours truly,

VINDEX.

LETTER XI.

Dec. 15, 1862.

MY DEAR FRIEND,—I know not how to ascribe to Bishop Colenso, or to any other Christian man, or indeed to any *candid* opponent of revelation, the perfectly arbitrary and self-sufficient way in which this writer sets aside every consideration which can bar the way to his grotesque conclusion, that every Hebrew mother, if the history be true, “must have had, on the average, forty-two sons!” I count it absolutely certain that nothing but a previously strong bias in favour of a foregone conclusion, could have induced him thus summarily to set aside all such considerations.

Still less can I believe that any one, or at least a man with anything like mathematical reputation, (and Bishop Colenso is a mathematician, if he be nothing else), would have fallen into such a blunder, even in the application of his own hypothesis. For, on the very same principles, we may prove that every *English* mother (and we have had no Pharaoh to massacre any male children among us) must have at least from twenty to thirty children!

But I will first briefly mention the by no means unreasonable mitigations of the difficulty about the “First-born,” which not only orthodox interpreters (whose solutions this complainant critic is so fond of contemptuously stigmatizing as utterly futile and untruthful), but modest Rationalists, have suggested as probable. One obvious thing is, that it is *possible*, on the principles already laid down in a previous letter, that we may not be in possession of the true numbers originally in the text, and that some such errors may lie at the bottom of the difficulty. This is, of course, not for a moment to be thought of; for whenever a *difficulty* is to be proved, no one can exceed our author in his solicitude to retain the text.

Again; Michaelis, who is not very conspicuous

for his orthodox proclivities, suggests that the "first-born" of the *father* is intended; and that, therefore, if polygamy prevailed, or to whatever extent it did so, there might be several first-born of mothers, in the same family, and yet only one first-born of the father and the mother both. If this be inadmissible, then there must be supposed many "first-born" in the same family; inconsistently, at least, with the legal and technical sense in which the term is used, when determining the rights of primogeniture, in the case of the first-born of two separate wives (Deut. xxi. 15-17). This, too, must go for nothing. Yet it is certainly probable enough to prevent any *candid* mind from being absolutely confident that it is false.

Again: Rosenmüller (no hot partisan of orthodoxy), and many others, conjecture that the HEADS of families, though they might be "first-born" themselves, were not reckoned among the "first-born;" and this *seems*, at all events, a not improbable thing in itself. Certainly, if such restriction were not acted upon, "Moses and the princes," who conducted the census, must have had many odd and puzzling cases to decide. There is an old gentleman of eighty, for example, whose father and mother, having early left him an orphan, have been in the grave for more than half a century, and he does not know whether they had an infant son or daughter before him or not; what is to be done with *him*? Another of seventy, whose parents have been dead forty years, fancies that he has heard that his mother had a still-born child, but can't be sure; if not, he is a first-born. Another of sixty had a twin-sister, but which of them came into the world first he cannot say, father and mother, doctor and nurse, having long since gone the way of all flesh.—If any one were asked to find out how many living first-born sons there were in the families of a village, I rather think it would not strike him to set down old men of seventy or eighty, who had been first-born sons, but whose fathers had been buried a score or two of years before, and who had first-born sons of their own in the prime of life. However, though this principle would seem a tolerably reasonable one, it is as summarily set aside, for no reason that I can find, except the usual and all-sufficient one,—it will mitigate a difficulty.

Another element for diminishing this objection is the fact mentioned by Kurtz, that the "first-born," according to the law of population, is more frequently a *girl* than a *boy*; and that, therefore, the proportion in which there would be first-born sons would suffer a further diminution. Will it be believed that, in his eager desire to throw aside everything that can be urged in favour of the Pentateuch, he seems to hint a doubt whether *this* natural law can have operated among the children of Israel:—"But in the case of the Hebrews, according to the story in the Pentateuch (whatever may be the case generally), the first-born was much more frequently a male than a female" (p. 86).

This is pretty well in one who, everywhere else, proceeds only too absurdly to judge in those far distant times and regions by modern parallels, and adjusts everything to the meridian of *London* and the nineteenth century. However, I daresay he knows well enough the greater importance attached to the *male* progeny throughout the whole of the Old Testament, and that it by no means implies that there were more sons than daughters, because the latter are less frequently mentioned. We should never have known that Moses had an elder sister, and that neither he nor Aaron was a "first-born," had it not been for the narrative of his rescue by Pharaoh's daughter.

I do not indeed intend to say, that all, or any, of these elements of solution may be regarded as demonstrably true; I only say that they are very probable, and, coming from such men as they do, no impartial investigator of truth, no man with the slightest particle of modesty, would summarily dismiss them all, as not "of any use whatever for the purpose of relieving the difficulty."

But let us look at the results obtained from his own data. The males of twenty and upwards, he says, were 600,000, and we must add about 300,000 for those under that age; about 900,000 in all. Very well; then divide 900,000 by 22,273, the number of the first-born, and it follows, it seems, that each mother must have had, on an average, forty-two sons! If one takes the 900,000, it will be forty and a fraction (if we must fall in with our author's exact humour); but if a woman has forty children, the fraction, I suppose, is of little consequence, more or less. Now, it is true that, according to this calculation, there might be, on an average, only one first-born to about forty-two males; but it remained for this critic to suppose that that is the same as saying that every *mother* must have had forty-two sons! For what can be more ridiculous than such a calculation? All it shows is that our author can at least work a long division sum; that 900,000, divided by 22,273, will give some such result approximately. But is it not obvious, that since every family in which the "first-born" son was dead, however numerous the *rest* of the males; every family in which the first-born was a daughter, however numerous the *brothers*; every family in which the infant, though a male, was under a month old; and every family in which the eldest was the son of a widow, were, as regards this census, thrown out of the reckoning altogether, though their males formed *part of the population*, the number of mothers cannot be the same with the number of the first-born sons? All the males, our wise critic says, must be placed under *one or other of the mothers of these 22,273!* What makes the fallacy more ridiculous is, that he has in this very chapter suggested the two principal exceptions. "Except," he says, "of course, any cases where the first-born of any family was a

daughter, or was dead, of which we shall speak presently," p. 84. "Except!" but these exceptions vitiate the whole calculation, and if set aside, will allow us to say that every English mother has, at least, from twenty to thirty children; ten or fifteen sons, and ten or fifteen daughters! If any one will take the trouble to calculate among any one hundred families, even on this writer's premisses, he will find the result will a little surprise him.—I will try it upon a chance case. There are five families, all within about a stone's cast of where I am writing, and presenting about the varieties we generally find in our population. The first family consists of twelve, —seven sons and five daughters; but the eldest is a daughter; the second consists of four sons only, and the eldest being a son, there is therefore one first-born; the third, of six,—five sons and one daughter, but the daughter again the eldest; the fourth,—of three sons and one daughter, but there was another, a son, who was still-born. The fifth, a couple who were recently married, and have one little boy, but under a month old. Of the five fathers, an old gentleman of near seventy is also a first-born; and if, as Michaelis and Rosenmüller conjecture, he ought not to be reckoned (I think he could prove that he was a first-born, if put to it), here are, counting the five fathers, twenty-five males; and, counting the five mothers, thirteen females—thirty-eight of the population, and only one first-born among them; and, according to the reasoning of this critic,—that "each of the males must have had one or other of the first-born males as the first-born of his own family,"—the mother of *this* first-born had twenty-five sons! Even if the first-born father be reckoned, there will but be two "first-born" to thirty-eight of the population. Some of our more scurrilous prints (as this reckless writer might have anticipated) have made themselves very merry with his grotesque deduction as to the prolific character of the Hebrew mothers; they may, on similar principles, make merry with their own; and prove that every English mother is (to use Burke's language on another subject) "the sow of imperial augury," with her litter of thirty offspring about her.

It may be said, perhaps, that it is not so absurd to represent every English mother with ten or fifteen sons (besides daughters), as to represent her with forty sons. Why no; but impossibilities of any dimensions are equally good for a *reductio ad absurdum*; and show clearly that the principle which leads to them must be an absurd one.

Our critic has the effrontery to add, that though every family which has a daughter for a first-born is to be deducted in the manner above mentioned, it will not affect the calculation; that if an equal number of first-born daughters be supposed, then there will be in all 44,546 first-born (sons and daughters) in all, and each mother will still have forty-two children,—twenty-one sons and twenty-one daughters.

He forgets that if he is to deal with the first-born "daughters" as with the "sons," then every family into which a son is first-born (however numerous the daughters), will have to be referred to some other mother; as also, every family in which the first-born, if a daughter, is *dead*, or any in which the first-born, when a daughter, is *under a month*; that is, we shall not have in either case the true number of the mothers at all determined by taking the number either of first-born sons or first-born daughters, *on the principle of this census*.

If, now, every first-born taken in families, excluding the heads, would, even in our country, represent from twenty-five to thirty of the population, how would it be if we had polygamy among us, and only he who was "first-born" both of father and mother was reckoned? and if also we had had a Pharaoh for a few years, making a massacre of the male children for the purpose of keeping down the population? The author allows that this last *might* tell on the result, and he makes a perfectly arbitrary and precarious deduction for it. We know not *what* it should be, and therefore any such ratio is perfect guess-work; but it is not unreasonable to infer that the number of "first-born" might represent in such a case not only twenty, but double the number of the male population.*

It is not the part of the Pentateuch to teach us social statistics, but many facts are presented there, which are well worth further investigation, as curious vouchers for the authenticity of the narrative. Thus the ratio of the entire number of the tribe of Levi, to that of the men between the ages of thirty and fifty, tallies with the ratio approximately established by modern statistics; and as one can hardly imagine the authors of the Pentateuch to have been much versed in economical science, we can only suppose it the effect of downright counting, unless we suppose it an unique instance of a lucky guess. Whenever solitary facts of this complex character occur in ancient history, and coincide with the inductions of modern science, we have symptoms of truth in the records. I commend this class of facts to the scrutiny of some new editor of Blunt; there is still a rich harvest of "undesigned coincidences" in the Pentateuch, awaiting the patience and sagacity of any one who knows how to put in the sickle. In stimulating such labours, our present critic may be of use; nearly all the great works on the "Evidences" have been evoked in this way, from the time of Celsus to the present. Christianity has often been accused of obtruding its evidences: never was a

* Rosenmüller's candid note on this subject is well worth reading. I cite a sentence:—"Vel hodie apud nos e septem, octo aut decem conjugiiis, etsi omnibus illis mascula prole numerosissimis, vix unum alterumve reperierimus quod primam prolem filium susceptum alat; reliqua omnia, quia in iis puella primi partus honorem præcepit, omni spe primogeniti alicujus unquam habendi, sunt exclusa. Neque tamen hæc sufficere ad difficultatem illam *prorsus* tollendam—."

charge less true. It would fain be about its proper business in the world, if the world would let it alone. From first to last, all the literature of the "Evidences" has been "apologetic."—Yours truly,

VINDEX.

LETTER XII.

December 22, 1862.

MY DEAR FRIEND,—The conclusion of this book, were it not for the name on the title-page, would alone perfectly convince me, that it was written by one who had thoroughly abandoned all belief in the claims of the Bible, to be considered a special Divine revelation. He places it on a par, as it appears to me, with any other so-called sacred books. All of them are to be considered equally inspired by the Divine Spirit, so far as they contain any truth—of which, again, man's intellect is the absolute criterion. In fact, the Old Testament and the New, the Koran, the Shasters, the utterances of the Sikh Goo-roos and the disciples of Ram, contain in various degrees truth and falsehood, and stand much on the same level.

That in every age there will be found men who have given expression to some sublime abstractions respecting the Deity, is very true; but if we suppose any such vague rhapsodies of poets or sages will really be an instrument of moral reformation to mankind, we must have read the history of the world to little purpose. Whatever abstract truths, or approximations to truths, might be occasionally struck out by philosophers, they needed to be conjoined with other truths, and to be expressed in other forms, to render them capable of interesting the minds and enlisting the affections of men, or even to impel those who had uttered them, to attempt to give them diffusion or make them victorious; and, consequently, the profound religious ignorance and gross superstitions of ancient Greece and Rome continued age after age, while the philosophers looked on in silent contempt, or (worse still) joined in the public rites with edifying devotion, and lent their example,—more powerful than speculation, even if that had not been kept to themselves,—to perpetuate the popular delusions. As to any effect of the speculations of the Sikh Goo-roos, or the disciples of Ram, and those of all the Hindu sages into the bargain, the condition, for ages, of the whole continent of India,—crowded with temples consecrated to superstitions equally senseless, filthy, and bloody,—is a sufficient answer. Our author seems to think, on the other hand, that those who despair of the Pentateuch, or even of the whole Bible, may turn to these "wise men of the East" with consolation, and fill that "vacuity of the heart" which the loss of their faith will occasion, by stuffing it with fragments of Hindu theology. If they have not Moses and the prophets, have they not the Sikh Goo-roos? If they have not the New Testament, let them be consoled; have they not the words of RAM?

It is sad that the long experiment on behalf of "Deism," in the first half of the last century, should not have been sufficient for us. It was preceded and accompanied by strong efforts to get rid of the historic credibility of the Bible, similar to those used now. The tendencies too of Deism then, as of Rationalism now, were entirely *negative*; such systems may destroy, but they cannot construct; and there they will always end. They may enable those who wish it, to get rid of the Bible; but will not make people take up with the meagre dogmas of Herbert, or the equally meagre revelations of RAM!

And while the positive effect has ever been *nil*, even the negative effect has been always transient and superficial. Bolingbroke, in his "Letters on History," and in his "Philosophical Works," wrote against the credibility of the Bible, but especially of the Pentateuch, with a genius and eloquence with which it would be absurd to compare the miserable carping of a writer like this. He was, in his day, extensively read, but, spite of his genius and eloquence, he has been long since consigned to the "dust and darkness of the upper shelf;" while the Pentateuch still remains, and speaks to the world in 150 dialects.

The present book, I fancy, will go where Bolingbroke and a host more since, have already gone. A few years will show. Perhaps indeed a few months will suffice; for I see the author has announced Part II., and if he fulfils his promise, of telling us *how* and *when* the Pentateuch was composed, I predict that he will lose himself. He will sink into that huge "Serbonian bog, where armies whole have sunk"—the Documentary Hypothesis; and flounder in the deep mud of *earlier* Elohist and Jehovist, and *later* Elohist fragments. I know no reason why, if Moses be the author of the Pentateuch, he should not (especially in Genesis, where he had to do with events that occurred long before his time) have incorporated, under Divine superintendence, some fragments of previous documents. But when, with a view to discredit his authorship, or that of any one else in particular, it is attempted to sever completely the elements thus fused together; to give a chemical analysis of the whole; to show precisely how many of these documents there are, and where each begins or ends, or rather where each bit of each begins and ends; terminating in the conclusion that said documents may be either two, or four, or six, or even ten or twelve; that they may have been put together, like a patchwork quilt, and at any different period between the time of the Judges and that of the Babylonish captivity; then, loud is the din of controversy, and infinite are the varieties of opinion. "I have found a fresh bit of the Elohist document," cries one great critic; "it begins in the middle of the thirteenth verse of this or that chapter, and it ends in the middle of the fourteenth, just at the word—." "No such thing," cries a second, "it is clearly Jehovistic; anybody can see that with

half an eye." "You are both mistaken," cries a third, "it belongs to neither, as I have proved in a new dissertation of 150 pages." And when it is to be determined at what epoch these fortuitous atoms were gathered together in the Pentateuch, equally edifying is the variety of opinion. "No part," says one, "can be as old as the Judges, that is, if there ever *were* any Judges." "At least," cries a second, "there is no trace of it before Samuel's time." "We must come down yet lower," says a third; "Nathan or Gad may have had a hand in it." "Pure nonsense," cries a fourth, "the Pentateuch was not known even in Solomon's time." "No, nor then," cries a fifth; "we must come down to the time of the Captivity; perhaps, if Ezra were alive, he could tell us something about it." And so you have your two, six, or ten documents to choose from, and compiled at any period between the time of the Judges and the Babylonish captivity! "Pray, gentlemen, agree among yourselves," an ordinary Christian feels inclined to say; "it is impossible criticism can be worth much, which terminates in such endless discordances." One happy thing is, however, that whenever one of these theories is combated alone, it immediately crumbles to pieces in our hands. And no wonder, for the learned authors of all the rest, as well as the advocates of the ordinary view, fall upon it. And such, I predict, will be the issue in the present case.

If I may judge from one or two hints in Part I., I fancy our author will endeavour to prove that the Pentateuch is a series of fictions, composed as a sort of Jewish "Library of Useful and Entertaining Knowledge," by Samuel or Nathan or Gad, or all of them; much as Æsop composed his "Fables," or John Bunyan his "Pilgrim's Progress;" that though they everywhere protest they are telling mere matter of fact, and somehow produce the effect that they meant to do so, and everywhere appeal to God that they speak in his name and by his authority, yet they really meant nothing of the kind at all: that, on the other hand, the Israelites,

finding that all this was very delightful reading,—though they and their forefathers are branded and libelled in every page, "are huffed and cuffed and disrespectit," are told that they will never come to any good, that they will always remain an "obstinate, stiff-necked generation," and will at length (which has curiously come to pass) be scattered among the nations, and become "a hissing, a byword, and a proverb,"—yet were so enamoured of this pleasant story-book, that they were somehow taken in, and fancied it was their *true history*, and forthwith handed it down, without one sound of protest, doubt, or repugnance, to all future generations, as not only true in fact, but as divinely inspired. Here is likelihood, here is wisdom! I cannot say *Credat Judæus*, for certainly no Jew ever would or did believe such nonsense; credulous scepticism alone is equal to that.

Of course we Englishmen can have no difficulty about believing it, because we all see that John Bunyan's "Pilgrim's Progress," having been written for much the same purposes, and having been read with intense entertainment, and without any of the drawbacks which the Israelites must have felt in reading the Pentateuch, is now swiftly passing into the domain of history, and will by and by be unanimously handed down as simple matter of fact!

I have now given you some of my reasons for presuming that Bishop Colenso cannot be the author of the book ascribed to him. If, in spite of all, he is, I shall never more be troubled with any of the alleged paradoxes of the Pentateuch, for they are, to me, immeasurably lighter.—Believe me, my dear friend, yours truly,

VINDEX.*

* Errata in previous Letters:—

P. 89, col. 1, for "force of the Hebrew verb *Hiphil*," read "form of the Hebrew verb, *Hiphil*."

P. 89, col. 2, for "levity, irreverence," read "levity or irreverence."

P. 91, col. 2, for "inclined our modern critics," read "inclined our modern sceptics."

ON AERIAL NAVIGATION, AS APPLIED TO SCIENTIFIC RESEARCH.

BY JAMES GLAISHER, F.R.S., ETC.

THE desire to navigate the atmosphere is most probably co-existent with man, and this is not to be wondered at, for when we behold the easy and graceful motion enjoyed by birds, their rapid flight, and facile mode of transition, it at once excites the desire to be possessed of the same facility of change of place, and of the pleasurable enjoyment of a bird's-eye view of the earth, adorned with its many and constantly-changing beauties.

Very many have been the attempts to attain the art of flying, and very numerous experiments have been made to solve the problem of atmospheric buoyancy; indeed, I may say, that such researches

and experiments extended over a thousand years, till the art of aerial navigation was discovered in France in the year 1782.

THE FIRE-BALLOON.

In that year, two brothers, Stephen and Joseph Montgolfier, who had noticed the rising of smoke, concluded that if they could confine smoke in a very light bag, it would rise into the air, and carry the bag with it; accordingly they constructed a bag of paper, leaving the lower part open, to which they applied burning paper with the view of producing smoke, upon which it began to expand, and,

in a few minutes, sustained itself by being held at its lower part, and shortly afterwards, on being released, rose to the ceiling of the room, and hence the origin of the fire-balloon.

THE AIR-BALLOON.

In the year 1766, Henry Cavendish discovered that inflammable air or hydrogen gas was lighter than air, and it immediately occurred to Dr. Black of Edinburgh, that a thin bladder filled with hydrogen gas would rise of itself.

In Dr. Thomas Thomson's *History of Chemistry*, vol. i., there is the following anecdote of Dr. Black, related by Mr. Benjamin Bell:—"Soon after the appearance of Mr. Cavendish's paper on hydrogen gas, in which he made an approximation to the specific gravity of that body, showing that it was at least ten times lighter than common air, Dr. Black invited a party of friends to supper, informing them that he had a curiosity to show them. Dr. Hutton, Mr. Clark of Eldin, and Sir George Clerk of Penicuik, were of the number. When the company invited had arrived, he took them into a room where he had the allantois of a calf filled with hydrogen gas, and, upon setting it at liberty, it immediately ascended and adhered to the ceiling. The phenomenon was easily accounted for; it was taken for granted that a small black thread had been attached to the allantois, that the thread passed through the ceiling, and that some one in the apartment above, by pulling the thread, elevated it to the ceiling, and kept it in its position. This explanation was so plausible, that it was agreed to by the whole company, though, like many other plausible theories, it turned out wholly fallacious, for when the allantois was brought down, no thread whatever was found attached to it. Dr. Black explained the cause of the ascent to his admiring friends; but such was his carelessness of his own reputation, that he never gave the least account of this curious experiment even to his class, and several years elapsed before this obvious property of hydrogen gas was applied to the elevation of balloons."

After several successful experiments with fire-balloons, it occurred to some of the scientific men at Paris, that a bag filled with hydrogen gas would rise of itself. A bag, twelve feet in diameter, was filled with hydrogen gas, and when liberated, it rose to a height of 100 feet, being retained there by ropes; but on the next day it was liberated, and allowed to rise freely, when, in the presence of an enormous crowd, it ascended to a height exceeding 3000 feet.

Thus two original kinds of balloon were invented nearly at the same time: one called fire-balloons, filled with rarefied air; and the other, air-balloons, inflated with hydrogen gas.

The results attained by the many experiments which were made during the years 1782 to 1785, having proved that a balloon would raise great weights, and continue in the air for a long time

thus suspended, caused great excitement over Europe and America.

ASCENTS IN BALLOONS FOR SCIENTIFIC INVESTIGATION.

There became a general desire to explore the higher regions of the air, and to pursue meteorological, magnetical, and other researches in the lofty regions of the atmosphere, and the invention of the balloon was looked upon as most important for these ends, and likely to produce great consequences. It was not, however, so far as I know, till the beginning of this century that any ascents were made for scientific purposes. In the years 1803 and 1804, Mr. Robertson made three ascents from St. Petersburg for the purpose of physiological, electrical, and magnetical experiments. On August 23, 1804, MM. Gay-Lussac and Biot ascended from Paris for a similar purpose; they reached a height of 13,000 feet, and came down safely, finding no difference in their experiments in magnetism, electricity, and galvanism from those made on the earth; a sad disappointment of the expectations of the scientific world.

On the 15th of September, Gay-Lussac ascended alone to a height of 22,977 feet. He found the time of the vibration of a magnet to be less than on the earth; his respiration was affected; the temperature of the air decreased from 82° to 15°, and its humidity very rapidly; he filled some glass bottles with air from the higher regions; was five hours and three quarters in the air, and noticed that the sky was deep blue. His observations on the temperature of the air were as follows:—

On the ground the temperature was	82 degrees.
At an elevation 9,930 feet it was	55 "
" 11,275 "	52 "
" 12,089 "	47 "
" 12,500 "	51 "
" 13,967 "	54 "
" 14,174 "	50 "
" 15,469 "	47 "
" 15,146 "	44 "
" 14,776 "	48 "
" 16,381 "	48 "
" 17,252 "	41 "
" 18,069 "	37 "
" 18,585 "	33 "
" 16,498 "	34 "
" 19,783 "	26½ "
" 20,000 "	29 "
" 20,119 "	26 "
" 22,546 "	19 "
" 22,851 "	15 "

In 1806, Carlo Brioschi, Astronomer-Royal at Naples, in endeavouring to ascend higher than Gay-Lussac, the balloon burst, but its remnant happily checked the rapidity of the descent, and falling in an open space, his life was saved; but he contracted a complaint which brought him to his grave.

A period followed of forty-four years, during which I do not know of any systematic attempts to take scientific observations by means of balloons.

In the year 1850, MM. Bixio and Barral conceived the project of ascending to a height of

30,000 to 40,000 feet, in order to study the many atmospheric phenomena as yet imperfectly known. On June 29th of that year, the balloon was filled with pure hydrogen gas in the garden of the observatory at Paris. The weather was bad. MM. Bixio, Barral, and the aeronaut placed themselves in the car, and, without testing the ascending power of the balloon, darted into the air like an arrow, and in two minutes were lost in the clouds at the height of 5000 feet. The gas in the balloon expanded with great force against the netting, which proved to be too small, the balloon became full and descended upon the car, which unfortunately was suspended by cords much too short, and consequently covered the occupants completely. In this difficult situation one of them, in his efforts to disengage the cord from the valve, caused an opening in the lower part of the balloon, from which the gas escaping at the height of their heads, occasioned them frequent illness; then they found that the balloon was torn considerably, and they were falling very fast; they threw away everything possible, and came to the earth in a vineyard, having left it only forty-seven minutes previously. They passed through a mass of clouds 9000 feet in thickness; the decrease of temperature up to 19,000 feet, the highest point reached, seemed to confirm the results obtained by Gay-Lussac in 1804.

In the following month, on July 27, the balloon began to be filled early in the morning with pure hydrogen as before. It proved to be a long operation, occupying till nearly two o'clock; then heavy rain fell, the sky became overcast; and at a few minutes after four o'clock the same gentlemen left the earth, and entered a cloud at 7000 or 8000 feet high, which proved to be fully 15,000 feet in thickness. They never, in fact, reached its highest extent; for when at the highest point, viz., 23,000 feet, at 4 h. 50 m., their descent began before they wished. Owing to a rent in the balloon, they could not check this involuntary descent, and reached the earth at 5 h. 30 m.

On approaching the limit of this cloud of 15,000 feet in thickness, an opening was formed in the vapour which surrounded them, through which they saw the blue sky. The polariscope, when directed towards this point, showed an intense polarization, and when directed to the side away from the opening, there was no polarization. An interesting optical phenomena signaled this ascent. Before reaching to the highest point, the bed of clouds which covered the balloon having become less dense, the two observers saw the sun dim and quite white, and, at the same time, they saw a second sun reflected as from a sheet of water, probably formed by the reflection of luminous rays falling on the horizontal sides of crystals of ice floating in the clouds.

The most interesting and extraordinary result, however, observed in this ascent, was the great change of temperature. At the height of about

19,000 feet, the temperature was about 15°, but in the next 2000 feet the temperature fell to *minus* 39°. This wonderful degree of cold was experienced whilst still in the cloud. What, we may ask, can the composition of such a cloud be? In this voyage, a height short of Gay-Lussac's by 50 feet was reached, yet a temperature of 50° lower value was experienced, and their clothes were covered with fine needles of ice. Since this time, I do not know of any ascent made in France in the service of science.

In the year 1852, Mr. Welsh, of the Kew Observatory, under the auspices of the British Association, made four ascents in the great Nassau balloon, from London, with the veteran aeronaut, Mr. Green, who had had the experience of 500 ascents. On August 17, August 26, October 21, and November 10, he reached the respective heights of 19,500, 19,100, 12,640, and 22,930 feet, and he took a series of observations in each ascent, from which he deduced, as far as temperature is concerned, "that the temperature of the air decreases uniformly with the height above the earth's surface, until, at a certain elevation, varying on different days, the decrease is arrested, and for a space of 2000 or 3000 feet, the temperature remains nearly constant, or even increases by a small amount; the regular diminution being afterwards resumed, and generally maintained at a rate slightly less rapid than in the lower part of the atmosphere, and commencing from a higher temperature than would have existed, but for the interruption noticed.

The facts recorded by Gay-Lussac relative to the decline of temperature with increase of elevation, appeared to confirm the law which theory, based upon observations made on mountain-sides, assigns for gradation of temperature in the atmosphere, viz., a *decrease* of one degree for *every* increase of height of 300 feet; and the deduction of Mr. Welsh from his experiments, tended to the confirmation of the same theory, though somewhat modified. Up to the present time, therefore, the high expectations entertained on the discovery of the balloon have never been realized; it has not led to any important results, and, with the exception of the instances which I have named, and a very few others, it has been used as a toy to please a crowd. Yet it is by no other means that we can free ourselves from the disturbing influences to which I shall presently allude; and ever since its invention, now eighty years ago, the question has been put again and again, and especially since the formation of the British Association, Whether the balloon does not afford a means of accomplishing, with advantage and great facility, the solution of many problems in physics, which are seriously affected by the influences in question, and which problems, without its use, would occupy many years of research, *under great disadvantages*, with this additional drawback, that the results obtained would always labour under certain suspicious.

Whether delicate and accurate observations can be made therein? Whether an observer, in such a position, can be sufficiently at ease to observe as well as on the earth? Whether the observations can be made with tolerable safety to himself?

No answer could be given to these questions, except by the personal experience of one well acquainted, by long practice, with the several instruments to be used, and who had acquired the power of concentrating all his energies upon his work irrespective of his position, and who would trust himself in a voyage through the air. This latter risk must necessarily be run; a risk honourable, I think, if the objects sought be *definite*, of *high value*, and *not otherwise* to be attained; but unquestionably foolhardy, if these objects were *indefinite*, of *little value*, or attainable by *other means*. For many years I have been anxious that these questions should be answered; and when we consider that all philosophical inquiries carried on near the surface of the earth are of necessity fully within the earth's influence, and are affected by the radiation, conduction, and reflection of heat, of ever-varying currents of air, and of the reflection of the rays of light; are within the influences of large or small evaporating surfaces on the one hand, or of condensing surfaces on the other, and of many other disturbing causes, every one of which is a source of error, and from which we cannot escape even by *going to the top of the highest mountain*. When we consider, also, what sciences would be benefited thereby, such as *astronomy*, *meteorology*, and allied sciences certainly, *magnetism*, *physiology*, and other sciences probably, the objects surely become sufficiently definite, worthy of some effort, and, if needs be, of some risk. Perhaps of all branches of physical research, the greatest good would accrue in the departments of *meteorology* and *astronomy*; and remembering the influence which a clear sky or a cloudy one exercises on the temperature and weather, and what an important part the condition of the sky has on our own comfort and wellbeing, there seemed to be a high probability that, by studying the laws that govern the higher strata of the air, and cultivating some acquaintance with these regions themselves, not only our knowledge of aerial phenomena would be much advanced, but it may be hoped that a mighty contribution would eventually be made to the cause of human welfare; while as to *astronomy* there is no more important point in the whole range of physics, to which experiments can be directed, than the improvement of our knowledge of the laws of refraction, since the ascertainment of the true position of any heavenly body is dependent upon our correct acquaintance with these laws. The objects attainable by means of a balloon seem to be, therefore, of high importance, and those attempted in the late ascents are as follows:—

To determine the pressure of the atmosphere.

To determine the temperature of the air.

To determine the hygrometrical states of the air at heights as high as possible.

To compare the readings of an aneroid barometer with those of a mercurial barometer up to five miles, or even higher.

To determine the electrical state of the air.

To determine the oxygenic state of the atmosphere by means of ozone papers.

To determine the time of vibration of a magnet on the earth, and at different distances from it.

To determine the temperature of the dew-point by Daniell's dew-point hygrometer, and Regnault's condensing hygrometer, and by the use of the dry and wet bulb thermometers as ordinarily used, and their use when under the influence of the aspirator, which caused considerable volumes of air to pass over both their bulbs; at different elevations as high as possible, but particularly up to heights where man may be resident, or where troops may be located, as in the high table-lands and plains in India; with the view of ascertaining what confidence may be placed in the use of the dry and wet bulb thermometers at those elevations, by comparison with Daniell's and Regnault's hygrometers; and also to compare the results as found by the two hygrometers together.

To collect air at different elevations.

To note the height and kind of clouds, their density and thickness at different elevations.

To determine the rate and direction of different currents in the atmosphere, if possible.

To make observations on sound.

To note atmospherical phenomena in general, and to make general observations.

JOURNEY IN A BALLOON SIX MILES HIGH.

When it is intended to ascend five or six miles high, the balloon is but little more than one-half full; because gas expands to double its bulk at three and three-quarters miles high, and to three times its bulk at five or six miles; to fill the balloon before starting would therefore be to waste gas, and possibly annoy the occupants of the car by its escape from expansion at the neck of the balloon.

The processes of expansion and contraction are constantly going on, and varies with every variation in the height of the balloon. On passing from a cloudy state of the sky to a clear one, it is necessary to go through the clouds, during which time the cordage and the balloon become bedewed with moisture, so increasing its load; but on breaking into bright sunshine, the expansion, from the sun shining on the balloon causes it to rise rapidly; two agencies being at work, viz., increase of heat and loss of weight by evaporation. But in passing from bright sunshine into cloud, the gas becomes contracted by loss of heat, and the balloon every instant absorbs moisture and so increases its load; both causes combining to make the balloon descend with great rapidity.

Moreover, this continual variation in the expan-

sion or contraction of the gas causes perpetual changes in the shape and course of the balloon, and so necessitates the constant attention, skill, and judgment of the *aéronaut*.

In the case of the extreme high ascents, the operations were performed where no eye but mine could witness them.

At the same time, a journey through the air, reaching to the height of five or six miles, is of so rare an occurrence, the position so novel, the phenomena which present themselves so peculiar, that nothing short of personal experience could give a correct knowledge of them, that I propose to give a descriptive account of a journey through the air, blending the experiences of the several ascents I have made somewhat together.

BEFORE LEAVING THE EARTH.

Imagine the balloon somewhat more than half inflated, eager for flight, with only one link connecting it with the earth, viz., a rope attached to an instrument called a liberating iron or catch.

When all the ballast, instruments, and everything else are placed in the car, with the grapnel attached outside, so as to be readily detached, and these amount to 4000 pounds, the balloon is brought to a *nice* and *even* balance, so that the addition of 20 pounds would prevent it from rising, but if removed would give it the required ascending power.

When all is ready, Mr. Coxwell, with his hand upon the catch, looks up at the sky, and is, apparently, staring at vacancy; but he is not. If the sky be partially cloudy, he watches till he is midway between the cloud that has passed and that which is coming, so that he may have a clear sky, and at least see the earth beneath, and avoid, if possible, passing through a cloud, though it may be cloudy all round; for the cloud which preceded will always precede, and that which follows will always follow. Nor is that all, he knows that in every wind, how strong soever it may be, there are periods of calms, and if he can start in one of them he avoids much rotatory motion; so he awaits for an opportune moment for a fair start, to combine these two states together, if possible.

THE DEPARTURE.

When the sun shines, the wind lulls, and the balloon stands proudly erect; the favourable moment arrives; the catch is pulled, and we are free. We are free, but not only so, we are in profound repose; no matter how violent soever the wind may be, no matter how agitated the balloon may have been swaying to and fro, now on this side, now on that, with sudden and violent action, notwithstanding all the efforts of the many individuals who were struggling to hold it; all agitation in a moment ceases, and we are in perfect stillness, without any sense of motion whatever, and this continues throughout our entire flight.

Once away, we are both immediately at work;

we have but little time for graceful acknowledgments to cheering friends. Mr. Coxwell proceeds to put the car in order, and accordingly looks to it, to his balloon, and to the course we are taking; and I must get my instruments in order. Without delay, therefore, at once place them in their situations, adjust them, and take a reading as soon as possible.

In a few minutes we are from 1000 to 2000 feet high; Mr. Coxwell looks intently upwards, to see how the huge folds of the balloon fill into the netting. If we have started from a town, its busy hum attracts our attention, and a glance shows us the many upturned faces in every street, and the town itself, which looks like an engineer's model in motion; and the now fast fading cheers of our assembled friends next attract our attention, and another glance shows us the quickly-diminishing forms of the objects we so recently left.

REACHING THE CLOUDS.

On approaching the clouds, Mr. Coxwell recommends me to take a farewell peep at the earth; and as I do this, the clouds receive us, at first in a light gauze of vapour, and then in their chilly embrace, where I examine their structure, note the temperature of the dew-point particularly. Shortly it becomes lighter, the light gradually increasing, till it is succeeded by a flood of light, at first striking, then dazzling; and we pass out of a dense cloud, to where the clouds open out in bold and fantastic shapes, showing us light and shade and spectral scenes, embellished with prismatic colours, disporting themselves around us in wild grandeur, till at length we break out into brilliant sunshine, and the clouds roll away into a perfect sea of vapour, obscuring the earth entirely; then in the line from the sun passing us, we see the shadow of the balloon and car and ourselves upon the clouds, very large and distinct, with encircling ovals of rainbow tints; forming altogether a wonderful scene—a wonderful contrast to that of their lower surface.

ABOVE THE CLOUDS.

When approaching the height of three miles, Mr. Coxwell directs my attention to the fact, that the balloon is full, and the gas is issuing from the safety-valve. He then directs my attention to the fit and proportions of the netting. I find the gas, which was before cloudy and opaque, is clear and transparent, so that I can look right up the balloon, and see the meshes of the network showing through it; the upper valve, with its springs and line, reaching to the car, and the geometrical form of the balloon itself. Nor is this an idle examination.

I have already said, that in passing through the cloud, the netting would gather moisture, augmenting the weight of the balloon; if this should not all have evaporated, the network would have become frozen, and be as wire-rope; so that, if

the diamond shape of the netting when under tension, and the form of the crown of the balloon, be not symmetrical, the weight might not be equally distributed, and there would be danger of it cutting the balloon. A sense of security, therefore, follows such an examination.

THREE MILES HIGH.

A stream of gas now continually issues from the neck, which is very capacious, being fully two square feet in area, which is always left open; and after a time I see Mr. Coxwell, whose eye has been continually watching the balloon, pass his fingers over the valve line, as if in readiness to pull the cord. I look inquiringly at him. He says, I have decided to open the large upper valve, and carefully explains why. "The tension," he says, "on the balloon is not greater than it would bear in a warm stratum of air with safety; but now that we are three miles up with a chilled balloon, it is better to allow some to escape at the top, as well as a good deal from the bottom.

FOUR MILES HIGH.

We are now far beyond the reach of all ordinary sounds from the earth. A sea of clouds is below us, so dense that it is difficult to persuade ourselves that we have passed through them. Up to this time, little or no inconvenience is met with; but on passing above four miles, much personal discomfort is experienced; respiration becomes difficult; the beating of the heart at times is audible; the hands and lips become blue, and at higher elevations the face also; and it requires the exercise of a strong will to make and record observations.

FIVE MILES HIGH.

Before getting to our highest point, Mr. Coxwell counts the number of his sand-bags, and calculates how much higher we can go, with respect to the reserve of ballast necessary to regulate the descent.

Then I feel a vibration in the car, and, on turning round, see Mr. Coxwell in the act of lowering down the grapnel; then looking up at the balloon; then scanning the horizon, and weighing apparently in his mind some distant clouds, through which we are likely to pass in going down.

A glance suffices to show that his mind is made up how much higher it is prudent to rise, and how much ballast it is expedient to preserve.

SIX MILES HIGH.

The balloon is now lingering, as it were, under the deep blue vault of space, hesitating whether to mount higher, or begin its descent without further warning. We now hold consultation, and then look around, giving silent scope to those emotions of the soul which are naturally called forth by such a wide-spread range of creation.

Our course is now about to change, but here I

interpose with "No, no; stop! not yet; let us remain so long, that the instruments are certain to take up their true readings, so that no doubt can rest upon the observations here. When I am satisfied, I will say, pull."

THE HIGHEST POINT.

Then, in silence, for here we respire with difficulty, and talk but little; in the centre of this immense space; in solitude, without a single object to interrupt the view for 200 miles or more all round; abstracted from the earth; upheld by an invisible medium; our mouth so dry we cannot eat; a white sea below us; so far below, we see few, if any, irregularities. I watch the instruments, but forcibly impelled again, look round from the centre of this immense vacuity, whose bounding line is 1500 miles, including an area of 130,000 square miles.

BEGINNING OF THE DESCENT.

When I find no further changes are proceeding, I wave my hand and say, "Pull." A deep resonant sound is heard overhead; a second pull is followed by a second report that rings as with shrill accompaniment down the very sides of the balloon. It is the working of the valve which causes a loud booming noise, as from a sounding-board, as the springs force the shutters back.

But this sound in that solitary region, amid a silence so profound that no silence on earth is equal to it; a drum-like sound meeting the ear from above, from whence we usually do not hear sounds, strikes one forcibly. It is, however, one sound only; *there is no reverberation, no reflection*; and this is characteristic of all sounds in the balloon, *one clear sound*, continuing during its own vibrations, then gone in a moment. *No sound ever reaches the ear a second time.* But though the sound from the closing of the valve in those silent regions is striking, it is also cheering, it is reassuring, it proves all to be right; that the balloon is sound, and that the colder regions have not frozen tight the outlet for gas.

ONE OR TWO MILES DOWN.

We have descended a mile or more, and our feelings improve with the increase of air and warmth. But silence reigns supreme. Mr. Coxwell turns his back upon me, scanning the distant cloudscape, speculating as to when and where we shall break through, and catch sight of the earth.

APPROACHING THE CLOUDS FROM ABOVE.

On nearing the clouds we observe the counterpart of our own balloon reflected upon them, at first small in size, momentarily increasing. This spectral balloon is charming to look upon, and presents itself under a variety of aspects, which are magnified or diminished by the relative distance of our balloon from the clouds, and by its position in relation to the sun, which produces the

shadow. At mid-day, it is deep down, almost underneath; but it is more grandly defined towards evening, when the golden and ruby tints of the declining sun impart a gorgeous colouring to cloud-land. You may then see the spectre balloon magnified upon the distant cloud-tops, surrounded with three beautiful circles of rainbow tints. Language fails utterly to describe these illuminated photographs, which spring up with matchless truthfulness and choice decoration.

DIPPING INTO THE CLOUDS.

Just before we enter the clouds, Mr. Coxwell having made all preparations for the descent, strictly enjoins me to be ready to put up the instruments, lest, when we lose the powerful rays of the sun, and absorb the moisture of the lower clouds, we should approach the earth with too great rapidity.

We now near the confines of the clouds, see the spectral balloon approaching us, nearly as large as our own, and just then dip swiftly into the thickest of them. We experience a decided chill, and hear the rustling of the collapsing balloon, which is now but one-third full; but cannot see it, so dense is the mass of vapour; one, two, three, four, or more minutes pass, and we are still in the cloud; how thick it must be, considering the rapidity of the descent.

BELOW THE CLOUDS.

Presently we pass below, and the earth is visible. There is a high road intersecting green pastures; a piece of water like polished steel. An open country lies before us; a shout comes up and announces that we are seen, and all goes well, save the rapidity of the descent, caused by the thick clouds through which we have just passed, shutting us out from the sun's rays, and loading us with moisture. Mr. Coxwell counteracts this by means of the ballast, and streams out one bag, which appears to fly up instead of falling down; now another, and another he casts forth, but still it goes up, till the wayward balloon is reduced within the bounds of moderation. Mr. Coxwell exultingly exclaims, "I have it now under perfect control, with sand enough, and to spare."

Glad to find the balloon checked, with the prospect of an easy descent, I read the several instruments as quickly as I can, noticing at the same time the landscape below, charming in its constant variation, rich with its mounds of green foliage, fields of various shades of green, intersected by roads, rivers, rivulets, etc.; and all this is seen with a distinctness superior to that on the earth; the line of sight is through a purer and less dense medium,

everything seems clearer, though smaller. At the height of four miles over Birmingham, both Mr. Coxwell and myself distinguished readily the New Street station, and the several streets in the town, with the naked eye. After descending slowly for a little time, Mr. Coxwell selects a spot for our descent, distant then two or three miles. The current near the earth, which is often stronger than the upper, wafts us merrily in that direction.

NEARING THE EARTH.

We are but a few hundred feet from the earth, when Mr. Coxwell requests me to put up the instruments, and he will keep on that level till I am ready. He throws out a little more sand, and I pack up the instruments in their wadded cases. Mr. Coxwell's eye is on the balloon—the course it is taking with respect to the inclination of its descent on the spot where he has chosen to land. Shortly he calls out, "Are you all right?" "All right," I respond. "Look out, then, and hold fast by the ropes, the grapnel will stop us in the large meadow, with the hedge-row in front."

AT ANCHOR.

Sure enough the grapnel catches in the hedge, and once again we are connected with the earth by one link. The valve line is drawn, and a little gas is allowed to escape. The sheep, which have been watching the descending balloon, huddle together and run away; and the cattle, becoming very frightened, place their tails horizontal, and wildly scamper off in all directions.

ON THE EARTH.

Villagers break through the hedges on all sides, and we are soon surrounded by an agricultural crowd, some of whom take hold of the rope attached to the grapnel, and, as directed, pull us down, or hold it whilst we float to the centre of a field. The valve is again opened, gas is allowed to escape by degrees, nothing is allowed to be touched till the reduced buoyancy of the balloon permits the removal of the instruments. The car is gradually lightened, till finally we step out, when a group of friends from among the gentry draw up near us; and although some few may question whether we belong to this planet, or are just imported from another, all doubt on the subject is soon set at rest, and we are greeted with a hearty welcome from all when we tell our story,—how that we have travelled the realms of space, not for the purposes of pleasure, not from motives of curiosity, but for the advancement of science and the good of mankind.

HE HEADED NOT.

THE song of singing brook to hear,
Or sermon of the silent stone,
Or, lapt in depth of shadow clear,
To watch how Nature works alone—
That man hath neither eye nor ear,
Who careth not for human moan ;

Who holds the city for a waste
In his refined poetic eye ;
The weak antennæ of whose taste
From touch of alien grossness fly ;
And draw themselves, in shrinking haste,
From sin that passeth helpless by.

And he whose heart is full of grace
To brothers, sisters, round about,
Finds more in any human face,
Beclouded all with wrong and doubt,
Than shines in nature's holiest place,
Where mountains dwell and streams run out.

A sound of strife assailed my ear,
As through the street I went one morn :
A wretched alley I drew near,
Whence plainer still the sound was borne—
Grows breaking into curses clear,
Retorted with a shriller scorn.

Straightway from round the corner came
A man consumed in smouldering ire :
Scarce fit to answer to his name,
His senses drowned with revels dire,
Flashes of sullen, fitful flame
Broke from the embers of his fire.

He cast a glance of stupid hate
Behind him, every step he took ;
Where followed him, like following fate,
An aged crone, whose bloated look
Outdid her son's. With feeble gait,
She tottered, rated him, and shook.

But why should I such lawless things
Weave into cadence ordered right ?
What, answering them, yet higher strings
Should sound in praise of love's own might,
Obedient to the law that brings
From evil good, from darkness light.

For he was haunted in his haste
By love that bred him some annoy :
In front, no higher than his waist,
Close to him stood a tiny boy ;
A feeble child, ill-clothed, pale-faced,
Whose eyes held neither hope nor joy—

But earnestness. You think he pled
With drunken siren to keep the peace ?
And home his wayward footsteps led,
To find in sleep his sin's release ?
The child, in evil born and bred,
Strove thus to make the evil cease ?

Not so. The boy spoke never word ;
But, seeming only to aspire,
Like a half-fledged, worm-hungry bird,
He stood on tiptoe—reaching higher :
With anxious care his soul was stirred,
With anxious service to his sire.

With waking pale, with anger red,
He, forward leaning, held his foot,
Lest on the darling he should tread :
A sense, somehow, had taken root,
Even in his poor bewildered head,
That kindness round him hovered mute.

And o'er the child his words of ill
Were gently, dumbly, powerless borne.
They hurt him not : the fleet bee will
The falling hail, uninjured, scorn.
He heeded not, but reaching still,
Buttoned his father's waistcoat worn.

Over his calm, unconscious face,
There passed no troubled change of mood ;
It kept its quiet earnest grace,
As round it seeing all things good ;
Clear as a pool in its own place,
Unsunned within a sunless wood.

Was the child deaf—the tender palm
Of Him that made him, folded round
The little head, to make it calm
And fearless ; so that every sound
Grew nothing there ; nor curse nor psalm
Could thrill the globe thus grandly bound ?

Or was it that, by nature's law
Accustomed words themselves efface ?
Or was he too intent for awe,
Love filling up the thinking place ?
I cannot tell ; I only saw
An earnest, an untroubled grace.

From evil men whose tongues are swords,
Who speak and have not understood,
Lord, keep us ! From the strife of words,
Fold up our hearts in something good.
Make silence with the hand that girds
The silent mountain, silent wood.

"He heeded not, but reaching still,
Buttoned his father's waistcoat worn."

REMINISCENCES OF A HIGHLAND PARISH.

BY THE EDITOR.

CHAPTER IV.—THE MANSE GIRLS AND THEIR
EDUCATION.

"Dost thou remember all those happy meetings,
In summer evenings round the open door;
Kind looks, kind words, and tender greetings
From clasping hands, whose pulses beat no more—
Dost thou remember them?"

THE manse girls were many. They formed a large family, a numerous flock, a considerable congregation; or, as the minister expressed it in less exaggerated terms, "a heavy handful." One part of their education, as I have already noticed, was conducted by a governess. The said governess was the daughter of a "governor," or commandant of one of the Highland forts—whether Fort-Augustus or Fort-William I remember not—where he had for years reigned over a dozen rusty guns, and half as many soldiers, with all the dignity of a man who was supposed to guard the great Southern land against the outbreaks and incursions of the wild Highland clans, although, in truth, the said Highland clans had been long asleep in the old kirkyard "among the heather," for, as the song hath it,—

"No more we'll see such deeds again,
Deserted is the Highland glen,
And mossy cairns are o'er the men
Who fought and died for Charlie."

The "major"—for the commandant had attained that rank in the first American war—left an only daughter who was small and dumpty in stature, had no money, and but one leg. Yet was she most richly provided for otherwise with every womanly quality, and the power of training girls in "all the branches" then considered most useful for sensible well-to-do women and wives. She was not an outsider in the family, or a mere teaching machine, used and valued like a mill or plough for the work done, but a member of the household, loved and respected for her own sake. She was so dutiful and kind, that the beat of her wooden leg on the wooden stair became musical—a very beating of time with all that was best and happiest in her pupils' hearts. She remained for some years educating the younger girls, until a batch of boys broke the line of feminine succession, and then she retired for a time to teach one or more families in the neighbourhood. But no sooner was the equilibrium of the manse restored by another set of girls, than the little governess returned to her old quarters, and once more stumped through the schoolroom, with her happy face, wise tongue, and cunning hand.

The education of the manse girls was neither learned nor fashionable. They were taught neither French nor German, music nor drawing, while

dancing as an art was out of the question, with the wooden leg as the only artist to teach it. The girls, however, were excellent readers, writers, and arithmeticians; and they could sew, knit, shape clothes, and patch to perfection. I need hardly say that they were their own and their mother's only dressmakers, and manifested wonderful skill and taste in making old things look new, and in so changing the cut and fashion of the purchases made long ago from the packman, that Mary's "everlasting silk" or Jane's merino, seemed capable of endless transformations; while their bonnets, by judicious turning, trimming, and tasteful placing of a little bit of ribbon, looked always fresh and new.

Contrasted with an expensive and fashionable education, theirs will appear to have been poor and vulgar. Yet in the long course of years, I am not sure but the manse girls had the best of it. For one often wonders what becomes of all this fashionable education in the future life of the young lady. What French or German books does she read as a maid or matron? With whom does she, or can she, converse in these languages? Where is her drawing beyond the Madonna's heads and the Swiss landscape which she brought from school, touched up by the master? What music does she love and practise for the sake of its own beauty, and not for the sake of adding to the hum of the drawing-room after dinner? The manse girls could read and speak two languages, at least—Gaelic and English. They could sing, too, their own Highland ditties: wild, but yet as musical as mountain streams and summer winds; sweet and melodious as song of thrush or blackbird in spring, going right to the heart of the listener, and from his heart to his brimming eyes. And so I am ready to back the education of the poor manse against that of many a rich and fashionable mansion, not only as regards the ordinary "branches," but much more as developing the mental powers of the girls. At all events they acquired habits of reflective observation, with a capacity of thoroughly relishing books, enjoying Nature in all her varying scenes and moods, and of expressing their own thoughts and sentiments with such a freshness and force as made them most delightful members of society. A fashionable education, on the other hand, is often a mere tying on to a tree of a number of "branches" without life, instead of being a developing of the tree itself, so that it shall bear its own branches loaded with beautiful flowers and clustering fruit.

But the manse school included more rooms than the little attic where the girls met around that familiar knot of wood which projected from be-

neath the neat calico of the major's daughter. The cheerful society of the house ; the love of kindred, —each heart being as a clear spring that sent forth its stream of affection with equable flow to refresh others ; the innumerable requirements of the glebe and farm ; the spinning and shearing ; the work in the laundry, the kitchen, and the dairy ; the glorious out-door exercise over field and moor, in the glens or by the shore ; the ministrations of charity, not with its doled-out alms to beggars only, but with its "kind words and looks and tender greetings" to the many cottagers around,—these all were teachers in the Home School. And thus, partly from circumstances, partly, it must be acknowledged, from rare gifts of God bestowed upon them, they all grew up with a purity, a truthfulness, a love and gladness, which made the atmosphere of the manse one of constant sunshine. Each had her own strong individual character, like trees which grow free on the mountain side. They delighted in books, and read them with head and heart, undisturbed by the slang and one-sided judgments of hack critics. And it occasionally happened that some Southern friend, who in his wanderings through the Highlands enjoyed the hospitality of the manse, sent the girls a new volume of pleasant literature as a remembrance of his visit. These gifts were much valued, and read as volumes are seldom read now-a-days. Books of good poetry especially were so often conned by them that they became as portions of their own thoughts.

The manse girls did not look upon life as a vain show, aimless and purposeless ; upon everything and every person as "a bore ;" or upon themselves as an insupportable burden to parents and to brothers,—unless they got husbands ! Choice wives they would have made, for both their minds and bodies had attractions not a few ; and "good offers," as they were called, came to them as to others. Young men had been "daft" about them, and they were too sensible and womanly not to wish for a home they could call their own ; yet it never crossed their thoughts that they *must* marry, just as one must get a pair of shoes. They never imagined that it was possible for any girl of principle and feeling to marry a man whom she did not love, merely because he had a number of sheep and cattle in a Highland farm ; or had good prospects from selling tea and sugar in Glasgow ; or had a parish as a minister, or a property as a "laird." Poor foolish creatures were they not to think so ? without one farthing they could call their own ; with no prospects from their father, the minister ; with no possessions save what he had last purchased for them from the packman ! What on earth would come of them or of their mother if the parson was drowned some stormy night with Ruari and "the Roe ?" Were they to be cast on the tender mercies of this or that brother who had a home over their heads ? What ? a brother to afford shelter to a sister ! Or could they seriously intend to trust Providence for the future,

if they only did His will for the present ? Better far, surely, to accept the first good offer ; snatch at the woolly hand of the large sheep-farmer, the sweet hand of the rich grocer, the thin, sermon-writing hand of the preacher ; nay, let them take their chance even with James, the tutor, who has been sighing over each of them in turn ! But no ; like "fools," they took for granted that it never could come wrong in the end to do what was right at the time, and so they never thought it to be absolutely incumbent on them to "marry for marrying sake." Neither father nor mother questioned the propriety of their conduct. And thus it came to pass that none of them, save one, who loved most heroically and most truly unto death, ever married. The others became what married ladies and young expectants of that life-climax call—Old Maids. But many a fireside, and many a nephew and niece, with the children of a second generation, blessed God for them as precious gifts.

I feel that no apology is required for quoting the following extract from a letter written by the pastor, more than sixty years ago, when some of the eldest of the manse girls left home for the first time. It will find, I doubt not, a response in the heart of many a pastor in similar circumstances :—

"It was, my dear, my very dear girls, at seven in the morning of Thursday, the 31st August, you took your departure from the old quay—that quay where often I landed in foul and fair weather, at night and by day ; my heart always jumping before me, anticipating the happiness of joining the delightful group that formed my fireside,—a group I may never see collected again. How happy the parents, the fewest in number, who can have their families within their reach ! happier still, when, like you, their families are to them a delight and comfort ! You left the well-known shores of —, and your parents returned with heavy steps, the weight of their thoughts making their ascent to the manse much slower and harder to accomplish than ever they found it before. We sat on the hill-side bathed in tears, giving many a kind and longing look to the wherry, which always went further from us, till our dim eyes, wearied of their exertions, could see nothing in its true state ; when, behold, cruel Castle Duart interrupted our view, and took out of our sight the boat that carried from us so much of our worldly treasure. Our thousand blessings be with our dear ones, we cried, and returned to the house,—to the manse of — ; a house where much comfort and happiness were always to be found ; where the friend was friendly treated, and where the stranger found himself at home ; where the distressed and the needy met with pity and kindness, and the beggar never went off without being supplied ; where the story and the joke often cheered the well-pleased guests, and were often accompanied with the dance and the song, and all with an uncommon degree of elegance, cheerfulness, and good humour. But with me these wonted scenes of merriment are now

over. The violin and the song have no charms for me; the dance and the cheerful tale delight no more. But hold, minister! what mean you by these gloomy thoughts? Why disturb for a moment the happiness of the dear things you write to, and for whose happiness you so earnestly pray, by casting a damp upon their gay and merry hours? Cease, foolish, and tempt not Providence to afflict you! What! have you not many comforts to make you happy? Is not the friend of your bosom, the loving dutiful wife, and the loving dutiful mother, alive to bless and to comfort you? Is not your family, though somewhat scattered, all alive? Are they not all good and promising? None of them ever yet caused you to blush; and are not these great blessings? and are they not worthy of your most cheerful and grateful acknowledgments? They are, they are, and I bless God for his goodness. But the thought—I cannot provide for these! Take care, minister, that the anxiety of your affection does not unhinge that confidence with which the Christian ought to repose upon the wise and good providence of God! What though you are to leave your children poor and friendless? Is the arm of the Lord shortened that he cannot help? is his ear heavy that he cannot hear? You yourself have been no more than an instrument in the hand of his goodness; and is his goodness, pray, bound up in your feeble arm? Do you what you can; leave the rest to God. Let them be good, and fear the Lord, and keep his commandments, and he will provide for them in his own way and in his own time. Why then wilt thou be cast down, O my soul; why disquieted within me? Trust thou in the Lord! Under all the changes and the cares and the troubles of this life, may the consolations of religion support our spirits. In the multitude of the thoughts within me, thy comforts, O my God, delight my soul! But no more of this preaching-like harangue, of which, I doubt not, you wish to be relieved. Let me rather reply to your letter, and tell you my news."

It was after this period that he had to mourn the loss of many of his family. And then began for the manse-girls the education within the school of sickness and death, whose door is shut against the intrusion of the noisy world, and into which no one can enter, except the Father of all, and "the Friend who sticketh closer than a brother."

The first break in a family is a solemn and affecting era in its history; most of all when that family is "all the world" to its own members. The very thought—so natural to others who have suffered—that this one who has been visited by disease can ever become *dangerously* ill—can ever die, is by them dismissed as a dreadful night-mare. Then follow "the hopes and fears that kindle hope, an undistinguishable throng;" the watchings which turn night into day, and day into night; the sympathy of sorrow which makes each mourner hide from others the grief that in secret

is breaking the heart; the intense realization, at last, of all that may be—ay, that must be—until the last hours come, and what these are they alone know who have loved and lost. What a mighty change does this first death make in a family, when it is so united, that if one member suffers all suffer! It changes everything. The old haunts by rock or stream can never be as they were; old songs are hushed for years, and, if ever sung again, they are like wails for the dead; every room in the house seems, for a time, tenanted more by the dead than by the living; the books are theirs; the seat in church is not empty, but occupied by them; plans and purposes, family arrangements and prospects, all seem for a time so purposeless and useless. No one ever calculated on this possibility! The trial which has come verily seems "strange." Yet this is, under God, a holy and blessed education. Lessons are then taught, "though as by fire," which train all the scholars for a higher school. And if that old joyousness and hilarity pass away which belong to a world that seemed as if it could not change—like a very Eden before the Fall—it is succeeded by a deeper life; a life of faith and hope which find their rest in the unchanging rather than the changing present.

Such was a portion of the education which the pastor and his family received for many succeeding years in the old manse; but its memory was ever accompanied by thanksgiving for the true, genuine Christian life and death of those who had died. I need hardly say that the girls, more than the other members of the family, shared these sorrows and this discipline; for whatever men can do in the storm of ocean or of battle, women are the ministering angels in the room of sickness and of suffering.

Before I turn away from the manse-girls, I must say something more of their little governess. She lingered long about the manse, as a valued friend, when her services were no longer needed. But she resolved at last to attempt a school in the low country, and to stamp some uneducated spot with the impress of the wooden knob. Ere doing so, she confided to the minister a story told her by her father, the fort-commandant, about some link or other which bound him to the Argyle family. What that link precisely was, no history records. It may have been that her mother was a Campbell, or that the major had served in a regiment commanded by some member of that noble house, or had picked an Argyle out of the trenches of Ticonderoga. Anyhow, the commandant fancied that his only daughter would find a crutch of support, like many others, in "the Duke," if he only knew the story. Never up to this time was the crutch needed; but needed it is now if she is to pursue her life-journey in peace. Why not tell the story then to the Duke? quoth the minister. Why not? thoughtfully ruminated the little governess. And so they both entered the manse-study—a wonderful little sanctum of books and

mss., with a stuffed otter and wild-cat, a gun, compass, coil of new rope, the flag of the "Roe," a print of the Duke of Argyle, and of several old divines and reformers, in wigs and ruffs. There the minister wrote out, with great care, a petition to the Duke for one of the very many kind charities, in the form of small annuities, which were dispensed by his Grace. The governess determined to present it in person at Inverary. But the journey thither was then a very serious matter. To travel now-a-days from London to any capital on the Continent is nothing to what that journey was. For it could only be done on horseback, and by crossing several stormy ferries, as wide as the Straits of Dover. The journey was at last, however, arranged in this way. There lived in one of the many cottages on the glebe, a man called "old Archy," who had been a servant in the family of the pastor's father-in-law. Archy had long ago accompanied, as guide and servant, the minister's wife, when she went to Edinburgh for her education. Having been thus trained to foreign travel, and his fame established as a thoroughly qualified *courier*, he was at once selected to accompany, on horseback, the governess to Inverary. That excellent woman did not, from nervous anxiety, go to bed the night previous to her departure; and she had laboured for a fortnight to produce a new dress in which to appear worthily before the Duke. She had daily practised, moreover, the proper mode of address, and was miserable from the conviction that all would be ruined by her saying "Sir," instead of "your Grace." The minister tried to laugh her out of her fears, and to cheer her by the assurance that a better-hearted gentleman lived not than the good Duke John; and that she must just speak to him as she felt. She departed with her black trunk slung behind Archy; and also with extraordinary supplies of cold fowls, mutton, ham, and cheese—not to speak of letters commendatory to every manse on the road. What farewells, and kissings, and waving of handkerchiefs, and drying of eyes, and gathering of servants and of dogs at the manse-door as the governess rode off on the white horse, Archy following on the brown! The proper arrangement of the wooden leg had been a great mechanical and æsthetic difficulty, but somehow the girls, with a proper disposal of drapery, had made the whole thing quite *apropos*. Archy too had patched up a saddle of wonderful structure for the occasion.

Time passed, and in a fortnight, to the joy of the household, the white mare was seen coming over the hill, with the brown following; and soon the governess was once more in the arms of her friends, and the trunk in those of Archy. Amidst a buzz of questions, the story was soon told with much flutter and some weeping—how she had met the Duke near the castle; how she had presented her petition, while she could not speak; how his Grace had expressed his great re-

gard for "his minister;" and how next day, when she called by appointment, he had signified his intention of granting the annuity. "It is like himself," was the minister's only remark, while his eyes seemed fuller than usual as he congratulated the little governess on her success; and gave an extra bumper, with many a compliment, to old Archy for the manner in which he had guided the horses and their riders. The little governess taught a school for many years, and enjoyed her annuity till near ninety. During her last days, she experienced the personal kindness and tender goodness of the present "Argyle," as she had long ago done, of the former "Argyles."

CHAPTER V.—THE MINISTER AND HIS WORK.

"A genuine priest,
The shepherd of his flock; or, as a king
Is styled, when most affectionately praised,
The father of his people. Such is he;
And rich and poor, and young and old, rejoice
Under his spiritual sway."

"When his course
Is run, some faithful eulogist may say
He sought not praise, and praise did overlook
His unobtrusive merit; but his life,
Sweet to himself, was exercised in good
That shall survive his name and memory."

WORDSWORTH.

In Dr. Macculloch's "Tour to the Highlands of Scotland," we have the most perfect and eloquent descriptions of scenery; but in Dr. Johnson's, the truest yet most complimentary delineations of the character and manners of the people. The physical features of the country are, no doubt, abiding, while its social condition is constantly changing; so that we can now-a-days more easily recognise the truth of the sketches by the former than by the latter tourist. But the minister of whom I write, and the manners of his time, belonged to the era of Johnson, and not to that of Macculloch.

There is something, by the way, peculiarly touching in that same tour of the old Doctor's, when we remember the tastes and habits of the man, with the state of the country at the time in which he visited it. Unaccustomed to physical exercise, obese in person and short-sighted in vision, he rode along execrable roads; and on a Highland shelly cautiously felt his way across interminable morasses. He had no means of navigating those stormy seas but an open boat, pulled by sturdy rowers, against wetting spray, or tacking from morning till night amidst squalls, rain, and turbulent tideways. He had to put up in wretched pot-houses, sleeping, as he did at Glenelg, "on a bundle of hay, in his riding-coat; while Mr. Boswell, being more delicate, laid himself in sheets, with hay over and above him, and lay in linen like a gentleman." In some of the best houses, he found but clay floors below and peat-reek around, and nowhere did he find the luxuries of his own favourite London. Yet he never growls or expresses one word of discontent or peevish-

ness. Whether this was owing to his having for the first time escaped the conventionalities of city life; or to the fact of the Highlands being then the last stronghold of Jacobinism; or to the honour and respect which was everywhere shown towards himself; or, what is more probable, to the genial influence of fresh air and exercise upon his phlegmatic constitution, banishing its "bad humours,"—in whatever way we may account for it, so it was, that he encountered every difficulty and discomfort with the greatest cheerfulness; partook of the fare given him and the hospitality afforded to him with hearty gratitude; and has written about every class of the people with the generous courtesy of a well-bred English gentleman.

His opinion of the Highland clergy is not the least remarkable of his "testimonies," considering his intense love of Episcopacy, and its forms of public worship, with his sincere dislike of Presbyterianism. "I saw," he says, writing of the clergy, "not one in the Islands whom I had reason to think either deficient in learning or irregular in life, but found several with whom I could not converse without wishing, as my respect increased, that they had not been Presbyterians." Moreover, in each of the distant islands which the Doctor visited, he met ministers with whom even he was able to have genial and scholarly conversation. "They had attained," he says, "a knowledge as may be justly admired in men who have no motive to study but generous curiosity, or, what is still better, desire of usefulness; with such politeness as no measure or circle of converse could ever have supplied, but to minds naturally disposed to elegance." When in Skye, he remarks of one of those clergymen, Mr. M'Queen, who had been his guide, that he was "courteous, candid, sensible, well informed, very learned;" and at parting, he said to him, "I shall ever retain a great regard for you. Do not forget me." In another island, the small island of Coll, he paid a visit to Mr. Maclean, who was living in a small, straw-thatched, mud-walled hut, "a fine old man," as the Doctor observed to Boswell, "well dressed, with as much dignity in his appearance as the Dean of a cathedral!" Mr. Maclean had "a valuable library," which he was obliged, "from want of accommodation, to keep in large chests;" and this solitary, shut up "in a green isle amidst the ocean's waves," argued with the awful Southern Don about Leibnitz, Bayle, etc., and though the Doctor displayed a little of the bear, owing to the old man's deafness, yet he acknowledged that he "liked his firmness and orthodoxy." In the island of Mull, again, Johnson spent a night under the roof of another clergyman, whom he calls, by mistake, Mr. Maclean, but whose name was Macleod,* and of whom he says that he was "a minister

whose elegance of conversation, and strength of judgment, would make him conspicuous in places of greater celebrity." It is pleasant to know, on such good authority, that there lived at that time, in these wild and distant parts, ministers of such character, manners, and learning.

The minister of our Highland parish was a man of similar culture and character with those of his brethren, two of whom mentioned by the Doctor were his intimate friends. He had the good fortune, let me mention in passing, to meet the famous traveller at Dunvegan Castle; and he used to tell, with great glee, how he found him alone in the drawing-room before dinner, poring over some volume on the sofa, and how the Doctor, before rising to greet him kindly, dashed to the ground the book he had been reading, exclaiming, in a loud and angry voice, "The author is an ass!"

When the minister came to his parish, the people were but emerging from those old feudal times of clanship, with its loyal feelings and friendships, yet with its violent prejudices and intense clinging to the past, and to all that was bad as well as good in it. Many of his parishioners had been "out in the '45," and were Prince Charlie men to the core.* These were not characterized by much religion. The predecessor of our minister had been commanded by this party not to dare in their hearing to pray for King George in church, or they would shoot him dead. He did, nevertheless, pray, at least in words, but not, we fear, in pure faith. He took a brace of pistols with him to the pulpit, and cocking them before his prayer began, he laid them down before him, and for once at least offered up his petitions with his eyes open. There was no law-officer of the crown, not even a justice

* The minister himself was a keen "Hanoverian." This was caused by his very decided Protestantism, and also, no doubt, by his devotion to the Dunvegan family, which, through the influence chiefly of President Forbes, had opposed the Pretender. The minister, on a memorable occasion, had his Highland and loyal feeling rather severely tried. It happened thus:—When King William IV., like our noble Prince Alfred, was a midshipman in the royal navy, his ship, the "Cæsar," visited the Western Isles. The minister, along with the other public men in the district, went to pay his respects to his Royal Highness. He was most graciously received, and while conversing with the prince on the quarter-deck, a galley manned with six rowers pulled alongside. The prince asked him to whom it belonged. On being informed that it belonged to a neighbouring proprietor, the additional remark was made, with a kind smile, "He was out, no doubt, in the '45? Of course he was! Ah, doctor, all you Highlanders were rebels, every one of you! Ha—ha—ha!" "Please your Royal Highness," said the minister, with a low bow, "I am thankful to say *all* the Highlanders were not rebels, for had they been so, we might not have had the honour and happiness of seeing your Royal Highness among us now." The prince laughed heartily, and complimented the minister on the felicity of his reply.

* The grandfather of the present, and the father of the late Rev. Dr. Macleod of New York, U.S., both distinguished clergymen.

of the peace at that time in the whole parish. The people were therefore obliged to take the law to some extent in their own hands. Shortly after our minister came to the parish, he wrote stating that "no fewer than thirty persons have been expelled for theft, not by sentence of the magistrate, but by the united efforts of the better sort of the inhabitants. The good effects of this expulsion have been sensibly felt, but a court of law having been established since then in the neighbourhood, the necessity for such violent means are in a great measure obviated."

The minister was too far removed from the big world of Church politics, General Assembly debates, controversial meetings and pamphlets, to be a party man. It satisfied him to be a part of the great catholic Church, and of that small section of it in which he had been born. The business of his Presbytery* was chiefly local, and his work was confined wholly to his parish.

After having studied eight years at a university, he entered on his charge with a salary of £40, which was afterwards raised to £80. He ministered to 2000 souls, all of whom—with the exception of perhaps a dozen families of Episcopalians and Roman Catholics—acknowledged him as their pastor. His charge was scattered over 130 square miles, with a sea-board of 100! This is his own description of the ecclesiastical edifices of the parish at the beginning of his ministry:—"There are two churches *so called*, but with respect to decency or accommodation, they might as properly be called sheds or barns. The dimensions of each is no more than forty by sixteen feet, and without seats or bells. It is much to be regretted that since the Reformation little or no attention has been paid to the seating of churches in this country." No such churches can now be found. How the congregation managed

to arrange themselves during service in those "sheds," I know not. Did they stand? sit on stones or bunches of heather? or recline on the earthen floor? Fortunately the minister was an eloquent and earnest preacher, and he may have made them forget their discomfort. But the picture is not pleasing of a congregation dripping wet, huddled together in a shed, without seats, after a long walk across the mountains. Sleeping, at all events, was impossible.

It is worth noticing, as characteristic of the times, that during the first period of his ministry there was no copy of the Gaelic Scriptures in existence, except the Irish Bible by Bedell. The clergy translated what they read to the people from the English version. The Highlanders owed much to Gaelic hymns, composed by some of their own poets, and also to metrical translations of the Psalms.* But even if there had been Bibles, most of the people had not the means of education. What could one or two schools avail in so extensive a parish? To meet the wants of the people, a school would require to be in almost every glen.

But preaching on Sunday, even on a stormy winter's day, was the easiest of the minister's duties. There was not a road in the parish. Along the coast indeed for a few miles there was what was charitably called a road, and, as compared with those slender sheep-tracks which wormed their way through the glens, and across some of the wilder passes, it perhaps deserved the name. By this said road country carts could toil, pitching, jolting, tossing, in deep ruts, over stones, and through the burns, like waggons in South Africa, and with all the irregular motion of boats in a storm. But for twenty miles inland the hills and glens were as the Danes had left them.

The paths which traversed those wilds were journeyed generally on foot, but in some instances by "the minister's horse," one of those sagacious creatures which, with wonderful instinct, seemed to be able, as Ruari used to say, "to smell out the road" in darkness. It is hardly possible to convey a just impression, except to those acquainted with Highland distances and wildernesses, of what the

* It may interest some of our southern readers to know that the government of the Established Church of Scotland is conducted as follows:—(1.) Over a single parish is the court called the *Kirk-Session*, composed of lay members, who are ordained for the office as Elders and as Deacons (to attend to the poor). The number of this court varies according to the size and circumstances of the congregation and parish. (2.) Over a number of parishes is the *Presbytery*, composed of all the clergy within a certain district, and a representative Elder from each Session. (3.) Over the Presbyteries of a Province is the Synod, composed of all the members of the several Presbyteries; and, finally, over the whole Church is the General Assembly, presided over by a nobleman, representing the Sovereign, and a "moderator" or chairman, elected by the Church, and composed of representatives, lay and clerical, from every presbytery, and also laymen from the Royal Burghs and Universities. These several courts have many privileges conferred upon them by Act of Parliament. Beyond Scotland, they are no more "established" than the Church of England. Both Churches are, by the Act of Union, placed on an equal footing as regards the State in the Colonies. The government of the Church of Scotland is very similar to that of all the Established Protestant Churches on the Continent.

* It is just as strange that the eldest son of "the manse" was the first to prepare a metrical translation of the Psalms in Irish, for the use of the Irish Protestant Churches. He also was the chief means of obtaining a new edition of the Gaelic Scriptures for his own countrymen, and of originating and helping on the Education Scheme of the Church of Scotland, which now instructs 20,000 children in the Highlands. In order to supply the hunger for knowledge which these additional means of education would create, he prepared admirable Gaelic school-books, and conducted a monthly magazine in Gaelic for several years, which, it is not much to say, was, in point of talent, interest, usefulness, and genius, the most precious literary boon ever conferred on the Highlands. A volume of selections from his writings will soon be issued, accompanied by a sketch of his life. I hope this allusion to one so recently departed may be kindly interpreted.

ordinary labours of such a minister was. Let us select one day out of many of a Highland pastor's work. Immediately after service, a Highlander saluted him, with bonnet off and a low bow, saying "John Macdonald in the Black glen is dying, and would like to see you, sir." After some inquiry, and telling his wife not to be anxious if he was late in returning home, he strode off at "a killing pace" to see his parishioner. The hut was distant sixteen Highland miles; but what miles! Not such as are travelled by the Lowland or Southern parson, with steps solemn and regular, as if prescribed by law. But this journey was over bogs, along rough paths, across rapid streams without bridges, and where there was no better shelter than could be found in a Swiss chalet. After a long and patient pastoral visit to his dying parishioner, the minister strikes for home across the hills. But he is soon met by a shepherd, who tells him of a sudden death which had occurred but a few hours before in a hamlet not far off; and to visit the afflicted widow will take him only a few miles out of his course. So be it, quoth the parson, and he forthwith proceeds to the other glen, and mingles his prayers with those of the widow and her children. But the longest day must have an end, and the last rays of the sun are gilding the mountain-tops, and leaving the valleys in darkness. And so our minister, with less elastic step, is ascending towards the steep *Col*, which rises for 2000 feet with great abruptness, and narrow zig-zag path from a chain of lakes up past the "Rhigi" I have already described. But as he nears the summit, down comes thick, palpable, impenetrable mist. He is confident that he knows the road *nearly* as well as the white horse, and so he proceeds with caution over deep moor-hags until he is lost in utter bewilderment. Well, he has before now spent the night under a rock, and waited until break of day. But having eaten only a little bread and cheese since morning, he longs for home. The moon is out, but the light reveals only driving mist, and the mountain begins to feel cold, damp, and terribly lonely. He walks on, feeling his way with his staff, when suddenly the mist clears off, and he finds himself on the slope of a precipice. Throwing himself on his back on the ground, and digging his feet into the soil, he recovers his footing, and with thanksgiving changes his course. Down comes the mist again, thick as before. He has reached a wood—where is he? Ah! he knows the wood right well, and has passed through it a hundred times, so he tries to do so now, and in a few minutes has fallen down a bank into a pool of water. But now he surely *has* the track, and following it he reaches the spot in the valley from where he had started two hours before! He rouses a shepherd, and they journey together to a ferry by which he can return home by a circuitous route. The boat is there, but the tide is out, for it ebbs far to seaward at this spot, and so he has to wait patiently for the return of the tide.

The tide turns, taking its own time to do so; half wading, half rowing, they at last cross the strait. It is now daybreak, and the minister journeys homeward, and reaches the manse about five in the morning.

Such land journeys were frequently undertaken, with adventures more or less trying, not merely to visit the sick, but for every kind of parochial duty—sometimes to baptize, and sometimes to marry. These services were occasionally performed in most primitive fashion at one of those green spots among the hills. Corrie Borrodale, among the old "shielings," was a sort of half-way-house between the opposite sides of the parish. There, beside a clear well, children have been baptized; and there, among the bonnie blooming heather, he has married the Highland shepherd to his bonnie blooming bride. There were also in different districts preaching and "catechising," as it was called. The catechising consisted in examining on the Church Catechism and Scriptures every parishioner who was disposed to attend the meeting, and all did so with few exceptions. This "exercise" was generally followed by preaching, both of course in the open air, and when weather permitted. And no sight could be more beautiful than that of the venerable minister seated on the side of a green and sheltered knoll, surrounded by the inhabitants of the neighbouring hamlets, each, as his turn came, answering, or attempting to answer, the questions propounded with gravity and simplicity. A simple discourse followed from the same rural pulpit, to the simple but thoughtful and intelligent congregation. Most touching was it then to hear the Psalms rise from among the moorland, disturbing "the sleep that is among the lonely hills;" the pauses filled up by the piping of the plover or some mountain bird, and by the echoes of the streams and water-falls from the rocky precipices. It was a peasant's choir, rude and uncultivated by art, but heard, I doubt not, with sympathy by the mighty angels who sung their own noblest song in the hearing of shepherds on the hills of Bethlehem.

That minister's work was thus devoted and unwearied for half a century. And there is something peculiarly pleasing and cheering to think of him and of others of the same calling and character in every church, who from year to year pursue their quiet course of holy, self-denying labour, educating the ignorant; bringing life and blessing into the homes of disease and poverty; sharing the burden of sorrow with the afflicted, the widow, and the fatherless; reproving and admonishing, by life and word, the selfish and ungodly; and with a heart ever open to all the fair humanities of our nature;—a true "divine," yet every inch a man! Such men, in one sense, have never been alone; for each could say with his Master, "I am not alone, for the Father is with me." Yet what knew or cared the great, bustling, religious world about them? Where were their public meetings,

with reports, speeches, addresses, "resolutions," or motions about their work? Where their committees and associations of ardent philanthropists, rich supporters, and zealous followers? Where their "religious" papers, so called, to parade them before the world, and to crown them with the laurels of puffs and leading articles? Alone, he, and thousands like him have laboured, the very salt of the earth, the noblest of their race!

CHAPTER VI.—PASSING AWAY.

- "I have had playmates, I have had companions,
In my days of childhood, in my joyful school-days;
All, all are gone, the old familiar faces.
- "I have a friend, a kinder friend has no man;
Like an ingrate I left my friend abruptly;
Left him, to muse on the old familiar faces.
- "Ghost-like I paced round the haunts of my childhood;
Earth seemed a desert I was bound to traverse,
Seeking to find the old familiar faces.
- "Friend of my bosom, thou more than a brother,
Why wert not thou born in my father's dwelling!
So might we talk of the old familiar faces—
- "How some they have died, and some they have left me,
And some are taken from me; all are departed;
All, all are gone, the old familiar faces."

THE minister, when verging on fourscore, became blind. A son of the manse, his youngest, was, to his joy, appointed to be his assistant and successor in the ministry. I cannot forget the last occasion on which "the old man eloquent" appeared in the pulpit. The Holy Communion was about to be dispensed, and, before parting for ever from his flock, he wished to address them once more. When he entered the pulpit, he mistook the side for the front; but old Rory, who watched him with intense interest, was immediately near him, and seizing a trembling hand placed it on the book-board, thus guiding his master into the right position for addressing the congregation. And then stood up that venerable man, a Saul in height among the people, with his pure white hair falling back from his ample forehead over his shoulders. Few, and loving, and earnest were the words he spoke, amidst the profound silence of a passionately devoted people, which was broken only by their low sobs, when he told them that they should see his face no more. Soon afterwards he died. The night of his death, sons and daughters were grouped around his bed, his wife on one side, old Rory on the other. His mind had been wandering during the day. At evening he sat up in bed; and one of his daughters, who supported his head, dropped a tear on his face. Rory rebuked her and wiped it off; for it is a Highland superstition (?), that no tear should ever drop on the face of a good man dying;—is it because it adds to the burden of dying, or is unworthy of the glorious hopes of living? Suddenly the minister stretched forth his hand, as if a child was before him, and said, "I baptize thee into the name of the Father, the Son, and the Holy Spirit," then

falling back, he expired. It seemed as if it were his own baptism as a child of glory.

The widow did not long survive her husband. She had, with the quiet strength and wisdom of love, nobly fulfilled her part as wife and mother. But who can know what service a wife and mother is to a family, save those who have had this staff to lean on, this pillow to rest on, this sun to shine on them, this best of friends to accompany them, until their earthly journey is over, or far advanced?

Her last years were spent in peace in the old manse, occupied then and now by her youngest son. But she desired, ere she died, to see her first-born in his lowland manse far away, and with him and his children to connect the present with the past. She accomplished her wishes, and left an impress on the young of the third generation which they have never lost during the thirty years that have passed since they saw her face and heard her voice. Illness she had hardly ever known. One morning a grandchild gently opened her bedroom door with breakfast. But hearing the low accents of prayer, she quietly closed it again, and retired. When she came again, and tapped and entered, all was still. The good woman seemed asleep in peace; and so she was, but it was the sleep of death. She was buried in the Highland kirkyard, beside her husband and nine of her children. There, with sweet young ones, of another generation, who have since then joined them from the same manse, they rest until the resurrection morning, when all will meet "in their several generations."

Old Rory next followed his beloved master. One evening, after weeks of illness, he said to his wife, "Dress me in my best; get a cart ready; I must go to the manse and bless them all, and then die." His wife thought at first that his strange and sudden wish was the effect of delirium, and she was unwilling to comply. But Rory gave the command in a tone which was never heard except when, at sea or on land, he meant to be obeyed. Arrayed in his Sunday's best, the old man, feeble, pale, and breathless, tottered into the parlour of the manse, where the family were soon around him, wondering, as if they had seen a ghost, what had brought him there. "I bless you all, my dear ones," he said, "before I die." And, stretching out his hands, he pronounced a patriarchal blessing, and a short prayer for their welfare. Shaking hands with each, and kissing the hand of his old and dear mistress, he departed. The family group felt awe-struck,—the whole scene was so sudden, strange, and solemn. Next day, Rory was dead.

Old Jenny, the henwife, rapidly followed Rory. Why mention her? Who but the geese or the turkeys could miss her? But there are, I doubt not, many of my readers who can fully appreciate the loss of an old servant who, like Jenny, for half a century, has been a respected and valued member of the family. She was associated with

the whole household life of the manse. Neither she nor any of those old domestics had ever been mere *things*, but living persons with hearts and heads, to whom every burden, every joy of the family were known. Not a child but had been received into her embrace on the day of birth; not one who had passed away but had received her tears on the day of death; and they had all been decked by her in their last as in their first garments. The official position she occupied as hen-wife had been created for her in order chiefly to relieve her feelings at the thought of her being useless and a burden in her old age. When she died, it was discovered that the affectionate old creature had worn next her heart, and in order to be buried with her, locks of hair cut off in infancy from the children whom she had nursed. And here I must relate a pleasing incident connected with her. Twenty years after her death, the younger son of the manse, and its present possessor, was deputed by his church to visit, along with two of his brethren, the Presbyterian congregations of North America. When on the borders of Lake Simcoe he was sent for by an old Highland woman, who could speak her own language only, though she had left her native hills very many years before. On entering her log-hut, the old woman burst into a flood of tears, and, without uttering a word, pointed to a silver brooch which clasped the tartan shawl on her bosom. She was Jenny's youngest sister, and the silver brooch she wore, and which was immediately recognised by the minister, had been presented to Jenny by the eldest son of the manse, when at college, as a token of affection for his old nurse.

Nearly forty years after the old minister had passed away, and so many of "the old familiar faces" had followed him, the manse boat, which in shape and rig was literally descended from the famous "Roe," lay becalmed, on a beautiful summer evening, opposite the shore of the glebe. The many gorgeous tints from the setting sun were reflected from the bosom of the calm sea. Vessels, "like painted ships upon a painted ocean," lay scattered along "the Sound," and floated double, ship and shadow. The hills on both sides rose pure and clear into the blue sky, revealing every rock and precipice, with heathery knoll or grassy Alp. Fish sometimes broke the smooth unrippled sea, "as of old the Curlews called." The boating party had gone out to enjoy the perfect repose of the evening, and allowed the boat to float with the tide. The conversation happened to turn on the manse and parish.

"I was blamed the other day," remarked the minister, who was one of the party, "for taking so much trouble in improving my glebe, and especially in beautifying it with trees and flowers, because, as my cautious friend remarked, I should remember that I was only a life-renter. But I asked my adviser how many proprietors in the parish—whose

families are supposed to have a better security for their lands than the minister has for the glebe—has yet possessed their properties so long as our poor family has possessed the glebe? He was astonished, on consideration, to discover that every property in the parish had changed its owner, and some of them several times, since I had succeeded my father!"

"And if we look back to the time since our father became minister," remarked another of the party, "the changes have been still more frequent. The only possessors of their first home, in short, in the whole parish, are the family which had no "possessions" in it!

"And look," another said, "at those who are in this boat. How many birds are here out of the old nest!" And strange enough there were in that boat the eldest and youngest sons of the old minister, both born on the glebe, and both doctors of divinity, who had done good, and who had been honoured in their time. There were also in the boat three ordained sons of those old sons born of the manse, in all, five ministers descended from the old minister. The crew was made up of an elderly man, the son of "old Rory," and of a white-haired man, the son of "old Archy," both born on the glebe.

But these clergy represented a few only of the descendants of the old minister who were enjoying the manifold blessings of life. These facts are mentioned here in order to connect such mercies with the anxiety expressed sixty years ago by the poor parson himself in the letter to his girls, which I have published.

One event more remains for me to record connected with the old manse, and then the silence of the hills, in which that lowly home reposes, will no more be broken by any word of mine about its inhabitants—except as they are necessarily associated with other "reminiscences." It is narrated in the memoir lately published of Professor Wilson, that when the eldest son of our manse came to Glasgow College, in the hey-day of his youth, he was the only one who could compete, in athletic exercises, with the Professor, who was his friend and fellow-student. That physical strength, acquired in his early days by the manly training of the sea and hills, sustained his body; while a spiritual strength, more noble still, sustained his soul, during a ministry, in three large and difficult parishes, which lasted, with constant labour, for more than half a century, and until he was just about to enter on his eightieth year—the day of his funeral being the anniversary of his birth. He had married in early life the daughter of one of the most honourable of the earth, who had for upwards of forty years, with punctilious integrity, managed the estates of the Argyll family in the Western Highlands. Her father's house was opposite the old manse, and separated from it by the "Sound." This invested that inland sea which divided the two

lovers, with a poetry that made "The Roe" and her perilous voyages a happy vision that accompanied the minister until his last hour. For three or four years he had retired from public life, to rest from his labours, and in God's mercy to cultivate the passive more than the active virtues in the bosom of his own family. But when disposed to sink into the silent pensiveness and the physical depression which often attend old age, one topic, next to the highest of all, never failed to rouse him—like a dying eagle in its cage, when it sees far off the mountains on which it tried its early flight—and that one was converse about the old parish, of his father, and of his youth. And thus it happened that on the very last evening of his life he was peculiarly cheerful, as he told some stories of that long past; and among others a characteristic anecdote of old Rory. How naturally did the prayer of thanksgiving then succeed the memories of those times of peace and of early happiness!

That same night, his first and last love—the "better half," verily, of his early life, was awoke from her anxious slumbers near him, by his complaint of pain. But she had no time to rouse the

household ere he, putting his arms round her neck, and breathing the words "my darling" in her ear, fell asleep. He had for more than twenty-five years ministered to an immense congregation of Highlanders in Glasgow; and his public funeral was remarkable, not chiefly for the numbers who attended it, or the crowds which followed it—for these things are common in such ceremonies—but for the sympathy and sorrow manifested by the feeble and tottering Highland men and women, very many of whom were from the old parish, and who, bathed in tears, struggled to keep up with the hearse, in order to be near, until the last possible moment, one for whom they had an enthusiastic attachment. The Highland hills and their people were to him a passion, and for their good he had devoted all the energies of his long life; and not in vain! His name will not, I think, be lost in this generation, wherever, at least, the Celtic language is spoken; and though this notice of him may have no interest to the Southern reader, who may not know, nor care to know, his name, yet every Gael in the most distant colony, who reads these lines, will pardon me for writing them. He belongs to them as they did to him.

ESSAYS FOR SUNDAY READING.

BY JOHN CAIRD, D.D.

III.—THE EXPEDIENCY OF CHRIST'S DEPARTURE.

WE can understand how difficult it was for Christ's disciples to perceive the truth of that saying, "It is expedient for you that I go away." It must have been hard for them to comprehend how they could gain by losing him. There are men, indeed, of whom it may be said with truth that it is for the world's advantage that they should go away; with respect to whom we can clearly see that it would be well for society to be rid of them. But these are not such as He from whose dying lips this strange intimation fell. The selfish man who absorbs, in the gratification of his own desires, what was meant for the general good; the profligate whose base delights are purchased at the cost of others' ruin; the ruthless, malicious, revengeful man, whose unbridled passions render him the torment of his associates; the tyrant and oppressor, whose selfish lust of power is gratified at the expense of the freedom and happiness of thousands, whose wealth is their poverty, whose exaltation the trampling of their rights under foot; of these, nay, of every wicked man, whose presence, influence, example, are a curse and not a blessing to mankind, it may, without hesitation, be pronounced that it is expedient for the world that they should leave it. But can the same thing ever be averred with respect to the good, the

gentle, the generous-hearted and open-handed, whose resources are ever employed, not for self, but for the good of others? Is it possible to think that when the man of profound wisdom and large experience, whose far-seeing, sagacious mind constitutes him the intellectual guide, the revered instructor, the ever-trusted master of less gifted men; or the man of eminent piety, whose pure and saintly life, breathing the spirit of heaven, hallows, softens, ennobles all within the reach of its influence;—is it possible to think that when these, and such as these, are taken away from us, it is a gain to us, and not rather a grievous privation? And is not the difficulty greatest of all when we are asked to believe this of the world's Greatest and Best; of the only perfect Life this world has ever seen; of Him from whose lips flowed wisdom such as its sages had never reached; from whose life streamed forth beneficent influence on all around Him; whose whole history is but a record of benignity and love, of self-devoted, self-sacrificing zeal for the good of men? Is it conceivable that men's advantage could ever lie in the loss of a being such as this? There are indeed those who seem to themselves to gain by the passing away of greatness or goodness from the world. Envy or interested selfishness, wounded pride or

jealous inferiority, may feel relieved by the removal of those for whom others mourn. The expectant heir not seldom grudges long life to the man who keeps him out of the inheritance; the death of a rival in place or power may, in the secret soul of a selfish competitor, be regarded with a guilty complacency. But not so could it be in the case before us. Neither worldly power nor wealth belonged to Jesus; from fame or fortune His continued presence constituted no barrier to any; and those to whom He now spoke knew no honour that was not theirs because they dwelt in the shadow of His greatness. Their whole hope and happiness were embarked in his cause, and their sole dependence for the successful prosecution of it was on His leadership. Strange, then—may, had they fallen from other lips, almost bitter and mocking—must have seemed to them those words in which Jesus announced that it was for their advantage that He should leave them. As well almost might it seem expedient for the hapless voyagers that the sagacious and experienced pilot should be swept overboard, while in darkness and storm the ship is being guided by his firm hand through shoals and breakers; or for the army that their great captain should be shot down in the very act of carrying out his dispositions in the heat of the fight; or for the family that the beloved father, on whose exertions their present support and future welfare depend, should be torn from them by sudden disease in the midst of his years and his usefulness; as well might it seem expedient for these that their head should be removed, as for Christ's followers, in their ignorance and weakness and dependence, that their Lord should "go away."

Yet, I need scarcely go on to say, this declaration of Christ contains a deeper truth than meets the eye, and one the import of which it will be most instructive for us to consider. Let us, then, proceed to inquire how it could be said to be expedient for Christ's disciples, and for His Church in all ages of her history, that the visible presence of their Lord should cease. Can we discover the grounds or reasons for the averment, "It is expedient for you that I go away?"

1. It may be suggested as one consideration preliminary to other and deeper reasons, *that the conceptions which the disciples formed of Christ, of his person, character, and mission, were rendered much more true and elevated by his removal.* Paradoxical as it may seem, they could entertain truer thoughts of Christ in His absence than when He was visibly and palpably before them. It may help us to understand this, if we reflect how often our conceptions of earthly greatness are vivified by death. It not seldom happens that great men are never truly known or adequately honoured till after they have passed from amongst us. There is something in the very fact of their bodily presence with us which tends to falsify our estimate of their character, and to render our impression of

their greatness less reverential and profound. The loftiest spirit is, alike with the meanest of mortals, compelled to submit to the commonplace conditions and necessities of life. Genius, with all its glowing aspirations and rapt contemplations, and communion with truth and beauty, must eat and drink, and dress and sleep, like base and common men. The poet must fold the ethereal wing of fancy, and stoop to the dull region of appetite and sense; the philosopher must come down from the mount of vision, where with eternal truth he has held high fellowship, to mingle with the crowd whose thoughts never range beyond the commonplace toils and gross cares of life; and whilst all men are capable of seeing and noting the lower half of his life in which he is on the same level with themselves, few or none may be capable of following him into the sphere of hidden thought and feeling which constitutes the higher and truer moiety of his being. There is in the mere daily familiarity with a great man's person, in coming into contact with him amidst the little minutiae of common life, a strange power to refine away the feeling of respectful inferiority which is due to his inner and spiritual excellence. So that often the last to recognise a distinguished man's merit are his familiar friends and associates. And the world may be ringing with his fame long before his neighbours and immediate connexions have permitted themselves to recognise it. No man is a hero to his personal attendant. "Is not this the carpenter's son, whose father and mother we know? Is not his mother called Mary, and his brothers, James and Joses; and his sisters, are they not all with us?" Moreover, besides this illusion of familiarity, the estimate which his contemporaries form of a great or good man is often further biased by personal rivalries, class prejudices, and the like, so that not till this refracting atmosphere has been swept away can they discern his real position and eminence. And finally, it is to be considered that the effects of a great man's labours, the results of his life and work, are often slowly developed, and only become fully apparent in the progress of time, and after he himself has passed away. A great principle is slow of being recognised, encounters often a thousand stubborn prejudices and antiquated but deep-rooted absurdities, before it begins to spread and obtain general recognition. A great discovery in science or art flashes in some moment of inspiration on the mind, but it may be long before the rude conception can be perfected, and embodied in a presentable form; for years it may be known only to a few men of thought and research; and perhaps not till the great author of it is beyond the reach of earthly honour does his work become the world's admiration, and his name a household word.

Now these considerations may open up to us one view of the expediency of Christ's departure. No little weaknesses or imperfections, indeed, ever discovered themselves to the closest inspection of His

earthly life, yet that illusion of familiarity, that unconscious underrating of greatness near at hand, of which we have spoken, could not fail to operate even more fatally in His case than in any other. If the littleness of common life contracts our estimate even of earthly greatness, how much more of that wondrous Being whose inner, spiritual grandeur transcended, by the distance between the finite and the infinite, the loftiest excellence that ever dwelt in human form. If it be difficult for the friends or associates of human genius to emancipate their minds from the deceptive influence of the mean details, the vulgar trivialities in which it is enveloped, to pierce through the coarse robe of common life, and discover the concealed kingly nature within, how much greater, how almost insuperable, the difficulty of shaking off this illusion, in the case of Him who was Lord of heaven and earth,—of seeing the Eternal Purity in the beggar's raiment. Looking on but one side, and that the mean and carnal one, of His nature, insensibly their conceptions of him became carnalized, and the carnal must be dissolved ere the spiritual could be truly discerned. In the Being so simple, lowly, gentle; who wandered by their sides in the same daily journeys, and retired at night to the same slumbers of exhausted nature; who looked like themselves, was hungry and weary like themselves, wore the same raiment, partook of the same meals,—in that most gentle companion, that kind, ever accessible friend, who took up little children in his arms, who went out to spend quiet nights with the family at Bethany, who suffered one loved disciple to lean on his bosom, and who washed the feet of all,—in that most intensely real human nature, how almost impossible for them to realize what a transcendent presence was ever near them. Through the rudely-shapen lamp they could catch but an occasional gleam of the inner glory; and the lamp must be broken ere the full brightness of that light of the world could burst forth upon their eyes. Death must dissolve the illusion of familiarity, and gather around the Man of Nazareth the mystery and awe of the world unseen, before they could rise to the apprehension of His awful greatness, and see in Him at once the Son of Man and Son of God. His great life must be seen no longer in separate parts and isolated incidents, but from the standing-point of enlightened reminiscence, viewed in all its completeness and symmetry as one perfect whole. The mighty power of His mission must begin to tell upon the world, the heavenly leaven to spread, the seed sown by His life and watered by His blood, begin to germinate and spring forth in a world's regeneration, ere they could learn to comprehend what a glorious contiguity had been theirs. Inasmuch, therefore, as only when He had vanished from their earthly eyes, could they see Him truly with the inner vision of the spirit, it was "expedient for them" that Jesus should "go away."

2. The more important explanation of this declaration of Christ yet remains. It was expedient

that He should go away, *because the outward and bodily presence of God in Christ was to be succeeded by an inward and spiritual manifestation of God to the souls of his people.* It was this to which Christ especially pointed in the text, as we are taught by the following words: "For if I go not away, the Comforter will not come unto you, but if I depart I will send him unto you." "I will pray the Father," He elsewhere declares, "and he shall give you another Comforter, that he may abide with you for ever; even the Spirit of truth . . . whom ye know, for he dwelleth with you, and shall be in you."

Great as their privilege had been who had lived in personal contact with the Son of God, a nearer, deeper, more blessed divine presence even than that of God manifest in the flesh, was in reserve for them; and the departure of Jesus would be no loss but a gain to them, if He who vanished as a visible material presence should come again as an inward and spiritual power and life dwelling within their hearts. As it has been sometimes expressed, in the religious history of the world God has manifested himself as dwelling successively in three temples; first in the visible material temple at Jerusalem, then in the temple of Christ's body, greater than the former, and finally in the temple of his redeemed Church, the hearts and souls of believers, which is the greatest of all. Now, as the destruction of the first temple would have been no loss, if it were necessary in order to the coming of one greater than the temple, so it was expedient, advantageous to man, and not the reverse, that the second temple, glorious though it was, should be removed, in order to the final manifestation, the climax of all God's revelations of Himself to man. And the truth of this statement you will perceive, if you consider one or two of the points in which the dispensation of the Spirit or Comforter is superior even to the dispensation of the Son.

It is so, for instance, in this respect, that the presence of God in Christ was an *outward and sensible*, whilst that of God the Spirit is an *inward and spiritual* presence.

In ordinary cases we lose for ever a good man's presence by his departure. His remembrance may be cherished in the hearts, his influence may be felt in the lives of the survivors, but with himself the world has no more direct and immediate intercourse. Poetry or affection may sometimes entertain the fond fancy that the dead are with us still, cognisant of the fortunes of those whom they loved on earth, hovering over us like unseen guardian spirits, when we wot not of their presence. But this is at best but the fanciful expression of our own yearning and wistful hearts to which reason lends no countenance. Our loved ones return no more. Their place who but as yesterday were with us, our advisers, guides, associates, entering with all our own earnestness into life's many interests, is vacant for ever. The gap can never be filled, the broken thread never taken up. Their

influence is a finished thing, their life an accomplished fact. If we need counsellors or friends, objects of love and fellowship, we must turn to others; for *their* voice we shall hear no more; we shall never more speak to them, consult them, feel the strengthening power of their stronger minds, or the sweet consciousness of their ever-watchful love. They have been borne away into regions and worlds unknown, and all that they were to us is a blank, a dead loss, never in the slightest measure to be retrieved till the eternal morning dawn.

But not so is it in the case before us. That which, with reference to our earthly friends, is but a dream or a fancy, is with reference to Jesus a sober fact, a most blessed reality. Heaven indeed was enriched, but earth, nevertheless, was not despoiled of her best treasure when Jesus passed away. He departed but in form, to return and dwell in more real and intimate communion with his people for ever. The wondrous phenomena of Pentecost, the rushing wind and lambent flames, the miraculous gifts and simultaneous conversions, were but the glorious inaugural of the returning Lord of the Church, no more as a mere outward and occasional visitant, but as an everlasting resident in the inmost souls of His people. It might seem to many, perhaps, an unspeakable privilege, beyond which they could not conceive a greater, if Jesus Christ, their divine Lord, should return in visible form, and, in like manner as of old he frequented earthly homes, so come and abide in theirs. What would it be to have the Lord Jesus himself coming back to spend a year, a month, a single day beneath your roof and within your family circle? What a home would that be where such a presence rested! What an atmosphere of heaven would pervade it! What a resource would its happy inmates possess in all difficulties and perplexities! What holy ardour, what strength for duty would fill every heart! And as the intelligence of this glorious visitation spread throughout the Church, might we not conceive the whole world filled with amazement at the signal honour conferred on this highly-favoured home, and multitudes from every land flocking to share in their privilege, and to catch if but a glimpse of the glorious visitant!

But we do not hesitate to say that a more inestimable privilege even than this is, in the dispensation of the Spirit, bestowed not upon one favoured family or individual, but upon every true-hearted member of the Church of Christ. Jesus comes no more as an outward visitant, He crosses in visible form no earthly threshold, and sits at no man's board; but He comes to every believer in a visitation nearer and more intimate than that. He enters not into the home, but, passing through all material barriers, into the very heart, and becomes a presence transfused, as it were, through the inmost soul of the believer. If it would be any help to you, longing for the good-

ness which you cannot reach, harassed by the evil from which you cannot escape—if it would be an unspeakably blessed resource to you in your contrition, your sorrow, your struggles and difficulties, to betake yourself to the visible presence of the Lord, to pour out your sorrow and faith at His feet, to take hold of His hand, to touch but the hem of His garment, to hear Him speak to you and comfort you, and to retire from that holy and august Presence soothed, strengthened, nerved for duty,—then surely it must be a most blessed thing to know that He is nearer still than this. Open the door of your heart to Him, and He will come in to you and bless you. He will not touch the hand, but dispensing with outward organizations, pass into and thrill the heart; your spirit will be suffused with His; the very heart of God will be beating within your breast. Say then, if this be the glorious fellowship by which it was to be succeeded, was it not indeed, in order to the bestowment of it, “expedient” that even the visible presence of Jesus should “go away.”

Another respect in which the dispensation of the Spirit may be conceived of as an advance on that of the Son, is that the latter implied only a *local and occasional*, the former involves a *universal and constant* presence of Christ with his people.

The visible, corporeal presence of Christ was of course possible only at one spot, and to, at most, a few of his personal followers at a time. The consecration which, it is natural to feel, that august Presence lent to every scene in which He moved was of necessity only an occasional and limited one, narrowed by the inevitable conditions of space and time. It is no mere fanciful or sentimental feeling that leads us to attach a special interest to the scenes of the Saviour's earthly life—that bears the steps of the Christian traveller to Palestine, and fills his mind with a strange awe as he gazes on the Galilean hills, or pushes off in the fisher's boat upon the lake of Gennesareth, or sits pensively on Olivet, or breathes a silent prayer in Gethsemane. It is a natural instinct which impels us to trace with interest the external scenes associated even with earthly greatness. You remember the well-known words of the great moralist when visiting our own country: “We were now treading,” he writes, “that illustrious island which was once the luminary of the Caledonian regions, whence savage clans and roving barbarians derived the benefits of knowledge and the blessings of religion. To abstract the mind from all local emotion would be impossible if it were endeavoured, and foolish if it were possible. Far from me and from my friends be such frigid philosophy as would conduct us unmoved over any ground which has been dignified by wisdom, bravery, or virtue. That man is little to be envied whose patriotism would not gain force upon the plain of Marathon, or whose piety would not grow warmer among the ruins of Iona.” And surely if local associations lend interest to scenes of earthly greatness or goodness,

such feelings may well attain their deepest intensity when we revisit

“Those holy fields,
Over whose acres walked those blessed feet,
Which, eighteen hundred years ago, were nailed
For our advantage on the bitter cross.”

It is something, we feel, to breathe the very air he breathed, to gaze on the very mountains and valleys on which His eyes looked, to stand where once of old He stood who is the Lord of our salvation: for every spot associated with His presence is to us holy ground.

And yet, all this admitted, it is our blessed privilege to rise above the mere sentiment of local association into the far more spiritual, more truly Christian experience of communion with an everywhere present and living Lord. Not the traveller standing at Bethlehem, or Nazareth, or Jerusalem, but the devout and loving-hearted Christian in every scene and spot on earth, may feel himself near to Jesus. The memories and associations of that sacred presence may linger still on the hills and valleys, the shadow of His earthly form haunt the cities and villages, of Palestine. But if the mere pietistic and sentimental mind should seek Him only there, the voice of the angel by the vacant sepulchre might well seem to sound in his ear the intimation, “He is not here, he is risen.” Not these plains, and hills, and streams only are

hallowed by His presence. Not amidst a few humble followers or scanty groups of listeners is the great Teacher to be found. Love Him, believe in Him, trust in Him, open your inmost heart and soul to Him, and lo! He is with you always unto the end of the world. Wherever you go, every hill will be to you a Carmel, every brook a Kedron, every home a Bethany. The cross where eternal love incarnate bleeds will rise before the eye of faith in every scene you behold, for the world will be crucified unto you, and you unto the world. You will “bear about in the body the dying of the Lord Jesus,” and Christ will be “in you the hope of glory.” “Wherever two or three are gathered together in Christ’s name”—not in sacred temples or at solemn communion seasons only—but in every family circle, at every common meal, in all the daily intercourse of life between Christian men, Christ will be in the midst. Work will become worship, daily toil as temple service, our common garments priestly robes, the world and human life, with all its manifold scenes, and objects, and events, holy and sacramental, because hallowed by the presence, transubstantiated into the symbols, and vivified by the communion and fellowship of Christ. By how much therefore the constant and universal is better than the occasional and local presence of the Lord, by so much was it “expedient for” His people that He “should go away.”

THE GOOD SAMARITAN.

THE PARABLES

READ IN THE LIGHT OF THE PRESENT DAY.

BY THOMAS GUTHRIE, D.D.

IV.—THE PARABLE OF THE GOOD SAMARITAN.

LUKE x. 30-37.

ON those summer mornings, when dews—sowing, as Milton says, the earth with orient pearl—lie thick on the meadow, and hang the trees with diamonds, and the smoke from cottage chimneys rises through the still air in blue and wreathed and graceful columns, the water of a lake looks like a mirror for Nature to admire her beauty in; cloud and mountain, rocks and hanging woods, the cattle that pasture and the flowers that adorn the banks, all faithfully reflected in this beautiful image of a soul at peace. On such an occasion, let a stone be thrown far out into the bosom of the quiet waters, and so soon as it goes down with a sullen plunge, a wave rises. This assumes the form of a circle, and, widening out equally on all sides, extends itself to embrace a larger and larger sphere. Symbol of our love, such it should be.

To love all in an equal degree is indeed impossible because, though some have larger hearts than others, the affections, like our other powers, act within certain limits. Our understanding is confined within bounds that it cannot pass; many subjects lie beyond its reach. Our eyes have a limited range of vision; we see the stars, not those who inhabit them. Our ears have a still more limited range of hearing; we see the flash of lightning when, too distant on the horizon or in the upper regions of air for us to hear the thunder, no sound reaches us. On the other hand, God embraces all creatures—those which are farthest removed from him, as well as the lofty archangels that stand nearest his throne. His heart has room enough to hold them all. Infinite, not less than eternal and unchangeable, unaffected by space or place, knowing neither distance nor nearness, he embraces this world with all its creatures, and all other worlds with theirs, in his heart, as he embraces them all in his arms. But though we were originally made after his image, our affections are of limited capacity. They diminish in strength in proportion as the objects we love are removed from us—as the circle in the lake, the larger it grows in size grows the less in height, till it is lost in the distant waters, or dies with a feeble ripple on the shore. It cannot be otherwise, else we were gods, not men.

We must admit this, and that, as a candle, shining brighter on near than remote objects, gives more light to the room where it burns than to the traveller who sees it gleaming afar in the cottage window, our love necessarily grows weaker the

more it is diffused. Still, like light, or the circle in the water, it ought, not moving in one direction rather than in another, nor limited in its outgoings to our own party, or sect, or race, or country, to diffuse itself on all around. Such is the grand and most necessary lesson which the parable of the Good Samaritan was designed to teach. In considering it, let us attend to

ITS OCCASION.

The Jews had no class whose office corresponded exactly to that of Christian ministers. But in their synagogues, where they met Sabbath by Sabbath to worship, and hear the Word of God enforced and explained, they had assemblies which corresponded more or less with our churches. There, after a fashion now only found among some Baptists and the Society of Friends, the public speaking was not engrossed by the leaders; but any person had the opportunity—which our Lord sometimes embraced—of addressing the congregation. Still, there was a class among the Jews who made the Bible their peculiar study; and who were therefore regarded as authorities on all questions connected with the laws of Moses. These men, the divines as we might call them and probably the common preachers of the country, were therefore called lawyers; and to the question of a man of that class, the world and church owe this beautiful parable.

The Evangelist says that he stood up and *tempted* our Lord, saying, Master, what shall I do to inherit eternal life? But we should do this lawyer injustice, and violate the charity which, thinking no evil, puts a favourable rather than an unfavourable construction on other men's conduct, were we to rank him with those who sought by their question about tribute to entrap our Lord. No doubt the same word is used in both instances. But to *tempt*—as when it is said that God tempted Israel, which in a bad sense we know he could not do—is simply to *try*; and by the law of charity, as well as from a regard to his answers and whole bearing, this man is entitled to a favourable construction both of his motives and object. He had heard of him whose fame filled the whole land; and to ascertain whether he was as great a teacher as fame, prone to exaggerate, reported, to measure his ability, perhaps to try his soundness, he tested him by this fair and momentous question: "Master, what shall I do to inherit eternal life?" It involved a weighty

matter; and would God that all of us went to Jesus with the same question, but with a still higher object—anxious and eager to be saved.

The words *do* and *inherit* which the lawyer employed, make it probable that there was such confusion in his ideas of the method of salvation as we find among many whose ignorance is less excusable. They seem to think that salvation is half of God's mercy and half of their own merits; that they are to do something, by way of reconciling themselves to an offended God, Christ doing the rest; his merits supplementing their shortcomings. Their prayers and pains, their good conduct and efforts after a holy life, though not sufficient to save them, are to fit them for being saved by the blood of Jesus. Now, how did our Lord meet such a case? As he treated Peter's—humbling his pride by bidding him walk the sea. The disciple who would have lorded it over his fellows, and claimed among them such pre-eminence as Popery has since given him in the Church, steps proudly on the billows; but has hardly left the boat's side, when, turning pale at the sight of the crested waves, he begins to sink. He confessed himself unequal to the ambitious task—crying, Lord, save me; I perish. It was such a course that our Lord followed here; and also on another such occasion. He bids this lawyer try the law; keep it if he can; obtain eternal life through obedience,—just to teach him, or rather to make his own failures teach him, that he cannot. When, in reply to Christ's question, he has recited the sum of the ten commandments, and shown, to his credit be it admitted, that he was acquainted with the spirit as well as the letter of the law, Jesus said to him, "Thou hast answered right: this do, and thou shalt live."

Whether there was anything in our Lord's tone or eye which, while his lips said, "Thou hast answered right: this do and live," said as plainly as words, You have not done it, and know you have not done it,—I do not know. But his own conscience smote the lawyer—telling him that what it was necessary and right to do, he had not done. To whatever extent he might deceive himself as to his loving God, he knew and remembered—as we all do—many cases in which he had not loved his neighbour as he loved himself. Well had it been for him had he instantly thrown himself at the feet of Jesus, to cry, "Save me; I perish!" And well for us, if convincing us of sin and misery, and teaching us our inability to obtain salvation by its works, the law has been a schoolmaster to bring us to Christ. These words, "This do, and thou shalt live," certainly shut us all up to Christ. Too blind to see this, or too proud to acknowledge it, the lawyer, driven to his shifts, attempts to escape from the dilemma in which he finds himself. One door seems open—offering him escape. If he can confine the term neighbour within very narrow limits, he may evade the difficulty, and, though he had failed doing to many what he

would have wished them to do to him, satisfy himself that he had kept the whole law. So, hoping to escape by this door—as Luke says, "willing to justify himself"—he immediately replied: "And who is my neighbour?"—a question that our Lord answers by a story, which, launching out beyond its limits, illustrates, in her active and true benevolence, the queen of graces—Christian Love. Let us attend now to the story of the Good Samaritan, as it divides itself into three distinct parts.

THE FIRST ACT.

The curtain rises to show a district of country lying between Jerusalem and Jericho. It is wild and rocky; a savage place—whose mountain caves conceal men, savage as the scenes they haunt. When one reads what crimes of violence and robbery were, less than a century ago, committed on travellers in the immediate neighbourhood of London, and remembers how in their early days the mails were conveyed along the high-roads by guards carrying fire-arms, we cease to wonder that the road between two such towns as Jericho and Jerusalem was infested by bold and bloody robbers. Between these two large cities there was, of course, much correspondence. Men of wealth and means often travelled the road—offering amid these wild and rocky solitudes a good chance for plunder; and where the carcass was, in outcasts, desperate men, and roving Bedouins, the eagles were gathered together. The gospel narrative represents this road as dangerous; and since some are now getting up objections to the Bible, which they are ignorant enough to fancy new—though they be as old as Tom Paine, and vain enough to deem unanswerable—though, answered over and over again, to refute them be to slay the slain, it may be worth while here to mark the perfect harmony between sacred and common history. Now, to say nothing of other authors, Josephus—the Jewish historian and no Christian, mentions that that road was in his day infested by robbers. It was the scene of such crimes as to be called, The Bloody Way; and so dangerous had it become to travellers, that Jerome states that the Romans found it necessary to erect a fort there for their protection.

Now, it is somewhere among its rocky defiles that the scene of this tragedy is laid. A solitary man appears—travelling from Jerusalem; from which it is said he went *down* to Jericho, just as we speak of going *up* to London, or coming *down* from it, because it is in point of fact our capital. Issuing from one of the defiles, or springing up from behind some rock, a band of ruffians fall on him. Very probably he stands on his defence. Swords are drawn; blows are struck; overpowered at length by superior numbers, he is felled to the ground. With all haste they plunder his person, nor stop till they strip him naked; and parting with a blow or two to finish their work, on the rule that dead

men tell no tales, they hurry off—leaving him on the ground, insensible, helpless, dying, in a pool of blood. So the first act closes, and the curtain falls.

SECOND ACT.

The curtain rises on the same scene—the man is where he fell, the pool of blood growing larger as life ebbs away. But he is not alone now. Two new characters appear on the road, travellers also going down from Jerusalem to Jericho. The foremost is a priest; the second we might call a priest's assistant—a Levite. He also is a minister of religion, and an official of the temple. Here again mark the correspondence between this story and what we know from other sources to be well-attested facts. Judging by these, the priest and Levite are the very men we would have expected to appear. The Jewish priests, though their homes were scattered over the country, were required, somewhat as the canons do in English cathedrals, to serve by turns in the temple at Jerusalem; and since no fewer than twelve thousand priests and Levites had their ordinary residence in Jericho, you will see how often they must have travelled this road, and how natural therefore their appearance on the scene.

Ministers of religion, fresh from the service of the holy sanctuary, men to whom others looked for an example of all that was humane, magnanimous, and godlike, in them surely help was at hand! It seemed a happy fortune for this unfortunate man that countrymen, strangers neither in faith nor speech nor blood; men devoted to duties calculated not to harden but to soften the heart; not to secularise and lower, but to improve and elevate the mind, and to form, in short, a noble character—should be the first to find him. Alas! this poor, bleeding victim may live or die for them. First the one, and then the other approaches—the Levite making a closer inspection than the priest. What then? No sooner do they see his naked form bleeding to death on the ground, than instead of hastening to his aid, shouting for help, and doing their utmost to save him, both pass on the other side; and, pressing forward, leave him to his miserable fate. David says, Put not your trust in princes; nor—says this story, and many portions of history besides—in priests.

Not that some excuse may not be pleaded for the priest and Levite. Not long years ago, in some cities of fair and sunny Italy, if a man was assassinated in broad day, and on the public streets, people fled the scene, leaving the wretch to die, lest, found by the bloody corpse, they should be accused of the murder. Such might be the fears which moved these men to what seemed a cruel neglect. Besides, it is plain that they themselves were in some danger of sharing a similar fate. The ship steers wide of the rock on which another lies wrecked. Its inhabitants fly from a house on fire—consulting their own safety, and thinking more how they themselves shall escape the danger, than how they may save others from it. And naturally

enough supposing that these rocks, in the perpetrators of this bloody deed, concealed men who waited to repeat it on the next passenger, they only did what thousands would have done—when, leaving this poor wretch to his fate, they hurried from the scene. Besides, his case seemed hopeless. To attempt to save him, therefore, was only to waste time, and rashly expose themselves—to risk their own lives without any great probability of being able to save his. Then they had this flattering unctiousness to lay to their souls, that they had not done this wrong; his blood was not on their hands: neither their friend, nor brother, nor acquaintance, he had no special claim on them. It was other people's business as much as theirs to aid him. What was he to them, or they to him?

I do not say that these were good excuses. Still, they are as good, and better than many have to offer, who, passing by misery on the other side, indulge a hateful selfishness—heaping up riches at the expense of the poor and needy, to the neglect of such as are ready to perish. God forbid that I should even seem to justify this priest and Levite! “With them mine honour be not thou united!” Yet there are thousands who have no right to condemn them. Condemning them, we are happy if we do not condemn ourselves. The same spirit of hateful and ungodly selfishness still walks the world; and, though in less tragic circumstances, how often have I encountered it—wearing a new face, perhaps a fair mask, but the same old enemy of God and man? The Jewish economy is gone; its temple is a ruin; its priests and Levites have passed from the stage of time—but not that selfish spirit. It belongs to our fallen nature. Nor will it ever be eradicated till God pour out his Spirit upon all flesh, and Christian love, in millennial days, reigns over a regenerated world, and crime and selfishness, if not all suffering, banished from earth, the golden rule shall be universally owned and acted on—“Do unto others as ye would have others do unto you.” Even so come, Lord Jesus! Come quickly!

THIRD ACT.

This story recalls another which I could not read without mingled feelings of anger and admiration. Dismasted and waterlogged on the wide ocean, a thousand miles away from the nearest land, a bark had drifted about till all hope of relief was dead in her starving crew. The cry, a ship! a ship! roused their flagging energies. Shawl and shirt on the end of boat-hooks were waved as signals of distress. The stranger changed her course and bore down on the miserable wreck. They put forth their utmost strength to send a long, loud shout over the deep: and as, on her nearing them, they discovered their country's flag, they congratulated each other on being saved. Who can fancy what men felt who had been for days hanging over a horrible death, at this blessed change? But still less can we fancy the sudden revulsion of feeling, the terrible sinking of heart, the awful howl which rose to heaven,

when the other vessel, sailing near enough to see the ghastly wretches who implored their pity, put about, and, going off on the other tack, left them to despair. Nor was that all. Recalling that scene in the infernal torments of the heathen poet, where Tantalus fills the cup, and no sooner raises it to his thirsty lips, than the water vanishes, the same hopes had been raised before by another ship—manned also by their countrymen, to suffer the same cruel disappointment. Sometimes cold and thin, blood, as their rescue proved, is not always thicker than water. When death had seized some, and despair all, a Norwegian bark, by God's good providence, came sailing across their path. Pity filled the hearts and eyes of the foreign sailors; nor till they had carried the last survivor on board their ship, did they desert the wreck, and leave it to drift away over the ocean—a wandering coffin with its unburied dead. A noble act! but still nobler his who now appears on the scene of this bloody tragedy to redeem the character of humanity, become an exemplar, in Christ's hands, to all future ages, and gaining an immortal renown, win for himself the famous title of The Good Samaritan. To appreciate his conduct aright, let us consider

WHO HE WAS.

He was "a certain Samaritan," is all that we are told. His name has not been preserved. No matter—he has left a broad footprint on the sands of time; and we may hope that, like many more nameless ones, his memorial is in the "book of remembrance" of which Micah speaks, saying, "They shall be mine, saith the Lord, in that day when I make up my jewels; and I will spare them as a man spareth his son that serveth him." On him, as a Samaritan, the wounded man has no claim; they are not countrymen—one either in blood or faith. The Samaritans were not, as some suppose, a race of degenerate Jews, with the blood of Abraham, though adulterated by admixture, flowing in their veins. When the land that had been occupied by the ten tribes was cleared, and they were carried away into perpetual captivity, their place was supplied thus: "The King of Assyria brought men from Babylon, and from Cuthah, and from Ava, and from Hamoth, and from Sepharvaim, and placed them in the cities of Samaria instead of the children of Israel: and they possessed Samaria, and dwelt in the cities thereof." Heathen colonists, they brought their gods with them; and though, with the view of being delivered from the lions, which, multiplying rapidly while the country lay waste, disputed possession of it with the new settlers, they adopted some Jewish forms, and stood in some awe of him they counted the God of the land, they clung long by their old faith. It is said of them in the book of Kings, what is remarkably descriptive of many professing Christians, "they feared the Lord, and served their own gods." Being enlightened in the course of time by the truth which streamed in on them from

the Jews, whose territories surrounded theirs, the Samaritans came at last to abandon the faith and practices of their heathen fathers. Setting up a temple and worship in Samaria, in opposition to that which had its seat in Jerusalem, they became worshippers of the true God. They had ceased to be heathens; still they were heretics. For, though they admitted the divine authority of the first five Books of Moses, they utterly rejected the Psalms, the prophets, and all the remaining portions of the Bible. For these reasons the Jews hated them—their rivalry, their heresy, and their heathen blood, breeding a bitterly rancorous hatred. So strong was this antipathy, that the woman by Jacob's well was astonished that our Lord would ask of her even a drink of water, saying, How is it that thou, being a Jew, askest drink of me, which am a woman of Samaria? for, adds the evangelist, "the Jews have no dealings with the Samaritans." Refusing them the common civilities of life, they used their name as a term of the bitterest reproach—for everything that was bad and abhorrent. When his enemies, for example, were so transported with rage against our Lord that, forgetting the sacredness of the place, they rose up in the temple to stone him, their passions found vent in this speech as the very concentration of the fiercest hatred, "Say we not well," they cried, as they gnashed their teeth on him, "Say we not well, that thou art a Samaritan, and hast a devil?"

It was to one of this race that the priest and Levite left their wounded countryman. Many a bitter gibe and sneer had this Samaritan suffered of the Jews; but now with that wretched man in his hands his hour of vengeance had arrived—and nobly he avenged himself! Alone with the victim,—no eye on him but the vulture's that, perched on a rock, waited the close of life's struggle to descend with foul beak and flapping wing on its prey,—he approaches, and bends over the dying man; but not to finish what the robbers had all but completed. Risking his property, venturing even his life, he treats a fallen enemy as if he had been a wounded brother—his own mother's son. How beautiful is humanity!

And how hateful the antipathies over which love won this signal triumph! Hateful in the Jew, they are, whether connected with churches, sects, nations, races, or colours, doubly hateful in the Christian—the follower of the meek and lowly and loving Jesus, of him in whom there is neither Jew nor Greek, bond nor free. Yet see how the laws of humanity and Christian love are outraged by the antipathy which the white man bears to the patient and injured African! In America, for instance, colour is worse than a crime. The Bible declares that God has made of one blood all nations of the earth, and by one blood redeemed them; and in practical contempt both of God and his word, they refuse to eat at the same table, ride in the same carriage, worship in the same church, or, unless under the pressure of a dire necessity, even to fight

in the same ranks with the negro; it is the old story,—"the Jews have no dealings with the Samaritans."

Here are the old, bad human passions. What if time should bring round as remarkable a parallel in God's righteous and retributive providences? Those whom one age sees riding on the top of the wheel of fortune, the next often sees eating dust. The fate of nations, as of individuals, has not seldom illustrated the laws expressed in these sayings: Pride goeth before destruction; The fathers have eaten a sour grape, and the children's teeth are set on edge. May those who have enslaved the unhappy negroes, bought and sold their brethren like cattle, trampled them under foot, and, using their name also as a term of reproach, repudiated something more sacred than their State debts—the claims of a common parentage and a common redemption, take warning! The haughty, intolerant, contemptuous Jews would not hear the warning, "Woe to the crown of pride!" and now they are a by-word, a proverb, and a hissing,—a nation scattered and peeled. As ages roll on, the providence of God will continue to show that it is not war with its bloody triumphs, nor commerce with its wealth, nor science with its arts, but righteousness that exalteth a nation. Depend on it, that the bread we cast on the waters, whether for evil or for good, will return though after many days. There is one true policy for nations and individuals. Regardless of immediate consequences, let them do what is right; if they have done wrong repent it, and, if possible, repair it—this their rule: What doth the Lord require of thee? but to do justly, and love mercy, and walk humbly with thy God.

WHAT THE SAMARITAN DID.

So soon as he saw the man weltering in his blood, it is said, "he had compassion on him." So, perhaps, had the priest and Levite. But observe, no mention is made of that; no account is kept of it, any more than we keep account of the blossoms in the orchard that come to nothing—are beautiful, but nipped by late frosts or blown away by winds, never turn to fruit. In that respect, this book is an exemplar of another, the book of judgment. It is deeds only that are entered there. "I was an hungered, and ye gave me meat; I was thirsty, and ye gave me drink; I was a stranger, and ye took me in; naked, and ye clothed me; I was sick, and ye visited me; I was in prison, and ye came unto me." "Go and do thou likewise."

Now what did the Samaritan do? Conquering his prejudices, and those fears for his safety which amid such scenes and with such a sight before him were not unnatural, he hastes to the rescue. Throwing himself from his steed, he bends over the bleeding form, and finding life still there, applies such remedies as circumstances permitted and his skill suggested. It was and is still common in the East, for travellers to carry their provisions with them; and it providentially happened here that what the Samaritan had for eating was not unsuit-

able for healing—the one man's meat was fit to be the other man's medicine. For that purpose he uses it—esteeming it better that he should suffer hunger than that this poor wretch should suffer death. Nor in oil and wine were his applications so unsuitable, and his surgery so rude, as some might fancy. In ancient times oil was employed to mollify wounds and deaden their pain; and wine to staunch their bleeding; and Galen, one of the greatest of Roman physicians, pronounces them excellent means for such ends. They were at any rate the best he had. Like the woman in the gospel, he did what he could—pouring them into wounds, which he hastily tore his own robes to bind. And as he watched with eager interest the signs of returning life, I can fancy the joy that thrilled through all his frame, when the pulse began again to beat, and colour returned to the bloodless cheek, and, opening his eyes, this poor man fixed them with looks of eloquent gratitude on the face of his kind benefactor.

Some, on beginning a good work, go at it at first with zeal; but, lacking perseverance, and loving change, they soon turn to something else—tiring of it, as children of their toys. But the Samaritan stuck by the cause on which he had embarked; and so presents a humble illustration of him who will perfect that which concerneth his people, and wherever he begins a good work carry it on to the day of the Lord Jesus. Tenderly lifting up the wounded, he places him on his own beast, and conveys him to an inn, which he (type as we shall see of our Lord) approaches in the form of a servant—walking while the other rides. In these countries no other accommodation was commonly provided for travellers than what the caravanserais still offer in bare walls and the shelter of a roof; but here the inn was one of the few which, anticipating our modern civilisation, in landlord and other provisions resembled our own.

Having ventured his life to save the Jew, and plucked him, I may say, from the wreck, bringing him safe to shore, the Samaritan's work was in a sense done. As the prophet said to the Shunamite, when, having called her boy back to life, he laid him in her happy arms, saying, "Woman, behold thy son," my work is done, it is yours now to care for him,—so he, casting the poor Jew on the kindness of his countrymen, might have left him; and had done so crowned with the highest honours of humanity. But he does more. He will finish what he has so well begun. Business calls him away next morning, but before leaving he undertakes all the expenses of this man's board and cure. "Twopence," the sum he left with the host, may seem to us inadequate; but money then had a different value from what it has now—a single penny being a good day's wage for a good day's work. Moreover, wise as he was humane, provident as he was generous—qualities that commonly shine in conjunction like binary stars, the Samaritan undertook, in case the sum should fall short, to

make good the deficiency when he next came that way. So, earning the admiration of the inn, and followed by the blessings of the wounded man, bringing a blush, let us hope, to the cheek of priest and Levite, and winning for himself an imperishable renown, this most noble philanthropist went on his way—his purse lighter, but his heart happier; in one sense poorer, but in another richer; finding a fame he never sought; and little dreaming of the finger that pointed the eyes of the world to his example, or the voice that said in words which shall ring, in never-dying echoes, on its ear, Go, and do thou likewise.

“Go, and do thou likewise”—this is the moral of the story. It was told to rebuke the narrow-minded prejudices and selfishness of the Jews. May it rebuke our own! Our love is confined within narrow channels, because it is a tiny stream. Let it swell into a bigger volume, and these could not contain it; and therefore may God, pouring out his Spirit in showers from heaven, so flood our hearts with love, that it shall burst the boundaries within which education, ecclesiastical, or national prejudices confine it, and, burying, drowning them, flow forth to all mankind! Py this story Jesus teaches us to do good to all men as we have opportunity, and to rejoice in the opportunities of doing it. If any man's sorrows need our sympathy, his bodily or spiritual wants our help, let us think no more of asking whether he belongs to our country or family, our party or church, than if we saw him stretching out his hands from the window of a burning house, or found him, like this object of the Samaritan's kindness, expiring in a pool of blood. Thus Christ loved us; and thus he teaches us to love one another. This leads me to remark, in bringing these observations to a close, that

JESUS CHRIST HIMSELF WAS THE GOOD SAMARITAN.

To jaundiced eyes blushing rose, blue sky, and green earth, everything, looks yellow; and so much does the appearance of objects depend on the medium through which we regard them, that viewed through stained glass, for instance, they assume its peculiar hue. Thus, if it is coloured red, the gentle moon puts on a fierce and angry aspect; and as if, at the sounding of the second angel, the burning mountain of the Apocalypse were cast into the sea, its waters change to blood. Fancy, under the influence of our affection, plays us, if I may say so, such tricks—is equally illusive. Distempered by grief, the weeping mother, in sounds that startle only her, hears the pattering of her dead infant's feet. Looking through superstitious fears, the peasant sees a ghost in the tombstone which the moon, bursting from a cloud, suddenly whitens; and as the owl hoots from the grey steeple, or brushes past him on noiseless wing, he rushes in frantic terror from the quiet dwellings of the dead. The Romans, bringing to the invasion of our country, tender recollections of their own, on reaching the top of the hill which

looks down on the Tay, exclaimed, Behold the Tiber! And under the influence of feelings stronger than fear, more sacred than grief, and loftier than patriotism, fancy has created resemblances and seen things in the Bible, that had no existence other than in a pious imagination. One example of that shines in a constellation of southern skies, and another blooms in the flowers of our conservatories. It was the reverence and love of Jesus Christ in the bosom of the ancient mariner, which, working through fancy, when his ships first ploughed the waters of southern seas, saw suspended in the heavens, and formed of brilliant stars—and looking down on the world, the tree on which its Saviour hung; and it was the same piety that discovered in the passion-flower an imitation by the hand of nature of the instruments of our Redeemer's torture, and of the halo which now crowns his head in glory. And it is the same piety which, by a pardonable mistake, has in some instances discerned types, symbols, and shadows of Jesus in the Bible, that belong more to the regions of fancy than of fact.

It may be that in seeing Christ in this Good Samaritan, we have passed into this cloud-land; it may be that this is no more than a devout imagination. But the fancy does not, at any rate, pervert God's word from its grand purpose, nor in the pulpit prostitute to mean and common purposes a place that should be sacred to the saving doctrines of “Jesus Christ and him crucified.” Here we rise, not sink; and as if we ascended on a sunbeam to its source in the sun itself, here we turn from contemplating Christian love in the Samaritan, to contemplate it in the Saviour—its celestial source and perfect pattern.

Viewed in this light, the story of the Good Samaritan grows in interest, and assumes the grandest character. The whole scene changes: and with it the characters that act their various parts upon the stage. Jerusalem, the city of the living God, with the mountains standing round about her, and crowned by the temple where Jehovah dwelt, now stands for man's originally happy and holy state. Man leaves it. He goes down from it; travelling downward to that place of misery, so aptly typified by that Jericho, against which the ark and armies of the living God waged war, and whose walls lay under this fatal shadow—“Cursed,” said Joshua, as he stood on its smoking, blood-stained ruins, “cursed be the man before the Lord, that riseth up, and buildeth this city Jericho; he shall lay the foundation thereof in his first-born, and in his youngest son shall he set up the gates of it.” In the fierce and savage robbers, who issue from their haunts in this gloomy gorge to spring on the traveller, assault him, rob him, strip him, wound him, leaving him to die in his blood, we see the enemy of souls—the spoiler of Eden—the robber of man's innocence and happiness and honour—Satan, who was a murderer, says our Lord, from the beginning. In the priest and Levite, its fit, official representa-

tives, the law comes with its works. But it does, nothing for man—it can do nothing. These, its representatives who pass on the other side, and refuse even to own this wounded wretch, teach us, that “by the deeds of the law shall no flesh living be justified.” The law has not the heart of mercy that takes compassion on the lost; nor in atoning merits oil and wine to stop the bleeding of sin’s mortal wounds. These are brought to the scene, to the rescue, to save at the uttermost, by Him who painted his own portrait in the Good Samaritan. “What the law could not do, in that it was weak through the flesh, God sending his own Son in the likeness of sinful flesh, and for sin condemned sin in the flesh, that the righteousness of the law

might be fulfilled in us who walk not after the flesh, but after the Spirit.” There is balm in Gilead, and a physician there.

If that Good Samaritan was a figure of the God-man, Jesus Christ, would God the man he saved at death’s door was a figure of us! May we be as willing as he to be saved! May we look to Jesus with the love that burned in his heart and beamed in his eyes! May we give ourselves as much over to Christ’s care and cure, as he to his kind benefactor, when he lay in his arms, and hung helpless on his neck; and with still warmer gratitude than his, may we ever cherish in our very heart of hearts, the memory of this world’s Good Samaritan!

COAL;

ITS NATURE, ORIGIN, DISTRIBUTION, AND MECHANICAL EFFICIENCY.

BY HENRY D. ROGERS, LL.D., F.R.S., &c., Professor of Natural History in the University of Glasgow.

To the reflective instructed student of Nature, few varieties of lifeless matter have so much of meaning in them, or awaken so many enlarged suggestions, as a lump of coal. Interpreted by the light of science, coal is at once a most legible and expressive page in the history of our earth, and a record to man unsurpassed in the physical system of things, of the sublimity and beneficence of purpose of the Supreme Intelligence.

To justify this admiration of its import and worth, I propose to set before my readers in this paper some account of the geology of coal, embracing a sketch of its distribution within the earth, and the conditions under which it originated, and also some attempt at estimating the fields of wealth it constitutes, and the vastness of the *mechanical power* it embodies in aid of man’s industrial triumphs, and social and moral progress.

THE NATURE AND ORIGIN OF COAL.

Contemplating it in its first aspect, or geologically, let us in the outset examine what the coal beds and their associated earthy or stony deposits are, and what they signify as to the state of the earth’s surface at the time of their formation. We will select any single layer of the coal itself, and ask of the chemist, naturalist, and geologist, what it is. They will tell us, that it is not a mineral mass nor earthy deposit of any sort, that it cannot from its composition and structure be, like the strata which enclose it, the wash of any of the rocky materials of the land, that it contains no pebbles, no granules of sand, and nothing derived from a mineral source, save a minute amount of much-diffused fine clay, or argillaceous sediment. They will, on the other hand, allege that it is of a vegetable nature and origin, a mass of semi-aquatic moss-like chiefly flowerless plants, matted intimately together, and decomposed by long soaking *where they grew* into

broad, thin, interblended layers, of a soft, pulpy, peaty texture, forming together one minutely laminated stratum. The geologist, accustomed to note the signs of the conditions under which beds of matter of all kinds accumulate, avers that the vegetable substance recognised as such by the chemist and the botanist can never have been washed or *floated* into this pure, uniform, compact, carbonaceous layer; for he well knows that no raft-like assemblage of entangled timber, or herbage of any sort, can have arisen without the introduction among it of a large proportion of clayey or other earthy matters, in irregular patches, filling the interspaces. Now, a bed of coal exhibits no such structure, its little amount of earthy matter is never in such lumpy accumulations, but occurs only in thinner or thicker layers, more or less coaly too, implying that they were formed as gentle sediments, slowly settling from very still, and but slightly turbid swampy waters. The whole structure, in fact, of any seam or bed of coal, most plainly intimates that its materials *grew* almost on the spots where they now lie; grew on flat, wide, watery plains, each successive stratum being the accumulated organic residuum of a vast wet meadow or fen. The striking continuity and evenness of the laminae of a coal bed, strongly demonstrate it to have had this original levelness. It is a horizontality which we cannot suppose compatible with any physical situation, but the marvellously beautiful plane which divides still water from the atmosphere. Nothing of irregularity of contour in the bottom of a seam of coal is anywhere to be seen, which indicates, when strictly examined, that the original floor was either dry land or very deep beneath the surface of the water; but this lower limit shows that the coal, or its generating vegetable bog, grew almost precisely at the water-level of its native home. A passing allusion has been made to

the absence of any mineral source for the materials of the coal beds. This is a fact, patent to every mineralist: and there is another fact disclosed by chemistry, that both the *carbon*, and the second other main ingredient of coal, the *hydrogen*, could have come together from no sources but the earth's atmosphere and waters, and only by the process of vegetative growth or plant life. Strange to say, this truth was very long overlooked. Indeed, it is only as it were yesterday, that the vegetable nature and origin of coal have become a doctrine of general acceptance in geology.

Directing a brief glance next to the attendant strata which immediately imbed the coal-seam between them, we learn from these deposits a further lesson as to the physical conditions which accompanied, or directly foreran and followed, the state of long repose and growth represented by the coal itself. The *underlying bed* or *floor* on which the coal reposes is almost invariably a layer of clay or finely comminuted mud, and this has seldom much lamination, but on the contrary every internal indication of its deposition in very tranquil water. This *under-clay*, as the miners (who were the first to draw the attention of geologists to it) term it, includes very generally the undisturbed roots of two or three gigantic varieties of now fossil, and long extinct plants, the relics of the very vegetation which, in their great size and redundant growth, contributed largely to the formation of the peaty matter, which by subsequent decay and chemical change became ultimately the coal. The prevalent under-clay is, in fact, the *old soil*, preserved to us almost intact, in which the vast coal meadows grew. The general absence of other kinds of less congenial or life-sustaining floor or soil, is itself a fact strongly corroborative of the views now adopted of the bog-like origin of all coal. In striking contrast with the under-clay is the overlying stratum or *roof rock*. For the most part it is a coarsely-bedded sandstone, or distinctly-leaved slate, or some other species of rock easily recognised as having been spread over the coal marsh or vegetable layer, by rather rapidly moving, often indeed very turbulent, water. Whether finely or coarsely grained, it abounds in that obliquity and those irregularities of bedding, which betray this turbulence. A further indication of such commotion is the almost invariable occurrence of broken, bent, and dismantled stems, or crushed branches and leaves of the coal-producing plants.

Thus each coal seam and its adjuncts discloses to us, in the state of the surface, three epochs. One was a period of deposition of fine mud in very quiet shallow water, the next a tranquil time—how prolonged it is difficult to say—of growth upon this mud as its soil of an exuberant matting of colossal forms of the lower tribes of vegetation, in the manner of a level and wide marine moss, or peaty sea-moistened meadow; and the last was an epoch of more or less sudden incursion of the waters over the surface of the air-breathing boggy growth; in

some instances merely a softly flowing on of the sea to form a limestone or calcareous shale, imbedding the shells or other preservable remains of sea-frequenting animals: but far more frequently a violent and wide inundation of the verdant plain, washing the sea-ooze upon its surface, uprooting or snapping off the more assailable of the giant weeds, rushing in upon the fast land, and dislodging thence of a quantity of fragmentary and earthy material strewn in the rebound of the flood in a promiscuous and more or less irregularly bedded stratum, composed of the tangled plants and all the earthy wreck. Thus was the submerged jungle covered, and the roof-rock of the future coal seam formed.

I would not have it be understood, that every coal-bed indicates just this series of phases in the earth's surface at its birth; but a somewhat wide and careful survey of many coal-fields, and the concurring testimony of the best observers, convince me, that, very commonly at least, the physical conditions and events in their creation and imbedding approximated closely to those I have here depicted.

If, now, we extend our attention from the coal-beds themselves, and their next underlying and over-resting deposits, to the whole great group of strata including these layers of fuel; that is to say, to all that coal-bearing division of the yet grander carboniferous system of rocks, called commonly the *coal-measures*, we shall see the entire formation to be everywhere composed of an alternation of these three-fold assemblages of the especial coal strata, with many other intervening sets of water-strewn and water-formed deposits of coarser or finer texture. All these intermediate masses are the remnants of a succession of level, wide, and for the most part shallow, sea-beds. And these sea bottoms were the recipients, in the intervals between the periods of growth of the successive coal-making meadows, of a vast variety of sediments quietly left by the gentlest currents, or swept from the land by inundations engendered during sudden disturbances and oscillations of the ocean's bed, or, in other words, during great *earthquakes*.

What a grand eventful epoch in the physical history of our earth is here developed! In the oft-repeated recurrence of the many coal-beds, each is a record of a term of long repose; while the many intervening groups of strata testify to ages of turmoil and agitation. The better to recognise the length and nature of this strange alternately turbulent and quiet period, the especial *day of plant-life*, in the youth of our globe, let us take a summary view of the bulk or thickness, and superficial breadth, of the coal-measures, and learn a little of the number and magnitude of the better-known individual coal seams.

DIMENSIONS OF THE EARTH'S COAL-FIELDS.

We have it, on the authority of competent surveyors, that the great coal-field of *South Wales*, the largest and deepest in Europe, covers a surface

of not less than 1000 square miles, and has a maximum thickness of from 7000 to 12,000 feet in its coal-measures. In this prodigious "book of time," there are, it has been computed, not less than 50 beds of coal, from 6 inches to 6 feet in thickness, and 25 of these are said to be each at least 2 feet thick. The smaller Forest of Dean coal basin contains, according to the Memoirs of the Geological Survey, 31 coal-beds in a thickness of coal-measures of 2400 feet. From the same source (the Survey) we learn that the North Staffordshire coal-measures have an aggregate depth of about 5000 feet; while those of the Newcastle district are believed to be at least 2000 feet thick, and to embrace a total thickness of coal equivalent to 60 feet. In the deepest portions of the extensive coal basin of Scotland, the upper productive coal-measures of Mid-Lothian have been found by the Survey to possess a thickness of not less than 1800 feet. The number of the seams of coal wrought in the Lanarkshire field is in all eighteen.

Turning to other countries, the depths or thicknesses of the coal-measures, and the numbers of the coal-beds, will be found to be on an equally grand scale.

But we can hardly get a just conception of the magnitude of the formation, the lapse of time and the physical changes involved in its production, and the wonderful stores of riches for man's future use which it contains, until we take a survey of the areas, the depths, the thicknesses in coal, and the present relative products in fuel of the chief coal tracts of the earth at present known. Looking, first, to the western side of the Atlantic, North America displays, commensurately with the breadth of her physical features generally, several enormous coal regions, three at least of which are the largest known upon the globe. One of these, the Appalachian basin, has a length of 875 and a maximum breadth of 180 miles, with an area in square miles of 55,500. Where deepest its coal-beds have an aggregate thickness of 40 feet. A second, the coal-field of Illinois, Indiana, and Kentucky, has length 370, maximum breadth 200, and area 51,100 miles. This basin has fifteen or sixteen good coal seams, with a maximum thickness of 50 feet. And the third, and largest, but least opened, shows length 550, breadth 200, and superficial area 73,913 miles. In the anthracite basins of Pennsylvania the thickness of coal-measures amounts to 3000 feet, while that of the workable coal is not less than 120 feet.

The aggregate area of the five chief coal-fields of the American continent amount, by a careful estimate, based upon the latest surveys and best geological maps, to rather more than 200,000 square miles; a surface greater by about twenty times than the sum of all the coal-fields of Europe, or, indeed, of the whole Eastern world. The British carboniferous basins may be estimated to embrace some 5400 square miles of coal; the French a little less than 1000; and the Belgian about 510. Rhenish Prussia has 960; Westphalia 380; the Bohemian field

some 400; that of Saxony only 30; that of Spain probably 200; and that of all Russia scarcely 100 square miles. Comparing the coal areas with the total surfaces of the respective coal-producing countries, the United States has one square mile of coal to each fifteen of land; Great Britain one to every 22½; Belgium a like proportion; and France but one of coal to every 200 of country. Adopting for the computed total area of the coal-fields of the world 220,000 square miles, and accepting twenty feet (a low estimate) for the average thickness of the available coal, the entire mass of the fuel under the soil for the future wants of man, amounts by calculation to a cubic lump of very nearly ten miles linear dimensions, or to a square plateau of coal 100 miles wide in its base, and something more than 500 feet in height. The British lump of coal is a cube of a little more than three miles in diameter.

Some of these coal-endowed nations have certainly capacious and well-supplied coal-bins for their present and future comfort, and industrial strength. Let us now turn our mental gaze for a brief while to the statistical figures which exhibit the relative rates at which some of them are drawing on these stores.

The history of the consumption of coal in the British Isles is especially interesting. It was for the first time regularly mined in pits at Newcastle, in the beginning of the 13th century. In the 15th century, Eneas Silvius relates, in a visit to Scotland, the novel sight of the giving of coal to beggars at the gates of monasteries. Curiously enough, the prejudice against the use of coal in London was such during the days of Queen Elizabeth, that in that reign there were stringent acts of parliament restricting its use there during the sessions. For a long while in that age two ships sufficed to supply the entire coal trade between Newcastle and London. In 1855 the annual consumption of London amounted to about 5,000,000 tons. In 1854 Great Britain extracted from her mines more than 64,000,000 tons. In 1861 the product was about 80,000,000 tons, equal to a cubic block of 430 yards in height. For the present year the probable product may be safely estimated at not less than the enormous quantity of 100,000,000 of tons. In the Preliminary Report lately printed on the census of the United States for 1860, it is shown that the coal product of the state of Pennsylvania amounted in that year to about 11,500,000 tons, while that of all the coal-yielding states together exceeded 15,000,000 tons. In the year 1850, Belgium took from her mines nearly 6,000,000 tons, France some 4,500,000 tons, and Prussia 4,000,000 tons. It has been calculated that one-fifth at least of the present vast product in coal of the civilised world, which fifth part we may roughly estimate at nearly 30,000,000 tons annually, is applied in the smelting and manufacture of iron alone, and it is probable that more than one-tenth of the whole of the fuel lifted, or some 15,000,000 tons, are converted

directly into mechanical *power*, through the generation of steam for the propulsion of machinery.

THE POWER REPRESENTED BY COAL.

Interesting and impressive comparisons have been instituted between the mechanical force of a given weight of coal applied as fuel in the steam-engine and the dynamic energy of a man. The human labourer exerting his strength upon a tread-mill,—a very economical mode of using it,—can, it is stated, lift his own weight,—we will say 150 lb.,—through a height of 10,000 feet per day, the equivalent of which is 1 lb. raised 1,500,000 feet in the same time. Now, the mechanical virtue of fuel is best estimated by learning the number of pounds which a given quantity—let it be *one bushel*—will elevate to a given height, say one foot, against gravity. Applied in the steam-engine, this performance of the bushel measure of coal is called its *duty*. In some improved modern Cornish engines, this duty,—the bushel's work,—is equivalent to the amazing result of raising 125,000,000 lb. one foot high, or 1 lb. 125,000,000 feet high. Now, as there are 84 lb. of coal in one bushel, this divisor 84, gives 1 lb. as equal to 1,488,000, or nearly one million and a half of feet, which, as we have seen above, is just the result of a man's toil for one day upon a tread-mill. Thus, *a pound of good coal is in reality worth a day's wages*. If, again, we estimate a lifetime of hard, muscular toil at twenty years, and portion three hundred working days to each year,—a full allowance,—we have for a man's total dynamic effort, six thousand days. But 6000 lb. constitute only three tons, so that we have arrived at the almost amusing fact, the cheering truth, that every three tons of coal in the earth is the convertible equivalent of one man's life-long muscular activity.

What a promise is here of the capacity of civilised inventive man to find an ample substitute for the life-wearing, brutalising and mind-benumbing expenditure of nerve and animal power exacted now of the *slaves of all complexions*. What a pledge has the all-bountiful and good Creator here given us, that the common lot of mankind is not to be, as always in the past, a lot of physical labour, but in the long future, at least one of a far higher, happier mode of effort. When I behold a section or block from out of a coal seam, and reflect that each cubic yard is in weight somewhat more than a ton; and that a column of it a yard in base and only three yards tall has more work in it than a man, more

mechanical energy than any force which willing effort, necessity, or the lash of the tyrant master, can exact from the human organisation, I exult in the reverential thought of the superabundant provision bequeathed to our race against the curse of over-physical toil in this marvellous condensation of mechanical strength. Looking at the tall column of the material, thirty-seven feet high, representing a coal-bed in Nova Scotia, displayed in the recent Great Exhibition in London, I said to myself, here is a black man, of the strength of some *four* of the stoutest dark-skinned men ever held in serfdom, and see what a willing service, what a painless bondage it can be made to undergo. This, our inanimate slave, can be compelled to work at any rate of gentleness or speed we choose. We can induce him to lengthen out his efforts for almost any term of years, or bid him convert himself into a herculean giant, concentrating the total force of four able-bodied men, spread over twenty years of life, and applying the whole of it in some titanic triumph against brute matter within a week or even a day.

Here it may be worth our while to turn from our *giant man of all work*, and take the Census of those populations of this sort which rest sleeping beneath the ground, but are ever ready, under the magic summons of a little art, to muster at the surface in any strength and await our bidding. Every acre of a coal seam, only four feet in thickness, and yielding one yard depth of pure fuel, will produce, if fitly mined, about 5000 tons—equivalent to the life-labour of more than 1600 strong men. Every square mile of such coal-bed contains about 3,000,000 tons of fuel, and represents one million of men labouring steadily through twenty years of their ripest vigour. Recalling our estimate that the existing annual product of the British mines is 100,000,000 of tons, and that some 15,000,000 of this supply is employed for the production of mechanical force, is it not clear that England virtually summons annually to her aid an obedient army of 5,000,000 of fresh men. Nor is this all; each of these represents a man toiling through twenty years, and as the above number comes every year, the actual population of workmen in the shape of coal is twenty times the 5,000,000 men, or it is the vast multitude, 100,000,000. Were *all* the coal annually lifted in Britain converted into *power* as well as mere heat, its aggregate energy would surpass the combined strength of more than all the adult human population of the Earth.

A FEW DAYS IN SPAIN.

THERE are several ways of getting to Spain. If you go by sea, there are good steamers from Southampton to Gibraltar; but then you strike the hot country first. The route by Marseilles and Valencia is the quickest, but it is the dearest, and there is a risk in that case of missing Burgos, just the sort of place to be dropped out of the fag-end of a tour. So we determined to go by Paris (which every one in his secret heart is glad to find an excuse for going to, if only for a day), and then on through western France by queenly Angoulême enthroned among her vineyards, and the quays of stately Bordeaux, and across the Landes—not without their mournful beauty, being a kind of Scotch steppe waving like the sea with heather and firs—to Bayonne, which is as much Spain in France, as St. Sebastian is France in Spain.

The drive across the spurs of the Pyrenees is often pretty, but never sublime. Its chief interest is that on all sides are the footprints of our great Wellington. At Irun, the first Spanish town, we showed our passports, which were never asked for again till we were leaving Malaga; and when we stopped at St. Sebastian we had our first glimpse of Spanish manners. The conductor of the diligence told us we were to take supper, and then vanished. There was no person from the inn to show us in the dark where the inn was, or to give us reason to suppose that our going there was of the slightest consequence to any one. We saw an open door and a flight of stairs, and then a room, with a table and plates on it, and being hungry and adventurous, we went in and waited for what was to come next. A handsome Spanish girl attended on us with a kind of dainty stateliness, taking round dish after dish, without volunteering a remark, and not condescending to show that she could speak French till we asked what we had to pay. The French conductor, too, furnished us with another glimpse of Spanish character; for, coming up in a kind of rollicking simplicity to the top of the table, he was quietly told by the Spaniards present to go down to the bottom, which he did instantly with a good-humoured grimace, and soon showed that his rebuff had not taken away his appetite.

Our ten mules pulled us on merrily till we joined the railway at Olazogoitia somewhere about 3 A.M. (the journey from Bayonne to Madrid is now performed in less than thirty hours); and then, by Vittoria, which we reached at sunrise, and where we shivered for cold, we went on through a barren and dreary land till the spires of a lofty cathedral, rising above a mass of dull yellow houses and under the crest of a fortified hill, told us that we were at Burgos. At our inn there (Fonda del Norte) we found iron beds, prettily papered rooms, a fair *cuisine*, and reasonable charges. The Cathedral of course we visited without delay. At the west end

are two crocketed and not very lofty spires. Behind these rises up an octagonal tower, built by the son of the Duke of Alva, and behind this again a lower tower, in itself a good-sized church. The interior is somewhat spoilt by bronze gates a good deal out of order, which “imprison the choir,” and give the church the look of being in handcuffs; but its airiness, loftiness, and lightness are quite wonderful, and the elaborate stone carvings, both in the octagonal tower and the mighty pillars which support it, make it a gem of Gothic art.

The convent of Miraflores, about a mile out of the town, possesses perhaps the very noblest monument in Spain, erected by Isabella of Castile to her parents; and though the French cruelly mutilated it, and a wretched painted railing makes it impossible to get near enough to examine it quite minutely, it well deserves a visit. The tomb is of the very finest alabaster, about three and a half feet high. On the top are the recumbent effigies of the king and queen,—he in his armour, she in her robes, ornamented with lace most marvellously chiselled,—while all round the monument are carved figures of martyrs and Apostles, each a gem of art. There are seven monks here, all on the silent system, and I did not know how sufficiently to pity them, or to execrate the cruelty that condemned them to their silence. We came across one of them, an accomplished man, who spoke fluently several European languages. He looked lost and unhappy; and a sickly smile lit up his face as he showed us a stick he had been chiselling, and observed (for they may speak to strangers), touching his forehead, “this would fail me if I might not thus employ myself.” It seemed perfectly natural that when we parted from him, he did not cast back one glance at us, but became instantly absorbed again in his tools and bits of wood. They were his best friends, while we were nothing to him, and to converse with us was but to remind him of his living grave.

Burgos is a dull, decayed place, and we were glad to get into the *correo*, or mail-coach, for Madrid; though, after a journey of twenty-four hours, during which we could buy nothing to eat or drink on the road, we were still more glad to get out of it. The drive is not quite without interest; occasionally we came on bits of wooded country; and, as the sun went down, the distant hills with their lights and shadows reminded us of the Westmoreland fells. Whenever we changed horses, the curé, and the gossips, and the children came to have a peep at us, and so we got a peep at them; and, provided you have no dust, and can have the *coupé* to yourself, a diligence journey now and then is a pleasant way of travelling, permitting meditation and talk more easily than a railway, and much better opportunities for seeing the country.

Madrid, which disappointed us when we entered it, grew on us afterwards; and though it cannot be compared with Paris, Naples, or Berlin, may fairly be ranked with Bordeaux or Milan. The *Puerta del Sol* (where was our excellent hotel, *Fonda de los Principes*) has recently been ornamented with a very effective fountain, and at night when lighted and crowded with people would be striking even in Paris. The *Prado* is said to be a brilliant scene on a summer's evening. The *Palace* is quite the grandest I know, but I have never been to *St. Petersburg*. The shops are third-rate, and enormously dear. Cabs are good and cheap. House-rent is becoming exorbitant. The best hotels are expensive (ours was sixteen francs a day), but provisions are dear, and the *cuisine* is equal to *Meurice's*. In summer the heat is frightful, and in winter the cold blasts from the *Guadarrama* mountains cut with the sharpness of a razor, but in spring and autumn the climate is perfect, and while we never once felt it hotter than chilly Englishmen wish to feel it, we also felt that we had not come in vain in search of the sun.

The glory of Madrid is its *Picture Gallery*. Externally the building is not remarkable, but the long gallery as you enter is very imposing, and in this respect superior to the *Louvre*, that there is neither gilding nor ornament to distract you from what you have come to see. The pictures moreover are well lighted; there is abundance of civil attendants, and you generally have the place to yourself.

Pictures are a tempting subject, and I have a wholesome fear of the editor's scissors. The main fault of the gallery is that there is no real attempt to classify the pictures in their several schools. The merit of it is the astonishing collection of really excellent pictures of all countries, as well as in the numbers of *chefs d'œuvre* of the greatest masters. Here moreover you come across painters not much known in England, such as *Velasquez*, the most natural and vigorous of portrait painters, and the somewhat sombre, but most meritorious productions of *José Ribera*. I would only add that, after a somewhat careful study of *Raphael* and *Murillo* in this gallery, I felt most thankful for the natural way in which they have painted the human life of Christ. In a cabinet picture by *Raphael* the infant Jesus is putting his arms round the Baptist's neck, and kissing him. In another, the Holy child is riding on a lamb, Joseph holding him. But the most domestic picture is perhaps one by *Murillo*, in which the boy Jesus, standing at Joseph's knee, holds in his hand a white bird towards which a dog is preparing to spring, while the Virgin at her spinning wheel looks on. To be made to feel that the joys and sensations of childhood have been shared by One who, when He became man, took to himself a humanity complete in all its sympathies and emotions; and that our Blessed Saviour was once a childlike child as well as a true man, is surely a help and light of no common value.

From pictures to bull-fights is a rapid transition, but the Bull-ring is near the *Museo*, which possibly accounts for the connection in my own mind. We did not see a bull-fight, for the only one that took place while we were there was on a Sunday, and under any circumstances it is hardly the place for a humane Christian man. From all I heard of it, the spectacle must be sickening and disgusting. The men no doubt are brave enough, and the bulls fierce enough, and the excitement must be appalling; but the horses, instead of being what they used to be, and in Spanish America are still, noble blood animals, capable of leaping over the bull, if he comes too near them, are worn-out jades, fit only for the knacker, and have to be goaded to their death. It often happens that, after the bull has gored them, they run round the ring trampling on their own entrails: and sometimes a boy will run up, stuff the wound with straw, and so they do for the next day.

The most hopeful feature about the thing is that the Queen in Madrid hardly ever goes to them; that the press is steadily writing them down, and that society very much takes its tone from France and England. It is possible therefore that in a few years' time this barbarous remnant of the old gladiatorial games may pass away.

Of course we went to the *Escorial*. Standing on a platform of granite at the foot of the *Guadarrama* range, it seems part of the mountain, which overshadows without dwarfing it: and partly monastery, partly palace, in more senses than one, it is the *Versailles* of Spain. Built on the plan of a gridiron, it is in shape a rectangular parallelogram, at each end flanked with towers surmounted by a grey spire, and with four tiers of windows. In the centre is the dome of the church, a grand and simple building, that reminded me of *St. Peter's*. The material is granite, so fresh that it looks as if it was finished yesterday, and the severe simplicity of the whole building is its chief merit. Under the dome is the burial-place of the sovereigns of Spain, from *Charles V.* to *Ferdinand VII.*, each in his own sarcophagus of marble.

The library, with the *edges* of the books turned outwards, is chiefly interesting for a portrait of *Philip II.* in his old age, who glares at you out of the canvas with a dull, cruel stare. The royal apartments are small and tawdry, but any one who has read *Motley's* histories would take an intense interest in visiting the suite of rooms where *Philip II.* spent his life in the deliberate infliction of pain. There is the rough chamber, where it was his whim to receive ambassadors—the tiny cabinet, with no window in it, where he sat at his desk hour after hour (for he was a glutton of work), reading despatches, and scrawling upon them; there is the chair on which he sat, the table where he wrote, the stool on which he rested his gouty leg, and just beyond, inside the church, and in view of the altar, is the spot where, in frightful agonies of body and mind, he breathed his last, gazing at the crucifix

that could not save him, and listening to the priests, who could not give him peace.

Toledo is one of the most interesting cities in Spain, and you can go and return to Madrid in the same day. It is perched on a kind of eagle's nest above the Tagus, which rushes beneath it through solid walls of granite, on its three hundred miles' journey to the Atlantic. The streets are very narrow, narrower than at Vienna. The inhabitants, who speak the purest Castilian, do not live in flats as in Madrid, but each in his own house, with its patee or inner court, musical with a fountain always playing, sweet and green with flowers, and cool with its thick awning to keep off the sun. Constantly our guide stopped us to point out some arabesque carving, or some ancient door studded with nails of a wonderful shape and thickness (the Moors were great in nails), or a deep well with its old iron lid. There are two beautiful synagogues here, which, since the Jews were expelled from Spain, have been turned to all kinds of uses, ornamented with Moorish tracery in brilliant colour; and there is also a noble fragment of a church built by Ferdinand and Isabella, hung outside with iron fetters taken off the Christian captives at the surrender of Granada. The cloisters here, wofully defaced by the French, seem to have been more beautiful than the Campo Santo at Pisa.

But the crown of Toledo is her Cathedral, worthy indeed of the seat of the Primate of all Spain (who ranks next to the Pope), and which impressed us almost more than Seville. Here, as elsewhere, the exterior is not remarkable (our English cathedrals far surpass in this respect those of Spain), but the interior is sublime to the last degree. Four tiers of enormous columns, themselves decorated with smaller columns, divide the nave. The choir, as is the case in all Spanish cathedrals, is quite in the way, and spoils the effect of the rest of the building, but the walnut stalls are very beautiful, and it contains a gorgeous chapel to the memory of Spain's greatest prelate, Cardinal Mendoza, the friend, and almost the equal of the Catholic kings. The numerous chapels are richly decorated. The sacristy is full of jewelled dresses, and gold and silver plate of a fabulous value. The reliquary is as well stored as that of St. Anthony at Padua, and as the afternoon sun streamed in through the windows of richly-painted glass, the church was filled with glory.

From Madrid to Granada is a journey of about twenty-nine hours, of which the first eight are now by railway. It is the great distances in Spain, and the expensiveness of good places in the diligence, that make travelling costly. Till you come to Santa Cruz (with the exception of an oasis of verdure at Aranjuez) you might imagine yourself in the desert; and this arises not only from the fact that in autumn much of the country is in stubble, but also that a good deal is not in cultivation; for as there is no means of transport, there is no use in growing corn which is not needed for home consumption.

The soil and climate of Spain produce the finest wheat in the world. In some places the bread is so white and rich that it looks like cake, and does not need butter. When the railway system at present in progress is completed to Barcelona in the north-east, to Santander in the north-west, and to Seville in the south-west, Spain will become the granary of Western Europe, and an impetus will be given to the trade of the Peninsula—the results of which it is impossible to foretell.

Santa Cruz is in the district of La Mancha, Don Quixote's home, and a very desolate land. Three hours from here, the road begins to climb the Sierra Morena (the backbone of this part of Spain), and by a really Alpine gorge, and past mountains, not indeed so brilliantly coloured as those of Wady Shellal, but still quite metallic with red and sulphur, leads down into Andalusia. On all sides, till the eye rests on a mighty background of mountains forty miles off, there stretch vast plantations of olives, carefully planted in rank and file: and here for the first time we come on the cactus, the wild aloe, and the pomegranate. At Bailen, the scene of a battle in 1808, where the Spaniards defeated the French, and were so frightened at what they had done, that they made no use of it, the road to Cordova and Granada diverge. Jaen was the next town we came to, a city set on a hill, and surrounded by fruit gardens of a delicious greenness. Then on we drove through a valley of Italian richness, where the fig and the vine, the peach and the nectarine, the melon and the pomegranate, the maize and the olive, told us of a land of milk and honey: as the sun fell, the moon rose, and through gorge after gorge, glittering in the silver air, we drew nearer to the majestic shadows of the Sierra Nevada, till we were roused out of a snatch of uneasy sleep, to find our journey over.

Granada is the Salzburg of Spain. Built at the extreme end of a most fertile valley, and embracing with both its arms the noble hill on which the Alhambra is built, it has a climate deliciously tempered by mountain breezes, and was the brightest jewel that Islam lost, and that Christendom won. I am not sure that the view from the bell tower of the Alhambra does not quite equal the famous view of Damascus: and when the Nevada is glittering with snow, and the plain fresh with its spring greenness, like Jerusalem of old, it is beautiful for situation, and the joy of the whole earth.

The Cathedral is a bad St. Paul's, but its great feature of interest is the Royal Chapel of Ferdinand and Isabella. There are two of the most exquisite marble tombs that ever the hand of man chiselled, and underneath, in the vault, their remains repose. They show you Ferdinand's own sword, and a splendid vestment worked by Isabella for Cardinal Mendoza: and then you go down into the narrow chamber, where a tall man could hardly stand upright; and before you are two plain lead coffins, one marked F., the other I., that contain all that is left of those strong and royal hearts.

The Carthusian convent outside the town commands a fine view of the plain, and of the Duke of Wellington's estate, the value of which is absurdly exaggerated by the Spaniards. In the sacristy you get a notion of the mineral wealth of Spain in some superb marbles, and the doors of the chapel are exquisitely inlaid in ebony and tortoiseshell.

But the Alhambra is the pride of Granada and the boast of Spain. A noble avenue of English elms leads up to it out of the town, and English tourists cannot be too strongly recommended to take up their quarters at a pretty little inn, called the Siete Suelos, which is right under the palace walls, and in every respect all that can be wished. The first thing to do is, if possible, about sunset, to climb the Torre de la Vela, where the Christian flag was first hoisted by Cardinal Mendoza, and where there is as glorious a panorama of mountain and plain as can be seen in Europe. We spent two evening hours there on our first visit, for the Alhambra, like Venice, is best seen in twilight: and we looked down on the city, and the dim outline of the distant mountains, and the grand sweep of plain at our feet till the moon rose over the shoulder of the Nevada, and with its silver splendour put out the lights beneath.

It is very difficult to describe the Alhambra, but the ornamentation of one room is very much like that of another; and the kind of thing is familiar to any one who has visited the Crystal Palace. Like all Oriental edifices, its beauty is within, and from without it is remarkable only for the thickness of its masonry, the imposing appearance of its towers, and the commanding elevation on which it is built. Even the interior at first disappoints some persons, for all colour is gone, except where you come across the admirable restorations now going forward, and there meet you everywhere marks of the tooth of decay. Never was I myself so much impressed with its size, as with the admirableness of proportion, and the exquisiteness of taste; and the feeling is rather one of delight at the refined handiwork of an inventive genius, than awe in the presence of commanding power. The Hall of Ambassadors is perhaps the most imposing part of it; while the Court of Lions, with its 128 pillars of white marble, so slender and delicate that you wonder how the roof is supported by them, gives the best impression of the capabilities of Moorish architecture. But the place will grow on you, as you visit it again and again, by yourself, and at all hours, especially in the moonlight: and when you succeed in forgetting the dilapidation and ruin that surrounds you, when you try to imagine that whitewashed plaster radiant in gold and colours: when you people those silent halls with the beauty, and the prowess, and the wisdom, and the nobility of those stately Moors: when you trace through the length and breadth of the land, how all that was honest, and true, and good in them, still blesses Spain,—you will see that if at last the Fleming conquered the Moor, in some things still the Moor

is master of the Fleming: and while you are thankful for the conquest of Granada, while in our age we have better things than Moorish palaces, and through God's goodness could tell those Moors, what their Koran could never tell them; we may still feel that God's Providence had a purpose in suffering them to be all those centuries in Southern Europe: we can all learn from each other, and we can all give to each other: let us be as great in our time with our advantages as they were then with theirs.

While at Granada I twice visited Matamoros in prison; a most true and noble sufferer for conscience sake, and not yet spoiled by sympathy. On another occasion I may relate what I saw.

From Granada to Malaga we went on horseback across the mountains, and a fagging ride of two long days we found it. The dip down from the Alhambra into the plain is as fine as anything in Italy; and Alhama, which we reached in the afternoon, a thoroughly Moorish town, and built on the edge of some enormous fissures in the hills, is most singular to look at, but woe to the flesh and blood of any Englishman that sleeps there. Soon after this we got more into the heart of the mountains, and passed through some glens that reminded me of the road from Dhahariyah to Hebron. Here however the rain came down smartly, and as it was dusk, we took refuge in a village posada, where everything was in common, and the muleteers came in to dry themselves by the fire, and then passed the night on the floor. One bed was made for us upstairs, on the outside of which we tried to snatch an hour's sleep, but the voracity of the insects soon disturbed us; and as no amount of capital punishment produced any effect on the survivors, we got up, and read till the moonlight and the approach of dawn made it prudent for us to proceed. For six hours we were scrambling about from one precipice to another in our descent towards the sea, which we saw at a great distance beneath us, and for the first two hours it was very cold; but when we got into the sunlight it was hot enough, and we found ourselves in a valley tropical both in its climate and vegetation, with the orange and the lemon, the sugar-cane and the palm. From Velez Malaga, where we breakfasted, it is a six hours' ride further to Malaga, by the side of the sea; and as we entered the town at sunset in a flood of golden mist, it seemed impossible ever to think Turner extravagant again.

From Malaga, where we stayed only one night, we went on to Gibraltar by steamer; an affair of eight hours. There too we remained just long enough to visit the lines, to find that none of our friends were in the place, to read the papers, and to be very anxious to get away.

The Spanish press is now agitating for the restoration of Gibraltar, but two questions have first to be settled. Does Spain deserve it, and could she keep it? It must always be remembered that England holds the Rock, not merely in the pride of

conquest, but in the interests of the rest of Europe, Austria, Turkey, Italy, and even Spain herself. It is certain that if England at this moment were to give up Gibraltar, every Spaniard in the country would instantly say, that we had given it up in fear of them; and instead of respecting us for our justice, they would despise us for our weakness. But the point is, how long would she keep it out of the hands of France?

And then surely it is a fair question, Does she deserve it? When Spain joins with the rest of the civilised world in honestly putting down the slave trade; when she permits foreigners to worship God according to their own conscience, and to have the rites of Christian burial if they die on her soil; when she grants to her own children full liberty of faith; when she pays her just debts, and becomes once more a solvent nation; when she has an independent diplomacy; when she has an army that can do something more than slaughter Moors; and when she has a navy to protect Gibraltar, if she gets it,—then it may be time for England to begin to listen to proposals which now even to think of would be high treason.

From Gibraltar to Cadiz is a voyage of eight hours, and in the finest weather trying to weak stomachs, when the boat gets fairly into the roll of the Atlantic. Of all the beautiful cities I ever saw, Cadiz is the most beautiful, rising like a lustrous pearl out of a sea of sapphire. The houses are clean and elegant, and with flat roofs. The streets are full of good shops, and crowded with people. The harbour is busy with shipping, for Cadiz is the great port for exporting the Xeres wines, and for communication with the American colonies.

In pursuance of our settled plan always to avoid the Queen on her state progress, we left Cadiz before she reached it, and passing Seville, where a grand display of fireworks was going on, made for Cordova. This is an old Moorish city, once almost the greatest in Spain, and now in its decay numbering 50,000 souls; but the streets are vastly dull, the shops poor, the heat clammy and sickening, the mosquitoes audacious, and our inn (the Fonda Suisse) the only one in Spain where we were over-charged. Still it is quite worth coming to for the Cathedral, or Mesquita, as it is still called, that is, the ancient mosque turned into a church. I do believe there is nothing like it in the world. You approach it through an open court filled with orange-trees, and with one noble palm laden with fruit. Outside it is long, low, and heavy. When you enter you almost imagine yourself in a forest; for no less than 850 marble pillars, all different in shape, colour, and carving, support the roof, and divide the cathedral; and as they are somewhat small, and by no means lofty, you seem all the closer to them. The effect perhaps is curious, rather than imposing; in fact, at first you hardly know what to make of it; but when you imagine yourself in a mosque, all seems natural, and the air of the place is much more Mahomedan than Christian. There is one exquisite fragment, a

sacred recess, where in old days the Koran was kept, and in which the arabesque carving and columns are in excellent preservation. The building is spoilt by a modern gilded choir stuck in the very centre, and even Charles V., who tried to do worse at the Alhambra, found grievous fault with this.

Seville, which is about four hours from Cordova by railway, is the capital of Andalusia, and in some respects the second city in Spain. The birthplace and the residence of Murillo, it contains some of his finest pictures, and those open to the public are chiefly to be found in the Chapel of the Caridad, the picture gallery, and the Cathedral. The two most important of those at the Caridad represent Moses striking the rock, and Christ, in a sitting posture, blessing the loaves before they were distributed to the multitude. The colouring and the drawing are of course irreproachable, but I confess they were just a proof to me that no artist, great as he may be, can excel in everything, and that historical painting, which requires great dramatic power and conception, was not Murillo's gift. In the picture gallery, all his pictures, by a most fatal mistake, are collected into a single room. Certainly you have not the feeling of sickening disgust that comes over you in the gallery at Munich, in the room devoted to Rubens, but painters want a foil more than any people, and you have here too much at once of the same thing. Among many gems the picture that struck us both most is one of St. Francis and Christ. The Saviour on his cross with one arm free is bending down to embrace the saint, to whom He seems to say, "Art thou equal for this cross, and am I sufficient to help thee to bear it?" while St. Francis (the world under his feet), to whom two infant angels, evidently not understanding what they do, hold out a scroll, with the words "Whosoever forsaketh not all that he hath cannot be my disciple," clasps his Divine master with a look that seems to say, "A hundred crosses with Thee."

The picture in the Cathedral which Borrow admires most—that of the Guardian Angel—was completely covered up by velvet drapery, placed there in honour of the Queen: but really, one fine thing is enough at a time, and the Cathedral is enough to admire by itself. Its finest external feature is the Moorish tower, called the "Giralda," which you ascend by a raised pathway, as in the Campanile at St. Mark's, and from the summit of which is a noble view of the country and town. It is unnecessary to say that the building is unfinished, and certainly it must not be mentioned the same day with the Duomo of Milan; but it is the purest and the largest specimen of Gothic architecture in the world, and I should be sorry for the man who could enter it for the first time without a real awe. Its vastness, its loftiness, and, to use a very hackneyed expression, its dim, religious light, impress themselves on you instantly. All the windows are in painted glass, and the organs are almost more magnificent than usual in Spanish cathedrals, which is saying a great deal. The

church music we thought beneath criticism, but there is no singing abroad that I have ever heard like our cathedral music at home. The son of Columbus is buried here; his father sleeps across the sea.

I wonder what Dean Close would say if he were to go over the tobacco manufactory here, which employs about 500 men and 5000 women daily in the manufacture of snuff, cigarettes, and cigars. The very sight of 5000 gowns and petticoats hung up against the wall, and the sound of 5000 female voices, not always of the gentlest, and all of course speaking at the same time, are astonishing enough by themselves. I greatly fear that a very cursory glance at Spain would convince him that tobacco is a national institution, and that smoking is the intemperance of the Spaniards. It will, however, I am sure, please him to know that the building is entirely closed on Sunday.

The Alcazar, or Moorish Palace, could not be seen, as it was being used by the Court: and for the same reason the Palace of St. Telmo, the residence of the Duke of Montpensier, flanking the Guadalquivir, and surrounded by gardens planted with very choice shrubs from all parts of the world, was not visible. But Seville itself is full of interest. There is much that is old, still mingled with the new. Orange and lemon-trees spring up everywhere—oranges are now the chief trade of the place—and the ladies of Seville are the most beautiful and fascinating in Spain. Let me venture to whisper it, there are two things, *two things only*, in which they surpass Englishwomen. They walk better; a Spanish lady glides, rather than walks, with a grace and dignity you see nowhere else: and then, as they never wear bonnets, but simply a black lace veil thrown over their heads (a most becoming head-dress), and invariably choose the quietest colours (when they go to church, they always wear black), they are preserved from that incredible rashness in mixing colours, which, with many of our own countrywomen, rob face and complexion and figure of more than half their due.

The great drawback to Seville is the plague of mosquitoes; and the inns are far from being equal to those of Madrid. Our way home we had intended to be by Lisbon, but circumstances made it expedient for us to return by the quickest route; and so we struck across the country for Valencia, a journey of forty-four hours, going by diligence to Santa Cruz, and then taking the railway to Alcazar, which there diverged in a branch line to the Mediterranean.

We were not prepared for the astonishing fertility we found in the district of Valencia, and which is mainly owing to the system of irrigation handed down from the Moors. The view from the Cathedral tower is a very panorama of richness, and the city itself is a thriving and bustling place. Evidently there is great heat, for the very streets are awned over from the sun. In the markets we saw frogs and snails for sale as articles of food; and economical

persons can buy as small an article as a chicken's leg. Tiles are manufactured here in great abundance, and also black silk. Here we finished Spain, ending well; and in a tartana, a kind of covered cart without springs, which has been compared to a gondola on wheels; we jolted down to the harbour, where we took the French steamer for Marseilles.

And now for a few closing sentences on Spain and Spaniards. In soil, in climate, in mineral wealth, in natural resources of all kinds, Spain is unrivalled; and it only needs a wise development of her commercial system to restore her to the level that she has so long lost. It is a great misfortune to her that the Tagus flows into the sea at Lisbon; and it was Philip the Second's fatal mistake in making Madrid the capital, that alienated Portugal. The settlement of the dynasty and the liberal constitution have done much to consolidate the institutions of the country; and the introduction of foreigners into Spain, as well as the taking of Spaniards out of it by increased facilities of travelling, must tend to introduce new ideas and principles into the country, and may pave the way for religious liberty. Borrow and Ford speak so severely of Spaniards, that I hesitate to give impressions which must be superficial, and are likely to be erroneous. But from what I heard from Englishmen resident in Spain, and from what I saw with my own eyes—which I did my best to keep open—I quite came to the conclusion that, with all their faults, they are a great people, and are certainly a nation of gentlemen. They seemed social and light-hearted, with neither the heaviness of the Germans, nor the levity of the French, nor the somewhat sad gravity of the English. There is a great deal of real dignity in them; you can see this in the way they dress, for they are certainly the best-dressed people you will find anywhere; and masters treat their servants with a consideration that would surprise us here. As an instance of this, one person told me that a maid-servant had refused to come to him unless she was called Señora. They have great veneration for their parents, for whom they mourn two years, and during that time never enter a theatre nor listen to music. Their faults remind one of a large family of brothers and sisters living together in a remote place, and who, compelled by circumstances to be independent of others, come to think there is nobody like themselves. Pride and poverty make them inhospitable. Their self-love creeps out sometimes very amusingly, and an English acquaintance told us that during the royal festivities at Seville, when a few regiments were being reviewed, he overheard the people saying to each other, "What a wonderful people we are. Who is like the Spaniards? No wonder we conquered the Moors." They dislike foreigners, though they are very civil to them. One Spaniard, who had lived as a political refugee in England, remarked to a gentleman, who repeated it to me, that he should like to banish all foreigners and foreign productions out of Spain altogether, and leave Spain to herself. But of all foreigners they

T. Morten

DAZIER

COUSIN WINNIE.

dislike us most, and for four reasons. We are heretics ; we have laid them under great political obligations, which they to a man ignore ; we have lent them money which they do not mean to repay ; and we hold Gibraltar. And yet one Spaniard, who began his sentence by the flattering observation, "I hate England," finished it by adding, "yet I never come into contact with an Englishman without liking him."

The serious faults of the Spaniards are pride, idleness, and corruption of morals. They have no

domestic life : their faith is alloyed and encrusted with superstition : the shadow of the Inquisition still haunts them ; even now no man dares speak out his mind where the Church has dogmatised ; and their Bible is sealed.

So, as we cross the Channel, and climb the old white cliffs, and rush up through the Weald of Kent, and enter once more the crash and roar of London, our one deep feeling is thankfulness that we are Englishmen.

A. W. THOROLD.

COUSIN WINNIE.

THE glad spring-green grows luminous,

With coming Summer's golden glow ;

Merry Birds sing as they sang to us

In far-off seasons, long ago.

The old place brings the old time back,

To eyes that mirage the Dawn i' their dew ;

My heart goes forth along the track

Where oft it danced, dear Winnie, with you.

A world of Time, a sea of Change,

Have rolled between the paths we tread,

Since you were my "*Cousin Winnie*," and I

Was your "*OWN LITTLE, GOOD LITTLE NED.*"

There's where I nearly broke my neck,

To harry a nest ! and hid my pain :

And then I thought your heart would break,

To have the Birds put back again.

Yonder, with lordliest tenderness,

I carried you across the Brook ;

So happy in my arms to press

You, triumphing in your timid look :

So lovingly you lean'd to mine

Your cheek of sweet and dusky red :

You were my "*Cousin Winnie*," and I

Was your "*own little, good little Ned.*"

My Being in your presence bask'd,

And kitten-like for pleasure purr'd ;

A higher heaven I never ask'd,

Than watching, wistful as a bird,

To hear that voice so rich and low :

Or sun me in the rosy rise

Of some superb, frank smile ; and know

A thrill of opening paradise.

The Boy might look too tenderly ;

All lightly 'twas interpreted :

You were my "*Cousin Winnie*," and I

Was your "*own little, good little Ned.*"

Well I remember, Winnie, how

I felt the heartbreak, bitterly,

When the Well-handle smote your brow,

Because the blow fell not on me.

Such holy longing fill'd my life,

I could have died, Dear, for your sake ;

IV-17

But, never thought of you as Wife :

A cure to clasp for love's heart-ache.

You enter'd my soul's temple, Dear,

Something to worship, not to wed :

You were my "*Cousin Winnie*," and I

Was your "*own little, good little Ned.*"

I saw you, heaven on heaven higher,

Grow into stately womanhood ;

Your beauty kindling with the fire

That swims in noble English blood.

Away from me—a radiant Joy !

You soar'd ; fit for a Hero's Bride :

While I a Man in soul, a Boy

In stature, shiver'd at your side.

You saw not how the poor little Love

Pined dumbly, and *thus* doubly pled :

You were my "*Cousin Winnie*," and I

Was your "*own little, good little Ned.*"

And then that other voice came in !

There my Life's music suddenly stopp'd :

Silence and darkness fell between

Us, and my Star from heaven dropp'd.

I led Him by the hand to you—

He was my Friend—whose name you bear :

I had pray'd for some great task to do,

To prove my love. I did it, Dear !

He was not jealous of poor me ;

Nor saw my life bleed under his tread :

You were my "*Cousin Winnie*," and I

Was your "*own little, good little Ned.*"

I smiled, Dear,—at your happiness—

So Martyrs smile upon the spears—

The smile of your reflected bliss

Flash'd from my heart's dark tarn of tears !

In love, that made the suffering sweet,

My Blessing with the rest was given :

"God's softest flowers kiss Her feet

On Earth, and crown Her head in Heaven."

And lest the heart should leap to tell

Its tale i' the eyes, I bow'd the head :

You were my "*Cousin Winnie*" and I

Was your "*own little, good little Ned.*"

I do not blame you, Darling mine ;
 You could not know the love that lurk'd
 To make my life so intertwine
 With yours, and with mute mystery work'd.
 And, had you known, how distantly
 Your calm eyes would have look'd it down,
 Darkling with all the majesty
 Of Midnight wearing her star-crown !
 Into its virgin veil of cloud,
 The startled dearness would have fled.
 You were my "*Cousin Winnie,*" and I
 Was your "*own little, good little Ned.*"

I stretch my hand across the years ;
 Feel, Dear, the heart still pulses true :
 I have often dropp'd internal tears,
 Thinking the kindest thoughts of you.
 I have fought like one in iron, they said,
 Who through the battle follow'd me.
 I struck the blows for you, and bled
 Within my armour secretly.
 Not caring for the cheers, my heart
 Far into the golden time had fled :
 There you were my "*Cousin Winnie,*" and I
 Was your "*own little, good little Ned.*"

Sometimes I see you in my dreams ;
 You ask for aid I may not give :
 Down from your eyes the sorrow streams,
 And helplessly I look and grieve
 At arms that toss for wild heartache,
 And secrets writhing to be told :

I start to hear your voice, and wake !
 There's nothing but the moaning cold.
 Sometimes I pillow in mine arms
 The darling little rosy head,
 And you are my "*Cousin Winnie,*" and I
 Am your "*own little, good little Ned.*"

I wear the name of Poet now ;
 And flowers at my feet are cast :
 I feel the crown about my brow ;
 So keen the thorns that hold it fast !
 Ay me, and I would rather wear
 The cooling green and luminous glow
 Of one you made with Cowslips, Dear,
 A many golden Springs ago.
 Your gentle fingers did not give
 This ache of heart, and throb of head,
 When you were my "*Cousin Winnie,*" and I
 Was your "*own little, good little Ned.*"

Unwearying, lonely, year by year,
 I go on laying up my love.
 I think God makes no promise here
 But it shall be fulfill'd above.
 I think my wild weed of the waste
 Will one day prove a Flower most sweet ;
 My love shall bear its fruit at last ;
 'Twill all be righted when we meet :
 And I shall find them gather'd up
 In pearls for you—the tears I've shed
 Since you were my "*Cousin Winnie,*" and I
 Was your "*own little, good little Ned.*"

SOLDIERS' WIVES.

BY AN ARMY CHAPLAIN.

OF late years there has been a marked improvement among our soldiers' wives, because there has been a marked improvement among our soldiers themselves. These two facts stand to one another in the relation of cause and effect, and the remark, we believe, extends to the whole British army, though it has been more immediately suggested by our knowledge of the character and habits of the household troops. There are ruffians and desperados amongst them, no doubt, as the defaulters' books and the police reports prove ; but we question whether six thousand better conducted men could be selected from the same class in any part of the United Kingdom. This moral improvement has been owing to different causes. The great sympathy shown for them and their wives and children during the Crimean war, softened their hearts ; the truths of religion preached by earnest and devoted chaplains obtained the mastery over many minds ; the establishment of reading rooms, soldiers' clubs and institutes, and the regulation now enforced in several of our battalions that every soldier must

attend the regimental school till he obtains a certificate that he can read and write ;—all these causes have united in making our soldiers something different from those old ruffians who were almost as terrible to their friends as to their enemies. Whoever remembers the character and habits of the old pensioners, scattered through our villages, some thirty years ago, will admit that this language is not exaggerated.

Paul tells us that marriage is honourable in all ; but the authorities at the Horse Guards affirm that marriage is honourable only in the case of six soldiers in every Company who have received the permission of their commanding officers, and decidedly to be disapproved of and discouraged in the case of all others. We shall have occasion afterwards to explain the cause of this exclusive arrangement, which, as matters stand at present, we believe to be necessary, and dictated by a feeling of kindness to the soldier himself. The pay-sergeant of every Company has a right, or at least is always allowed to marry if he chooses, as soon as he receives that

appointment. All the other non-commissioned officers are placed, in this respect, on the same footing as the privates of the regiment; they have all to wait their turn, and their promotion to the ranks of Hymen depends on length of service and priority of application. As soon as Sergeant Smith or Private Brown comes to the conclusion that the young woman with whom he keeps company, is a suitable partner for life, he applies through his pay-sergeant to have his name inserted in the list of intending Benedicts, kept in the orderly-room of the regiment. He knows that years may elapse before his turn comes, so as soon as he sees the smallest prospect of Hymen looming in the distance, he loses no time in making his application. Meanwhile he and Mary continue to keep company when the latter has her Sunday out, and on such other occasions as they can contrive to meet. It is well for them if they have patience and prudence to wait till they reach the top of the list; to marry without leave would be to entail on themselves certain misery.

None of our military chapels are consecrated or registered for the celebration of marriages, so that the chaplains are either debarred from marrying, or must perform the ceremony at some civil place of worship. In point of fact, however, very few of our soldiers are married by the chaplains. The ladies have always the right of choice in this matter, and Mary usually prefers the minister of the chapel where she attends worship. As soon as the knot is tied, she becomes an institution. She is part of the regiment, and has a recognised rank in it. She is entitled to certain privileges, which are never extended to the outsiders who are married without leave. She has a share in the washing of the Company, which is divided equally among the six married women. Every soldier pays sixpence a week for his washing, and of course, her income depends very much upon the strength of the Company. Soldiers in hospital have their washing done there, and there are always a good many men absent on furlough or duty. At an average throughout the year, she will have to wash for eight men, and will thus earn four shillings a week. The officers usually give their washing to the wives of the pay-sergeants of their Companies, or to those of their servants, if the latter happen to be married. One officer (merely of course in the matter of washing) is considered equal to six men.

A share in the washing of her husband's Company is not the only privilege which she enjoys. Her husband is exempted from attending the mess of his Company, and from contributing to the expenses which absorb the greater part of the soldier's pay. He may spend all his time, when off guard and free from duty, in her society, and they can sit at the same table (sometimes they only do so metaphorically, being unprovided with that article of furniture), and partake together of the same meal. The raw material for that meal is obtained chiefly from the government stores. They are entitled to

draw rations twice a week at the government price, which is very much beneath the usual market price. The rations for the two consist of two pounds of bread and one pound and a half of meat, for which they pay 9*d.* The pay of a private soldier is 8*s.* 2*d.* a-week, or, with the 4*s.* earned by his wife, 12*s.* 2*d.* From this we must deduct 5*s.* 3*d.* paid for rations, which leaves 6*s.* 11*d.* in hand. The allowance for lodging-money to every man married with leave is 1*s.* 2*d.* a-week for the Guards, and 2*s.* 4*d.* for the regiments of the line. It would be difficult to account for this difference, as lodgings are everywhere cheaper than in London. It is felt to be a hardship, also, though the Guards are too well-disciplined ever to make any complaint, that when they are sent to country quarters where a regiment of the line is stationed, they still receive only one half of the lodging-money allowed to the latter. This seems the more unaccountable, as the Guards have to change their quarters every six months, and married men have to remove their wives and children and other *impedimenta* at their own expense.

We left the married private with 6*s.* 11*d.* a-week after deducting the price of rations, or 8*s.* 1*d.* with the allowance for lodging-money. It is impossible to get a corner in the most miserable den in London for 1*s.* 2*d.* a-week; even in the lowest slums in Westminster, he will have to pay 3*s.* a-week for a room where he can scarcely turn or stand upright. A room of even these dimensions can only be had in the most wretched lanes, where fever is endemic and the lowest outcasts of society have sought to hide their shame. One cannot touch pitch without being defiled, and it is impossible for our soldiers' wives to breathe such an atmosphere without being more or less tainted. The only ground for surprise is, that, surrounded by such vitiating influences, they should still remain such an industrious, sober, hard-working class as they generally are. We do not know a single soldier's wife in the Guards who can be called a drunkard, though the temptations to this vice, owing to the causes already mentioned, must be very great.

After paying for his lodgings, the soldier has 5*s.* 1*d.* in hand to provide fuel and light (which cost at an average 1*s.* 6*d.* a-week), tea, sugar, beer, clothing for his wife and children,—in a word to meet all expenses, necessary or contingent. How every penny must be eked out before they can make ends meet; and what a clear head the wife, who is usually Chancellor of the Exchequer, must have, to pare down the expenditure so as not to exceed the revenue! And how she must labour, and toil, poor woman, that "her bairns may be like other folks' bairns," for soldiers' wives have this pardonable pride as much as any other class; and long may it be before they cease to have it. When there are five or six children, the mother leaves the younger ones under charge of the elder, and goes to work at some laundry in the neighbourhood, where she receives 2*d.* an hour. Occasionally she leaves her

baby at a public nursery established by the Sisters of Charity in Westminster, where, by paying 4d., she can have it taken care of during the day, and restored to her at night. This nursery, however, is generally pronounced a failure, and given up after a few trials. "The sisters don't know how to manage babies—they have no ways." How should they? They must be as much frightened at the babies as a young curate on the occasion of his first baptism.

A series of life-like sketches of English life and manners have appeared from time to time in the *Revue des Deux Mondes*, from the pen of M. Esquiros, a foreign gentleman, who seems as much at home in the tents of the wandering gypsies as in the *salons* of our highest aristocracy. Among others, our soldiers have not escaped his notice, and he gives one characteristic anecdote which we cannot avoid quoting. On one occasion he was passing through Charles Street, Westminster, a locality frequented chiefly by recruiting-sergeants, who may be seen there at any hour of the day, marching up and down with flaunting ribbons and martial tread. M. Esquiros saw one of these heroes make certain advances to a good-looking servant girl, who happened to be passing, but he met with no encouragement. M. Esquiros, with the easy gallantry peculiar to his countrymen, made up to her, and hinted that she might make a worse choice. "Ah!" she answered, with an emphasis which showed that she thoroughly understood the subject, "I have no mind to spend my life at the wash-tub." She knew that, if she married a soldier, she must become a slave of the tub; and, great as might be the attractions of her martial admirer, she was not prepared to submit to such a fate. We have heard somewhere of a recruiting-sergeant who had gone to a country fair to beat up for recruits. He was descanting with much eloquence to a circle of gaping bumpkins on the glory and the charms of a military life, when an old lame beggar, who had been disabled in the service, pushed his way through the crowd, and holding aloft his meal-pock and his crutches, shouted "Ay, ay, and this is what it will all come to!" The sergeant got no more recruits that day. And so when Mary's military admirer is whispering soft nothings in her ear, let her think of the wash-tub, and it may have the same effect as the beggar's meal-pock on the rustics.

And yet we are afraid that it will not. Mary's military admirer is so spruce, so smart, so neat, so different from all her other admirers, that the red-coat is always sure to carry the day. Nor does she stand alone in this respect: others still higher in rank act on the belief that none but the brave deserve the fair. Visions of crutches and a meal-pock will not deter young men from serving Her Majesty, nor will the phantom of a tub-full of soap-suds frighten Mary from accepting the hand of her admirer when they obtain leave. It is a well-known fact that our Guardsmen may have the *élite* of the

servant girls of London to choose their wives from; and no wonder, considering what tall, handsome, fine-looking men are to be found in the ranks of the household troops. We often hear of the beauty of the British aristocracy, but we undertake to select from the ranks of the Guards men who, so far as regards mere *physique*, will bear comparison with our young nobility or any other class. When the *Times'* correspondent examined the slain on the fields of battle in the Crimea, he never failed to be struck with the manly beauty of our dead Guardsmen, especially when contrasted with the half-savage Tartar features of the Russians by their side; and we venture to say that no country can show a body of men equal to our household troops. When the Emperor Nicholas was over in this country, some years before he discovered the mortal illness of the sick man, and, from a feeling of mercy, tried to throttle him, he expressed himself to the same effect after a review in Hyde Park.

There are three classes of women from which our Guardsmen select their wives, *viz.*, domestic servants, laundresses and needle-women. Hyde Park of a Sunday serves the same purpose as a ball-room in Belgravia. It is there that, in most cases, they first meet and form one another's acquaintance. There is no necessity for a formal introduction; it is quite in accordance with etiquette for the Guardsman to march up to and address any servant girl enjoying her Sunday out who may strike his fancy. This, instead of being resented as a freedom, is appreciated rather as a compliment. There is no *mauvaise honte* on either side; if Mary is engaged, she frankly says so; if she is fancy-free, she takes her admirer on trial. The length of the ordeal to which he is subjected, depends upon her obduracy or prudence; but, if he passes through it unscathed, they then begin openly and publicly to keep company. He is introduced to her friends, and received as her acknowledged lover. All his spare hours are spent in her society; and many of these poor fellows are as faithful in love as they are daring in war. It is quite a prejudice to suppose that our Guardsmen are worse than the same class in civil life; and Mary will be quite as safe under the protection of her red-coated admirer, as if she were keeping company with the baker or the butcher. It very often happens that two comrades marry two sisters, the one being introduced by the other; and there are some families that never marry out of the regiment, and are as much identified with it as the old battered colours that are carried before it.

Those girls who have been trained as laundresses are most useful as soldiers' wives, and earn more money than those who can merely wash. If they can get up linen well, they are almost sure to obtain some of the officers' washing, as the latter are far more particular in this respect than the men. A good needle-woman may also earn considerable wages by making soldiers' clothing. This used to be done entirely by contract, but trousers and

tunics are now given out from the Military Clothing Establishment at Pimlico, and the greater part of the sewing is done by women.* The work is easier than washing, though it is not considered so healthy, and it is certainly not so remunerative; a good laundress may make 2s. a-day, while the most skilful needle-woman can rarely make more than 1s. Sewing, therefore, is adopted only by those who have not sufficient strength to spend twelve hours a-day in a stooping position over the wash-tub.

Besides the six men in every Company who have received permission to marry, there are also usually ten or twelve who enjoy what is called Weekly Leave. They are a kind of supernumerary Benedicts, tolerated rather than encouraged, and their number depends very much on the character of the commanding officer. If he is a stern old bachelor, he sets his face against these abnormal marriages, but if he is a kind-hearted husband and father, he remembers his own youthful days, and grants the weekly, which is always preliminary to full leave. Weekly leave is obtained when a lover becomes desperate and can hold out no longer. It would be folly, however, to extend this privilege to those who have no other means of subsistence than their pay, and it is enjoyed chiefly by the tailors and shoemakers employed in the regimental workshops, who can earn from 10s. to 12s. a week in addition to their pay, and may, therefore, be regarded as *grands partis*. Those who have weekly leave are permitted to sleep out of barracks and to draw rations from the government stores, the same as those who have full leave, but it confers no other advantage and may be forfeited at any time through misconduct. It is only fair, however, to mention that we have never known any instance of this privilege being thus forfeited; and we are convinced that our married soldiers, in point of morality and good conduct, will bear favourable comparison with any other class of the community.

It is difficult to say how many soldiers in a regiment are married without leave, as they have every reason to conceal the fact. Such marriages are prudently ignored, and every precaution is used to deter the men from contracting them. Every month, a paper is read by the pay-sergeant of each Company, in which the men are warned, that, if it is discovered that any of them are married without permission, their names will be struck off the list of applicants for leave; and they themselves debarred from that privilege at any future period. Passion, however, is often stronger than prudence, and it is only when a regiment is ordered on foreign service, that the actual number of such marriages becomes known. About a year ago, two battalions of the Guards were ordered to Canada, and we accom-

panied them to the Waterloo Station when they left. There were many wives present on that occasion, whose names are unknown in the regimental books: they braved every risk to bid their husbands farewell. It was a heart-rending scene, and even the crowd of roughs who had assembled to witness their departure, were subdued into something like sympathy. There was only one exception: a poor, weak, shivering creature (it was a raw December morning) was clinging to her husband, and weeping as if her heart would break. A voice exclaimed, "Ah, he will get killed; you will never see him again." A cry of "shame!" rose from the crowd, and the brute slunk away and disappeared.

It was only after the departure of these two battalions, that the extent to which marriage without leave prevailed, became known. In a few weeks, the poor creatures, being left utterly destitute, crept forth from their miserable dens, and made their wants known to the commanding officers. Most of them had been married before their husbands enlisted; but this fact had been concealed by the latter when attested, as otherwise they would have been rejected. A fund was immediately formed by the officers, for the relief of such cases, and one or two sergeants told off, to visit the most necessitous, and to report as to their condition. One poor creature was found living in a wretched garret in a low lane in the Borough. The room was so small that there was scarcely room to turn in it: most of the panes of glass in the window were broken and patched up with paper. Three persons had died in the house of typhus fever in the course of a week. Her own child was labouring under an attack of scarlatina and suffering from an abscess in the throat. She had nothing to eat, and every available article of clothing and furniture had been pawned. She stuck to the house, though death was busy around her, because she could not find a room anywhere else for 1s. 6d. a week. She had formerly earned a few shillings a week as a bottle-washer in an export house in the City engaged in the American trade, but, owing to the war, they had reduced their hands, and she had been dismissed.—All her debts were paid, her clothing and furniture redeemed, and she herself put in a position to earn a livelihood.

Another case was that of a middle-aged Scotchwoman, the mother of three children. Her husband had been earning £3 a-week, but gave himself up to habits of intemperance, lost his situation, and enlisted as a soldier in the Guards. It was not known that he was married till after he had left for Canada. One morning another Scotchwoman, a soldier's wife, called upon me and said that Mrs. F. had just been confined, and had no money or friend in London except herself. I obtained her address, and hurried off to the place, which was near the Abbey. Few people, alas! know the amount of misery that lies almost within the shadow of the venerable towers of Windsor Castle and West-

* Since this was written, sewing-machines have been introduced into the Pimlico Establishment, and all the work is done on the premises. This is felt to be a hardship by those married women who cannot leave their homes.

minster Abbey. It was such a street as no respectable person would like to be seen in by day or by night. I soon found myself surrounded by a crowd of thieves and prostitutes, when the happy idea occurred to me to tell them, who I was and what I wanted. Their manner and bearing changed at once, and some of them proffered their assistance, but I was not sorry when a policeman, with whose aid I discovered the place, made his appearance. I deem it better to draw a veil over the rest, but, on inquiry, I found that the woman and her child would both have perished, if the other soldier's wife had not provided her with blankets from her own bed, shared her rations and her money with her, and waited upon her during her confinement. The sympathy of these poor creatures with one another always assumes a practical shape, and is often most touching. Their kindness and tenderness to one another would melt the heart of a misanthrope, and teach the most cynical "mild humanity." If a Saturday Reviewer witnessed such scenes it would take half the gall from his pen in writing his next review. The soldiers themselves though made of sterner stuff, and with little to spare, often club their coppers together to relieve an urgent case of distress, and all the Guards, officers and men, have recently given a day's pay to the Lancashire weavers.

The woman to whom we allude, besides other assistance, obtained relief from the Lying-in charity, a fund bequeathed by a lady (her name is unknown to me, but her memory is blessed) for the benefit of soldiers' wives, and managed by the hospital sergeant of each regiment in London. Its benefits are usually confined to those married with full or weekly leave, but by a generous interpretation, in this case as in others, they were extended to the outsiders. They receive tea, sugar, baby-linen, &c., to the value of £1 5s., and are moreover entitled to medical attendance and medical comforts.

We have often been struck with the tenderness which these women display towards their husbands when sick or dying; though the future that awaits them, when the bread-winner is removed, be dark and gloomy, no word of complaint or despondency ever escapes from them; they feign a cheerfulness which they do not feel, that their husbands' last hours may not be troubled, and use the language of hope and faith, when the latter allude to the subject. We have just left the deathbed of a pay-sergeant, one of the most intelligent and best conducted non-commissioned officers we have ever known; in a few months he would have completed twenty-one years of service, and been entitled to a pension of 2s. a-day; as it is, his wife and five children will receive nothing from government.* The woman was quite aware of this, and spoke to her husband as cheerfully of the future, as if he had left her a rich jointure, though we have some-

times seen her turn away to weep in secret. We have all heard how our soldiers fought on the battle-fields of India and the Crimea; few know how their widows have to fight in the back slums of Westminster. It must be a desperate struggle, almost as desperate as the fatal charge at Balaclava, to fight unnoticed and unknown against such inexorable foes as hunger, disease, and death; for the shadows of all these enemies are darkening the vision of the widow, as she hears the last volley fired over her husband's grave, and sees the last wreath of smoke curling away in the distance. The Dead March in Saul and the death of a comrade are soon forgotten; the band strikes up its liveliest air, and the poor widow creeps back to her garret to weep for him, who will never march again till he hears the last *réveil*.

But there are some of these men who, though dead, still live in the affectionate remembrance of their comrades. Of the number of these is the late pay-sergeant Cosmo Gordon, of the Scots Fusilier Guards, a native of the Cabrach in Banffshire. He was the son of an officer, and deserved to have been an officer himself; he was the tallest, strongest, bravest man in the regiment. "His arm, sir," said an old soldier the other day, "was like a shoulder of mutton, and he had the strength of ten men. At the battle of Inkerman, he climbed a wall as we were charging up the hill, and stood on the top of it exposed to the fire of the enemy, till he had pulled the last man of his company up." "And then?" "And then he fell down dead with several balls in his body." We have seen the kind letters which the officers of his Company wrote to his widow; and what was still more interesting, we have seen the *moustaches grises* of the regiment gather round his two boys, at the Wellington Chapel, pat them fondly on the back, and point them out proudly to us: "Their father was a brave man, sir, one of the bravest of those who fell in the East." These old fellows felt that the boys were in some measure their own property, or, at least, that they had a vested interest in them. Both of these boys were educated in the Caledonian Asylum, a noble institution of which Scotland has reason to be proud, and their mother has also been provided for.

Nor is Robert Bruce, the gentle, the tender-hearted, the Christian soldier, forgotten. There was not a rough in all the regiment but loved Bruce, and respected his consistent piety. His wife was one of the four women belonging to the Guards who weathered the whole Crimean campaign, and returned in safety to England. A mite of a woman, whom a strong wind might have blown away, and yet with the heart of a lioness protecting her young, she watched over her husband in every danger, and received his last breath in the Vauxhall Hospital. "God has blessed you with a good wife, Robert," we said, a few minutes before his death. He put his arm round her neck, raised himself slightly on his pillow, and looked up in her face with ineffable tenderness. "No man ever had a better, sir; no-

* An effort is being made to get one of his children admitted into the Royal Caledonian Asylum.

one knows what she has been to me, or all that she has done for me. Once when I was in the trenches she braved all the bullets of the enemy to bring me a bottle of porter. She has often—"but here the poor fellow was stopped by a fit of coughing, which left him so weak that he never spoke again, but, as long as his soul was in his body, his eye was never turned aside from his wife's face. That look of love he carried with him into the other world, and she will know him by it when they meet again.

Enough has been said to show that soldiers' wives are not the disreputable class which many suppose them to be, and perhaps to enlist a little sympathy in their favour. It may seem a hardship at first sight that so few soldiers are permitted to marry, but we are convinced that this restriction, as matters at present stand, is the means of preventing a far greater amount of suffering. A share in the washing of the company is the chief privilege which their wives enjoy at present, and if this privilege were extended to a larger number, it would diminish its value. And, after all, the hardship is more apparent than real. The soldier knows, or ought to know, when he enlists, that he will have to wait his turn before he can marry, and if he objects to this arrangement he need not enter the army at all. Moreover, the same hardship exists among classes far superior to the soldier in social rank. Few lawyers, doctors, or clergymen are in a position to marry before they are thirty years of age. The average age of our soldiers when they enter the army is eighteen, and they can always receive permission to marry before they have been ten years in the service, or return to civil life at the end of that period. A much more real and substantial grievance is this, that while the widows of commissioned officers, who have completed ten years' service, receive a pension equal to one-fourth of their husbands' full pay, the widows of non-commissioned officers and privates receive nothing at all. It would be a great boon to a poor woman, struggling with poverty, to receive 6*d.* or even 3*d.* a day.

Much good might be done by the establishment of a female agency to visit these women, few of whom, we are sorry to say, attend any place of worship. For obvious reasons, officers' wives, however anxious to do so, could not venture into the miserable and dangerous localities which they inhabit, but a few Bible women or Female Scripture Readers might be appointed to visit them, and to bring the worst cases of distress under the notice of the Chaplains or a Relief Committee. These poor creatures suffer in silence and give no sign; there is no friendly press to advocate their cause, and to call forth the sympathy of the public, so that they are often left without bread, while the nation is rejoicing in the victories achieved by their husbands' bravery.

Something also might be done to improve the lodgings occupied by married soldiers. So long as

the married soldier in London receives 1*s.* 2*d.* a week from Government as lodging-money, and pays 3*s.* for such wretched accommodation as we have already described, he cannot provide sufficient or wholesome food for himself, his wife and children; and we have known cases where the husband was struck down by fever, through starving himself, that his wife and children might eat. Such things ought not to be, and the greatest boon which could be conferred on married soldiers and their wives, would be to withdraw the allowance for lodging-money, and to erect three or four model lodging-houses, similar to the one in the Vauxhall Road. It is not one of the finest, but it is certainly one of the most useful buildings in London. It was built by subscription, and Albert the Good was one of those who contributed most liberally, and ever took a warm interest in its success. It provides accommodation for fifty married soldiers, their wives and children; each family is provided with two rooms, with a separate entrance, so as to ensure as much privacy as if each compartment were a distinct house. The rooms are supplied with every convenience for cooking and washing, and are far more comfortable than the single apartments allotted to the pay-sergeants in all the barracks in London, except St. George's, where they have two. The whole establishment is under the care of a Barrack Sergeant, whose duty it is to see that the regulations established to secure cleanliness and proper ventilation are duly observed. There is also an excellent school for the education of the children in this Model Lodging House, which is worthy of its name.

At first the married soldiers had to pay 3*s.* a week for their two rooms, and as only a limited number of applicants could be received, the preference was given to those who had been longest married. About two years ago, the government, acting under the advice of the late Lord Herbert, that noble-hearted Christian gentleman, who died too soon for his country though not for himself, purchased the building from the subscribers, and threw it open, free of any charge, to the oldest married soldiers. Seven married soldiers from each of the seven battalions of the Foot Guards were provided with lodging and fuel at the expense of the government, and now that the wives and children of the two battalions in Canada have been sent out to them, there are ten soldiers' families from each of the five remaining battalions in the Model Lodging House. No political economist could object to this expenditure of the public money; it encourages good conduct, teaches habits of self-respect, improves the health of our soldiers, and elevates their families in the social scale. At no distant period we hope to see four or five of these Model Lodging Houses in London, and others also erected in the garrison towns where our troops are stationed.

P. C. B.

CHRISTIAN GOTTLOB BARTH.

No more welcome utterer of good words has lived among men than Christian Barth. Before his death he might have presented his guests with the 175th edition of his first book ; he might have given them ample choice of language, for it was printed in half the languages of the globe ; but for his modesty, he might have informed them that his works circulated by the million. Other statistics that reach us are on the same scale. His correspondents included about a thousand missionaries ; he carried on four mission-journals at the same time ; he wrote the most popular of religious stories ; he worked out a Society which is to Germany what *The Religious Tract Society* is to us. With all this he was a genuine man, sincere, simple, unpretending ; a man who, for what he did and what he was, demands some memorial, and the more, as there was little extraordinary about him, save his work, to raise him much above other men. The biography of splendid genius is often chilly and disheartening ; pleasant to read—impossible, if not unnatural, to follow. It is helpful to learn the story of some average man, and how, by exercise of some quality not beyond common reach, he placed himself above the average ; helpful above all when his quality is rather Christian consecration and earnestness, than any one gift or prominence of character.

Barth was born at Stuttgart, in the last year of last century, of humble but devout parents. His father, a painter by trade, belonged to one of those small circles of pious Christian folk that abound in Württemberg. For Württemberg is the religious heart of South Germany, as the Wupperthal is of the North ; and the Württembergers are marked by a certain very warm and impulsive piety not always within the strictness or control of the Church. For, indeed, it is this warmth and force of religious life there which nourishes, and to some extent forms the Church, and produces a freer church-life than elsewhere ; a life sustained more by the communion of saints than the orthodoxy of creeds and ecclesiastical order. The people have their own meetings, unite by mere sympathy of Christian brotherhood, study the Bible for themselves ; and these little groups are thickly scattered over the country, and are so many sources of Christian influence, and a pleasant sign in any Christian land. But not without dangers and drawbacks, and many party differences on minute points, and singular small heresies and hobbies, like that of Mr. Hoffmann for the rebuilding of Jerusalem ; just such aberrations and divisions as are associated with the history of Pietism, and prove it, for all its attractiveness, to be one-sided, and to need the definiteness of the Church.

To one of these pious circles the elder Barth had attached himself, and from schoolmaster Gundert and others his son (left early fatherless) heard

an excellent report, and grew up with the dear memory of a Christian father. His mother is described as a woman of great force of character and even majesty, and graceful in her true simplicity ; a woman of the temper of good Monica, and of many prayers and tears for her children. Thus, in pious atmosphere and a happy home, young Barth grew up, and even at eleven was a lad of great promise. In the gymnasium he was painter, musician, poet ; and wrote political ballads during the stirring close of the European war, but merely, it would seem, to work off some natural effervescence, for almost immediately there followed grave hexameters on Jung Stilling, whom he had visited, and who left on him, as on most earnest men of the time, a profound impression. Till his death it was his habit to read Stilling's *Homelongings* once a year. At Tübingen he had the reputation of a brilliant student, of humour, quickness, and thorough earnestness. He joined a set of afterwards eminent men, almost exclusively Pietists, Passavant, Hoffacker, Roos, Burk, and others, to whom he was a perpetual marvel and uneasiness, as not knowing whether his restlessness and genius might lead him. He chose for his motto *Odi tranquillitatem* ; studied classics and philosophy ; read hard in the Talmud ; painted his friends ; taught ; wrote pamphlets ; preached occasionally. His pamphlets were successful ; people flocked to hear his sermons ; yet his friends were still uneasy, his mother more than all. He was unsettled, would be a missionary at one time, then a pastor, then a writer. She longed to see him enter with more consecration on the duties of a minister. She criticised his sermons ; told him it was a mercy he ever got through them. She put down his pamphlets as much as others put them up ; "don't believe those who flatter you," she would say, "but kneel down and ask forgiveness for all your sins." Barth stoutly maintained his views even in the face of such counsel, and proved that there was less vanity than she dreaded, more truth than she hoped. Still he found afterwards that there was much truth in hers ; and faithfully and unshrinkingly she dealt out her counsel, and rejoiced in secret over any sign of his spiritual progress. He left the university with the testimony of *Fallen away into the errors of mysticism*, and entered at once into close intercourse with Pietists of every school. After two or three curacies, he was appointed pastor of Möttingen in the Black Forest, and commenced the work of his life.

One leading thought of his was the unity of Christians ; a prevalent thought with the genuine mystic—more prevalent in Barth's early days from the necessity for true Christians of every type working heartily together. His friends were chosen in no narrow circle. Their aspirations, the aspirations of most pious men then, were the same ; strong

sectional barriers in the Church were ignored, Christ only was sought. Even Roman Catholics dropped their exclusiveness for the sake of Christian union. In the north Protestants and Romanists met at the table of Princess Galitzin; in the south Gossner and Bois were welcome guests in Christian circles; the Romanist Van Ess took Barth's place at a missionary society. For the mission in Germany sunk its confessional element in its origin; it rose out of the free intercourse and zeal of private Christians: it offered a meeting point and common sphere of work for those who lamented the carelessness of the churches as well as for those who longed to forget church differences in the love of God. It was natural that the mission should take its strongest hold upon Barth; that his sermons should be touched with it; that he should seek content with missionary workers. Its breadth, and union, and downright earnestness were irresistibly attractive. Wherever he was he founded some missionary society; and at last altogether withdrew from the pastorate to work out the cause of missions at Calw. His pastorate was faithful, and a blessing that was long thankfully remembered in the parish. But it was not as pastor God had chosen him. To increase the interest in missions he proposed adding a new periodical to the only one then existing. The friends at Basel laughed at the notion. He matured it, and in January, 1828, there appeared the first number of the Calwer Missionary Journal, a paper which speedily rose to a large circulation. Three other mission periodicals were added by him and carried on simultaneously, each addressing itself to a special class of readers. The income, which grew to be considerable, was his donation to the Basel Society. By the interest of his papers he mainly fought the battle of missions. From being scorned and few, he lived to see them honoured and wide-spread. And Gossner's name was not oftener nor kindlier spoken than Christian Barth's. What the man himself was like at this time and afterwards, what impression he made, cannot be better told than in a letter which I have received from a friend who was also his friend:—

“I visited Dr. Barth in the winter of 1851. Having reached his door by an eilwagen long after sunset, and left it next morning before dawn, I have no knowledge of the town of Calw or its neighbourhood. Amidst the darkness which in memory broods over that district of the Black Forest, the only luminous spot is Dr. Barth's room, with his own glowing countenance as its sun, radiating ‘godliness, brotherly kindness, and charity.’

“The feature of that house of his which survives every other minor impression made by it, was its singular missionary character. One felt as if in some centre of telegraphic communication with all the missions of the world, and that the Doctor had only to touch some mysterious wire and ascertain what was doing in Otaheite or Sumatra, Greenland or New Zealand. When I entered his

study, I found a comfortable table spread for me, but it was all redolent of missions. I was welcomed with a glass of wine sent by missionaries from Lebanon; helped to reindeer tongue sent by missionaries from Greenland; and to honey gathered by the bees of Bethlehem. My footstool was a stuffed panther, the original stuffing having been made by Gobat in Abyssinia. The room in which we sat was hung with large mission maps. Primitive working clocks were ticking from its walls, which had been made and presented to him by Moravians, and they were set so as to tell the time at Jerusalem, New York, Otaheite, and Peking. ‘Ah! see now,’ Barth would say, pointing to one of them somewhere or other during the night, ‘the sun is setting just now to the missionaries in Jerusalem;’ or, ‘It is wakening them up in Sumatra.’ On his desk were mementos of names ‘familiar as household words’ in the Church, such as Oberlin, Neff, &c. In another room he had an interesting missionary museum, full of minerals, coins, dresses, arms, models of houses, ever illustrative of the natural history, manners, and customs of the inhabitants of those lands in which missionaries laboured. Letters had come in that evening, as I presume they had come in every evening for years, from different missionaries, telling him, as if to a Pope or General of an ‘Order,’ all they were doing, and asking his counsel. We sat up until it struck three in the morning, and never did I spend a more delightful night. He was so full of information, so genial and frank, with so much freshness and humour, and so thoroughly sincere, truthful, and godly, that it did good to heart and head to gaze on those full hazel eyes, twinkling through the large spectacles, with the broad forehead above, and the brown hair which strewed down on each side of the full cheeks, with the large knotted white neckcloth that supported the broad chin. I felt as if talking to some mediæval portrait that had walked out of a picture frame. The only thing one saw in the living man, which has never, as far as I know, been pictured in the portrait of a clergyman, was a cigar, which either lasted for hours, or was a successor or predecessor of similar luminaries.

“When at length I retired to my room, to snatch a little rest ere resuming my winter journey, I found every inch of its walls covered with engravings of the clergy of all lands—a large, interesting, and most powerful Evangelical Alliance. The likenesses seemed taken from every available quarter, books having evidently afforded a considerable number of them. The Doctor called them his ‘cloud of witnesses.’

“I need not trouble you with any part of our conversation that night, which was wholly on the work of the Christian Church. . . . I shall ever retain a most affectionate remembrance of him, as one of the simplest, purest, best, and most interesting men whom I have ever had the happiness of meeting or the high privilege of knowing.”

How in this quiet forest village he grew to be a man of fame in the broad world; how visitors came to him from every part of Europe, missionaries from every corner of heathenism, a Russian princess one day, a native preacher from India the next; how he wrote wonderful tales for children, and Bible stories that have been translated into fifty languages, and all manner of histories, and even an edition of the Bible of no little notoriety; how his publishing office at Calw grew into importance, and furnished half the juvenile Christian books of Germany; how he received crosses and ribbons from almost every sovereign of Europe, and quietly put them away in his drawer; how he did the same by university honours, and the like, that crowded on him: this and the rest will no doubt be one day related. Through all, his character remained unchanged—his freshness, naïveté, homeliness, and strong individuality. To the last he held a free position in the Church, and sought his early ideal

of union. To the last, he was singular in some of his views, entertaining some theological speculations with which the Church has little sympathy. But to the last, also, the love of Christ sustained him, filled his heart with life, and peace, and brotherly love; and none that loved Christ could resist the infection of his sympathy. On a November day of last year, a modest funeral wound up from the picturesque Calw,—up, and over the rough forest-paths, over the dead red leaves, and under the silent pines; and through every hamlet that they passed the mourners chanted funeral psalms, and the villagers came out to meet them, and stood with bared head bent in prayer as the train passed by, until at last they came to Möttlingen. And there, in his old cure, beside his faithful mother, they laid the good man to his rest. Other men will fill a larger space in the eye of the world, but Christian Gottlob Barth will always have a large place in the story of God's kingdom.

S. W.

NOT ABOVE HIS BUSINESS.

THOSE who are very familiar with the old town of Greenwich, particularly with that most ancient portion which lies off the High Street towards the river, may probably have noticed a little barber's shop distinguished by the usual outward signs of the barber's trade, and the inscription, "Hackblock: established 1750." The top part of this house is built of wood—of black tarred planks which would be like the side of a ship, if they were not as frail-looking as an egg-chest. The shop part is very low, and is entered by a sunken narrow doorway at the bottom of two well-worn stone steps. The outside of this house might be considered rather repulsive by people who are fond of new brickwork and stucco, but the inside leaves nothing to be desired in neatness and cleanliness. The roof, of course, is low, the floor has a downhill tendency towards the fireplace; the looking-glass over the mantel-shelf is of that quality which makes the human face look as muddy as a bad photograph; but the floor is always well sanded, the towels are spotless, and those who keep the shop are evidently devoted to their business. They are a father and son, and though the bulk of the work falls on the younger of the two, the elder does all he can to help, and they evidently live very comfortably together. The father is a little, thin man, nearly eighty years of age, always dressed in drab knee-breeches, with very white stockings, and wearing an apron, and a waistcoat with black sleeves. His hair is very scanty and white, but it is made the most of by judicious brushing and combing, and the son, though a young man about thirty-eight, and careful about his appearance, hardly looks as thoroughly healthy and fresh as his father. Both are what are popularly called well-spoken persons, that is persons

who have had some little education in their youth, which has clung to them in after life; and they are consequently free from the flippancy which is so general amongst common barbers.

Anybody who entered the shaving-shop of the Hackblocks, father and son, for the first time, might suppose that the calm life within had gone on for years without any break or hindrance; that the son was a young man without impulse or ambition, who had always been tied to his father's apron-strings, and was content with an apparently stagnant existence. To those who are drunk with the romance of self-help, who believe that to wander is to thrive, that every boy can become at will a Lord Mayor, or a Lord Chancellor, this contentment of young Hackblock must appear very mean and degrading. Young Hackblock, however, would not be fairly judged by such observers, though his youthful ambition, fed by a restless uncle, an old Greenwich pensioner, was not much to be proud of, if estimated by results.

Commonplace as this old barber's shop and their keepers look, still they have their story, to tell which—and we think it is worth telling—we must go back nearly ten years.

Early in the year 1853, on a cold spring morning, old Hackblock entered his shop, the same shop we have just been describing, rather dejected in appearance. He was then ten years younger than he is now, but he looked quite as old, and more careworn. His niece, Fanny Hackblock, was in the shop when he entered, dusting the scanty furniture, and arranging the old-fashioned shaving-chair with its crutch-like back, for the day's business. Fanny's father, old Hackblock's brother, was a Greenwich pensioner, and Fanny, though she

attended to her uncle as much as possible, got her living in the town as a bonnet-maker. She was a young woman about eight-and-twenty, not what is called pretty, and very plainly dressed.

"Good morning, uncle," said Fanny, as old Hackblock entered.

"Ah, Fanny," said old Hackblock, with a slight air of abstraction, "making the old place tidy, as usual? No customers have been in to be shaved?"

"No, uncle," returned Fanny, "or I should have called you."

"They never do come on a Wednesday," said old Hackblock. "I might as well shut the shop up on that day, if it wasn't for cutting children's hair in the afternoon, because it's half-holiday at the schools."

"I see that father was here yesterday," continued Fanny, "by the mess the stove was in with tobacco-ashes. I wish you wouldn't let him smoke so much; I'm sure it isn't good for him."

"He does as he chooses, Fanny; just as he chooses. Though I'm his elder brother, I don't like to stint him in his pipe, because they're rather strict up at Greenwich Hospital yonder; but I'll never forgive him for causing my Harry, my poor boy, to run away, by his wild yarns about glory, adventures, and foreign countries."

"Let bygones be bygones, uncle," said Fanny, persuasively.

"That's the way with relations," continued old Hackblock, partly to himself; "they always interfere with your family affairs, always know better what to do with your children than you do yourself."

"Father thought he was doing all for the best."

"It was cruel, very cruel; just as the boy was nearly ready to take my place, and handled his razor so cleverly."

"Cousin Harry was quite as much to blame for going as father was for persuading him to go, when he knew you were almost alone in the world."

"There's the pinch, Fanny, there's the pinch," continued old Hackblock, this time addressing his remarks to his niece. "Perhaps I ought to be glad that he had the spirit to go, but I'm not. When *she* dropped off, the mother of them all, and they all followed her except him, I certainly hoped to keep him near me. It may have been a weak, womanish feeling, but I couldn't help it."

"Of course not," replied Fanny, sympathising with her uncle's evident emotion.

"And then the business, too," continued the old man; "it requires a young, steady hand to keep it together. I sometimes think that it's going, slipping through my old fingers."

"Oh, no, uncle," returned Fanny; "that's impossible. You've been established too long to lose your customers. People don't forget those who've served them for fifty years."

"Fifty years?" exclaimed old Hackblock, in a tone of petulant pride. "More than that, Fanny; more than that. A hundred years at least, if you count the time my father had it before me."

"Of course; I'd forgotten that, which makes it all the better."

"I wish I could think so," continued old Hackblock, in a desponding manner, as he fetched a razor from a side-table, and stropped it slowly on a strop; "I wish I could think so; but my hand is sometimes very shaky, and people are so nervous about razors."

"Oh, no, they're not, uncle," said Fanny, trying to re-assure him. "I heard old Mr. Jones, the baker, say, the other day, that he'd rather be shaved by you in the dark, than by all the chattering shopmen at the new hair-cutting 'saloon,' as they call it, in the High-street, by broad daylight."

"Ah, that's because I know all his pimples."

"Oh, no, uncle! I've heard others say the same who've got no pimples."

"Have you, Fanny?" said old Hackblock, brightening up a little. "Well, well, I know my business thoroughly, and that goes a long way. Half your barbers now-a-days who call themselves *professors* ought no more to be trusted with a chin or a head of hair than with a rowing-boat on the Thames. I don't care what a man's trade may be, but I do like him to learn it thoroughly and to take a pride in it."

Old Hackblock, at this point of the conversation, sat down in the shaving-chair, continuing his task of stropping the razor, and at the same moment his brother, Boatswain Hackblock, the old Greenwich pensioner, entered the shop. Boatswain Hackblock was about five years younger than the barber, much stouter and stronger, with a red face, bushy eyebrows, and a very obstinate expression. His dress was the ordinary Greenwich pensioner's dress, he had a wooden leg of the old clumsy make to supply the place of a lost right limb; and to compensate him for this disfigurement, two medals, hanging by ribbons, glittered on his breast.

"Halloo, my hearties," roared out the boatswain, as he stumped heavily into the little shop, making the fire-irons tremble in the fender; "what cheer?"

"For goodness' sake, father," said Fanny, going up to him, "don't be quite so boisterous: you alarm the neighbourhood, and uncle's got his living to get!"

"Ay, ay," returned the old pensioner, a little softened; "give us a pipe of tobacco, and I'll bring myself to an anchor."

Fanny looked towards her uncle when she heard this request. Old Hackblock nodded his head, and then Fanny went to a jar in the window, from which she took what her father asked for.

"Don't make the stove in such a mess as you did yesterday," said Fanny, as she gave the tobacco to her father; "it took me half-an-hour to clean it this morning, and I shall have to fetch the time up at my bonnet-work."

"Oh, shiver the work," returned the old pensioner; "I believe, if the Hackblocks had their rights, they'd be riding in their carriages like admirals."

"Well, father," said Fanny, putting on her

bonnet and shawl, "when you've got a fortune to give me, I'll be a fine lady; but till that time comes I must grub on in the old hard-working way."

When Fanny had delivered this speech, she ran off to her work at the bonnet-maker's in the town, leaving her father and uncle together. The old pensioner prepared to enjoy himself with his pipe, while old Hackblock seemed to have sunk back into his former melancholy.

"Do you know what day this is?" said old Hackblock, addressing his brother, and stropping the razor slowly.

"I never keep any log, now," returned the old pensioner, through puffs of smoke, "and only remember the days when my pension becomes due, and the big-wigs come down to inspect us at the Hospital."

"Ah, it must be very pleasant to have such a bad memory, Jack," continued the old barber.

"What tack are you on now, Harry?" asked the old pensioner.

"This is the day on which *he* went away, exactly fourteen years ago; stole off in the night like a thief, without thinking of anybody but himself."

"Don't drag up that story: the boy thought it was all for the best."

"Of course *you* say so. If you hadn't filled his head with dreams about prize-money, glory, and Trafalgar, he might now have been a well-to-do barber."

"Of course he might," retorted the old pensioner, getting excited; "or a well-to-do tailor, or a bonnet-builder, like my girl,—or—*or*—or any other landlubber."

The delivery of this speech, far from calming the old pensioner, seemed to excite him still more, and he stamped about the room with his wooden leg in a way that endangered the rather tender flooring.

"Now do be careful, Jack," exclaimed the old barber, anxiously, "with that wooden leg of yours: you're not dibbling a potato-field. I can't afford to pay another pound this quarter to mend the holes which you make in the floor."

"Ay, ay," returned the old pensioner, becoming a little quieter. "You're all very well, Harry, but you've got no pride."

"What good's my boy done by his pride, or rather your pride, which you put into him? He ran away from steady, honest work, became a private soldier, was ordered about for years from station to station like a dog, wrote home just when he wanted a little money, and now Heaven only knows whether he's alive or dead."

"That's because he went into the wrong service. I didn't want him to become a soldier, did I? If he'd not been cross-grained, and had listened to me, he'd have been a chief-mate by this time, perhaps a captain."

"Not he: it's not in the family."

"Oh, isn't it?" returned the old pensioner, with great self-importance, displaying the two medals on his breast rather ostentatiously.

"Ah," said the old barber, rather sadly, "it's not the first time, by a good many, that I've seen those medals, and heard of them, too. It's my belief the sight of their glitter helped to make the boy discontented."

"If you can't understand what glory is, Harry, that's not my fault; I can."

"Especially when your wooden leg goes through my floor, and you bawl to me to pull you out."

"You wouldn't have me wear these medals for nothing, would you?—walking about like a beadle who's never earned his ribbons? You know you're as proud of the bits of metal as I am, and, if not, you ought to be."

"Perhaps I am, Jack," replied the old barber, a little softened. "Perhaps I am."

"They're no disgrace, are they?"

"No, no," said the old barber, pettishly; "but one hero's quite enough in the family."

"Yes," retorted the old pensioner, "and so's one barber—more than enough."

"I take it very unkindly of you, Jack," said old Hackblock, "coming here and taunting me about my business. I've never disgraced the family in it, have I? It's what our father got his living at before us."

"I can't stomach it, Harry; it isn't manly. I can't bear to see a brother of mine compelled to take every scrubby fellow by the nose who pays him a penny to do so. Why, when I was in active service—"

"There," interposed old Hackblock, stopping his brother's words, "I don't want to hear any slaughter-house yarns. You'd have done your duty."

"Of course I should."

"And I'm doing mine. I only want to be left alone to do it. You've driven one member of the family out of the business—perhaps to die amongst strangers—be content with that."

"Well, come, Harry," said the old pensioner, after a slight pause, and in a softened manner, "don't let you and I be at sixes and sevens. There's plenty of people to quarrel with without two brothers going at it tooth and nail. Give us a bit more tobacco."

"You know where to find it," returned the old barber; adding, to himself, "you smoke all my little profit away on that article."

Boatswain Hackblock went to the window, helped himself out of the jar, and re-filled his pipe. After this he came towards his brother.

"Harry," he said; "it wants six weeks to quarter-day."

"I'm glad to hear it, Jack," returned the old barber.

"That's because you've got to pay instead of to receive, Harry: I think I must get you to let me have another half-a-crown to keep me afloat till then."

"Afloat in grog, you mean."

"No, no," returned the old pensioner, apologetically.

Old Hackblock gave his brother the money, after a pause, but with a remark about barber's work not being quite as profitable as it used to be.

"You'd better make it a crown," said the old pensioner, "and then I shan't have to ask you again."

This second request was complied with, though not with a very good grace. Old Hackblock had not the firmness to say no, and yet he always felt irritated after he had given the money—for it was generally a gift in the name of a loan. To avoid more bickering on this occasion, he put on his hat to go out to shave a customer, asking his brother to mind the shop.

"I'll do my best, Harry," said the old pensioner, in answer to this request, "though it's not exactly in my way."

When old Hackblock had gone out, the old boatswain settled down over the fire with his pipe and a newspaper. It was the period when the Crimean war was at its height, to the great delight of the old pensioner. He had waited so long for a good war, as he called it, since the great French war in which he was engaged, that he began to think the art of fighting was lost for ever. The fact that the English were fighting side by side with the French, instead of against them, seemed to puzzle him a little, but he solved the difficulty by supposing that it was all for the best. Of course he retained his old prejudices, and called the French "Mounseers;" but in this he was not far behind many better-educated persons who now called them "Mossoos." Like all obstinate, self-willed people, he never liked to admit, even to himself, that he had made a mistake, and, therefore, he persisted in believing that his nephew, young Harry Hackblock, was alive, well, and prosperous, though the runaway had not been heard of for several years. The last that had been heard of him was from the Cape of Good Hope, where he had been sent with his regiment from the West Indies to quell a disturbance amongst the Kaffirs. From the Cape his regiment had been sent to the Crimea, at the outbreak of the war; and though there was no evidence to show that he went with it, old boatswain Hackblock was determined to regard him as alive and in the thick of the battle.

"He *must* be alive," said the old pensioner, as he pored over the warlike news in the paper, "and *must* be doing great things, for he's got more of my spirit in him than his father's. He was never cut for a barber; oh, no; and he'll turn up some day to prove that I was right, as I always knew I was from the first."

Judgments formed on much surer grounds than those which seemed to satisfy the old pensioner have been proved to be false before now in the most striking manner, and we can, therefore, hardly feel surprised that at that moment the person old boatswain Hackblock was talking and thinking about appeared in the low doorway. His dress looked rather shabby and travel-stained, with

nothing like military stiffness about it, and in stepping suddenly into the shop he made an odd hat look even worse by crushing it against the door-sill. He was fourteen years of age when he left home, and twenty-eight when he returned, and had forgotten, for the moment, that he had grown two feet higher in his wanderings.

"Everything seems very small," he said to himself, looking round; "the streets seem narrow, the distances short, the houses low. Most things have changed very much: I wonder whether father has changed with them."

Young Harry Hackblock, like all persons returning home after an absence of many years, seemed to have acquired a sudden delicacy of feeling. He felt that his father, whom he knew to be alive, from inquiries he had made in the town, must be getting old and feeble, and that it would hardly be kind to show himself too suddenly. Trusting to the disguise of a dense brown beard, which he had suffered to grow during his travels, and also to the change in his growth and appearance, he resolved to play the part of an ordinary customer for half-an-hour. He was curious to hear what his father really thought of his conduct in running away, and he was candid enough to admit to himself that he deserved very little tenderness.

He had no sooner entered the little shop in the manner we have described, than he observed old boatswain Hackblock reading the newspaper.

"I do believe that old Greenwich pensioner is my uncle," he said to himself, "and he's sitting, as usual, by father's fire. I don't think he's altogether a humbug, but he deceived me nicely with his yarns about glory."

Knowing his uncle's chief weakness, young Hackblock shouted out "shop," very loudly.

"Sir!" said the old boatswain, leaping in his seat, and turning round suddenly.

"Shop!" repeated young Hackblock, with marked emphasis.

"What d'ye come in without knocking for?" asked the old pensioner, indignantly.

"We never knock at *shops*," returned young Hackblock.

"I don't know anything about shops; what d'ye want?"

"A barber, of course."

"You'd better call another time. My brother (hem), Mr. Hackblock, is out."

"No, I shan't; I shall wait."

"Very well, sir, wait."

When boatswain Hackblock had finished his part in this dialogue, he turned round rather sulkily to read his paper, sitting more closely than before over the fire, and leaving young Hackblock to do as he liked.

"A good guard to leave in charge of a shop," said the disguised nephew to himself, "if you want to drive all the customers away. Ah," he continued, looking round the shop, "I suppose that's the old block on which I used to dress wigs, and

that's the old strap on which I used to sharpen razors. I might have learnt a worse trade than that, though I didn't think so at one time."

The mummings of the young man appeared to disturb the old pensioner, and it is possible that another altercation would have ensued, if Fanny Hackblock had not entered at that moment. She had a large bonnet-box in her hand, which she placed on a side-table near the fireplace; and as young Hackblock was seated in the old, deep shaving-chair, she did not notice him for a minute or two.

"There," she said, audibly, taking off her bonnet and shawl, "I've brought as much work as I shall be able to get through this afternoon; and then, as it's a slack day with uncle, I can mind the shop while he takes a walk—I'm sure he wants it."

By this time she had observed young Hackblock, though without recognising him, and she apologised for her uncle's absence, saying that he would be back in a few minutes.

"That must be my cousin Fanny, then," said young Hackblock to himself; "I'm sure I shouldn't have known her if I'd met her in the street. She's more improved than her father has. His wooden leg's the only thing about him that's not altered for the worse; but that, perhaps, is a new one."

Young Hackblock's further reflections were here interrupted by the entrance of his father, who looked as if something had just occurred to annoy him.

"Fanny," said the old man, rather sadly, beckoning his niece towards him, and not seeming to notice any one else, "you told me something this morning about old Mr. Jones, the baker."

"Yes, uncle," replied Fanny; "about his confidence in you."

"Was it true?" asked the old man, with a slight look of suspicion.

"Uncle!" returned Fanny, hurt and astonished, "you don't think I'd deceive you?"

"No—no."

"What's the matter?"

"He's gone over to the rival shop—the 'saloon,' as they call it."

"Oh, he'll soon get tired of that," said Fanny, in a re-assuring tone, though she inwardly hoped that some harm from careless shaving would happen to Mr. Jones's pimples.

"I suppose there's a good reason for it," said old Hackblock, resignedly; "I'm not so quick and certain as I was,—I can't be,—I can't be."

"Rubbish," replied Fanny, rather coarsely, but with a good intention; "I know the reason. They take more loaves at the 'saloon' than we do. He's been bought over by that."

"Very likely, Fanny," continued the old man, "we can't eat more bread than we do unless another mouth was present. We eat as much now as we can pay for."

Young Hackblock overheard this conversation, and it had a strong effect upon him. He was just about to rise from the chair, and declare who he

was, when he was checked by Fanny recalling the old barber to his business.

"You're forgetting a new customer, uncle," said Fanny, pointing to young Hackblock.

"I beg your pardon, sir," said the old man, addressing his son without knowing him, "but I've been rather put about. I'm not one who likes to neglect his business."

"I know that; I know that," replied young Hackblock.

Fanny went to the side-table and began her work, leaving the old barber to do his.

"Hair cut, or shaved, sir," said the old man, in a familiar, tradesmanlike tone.

"Well," returned young Hackblock, who had suddenly hit upon a plan for gradually making known who he was; "it may seem strange to you, but I want to get rid of this beard."

"Oh, no," returned old Hackblock; "not at all strange,—not at all. It seems stranger to me that anybody should wear such a load of hair."

"What!" shouted boatswain Hackblock, rousing himself, and looking round when he heard this,— "Wants his beard shaved off?—a full-grown beard shaved off? He'll want his head shaved next!"

Young Hackblock merely smiled at this petulant outburst; but old Hackblock, thinking his customer would be offended, felt very nervous, and Fanny, sharing in the same feeling, tried to quiet her father. The old barber fetched his razor and strop, and prepared his lather, and the old boatswain turned once more to his newspaper.

"No one seems to know me," said young Hackblock to himself, as if he felt rather disappointed; "surely my father will recollect me when my beard is shaved off? I can't have grown entirely out of remembrance?"

"Are you a stranger in Greenwich, sir?" asked old Hackblock, as he made his preparations.

"Oh, no!" returned young Hackblock. "I know it very well, though I've been away from it for a long time. It seems a good deal changed."

"Still it's a nice place; I don't know a nicer place," said old Hackblock, admiringly.

"Of course not, and why?" again interrupted boatswain Hackblock. "Because you've lived here, like a mushroom, all your life."

"I don't think that's any disgrace, father," said Fanny, defending her uncle.

"Nor I, either," said young Hackblock.

"I've not done as well as I might," replied the old barber, meekly; "but that's not altogether my fault. I know many rolling stones that haven't done much better."

"Ah, you may well say that," responded young Hackblock, with earnestness.

"Have you travelled much, sir?" inquired the old barber, as he stropped his razor.

"A good deal too much," was the answer.

"No one but a born landlubber can travel too much," exclaimed boatswain Hackblock, again aroused.

"I *am* a born landlubber," returned young Hackblock.

"I'm sorry to hear it."

Fanny and old Hackblock again got very nervous, and the old barber even offered to check his brother; but young Hackblock motioned him to take no notice of the interruption, and he returned to his task.

"Your hair's very grey, sir, for a young man, and rather bald, too," said the old barber, speaking the truth, though he was uttering the common jargon of his trade.

"I wouldn't advise you to say much about that," replied young Hackblock.

"Why not?"

"Because I had it of you."

The old boatswain joined in here again with a loud, mocking laugh.

"If it's one of my wigs," returned the old barber, with some pride, "I don't wonder that it deceived me. They were always thought to be more natural than the real hair."

"I know they were," replied young Hackblock, beginning to be sorry for his joke; "but my hair is not a wig. When I said it was yours, I meant that it grew up under your guidance. You used to dress it and cut it," he added, feelingly, "and take a pride in it as if it was your own."

"Yes," roared out boatswain Hackblock; "and soak it, as he does the whole of his customers, with dripping-pomatum. Ha, ha! I don't wonder that it turned grey. You were caught there, brother Harry, completely caught."

"You always know everybody's business, Jack, better than your own," exclaimed the old barber, this time with some spirit. "I'm not responsible for a head of hair after it leaves my shop, am I? My memory's not as good as it was; but I'm sure this gentleman"—alluding to his unrecognised son—"has not been here for some years."

"Twelve or fourteen years, at least," replied young Hackblock.

"Ah," said the old barber, sadly, "about the time my foolish boy, Harry, ran away from his bread."

"Your name's Hackblock, isn't it?" asked the young man, with suppressed emotion.

"It is."

"Wasn't your son once in the army—a private in the 42nd Foot, which was moved from Jamaica, some years ago, to the Cape of Good Hope?"

"He was," replied the old barber, leaving off shaving his customer, while Fanny leaned forward to listen.

"Yes, yes, he was," exclaimed boatswain Hackblock, this time chiming in anxiously, though pettishly.

"Then I'm sure I knew him," returned the young man, watching keenly the effect of his words or his father.

The old barber dropped his razor, and put up his hands towards his ears.

"Is—he—alive?" he asked, pausing between his words, and dreading to hear the reply.

Fanny and the old boatswain came forward.

"He is," replied the young man, quickly.

"Thank Heaven," said Fanny; but old Hackblock could not speak. He wiped his face with a towel which he held in his hand, and trembled violently. Boatswain Hackblock took the good news less quietly.

"Of course he is; I knew he was," he shouted, stamping his wooden leg violently on the floor, "and doing well, too? Eh, young man?"

"What would you call well?" asked the young man, as the old barber tried to compose himself once more for his task of shaving.

"What should I call well?" asked boatswain Hackblock, almost derisively; "why, promotion—rewards—reputation. Has he been in action? Did he wound many people, eh?"

"Yes, several," returned young Hackblock.

"Good, good," was the response.

"How can you be so bloodthirsty, father," said Fanny, "when you've retired from business?"

"Don't talk to me," returned boatswain Hackblock, impetuously; "an old salt never retires from business. What did he wound them with, eh, young man? the gun or the bayonet?"

"Neither."

"Neither?" asked the old barber, anxiously.

"What with, then?" inquired boatswain Hackblock, with growing impatience. "A sword?"

"No," replied young Hackblock, still playing with his uncle's curiosity.

"What with, then? what with, then?" asked the old boatswain, now growing very red in the face, and stamping his wooden leg upon the ground.

"Well, if you must have it," replied young Hackblock, while his eyes twinkled, "it was a razor."

"A razor!" exclaimed the old pensioner, his brother, and Fanny, in chorus.

"Yes, a razor; there's nothing extraordinary in that; people are very easily wounded with razors."

"Don't beat about the bush, sir," said the old boatswain, testily. "Is he promoted?"

"Yes," replied young Hackblock. "He became the barber of his regiment."

This announcement had the effect of making old Hackblock smile with satisfaction, while Fanny laughed outright. Boatswain Hackblock, after the first explosion of rage, recovered himself sufficiently to speak, but not before he had stamped half round the shop in his usual style.

"Barber to his regiment!" he said, bitterly, "barber to his regiment! Why, hang me, he'd better have stopped at home—much better."

"I always said so, Jack, I always said so," returned the old barber, rather triumphantly. "What's bred in the bone, you know—it's my turn to laugh now."

"There's one comfort," retorted the old boatswain, clinging to his last chance of escape from defeat. "He'll have to fight in the Crimea—barber or no barber."

"He's not in the Crimea," said young Hackblock.

"Not in the Crimea?—not at the seat of war?" shouted the old boatswain, with renewed excitement.

"No; he bought out of his regiment some years ago, and started a small easy-shaving shop—much smaller than this—at Cape Town."

"Easy-shaving shop!"—shouted boatswain Hackblock, with riotous contempt, while the old barber's delight increased. "Easy cats'-meat shop! He's a disgrace to the family."

"No, Jack," said the old barber, interposing with much natural dignity and feeling; "I'm the best judge of that. I don't approve of his clumsiness with the razor, which this gentleman has mentioned,—I can hardly believe in it when I know what a careful education I gave him, and how he used to shave the customers here.—I don't approve of his not writing home for so many years—but—but I've heard nothing that tells me he's disgraced his family.—He's not disgraced *me!*"

Young Hackblock could hardly suppress the emotions naturally-aroused by this speech, but, by a great effort, he prevented himself rising and declaring himself at once.

"You may well say what's bred in the bone," grumbled boatswain Hackblock, as he retired to the fire-place to smoke, followed by Fanny,—"none of you've got any proper pride, except me."

The old barber, after this, resumed his task of shaving his customer, with a very shaking hand, and with many anxious inquiries about his supposed absent son.

"Tell me more, sir, about him," he said, "tell me more. Why didn't he write? He ought to have written."

"He ought," returned the young man, "but he has an excuse. He grew ashamed of drawing money from home after having run away, and made up his mind not to write until he could say that he was better off."

The old barber had now nearly half finished his task, and nearly one side of young Hackblock's

beard had been shaved off. The old man seemed to be struggling with some thought, or recollection, for he walked a few steps away from the shaving-chair, and looked curiously at his customer.

"He started in the business he had been bred up to," continued young Hackblock, appearing not to notice his father's change of manner, "hoping to get on, but several years soon passed without any luck."

"Strange!" murmured old Hackblock to himself, leaving his task again, and looking at his customer keenly from another point of view; "I can hardly hold the razor! I cannot be dreaming?"

"As he couldn't make a fortune," still continued young Hackblock, though with decreased command over himself, "he scraped together his passage-money."

The old barber by this time had finished his task, and his son's face stood before him free from all its unfamiliar covering. The old man hesitated once more for a moment, but only for a moment, and before Fanny and the old boatswain could get round the old shaving-chair, the father and son were re-united and the truth was revealed. After the first burst of joy and astonishment was over, the old boatswain could not refrain from amusing himself at the expense of his brother.

"Harry," he said to the old barber, who was now sitting down half exhausted in the shaving-chair, "you're caught again. It's a wise father who doesn't know his own son, isn't it?"

"I *must* have known him all along, Jack," returned the old man, almost crying, "for I'm sure I never shaved anybody so badly in my life."

"Ah, tell that to the marines," replied the old boatswain, incredulously.

"Let us settle all family differences now," said the old barber, kindly, "and start afresh. We can't all be big-drummers, that we know; but we can all try with heart and soul to be good little ones."

JOHN HOLLINGSHEAD.

DECLENSION AND REVIVAL.

"From Me is thy fruit found."—Hosea xiv. 8.

DIE to thy root, sweet flower,
If so God wills, die even to thy root;
Live there awhile an uncomplaining, mute,
Blank life, with darkness wrapp'd about thy head;
Oh, fear not for the silence round thee spread,
This is no grave though thou among the Dead
Be counted, but the Hiding-place of Power!
Die to thy root, sweet flower.

Spring from thy root, sweet flower,
When so God wills, *spring even from thy root;*

Send through the earth's warm breast a quicken'd
shoot,
Spread to the sunshine, spread unto the shower,
And lift into the sunny air thy dower
Of bloom and odour; life is on the plains,
And in the woods a sound of birds and rains
That sing together; lo, the winter's cold
Is past; sweet scents revive, thick buds unfold;
Be thou, too, willing in the Day of Power,
Spring from thy root, sweet flower!

NOT ABOVE HIS BUSINESS.

THE SUN.

BY SIR JOHN F. W. HERSCHEL, BARR.

THE subject we have chosen for this paper is perhaps an ambitious one, for it is no less than an attempt to convey to our readers some faint impression of the vastness and grandeur of the most magnificent object in nature—of that glorious body which occupies the centre of our planetary system, and on which not only our own globe, but all the other planets, many of them of far greater magnitude and possibly too of greater importance in the scale of being than our own, depend in the most immediate manner for the fulfilment of those conditions without which animated existence and organic life are impossible—THE SUN. There is a poem of Byron's entitled "Darkness," which begins thus:—

"I had a dream which was not all a dream.
The bright sun was extinguished, and the earth
Did wander darkling in th' eternal space
Rayless and pathless,"

and so on: describing, or trying to describe, the horrors of that desolation which would ensue. They are assembled and piled on one another in this powerful poem with the hand of a master of the horrible; and in the end everybody goes mad, fights with everybody else, and dies of starvation.

But there would not be time for starvation. In three days from the extinction of the sun there would, in all probability, not be a vestige of animal or vegetable life on the globe, unless it were among deep-sea fishes and the subterranean inhabitants of the great limestone caves. The first forty-eight hours would suffice to precipitate every atom of moisture from the air in deluges of rain and piles of snow, and from that moment would set in a universal frost such as Siberia or the highest peak of the Himalayas never felt—a temperature of between two and three hundred degrees below the zero of our thermometers. This is no fanciful guess-work. Professor Tyndall has quite recently shown that it is entirely to the moisture existing in the air that our atmosphere owes its power of confining, and cherishing as it were the heat which is always endeavouring to radiate away from the earth's surface into space. Pure air is perfectly transparent to terrestrial heat—so that but for the moisture present in the atmosphere, every night would place the earth's surface as it were in contact with that intense cold which we are certain exists in empty space, a degree of cold which from several different and quite independent lines of inquiry we are sure is not less than 230 degrees of Fahrenheit's thermometer below zero. No animal or vegetable could resist such a frost for an hour, any more than it could live for an hour in boiling water. Such a frost exists, no doubt, over the dark half of the moon, which has no atmosphere, neither air nor vapour, and in all probability quite as violent an

extreme of heat, a boiling temperature at least, over the bright half; so that we may pretty well make up our minds as to that half of the moon at least which we see, being uninhabited; while on the other hand, if it would not lead too far away from our immediate subject, I think it might be shown on admissible principles, that Venus and Mercury, in spite of their nearness to the sun, and possibly also Jupiter and Saturn, in spite of their remoteness, may have climates in which animal and vegetable life such as we see them here, might be maintained.

But it is with the sun itself that we are now concerned. What I am going to say about the sun will consist of a series of statements so enormous in all their proportions, that I dare say, before I have done, some of my readers will almost think me mad, or intending to palm on them a string of rhodomontades, like some of the mythical stories of the Hindûs. And yet there is nothing more certain in modern science than the truth of some of the most extravagant of these statements; and, wild as they may seem to those who for the first time hear them, they appear not only not extravagant, but actually dwarfed into littleness by the still vaster revelations of that science respecting the scale of the visible universe; in every part of which when we come to measure in figures either the magnitude or the minuteness of its mechanisms, we find our arithmetic almost breaking down in the attempt, and numbers of ten or twenty places of figures, as it were tossed about like dust, and turning up on every occasion.

To come then to our subject. The first and most important office the sun has to perform in our system is to keep it together, to keep its members from parting company, from *seceding*, and running off into outer darkness, out of the reach of the genial influence of his beams. Were the sun simply *extinguished*, the planets would all continue to circulate round it as they do at present, only in cold and darkness; but were it annihilated, each would from that moment set forth on a journey into infinite space in the direction in which it happened then to be moving; and wander on, centuries after centuries, lost in that awful abyss which separates us from the stars, and without making any sensible approach even to the nearest of them in many hundreds or even thousands of years. The power by which the sun is enabled to perform this office,—to gather planets round its hearth and to keep them there—is the same in kind (though very different in intensity) with that which when a stone is thrown up into the air draws it down again to the earth. As to the manner in which this is effected by the weight of the stone, or its tendency to fall straight down, aiding to turn or draw it out

of its right-lined course oblique to the surface, and oblige it to move in a curve,—with the explanation of that we have here nothing to do. That belongs to mechanics, and we must take it for granted. But in order to understand how it is possible to pass from this familiar case that we see every day before our eyes, to that of a vast globe like the earth revolving in an orbit about the sun, it will be necessary to enlarge the scale of our ideas of magnitude. We must try to conceive a similar degree of command and control exercised over such a mass as our globe, and over the much greater masses of the remote planets, by the sun as a central body, hardly moved from its place while as it were swinging all the others round it. And for this purpose it is necessary to possess some distinct conception of what sort of a body the sun really is—of its size—of its distance from us—of its weight or mass—and of the proportion it bears to the other bodies, the earth included, which circulate round it.

It is strange what crude ideas people in general have about the size of very distant objects. I was reading only the other day a letter to the *Times* giving an account of a magnificent meteor. The writer described it as *round, about the size of a cricket-ball, and apparently about 100 yards off*. Many persons spoke of the tail of the great comet of 1858 as being several yards long, without at all seeming aware of the absurdity of such a way of talking. The sun or the moon may be covered by a threepenny-piece held at arm's length, but it takes a house, or a church, or a great tree to cover it on a near horizon, and a hill or a mountain on a distant one; so that it must be at least as large as any of these objects. Among the ancient Greek philosophers there was a lively dispute as to the real size of the sun. One maintained that it was "precisely as large as it looks to be," a thoroughly Greek way of getting out of a difficulty. All the best thinkers among them, however, clearly saw that it must be a very large body. One of them (Anaxagoras) went the length of saying that it might be as large as all Greece, for which he got laughed at. But he was outbid by Anaximander, who said it was twenty-eight times as large as the earth. What would Anaximander or the scoffer of Anaxagoras have said, could he have known what we now know, that, seen from the same distance as the sun, the territory of Greece would have been absolutely invisible; and that even the whole earth, if laid upon it, would not cover more than one thirteen-thousandth part of its apparent surface,—less in proportion, that is to say, than a single letter in the broad expanse of type which meets the reader's eye as this volume now lies open before him.

Our object in this notice is not to put before our readers, except in one single instance, any connected chain of reasoning and deduction, or to show how, from the principles of abstract science combined with observation, the results I have to state have been obtained. This would lead me a great deal

too far, and would require not one but a whole series of such essays. What I aim at is to convey to their minds, as matters of fact, what those results *are* in the case of the sun, and to enable them to form a conception of it as a reality. Still it is reasonable for any one to ask how it is possible to prove such a statement, for instance, as that just made; and as the kind of process by which our conclusions as to the size and mass of the sun are arrived at may be put in a few words, it will not be amiss to give a sketch of it.

The first step towards ascertaining the real size of the sun is to determine its distance. Now, the simplest way to find the distance of an object which cannot be got at, is to measure what is called a base line, from the two ends of which it can be seen at one and the same moment, and then to measure with proper instruments the angles at the base of the triangle formed by the distant object and the two ends of the base. Geography and surveying in modern times have arrived at such perfection, that we know the size and form of the earth we stand upon to an extreme nicety. It is a globe a little flattened in the direction of the poles,—the longer diameter, that across the equator, being 7925 miles and five furlongs, and the shorter, or polar axis, 7899 miles and one furlong; and in these measures it is pretty certain that there is not an error of a quarter of a mile. And knowing this, it is possible to calculate with quite as much exactness as if it could be measured, the distance *in a straight line* between any two places whose geographical positions on the earth's surface are known. Now there are two astronomical observatories very remote from one another, the one in the northern hemisphere, the other in the southern, viz., at Hammerfest in Norway, and on the Cape of Good Hope, both very nearly on the same meridian, so that the sun, or the moon, or any other heavenly body attains its greatest altitude above the horizon of each (or as astronomers express it, passes the meridian of each) very nearly at the same time. Supposing then that this, its *meridian altitude*, is carefully observed at each of these two stations on the same day, it is easy to find by computation the angles included between each of the two lines of direction in which it was seen from the two places, and their common line of junction; so that taking this latter line for the base of a triangle, of which the two sides are the distances of the object from either place, those two sides can thence be calculated by the very same process of computation which is employed in geographical surveying to find the distance of a signal from observations at the ends of a measured base. Now, the distance between Hammerfest and the Cape in a straight line is nearly 6300 miles, and owing to the situations of the two places in latitude, the triangle in question is always what a land surveyor would call a highly favourable one for calculation: so that with so long a base we may reasonably expect to arrive at a considerably exact knowledge of its sides,—after which a little addi-

tional calculation will readily enable us to conclude the distance of the object observed from the earth's centre.

When the moon is the object observed this expectation is found to be justified. The triangle in question, though a long one, is not extravagantly so. Its sides are found to be, each about thirty-eight times the length of the base, and the resulting distance of the moon from the earth's centre about thirty diameters of the latter, or more exactly sixty times and a-quarter its radius, that is to say, 238,100 (say 240,000) miles, which is rather under a quarter of a million—so that, speaking roughly, we may consider the moon's orbit round the earth as a circle about half a million of miles across. In the case of the sun, however, it is otherwise. The sides of our triangle *are* here what may be called extravagantly out of proportion to its base, and the result of the calculation is found to assign to the sun a distance very little short of four hundred times that already found for the moon—being in effect no less than 23,984 (in round numbers 24,000) radii, or 12,000 diameters of the earth, or in miles 94,880,700 or about 95,000,000.

When so vast a disproportion exists between the distance of an object and the base employed to measure it, a very trifling error in the measured angles produces a great one in the result. Happily, however, there exists another and a very much more precise method, though far more refined in principle, by which this most important element can be determined; viz., by observations of the planet Venus, at the time of its "transit" (or visible passage) across the sun's disc. It would lead us too far aside from our purpose to explain this, however, at length. The necessary observations were made at the time of the last "transit" in 1769, and will no doubt be repeated on the next occasion of the same kind, in 1874.*

From the distance of the sun so obtained, and from its apparent size (or, as astronomers call it, its angular diameter), measured very nicely by delicate instruments called micrometers, the real diameter of the sun has been calculated at 882,000 miles, which I suppose may be taken as exact to a few odd thousands.

Now, only let us pause a little, and consider among what sort of magnitudes we are landed. It runs glibly over the tongue to talk of a distance of 95,000,000 of miles, and a globe of 880,000 miles in diameter, but such numbers hardly convey any distinct notion to the mind. Let us see what kind of conception we can get of them in other ways. And first then, as to the distance. By railway, at an average rate of 40 miles an hour one might travel round the world in 26 days and nights. At the same rate it would take 270 years and more to get to the sun. The ball of an Armstrong 100-pounder leaves the gun with a

speed of about 400 yards per second. Well, at the same rate of transit it would be more than thirteen years and a quarter in its journey to reach the sun; and the sound of the explosion, supposing it conveyed though the interval with the same speed that sound travels in our air, would not arrive till half a year later. The velocity of sound, or of any other impulse conveyed along a steel bar, is about sixteen times greater than in air. Now, suppose the sun and the earth connected by a steel bar. A blow struck at one end of the bar, or a pull applied to it, would not be delivered, would not begin to be felt, at the sun till after a lapse of 313 days. Even light, the speed of which is such that it would travel round the globe in less time than any bird takes to make a single stroke of his wing, requires seven minutes and a half to reach us from the sun.

The illustration of the distance of the sun which I have just mentioned, by supposing it connected with the earth by a steel bar, will serve to give us some notion of the wonderful connection which that mystery of mysteries, gravitation, establishes between them. The sun *draws* or pulls the earth towards it. We know of no material way of communicating a pull to a distant object more immediate, more intimate, than grappling it with bonds of steel; and how such a bond would suffice we have just seen. But the *pull* on the earth which the sun makes is instantaneous, or at all events incomparably more rapid in its transmission across the interval than any solid connection would produce, and even demonstrably more rapid than the propagation of light itself.

Let me now try to convey some sort of palpable notion of the size of the sun itself. On a circle six feet in diameter, representing a section of it through the centre, a similar section of the earth would be about represented by a fourpenny-piece, and a distance of a thousand miles by a line of less than one-twelfth of an inch in length. A circle concentric with it, representing on the same scale the size of the moon's orbit about the earth, would have for its diameter only thirty-nine inches and a quarter, or very little more than half the sun's. Imagine now, if you can, a globe concentric with this earth on which we stand, large enough not only to fill the whole orbit of the moon, but to project beyond it on all sides into space almost as far again on the outside! A spangle, representing the moon, placed on the circumference of its orbit so represented, would require to be only a sixth part of an inch in diameter.

It is nothing to have the size of a giant without the strength of one. The sun retains the planets in their several orbits by a powerful mechanical force precisely as the hand of a slinger retains the stone which he whirls round till the proper moment comes for letting it go. The stone pulls at the string one way, the controlling hand at the centre of its circle the other. Were the string too weak, it would break, and the stone, prematurely released,

* The distance above stated is that which results from this more precise mode of procedure.

would fly off in the wrong direction. If a mechanist were told the weight of the stone (say a pound), the length of the string (say a yard, including the motion of the hand), and the number of turns made by the stone in a certain time (say sixty in a minute, or one in a second), he would be able to tell precisely what ought to be the strength of the string so as *just not to break*; that is to say, what weight it ought at least to be able to lift without breaking. In the case I have mentioned, it ought to be capable of sustaining 3 lb. 10 oz. 386 grs. If it be weaker it will break. And this is the force or effect which the hand must steadily exert, to draw the stone in towards itself out of the direction in which it would naturally proceed if let go, and to keep it revolving in a circle at that distance.

Now, what the string does to the stone in the sling, that, in the case of the sun retaining the earth in its orbit, is done—that same office is performed—that effort (in some mysterious way which the human mind is utterly incapable of comprehending) is exerted—that pull communicated, in an instant of time, and so far as we can discover, without any material tie, by the force of gravitation. We know the time the earth takes to revolve about the sun. It is a year, of so many days, hours, minutes and seconds, and we know its distance—95,000,000 of miles, which may easily be turned into yards. Well, now, suppose a stone or a lump of lead of a ton weight to be tied to the sun by a string, and slung round it in such a circle and in such a time. Then, on the very same principles, and by the same rules of arithmetic, one may calculate the amount of pull, or tension of the string, and it will be found to come out 1 lb. 6 oz. 51 grs.

We all know what sort of lifting power—what amount of muscular force—it takes to sustain a pound weight. Multiply this by 2,240 and you have the muscular effort necessary to sustain a ton. It would require three or four strong horses straining with all their might. Well, now, it is one of the peculiarities of this mysterious power of gravitation, that its intensity—the energy of its pull—is less and less as the distance of the thing pulled is greater: and *that* in a higher proportion. At double the distance, the force of the pull is not halved, but quartered: at triple, it is not a third part, but a ninth. There are mountains in the world five miles high; that is to say, whose summits are five miles farther from the centre of the earth than the sea-level. If a ton of lead were carried up to the top of such a mountain, though it would still balance another ton, or 2,240 weights of a pound each on the scales, then and there; yet it would not require so great an effort, such an exertion of muscular force, to raise and sustain it by five pounds and a half. Now, fancy it removed to a height of 94,900,000 miles, and estimating by the same rule its apparent weight, you will find, if you make the calculation, that it would not require more effort to sustain it from falling, than would suffice to lift one thirty-

seventh part of a grain from the surface of the earth.

This, then, one thirty-seventh part of a grain, is the force which the earth, placed where the sun is, would exert on our lump of lead. But we have seen that to retain such a lump in such an orbit requires a pull of 1 lb. 6 oz. 51 grs. Of course, then, the earth, so placed, would be quite inadequate to retain it from flying off. To do this would require as many earths to pull it as there are thirty-seventh parts of a grain in 1 lb. 6 oz. 51 grs.: that is to say, by an easy sum in arithmetic, 356,929; or in round numbers, 360,000. Now, this is equivalent to saying, that to do the work which the sun does upon each individual ton of matter which the earth consists of, it must pull it as if (mind I say *as if*) it were made up of 360,000 earths. And this is what is meant by saying, that the mass or quantity of gravitating matter constituting the sun is 360,000 times as great as the mass or quantity of such matter in the earth.

Thus, now, you see, we have weighed as well as measured the sun, and the comparison of the two results leads to a very remarkable conclusion. In point of size, the globe of the sun, being *in diameter* 110 times that of the earth, occupies *in bulk* the cube of that number, or 1,331,000 times the amount of space. The disproportion in bulk, then, is much greater than the disproportion in weight,—very nearly four times greater: so that you see, comparatively speaking, and of course on an average of its whole mass, the sun consists of *much lighter* materials than the earth. And in this respect it agrees with all the four great exterior planets, Jupiter, Saturn, Uranus, and Neptune; while all the others—Mercury, Venus, and Mars—agree much more nearly with the earth, and seem to form a quite distinct and separate family.

From this calculation of the mass of the sun, and from its diameter, we are enabled to calculate the pressure which any heavy body placed on its surface would exercise upon it, or what power it would require to lift it off. It is very nearly thirty times the power required to lift the same mass here on earth. A pound of lead, for instance, transported to the sun's surface, could not be raised by an effort short of what would lift thirty pounds here. A man could no more stand upright there, than he could here on earth with twenty-nine men on his shoulders. He would be squeezed as flat as a pancake by his own weight.

Giant Size and Giant Strength are ugly qualities without beneficence. But the sun is the almoner of the Almighty, the delegated dispenser to us of light and warmth, as well as the centre of attraction; and as such, the immediate source of all our comforts, and indeed of the very possibility of our existence on earth. Even the very coals which we burn, owe their origin to the sun's influence, being all of vegetable materials, the remains of vast forests which have been buried and preserved in that form for the use of man, millions of ages before he was placed on the earth, and which, but for the

solar light and heat, would have had no existence.* Indeed, the theory of heat which is now gaining ground would go to prove that it is the actual identical heat, which the sun put into the coal, while in the form of living vegetation, that comes out again when they are burnt as coals in our grates and furnaces; so that, after all, Swift's idea of extracting sunbeams out of cucumbers, which he attributes to his Laputan philosophers, may not be so very absurd. †

But how shall I attempt to convey to you any conception of the scale on which the great work of warming and light is carried on in the sun? It is not by large words that it can be done. All "word-painting" must break down, and it is only by bringing before you the consideration of great facts in the simplest language, that there is any chance of doing it. In the very outset here is the greatest fact of all—the enormous waste, or what appears to us to be waste—the excessive, exorbitant, prodigality of diffusion of the sun's light and heat. No doubt it is a great thing to light and warm the whole surface of our globe. Then look at such globes as Jupiter and Saturn and the others. This, as you will soon see, is something astounding; but then look what a trifling space they occupy in the whole sphere of diffusion around the sun. Conceive that little globe of the earth, such as we have described it in comparison with our six feet sphere, removed 12,000 of its own diameters, that is to say, 210 yards from the centre of such a sphere (for that would be the relative size of its orbit)! why, it would be an invisible point, and would require a strong telescope to be seen at all as a thing having size and shape. It occupies only the 75,000th part of the circumference of the circle which it describes about the sun. So that 75,000 of such earths at that distance, and in that circle placed side by side, would all be equally well warmed and lighted,—and, then, that is only in one plane! But there is the whole sphere of space above and below, unoccupied; at any single point of which if an earth were placed at the same distance it would receive the same amount of light and heat. Take all the planets together, great and small; the light and heat they receive is only one 227 millionth part of the whole quantity thrown out by the sun. All the rest escapes into free space, and is lost among the stars; or does there some other work that we know nothing about. Of the small fraction thus utilized in our system, the earth takes for its

share only one 10th part, or less than one 2000 millionth part of the whole supply.

Now, then, bearing in mind this huge preliminary fact to start with, let us see what amount of heat the earth *does* receive from the sun. The earth is a globe, and therefore, taken on an average, it is constantly receiving as much, both of light and heat, as a flat circle 8000 miles in diameter, held perpendicularly to receive it. Now, that section is 50,000,000 square miles, so that there falls at every instant on the whole earth 50,000,000 times as much heat as falls on a square mile of the hottest desert under the equator at noonday with a vertical sun and with not a cloud in the sky—and in fact nearly a third more; for more than a quarter of the sun's heat is absorbed in the air in the clearest weather, and never reaches the ground. Now, we all know that in those countries it is much hotter than we like to keep our rooms by fires. I have seen the thermometer four inches deep in the sand in South Africa rise to 159° Fahr., and I have cooked a beef-steak and boiled eggs hard by simple exposure to the sun in a box covered with a pane of window glass, and placed in another box so covered.

From a series of experiments I made there, I ascertained that the direct heat of the sun, received on a surface capable of absorbing and retaining it, was competent to melt an inch in thickness of ice in 2^h 13^m, and from this I was enabled to calculate how much ice would be melted per hour by the heat actually thrown on a square mile exposed at noon under the equator, and the result is 58,360,000 lb. or in round numbers, 26,000 tons, and this vast mass, has to be multiplied 50 million-fold to give the effect produced on a diametral section of our globe.

And, now, let us endeavour to form some kind of estimate of the *temperature*; that is to say, the degree or intensity of the heat at the actual surface of the sun. By a calculation, with which I will not trouble you, it turns out to be more than 90,000 times greater than the intensity of sunshine here on our globe at noon and under the equator—a far greater heat than can be produced in the focus of any burning-glass, though some have been made powerful enough to melt, not only silver and gold, but even platina, and, indeed, all metals which resist the greatest heats that can be raised in furnaces.

Perhaps the best way to convey some sort of conception of it, will be to state the result of certain experiments and calculations recently published; which is this—that the heat thrown out FROM EVERY SQUARE YARD of the sun's surface is equal to that which would be produced by burning on that square yard six tons of coal per hour, and keeping up constantly to that rate of consumption—which, if used to the greatest advantage, would keep a 63,000 horse steam-engine at work.—And this, mind, on each individual square yard of that enormous surface which is 12,000 times that of the whole surface of the earth!

* See the treatise on Astronomy, by the author of this paper, in "Lardner's Cabinet Cyclopædia," published in 1833.

† Not more so at least than some of his other Laputan speculations; such as calcining ice into gunpowder; or moving vast locomotive masses by magnetism, both which feats have, in a somewhat altered form of expression, been accomplished (as in the explosion of potassium when laid on ice, and the movement of a ship by electro-magnetism); or than his plan for writing books by the concurrence of accidental letters, and selection of such combinations as form syllables, words, sentences, &c.

Let me say something now of the *light* of the sun. The means we have of measuring the intensity of light are not nearly so exact as in the case of heat—but this at least we know—that the most intense lights we can produce artificially, are as nothing compared *surface for surface* with the sun.—The most brilliant and beautiful light which can be artificially produced is that of a ball of quicklime kept violently hot by a flame of mixed ignited oxygen and hydrogen gases playing on its surface. Such a ball, if brought near enough to appear of the same size as the sun does, can no more be looked at without hurt than the sun—but if it be held between the eye and the sun, and *both* so enfeebled by a dark glass as to allow of their being looked at together—it appears as a black spot on the sun or as the black outline of the moon in an eclipse, seen thrown upon it. It has been ascertained by experiments which I cannot now describe, that the brightness, the intrinsic splendour, of the surface of such a lime-ball is only one 146th part of that of the sun's surface. That is to say, that the sun gives out as much light as 146 balls of quicklime *each the size of the sun*, and each heated *over all its surface* in the way I have described, which is the most intense heat we can raise, and in which platina melts like lead.

On the benefits which the sun's light confers on us it cannot be necessary to say much; only one thing, I think, may not be known to all who may read these pages; viz., that it is not only by enabling us to see that it is useful, but that it is quite as necessary as its heat to the life and well-being both of plants and animals. Animals, indeed, may live some time in complete darkness, but they grow unhealthy, lose strength and pine away, while plants very quickly lose their green colour, turn white or pale yellow, lose all their peculiar scent and flavour, refuse to flower, and at last rot and die off. What I have now to say about the light of the sun is of quite a different nature.

The sun's light, as we all know, is purely *white*. If the sun sometimes looks yellow or red, it is because it is seen through vapours, or smoke, or a London fog of smoke *and* vapour *mixed*. It has been seen blue; but when high up, in a clear sky, it is quite white. The whiteness of snow, of a white cloud, of white paper, is the whiteness of the sun's light which falls upon them. Whatever reflects the rays of the sun *without choice or preference*, *appears white*. Whatever does not do so appears coloured, and if it does not reflect them at all—black. Now I must explain what I mean by saying—"without choice or preference." Every ray of light which comes from the sun is not a simple but a compound *thing*. Here, again, I must explain. The air we breathe is not a simple but a compound *thing*. It is separable at least into four distinct *things*, as different from one another as any four things you can name. Well, then, so of a ray or beam of the sun; it may be separated, split, subdivided, not into four, but into many hundreds, nay

thousands, of perfectly distinct rays or things, or rather of three distinct sorts or species of rays, of which one sort affects the eyes as light; one the sense of feeling and the thermometer as heat; and one the chemical composition of everything it falls upon, and which produces all the effects of photography. Each of these three classes (and I believe there are several more, indeed I have proved the existence of one more) consists of absolutely innumerable *species* or sorts, every one of which is separated from every other by a boundary line, as sharp and as distinct as that which separates Kent and Sussex on a map. A ray of light is a world in miniature, and if I were to set down all that experiment has revealed to us of its nature and constitution, it would take more volumes than there are pages available for the rest of this paper.

When the sun's light is allowed to pass through a small hole in a dark place, the course of the ray or sunbeam may be traced through the air (by reason of the small fine dust that is always floating in it), as a straight line or thread of light of the same apparent size, or very nearly so, from the hole to the opposite wall. But if in the course of such a beam, be held at any point the edge of a clear angular polished piece of glass called a *prism*, the course of the beam from that place will be seen to be bent aside in a direction towards the thicker part of the glass—and not only so bent or *refracted*, but spread out to a certain degree, so that the beam in its further progress grows continually broader, the light being *dispersed*, into a flat fan-shaped plane: and if this be received on white paper, instead of a single white spot which the unbroken beam would have formed on it, appears a coloured streak, the colours being of exceeding vividness and brilliancy, and following one another in a certain fixed order—graduating from a pure crimson red at the end least remote from the original direction (or least *deviated*), through orange, yellow, green, and blue, to a faint and rather rosy violet. This beautiful phenomenon—the *Prismatic Spectrum* as it is called—strikes every one who sees it for the first time, in a high degree of purity, with wonder and delight; as I once had the gratification of witnessing in the case of that eminent artist the late David Wilkie, who, strange to say, had never seen a "Spectrum" till I had the pleasure of showing him one, and whose exclamations, though a man habitually of few words, I shall not easily forget. I shall not attempt to give any account of the theory of this *prismatic dispersion* of the sunbeam, but an illustration of it may be found in a very familiar and primitive operation—the winnowing of wheat. Suppose I had a sieve full of mixed grains and other things—shot, for instance, wheat grains, sand, chaff, feathers; and that I flung them all out across a side wind, and noticed where they fell. The shot would fall in one place, the wheat in another, the sand in another, the chaff in another, and the feathers anywhere—nowhere; but none of them in

the straight direction in which they were originally tossed. All would be *deviated*; and if you marked the places of each sort, you would find them all arranged in a certain order—that of their relative lightness in a line on the ground, oblique to the line of their projection. You would have separated and assorted them, and formed a *spectrum*, so to speak, on the ground, or a picture of what had taken place in the process, which would in effect have been the performance of a mechanical analysis of the contents of your basket.

Bearing always in mind that it is an illustration of a series of facts, not a theoretical explanation of a natural process, which is here intended, I will now proceed to observe that the analogy of this case to that of the prismatic analysis of a sunbeam may be pursued still further. If the original contents of the basket had been all of one material, such as sand, consisting of a mixture of particles of every gradation of coarseness and fineness, from small pebbles down to impalpable dust, the trace upon the ground, the sand spectrum, however long, would be **uninterrupted**: the coarsest particles lying at one end, the finest at the other, and every intermediate size in every intermediate place. On the other hand, in the case first supposed, and supposing the shot to differ *inter se* in respect of size within certain limits, the wheat grains again within certain other, the sand within other, and so on; they would be found after projection all indeed lying in a line, but that line an interrupted one—consisting first of shot occupying a certain length, then an interval, then wheat grains to a certain extent—another interval—then sand, chaff, and so on. Now this is by no means an inapt though a coarse representation of the constitution of the Prismatic spectrum. When it is formed by an extremely pure prism, and with certain precautions (which need not here be detailed) to ensure the perfect purity of its colours, it is found to be *discontinuous*: that is to say, not a simple streak like a riband of paper coloured from end to end by tints graduating insensibly from red to violet, but like such a riband marked, *across its breadth*, by perfectly black lines of exceeding delicacy, yet some wider some narrower than others, and where these lines are the paper is not illuminated at all. Into these spaces (for narrow as they are, they have each a certain breadth) none of the light dispersed by the prism falls. These lines, be it also observed, are not occasional or accidental, but permanent, and belong to the sun's light *as such*. They divide the spectrum into compartments as the boundary lines between counties on a map divide the soil into regions, and each individual of these compartments differs in other qualities besides colour from its neighbours on either side; much as contiguous regions of a country differ in soil and cultivation as well as in climate. It is as if our assorted grains were distinguished not only by being coloured according to their respective sizes, but each particular size and weight distin-

guished also by differences in the material of which they consisted.

Every observer who has examined the spectrum with more care than the last, has added to the number of these lines. Dr. Wollaston first noticed two or three of the most conspicuous. Fraunhofer registered and fixed the places of some thirty or forty more, and later observers have mapped down with all the precision of a geographical survey, not less than two thousand of them. The knowledge of them, and the precise measurement of their distances from one another, has proved most valuable in a great many lines of scientific inquiry, and most particularly in Optics and Chemistry, and, quite recently, has been the means of revealing facts respecting the constitution of the sun itself, which one would have supposed it impossible for man ever to have become acquainted with. One word more on these lines—for we must husband space, as there remains a great deal more ground to go over. I have said that they are not *occasional*, but belong to the sun's light *as such*. But they may be considered as in some sort *accidental* as regards the sun—for the light of each of the stars when thrown into a spectrum, is found to have a different system of these "fixed lines." And what is more, the light of every flame has its peculiar lines, which indicate the nature of the burning substance. And in this way there seems to arise a possibility that by studying these lines carefully, as exhibited by terrestrial flames and other sources of artificial light, we may come to a knowledge of what the sun and stars are made of. This is what men of science are now very busily occupied about, and it seems to have been rendered at least highly probable—I do not say that it has been proved—that a great many of the chemical elements of this our earth exist in the sun—such as, for instance, iron, soda, magnesium, and some others. We cannot here state the extraordinary facts on which this conclusion rests. But the conclusion itself is not so absolutely strange and startling as it may at first appear. The analysis of meteorolites, which there can be no doubt have come to the earth from very remote regions of the Planetary spaces, has, up to the present time, exhibited no new chemical element—so that a community of nature, at least as regards material constitution between our earth and the rest of the bodies of our system, is at all events no unexpected, as it is, in itself, no unreasonable conclusion.

Not that it is meant, by anything above said, to imply that the light of the sun is that of any flame, in the usual sense of the word. A late celebrated French philosopher, M. Arago, indeed, considered that he had proved it to be so by certain optical tests. But in the first place his proof is vitiated by an enormous oversight, and the thing, besides, is a physical impossibility. The light and heat of the sun cannot possibly arise from the burning of *fuel*, so as to give out what we call flame. If it be the sun's substance that *burns* (I mean consumes), where

is the oxygen to come from? and what is to become of the ashes, and other products of combustion? Even supposing the oxygen supplied from the material, as in the cases of gunpowder, Bengal light, or gun cotton, still the chemical products have to be disposed of. In the case of gun cotton, it has been calculated that, if the sun were made of it so condensed as only to burn on the surface, it would burn out, at the rate of the sun's expenditure of light and heat, in eight thousand years. Anyhow, fire, kept up by fuel and air, is out of the question. There remain only three possible sources of them, so far as we can perceive—electricity, friction, and vital action. The first of these was suggested by the late Sir William Herschel in 1801; the second, at least as a possibility, though without indicating any mode by which the necessary friction could arise, by myself, in a work* published in 1833. The theory at present current of it is founded on what may not unfairly be considered a further development of this idea, the friction being supposed to arise from meteoric matter circulating round the sun, and gradually subsiding into it, and either tearing up its surface, or ploughing into its atmosphere. But on this we cannot dilate, as nothing has been hitherto said about the appearance of the sun in telescopes, and the strange phenomena its surface, so examined, exhibits.

One of the earliest applications of the telescope was to turn it on the sun. And the first fruits of this application (which originated about the same time), in the year 1611, with Harriot, in England, Galileo in Italy, and Fabricius and Scheiner in Germany, was the discovery of black spots on its surface, which, when watched from day to day, were found to change their situation on its disc, in a certain regular manner; coming in, or making their first appearance on the eastern edge or border of the disc: *i. e.*, on the left-hand side of the sun when seen at noon day; and going off, or disappearing at the west, or on the right-hand side. It very soon became evident that, whatever these spots might be, they adhered to the body of the sun, and that their apparent motions could only be accounted for by a real motion of rotation of the sun on an axis nearly, but not quite, perpendicular to the ecliptic. By following out this indication by careful observation and calculation, it has become known that the sun does so rotate; that the time occupied in a single rotation is very nearly 25 days, 7 hours, 48 minutes; that the axis of rotation is about 7° inclined to a line perpendicular to the ecliptic, its direction in space being that of a line pointing nearly to the star τ (tau), in the constellation of the Dragon; in consequence of which on and about the 11th of June, the spots appear to pass across the sun in straight lines, from the apparent northern to the apparent southern hemisphere of the sun, and the reverse on and about the 12th of December, while at inter-

vening times, their course across the sun is a flattened elliptical or oval curve, a necessary consequence of their real motion being in a circle much inclined to the line of sight. Their ellipses are most open on the 11th of March, and the 13th of September; on the former of which days we get the best view of the south pole of the sun, and on the latter of the north.

But here comes the strange part of their history. These spots are not permanent marks on the sun's surface. They come and go. They begin as small dim specks, grow to be great blotches, and then dwindle away. Sometimes they are large enough to be seen without a telescope, when the sun is near setting or just risen, so as to have its dazzling splendour mitigated by the vapours of the horizon, and admit of being looked at steadily. Many instances of such appearances are recorded, some very remarkable ones, long before the invention of the telescope. Two were so seen by my son, Mr. A. Herschel, in London, in November, 1861, who sent me a drawing of them, which I found verified on comparison with a drawing taken from the telescope on the same day, by a very assiduous observer in my immediate neighbourhood.

Ever since the first discovery of the solar spots, they have been watched with great interest, and it has been ascertained that they do not make their appearance indiscriminately upon every part of the globe of the sun. At or near either of its poles they never appear, and very rarely indeed on its equator, or on any part of its body beyond the 40th degree of latitude—understanding that term on the sun in the same acceptation which geographers attach to it on our own globe. They mainly frequent two zones or belts parallel to its equator, bearing very nearly the same relation to that great circle of its sphere which the regions on our own globe, in which the trade winds prevail, bear to the equatorial region of the earth—extending, that is to say, to some 25 or 30° of north, and not quite so far, or in such abundance in south latitude, with a comparatively spotless intermediate belt, of five or six degrees broad between them, answering to our region of equatorial calms. The resemblance is so striking as most strongly to suggest some analogy in the causes of the two phenomena—and it has been held that as our trade winds originate in a greater *influx* of heat from without on and near the equator than at the poles, combined with the earth's rotation on its axis, so the maculiferous belts of the sun may owe their origin to a greater equatorial *efflux* of heat, combined with the axial rotation of that luminary. There is another extremely remarkable feature in the appearance and disappearance of these spots. I have said that they are not *permanent*. Sometimes, indeed, but rarely, one and the same spot lasts long enough, after disappearing at the western edge of the sun, to come round again and re-appear at the eastern; and it has happened that a spot has lasted long enough to re-appear four or five times; but for the most part this is not the

* "Lardner's Cabinet Cyclopaedia," Astronomy, s. 337, p. 212.

case. But as regards the number of spots which appear on the sun at different times, there is the greatest possible difference. Sometimes it is quite spotless; at others the spots swarm upon it, and as many as fifty or sixty spots or groups, large and small, have been seen at once, arranged in two belts.

Now, it has lately been ascertained by a careful comparison of all the recorded observations of the spots, that the periods of their scarcity and abundance succeed one another at regular intervals of a trifle more than five years and a half, so that in eleven years and one-tenth, or nine times in a century, the sun passes through all its states of purity and spottiness. Thus, for instance, in the present century, the years 1800, 1811, 1822, 1833, 1844, 1855-6 were years in which the sun exhibited few or no spots, while in the years 1805, 1816, 1827, 1838, 1849, 1860, the spots have been remarkably abundant and large. Several attempts have been made to connect this with periodical variations in the weather, with hot and cold years—wet and dry ones—years of good and bad harvests, &c.; but though I believe there is some such connection, it is so overlaid and, as it were, masked by the multitude of causes which act to produce what we call the prevalent weather of a season, that nothing satisfactory has been made out. But there are two classes of phenomena or facts which occur here on earth which certainly do stand in very singular accordance with the appearance and disappearance of the sun's spots. The first is that splendid and beautiful appearance in the sky which we call the Aurora or Northern lights, and which, by comparison of the recorded displays, have been ascertained to be much more frequent in the years when the spots are abundant, and extremely rare in those years when the sun is free from spots. The other is a class of facts not so obvious to common observation, but of very great importance to us, because it is connected with the history and theory of the mariner's compass, and with the magnetism of the earth, which we all know to be the cause of the compass needle pointing to the north. This is only a rough way of speaking. It does *not* point to the north, but very considerably to the west of north, and that, not always alike. Three centuries ago it pointed nearly as much east as now west of north. From year to year the change is very perceptible; and, what is more, at every hour of the day there is a small but perfectly distinct movement to and fro, eastward and westward, of its average direction. But besides this, the compass needle is subject to irregular, sudden, and capricious variations—jerking, as it were, aside, and oscillating backwards and forwards without any visible cause of disturbance. And, what is still more strange, these disturbances and jerks sometimes go on for many hours and even days, and often at the same instants of time, over very large regions of the globe, and in some remarkable instances, over the whole earth—the same jerks and

jumps occurring at the same moments of time (allowance made for the difference of longitude). These occurrences are called magnetic storms, and they invariably accompany great displays of the Aurora, and are very much more frequent when the sun is most spotted, and rarely or never witnessed in the years of few spots.

The last four years have been remarkable for spots, and there occurred on the 1st September, 1859, an appearance on the sun which may be considered an epoch, if not in the sun's history, at least in our knowledge of it. On that day great spots were exhibited, and two observers, far apart and unknown to each other, were viewing them with powerful telescopes, when suddenly, at the same moment of time, both saw a strikingly brilliant luminous appearance, like a cloud of light far brighter than the general surface of the sun, break out in the immediate neighbourhood of one of the spots, and sweep *across* and *beside* it. It occupied about five minutes in its passage, and in that time travelled over a space on the sun's surface which could not be estimated at less than 35,000 miles.

A magnetic storm was in progress at the time. From the 28th of August to the 4th of September many indications showed the earth to have been in a perfect convulsion of electro-magnetism. When one of the observers I have mentioned had registered his observation, he bethought himself of sending to Kew, where there are self-registering magnetic instruments always at work, recording by photography at every instant of the twenty-four hours the positions of three magnetic needles differently arranged. On examining the record for that day, it was found that at that very moment of time (as if the influence had arrived with the light) all three had made a strongly marked jerk from their former positions. By degrees, accounts began to pour in of great Auroras seen on the nights of those days, not only in these latitudes, but at Rome, in the West Indies, on the tropics within 18° of the equator (where they hardly ever appear), nay, what is still more striking, in South America and in Australia, where, at Melbourne, on the night of the 2nd of September the greatest Aurora ever seen there made its appearance. These Auroras were accompanied with unusually great electro-magnetic disturbances in every part of the world. In many places the telegraphic wires struck work. They had too many private messages of their own to convey. At Washington and Philadelphia, in America, the telegraph signal-men received severe electric shocks. At a station in Norway the telegraphic apparatus was set fire to; and at Boston, in North America, a flame of fire followed the pen of Bain's electric telegraph, which, as my readers perhaps know, writes down the message upon chemically prepared paper.

I must now proceed to tell you what the telescope has revealed to us as to the nature and magnitude of these spots. And here again, the closer we look, the more the wonder increases. The spots were at

first supposed to be clouds of black smoke floating over the great fiery furnace beneath,—then great lumps of fresh coal laid on, then comets fallen in to feed the fire, then tops of mountains standing up above a great surging ocean of melted matter. They are none of all these things; they are not clouds floating above the light, nor protuberances sticking up above the general surface; they are regions in which, by the action of some most violent cause, the bright, luminous clouds, or what at all events we may provisionally call clouds, which float in the sun's atmosphere, are for a time cleared off, and through the irregular vacuities thus created, allow us to see perhaps thousands or tens of thousands of miles below them: *first*, a layer of what we may consider real clouds, which appear comparatively dark, *as if* they were not self-luminous, but were seen only by the reflected light of the upper layer of bright ones; *secondly*, through other openings in this first layer, a second still darker layer, independent of the first, and probably still thousands of miles below that, and reached by some—but very little—light from above; and *thirdly*, through again other openings, what at present we must consider to be the solid body of the sun itself—at some vast and immeasurable depth still lower—and receiving so little light in comparison as to appear quite black, though that does not prevent its being in as vivid a state of fiery glare as a white-hot iron, when we remember what has been said of the lime light appearing black against the light of the sun's surface. And it is a fact, that when Venus and Mercury pass across the sun, and are seen as round spots on it, they do really appear sensibly blacker than the blackest parts of the spots.

The sun then has an atmosphere, and in that atmosphere float at least three layers of something, that, for want of a better word, we must call clouds. The two nearest the body are not luminous. They cannot possibly be clouds of *watery* vapour, such as we have in our air, for water in a non-transparent state could not exist at that heat; but they may be what perhaps we might call smokes, that is to say, clouds in which the metals or their oxides and the earths exist in the same intermediate form that water does in our clouds. The third or upper layer of luminous clouds, or, as it is called, "the photosphere," is a sort of thing that three or four years ago we might be said to know nothing at all about; I mean as to its nature and constitution; but within that time a most wonderful discovery has been made by Mr. Nasmyth. According to his observations, made with a very fine telescope of his own making, the bright surface of the sun consists of separate, insulated, individual objects or *things*, all nearly or exactly of one certain definite size and shape, which is more like that of a willow leaf, as he describes them, than anything else. These leaves or scales are not arranged in any order (as those on a butterfly's wing are), but lie crossing one another in all directions, like what are called spills in the game of spillikins; except at the borders of

a spot, where they point for the most part inwards towards the middle of the spot, presenting much the sort of appearance that the small leaves of some water-plants or seaweeds do at the edge of a deep hole of clear water. The exceedingly definite shape of these objects, their exact similarity one to another, and the way in which they lie across and athwart each other (except where they form a sort of bridge across a spot, in which case they seem to affect a common direction, that, namely, of the bridge itself),—all these characters seem quite repugnant to the notion of their being of a vaporous, a cloudy, or a fluid nature. Nothing remains but to consider them as separate and independent sheets, flakes, or scales, having some sort of solidity. And these flakes, be they what they may, and whatever may be said about the dashing of meteoric stones into the sun's atmosphere, &c., are evidently the *immediate sources of the solar light and heat*, by whatever mechanism or whatever processes they may be enabled to develop and, as it were, elaborate these elements from the bosom of the non-luminous fluid in which they appear to float. Looked at in this point of view, we cannot refuse to regard them as *organisms* of some peculiar and amazing kind; and though it would be too daring to speak of such organisation as partaking of the nature of life, yet we do know that vital action is competent to develop both heat, light, and electricity. These wonderful objects have been seen by others as well as by Mr. Nasmyth, so that there is no room to doubt of their reality. To be seen at all, however, even with the highest magnifying powers our telescopes will bear when applied to the sun, they can hardly be less than a thousand miles in length, and two or three hundred in breadth.

Next as to the actual size of the spots themselves: the distance of the sun is so vast, that a single second of angular measure on its surface as seen from the earth corresponds to 460 miles; and since, to present a distinguishable *form*, so as to allow of a certainty, for instance, that it is round or square, in the best telescopes, an object must present a surface of at least a second in diameter, it follows that to be seen at all so as to make out its shape, a spot must cover an area of not less than two hundred thousand square miles. Now, spots of not very irregular, and what may be called compact form, of two minutes in extent, covering, that is to say, an area of between seven and eight hundred millions of square miles, are by no means uncommon. One spot which I measured in the year 1837 occupied no less than three thousand seven hundred and eighty millions, taking in all the irregularities of its form; and the black space or "nucleus" in the middle of one very nearly round one, would have allowed the earth to drop through it, leaving a thousand miles clear of contact on every side: and many instances of much larger spots than these are on record. What are we to think, then, of the awful scale of hurricane and turmoil and fiery tempest which can in a few days

totally change the form of such a region, break it up into distinct parts—open up great abysses in one part, such as that I have just described, and fill up others beside them? As to the forms of the spots, they are so conspicuously irregular as to defy description.

But we must proceed, for there are more wonders yet to relate. Far beyond the photosphere, or brilliant surface of the sun, extends what perhaps may be considered as its true atmosphere. This can only be seen at all in the rare opportunities afforded by total eclipses of the sun. Everybody knows that an eclipse of the sun is caused by the moon coming between it and us. Now, by an odd coincidence, it so happens that the sun being 400 times farther off than the moon, is also ALMOST exactly, but a trifle less than 400 times as large in diameter; so that when the centre of the moon comes exactly in the line with the centre of the sun it appears to cover it, and a very little more, so as to project on all sides a very little beyond it. Now, as the moon is opaque (or not transparent), it completely stops all the light from every part of the bright disc of the sun, so long as the total eclipse continues, which is sometimes as much as two or three minutes; and then are witnessed, what at no other time can be seen, viz., certain wonderful appearances of rose-coloured masses of light projecting, as it were, from the dark edge of the moon, for the most part like knobs, or cones, or long ranged ridges of what would seem to be mountains, rising from it, but sometimes like clouds or flaring flag-shaped masses of red light, some of which have been seen quite detached from all connection with the moon's border. That they belong to the sun, however, and not the moon, is evident from the fact that the moon in its progress over the sun's face gradually *hides* those to which it is approaching, and discloses those which belong to that side of the sun which the moon is going to leave; for I should mention that they are seen irregularly placed all round the edge of the sun.

Now, what *are* these singular lights? Flames they certainly are not; clouds of some sort it is extremely probable that they are, of most excessively thin and filmy vapour, floating in a transparent atmosphere which must for that purpose extend to a very considerable height above the luminous surface of the sun. We are all familiar with the beautiful appearance of those thin vapoury clouds which appear in our own atmosphere at sunset. But these solar clouds must be almost infinitely thinner and more unsubstantial, since even in that intense illumination they are only seen when the sun itself is hidden; and when it is remembered that the head of the comet of 1843 was seen at noon-day within two or three degrees of the sun by the naked eye.

Then, again, as to the magnitude of these cloudy masses, it must be enormous. Some of them have projected or stood out from the edge of the sun to a distance calculated at no less than forty or fifty

thousand miles. They have now been observed in three great eclipses, that of 1842, 1851, and 1859, on which last occasion they were photographed in Spain by Mr. De la Rue, under such circumstances as left no possibility of doubting their belonging to the sun. I dwell upon this, because there is another luminous appearance seen about the moon in total eclipses of the sun, which can only be referred to vapours of excessive tenuity, existing at an immense height in our own atmosphere, and which exhibits the disc of the moon like a glory, or *corona*, as it is called. By the accounts of all who have witnessed a total eclipse of the sun, it is one of the most awful of natural phenomena. An earthquake has "rolled unheededly away" during a battle, but an eclipse has on more than one occasion either stopped the combat or so paralysed one of the parties with terror, as to give the others who were prepared for it an easy victory: and I may as well add that two very remarkable battles in ancient history, the one on the 28th May, B.C. 585, the other the 19th May, B.C. 557, which were in progress during total eclipses, have had the years and days of their occurrence thereby fixed by calculation with a certainty which belongs to no other epochs in ancient chronology.

There is only one more point which my limits will allow me to touch upon. I will go back to my original metaphor. Our giant may be a huge giant and a strong giant, and a good-natured giant, but if he be a sluggard he is no giant worth the name. We have seen that he is a little slow to turn on his axis and roll himself round in his nest. But take him in his relation to the outer world, he is lively enough; he "rejoices as a giant to run his course;" and vindicates his credit as a swift runner with a vengeance! Hitherto I have only spoken of the sun as a sun, the centre of our system; and, as such, regarded by us as immovable. Even in this capacity he is not *quite* fixed. If he pulls the planets, they pull him and each other, but such family struggles affect him but little. *They amuse them*, and set them dancing rather oddly, *but don't disturb him*. As all the gods in the ancient mythology hung dangling from and tugging at the golden chain which linked them to the throne of Jove, but without power to draw him from his seat, so if all the planets were in one straight line, and exerting their joint attractions, the sun, leaning a little back as it were to resist their force, would not be displaced by a space equal to his own radius; and the fixed centre, or, as an engineer would call it, the centre of gravity of our system, would still lie within the sun's globe.

But the sun has another and, so far as we can judge, a much vaster part in creation to perform than to sit still as the quiet patriarch of a domestic circle. He is up and active as a member of a community like himself. The sun is not only a *sun*, he is a *STAR* also, and that but a small one in comparison with individual stars (one of which, Sirius, would make two or three hundred of him), and

among these glorious compeers he moves on a path which is just beginning to become known to us, though in what orbit, or for what purpose, will never be given to man to know. Yet we do know—almost to a nicety—the direction in which that path is leading, and the rate of his travel (though this is less exactly determined). Still this rate, at the very lowest estimate, cannot be taken under four or five hundred thousand miles a day; and yet this speed, vast as it is, in the 2000 years which separate us from the observations of Hipparchus (who made the first catalogue of the stars), would not suffice to carry it (and of course our system along with it) over one sixtieth part of the distance which now separates it from the very nearest of the stars. When we travel through a diversified country, we become aware of our change of situation by the different grouping and presentation of the objects around us; but though travelling at this amaz-

ing rate through space, successive generations of mankind witness no change in the order and arrangement of the stars; and Hipparchus, were he to come once more among us, would recognise the old familiar forms of his constellations, and, without better means of observation than he then possessed, would be unable to detect, with certainty, any change in their appearance; though we, who are better provided in that respect, are enabled to do so.

Such, then, is the scale of things with which we become familiar when we contemplate the sun. In what has been said, it will be perceived that I have been more anxious to dwell upon facts than theories, and rather to supply the imaginations of my readers with materials for forming a just conception of the stupendous magnificence of this member of God's creation, than to puzzle them with physical and mathematical reasonings and arguments.

CHRIST'S ATONEMENT FOR SIN.

BY WOLFGANG FRIEDRICH GESS.

THE atonement of Christ for the sins of men, the blessed mystery to the contemplation of which we devote one solemn week in every year, this is to be the subject of our paper.

God has given Free-will to men; it is with us a matter of choice whether we shall act in this way or in that, more especially whether we shall follow the voice of our conscience or not. But how if man perverts this his liberty to a consciously sinful course of action? And, in truth, fearful is the stream of unrighteousness which has for ages run through the history of humanity. What an amount of cruelty of man to man, not only on the battle-field of the invader, or in the markets of the slave-holder, but in the stately houses and the lowly cottages of our own land! And what an amount of wrong inflicted by the licentiousness of man! But how immeasurably greater would this dark tide of sin appear could we pierce below the surface of action into the thoughts and motives of the heart! Plato on one occasion divided human beings into three classes. He placed the unjust and the dissolute in the lowest class, as deserving to be transformed, after their death, into wolves and apes. The second class was made up of moral and well-behaved people, who were temperate and upright indeed, but lacked the spiritual sense, and held no communion with the Eternal; these he, in his half-jesting, half-earnest strain, pronounced well-qualified for transmigration into wasps and ants. We see, therefore, that the Greek philosopher had no very profound respect for mere outward propriety. It was only those belonging to the third class, those who occupied their lives with the contemplation of the Eternal, and departed this world free from stain of any sort, who were after

their death to be admitted among the gods. Thus this wonderfully gifted man anticipated in a measure the great Christian verity, that not mere morality of conduct, but inward and spiritual righteousness leads to blessedness. We seldom find this recognised amongst ourselves. We are far too ready to judge character from without. This tendency to rest in the external is a very prevalent evil now-a-days in theory and practice.

“Thou shalt love the Lord thy God with all thy heart, with all thy soul, and with all thy strength;” this is the eternally stringent law for beings made in the image of God. Now, if this be the law, how heavy the condemnation that attends upon our actual condition! The law of God is *holy*. Consequently from the opposition of our lives to this law, a fearful alienation, a profound unhappiness, must needs ensue. And so indeed it is, and we each know by experience how heavy a burthen of woe rests upon our race.

This burthen of woe is ordained by God for a twofold purpose: for the purpose of discipline, and the purpose of retribution.

The purpose of discipline:—The wretchedness which proceeds from sin is intended to lead us to see the folly of ungodliness; they who will not believe shall feel experimentally that out of God there is no life: and it is thus that the Holy One, who delighteth not in the death of the sinner, would recall us to Himself, the only fount of life and joy. The inspired writers are unwearied in their forcible declarations of this purpose of divine love to improve us by suffering. But God's chastening has also another aim. The sin of man is a violation of the divine law, a dishonouring of the divine name. This is especially evident in the case of perjury, but it is

true also of all sin; God has made himself known to man, He has revealed his name in our midst; sin is an ignoring of God, a desecration of the Divine Spirit who dwells or desires to dwell in the human soul, just as impurity is a desecration of the Temple of the Holy Spirit, whose temple the human body should be. Now, as surely as God is a living God, so surely must He support his holy law and name; the consequence of such desecration must fall on him who has attacked the sanctuary; the sinner must, in the language of Scripture, "bear his sins;" God must recompense sin by punishment.

This purpose of retribution is not less emphatically dwelt on by the prophets, apostles, and our Lord Jesus Christ himself, than that other purpose of discipline. Take, for instance, the passage—"With what measure ye mete it shall be measured to you again;" and where is the man whose conscience does not at once recognise the incontrovertible truth and justice of these words? The necessity of retribution is most deeply imprinted upon the human mind. When misfortune comes, how frequently is it accompanied by a flash of conviction that it is the righteous reward of some evil action or other. This law of retribution is the fundamental idea of many of our noblest poetical works; not only do we trace it in the lives of individual men, but in the life of nations also. Whoever sets himself in good earnest to gain a comprehensive view of the history of humanity, will infallibly find, on the one hand, such clear traces of a fixed and wise plan, as in spite of co-existing confusion force upon him the conviction that the course of human events is ordered by the wisdom of a personal God; on the other hand, such disturbances and hindrances as can only be viewed as punitive acts of this same God. I would instance the fearful sway permitted for many centuries to the fanaticism of Mahometans. How many lands that might else have yielded a rich harvest of spiritual life they have trodden down into barrenness! But, above all, the law of retribution has been displayed in the history of the Jewish people, the people of revelation as we may emphatically call them. A long series of prophets down to Jeremiah had foretold (this every critic concedes) their carrying away by the Assyrians first, and then by the Babylonians, as God's judgment upon their disloyalty; and this really did come to pass 600 and 700 years before Christ. Again, Christ himself prophesied their overthrow as the retribution for their rejection of the Messiah, and in the following generation Jerusalem was destroyed, and for 1800 years Israel has been scattered abroad among the nations; still retaining so marked an individuality, that wherever they may meet Jew recognises Jew; a people without land or home, indestructible limbs of a torn and scattered body, a body from which the spirit has fled, because they sinned against the Spirit of Life. Schiller has missed the truth in saying that the history of the world is the judgment the world passes upon itself; the true statement is rather this,—the world's

history is a judgment upon the world,—“The wrath of God is declared from heaven upon all ungodliness of men who hold the truth in unrighteousness.” In these words St. Paul deliberately states the nature of that relation of things and events which history records for us.

What follows, then? If each one of us individually, and the race as a whole, lie under the retributive justice of God, how are we to escape its sentence? Many have their answer ready prepared: “God is Love, consequently God will forgive us.” But this is too hasty a conclusion. Doubtless God is love; He, the God of life, has called us into existence that we might enjoy it, and He is willing to call the dead in sin out of that death into life again. But, on the other hand, humanity lies under the retributive government of God. The sorrow that weighs upon the sinner practically teaches him, that joy, well-being, life itself is inconsistent with alienation from God, since He alone is the source of these blessings. Thus must the majesty of God be glorified in those who have desecrated it. Every one who has reflected upon the Divine Being will acknowledge that God's actions are not as ours, *arbitrary*, but that what He does is *necessary*. And it is equally clear from the very nature of God, that He cannot enter upon any course of action and then relinquish it, as is often the case with us changeable mortals. God's purpose cannot fail of its accomplishment. Hence it follows inevitably, that since men lie under the divine law of retribution, that law must take its full course, and attain its ultimate purpose, which is no other than the triumph of the Divine Majesty over the sins of men. God is indeed love; He delights not in killing, but in making alive; but his quickening and saving of those who have dishonoured his great Name *can* only be brought about by a full display of that Name's inalienable glory. Imagine one called to the death-bed of a friend, imagine that dying friend confiding to him that his conscience is heavily laden by guilt, and entreating some consolation; what would he say to him? We are often told, that according to the fundamental principles of Protestantism, all Christians should be priests, and doubtless this ought to be the case; what priestly word then have you to utter on an occasion like this? Imagine one ignorant of all connected with Christ's atonement, and retaining at the same time a firm hold of the truth that God by his very nature can neither be arbitrary nor changeable, and you will find that this alone remains for him to say: “My friend, God's justice must indeed mete to you that measure with which you yourself have measured; you must needs bear whatever retribution you have incurred. But submit yourself humbly to God's sentence, acknowledge its justice, let your heart be melted in the fire of the divine judgments, and turn under their influence to the Lord, so will He who is still Love,—after his majesty has been manifested in you, as well as practically acknowledged by your humble submission,—manifest also his quickening and saving power in your behalf.”

This is the only answer that he could possibly—of course I am now excluding Christ's atonement—make to his sorrowful and dying friend.

But is this a comforting answer? He who looks deeper into the human heart will find no comfort here. "Bear ye the weight of the divine judgments!" Surely these are fearful and melancholy words. "Be converted by the divine judgments!" Good,—but Christ has said, "He that doeth sin is the servant of sin;" and even the heathens of antiquity were well aware that nothing is so difficult as to gain the empire over one's own heart. "Let your hearts be softened by the chastening fires." That were well, did not experience teach us that a self-seeking heart—and this is what a sinful heart is sure to be—does *not* become softened by the furnace of tribulation, but rather embittered, rather kindled with hatred and even blasphemy against its judge. "The law worketh wrath,"* says St. Paul. "The people when hungry and hardly treated shall fret themselves and curse their king and their God," wrote Isaiah nearly three thousand years ago; and as it was in his day, so is it experience teaches us in our own. And as it is on this side death, so will it be on the other, for death can in no way change the heart of man.

How then do we stand? On one side, so certainly as the voice of conscience which proclaims the fact of a divine law of retribution is no self-delusion, and so certainly as the hallowing of the Divine Name is the highest law of all, that is, so certainly as God is a living God, even with equal certainty must the sinner remain separated from God, that is, from the Source of life, till he bears the divine judgments in a fitting spirit,—in other words, till he is sanctified by them; and on the other side, if we must needs bear the judgment our dishonouring of God's name has incurred to the end, we shall infallibly wax worse and worse, and add new debts and new guilt to our old. And taking these two truths in connection, we must needs come to the conclusion, that no one can show us a way of escape from the penalty we lie under.

But now let us look to Christ. He tells us that He is come to seek and to save the lost. In what way then does Christ propose to save these? Even his first step towards such an end is of the utmost importance. He submits, we find, to that very baptism in Jordan which the Baptist instituted as a typical confession of sin for the sinful people to whom Messiah came. While the baptism of the people in the Jordan typically declared that only in the way of deep repentance could they meet their Messiah, the Messiah's own participation in the rite testified, that only by the way of *Death* could He bring help to the people. Messiah must die to save the lost; with this conviction Jesus went on his saving way. But how does this death of the Messiah bring salvation within the reach of the lost? I will content myself with citing some of the Lord's most striking

statements upon this subject. On his last journey to Jerusalem, two of his disciples entreat as a mark of favour to be placed the one on his right hand and the other on is left when He shall come in his kingdom. He however replies that they must leave domination to the princes of this world, that their greatness must consist in serving, "even as the Son of man came, not to be ministered unto, but to minister, and to give his life a ransom for many." This expression clearly denotes the significance of his death. Are any disposed to inquire how it was that a just God could deliver over Jesus to death? He himself gives the answer: the Son of Man came to give away his life for you. And for what purpose did the Son of man give his life away? Hear his own words: "To be a ransom for many." Now, when a ransom is needed there must needs be prisoners. And where the ransom is a life, clearly the life of the prisoners must be involved. And if this ransom has to be paid for many, it is plain that they are unable to pay it themselves, though they owe it; and therefore He steps into their place. A few days later the Lord was keeping the holy festival of the Passover, the memorial of the gracious sparing of Israel in Egypt at the time of the slaying of the first-born in every Egyptian family, as well as of their deliverance from Egyptian bondage. This supper was the last, the parting meal of Jesus and his disciples, for his death was to take place on the morrow. The Lord therefore took bread and said, "Take, eat, for this is my body; and after that the cup, and said, Drink ye all thereof, for this is my blood, the blood of the new covenant which was shed for many for the remission of sins: this do in remembrance of me." He substituted the feast of the new testament for that of the old, and this feast was to commemorate his death. But why should the remembrance of Christ be most especially a remembrance of His *death*? He answers, "My blood is the blood of the new testament." But how can Christ's blood ratify the new testament? He says, "It is shed for many, for the remission of sins." Thus it is the forgiveness of sins that leads to a new covenant, this forgiveness being brought about through the shedding of Christ's blood. It was on the selfsame evening that Christ offered up that prayer (John xvii.), which we are accustomed to call a sacerdotal prayer. I may here mention that even De Wette speaks of this as the most exalted portion of the gospel, the purest expression of the divine consciousness and divine peace of Jesus, having previously observed of several others of our Lord's discourses, recorded by the same Evangelist, that they ray forth a greater than earthly brightness, so that it is inconceivable that John should have himself invented them. In this prayer, then, the Lord says, in reference to his death, "For their sakes I sanctify myself, that they also might be sanctified through the truth." And this significant expression, interpreted by the sacrificial language of the Old Testament, is to be understood thus: I devote myself as a *sacrifice* for them; this being the only way by which even the

* Romans iv. 15.

disciples of Jesus became holy men. The last allusion made by Christ to his death which I shall here quote belongs to the same occasion. When he was about, as he was wont, to set out with his disciples to the Mount of Olives, he said: "This that is written must yet be accomplished in me: 'and he was numbered among the transgressors,' for the things concerning me have an end." Christ here alludes to a most remarkable prophecy in the 53rd of Isaiah concerning that servant of the Lord who was to come forth as a root out of dry ground, without form or comeliness, despised and rejected, a man of sorrows and acquainted with grief, taken out of the land of the living, but bearing the people's grief and carrying their sorrows, the Lord having laid their iniquity upon him, who like a sheep before the shearers was dumb, opening not his mouth, but making his soul an offering for sin, interceding for the transgressors, being the righteous servant by whom many should be justified because of his having borne their iniquities. It is not possible to set forth in plainer words than these that sinners are saved through the vicarious suffering of one who has borne their penalty in their stead; and Christ, we have seen, declares that these words are accomplished by his death. You know that a few years after Christ's death, Stephen died a martyr for his faith. After a few years followed James, Peter, Paul. And who can count the numbers down to the time of Wickliffe and Huss, who sealed their witness with their blood?

The enemies of Christian truth at the present day would make the death of Jesus nothing more than a martyrdom. The Pharisees, they say, who hated him because of his reproval of their hypocrisy, accused him to Pilate; Jesus remained unshaken in his testimony to the truth, and this cost him his life. Now, it is doubtless a glorious thing to lay down one's life for the truth, and there are not many in this age of ours whose souls are lofty enough for such a sacrifice. But Jesus is so exalted, that a deed which confers the highest renown on mere men, would be in Him poor, and small, and inadequate. If Jesus be the great witness for the truth, and if the most important revolution in the world's history be brought about by Him, those who have any proper historical sense should first of all ask of Jesus himself the meaning of His own death. His answer we find far transcends language applicable to mere martyrdom. "My life," He declares, is a *ransom*, my blood is the blood of the new covenant,—it is shed for the forgiveness of sins. Thus the Saviour reveals the *atonement* character of His death; for, whatever act or suffering is of a quality to expiate offences is called *atonement* for those offences, and it is through *atonement* for human guilt that Jesus brings about the reconciliation of Man with God,—his restoration to the character and privileges of a son.

But how does His death atone for our sins? In order to understand this, we must be careful clearly to *distinguish* between the two fundamental ideas

found in our Lord's own Words. When He says that at His death He sanctifies himself for His disciples, He characterises his dying as a freewill and holy offering of his life to God. And when He declares that the Son of Man came to give His life a ransom for many, this giving His life is represented as a perfectly free act, and the life given as a costly gift—for a ransom must needs be costly. This is the first fundamental idea in all our Lord's statements concerning His death,—in free love He gave up His holy life to the glory of God. But, on the other hand, Christ describes His death as the fulfilment of that prophecy which declares, that the righteous servant dies because God has laid on him the iniquity of the unrighteous,—their sentence being executed upon him,—their transgressions the burthen under which he sinks. This is the second point of view in which the Lord teaches us to consider His dying. If, then, we would know the real truth and the whole truth, we must grasp both points of view in their vital *unity*. And if this be done, one class of objections, often adduced, will die away of themselves. For with regard to all profounder truths, the great desideratum, but at the same time the most serious difficulty, is to apprehend by a living glance the essential oneness in which two different truths converge, and from whence they radiate;—the beating heart, so to speak, from which, and to which, the streams of truth flow; superficial minds discerning often nothing but contradictions in the profound subjects which reward a deeper insight with the highest intellectual enjoyment, because it is just in those profoundest depths that it recognises harmony.

I must now revert to our supposed answer to the dying man, convinced by his awakened conscience that for a guilty sinner it is a fearful thing to fall into the hands of the living God. We have imagined ourselves telling him that he must needs submit to the consequences of his actions, be they what they may; but that if he, in another world, bows humbly to the just judgment of his God, and turns in penitence to Him, his Creator will, after the expiation of the sentence due, cause His face to shine upon him once more. But, in point of fact, the retributive justice of God does not begin in another world: the life that now is, is often fearfully shattered by sin, and the weight on the conscience most oppressive here; nay, we trace the effects of this law of retribution in national as well as individual life, and through the whole progressive history of the race. Now, there are two points which must be taken into consideration, before we can rightly understand the nature of this retributive justice. The holy men who spake by inspiration of God, both in the Old and New Testament, most distinctly state that physical death is the wages of sin. Not that we can suppose, that even had we been sinless, these earthly bodies of ours could eternally have clothed our immortal spirits. But the manner in which our earthly life now ends, in complete severance of the spirit from all material

organisation whatsoever, this, the Scripture teaches, is not the original ordinance of the Creator. According to that original ordinance our spirits would, during our mortal life, have evolved for themselves out of these earthly and material bodies a higher and an undying corporeity. But physical death as it exists now, or, to adopt the language of St. Paul, the "being *unclothed*" instead of the "*being clothed upon*," this it is which is the wages of sin. Now, what is it that constitutes the distinctive character of the judgment which sinners have incurred,—what is the special root out of which death grows? It is the alienation of the sinner from that communion with God which is the only source of life. If we take a tree out of the soil from whence its roots derive their nourishment, it will die; and so it is with our own life, which we have, by reason of our sin, taken out of the very element of life—that is to say, out of fellowship with the living God.

Thus we see that the sentence of death treads on the heels of sin by invincible necessity. And now remember, also, that since there is no shadow of repentance, or turning with God, this sentence cannot end before it has accomplished its aim, its purpose, which purpose is the manifestation of the Divine Majesty. Just as the symptoms of bodily disease will not disappear, till the cause of the disease be removed, so the processes by which death saps human life cannot disappear till the separation of man from the Source of life be done away with, and the Spirit of the living God be restored to the human race. Yet how shall the Divine Spirit be ours till we have in humble submission borne God's judgment, borne it in a holy frame of mind and borne it to the end? This brings us back to the very point we stood at before: there is no human way of escape from the sentence of condemnation under which we lie! But we stand in a different attitude than we did, for now we have heard the words of Christ. The judgment which we had to bear has been already borne, for Christ declares himself to be that righteous servant who is, according to prophecy, while bearing the sins of many, to give his life as a sacrifice for their guilt. And thus God's judgment has been holly borne, for He who bore it sanctified himself, as He himself says, "I sanctify myself for them." Christ has not merely *suffered* death in consequence of sin. He has suffered it with the full consciousness that Death was the wages of sin, submitting with holy, loving, and reverent submission to the conditions of Divine justice; and hence is it that his death has in it power and virtue to atone for our sins.

But I must show, with still greater distinctness, what we are to understand by Christ's holy bearing of the Divine judgment. Jesus the Holy One, who could declare that no one knoweth the Father but the Son—Jesus might have had joy* uninterrupted;

He might have withdrawn himself from the guilty race who did not desire Him, and have lived solely in the blessed contemplation of His Heavenly Father. For, as He himself says, "This is life eternal, to know thee, the only true God."* It was his zeal for God's glory, his love for mankind, that forbade this; He desired to reveal his Father to men. Why, we may ask, did He not limit this revelation to the true Israelites, to a Nathanael, a Peter, a John? His love could tolerate no such limitation; it impelled Him to seek the publicans and sinners. But why, at least, did He not remain at a distance from the Pharisees, who had been already declared by the Baptist to have rejected the counsel of God?† Because his love could tolerate no limitations of any sort: the Son of Man had come to seek the *lost*, wherever and whatever they might be. Now, any one who is feelingly alive, on the one hand, to the sinless purity of Him who condescended to sit and eat with sinners; and, on the other hand, to the fact, that this pure and sinless one was *very man*,—not a mere, but still a true man; in all things susceptible of pain, sorrow and temptation, even as we are,—will at once discern how great an effort of absolute self-denial is implied in this companionship of Christ with sinners, and will see that his inward agonies, inward crucifixion, must have begun long before his bodily death. If an unholy man feels constrained and distressed in the company of the holy, surely the fellowship of worldly men must have been a deep grief to the Divine holiness of the Saviour. But when we further take into consideration the practical bondage of men to sin, and the hatred of men to God's judgment upon sin, we may well say that Christ, in his intercourse with men, bore the punishment which God has affixed to human guilt.

Christ knew well the inward anguish that awaited Him, when He appeared as a Prophet in the midst of rebellious men; but, for the glory of God and the welfare of those men, He willingly took upon Him all the miseries which Divine Justice has associated with human intercourse ever since the Fall; He, so to speak, accepted the conditions under which alone, according to God's ordinance, it is possible for a holy being to act and work amongst sinners, and in this manner he practically acknowledged the holiness and justice of God, in evolving out of human sinfulness itself the penalty that attends upon all human intercourse. On the other hand, we have seen that Christ gave up his life voluntarily. As He himself said, no one took his life away from Him: He gave it up of himself. At the very moment of his capture in the garden, He might have prayed to his Father, and He would have sent Him down legions of angels; those even who came to take him fell to the earth at his words, "I am he." This voluntariness of the sacrifice of Christ appears prominently from the narrative of his Transfiguration; the Holy Jesus might have returned from the

* Heb. xii. 2.

* St. John xvii. 3.

† See Christ's own words, Luke vii. 30.

Mount to the invisible world, without undergoing death. Wherefore, then, was it that He submitted to die? It was that amidst the myriads of men who *must* of necessity die, being sinners, and who, before Christ's spirit was shed abroad, never rightly *understood* either their sinfulness, or the sentence of death that they lay under,—to say nothing of their powerlessness to undergo that sentence in a right spirit,—it was that amongst all these myriads there should be *one* who suffered death with full *comprehension* both of the nature and penalty of sin; full comprehension that the law of mortality is a holy judgment of God passed upon sin; that one amongst the many should suffer death in holy *submission* of his soul to the *justice* of this divinely-appointed penal law.

Again, in the third place: the root from which Death springs is, as we have before seen, the separation of the sinful soul from life-giving communion with the living God. The bitterest drop in the cup of the lost will be that they have lost their God, torn for ever with their own hands the bond between themselves and Him. For—for him who hath sinned against the Holy Spirit there remaineth no forgiveness, and his will be a fearful isolation when it is finally decreed that he is and must continue separated from Him who created him, and who is the alone source of life. Even now, the men who are without God in the world, know something of this terrible loneliness; but what has only faintly begun here, will be fully developed hereafter; what is now felt in secret will then be made manifest. On the other hand, the highest happiness of the Christian, even now, is that of which St. Paul speaks, the Spirit bearing witness with his spirit that he is the Son of God. And now consider these words of Christ: "My God, my God, why hast thou forsaken me?" Not, indeed, that this forsaking of the Son by the Father could resemble the forsaking of the wicked by the God whom they have rejected. Christ expressly states, the very evening before his death, "I am not alone, because the Father is with me," and his cry on the cross is, "*My God, my God!*" But for the dread time during which He was given over into his adversaries' hands, the Father's inner voice, witnessing of his communion with the Son, was hushed, that so the Son might, in this *silence* of the Father, experience the darkest portion, the very essence of God's judgment against sin, and, by believing and humble submission, recognise the linking of even *this* awful consequence with sin, to be a righteous law of the Righteous Judge; thus, by his holy bearing of the sentence accomplishing its purpose, and by fulfilling it to the end, doing it away. For the atoning power of all our Lord's sufferings lies in this *holy* bearing of the judgment which God has indissolubly linked with human sin; not in his physical pains, his wounds, his blood as such, but in the holy labour of his soul, when he voluntarily underwent the penalty affixed by God to sin, received the bitter cup from God's hand

into his, the Son of Man's, thus, by fulfilling its purpose, accomplishing its aim—*exhausting* the judgment. This is what is included in the atonement of Christ; a profound suffering, not merely *external* suffering and submission, but inner and intense, the most free and most absolute spiritual act of sacrifice that ever was recorded in the history of humanity.

Any one who has followed the above train of thought with deep attention and spiritual recollection, will find in it an answer to the two following questions: why could not God's forgiveness be obtained except through the death of Christ? and in what manner does Christ's death bring about the forgiveness of sins? But there are two other questions which spring out of the above statements, to which I have yet to reply: and these are, first: How can the holy sufferings of the one man Christ Jesus atone for the sins of hundreds and thousands of millions?—and, secondly, in what way can Jesus appear before God as the representative of humanity? And these two questions I the more willingly propose to answer, because of the deeper insight we shall thus gain both into the wisdom of God, and into the mystery of the Saviour's person.

How, then, can one man's holy endurance of the Divine judgment upon sin atone for the sins of millions? The briefest answer I can give to this question is as follows: If you compare humanity to a tree, Christ's relation to this tree with countless leaves, is not that of a leaf like other leaves; and if you compare humanity to a body with many limbs, Christ is not a limb like other limbs. In all organic life, each part is doubtless vitally related to the whole, but the different parts are not alike vitally important to that whole. Look at the facts of Nature—the tree includes root, trunk, several arms, a multitude of smaller branches, a countless abundance of leaves; if of these leaves you take away numbers, your eyes will scarcely note their loss, the tree will not suffer; but if you take away the root, what becomes of the tree? So with regard to the body—we deprecate the loss of a limb, yet how many a soldier returns, seriously maimed indeed, but in good health and spirits, to his home; whereas if the bullet reach the heart, all is over with him. And so it is in the organism of human society. The members of the family are father, mother, children, but we call the father the *head*: the duty of the children is to obey, even when they do not understand him; while his part is to understand the wants of wife and children better even than they can; and not only to understand, but to supply. The State, too, is divided into members, into citizens and governing authorities, and every citizen is of use to the State, but in the most free Republic it has never been imagined that each citizen could be a statesman. We call statesmen those who have insight to discern, and power to execute, that which is best for the many-sided life of the people at large. So, too, in ecclesiastical organisation; each member is of use to the whole body, but there are some who

have more especially *the cure of souls*; whose vocation it is to assist and support in all questions relating to spiritual life, men of various ages, positions, callings, gifts, and temperaments; and this can only be rightly and really done by one who can connect his own experience with the experience of men of every shade of character, and take by sympathy the varied life of others into his own: only such a one can speak the appropriate word of help to each separate case that comes before him. But how remarkable the extension of the horizon both of thought and action in those highly-gifted spirits that God sends among us from time to time. Some live in the narrowest sphere, and hardly understand themselves; others have not only a deep insight into their own life as well as into the lives of a wide circle of their fellow men, but are able to enrich all alike with special and appropriate gifts. This may, in some degree, prepare us to understand the relation of Christ to the whole of humanity. Christ was an Israelite according to the flesh, and he remained dutifully subject to the law which made the Jews what they were. But the name by which he was wont to name himself was, "*the son of man*," the field in which he sowed the seed was *the world*, all nations were to be his disciples, and of *all his disciples* alike he required that they should love him with their whole power of loving. And, in point of fact, how wondrous the might with which for these eighteen hundred years one Jew has actually subjected to his mild yoke thousands and thousands of souls out of every nation! Syrians, Egyptians, Greeks, Romans, Saxons, Celts, Slaves, have said to Him, as said his Jewish disciples of old: "Lord, to whom shall we go? Thou hast the words of eternal life!" Yea, not only hast thou the *words* of life, but *thou thyself art* the life. "He who hath the son of God hath life." For wherever the religious life of Christians really exists, there will be found a fellowship with Christ's person, there the language held will be: "Thou art the vine, we will be the branches." All such souls have acknowledged that it was this Jesus, this personal Saviour, who awakened and quickened their inner man; that it is this fellowship with Him which enables their better nature so to triumph over their lower, that they can partly reach the goal towards which their conscience strives. This intimate and indissoluble bond which unites all such spirits to Christ, to his *person*—and the closer the bond, the completer the liberty—this is the most remarkable fact in the history of the human race, the highest problem with which psychology can possibly occupy itself. Now, the only possible explanation of this fact lies in this, that He who calls himself the *son of man* was not a mere man, but the eternal and incarnate Lord, for whom and by whom all human spirits were created. But however I will not dwell further here on the person of Christ; I will only show in what way this one man can be the priestly representative of the whole race. He who appears before God as the priest of sinful

men must be able to take an adequate view of the guilt of the people whom he represents; he must not look upon it as less than it is in the eyes of a Holy God; he must apprehend its depth, its full extent, its wide-spreading ramifications—I say its *ramifications*, because, as humanity in God's sight is not a mere aggregate of separate men, but an organic whole, having a common moral sense implanted in it by its Creator, sin has necessarily a *common* and corporate existence, the *world* lies in wickedness, the *spirit of the world* is become a spirit of evil. Now no man, except Christ, has ever yet been able rightly to discern the nature and extent of sin, because only one who is sinless can see how black its stain; only one who himself stands in the light can truly know what darkness is. And this *son of man* is also the only one whose penetrating gaze can apprehend the whole of the glory and worth of which God created humanity capable, the whole tenor of its downward way, and the high end it may yet attain; none but Jesus has ever sounded the whole extent of the aberrations, degradations, and disorder of our race. He, however, *has* sounded all these depths, his heart has been pierced with adequate sorrow for all that dishonouring of God's holy name of which the beings whose brother He became are guilty; and consequently He has fully apprehended the righteous severity of divine justice in connecting sin with death, death in its various forms. And because He has manifested the righteousness and justice of the divine sentence—not in words only, but practically by his silent and holy endurance of its penalty—He has accomplished the *purpose* of divine punishment, and has terminated it—on behalf of whom? On behalf of all those who by faith appropriate this his holy endurance of the divine judgment as their own.

This last sentence contains also an answer to the second question—In what sense is it that Christ stands in the place of other men, or how is He to be my representative, and how am I to avail myself of his work? It is in and by faith, living faith, that I appropriate that work, and make it mine. Of course it is essential to the satisfactoriness of this answer that we should thoroughly understand what is meant by faith. No doubt to any who hold, as the opponents of Christian truth in our day generally do, the fundamental error that faith is a mere *belief* or opinion, the whole of Christianity, but most especially the doctrine of the atonement, must remain hopelessly unintelligible. But are these enemies of faith, who would willingly give themselves out to be theologians, quite unacquainted with the writings of the Reformers, or if they know them—if, for instance, they only know Luther's famous Introduction to the Epistle to the Romans, or his work upon Christian Liberty—how is it possible that they can now attribute to us that poor and inadequate conception of the nature of faith with which the Church of Rome sought to oppose the Reformation? Are not these theologians aware that one of the fundamental differences between the Church of Rome and the Reformed Church lies in

this, that the former confounds faith with mere belief, *i.e.*, the assent of the understanding to a fact or facts; whereas the Reformers understand thereby an affair of the heart, the will, the very core, so to speak, of personal consciousness. When our Lord said to the woman who was a sinner, "Thy sins are forgiven thee, thy faith has saved thee;" are we to understand by this: thy opinion, thy mere *belief*, has saved thee? When St. Paul writes to the Galatians, "It is no more I that live, but Christ that liveth in me; and the life that I now live in the flesh I live by the faith of the Son of God, who loved me, and gave himself for me;" are we to cut down these beautiful words to "I live by mere theoretical belief in the Son of God?" And, again, are we to affix this lamentably inadequate interpretation to those other words of St. Paul to the Philippians, "I count all things loss, that I may win Christ, and be found in him, not having my own righteousness which is by the law, but that which is by the faith of Christ, the righteousness of God by faith; that I may know him and the power of his resurrection, and the fellowship of his sufferings." Truly we need not to be theologians, we need only have a sound intelligence, to discover at once from expressions such as these, that to have faith in Christ means to trust Him, to draw near to Him, to be found in Him, to live in Him. To have faith in Christ implies such an experimental knowledge of our own unrighteousness, as leads us to distrust our own wisdom with regard to the things of God; such deep and dominant conviction of Christ's wisdom, Christ's holiness, Christ's spiritual majesty, and such inward experience of his quickening power, as makes us trust only in his word, and experience in ourselves a real communion with Him who was dead, but who now liveth for evermore. It is self-evident that those who believe in Christ assent to the truth of his mission; but they do this, not from hearsay, not on outward evidence, but from personal spiritual experience, just as he who walks in the sunshine is convinced that the sun is up there in the sky, even if—his sight having been weak from childhood—he has never gazed full at the radiant orb.

Now, it is this personal experience which is the very soul of faith, and without which the mere assent of the understanding is a lifeless thing which the enemies of Evangelical truth ignore in their description of faith, although it is surely illogical and unfair to omit the main point of a definition. But on the other hand, they who know what is really implied in believing in Christ, living by faith of the Son of God, being found in Christ, have no difficulty in understanding how the believer has a property in all Christ is and has, more especially in his holy bearing of the divine punishment of sin. We take an illustration—Christ has given us the Lord's Prayer, a prayer so short, so simple, and yet so perfectly complete, that surely no man will presume to say he himself could ever have invented such a one. Thousands repeat these words

thoughtlessly every day, and call this repetition prayer; and at last fifty repetitions of it at a time are called a rosary, and held to be meritorious, though every intelligent mind knows well what a wide difference there is between parrot-like repetition and prayer. Such saying over the Lord's Prayer as this, of course is alike without virtue or result. But how is it when a man whose soul thirsts for the living God hears this filial prayer of the Lord Jesus, and feels at the same time the holy Spirit of Adoption dwelling within him? It may be that for a long time he fails to apprehend all the depths and heights there are in this prayer, but he breathes its spirit; the Spirit that maketh intercession therein is blended with his own, and when he approaches his Father which is in Heaven in those words which did not, indeed, spring from his mind, but from that of Christ,—think you that, in the eyes of that Father, it is not all one as though from that praying human soul the prayer had originated? Yea, verily, by the very equity of the divine holiness it must needs be so. Here we see that Christ's act of prayer is the property of mankind; just so is it with the work of suffering by which he acknowledged and satisfied the justice of God's sentence upon sin. As the Lord's Prayer was originally not ours but his, so are his holy sufferings his not ours. And as his prayer may be repeated mechanically, and to such repetition the name of prayer be given, so may a lifeless assent be paid to the fact of his atoning work, and that assent may be confounded with faith. And as such repetition of the Lord's Prayer is a useless and barren thing, so this assent of the understanding to the fact of the atonement may leave the soul of the man year by year unatoned for.

But, on the other hand, just as the holy spirit of the Lord's Prayer may take such hold of a human soul that the man's whole delight is in it, that he inhales its spirit as the sick man inhales the pure mountain air, so also may the holy spirit in which Christ submitted to God's just anger against sin, become the spirit of the sinful man who is bowed beneath the sense of personal guilt and divine displeasure. And now, how does such a one stand in relation to Christ's act of expiatory suffering? Christ's death fills him with the keenest sorrow, for he truly says: It is owing to the sins of the world, and to my sins also, that this sentence of death, which the holy Saviour bore, came upon the world; but at the same time, the sacredness of Christ's death inspires him with a joy equally keen; he praises and blesses the Son of Man who bore *righteously* and *holyly* the punishment of sin, and thereby acknowledged and submitted to God's justice, and thus did what the whole world never could have done, *endured* and *exhausted* the penalty, and magnified God's moral government, so that the sentence having accomplished its purpose, was done away with. Such a man will say: I ought to have done what Christ did, but I was not able. I thank the Saviour that he did it. Such a man will confess that his whole being is nothingness and unworthi-

ness. It is the holy sufferings of Christ with which he identifies himself, in which he delights, and which he takes for his only portion. So that henceforth he lives not to himself, but to Him by whom the saving work was done. Of a truth, a very different relation to Christ's death is herein implied than that mere *belief in the fact*, which the unenlightened confound with faith, could possibly afford; *this* faith is nothing short of a dying with Christ in order to live with him, and he who thus identifies himself with the atoning work of Christ, must needs be held by the divine justice to have a property in it; for *not* to forgive a man who thus, in the sufferings of Christ discerns, confesses and magnifies God's holy judgments *upon his own sins*, would be to continue the sentence after it has been undergone, the penalty after its purpose had been fulfilled.

It was thus that the apostles believed in the death of Christ, and history tells us what great things they gladly did in the strength of such a faith. Let, then, the Church of our day so believe therein, and it will once more be strong and joyful as the Apostolic Church was. For the foolishness of the Cross is wiser than men; and as the great poet said of the works of God's creation—of the rushing of the rivers, the flash of the lightning, the waves of the sea, the rotation of the earth, the triumphal march of the sun—"these incomprehensibly great works are glorious as on the first day," so is it true of all Christ's works; it is true of his atoning work (to-day, yesterday, and for ever), that "its love is incomprehensibly great and glorious now, as on its first day."

WHY WILL FEBRUARY HAVE A DAY MORE NEXT YEAR THAN THIS?

MANY readers will be ready to answer this question by repeating these most classic lines:—

"Thirty days hath September,
April, June, and November;
All the rest have thirty-one;
February twenty-eight alone,
Except in leap-year, I opine
When that month's days are twenty-nine."

A very proper answer, gentle reader, so far as it goes; only not a very complete one. It is quite true that the February of next year will be more liberally endowed with days than his brother of this year, because next year will be leap-year, and this is not; but the lines only suggest other questions, without answering them. *Why* does the February of leap-year get a larger portion than his brothers? And then, what is leap-year? and why are there leap-years at all?

The subject is one of considerable interest, and one which everybody, in these march-of-intellect days, would be as well to understand. Most of the readers of *Good Words*, no doubt, know as much about the matter as I do. Of the few who do not, there are probably some who do not care to know any more about it than they do. It is just possible that there may be one or two, also, who will not understand it, with all the clear explanation that I am going to give of it. All of these, then,—those who know all about it, those who do not want to know all about it, and those who are sure that they never can know all about it,—may skip this paper altogether. I have no doubt that they will find in the *Part*, instruction for the most knowing, something more attractive for those who do not care how many days there be in a month; and something simple enough for those who dare not face the little calculations we shall have to make,—those who resemble a certain lady, of whom we have read, who declared

that her sums "would not add up." But perhaps, out of the half-million readers of *Good Words* there may be a few of inquiring dispositions, who would like to know more about the matter than they happen to have learned about it; and to these few I make my bow, and introduce myself as their instructor, and, withal, their very humble servant.

First of all, then, I must begin my lesson by calling you to notice a distinction between the different divisions of time which are in use among us. If I were writing for those who know all about it, I would say that some of these divisions are natural, and some of them arbitrary; but it will be better to say to you that some of the divisions are made *for us*, and that some of them *we* make ourselves. You will understand this if you will think of a *day*, and of an *hour*. The time between one sunrise and another, or between one sunset and another, might be called a day. But it is more convenient, for reasons which I need not explain, to give that name to the time between one noon and another. Now this is what we do; only, as we find that these intervals are not exactly of the same length, we take the average length of them, and call *that* a day. But, for all that we have to do with it at present, we may consider a day to be the interval between one noon and another; that is, between the time when the sun is exactly to the South of us, and the time when he is there again. Now, what I wish you to notice is, that this period is fixed for us. We cannot make it longer or shorter; all that we can do is to give it a name. It is measured and marked off for us by the sun, which its Creator and ours appointed to be "for signs and seasons, and for days." But there is nothing in nature to mark out an hour or a minute. We simply choose to divide the day into twenty-four equal parts; and it is a very convenient division. I do not know that any other division

would be more so; but still there is nothing in nature to hinder our making any other. If we chose, we might divide the day into twenty, or into thirty, or into any other number of hours; and so we might divide the hour into fifty, or into one hundred, or into any other number of minutes. This, then, is what I mean by an arbitrary period or division of time. It is one that is made by men, according to their own will or choice, as distinguished from a natural period, or division, which is fixed by nature, that is, by God, the Creator of the world, the Author of nature.

Now, then, the period of time that we have to do with in this little lesson is the *year*; and the question which we have now to ask about it is, to which of these two classes does it belong? Is it a natural, or an arbitrary period? And the answer to this question is, that it is a natural period, as distinctly pointed out by the sun, as the day is by his coming to noon; for God appointed the sun to be "for years," as well as "for days." I shall tell you how the sun measures off a year.

Of course every one knows that the sun does not always rise, and does not always set, at the same time. In winter we see much less of him than in summer. If we attend to the matter, we shall find that near the end of December, he rises very late and sets very early; but that he begins to rise a little earlier and set a little later every day; that about the middle of March he rises and sets about six o'clock, and that he is twelve hours above the horizon, and twelve hours below it. He still goes on rising earlier and setting later till about the middle of June, when he begins to shorten the period of his shining, just as he had lengthened it before; so that in September we have him again above the horizon for just twelve hours, the time being gradually shortened until it comes to the shortest in December; yet so that the longest night, in December, is of the same length with the longest day, in June, (meaning by *day*, here, the period of sunshine). All this we can see in general by the most ordinary attention, indeed by such an amount of attention as it is almost impossible not to give. It is therefore very clear that the interval between one longest day and another; or between one shortest day and another; or between one time when the lengthening days are just twelve hours long and another; or between one time when the shortening days are just twelve hours long and another; is a natural period, over which we have no control. All that we can do is to give it a name, and to accommodate our arrangements and our occupations to it. In point of fact, this is the natural period to which we give the name of a *year*. We may consider it as beginning whenever we like; though perhaps the most natural time for its beginning would be one of the four that we have mentioned, the longest day, or the shortest day, or one of the two days when the time is equally divided between light and darkness. In point of fact, we do not begin our year at any of these

periods, but a few days after the shortest day. But while it is quite optional with us to make the year begin when we please, the length of the year is absolutely fixed, so that it is altogether beyond our power to alter it.

Suppose now that we have means of ascertaining with perfect accuracy the time of the day, say by a clock which is absolutely correct; let us ascertain that on some day in the month of March the sun rises exactly at six o'clock; and let us carefully note the number of days that elapse before this occurs again. We find that it does so after about 180 days; but we need not pay any attention to this, as the explanation already given is enough to show us that it is only a half year, and not a whole year that has elapsed since we began our observations. We therefore wait patiently for 180 days more, and then we begin to observe with intense anxiety the time of the sun's rising. When 360 days have passed since our observation began, we find that the sunrise is a little after six in the morning, and the sunset a little before six in the evening. On the 365th day we find that the rising is very little after, and the setting very little before, six; while on the 366th day the rising is a very little before, and the setting a very little after, six; but that there has not actually been a day on which it rose and set at precisely the same instant as on the day on which we began our observation. We therefore conclude that the year was not quite done on the 365th day, and that it was a little more than done on the 366th; in other words, that the length of the year is 365 days and a fraction of a day. We might also find, if we could make our observations with sufficient accuracy, that the time the sunrise was after six on the 365th day, was only about one-third of the time that it was before six the next day; and so we conclude that the length of the year is very nearly 365 days and a quarter of a day.

Well, then, it appears that Nature's year consists of so many days and a part of a day; but our year must consist of complete days. If, however, we make our year to consist of 365 days, it will be about a quarter of a day too short; and if of 366 days, it will be about three-quarters of a day too long. In the former case we shall be gaining upon Nature at the rate of one day, and in the latter, losing at the rate of three days, in four years; or twenty-five days in the one case, and seventy-five in the other, in a century. Now, as the sun is appointed to be for "seasons" as well as for days and years, it would manifestly be inconvenient to have our years thus differing from Nature's years. We, therefore, fall upon the expedient of having three short years and one long one, that is, three of 365, and one of 366, days; and so four years consist of 1461 days: and this is the reason why every fourth year gives an additional day to February, whereas in the intervening years he has "twenty-eight alone."

Now, this would be perfectly accurate, provided that the real year consisted exactly of 365 days and

a quarter. But this is not the case. The most accurate observations give the true length of the year to be about 365 days, five hours, forty-eight minutes, fifty-two seconds. So that four years ought to consist, not of 1461 days, but of 1460 days, twenty-three hours, fifteen minutes, twenty-eight seconds. Our years, therefore, are too long by nearly three-quarters of an hour in four years; which will amount to a day in about 130 years. A correction is therefore necessary. But it would not be convenient to apply it once in 130 years, even if this were the exact time at which it is necessary, which it is not. It is, therefore, applied at the end of 100 years; that is to say, the year that is named by even hundreds, such as 1700, 1800, 1900, which ought, according to the first rule, to be a leap-year, is made a common year. Thus a century consists of twenty-four leap-years and seventy-six common years, that is, of 36,524 days; whereas, it ought to consist of 36,524 days, five hours, twenty-six minutes, and forty seconds. The error now is, therefore, about a quarter of a day in a century, and our years are too short; and we shall therefore come very near correcting it, if we add a year in four centuries. In this way 400 years will consist of ninety-seven leap-years and 303 common years, or 146,097 days, whereas their proper length is 146,096 days, twenty-one hours, forty-six minutes, forty seconds. There is thus an error of about two hours and a quarter in 400 years, which will only amount to a day in about 4000 years. We may therefore rest in tolerable security that all is right for forty centuries to come.

The way in which these corrections are introduced is very simple.

The general rule is, that a year has 365 days.

The exception to that rule is, that every fourth year—that is, every year whose number can be divided by 4 without a remainder—has 366 days.

The exception to that exception to that rule is, that every year whose number is divisible by 100 without a remainder, has 365 days.

The exception to that exception to that exception to that rule is, that every year whose number is divisible by 400 without a remainder, has 366 days; and thus we might lay on tier after tier, after the fashion of the building of Jack's house.

Thus, 1864 will be a leap-year, and every fourth year after that till we come to 1900. That ought, by the first exception, to be a leap-year, but is excluded by the second exception. But 1904 will be a leap-year, and every fourth year until we come to 1996. Then the year 2000 ought to be a common year by the second exception, but it is made a leap-year by the third exception.

Thus I have shown you, inquiring reader, why some of our years should have 365 days in them, and some should have 366. But if you be as sharp as I hope you are, you will be ready to say, "Yes, I see that clearly enough. But why should poor February be the victim of all these experiments and corrections? Why should he be laid in that old

fellow's bed that I have read about, and be stretched out or pared down to suit our convenience?" I am afraid I cannot give you any very good reason for it, excepting that February was once the last month in the year, and perhaps they thought that they could use liberties with him, as being the youngest of the family. It would certainly be altogether a neater year if the months consisted of 31 and 30 days alternately in a leap-year, and the last were shortened to 29 in common years. Somewhat after this fashion—

January 31.	July 31.
February 30.	August 30.
March 31.	September 31.
April 30.	October 30.
May 31.	November 31.
June 30.	December 29 or 30.

If you and I should ever go to found a colony in a desert island, we shall probably adopt some such order as this; but as long as we dwell in the "old country," we must just be content with the old plan; refreshing our memories, if necessary, by an occasional repetition of the fine old lines which I quoted a little while ago.

But perhaps you will not object to my trying my hand at a little allegory.

Once on a time, old father *Annus* was resolved to retire from business, and divide his stock amongst his twelve sons. So they came and stated their claims, each one anxious to secure as large a portion as possible for himself. First came March, a burly blustering fellow, a soldier all over. He had not many words; but what he said was to the point, "I am," said he, "your eldest son, and fairly entitled to a good share; and if you do not give it me, why, I shall take it." So good old *Annus*, afraid of dispute, and knowing that his soldier-son would be as good as his word, allowed his claim, and gave him 31 days. Then came April, a silly inconstant fellow, no favourite either with his father or his brothers; and although he sometimes cried like a baby, and sometimes cringed and flattered and smiled upon the old man, he could not prevail upon him to give him more than 30 days. Next came the fair May, smiling and pleasant, the loved of all, and old *Annus* held out his hand to him and said "Take you as large a share as any"; and all the family clapped their hands. Then June came, and he expected to fare as well; but there were heavy complaints lodged against him. The cattle complained that he sent the gad-fly amongst them, and the milk-maids that he soured the milk in their pails, and the little lambs that he scared them with his thunder. Then the old judge looked very grave and somewhat sad, and he said, "I am afraid that I must decide against you. I confess I should have liked to give you a larger share, but justice must be done; I cannot give you more than 30 days. Then stood forth July and August, twin brothers, and they bore in their hands the heavy horn of plenty, and their heads were wreathed with

garlands of ripe ears of corn; and before they opened their mouth, their old father smiled upon them, and said, "Take 31 apiece," and a hum of approbation was heard in the court. But when September came, there arose a low murmur of complaining from the earth; and accusations were laid against him that he sent malaria, and colds, and agues, and fevers upon the earth, and destructive gales upon the sea; and he had not a word to say in his own defence, and was glad to get even so much as a thirty-days' share. But October put in a better plea for himself. "I," he said, "enable the husbandmen to gather in the later fruits of the earth, and to make all snug and comfortable in preparation for winter. I give the new-shorn flocks time to renew their fleeces, and I clothe the woods with a still richer beauty than that of May." His plea was allowed, and he went off with one-and-thirty days. November was not so fortunate. He was a dark, gloomy, unloving and unloveable character; and when he was going to speak, old *Annus* took him up sharp, and said, "Take a thirty-days' share, and be thankful for it. It is more, I believe, than you deserve." Then December and January came together, for they also were twins, and they were crowned with bright holly leaves, and they sang a blithe Christmas carol, and a thrill of joy went through the old heart of *Annus*, and he heartily shook hands with them both, and awarded them each one of the larger shares. And last of all came February; and there arose a loud complaint against him, that he was a monster of deceit and cruelty; that by flattery and smiles he often seduced the tiny flowers out of their beds in the earth, and the delicate leaf-buds from theirs in the branches, and then sprang upon them and devoured them. Then *Annus* looked very stern indeed; for he could tolerate anything rather than deceit and hypocrisy. He therefore declared that he should cut off this unworthy son with a share less than the least of those that his brothers had received. "Be thankful that you get even 28 days, and consider yourself far better used than you deserve." But then a snowdrop, who had been herself one of the victims

of February's deceit, interceded for him so earnestly, that the stern judge relented, and was prevailed upon to grant him an additional quarter of a day. And then three hearty cheers were given, and the assembly broke up.

Might not a writer of fiction make a telling use of this 29th of February, as a means of introducing into his plot that confusion which is so much admired? The hero-lover vows that, ere revolving suns bring back this day, he will return and claim Amanda as his bride. And he goes to the far east, and does deeds of unheard-of daring at the siege of Babachakhanipore, and the year speeds away, and he returns not; but hope sustains the heart of his lady-love, and she turns a deaf ear to all the entreaties of other lovers; for her heart is with her Rustum in the trenches before Babachakhanipore. So three years pass, and the fourth is on its final stroke, when at 11 o'clock on the 29th of February, the hero arrives by the last train, and pours out a whole carpet-bagful of loot at the feet of his lady-love!

One thing is clear enough, that in real life, it must be no small hardship to have, as one person in every 1500 must have, but one birth-day, and consequently but one birth-day holiday, and but one set of birth-day presents, in four years. I should think there might also be important legal questions dependent upon this day. Suppose, for example, that on a 29th of February, A promises that he will pay £1000 to B "on this day twelve-months"; when does the sum become due? Surely not on the 28th. It has its own burdens to bear. Surely not on the 1st of March. It is no part of February at all. Does it then ever become due? Or, suppose a posthumous child is left under the guardianship of an unprincipled uncle until her twenty-first birthday: must she still remain under pupilage till she attain the ripe age of 84 years? I suppose the lawyers have answers cut and dry for all such questions; but, oh weary and eye-rubbing reader, you and I cannot answer them, for we are no lawyers.

THOMAS SMITH.

REMINISCENCES OF A HIGHLAND PARISH.

BY THE EDITOR.

CHAPTER VII.—SOME CHARACTERISTICS OF THE HIGHLAND PEASANTRY.

I KNOW little from personal observation about the Highlanders in the far North or in the central districts of Scotland, but I am old enough to have very vivid reminiscences of those in the West; and of their character, manners, and customs as these existed during that transition period which began after "the 45," but has now almost entirely passed away with emigration, the decay of the "kelp" trade, the sale of so many old properties, and the introduction of large sheep farms,

deer forests, and extensive shootings. I have conversed with a soldier—old John Shoemaker, he was called—who bore arms under Prince Charlie. On the day I met him he had walked several miles, was hale and hearty though upwards of a hundred years old, and had no money save ten shillings which he always carried in his pocket to pay for his coffin. He conversed quite intelligently about the olden time with all its peculiarities. I have also known very many who were intimately acquainted with the "lairds" and "men" of those days, and who themselves had imbibed all the im-

pressions and views then prevalent as to the world in general, and the Highlands in particular.

The Highlanders whom the tourist meets with now-a-days are very unlike those I used to know, and who are now found only in some of the remote unvisited glens, like the remains of a broken-up Indian nation on the outskirts of the American settlements. The porters who scramble for luggage on the quays of Oban, Inverary, Fort William, or Portree; the gillies who swarm around a shooting-box, or even the more aristocratic keepers—that whole *set*, in short, who live by summer tourists or autumnal sportsmen—are to the real Highlander, in his secluded parish or glen, what a commissionaire in an hotel at Innspruck is to Hofer and his confederates.

The real Highland peasantry are, I hesitate not to affirm, by far the most intelligent in the world. I say this advisedly, after having compared them with those of many countries. Their good-breeding must strike every one who is familiar with them. Let a Highland shepherd from the most remote glen be brought into the dining-room of the laird, as is often done, and he will converse with ladies and gentlemen, partake of any hospitality which may be shown him with ease and grace, and never say or do anything *gauche* or offensive to the strictest propriety. This may arise in some degree from what really seems to be an instinct in the race, but more probably it comes from the familiar intercourse which, springing out of the old family and clan feeling, always subsists between the upper and lower classes. The Highland gentleman never meets the most humble peasant whom he knows without chatting with him as with an acquaintance, even shaking hands with him; and each man in the district, with all his belongings, ancestry and descendants included, is familiarly known to every other. Yet this familiar intercourse never causes the inferior at any time, or for a single moment, to alter the dignified respectful manner which he recognises as due to his superior. They have an immense reverence for those whom they consider "real gentlemen," or those who belong to the "good families," however distantly connected with them. No members of the aristocracy can distinguish more sharply than they do between genuine blood though allied with poverty, and the want of it though allied with wealth. Different ranks are defined with great care in their vocabulary. The chief is always called lord—"the lord of Lochiel," "the lord of Lochbuy." The gentlemen tenants are called "men"—"the man" of such and such a place. The poorest "gentleman" who labours with his own hands is addressed in more respectful language than his better-to-do neighbour who belongs to their own ranks. The one is addressed as "you," the other as "thou;" and should a property be bought by some one who is not connected with the old or good families, he may possess thousands, but he never commands the same reverence as the poor man who has yet "the blood" in him. The "pride and poverty" of the Gael have passed into a proverb, and express a fact.

They consider it essential to good manners and propriety never to betray any weakness or sense of fatigue, hunger, or poverty. They are great admirers in others of physical strength and endurance: those qualities which are most frequently demanded of themselves. When, for example, a number of Highland servants sit down to dinner, it is held as proper etiquette to conceal the slightest eagerness to begin to eat; and the eating, when begun, is continued with *apparent* indifference—the duty of the elder persons being to coax the younger, and especially any strangers that are present, to resume operations after they have professed to have partaken sufficiently of the meal. They always recognise liberal hospitality as essential to a "gentleman," and have the greatest contempt for narrowness or meanness in this department of life. Drunkenness is rarely indulged in as a solitary habit, but too extensively, I must admit, at fairs and other occasions—funerals not excepted—when many meet together from a distance with time on their hands and money in their pockets.

The dislike to make their wants known, or to complain of poverty, was also characteristic of them before the poor law was introduced, or famine compelled them to become beggars upon the general public. But even when the civilised world poured its treasures, twenty years ago, into the Fund for the Relief of Highland destitution, the old people suffered deeply ere they accepted any help. I have known families who closed their windows to keep out the light, that their children might sleep on as if it were night, and not rise to find a home without food. I remember being present at the first distribution of meal in a distant part of the Highlands. A few old women had come some miles, from an inland glen, to receive a portion of the bounty. Their clothes were rags, but every rag was washed, and patched together as best might be. They sat apart for a time, but at last approached the circle assembled round the meal *dépôt*. I watched the countenances of the group as they conversed apparently on some momentous question. This I afterwards ascertained to be, which of them should go forward and speak for the others. One woman was at last selected; while the rest stepped back and hung their heads, concealing their eyes with their tattered tartan plaids. The deputy slowly walked towards the rather large official committee, whose attention, when at last directed to her, made her pause. She then stripped her right arm bare, and holding up the miserable skeleton, burst into tears, and sobbed like a child! Yet, during all these sad destitution times, there was not a policeman or soldier in those districts. No food riot ever took place, no robbery was attempted, no sheep was ever stolen from the hills; and all this though hundreds had only shellfish, or "dulse," gathered on the seashore to depend upon.

The Highlander is assumed to be a lazy animal, and not over honest in his dealings with strangers. I have no desire to be a special pleader in his

behalf, with all my national predilections in his favour. But I must nevertheless dissent to some extent from these sweeping generalisations. He is naturally impulsive and fond of excitement, and certainly is wanting in the steady, persevering effort which characterises his Southern brother. But the circumstances of his country, his small "croft" and want of capital, the bad land and hard weather, with the small returns for his uncertain labour, have tended to depress rather than to stimulate him. One thing is certain, that when he is removed to another clime, and placed in more favourable circumstances, he exhibits a perseverance and industry which make him rise very rapidly.

It must be confessed, however, that Highland honesty is sometimes very lax in its dealings with the Sassenach. The Highlander forms no exception, alas, to the tribe of guides, drivers, boatmen, all over Europe, who imagine that the tourist possesses unlimited means, and travels only to spend money. A friend of mine who had been so long in India that he lost the Highland accent, though not the language, reached a ferry on his journey home, and, concealing his knowledge of Gaelic, asked one of the Highland boatmen what his charge was. "I'll ask the maister," was his reply. The maister being unable to speak English, this faithful mate acted as interpreter. "What will you take from this Englishman?" quoth the interpreter. "Ask the fellow ten shillings," was the reply of the honest maister, the real fare being five shillings. "He says," explained the interpreter, "that he is sorry he cannot do it under *twenty* shillings, and that's cheap." Without saying anything, the offer was apparently accepted; but while sailing across, my friend spoke in Gaelic, on which the interpreter sharply rebuked him in the same language. "I am ashamed of you!" he said; "I am indeed, for I see you are ashamed of your country; och, och, to pretend to me that you were an Englishman! you deserve to pay *forty* shillings—but the ferry is only five!" Such specimens, however, are found only along the great tourist thoroughfares, where they are in every country too common.

I have said that the Highlanders are an intelligent, cultivated people, as contrasted with that dull, stupid, prosaic, incurious condition of mind which characterises so many of the peasantry in other countries. Time never hangs heavily on their hands during even the long winter evenings, when outdoor labour is impossible. When I was young, I was sent to live among the peasantry "in the parish," so as to acquire a knowledge of the language; and living, as I did, very much like themselves, it was my delight to spend the long evenings in their huts, hearing their tales and songs. These huts were of the most primitive description. They were built of loose stones and clay, the walls were thick, the door low, the rooms numbered one only, or in more aristocratic cases two. The floor was clay; the peat fire was built in the middle of the floor, and the smoke, when amiable and not bullied

by a sulky wind, escaped quietly and patiently through a hole in the roof. The window was like a porthole, part of it generally filled with glass and part with peat. One bed, or sometimes two, with clean home-made sheets, blankets, and counterpane; a "dresser" with bowls and plates, a large chest, and a corner full of peat, filled up the space beyond the circle about the fire. Upon the rafters above, black as ebony from peat reek, a row of hens and chickens with a stately cock roosted in a Paradise of heat.

Let me describe one of these evenings. Round the fire are seated, some on stools, some on stones, some on the floor, a happy group. Two or three girls, fine, healthy, blue-eyed lasses, with their hair tied up with ribbon snood, are knitting stockings. Hugh, the son of Sandy, is busking hooks; big Archy is peeling willow-wands and fashioning them into baskets; the shepherd Donald, the son of Black John, is playing on the Jews' harp; while beyond the circle are one or two herd boys in kilts, reclining on the floor, all eyes and ears for the stories. The performances of Donald begin the evening, and form interludes to its songs, tales, and recitations. He has two large "Lochaber trumps," for Lochaber trumps were to the Highlands what Cremona violins have been to musical Europe. He secures the end of each with his teeth, and grasping them with his hands so that the tiny instruments are invisible, he applies the little finger of each hand to their vibrating steel tongues. He modulates their tones with his breath, and brings out of them Highland reels, strathspeys, and jigs,—such wonderfully beautiful, silvery, distinct, and harmonious sounds as would draw forth cheers and an encore even in St. James's Hall. But Donald the son of Black John is done, and he looks to bonny Mary Cameron for a blink of her hazel eye to reward him, while in virtue of his performance he demands a song from her. Now Mary has dozens of songs, so has Kirsty, so has Flory,—love songs, shearing songs, washing songs, Prince Charlie songs, songs composed by this or that poet in the parish, and therefore Mary asks, What song? So until she can make up her mind, and have a little playful flirtation with Donald the son of Black John, she requests Hugh the son of Sandy to tell a story. Although Hugh has abundance of this material, he too protests that he has none. But having betrayed this modesty, he starts off with one of those tales, the truest and most authentic specimens of which are given by Mr. Campbell, to whose admirable and truthful volumes I refer the reader.*

* Since the above was in type I have refreshed my memory by reading again Mr. Campbell's admirable introduction to his Highland tales. No man knows the Highlanders better than he does—very few so well—and I am glad to quote his opinions, of which I had no recollection while writing the above gossip. He says—

"I have wandered among the peasantry of many countries, and this trip but confirmed my old impression. There are few peasants that I think so highly of, none that I love so well. Scotch Highlanders have faults in

When the story is done, improvisatore is often tried, and amidst roars of laughter the aptest verses are made, sometimes in clever satire, sometimes with knowing allusions to the weaknesses or predilections of those round the fire. Then follow riddles and puzzles; then the trumps resume their tunes, and Mary sings her song, and Kirsty and Flory theirs, and all join in chorus, and who cares for the wind outside or the peat reek inside! Never was a more innocent or happy group.

This fondness for music from trump, fiddle, or bagpipe, and for song-singing, story-telling, and improvisatore, was universal, and imparted a marvellous buoyancy and intelligence to the people.

These peasants were, moreover, singularly inquisitive, and greedy of information. It was a great thing if the schoolmaster or any one else was present who could tell them about other people and other places. I remember an old shepherd who questioned me closely how the hills and rocks were formed, as a gamekeeper had heard some sportsmen talking about this. The questions which are put are no doubt often odd enough. A woman, for example, whose husband was anxious to emigrate to Australia, stoutly opposed the step, until she could get her doubts solved on some geographical point that greatly disturbed her. She consulted the minister, and the tremendous question which chiefly weighed on her mind was, whether it was true that the feet of the people there were opposite to the feet of the people at home? and if so—what then?

There is one science the value of which it is very difficult to make a Highlander comprehend, and that is mineralogy. He connects botany with the art of healing; astronomy with guidance from the stars, or navigation; chemistry with dyeing, brewing, &c.; but "chopping bits off the rocks!" as he calls it, this has always been a mystery. A shepherd, while smoking his cutty at a small Highland inn, was communicating to another in Gaelic

plenty, but they have the bearing of Nature's own gentlemen—the delicate, natural tact which discovers, and the good taste which avoids, all that would hurt or offend a guest. The poorest is ever the readiest to share the best he has with the stranger; a kind word kindly meant is never thrown away, and whatever may be the faults of this people, I have never found a boor or a churl in a Highland bothy."

"The Highlander sees every year a numerous flood of tourists of all nations pouring through his lochs and glens, but he knows as little of them as they of him. The shoals of herring that enter Loch Fyne know as much of the dun deer on the hill side, as Londoners and Highlanders know of each other. The want of a common language here, as elsewhere, keeps Highlands and Lowlands, Celt and Saxon, as clearly separate as oil and water in the same glass." He remarks with equal truth regarding their stories: "I have never heard a story whose point was obscenity publicly told in a Highland cottage; and I believe that such are rare. I have heard them where the rough polish of more modern ways has replaced the polished roughness of 'wild' Highlanders; and that where even the bagpipes have been almost abolished as profane. I have heard the music of the Cider Cellars in a parlour, even in polished England, where I failed to extract anything else from a group of comfortably dressed villagers."

his experiences of "mad Englishmen," as he called them. "There was one," said the narrator, "who once gave me his bag to carry to the inn by a short cut across the hills, while he walked by another road. I was wondering myself why it was so dreadfully heavy, and when I got out of his sight I was determined to see what was in it. I opened it, and what do you think it was? But I need not ask you to guess, for you would never find out. It was stones!" "Stones!" exclaimed his companion, opening his eyes. "Stones! Well, well, that beats all I ever knew or heard of them! and did you carry it?" "Carry it! Do you think I was as mad as himself? No! I emptied them all out, but I filled the bag again from the cairn near the house, and gave him good measure for his money!"

The schoolmaster has been abroad in the Highlands during these latter years, and few things are more interesting than the eagerness with which education has been received by the people. When the first deputation from the Church of Scotland visited the Highlands and islands, in a Government cruiser put at their disposal, to inquire into the state of education and for the establishing of schools in needy districts, most affecting evidence was afforded by the poor people of their appreciation of this great boon. In one island where an additional school was promised, a body of the peasantry accompanied the deputies to the shore, and bade them farewell with expressions of the most tender and touching gratitude; and as long as they were visible from the boat, every man was seen standing with his head uncovered. In another island where it was thought necessary to change the site of the school, a woman strongly protested against the movement. In her fervour she pointed to her girl and said, "She and the like of her cannot walk many miles to the new school, and it was from her dear lips I first heard the words of the blessed Gospel read in our house; for God's sake don't take away the school!" Her pleading was successful. Old men in some cases went to school to learn to read and write. One old man, when dictating a letter to a neighbour, got irritated at the manner in which his sentiments had been expressed by his amanuensis. "I'm done of this!" he at length exclaimed. "Why should I have my tongue in another man's mouth when I can learn to think for myself on paper? I'll go to the school and learn to write!" And he did so. A class in another school was attended by elderly people. One of the boys in it, who was weeping bitterly, being asked by the teacher the cause of his sorrow, ejaculated in sobs, "I trapped my grandfather, and he'll no let me up!" The boy was immediately below his grandfather in the class, and having "trapped," or corrected him in his reading, he claimed the right of getting above him, which the old man had resisted.

I may notice, for the information of those interested in the education of the Irish or Welsh speak-

ing populations, that Gaelic is taught in all the Highland schools, and that the result has been an immediate demand for English. The education of the faculties, and the stimulus given to acquire information, demand a higher aliment than can be afforded by the medium of the Gaelic language alone. But it is not my intention to discourse, in these light sketches, upon grave themes requiring more space and time to do them justice than our pages can afford.

Another characteristic feature of the Highland peasantry is the devoted and unselfish attachment which they retain through life to any of their old friends and neighbours. An intimate knowledge of the families in the district is what we might expect. They are acquainted with all their ramifications by blood or by marriage, and from constant personal inquiries, keep up, as far as possible, a knowledge of their history, though they may have left the country for years. I marked, last summer, in the Highlands the surprise of a general officer from India, who was revisiting the scenes of his youth, as old men, who came to pay their respects to him, inquired about every member of his family, showing a thorough knowledge of all the marriages which had taken place, and the very names of the children who had been born. "I declare," remarked the general, "that this is the only country where they care to know a man's father or grandfather! What an unselfish interest, after all, do these people take in one, and in all that belongs to him! And how *have* they found all this out about my nephews and nieces, with their children?" Their love of kindred, down to those in whom a drop of their blood can be traced, is not so remarkable, however, as this undying interest in old friends, whether they be rich or poor. Even the bond of a common name—however absurd this appears—has its influence still in the Highlands. I remember when it was so powerful among old people, as to create not only strong predilections, but equally strong antipathies, towards strangers of whom nothing was known save their name. This is feudalism fossilised. In the Highlands there are other connections which are considered closely allied to those of blood. The connection, for instance, between children—it may be of the laird and of the peasant—who are reared by the same nurse, is one of these. Many an officer has been accompanied by his "foster-brother" to "the wars," and has ever found him his faithful servant and friend unto death. Such an one was Ewen McMillan, who followed Col. Cameron, or Fassiefern—as he was called, Highland fashion, from his place of residence,—to whom Sir Walter Scott alludes in the lines

"Proud Ben Nevis views with awe
How at the bloody Quatre Bras
Brave Cameron heard the wild hurrah
Of conquest as he fell."

The foster-brother was ever beside his dear master, with all the enthusiastic attachment and devotion of the old feudal times, throughout the Peninsular

campaign, until his death. The 92nd Regiment was commanded by Fassiefern, and speaking of its conduct at the Nive, Napier says,—“How gloriously did that regiment come forth to the charge with their colours flying and their national music playing as if going to review! This was to understand war. The man (Col. Cameron), who at that moment, and immediately after a repulse, thought of such military pomp, was by nature a soldier.” Four days after this, though on each of those days the fighting was continued and severe, the 92nd was vigorously attacked at St. Pierre. Fassiefern's horse was shot under him, and he was so entangled by the fall as to be utterly unable to resist a French soldier, who would have transfixed him but for the fact that the foster-brother transfixed the Frenchman. Liberating his master, and accompanying him to his regiment, the foster-brother returned under a heavy fire and amidst a fierce combat to the dead horse. Cutting the girths of the saddle and raising it on his shoulders, he rejoined the 92nd with the trophy, exclaiming, “We must leave them the carcase, but they will never get the saddle on which Fassiefern sat!” The Gaelic sayings “Kindred to twenty degrees, fosterage to a hundred,” and “Woe to the father of the foster-son who is unfaithful to his trust,” were fully verified in McMillan's case. I may add one word about Col. Cameron's death as illustrative of the old Highland spirit. He was killed in charging the French at Quatre Bras. The moment he fell, his foster-brother was by his side, carried him out of the field of battle, procured a cart, and sat in it with his master's head resting on his bosom. They reached the village of Waterloo, where McMillan laid him on the floor of a deserted house by the wayside. The dying man asked how the day went, expressed a hope that his beloved Highlanders had behaved well, and that “his country would believe he had served her faithfully;” and then commanded a piper, who had by this time joined them, to play a pibroch to him, and thus bring near to him his home among the hills far away. Higher thoughts were not wanting, but these could mingle in the heart of the dying Highlander with “Lochaber no more.” He was buried on the 17th by McMillan and his old brave friend Capt. Gordon—who still survives to tell the story—in the *Allée Verte*, on the Ghent road. The following year the faithful foster-brother returned, and took the body back to Lochaber; and there it lies in peace beneath an obelisk which the traveller, as he enters the Caledonian Canal from the South, may see near a cluster of trees which shade the remains of the Lochiel family, of which Fassiefern was the younger branch.*

It must, however, be frankly admitted that there is no man more easily offended, more *thin-skinned*,

* A very interesting memoir of Fassiefern, from which these facts are taken, has been written by the Rev. A. Clark, the minister of the parish in which the Colonel is interred. It is published by Murray & Son, Glasgow.

who cherishes longer the memory of an insult, or keeps up with more freshness a personal, family, or party feud than the genuine Highlander. Woe be to the man who offends his pride or vanity! "I may forgive, but I cannot forget!" is a favourite saying. He will stand by a friend till the last, but let a breach be once made, and it is most difficult ever again to repair it as it once was. The "grudge" is immortal. There is no man who can fight and shake hands like the genuine Englishman.

It is difficult to pass any judgment on the state of religion past or present in the Highlands. From the natural curiosity of the Highlanders, their desire to obtain instruction, the reading of the Bible, and the teaching of the Shorter Catechism in the schools, they are on the whole better informed in respect to religion than the poorer peasantry of other countries. But when their religious life is suddenly quickened it is apt to manifest itself for a time in enthusiasm or fanaticism, for the Highlander "moveth altogether if he move at all." The people have all a deep religious feeling, but that again, unless educated, has been often mingled with superstitions which have come down from heathen and Roman Catholic times. Of these superstitions, with some of their peculiar customs, I may have to speak in another chapter.

The men of "the 45" were, as a class, half heathen, with strong sympathies for Romanism or Episcopacy, as the supposed symbol of loyalty. I mentioned, in a former sketch, how the parish minister of that time had prayed with his eyes open and his pistols cocked. But I have been since reminded of a fact which I had forgotten, that one of the Lairds who had "followed Prince Charlie," and who sat in the gallery opposite the parson, had threatened to shoot him if he dared to pray for King George, and, on the occasion referred to, had ostentatiously laid a pistol on the book-board. It was then only that the minister produced his brace to keep the Laird in countenance! This same half-savage Laird was, in later years, made more civilised by the successor of the belligerent parson. Our parish minister, on one occasion, when travelling with the Laird, was obliged to sleep at night in the same room with him in a Highland inn. After retiring to bed, the Laird said, "O minister, I wish you would tell some tale." "I shall do so willingly," replied the minister; and he told the story of Joseph and his brethren. When it was finished, the Laird expressed his great delight at the narrative, and begged to know where the minister had picked it up, as it was evidently not Highland. "I got it," quoth the minister, "in a book you have often heard of, and where you may find many other most delightful and most instructive stories, which, unlike our Highland ones, are all true—in the Bible."

I will here recall an anecdote of old Rorie, illustrative of Highland superstition in its very mildest form. When "the minister" came to the parish, it was the custom for certain offenders to stand before

the congregation during service, and do penance in a long canvas shirt drawn over their ordinary garments. He discontinued this severe practice, and the canvas shirt was hung up in his barn, where it became an object of awe and fear to the farm servants, as having somehow to do with the wicked one. The minister resolved to put it to some useful purpose, and what better could it be turned to than to repair the sail of the Roe, which had been torn by a recent squall. Rorie, on whom this task devolved, respectfully protested against patching the sail with the wicked shirt; but the more he did so, the more the minister—who had himself almost a superstitious horror for superstition—resolved to show his contempt for Rorie's fears and warnings by commanding the patch to be adjusted without delay, as he had that evening to cross the stormy sound. Rorie dared not refuse, and his work was satisfactorily finished, but he gave no response to his master's thanks and praises as the sail was hoisted with a white circle above the boom, marking the new piece in the old garment. As they proceeded on their voyage, the wind suddenly rose, until the boat was staggering gunwale down with as much as she could carry. When passing athwart the mouth of a wide glen which, like a funnel, always gathered and discharged, in their concentrated force, whatever squalls were puffing and whistling round the hills, the sea to windward gave token of a very heavy blast, which was rapidly approaching the Roe, with a huge line of foam before it, like the white helmet crests of a line of cavalry waving in the charge. The minister was at the helm, and was struck by the anxiety visible in Rorie's face, for they had mastered many worse attacks in the same place without difficulty. "We must take in two reefs, Rorie," he exclaimed, "as quickly as possible. Stand by the halyards, boys! quick and handy." But the squall was down upon them too sharp to admit of any preparation. "Reefs will do no good to-day," remarked Rorie with a sigh. The water rushed along the gunwale, which was taking in more than was comfortable, while the spray was flying over the weather bow as the brave little craft, guided by the minister's hand, lay close to the wind as a knife. When the squall was at the worst, Rorie could restrain himself no longer, but opening his large boat knife, sprang up and made a dash at the sail. Whirling the sharp blade round the white patch, and, embracing a good allowance of cloth beyond to make his mark sure, he cut the wicked spot out. As it flew far to leeward like a sea bird, Rorie resumed his seat, and, wiping his forehead, said: "Thanks to Providence, that's gone! and just see how the squall is gone with it!" The squall had indeed spent itself, while the boat was eased by the big hole. "I told you how it would be. Oh! never, never, do the like again, minister, for it's a tempting of the devil!" Rorie saw he was forgiven, as the minister and his boys burst into a roar of merry laughter at the scene.

One word regarding the attachment of the High-

landers to their native country. "Characteristic of all savages!" some reader may exclaim; "they know no better." Now, I did not say that the Highlanders knew no better, for emigration has often been a very passion with them as their only refuge from starvation. Their love of country has been counteracted on the one hand by the lash of famine, and on the other by the attraction of a better land opening up its arms to receive them, with the promise of abundance to reward their toil. They have chosen, then, to emigrate, but what agonising scenes have been witnessed on their leaving their native land! The women have cast themselves on the ground, kissing it with intense fervour. The men, though not manifesting their attachment by such violent demonstrations on this side of the Atlantic, have done so in a still more impressive form in the Colonies,—whether wisely or not is another question,—by retaining their native language, and cherishing feelings of the warmest affection for the country which they still fondly call "home." I have met in British North America very many who were born there, but who had no other language than Gaelic. It is not a little remarkable that in South Carolina there are about fifteen congregations in which Gaelic is preached every Sunday, by native pastors, to the descendants of those who emigrated from their country about a century ago.—

"From the dim Shieling on the misty islands
Mountains divide us, and a world of seas:
But still our hearts are true, our hearts are Highland,
And we in dreams behold the Hebrides!"

Among the emigrants from "the Parish," many years ago, was the Piper of an old family which was broken up by the death of the last Laird. Poor "Duncan Piper" had to expatriate himself from the house which had sheltered him and his ancestors. The evening before he sailed he visited the tomb of his old master, and played the family pibroch while he slowly and solemnly paced round the grave, his wild and wailing notes strangely disturbing the silence of the lonely spot where his chief lay interred. Having done so, he broke his pipes, and, laying them on the green sod, departed to return no more.

CHAPTER VIII.—THE WIDOW AND HER SON.

A WIDOW, who was, I have heard, much loved for her "meek and quiet spirit," left her home in "the parish," early one morning, in order to reach, before evening, the residence of a kinsman who had promised to assist her to pay her rent. She carried on her back her only child. The mountain-track which she pursued passes along the shore of a beautiful salt-water loch; then through a green valley, watered by a peaceful stream which flows from a neighbouring lake. It afterwards winds along the margin of this solitary lake, until, near its further end, it suddenly turns into an extensive copse-wood of oak and birch. From this it emerges half-way

up a rugged mountain side; and, entering a dark glen, through which a torrent rushes amidst great masses of granite, it conducts the traveller at last, by a zigzag ascent, up to a narrow gorge, which is hemmed in upon every side by giant precipices, with a strip of blue sky overhead, all below being dark and gloomy.

From this mountain-pass the widow's dwelling was ten miles distant. She had undertaken a long journey, but her rent was some weeks overdue, and the sub-factor threatened to dispossess her.

The morning on which she left her home gave promise of a peaceful day. Before noon, however, a sudden change took place in the weather. Northward, the sky became black and lowering. Masses of clouds came down upon the hills. Sudden gusts of wind began to whistle among the rocks, and to ruffle, with black squalls, the surface of the lake. The wind was succeeded by rain, and the rain by sleet, and the sleet by a heavy fall of snow. It was the month of May, and that storm is yet remembered as the "great May storm." The wildest day of winter never beheld snow-flakes falling faster, or whirling with more fury through the mountain-pass, filling every hollow and whitening every rock!

Little anxiety about the widow was felt by the villagers as many ways were pointed out by which they thought she could have escaped the fury of the storm. She might have halted at the home of this farmer, or of that shepherd, before it had become dangerous to cross the hill. But early on the morning of the succeeding day they were alarmed to hear from a person who had come from the place to which the widow was travelling, that she had not made her appearance there.

In a short time about a dozen men mustered to search for the missing woman. They heard with increasing fear at each house on the track that she had been seen pursuing her journey the day before. The shepherd on the mountain could give no information regarding her. Beyond his hut there was no shelter; nothing but deep snow; and at the summit of the pass, between the range of rocks, the drift lay thickest. There the storm must have blown with a fierce and bitter blast. It was by no means an easy task to examine the deep wreaths which filled up every hollow. At last a cry from one of the searchers attracted the rest to a particular spot, and there, crouched beneath a huge granite boulder, they discovered the dead body of the widow.

She was entombed by the snow. A portion of a tartan cloak which appeared above its surface led to her discovery. But what had become of the child? Nay, what had become of the widow's clothes? for all were gone except the miserable tattered garment which hardly concealed her nakedness? That she had been murdered and stripped, was the first conjecture suggested by the strange discovery. But in a country like this, in which one murder only had occurred in the

memory of man, the notion was soon dismissed from their thoughts. She had evidently died where she sat, bent almost double; but as yet all was mystery in regard to her boy or her clothing. Very soon however these mysteries were cleared up. A shepherd found the child alive in a sheltered nook in the rock, very near the spot where his mother sat cold and stiff in death. He lay in a bed of heather and fern, and round him were swathed all the clothes which his mother had stripped off herself to save her child! The story of her self-sacrificing love was easily read.

The incident has lived fresh in the memory of many in the parish; and the old people who were present in the empty hut of the widow when her body was laid in it, never forgot the minister's address and prayers as he stood beside the dead. He was hardly able to speak from tears, as he endeavoured to express his sense of that woman's worth and love, and to pray for her poor orphan boy.

More than fifty years passed away, when the eldest son of "the manse," then old and grey headed, went to preach to his Highland congregation in Glasgow, on the Sunday previous to that on which the Lord's supper was to be dispensed. He found a comparatively small congregation assembled, for heavy snow was falling and threatened to continue all day. Suddenly he recalled the story of the widow and her son, and this again recalled to his memory the text:—"He shall be as the shadow of a great rock in a weary land." He then resolved to address his people from these words, although he had carefully prepared a sermon on another subject.

In the course of his remarks he narrated the circumstances of the death of the Highland widow, whom he had himself known in his boyhood. And having done so, he asked, "If that child is now alive, what would you think of his heart, if he did not cherish an affection for his mother's memory, and if the sight of her clothes, which she had wrapt round him, in order to save his life at the cost of her own, did not touch his heart, and even fill him with gratitude and love too deep for words? Yet what hearts have you, my hearers, if, over the memorials of your Saviour's sacrifice of Himself, which you are to witness next Sunday, you do not feel them glow with deepest love, and with adoring gratitude?"

Some time after this, a message was sent by a dying man requesting to see the minister. The

request was speedily complied with. The sick man seized him by the hand, as he seated himself beside his bed, and, gazing intently on his face, said, "You do not, you cannot recognise me. But I know you, and knew your father before you. I have been a wanderer in many lands. I have visited every quarter of the globe, and fought and bled for my king and country. But while I served my king I forgot my God. Though I have been some years in this city, I never entered a church. But the other Sunday, as I was walking along the street, I happened to pass your church door when a heavy shower of snow came on, and I entered the lobby for shelter, but not, I am ashamed to say, with the intention of worshipping God, or of hearing a sermon. But as I heard them singing psalms, I went into a seat near the door; then you preached, and then I heard you tell the story of the widow and her son,"—here the voice of the old soldier faltered, his emotion almost choked his utterance; but recovering himself for a moment, he cried, "I am that son!" and burst into a flood of tears. "Yes," he continued, "I am that son! Never, never, did I forget my mother's love. Well might you ask, what a heart should mine have been if she had been forgotten by me! Though I never saw her, dear to me is her memory, and my only desire now is, to lay my bones beside hers in the old churchyard among the hills. But, sir, what breaks my heart, and covers me with shame, is this,—until now I never saw the love of Christ in giving Himself for me,—a poor lost, hell-deserving sinner. I confess it! I confess it!" he cried, looking up to heaven, his eyes streaming with tears; then pressing the minister's hand close to his breast, he added, "It was God made you tell that story. Praise be to His holy name, that my dear mother has not died in vain, and that the prayers which, I was told, she used to offer for me, have been at last answered; for the love of my mother has been blessed by the Holy Spirit, for making me see, as I never saw before, the love of the Saviour. I see it, I believe it; I have found deliverance now where I found it in my childhood,—in the cleft of the rock; but it is the Rock of Ages!" and, clasping his hands, he repeated, with intense fervour, "Can a mother forget her sucking child, that she should not have compassion on the son of her womb? She may forget; yet will I not forget thee!"

He died in peace.

TWO EASY LESSONS ON GREAT SUBJECTS.

I.

THE friend of a blind man was very anxious to give him an idea of colours, and had a long discussion with him. It was however unsatisfactory and fruitless; he tried in vain to frame an intelligible definition. The blind man, unable to attach any meaning to the words he uttered, became at last impatient and irritated, and exclaimed: "Stop, I beseech you, to torment me with empty words, which convey no meaning. There you go on, saying red, white, white, red—mere vocables, in which there is no sense. I want a regular mathematical definition, something that I can comprehend, and if I may so say, *hear* distinctly. Then I will credit that there are such things in the world as different colours."

Is not the poor obstinate blind man to be pitied? And is not his friend likewise to be pitied, who undertakes to give him a definition of colours, so that he shall comprehend them and perceive them by the sense of hearing? Would not the honest and kind way of treating him be to say: "So long as you are blind it is impossible for you to understand this; in order to *see* the meaning of red and white, it is necessary to *see*? Come to the skilful surgeon and be cured of your blindness. Then you will see what I see, and not stand in need of any definition. The argument is valid and without flaw; the fault is in your eye."

But suppose the blind man should reply: "What do you mean by seeing? I do not see; therefore you do not see, but are dreaming. It is dark all round me, and dark round every one. For I am as much a human being as you are. And as for your assertion, that I was born blind, different from other people, it is contrary to all my knowledge and experience. I have no doubt, the people who talk about light and colours are possessed of a fixed idea, which fills their imagination with these conceptions. There is no such thing as light; I have heard many things, I have listened carefully to all kinds of sounds, and never was able to discover such a thing. And as for your surgeon and the painful operation you propose, why should I subject myself to certain pain? I know you are only mocking me, and would fain deprive me of the inward, true, and real clearness of thought which I possess."

Such blind men cannot of course exist in the natural world, and why not? Because there are thousands of men who see against a few who are blind. But supposing there was only one seeing man among a thousand blind, would they not be tempted to speak in this manner, and would they not be equally foolish and wrong? It is thus that so many who are spiritually blind say with the Pharisees, "Are we also blind? How is this possible?" The natural man says "There is no Spirit of God, because I have not experienced his existence

and influence." We do not deny the latter fact, but we cannot admit that the former statement is a logical inference. And we must add, that there is with the spiritually blind a glimmer, which would fain allure them to the light and the Physician.

II.

"But, friend, this is really too bad! In your obstinacy you isolate yourself completely, and will not allow the light to penetrate into your cell. You reject everything without examination, and adhere to your opinions with the most unjustifiable pertinacity and confidence. You ought to read and examine the learned works of all deep thinkers, ere you presume to give your opinion. You sit here in perfect ignorance of the wonderful activity of thought, which now characterises the world of thinkers in their search after truth. You have not even read the most important work of —, which contains so many new disclosures; you condemn it without having seen it. Do you call this reasonable? Why do you cleave to traditionalism in such an indolent and slavish manner? Excuse my warmth, but I am concerned for you. We must progress with the times and hear every opinion, for it may possibly contain the truth."

Thus one theologian addressed the other, when he was interrupted. "Possibly contain the truth! Do you perceive what you have conceded? You admit that you do not yet know the truth and are only guessing at it, and still profess to be a theologian!"

"What do you mean? We all know that we are imperfect and liable to err, and that no person should have such confidence in himself as to exclude the views of the whole brotherhood of thinkers, and not allow them to modify and correct his opinions."

"You are quite right," replied the true theologian, "so long as it concerns mere opinions, and I do not object in that case to your plan, only take care that you really consult *all* thinkers. But when we possess something more than an opinion, when we have a *conviction*, we do not look out so eagerly for novelties and are indifferent to the variety of views expressed by people; and when we have more than conviction, again, when we have heart-experience, and faith, a gift of God,—when we have found the truth, the real living truth, it is not unnatural, nor is it presumptuous to say, 'No man can give me another truth.' I do not wish to be like the heathen, who asked 'What is truth?' while Truth Personified stood all the time before him. How few stand before the quiet countenance of Him whose silence taught the proud Roman; how few enter into solitude with Him! They admit with Pilate 'I find no fault in the man,' but they allow

Him to be crucified, and prefer continuing asking questions."

"I don't understand you, and instead of your mystic witticisms and allegorising—please speak distinctly."

"You understand me, I dare say, very well. I cannot help speaking in parables, and must take leave to add another, but one which shall give you no cause to complain of obscurity. You have seen several maps of Africa, and you have noticed that there are various and contradictory pictures of the interior country. In a society of geographers, a new map of Africa was examined and discussed. They compared it eagerly with former maps, and the greatest interest and excitement prevailed. Only one man appeared quite indifferent, and showed no desire to see the new map. Blamed on account of his apathy, he replied: 'I have just arrived from Cadiz; I have lived and travelled several years in the interior of Africa.' Was this man's indifference foolish? And was it not clear that the geographers had no other knowledge of Central Africa than that derived from maps?"

The friend replied, not without annoyance, "I see what you mean; but this is the unpardonable

and irrational presumption of your party. You say, 'We alone know the truth, we have been in the land of truth, while you others are merely guessing about it, and know only maps!'"

"Just the reverse," was the reply. "The irrational and presumptuous conduct is on the part of those who deny and oppose the testimony and experience of men, who have been in the land of truth—oppose them solely because their testimony does not harmonise with the imaginary and erroneous maps."

During this explanation the friend had become serious, and instead of thinking about a reply, listened sincerely and earnestly. The true theologian perceiving this, took his hand with a warm, affectionate grasp, and laying hold of a Bible, opened it and read John vii. 17: "If any man will do the will of God, he shall know of this doctrine that it is of God." "This rule refers," he added, "to an understanding of the Old Testament, in which Jesus speaks, and of the New, which is based on the Old. The centre of all is God's will to redeem and renew us. The way: Humility of the sinner, and sincere prayer for grace and illumination."

A. S.

SOUL-GARDENING.

I.

So spake the hoary thyme,
Half hidden in the grass:—
I watch from morning prime
Until my Lord shall pass.

How bright beneath the sun,
How sweet within the glade,
The flow'rets ope, each one
Beloved by him who made,
His flowers that live in light,
His flowers that live in shade.

The primroses are pale,
Yet fair; the violet grows
Beneath her leafy veil,
And be she pale none knows,
Or be she fair, so sweet
Her soul that overflows.

But all my head is strew'd
With ashes gray; and bent
Beneath the footfall rude,
Steals forth my timid scent,
Crush'd from a leaf that curls
Its wound to hide content.

Why should my Lord delight

In me? Behold how fair
His garden is! How bright
His roses blowing there;
His lilies all like queens,
That know not toil nor care,

In white calm peace on high
Each rears a blossom'd rod;
The gentian low doth lie,
Yet lifts from up the sod
An eye of steadfast blue,
That looks up straight to God.

I wait my Lord to greet,
I can but love and sigh;
I watch his eye to meet,
He can but pass me by;
And if his hasty feet
Should crush me, it were sweet
Beneath his feet to die.

II.

My Love, my Lord, has gone
Down to his garden fair,
To tell o'er his roses, one by one,
And to gather lilies there;

SOUL GARDENING.

*Now will I rise and sing
A song which I have made,
Unto my Lord the King,
Nor will I be afraid
To ask him of his flowers that spring
In sunshine and in shade.*

*"Oh, what are these roses bright,
That in thy garland blow?
These roses red as blood,
These roses white as snow?"*

*"These blood-red roses grew
On a field with battle dyed;
These snow-white roses strew
A path that is not wide;
None seek that path but they who seek
Him who was crucified!"*

*"Oh, what are these lilies tipp'd
With fire, that sword-like gleam?
Oh, what are these lilies dipp'd
As in the pale moon-beam,
That quiver with unsteadfast light,
And shine as through a dream?"*

*"These fiery spirits pass'd
From earth through sword and flame;
These quiet souls at last
Through patience overcame:
These shine like stars on high, and these
Have left no trace nor name;
I bind them in one wreath, because
Their triumph was the same."*

*"Oh, what are these flowers that walk
So cheerful to the morn,
All wet with tears of early dew;
And these that droop forlorn,
With heavy drops of night drench'd through?"*
"These little flowers of cheerful hue

*Familiar by the wayside grew,
And these among the corn.*

*"And these, that o'er a Ruin wave
Their crimson flag, in fight
Were wounded sore, yet still are brave
To greet the scent and sight;
And these I found upon a grave
All wet with drops of night.*

*"And some I have that will unfold
When night is dusk and still,
And some I have that keep their hold
Upon the wind-swept hill;
These shrink not from the summer heat,
They do not fear the cold,
And all of these I know for sweet,
For patient and for bold."*

*"Thou bearest flowers within thy hand,
Thou wearest on thy breast
A flower; now tell me which of these
Thy flowers thou lovest best;
Which wilt thou gather to thy heart
Beloved above the rest?"*

*"Should I not love my flowers,
My flowers that bloom and pine,
Unseen, unsought, unwatch'd for hours
By any eyes but mine?"*

*Should I not love my flowers?
I love my lilies tall,
My marigolds with constant eyes,
Each flower that blows, each flower that dies
To me, I love them all.*

*I gather to a heavenly bower
My roses fair and sweet,
I hide within my breast the flower
That grows beside my feet."*

DORA GREENWELL.

ESSAYS FOR SUNDAY READING.

IV.—THE ALABASTER BOX OF OINTMENT.

BY JOHN CAIRD, D.D.

AMONGST the incidents which marked the close of Christ's earthly history, there is none more touching or suggestive than that which the Evangelist thus narrates:—

“And being in Bethany in the house of Simon the leper, as he sat at meat, there came a woman having an alabaster box of ointment of spikenard, very precious; and she brake the box, and poured it on his head. And there were some that had indignation within themselves, and said, Why was this waste of the ointment made? For it might have been sold for more than three hundred pence, and have been given to the poor. And they murmured against her. And Jesus said, Let her alone; why trouble ye her? she hath wrought a good work on me. For ye have the poor with you always, and whosoever ye will ye may do them good: but me ye have not always. She hath done what she could: she is come aforehand to anoint my body to the burying. Verily I say unto you, Wheresoever this gospel shall be preached throughout the whole world, this also that she hath done shall be spoken of for a memorial of her.”

MARK XIV. 3—9.

We have here a noble and beautiful action rescued from detraction, and consigned by One, from whose judgment there is no appeal, to immortal honour. And you will notice with what exquisite delicacy our Lord here balances censure with commendation, sets honour over against detraction. “There were some that had indignation,” it is said, “within themselves,” when the woman, in her lavishness of devotion, poured forth the rare perfume on the head of Him she so loved and honoured. “Nay,” is the burthen of the Saviour's reply, “condemn her not; this very deed which in your narrowness and coldness ye censure, shall go down to unborn ages, and be the theme of praise to countless tongues. Wheresoever this Gospel is preached, this that she hath done shall be spoken of for a memorial of her.” Or, again, did the censurers regard her action as that of a mere thoughtless, unmeaning prodigality? “Why was this waste of the ointment made? it might have been sold for so much and given to the poor!” “Nay,” is the Saviour's reproof, “her deed is neither meaningless nor profuse:”—not meaningless, for she has in this, her strange demeanour, a deeper meaning than meets the common eye. She has in her heart a love which yearns for expression, and yet which transcends the power of mere uttered language to express; and the only way she can find to give vent to her irrepressible emotion is to declare it thus. All she can do is to symbolise it, to pour forth as if her very soul in the precious ointment with which she besprinkles her Lord's head, and to feel the incense of her gratitude, with the fragrance of the perfume, floating forth on the very air He breathes. “She hath done what she could to express her affection.” Nor, our Lord teaches them, is her act to be regarded as profuse and wasteful any more than unmeaning. For the

precious material she so lavishly expended might indeed have been turned into money, or into meat and drink and clothes, and so, as her censurers suggested, have been given to the poor. But in so conceiving of it, they applied to an act of beauty a mere utilitarian standard; they would fain test by the criterion of material utility a deed belonging to a far higher and nobler order of things. As well might they have sought to weigh love in scales, or measure thought by rule and compass, or try to detect the presence of moral evil by a chemical test, as judge by a money-standard an act of most delicate spiritual nobleness. As well might they have looked on the summer fields and asked to what purpose this waste in the growth of lily and rose? Might not all this fertility of nature, instead of running to waste on useless flowers, have gone to grow provender for cattle or food for man?—as well so have questioned as have asked, in their gross irrelevancy of thought and feeling, “might not” the material wasted on this act “have been sold for three hundred pence?”—might not this beauty have been turned into hard cash, “and given to the poor?” Yes, it might have been, but the world had been no gainer by the exchange. The bodies of a few hungry men might have been fed with bread, but an act had never been done which has fed, age after age, countless hearts with the inspiration of nobleness and self-devotion and love. Saved and turned into money, the means of a slight dole of alms might have been gained, but there had been irrecoverably lost the opportunity for an act of touching pathos of almost prophetic tenderness to the dying Redeemer of the world. “For,” said the Lord to the utilitarians of Bethany, “the poor ye have with you always, but me ye have not always. . . . She is come aforehand to anoint my body to the burying.”

We have here, then, exception taken to a noble act of Christian feeling and devotion, and our Lord's defence of it: from which defence three thoughts, with reference to acts of which this woman's is the type, suggest themselves, viz. :—

- I. The immortal honour that attends them.
- II. Their symbolic power of expression.
- III. The non-utilitarian standard by which they are to be measured.

I. Condemned by other observers, this woman's action was consigned to immortality by Jesus. “Wheresoever,” said He, “this Gospel shall be preached throughout the whole world, this also that she hath done shall be spoken of for a memorial of her.” Though not the motive, yet it constituted one element in the reward of her act of simple devotion to her Lord, that it should be had in undying remembrance, and that her name should

go down to future ages linked with the name of Him she revered and loved. Not many names, amidst the myriads who have lived and died on this earth, have survived in the world's remembrance. Of the deeds which men have done in the past, how few are those which still live in history! But amidst that bright galaxy of men renowned for the great words they have spoken or the noble deeds they have done,—poets, philosophers, statesmen, warriors, philanthropists, heroes, martyrs,—amidst the world's noblest who have made this earth illustrious by their presence, and who shine as the stars for ever, how strange to reflect that the only one to whom inspiration has assigned a place is this simple villager of Bethany; and that the one act to which undying fame is promised is not an achievement of genius, or power, or heroism; no production even of inspired intelligence, or daring, or devotion; no glorious poet's song, or warrior's victory, or martyr's death; but a simple insignificant tribute of affection offered to her Lord by a lowly woman at a village feast. She aspired not to greatness; she dreamt not of fame; but there, on the firmament of glory, next to that bright and morning star, her pure light in unobtrusive beauty shall shine for ever. To have her name united in honour to the name of Jesus was a destiny to which her humble spirit, in its highest visions of happiness, could never have soared; yet, as the sculptor of old engraved his own name indelibly on the marble of which the statue was fashioned, so that that must perish ere he could be forgotten; so, though by no presumptuous act of hers, this her deed of love has graven her name, as with a pen of iron, on the rock for ever, in that Gospel which is her Lord's everlasting memorial.

And yet it may be said, of what avail to her is all this fame and honour? Of what avail to any man is posthumous fame? Satire has often aimed its keenest invectives against the desire of posthumous fame, and in one view of the matter, not unwisely or unjustly. "What's fame?" exclaims the moralist:

"A fancied life in other's breath,
A thing beyond us even before our death;
Just what you hear, you have, and what's unknown:
The same to you if others or your own."

Strange illusion, surely, it is, when men throw away life to acquire after death a renown which they can no longer enjoy—when their imagination anticipates a fame they shall never know, and the applauses they are never to hear ring in their ears and prompt them to the sacrifice of present ease and enjoyment. What shall it matter to you, whether you are remembered or forgotten, execrated or applauded, when of neither praise nor censure can you any more be conscious—when you are for ever beyond the reach of the world's honour or the world's malice? Why seek or care for that which will be to you as if it were not, the gain or the loss of which will be alike to you? What worse than childish folly to waste thought and energy in

the pursuit of that honour which is to be won only when the ear is deaf to the voice of applause and the pulse of ambition is stilled for ever! And so, was it not, after all, a boon of little worth which in this promise the Lord conferred on his humble follower? Gone for ever from the world, does it not seem as if it would affect her just as little to be set, like Judas, as the mark of the world's undying scorn and abhorrence, as to be cherished and honoured for ever as the loved and loving friend of Jesus!

Now, though there may be some ground for that view of the matter, which makes the absurdity of the desire of posthumous fame one of the stock moralities of ethical writers, yet, as we might well infer from its forming the subject of an express promise of our Lord, it must be not altogether an unworthy or unchristian object of desire; it must, at any rate, be no despicable result of noble acting, to be cherished in men's remembrances when we are gone, and to have that "which we have done spoken of for a memorial of us."

And of this a moment's reflection will convince us. It is, indeed, unquestionable that fame, applause, glory, the honour that cometh from men, can never, considered in itself, be a legitimate object of a Christian's desire. To interpret the words of our Lord as implying or inculcating such a notion, would be to set them in direct contradiction to other passages of Scripture,—as where those are condemned who "do their works to be seen of men," "who love the praise of men more than the praise of God," who "seek the honour that cometh from man and not the honour that cometh from God only." No! the first aim of a Christian is not to *appear*, but to *be* right, not to gain the *honour* of nobleness and goodness, but to *be*, through Christ's grace, noble and true and good. Reality, not seeming; goodness, not glory; sincerity before God, not show or semblance, however imposing before the eye of man,—this is what a Christian seeks. His love for Christ, and devotion to the will of God, should ever be such as that he would do the right, not only, though in doing right he be unknown and unhonoured, but though it expose him to dishonour and infamy. Who can doubt that obscure goodness is infinitely preferable to illustrious sin? If the two are incompatible, could a Christian hesitate for a moment to sacrifice the love and honour and respect that make life sweet and death less bitter—to tear from his heart the most cherished hope and wish, rather than wound conscience or tamper with truth and holiness? Would it be a light thing, in reason's eye, to gain immortality of renown at the expense of one untrue word? Or to be hooted and hounded out of the world with scorn and shame, and consigned to eternal infamy amongst men—would not this be a fate, however terrible, from which a wise man should not shrink, if only thus could he keep true to Christ? Of what avail the acclamations of a world he has left behind, to the soul that is trembling in dismay beneath the frown of God? Or can it alleviate one pang of a lost

spirit's agony, that the far distant scene of its former life is ringing with its praises at that very moment when it is stretched on the rack of Jehovah's wrath? Nay, better one smile of God, than a world's hallelujahs; more appalling one shadow darkening the brow of Infinite Justice, than to be for ever execrated by the whole race of men.

But, all this admitted, it is yet not the less true, that, though not the motive of a Christian's actions, it is a most noble result, a glorious reward of them, when a good and holy man's memory is embalmed in the affections of mankind. To dwell with God is the chief desire, but who that knows what it is to love and to be loved would not wish to be remembered, when he is gone, by those who were dear to him on earth? If the memory of the sainted dead be dear to us who survive them, if there be homes where the loved and lost, still in the sacredness of an undying affection, may be said to live, if there be scenes which are haunted and hallowed by an invisible presence, where the dear old voices seem sometimes to fall sadly and sweetly on the ear, and we name softly and reverently the household names of those whom God hath taken, is it not natural that we, in our turn, should wish so to be remembered? It is a natural, and by no means an unchristian feeling, that makes us cling to old scenes and friends the longer we live; that makes it sad for a man of strong affections, as the end approaches, to think that the hour is coming when on all he loves and has cherished so long he shall look his last—that in a few brief months his step shall fall no more on the old path or the familiar threshold, and that on these dear faces he shall never, never, in all the ages, look again. And so it is something to be told that, like this woman, we shall still in memory survive, and that our name and our deeds shall live on loving lips. We seem to ourselves to gain thus, even on earth, some triumph over death—to enlarge and prolong existence in the hearts of those that shall never cease to love us. And if we extend the same thought to others beyond the circle of our immediate friends, surely to a man of large and expansive Christian spirit it must be a thought unspeakably delightful, that some word he has spoken, or deed he has done, shall survive, age after age, to enkindle holy ardour in many a mind, and to prompt to deeds of Christian nobleness while the world endures.

And who can tell of what incalculable results each Christian act, a word spoken in season, an act of noble truthfulness, or tenderness, or self-sacrifice, may be the seed? Who can trace the innumerable lines of influence along which a Christian's example may be propagated? What mind can embrace the calculation of all the possibilities of good, on through age after age, down the ever-growing future, which may spring from one holy Christian life? And if earthly greatness has sometimes caught inspiration to deeds of heroism from the dream of posthumous fame, if it fired the poet's heart, old, blind, and poor, to think that he was writing words which the

world would not let die, or if the dying warrior has ever found strange consolation in the thought of his country's gratitude, a name in her annals and a sepulchre among her heroes, surely to a Christian heart not less dear should be the thought, nor less inspiring to holy deeds in Christ's service, that the good we do shall live after us; that our example, if not our name, shall survive us; that our influence at least shall be associated with all that is holiest and purest and noblest on earth, even if it may not be said of us literally as of this woman, "That wheresoever this Gospel is preached this which she hath done shall be told for a memorial of her."

II. The second view of this woman's action to which I propose to direct your attention is its *silent, symbolic, power of expression*. She had in her heart feelings which craved for outward expression, and yet which, in their intensity and illimitableness, transcended the power of mere words to express. And so she did what she could. As always, in such states of mind, feeling clothed itself in the form of imagery or symbol, and she gave vent to her emotion in the expressive act here narrated. And a moment's reflection will teach us how exquisitely true to nature, and so how fraught with instruction in this respect the narrative before us is. For are we not all conscious often of states of mind, of thoughts and feelings, which it is impossible adequately to express in words; and if we try so to express them, we find that we have miserably failed? The attempt to convey by words to others all that is in our hearts is often vain, not simply from our imperfect command of language, but from the inherent insufficiency of language, with all its compass, copiousness, flexibility, as a medium of expression for our internal experiences. And so, when language fails us—when either from intensity of feeling we have not the heart to speak, or when we try, and feel it to be all in vain—we involuntarily betake ourselves to that other mode of telling forth our soul, the silent mode of sign, of symbolic look or act. The word joy is but a poor, cold vocable, that conveys to the outward ear no meaning save, as the auditor already knows, the emotion for which it conventionally stands. But who fails at once to see what is meant by a smile or look of delight beaming on the countenance, or to know what the feeling is that tells itself out in a merry laugh ringing from the lip? The word sorrow is not like the thing it represents, and any other word, if men agreed upon it, would serve as well. But who mistakes the meaning of the trembling lip and tearful eye? and when in deep grief the sufferer's lip is dumb with an anguish which cannot shape itself into words, the blank look of unutterable sorrow may be stamped, in language far more expressive than the tongue could utter, on every lineament and motion of the face and form. Hours would be insufficient to describe emotions that may be conveyed by a glance, and in a moment of high-wrought feeling there may be concentrated into a

single look what the most eloquent observer could not exhaust in the longest verbal delineation. "And the Lord turned and looked upon Peter." Imagine yourself present at that scene, and conceive that it had been yours to witness that look, to behold that face, with all its majestic purity, its awfulness, its gentleness, its unearthly sorrow and tenderness, turned upon the wretched disciple when that cruel word of thrice-spoken falsehood had just crossed his lip. Do you think that the most eloquent tongue might not weary itself in the endeavour, by all forms of uttered speech, to convey all the mingled sorrow and love, the reproachful pity, the lofty scorn of baseness, yet unwearied forbearance and love to the base, the more than kingly dignity, yet also more than womanly tenderness, which that one glance of Jesus expressed?

And in the same way with symbolic actions, such as that of the text. The beauty of such actions lies in this, that they condense into a moment thoughts and feelings which it would require a long and elaborate description verbally to portray, and which even then would be but faintly and inadequately expressed. Take, for instance, one most touching incident in the history of David. As he lay, we are told, worn and faint, in a mountain cave, there came on the warrior an irrepressible longing for a draught of water from the well of Bethlehem; and though his longing seemed vain and foolish, for the foe lay encamped between him and the fountain of whose streams he had so often drunk, he could not refrain from giving vent in words to the craving, "Oh that one would give me to drink of the water of the well of Bethlehem that is by the gate!" There were those around him who loved their chief so dearly that they were ready to imperil their life for the gratifying of his slightest wish. And without a word, caring not for the dangers to which for so slight an end they exposed themselves, "three mighty men" fought their way through the host of the Philistines, and brought back to him who was dearer to them than life that for which he craved. But we are told the king, when he received it, would not drink that draught which at such cost had been gained, "but poured it out unto the Lord," saying, "Be it far from me, O Lord, that I should do this; is not this the blood of men that went in jeopardy of their lives?" What wantonness, what worse than childish fickleness, are we not at first tempted to exclaim, is here! To what purpose this waste of that for which such a price has been paid? What gross ingratitude in return for heroic devotion. Nay, it was far otherwise. For is there not more in this action than meets the eye? As we try to fathom and express its meaning, do we not begin to perceive what a world of unexpressed feeling, of lofty thought and nobleness, and generosity and piety, is involved in it. This simple draught of water, so procured, is to David's eye the type of that which is most noble in humanity, of love and

faith and courage and self-sacrifice; it is an offering not fit for such as he, too great for mortal to receive. To God alone is it meet to be offered up. And so, in kingly humility, in unselfish piety, he pours it out to Him to whom life and love and all that is noblest in man are due.—This, and infinitely more than this, is involved in that simple act. What long-drawn words would be required to unfold all its expressiveness!

Precisely analogous is the case brought before us in the text. This woman owed herself, and all that made life dear to her, to Jesus. His mysterious hints of a dark doom that was at hand told her that from that dear Lord she soon must part. Love and faith and self-devotion, boundless tenderness and sorrow struggling in her heart, she was conscious of feelings that craved for expression, and yet which, in their intensity and illimitableness, transcended the power of words to express. She could not speak, but she did what she could. Spontaneously feeling clothed itself in a form that was its own. The affection, the self-surrender, the yielding up of all that was precious, the yearning to pour forth as if her very being in the service of this all-glorious One—this, and infinitely more than this, of which she was herself unconscious, she involuntarily shadowed forth in the breaking of the vessel and the pouring forth of its precious deposit on the head of Jesus.

And He to whom the offering was made discerned a meaning in her simple act, which words had been poor to tell. Happy we, let me add, if in our symbolic acts our Lord can discern the same spirit of love and faith and self-devotion. Our holy communion service, for instance, might, in one view of it, seem as the woman's act seemed to the unsympathising spectators, a mere meaningless work, or a waste of substantial food on empty ceremonial. The material of our holy offering, too, might be sold for so much and given to the poor. But not useless or unmeaning will it be, if, like hers, it be to many a devout spirit the medium of holiest thought and feeling. As we assemble at our simple communion feast, there will come amidst us the same Divine guest who sat at that humble board at Bethany. Here, too, to the Lord's side many a Mary-like spirit may repair, to hallow and ennoble these poor earthly elements, by that which to Him who reads all hearts they silently, yet so touchingly, express. Happy we, if, as we break the bread and drink the wine, we feel our Saviour near; and by this our simple act, tell forth a love, a trust, a high resolve and holy aspiration, a boundless affection and self-surrender, such as that which through her offering breathed. Then will the odour of a more precious ointment, a fragrance sweeter far than this earth's rarest incense, fill the house. And of us, too, will our gracious loving Lord declare—"They have wrought a good work on me."

III. The last point to which I call your attention is the *unworldly or unmaterial standard by which the woman's action is to be estimated*. To her censurers

it seemed an act of unmeaning prodigality. They saw in it only a resultless expenditure of what might have been turned to substantial material uses. If there was to be such expense incurred, why not get some substantial result from it?—why not, instead of wasting the costly essence on the empty air, turn it into hard cash and buy meat and drink and clothing with it for the poor? “Why was this waste of the ointment made? for it might have been sold for three hundred pence and given to the poor.”

Now our Lord's reply condemns this view of the woman's action as false and shallow. There was no real waste in its seeming profusion. It was a good and noble action, and it was made to appear otherwise, only by the application to it of a narrow and fallacious standard. In conceiving of it as they did, they applied to an act of beauty a mere utilitarian measure, and would fain test a deed of spiritual nobleness by a criterion which had no relation to the order of things to which it belonged.

Now, the error which these superficial censors committed is one which in principle lies at the root of many of our false judgments, both in matters secular, and in matters spiritual—the error, viz., of reversing the order of importance, and judging of that which is the end, as if it were only the means. There are some things, which, according to the nature which God has given us, we admire and love as ends, others which we come to admire and love in a secondary way as contributing to those ends. The latter may be compared to the ladder by which we climb, useful only because it helps us up; the former to the object we wish to reach. The one is as the road which leads homeward, or the carriage in which we travel, valued only because of the facility and speed with which they enable us to reach our journey's end; the other is as that desired end itself, valued for itself, as our ultimate destination.

Now the error into which, even in secular things, we are very apt to fall, and which in spiritual things may be described as the essential spirit of irreligion, is that, either of stopping short at the means, and prizing them as if they were ends in themselves, or of absolutely reversing the right order, and valuing the ends only as means, while we elevate the means to the place of honour, as ends. To take one of the grossest examples of this error, money, which is obviously only a means to the attainment of something else, may become an ultimate object of desire, in and for itself. It is of course beyond dispute, that money were mere dross if it did not stand for food and raiment, and shelter and comfort; if it were not the conventional representative of innumerable objects of desire, which it is the means of procuring. But it is also notorious, that men often begin to like money as an end, to drop out of sight all that can be got by means of it, and to seek to accumulate it with a more and more intense desire only for its own sake. Nay, sometimes the diseased craving goes to such a height, that everything which money can procure, all that renders money valuable, will be sacrificed

for the sake of money, and the covetous or avaricious man will pinch his appetites, dress sordidly, live meanly, never expend a farthing on the gratification of the intellectual or religious part of his nature—in short, give up all the ends which alone are money's worth for the sake of money's self. And the insane standard by which such an one measures all things, the question by which every action is to be decided, is, “How much money will it save or spend?” Plead with him the cause of religion or charity, set before him some noble end of patriotism, of social or national honour, of intellectual or moral worth—his only answer is, “To what purpose this waste?” Nay, visit the home where the miserly wretch is denying himself and his family the common comforts of life, wholesome food and warm clothing. Pelf is dearer to him than these, and still his answer is, “To what purpose this waste?”

Another and more common, though less palpable example of the same error, is the false estimate of the value of knowledge. There is a constant tendency to degrade knowledge from the position of an end to that of means, to value it only in so far as it contributes to practical uses, and to regard the time and money expended on those kinds of knowledge which cannot be turned to practical account as so much sheer waste. It is undoubtedly true, that knowledge is useful as the means towards a thousand valuable ends. But it is also true that there are few of the things which knowledge can enable us to get,—money, food, sensual gratification, social position and rank, fame, honour, and the like,—which are more worth having than knowledge itself; and to say that the time spent in filling the mind with any kind of knowledge, which cannot help a man to make money and get on in life, is wasted, is to say, that money, and getting on in life, are higher and better things than knowledge.

Of what use are learning and scholarship? Why let your son waste precious years in mastering dead languages, or studying philosophy, or cultivating a taste for poetry and art, when he is intended not to be a clergyman or an author, but a practical man of business? These things won't help him on in life! All the scholarship on earth won't make him a better judge of dry goods. The learning of Porson or Bentley would not help him a bit in a speculation on cotton, or an investment in bank or railway stock. The youth must push his fortune as a manufacturer, or merchant, or engineer,—what will all the poetry and metaphysics in the world do to help him here? No! let the few years he has to spend on education be devoted to the practical branches; let him learn to write a good hand, be ready at accounts, acquire, if need be, a knowledge of the modern languages; but that is all the learning he needs. Other kinds of learning might only make him a book-worm, and at any rate, if they did not spoil him for a man of business, they are practically useless,—to what purpose such waste?

Now it is, as I have said, quite true that in the sense of being directly turned to account in the

business of life many kinds of knowledge are utterly useless. And if the chief end of a man, even in this world, be to be a clever and successful man of business, to spend his time in acquiring such knowledge is sheer waste. Moreover it is also true, that forasmuch as to live is the condition of all other enjoyments, it is a very important thing for a youth to master those kinds of knowledge which are technical or professional, which will qualify him to earn his bread, and creditably to discharge the duties of his secular calling. Nor can any man be such an idiot as to despise money, or the qualifications that enable us to make it, seeing that money is the means not of low enjoyment only, but of all sorts of enjoyment and influence, high as well as low. Yet, on the other hand, when all this is said, it leaves the broad principle unaffected that practical utility is not the test of knowledge, seeing that knowledge in itself, and for its own sake, is, to him who knows its worth, better and higher than all that can be got by means of it. All that can be gained at the very best by excluding what is called useless learning, and confining a boy to the kind of knowledge that will help him to push his fortune in life, —all that at the very best can result from this is, that he makes a fortune. But a fortune is worth only what a man can enjoy out of it; and if his mind is narrow and uncultured, if he has not in youth acquired the invaluable power of conversing with the great minds of all ages, of appreciating and enjoying those things which a cultured taste and a comprehensive, broad, liberal intelligence alone can enjoy, then is he shut out from that which gives its chief value to money and leisure. He may indeed, without this, have everything that can minister to animal and sensuous delight; but a man can't get more than a limited animal enjoyment out of his money. If he try, he is drawn back by the warning hand of physical disease; if he persist, he soon, by the endeavour after excessive sensual enjoyment, destroys the very power of enjoying. The only way in which affluence and leisure can extract more out of life is when its possessor can thereby command the means of wider intellectual happiness, when his large and liberally cultured mind can rise beyond the narrow limits of sense, and by the expansiveness, the elevation, the intensifying of existence which knowledge communicates, live, as compared with the mere moneyed man, three lives for one. It is no waste, then, to cultivate and inform the mind in youth even with what seems useless learning. It is false economy to restrict it to the narrow beat of practically convertible information. There are not a few men of business, who, even in the secular sense, have chosen for themselves and their children this better part—men who, amidst all the toil of business, manage to keep up liberal tastes, and who can escape from the feverishness and shake off the dust and soil of life's conflicts ever and anon, in converse with the great minds of ancient or modern times, of their own or other countries and tongues. But no man who has

ever happened to witness the spectacle which you have sometimes observed—that which is presented by a man who has got on in life, who has succeeded in amassing affluence, yet whose lack of culture leaves him with money but without the larger part of money's worth—the coarse, narrow-minded, ill-informed man of small ideas and a big purse, with a plethora of wealth and a collapse of thought, at whose table your body is overfed and your intellect starved, whose walls are covered with pictures which he cannot appreciate, and shelves filled with books of which he can enjoy nothing but the gilt backs, the man of soulless unrefined affluence and vulgar magnificence—no man, I say, that has ever witnessed and understood such a spectacle, would be disposed, in answer to the exhortation largely and liberally to cultivate the mind, to say, "To what purpose this waste?"

But the last and most deplorable example of the reversal of the order of importance between means and end is that which relates to the highest of all ends—those of religion. Most mournful is it if, with respect to these, a man ever, either in express words or virtually by his conduct, says, "To what purpose this waste?"

Religion, religious faith, religious acts, are of those things that are their own ends, and with respect to which it is foolish, as well as wrong, to ask of what use are they? what shall we gain by them? or to what purpose this waste? This question may be asked in two ways—one of a more gross and material sort than the other, but both equally false in principle. "To what purpose this waste?" may be an inquiry with reference to the rewards or profitable results of religion, either in the life that now is, or in that which is to come. And in both cases the same answer must be given. The value of religion does not consist in these things—not in anything out of itself—not in what it brings or gains, but in what it is.

There can be no question that, in so far as external advantages in this world are concerned, much that we include under the designation "religion" is utter waste. Religion is not a marketable commodity. Its duties are not only not conducive to temporal gain and advancement, but often in many ways act as a drag or hindrance in the pursuit of them. The time spent on religion, for instance, is so much abstracted from other occupations: a sincerely pious man will, in proportion to the earnestness of his piety, be withheld from that exclusive devotion of his best hours and energies, that unremitted self-surrender to business, which is often the indispensable condition of great success. The man whose heart is set on a heavenly reward cannot throw himself with the same intensity of desire into the pursuit of earthly honour or fame as those who have no higher end in view, to whom these things are all in all. He who is living in habitual communion with God and the things unseen must often slacken the ardour and shorten the hours which the man who lives only for the things of time may devote—and successfully devote—to worldly industry. For the latter objects, much of the time

that is spent in prayer, meditation, holy exercises and employments, is mere waste. Moreover, the *money* devoted to religious objects, to charities, schemes of Christian usefulness—churches, Sunday-schools, religious instructors, missions at home and abroad—all this is a direct abstraction from the gains which a non-religious man is permitted to retain. And, in general, whilst good conduct tends in some sort to success in life, it is yet true that that which constitutes the essence, the life and soul of religion—its internal spirit, its exercises of love and faith and aspiration, its self-denials and struggles, its inward conflicts and triumphs—has no connection with earthly advantage, and has often led to earthly ruin and loss. “We have left all and followed thee; what shall we have therefore?” was the miserable question of religious selfishness: and the answer, as we contemplate the earthly issue of many and many a Christian life; its utter lack of earthly good; its poverty, obscurity, ill-health; its family troubles, bereavements, early death—still more if we go back in history and stand by the martyr’s side as he is hurried in shame and horror out of the world, the answer is—“Nothing, worse than nothing.” And we are thus unable, from his point of view, to utter one word in reply when the observer to whom this world is all in all asks, “To what purpose this waste?”

But this world is not all. And the answer, which might seem a sufficient and satisfactory one to many, would be;—there is no waste in all this worldly expense and loss, for the religious man will reap, for all his religious toils and sacrifices in this world, a rich recompense in the world to come. But this is an answer only less defective and fallacious than the other. For my last remark is, that religion, in so far as it is real and pure, is not a thing which is precious to a man because even of an eternal reward to which it leads, but simply because it is in itself, now and for ever, the supreme delight, the chief joy of the soul. It is true that there is a reward in store for the child of God, that there are blessings outward as well as inward awaiting him—a prize of ineffable joy and blessedness in comparison with which this world’s highest moments of rapturous delight are faint and cold; and to this coming joy and happiness, the Christian, in all his efforts and sacrifices, is not forbid to look. Still it is not less true that that which gives to religion its value, to religious acts and exercises their preciousness, is not anything future, anything eternal. They are precious in and for themselves. He is not a true lover of this world’s knowledge who loves it only for the prizes which scholarship wins, for the distinction or emolument which attends it. But he is the true lover of knowledge who loves it for itself;—to whom to know truth, to bring the mind into contact with it, is all the reward he seeks. And in like manner of divine knowledge. The truth of God to the earnest and holy-minded man is not precious only or chiefly because to believe it is the means of salvation, because only by the knowledge

and belief of it can he escape hell and gain heaven. If this were all, in his study of God’s Word the believer would be but getting up his salvation-lesson, going through the necessary drudgery for the prize of a future heaven. But to the truly spiritual man divine knowledge is its own end, the contemplation of truth its own most precious reward. To know God, to have the eye of the soul opened to the perception of infinite purity, to be brought in mind and spirit into contact with that light of the knowledge of the glory of God which is revealed in the face of Christ; this is as much the immediate reward and delight of the soul as natural light and beauty are the immediate delight of the eye or sweet melody the present joy of the ear. And as it is with knowledge, so is it with love. What true-hearted child ever asks of what use is it to love my father or mother? What shall I gain by all this expenditure of affection? To what end or purpose all this waste of tender words, and loving, reverential acts? Or what brother, husband, or friend ever dreamt of inquiring, Why should I repair to the presence, and reciprocate the affection of him who is so dear to me? What practical future benefit shall I gain by all this expression of fondness, by all these words and acts and gifts of love?—Would it not be an insult to love to ask such questions as these? Would not the all-sufficient answer be: “Gain! reward! result! I seek none, dream of none. Love is its own most precious reward; the richest joy that love can confer is simply to love, to love more, to love on for ever.” And so with the divine object of a Christian’s reverential love, the Father of his Spirit, the Lord, Redeemer, Lover of his soul. Earth knows no sublimer emotion than that mingled awe and tenderness, reverence and affection, which breathe in the Christian’s heart towards the Father in heaven. And if it be joy for the loving child to cling to the father’s presence, or to rest in the mother’s arms, ask not of what use it is for the soul, amid the anxieties and perturbations of life, to repose in the Infinite affection, and in all doubt and sorrow, through all change and care and trouble which the changing years are bringing, to rest in the Everlasting arms. If earthly affection or friendship has ever known the strange bliss of sacrifice, the sweetness of toil or sorrow or pain borne for the sake of one who is dearly loved, ask not the Christian soul why, or for what ulterior end, it gives and spends and suffers for Jesus? What practical gain shall issue from it? To what future good or reward does it tend? To what purpose this waste? Oh, cold heart! Oh, ungenerous spirit of calculating selfishness! What reply can such questions merit? The goodly fellowship of the prophets, the glorious company of the Apostles, the noble army of martyrs, the holy Church of Christ throughout all the world, with one consenting voice reply, “We count all things but loss for the excellency of the knowledge of Christ Jesus our Lord; for whom we have suffered the loss of all things—rejoicing even in this that we are counted worthy to suffer for His sake.”

THE UNJUST JUDGE.

THE PARABLES

READ IN THE LIGHT OF THE PRESENT DAY.

BY THOMAS GUTHRIE, D.D.

V.—THE PARABLE OF THE UNJUST JUDGE.

LUKE xviii. 1.

IN descending by one of the passes of the Alps into the lovely valley of the Saarnen, the traveller may notice on the right hand of the path a pine-tree, growing in extraordinary circumstances. Enormous masses of hoary rock lie scattered in the bottom of the ravine; they have fallen from the crags which form its stupendous walls; and it is on the top of one of these, a bare, naked block, that the pine-tree stands. No dwarf, mis-shapen thing, like the birch or mountain ash on an old castle wall, where the wind or passing bird had dropped the seed; it is a forest giant—with rugged trunk, and top that shoots, a green pyramid, to the skies. At first sight one wonders how a tree, seated on the summit of a huge stone, raised above the soil, with no apparent means of living, could live at all; still more, grow with such vigour as to defy the storms that sweep the pass, and the severe, long winters that reign over these lofty solitudes.

A nearer approach explains the mystery. Finding soil enough on the summit, where lichens had grown and decayed, to sustain its early age, it had thrown out roots which, while the top stretched itself up to the light, lowered themselves down the naked stone—feeling for the earth and food. Touching the ground at length, they buried themselves in it, to draw nourishment from its unseen, but inexhaustible, supplies to feed the feeble sapling into a giant tree. So we thought, as we stood looking on this natural wonder, the believer grows. Tempest-tossed by many storms, but, like the pine-tree with its gnarled roots grown into mighty cables, firmly moored to the Rock of Ages, he also raises his head to the skies, and, through his prayers, draws spiritual nourishment and growth in grace from the inexhaustible supplies which lie hidden in Jesus Christ, and are provided for all such as love him. Often placed in circumstances not less unfavourable to his growth than that naked stone to the growth of the pine perched on its summit, his prayers, like the roots that descended to the soil and, penetrating it, brought up its riches to feed the tree, form a living communication between him and God. Thus his life is sustained: thus he grows in grace—green and fruitful where others wither, and living where others die. Such being the office of prayer, and the end it serves, it can surprise none to find one or two of our Lord's parables devoted to so great a duty: indeed, anything else would have surprised us on the part of Him who spent, not hours, but

whole nights, in prayer. The sun, as it sank in the western sea, often left him, and as it rose behind the hills of Moab returned to find him, on his knees.

In almost all our Lord's other parables, the truth which they are intended to teach is stated at their close. We travel through the story before we arrive at the moral. Here that meets us at the entrance, standing like an inscription over the door of a public building to tell its use and purpose, in these words: "He spake a parable unto them to this end, that men ought always to pray, and not to faint." As Matthew Henry says, "This parable has its key hanging at the door." Let us, however, take up the story first, and afterwards the persons it introduces in the order in which they appear.

THE UNJUST JUDGE.

Others besides judges may be unjust—the trustee who takes advantage of his position to defraud the widow or fatherless whom a dying friend has cast on his care; the merchant who, adulterating his goods, deceives his customers, or, removing them, defrauds his creditors; the tradesman who, earning the wages of iniquity, makes bad work pass for good. But these are not to be compared with an unjust judge. Of all men, he is the worst; unless, perhaps, the minister of religion, be he Bishop or Presbyter, who takes advantage of his position to disseminate error, or corrupt the morals of society. To such cases how appropriate the question—If the light that is in you be darkness, how great is that darkness? If the foundations be destroyed, what can the righteous do?

To pollute the fountains of justice is, indeed, one of the greatest evils which can be inflicted on society. It is like poisoning the public wells, or the air we breathe, or the bread we eat. Its inevitable result is anarchy. Denied justice by those who should dispense it, despairing of protection to life, liberty, and property, men will, as our forefathers did, take the law in their own hands—become, as the Apostle says, a law unto themselves; and, executing vengeance on the workers of iniquity, commit deeds which it is easier for us to condemn than it was for them to refrain from,—and which no man will harshly condemn who remembers these words of Scripture, "Surely oppression maketh a wise man mad."

This unjust judge recalls days when in England

one of her greatest sons, the father of modern philosophy, and we trust, notwithstanding his error, a true Christian, Lord Bacon, was ignominiously dismissed from the bench for accepting a bribe; and when, in Scotland, scaffolds reeked with the best blood of the land, shed by iniquity on the seat of judgment. We ought not, and we cannot, recall those times without blessing God that, though not without the frailties that belong to humanity, our judges are just and our exactors righteous. It is certain that hundreds and thousands now living who have done no wrong would have been hanged in olden times; and, when expressing our loyalty to the heir of a throne that, amid the convulsions which shake other nations, stands secure in the affections of our own, let us cherish the memory of the mighty dead; and the gratitude we owe to the patriots who shed their blood to purify the fountains of public justice, and purchase the liberties of the people—making our country the envy of the world. By them the Lord hath done great things for us whereof we are glad, and wherefore we should be grateful.

This parable turns on a state of public affairs of which we happily are ignorant; but it came home to the understanding of those whom our Lord addressed. The most common characteristic of Eastern nations was, and is still, the difficulty of clients obtaining justice. How astonished we should be if any judge, on retiring from the bench into private life, were to protest that he had never sold justice; never, by accepting a bribe, stained the ermine of his robe! Yet a better man than they, or we, did so. In taking his leave of a people, some of whom, judging that noble old man by themselves, were mean enough to suspect him of mercenary ends, Samuel, indignant at the foul suspicion, said—"I am old and grey-headed; behold, here I am; witness against me before the Lord and before his anointed. Whose ox have I taken? or whose ass have I taken? or whom have I defrauded? whom have I oppressed? of whose hand have I received any bribe to blind mine eyes with, and I will restore it?" It is a sorrowful thing to think that such a man should have had to stoop to this defence; but if calumny had breathed even on Samuel, dimming for a brief moment the lustre of his character, it shows how many unjust judges there were in old times, and how our Lord, in the picture of this one, was painting a very common portrait—as was his wont, drawing his illustrations of divine truth from familiar objects. Now, in studying this picture of the Judge, let us look at

HIS CHARACTER.

A bold, bad man; he says—"I fear not God, nor regard man." What unblushing effrontery! yet in their autobiographies men are seldom so honest. His conduct corresponds to his character. Had he feared God, this widow had not waited so long on justice. "Ye shall not," said the Lord, "respect persons, in judgment; but ye shall hear the small

as well as the great. Ye shall not be afraid of the face of man, for the judgment is God's."

A bold, bad man; he had no regard for the good opinion even of his fellow-men. Not that that morally qualifies a man for an office which he only is fit to fill who believes in the judgment of the oath which he administers, and that he who tries others, stripped of his state and placed at God's bar, shall himself one day be tried. An immoral life debauches the mind as well as the body—blunting the fine edge of conscience.

Nor, unless they are men of principle and of character, has a country any security that her judges will be just, or her exactors righteous? Animated by the fear of God, a man will do right though all the world think him wrong; Pilate would have faced round on the Jewish crowd, and placing himself between Jesus and his enemies, seized a lull in the storm, to say, in answer to their cries of "Crucify, crucify him,"—He shall not be crucified; otherwise than over my dead body you shall not reach this innocent victim. The world, no doubt, has substitutes for the fear of God; and though in their nature inferior motives, a sense of honour, regard to the good opinion of mankind, the love of praise, and the fear of censure, are not without value. But even to these this judge was insensible, caring neither for God nor for man, so he gained his own selfish ends—got his appetites gratified, and enjoyed a life of ease and pleasure.

Let me remark that, in this hateful picture of selfishness incarnate, we see human nature, if I may say so, full blown; and in him, what all of us should be, were God to withhold the influences of his Spirit, or withdraw the restraints of his Providence. In yonder starved and beaten, caged and cowed animal of velvet step and painted skin, that but now and then shows its teeth to utter an angry growl, you do not see the tiger. Unchain him, uncase him; and there now is the bloody tyrant of the jungle, as with roar of thunder and eyes of fire, he leaps from his den, and with a blow of his paw felling one of the flying crowd, fastens on his throat to suck the flowing blood. And never is the sin inherent in our nature fully seen but in cases such as this, where, somehow or other, it grows up to its full development—fearless of God and regardless of man. Hence the necessity of being born again; and that we all should offer, and God to all of us should answer, the prayer of David, "Create in me a clean heart."

THE WIDOW.

Not long years ago you might have seen a pile of wood on the banks of the Ganges, surrounded by a mighty throng. The crowd opens, and up through the vista a lifeless body is carried to be laid on the summit of that funeral pile. Again the crowd opens, and, like a wave in the wake of a ship, it closes behind a woman, the dead man's widow, who comes to share his fiery bed. Attired for the sacrifice, on taking farewell of children and friends, she lies

down by the corpse. As she embraces it in her arms the signal is given, and the pile is lighted; and, though in some instances, mad with agony and all on fire, the victim would leap for life through the flames and smoke, commonly, while her piercing shrieks were drowned in shouts, the poor widow submitted with patience to her fate. She submitted to it very much to escape a worse one. These funeral piles throw a lurid glare on the wretched state of widows in that heathen land; and, though not doomed in all other lands to so hard a fate, oppression and cruelty was the common lot of a class than which there is none that owes more to the humanising influences of Christianity. I suppose there are few of us but, among competing claimants on our pity, time, money, help, would, whether she was a queen or beggar, give the preference to one in a widow's garb. Here we see the benign influence of the Gospel, and God fulfilling his words—"Let thy widows trust in me." How cruelly their circumstances were taken advantage of is plain from the manner in which God, constituting himself the husband of the widow, and espousing her cause, threatens, to avenge her wrongs. Nor is this less evident, from the strong terms which our Lord employs to denounce those who, worst of hypocrites, made a stalking-horse of religion to get access to the widow's house, for the purpose of devouring her substance.

It is one of this class who demands justice from the unjust judge. None had less chance of getting it. Plundered probably of her little all, she has no money to buy it. Without powerful friends to back her, she has no means of compelling it. And to expect that this selfish, voluptuous, cold, iron-hearted man will espouse her cause, and put himself to trouble to see her righted like a magnanimous judge—draw the sword of justice in her defence against the rich and the great, perhaps his own friends, alas! that were to run her horses on a rock, and plough there with oxen. Well may she renew her grief over a husband's grave; and as, like a mother bird when the hawk is abroad, she gathers her little ones to her side, well may she clasp her hands to cry, God help me! there is none else to help. And yet from one who had no regard either to right or wrong, to whose eyes her distress brought no tears, and in whose heart her sorrows touched no chord of pity, she obtains justice—bringing fire out of a cold flint, gushing water from a hard, dry rock.—Consider

THE MEANS OF HER SUCCESS.

She owed it to importunity. Nature herself prompts to this—the babe cries till it gets a mother's breast. The power of importunity is one of the first lessons a child learns, and proceeds to practise. The boy keeps hanging on his father, harping on the same string, giving him no rest or peace, now pleading with winning smiles and now with tears, returning after every defeat to renew the attack, till, worn out, he yields assent; and

thus by importunity, in a sense, the weak things of the world confound the mighty, and foolish things the wise. It is not long since it won daily triumphs in these streets, where the ragged boy, on naked feet, with piteous whine, and outstretched, emaciated hands, ran down the game. His story seemed to fall on a deaf ear; he knew better. Getting no answer but a rough refusal, he seemed to be wasting breath and time; he knew better. Following the object of his attentions like a shadow, sticking to him like a leech, robbing the day of its brightness, and the saunter of its pleasures, the urchin not only overcame the philanthropist's sense of the evils of indiscriminate charity, but opened even the niggard's hand. To get rid of a pest so intolerable, how often was he bought off with money?

This art is carried to its highest perfection in the East. A traveller in Persia tells how he was besieged by one who solicited a gift more costly than he was prepared to give. The hoary, and as the people esteemed him, holy mendicant set himself down before his gate, throwing up a rude tent to shelter himself from the noonday sun. There he remained like a sentinel; nor left his post but to follow the traveller out of doors, and return with him. Taking snatches of sleep during the day when the other rested in the house, he kept up a hideous howling and clamorous demands all the hours of night,—an annoyance which, persisted in for successive days and nights, and even weeks, seldom failed, as you can suppose, to gain its object.

Such were the means by which the widow gained hers. So soon as ever this unjust judge took his seat at the gate of the city, where in the East courts are held and all causes heard, his eye as it roamed over the crowd fell on her. There she was, and always was—sorrow in her dress, but determination in the flash of her eye; her form bent down with grief, but her spirit unbroken; resolved to give that judge no rest till he had avenged her on her adversary. Now breaking in on the business of the court, she is on her feet passionately demanding justice; and now stretched on the ground at his, she piteously implores it. Nor can he shake her off. Denied her suit, she follows him to his house to interrupt his leisure and embitter his pleasures. Her voice ringing loud on the threshold demanding entry, she bursts into his presence; and is dragged away by the servants, thrust out, but only to return, as the ball struck rebounds—the billow shattered on the rock falls back into the deep to gather volume and strength for a new attack. And as by constant dashing the waves in time cut into the cliff, which, yielding to the incessant action of a weaker element, some day bows its proud head, and, precipitating itself forwards, falls into the sea, which swallowing it up, sweeps over it with jubilant, triumphant waves, so the persistence of the widow overcomes the resistance of the judge. Diamond cuts diamond. She conquers by importunity: yielding to her request, he says, "Because this

widow troubleth me, I will avenge her, lest by her constant coming she weary me."

THE CONCLUSION,

Which our Lord draws as expressed in the question, "Hear what the unjust judge saith; and shall not God avenge his own elect, which cry day and night unto him, though he bear long with them?"

There are points of resemblance between God's people and this widow. In Satan, have not we also an adversary to be avenged on? Are not we also poor and needy? She had known happy days; and so also had man. By death she had lost her husband; and by sin we have lost our God. Poor and friendless, she had no means of avenging, of righting herself; no more have we—we were without help when Christ died for the ungodly. "The sons of Zoruah," cried David, "are too many for me;" and so are sin and its corruptions, the world and its temptations, the devil and his wiles, for us.

There are likewise some points of resemblance between God and this unjust judge. Long had he stood by and, without one effort on her behalf, seen this poor woman spurned and oppressed; and long also God seemed to stand by when his people were ground to the dust in Egypt; in old Pagan and in more modern Popish times, when their cruel enemies shed the blood of his saints like water, and, immured in dungeons, bleeding on scaffolds, hiding in the caves of our mountains, his elect cried to him day and night, and the Church, helpless as a widow, implored him saying, "Avenge me of mine adversary! And this is true also of his dealings with individual believers. How long in their corruptions are the messengers of Satan left to buffet them? Weary of the struggle with some besetting sin, and hating it as a slave his cruel tyrant, they cry, "How long, O Lord, how long?" how often, all but despairing, are they ready to exclaim with Paul, "Who shall deliver me from the body of this death?"

But there are important points of disparity between this judge and our God: and in these I find assurance of final victory, and the highest encouragements to instant, constant, urgent, prayer. A bad man, with a heart cold as ice and hard as iron, was he moved by importunity to redress the wrongs of one for whom he felt no regard, whose happiness or misery was nothing to him?—how much more will God be importuned to grant our prayers! Just, and more than just, he is merciful and gracious, long-suffering and slow to wrath, abundant in goodness and in truth. He has no pleasure in the death of the wicked—he is willing that all should come to him and live—he waits to be gracious. Let his people trust in him, and wait on him. He may hide his face from them; it is but for a little. The dead, the widow's husband, never loved like the living God. Her wrongs did not disturb him in his grave; but ours move Jehovah in the heavens. Above the anthems of the celestial choir, he hears our feeblest cry; and amid the glories of the upper sanctuary, Christ's eye turns less on the glittering crowns his redeemed

ones cast at his feet than on his people here—fighting in this field of battle, weeping in this vale of tears. Therefore let us pray on, nor cease praying till we cease living. He may address us as he did his mother, saying, "Woman, my hour is not yet come; but come it shall. Rest assured that no prayer is lost; and let this help them that wait on the Lord to renew their strength, and in the hour of devotion to mount up with wings as eagles! If he spared not his own Son, shall he not with him also freely give us all things—and fulfil, at his own time and in his own way, these his own gracious words, "For the oppression of the poor and for the sighing of the needy, now will I arise, saith the Lord?"

When night fell on Jerusalem, and the tide and hum of business had ceased, and one after another the lights were extinguished, and all fires quenched in the sleeping city, one was kept alive—the fire that burned on God's holy altar. "It shall not be put out," said the Lord, "the fire shall ever be burning on the altar, it shall never go out." Fed by such logs as blazed on the hearths and roared in the chimneys of olden times, yet this had not been kindled by man's hands or blown into flame by his breath. Like God's love on a lost world, or his wrath on the head of his dying Son, it had descended from the skies. "There came," it is said, when Aaron and his sons were offering their first sacrifice, "fire out from before the Lord, and consumed the burnt offering and the fat, which when the people saw, they shouted and fell on their face." Whether slumbering in its ashes or flaming with the fat of sacrifices, this fire burned by night and day on the altar; nor was it till after the lapse of nearly a thousand years that it went out—quenched hissing in the blood of priests who fell in defence of the temple at the first captivity. Now in that old altar on which the sacred fire was always burning, but where sacrifices were not always offering, we see the heart of a devout believer. He is not always praying; but within his bosom there is a heaven-kindled love, fires of desire, fervent longings, which make him always ready to pray and often engage him in prayer. And thus he who engages in devout meditations and holds communion with God through his word and also through his works, may, in respect of his habitual, prevailing frame of mind, as well as of his frequent prayers, be said to "pray without ceasing," "always to pray;" he is like an *Æolian harp*, on whose strings, by night or day, the wind has but to breathe to wake up sweet and plaintive music.

In considering more particularly the lessons regarding prayer which our Lord told this parable to teach, I remark that

IT DOES NOT TEACH US TO PRAY.

There is no need it should; or that the Bible should—any more than it should prove, what it always assumes, the being of a God. Such a monster as an atheist, who denies that, it does not suppose to exist; nor any one, man or woman, who does not acknowledge, whether they practise it or

not, the duty and necessity of prayer. Nor this without reason. Like the belief in a God, the moral sense of right and wrong, the hope of immortality, the expectation of a judgment, prayer seems as much an instinct of the soul as breathing, eating, drinking are instinctive actions of the body which we need neither to be told, nor to learn, to do. No doubt, men who would be "wise above what is written,"—prying into the secret things of God, and, like one who attempts to close his fingers on this big globe, attempting to grasp the infinite with finite minds,—have started objections to prayer. They ask, does God need to be told what we need? is man vain enough to suppose that his prayers can change the divine purposes? that creatures so feeble and insignificant as we can move the hand that moves the universe? or that our will can be of the smallest consequence to him who does everything according to the counsel and purpose of his own? It is not needful to answer such objections. I have read how a great poet, who was a sceptic, when he and Byron in a storm at sea expected every moment to be their last, dropt on his knees on the watery deck, and, beating his breast, cried passionately to God—the tempest blowing away, like cobwebs, his flimsy objections to prayer. In such hours Nature rising in her might and majesty asserts her supremacy; and the instinct of prayer bears a man over all these difficulties as on the crest of a mountain wave. With these, simple Christians give themselves no trouble; they are like an infant who knows nothing of the philosophy of sucking, nor waits to know it, but, so soon as put to a mother's breast, fastens on it. And it seems as natural for man to pray as for babes to suck—in his distress and danger to cry to God, as on falling into the water to make instinctive efforts to reach the rock for footing, or rise to the surface for breath. Prayer belongs to man as much as speech: for, as there was never a nation found, the rudest, most savage, in their habits and homes the nearest to the brutes, which did not speak; there never was a nation found, the rudest, most savage, in their homes and habits the least raised above the brutes, which did not pray.

IT TEACHES US HOW TO PRAY.

This subject, dividing itself like a tree into many branches, embraces the spring of prayer, which lies in our sense of need—the spirit of prayer, which consists in devout sincerity—the object of prayer, which is our Father in heaven—the channel of prayer, which is his son Jesus Christ, the mediator of the new Covenant. Important as these subjects are, this parable directs our attention to a matter belonging to prayer, not less important. The point here, is the fervour and frequency, the constancy and perseverance, or what has been called, in one word, the *importance* of prayer. "He spake a parable unto them," says the Evangelist, "to this end, that men ought always to pray and not to faint"—to pray on, nor give up praying till they get the thing prayed for. This implies at least on our part

STATED DAILY PRAYER.

It is in the morning and evening that Nature, who gives her nights to sleep and her days to work, pays, if I may so say, her worship to God. At dewy morn and eve, from their golden and silver censers, the flowers offer the incense of their fragrance, and skies and woods which were mute during the heat of the day and darkness of the night, break out into a melodious burst of song. The bird that, leaving God to care for it, sleeps with its head beneath its wing in the darkness, and spends the busy day gathering its food or catering for its young, drops at even from the skies, singing, into its grassy nest; and mounts thence at rosy dawn to praise God by the gate of heaven ere it begins the labours of the day. And so, in a way, does every man and woman who has the least pretensions to a Christian's character—morning and evening finds them on their knees before God. What day closes without many mercies to be grateful for, and many sins to be confessed and pardoned? and what day is entered on that has not burdens to be borne, and battles to be fought, to which it behoves us to go forth guided by the counsel, guarded by the power, strengthened by the grace, and defended, like a mail-clad warrior, from head to heel, by the whole armour of God? To omit prayer, is to go to battle having left our weapons behind us, in the tent; is to go to our daily labour without the strength imparted by a morning meal; is to attempt the bar where breakers roar and rocks hide their rugged heads without taking our pilot on board. If from a sense of weakness Moses, on Sinai's thundering, flashing, quaking mount, exclaimed "If thy presence go not with me, let us not go *up*," well may we say of the world, with its daily trials and temptations, works and warfare, Unless thy presence go with us, let us not go *down*. Therefore ought men, unless in very rare circumstances, always, morning and evening, to pray. Thus, like soldiers on the morning of the conflict, we grind our swords for battle with the world, the devil, and the flesh; and thus, when the day's combat is over, retiring to pray, we apply a healing ointment, the balm of Gilead, to the wounds of conscience; and thus, as a begrimed workman on coming home repairs at even-tide to bathe in flowing river or swelling sea, we resort to prayer to wash away sin's daily, guilty stains in the fountain of Jesus's blood.

Judge Hale, one of the greatest ornaments of the English church and the English bench, in expressing the value he set on the Sabbath as a day, not of business or worldly recreation, but of holy rest, said that he found the work of the week go well according as the Sabbath had been kept well. For as I have seen one stroke of an eagle's wings send her, without further effort, sailing a long way on through the fields of air, the impulse which a well-spent Sabbath gave him was sensibly felt throughout all the running week. As much may be said for daily prayers—the morning, elsewhere than in the

skies, settling, for good or evil, for conquest or defeat, for progress or backsliding, the character of the coming day. Therefore ought men always to pray, morning and evening, day by day.

Are our bodies so constituted that the food of one day suffices for the wants of the next? Do even occasional banquets dispense with the necessity of daily bread? Are the arrangements of nature such that one bright day each week is enough—sufficient to melt the snows of winter, to turn the naked forests into a sea of foliage, or cover our fields in autumn with sheaves of golden corn? No; the body needs daily bread; fields for the ripening of their fruits, and gardens for the beauty of their flowers, need daily sunlight, if not sunshine. And the soul cannot thrive, nor its graces grow and ripen, without daily prayer to God and frequent communion with the skies. I say, therefore, we ought always to pray morning and evening at the least; so much oftener, so much the better—and the result, if it is devout, earnest, believing prayer, will be to maintain our spiritual life under what appears the most unfavourable circumstances. On the rocks by the sea-shore I have seen marine creatures living when the tide was out; not in the briny pools it leaves, but on the dry and naked rock—in the withering air—in the burning, broiling sun. They lived because, when twice each day the foaming tide came in, and rising, covered the rocky shelves they clung to, they opened their shut and shelly mouths to drink in water enough to last them when the tide went out, and till the next tide came in. Even so, twice a day also at the least, are we to replenish our thirsty souls,—fill our emptiness from the ocean of grace and mercy that flows, free and full in Christ, to the least of saints and chief of sinners. In Him dwelleth all the fulness of the Godhead bodily.

IT TEACHES PERSEVERING PRAYER.

What would be thought of a man who was ashamed to own his country, nor would take up even speech in her defence among strangers, in a foreign land? It is when broad seas part us from our native shores that the love of country burns strongest. Her songs sound sweetest in the exile's ear. Those faults of hers we lay bare at home, we conceal abroad; and, like dutiful sons, try to cast a mantle on her shame—hiding it from the eyes of aliens. We are not ashamed of our country; yet, alas! how many seem ashamed of their religion and their God? Some could hardly blush more to be caught stealing than they would do to be caught praying—starting from their knees like men engaged in some guilty thing. And how many young men and women, abandoning the praying habits of their early life and a pious home, have been lost through this false and coward shame? Insult their country, they will resent the offence—the poorest Highlander standing up for the honour of clan and chief, nor consenting, without a bleeding heart, to be torn from the barren and

stormy rocks to which his affections cling. Would God our piety were as fervent and brave as our patriotism! But, thrown into the company of strangers, perhaps of the ungodly, shrinking lest these should wonder at them or make them butts for ridicule, some steal to bed and leave it without bending the knees in prayer. This is to repeat the crime of Peter, and say, amid scenes where Christ is insulted by his enemies and should be boldly honoured by his friends, I know not the man.

If it is right for men, as an old heathen says, to learn from enemy, it is right for Christians to learn from such as are ignorant of their faith, or hostile to it. And how might it bring a blush to a coward's cheek to see the poor Mahomedan—in company as in solitude, on the mart of commerce or on the muddy street, on the slippery deck or on the sandy desert, wherever he is and before whomsoever he is, beggar or king, pagan or Christian—drop on his knees at sundown to offer his devotions, ready rather to die than miss them; like a wise man, counting them, not his shame, but glory. If, boasting of their villainies, of their feats of dissipation and debauchery, of their triumphs over simple innocence, unsuspecting virtue, the flowers they have vilely plucked to cast on the streets when their bloom was gone, bad men glory in their shame, shall Christians be ashamed of their glory? God forbid! Show the world your colours—fling out the blood-dyed, time-honoured banner, saying—

“I'm not ashamed to own my Lord,
Or to defend his cause,
Maintain the glory of his cross,
And honour all his laws.”

As to the point especially in hand—persevering prayer—the very heathens seem, more than many professing Christians, to appreciate its power and value. A traveller, for instance, who was lately exploring some of the loftiest valleys of the Himalayas, found a tribe close by the regions of eternal snow, whose religion had a feature that struck him with great surprise. Indeed, he sneers at it; though no man's faith should be turned to ridicule, or even lightly assailed, unless care is taken to substitute something better in its place. It may be a false hope; yet it is his all. It may be a dream; yet it is a happy one—soothing the sorrows of life, and scattering some beautiful, though fading flowers along the margin of its rugged path. Then what is the crime of those who in these days recklessly cast doubts on the Christian faith, and start difficulties in the minds of simple, unlearned ones, which I can answer, but they cannot? How cruel to disturb their peace who were quietly, and usefully, and hopefully, and happily, holding on their course to heaven? It is no light thing to shake a man's confidence in what he believes to be the Word of God—in a book which he clasps to his bosom as life's greatest treasure, and will lay below his head as death's softest pillow. It requires no great ability to do this wrong. The puniest buzzing insect may annoy us by its tiny sting; and many a man's peace may

be disturbed by objections by which, thank God, it cannot be destroyed.

What excited both the surprise and sneers of the traveller in the religion of these Indian mountains, was the practice the people followed of praying by machinery. Certain prayers were placed on revolving cylinders; and as the wheel went round, and the prayer came up, each time its face turned to heaven, God was supposed to read it. It was as good as spoken by living lips. While engaged in his work, or passing the cylinder at intervals, the worshipper from time to time gave it a turn so as to keep it almost constantly spinning on its axis. Others more devout and still more ingenious, improving on that, set the cylinder in the run of a stream, that, as it turned like a mill-wheel, prayer might be offered day and night continually. Well, though it may be a bold thing to say, I would rather, in that rude way, "pray without ceasing," than, like some, never pray at all—in other words, I would, rather live and die a devout pagan than an undevout Christian. No doubt the mind of the Indian who trusts to such prayers may be dark as his tawny skin; and, not proceeding from the heart, they may leave it cold as the snows, and hard as the rocks among which, remote from the Christian world, he holds his mountain fastness. But, not to say that the prayers of our lips may be as formal and lifeless as those of the Buddhist's wheel, rude as is the method of his worship, and dark as may be the mind of the worshipper, there is a glimmering here of these truths—"instant in prayer," "pray without ceasing"—"men ought always to pray, and not to faint."

It is hard, fainting work, praying. It is harder work to pray than preach; since for one who could pray well, I will get you a hundred who could preach well a whole hour. How much easier for the sailor

to watch the night through on the rolling deck, the sentinel on the beleaguered wall, than, with John Welsh in Ayr's old church, alone, in the darkness, with the town sleeping in their houses, and the dead around sleeping in their graves, to pass a whole night on our knees?

We ask, and receive not. Why? Because, says the Apostle, we ask amiss. We do not believe what we profess; nor feel what we say; nor wish what we ask—or, if we do, we do not take the right way of getting it. And how can we expect God to answer prayer when he sees, what we ourselves might see, that we are not earnest? If we were, we would be urgent—praying in the house, by the way, on our beds, at our business—prayer, sounding or silent, a constant flowing stream. By constant dropping, the water wears a hole in the hardest stone. By constant growing, the tree-root rends the hardest rocks asunder. And who, as he sat on a jutting crag amid the spray of the roaring, flashing cataract, has not marked how by her constant flow the river has polished its rugged sides, and worn out smooth runnels for its streams? With such a feeble power, through the force of continued action, how great the results? That rock, indeed, is no more a symbol of the kind heart of God than this unjust judge is, in character, a type of Him who is, I repeat it, not unjust, but just; nor merely just, but merciful and gracious, long suffering, and slow to wrath, abundant in goodness and in truth. Yet, as it is only perseverance in grace that can carry us up to heaven, it is only perseverance in prayer that can bring its blessings down. Such is the plan of redemption, the ordinance of God—"The kingdom of heaven suffereth violence, and the violent take it by force."

CONCERNING OLD ENEMIES.

It may be assumed as certain, that most readers of this page have on some occasion climbed a high hill. It may be esteemed as probable, that when half-way up, they felt out of breath and tired. It is extremely likely that, having come to some inviting spot, they sat down and rested for a little, before passing on to the summit. Now, my reader, if you have done all that, I feel assured that you must have remarked as a fact, that though when you sit down you cease to make progress, you do not go back. You do not lose the ground already gained. But if you ever think at all, even though it should be as little as possible, you must have discerned the vexatious truth that in respect of another and more important kind of progress, unless you keep going on, you begin to go back. You struggle, in a moral sense, up the steep slope: and you sit down at the top, thinking to yourself, Now *that* is overcome. But after resting for a while you look

round: and lo! insensibly you have been sliding down; and you are back again at the foot of the eminence you climbed with so much pains and toil.

There are certain enemies with which every worthy human being has to fight, as regards which you will feel, as you go on, that this principle holds especially true: the principle that if you do not keep going forward, you will begin to lose ground and go backward. It is not enough to knock these enemies on the head for once. In your inexperienced days you will do this: and then, seeing that they look quite dead, you will fancy they will never trouble you any more. But you will find out, to your painful cost, that those enemies of yours and mine must be knocked at the head repeatedly. One knocking, though the severest, will not suffice. They keep always reviving: and struggling to their feet again: a little weak at first through the batter-

ing you gave them ; but in a very short time as vigorous and mischievous as ever. The Frenchman, imperfectly acquainted with the force of English words, and eager that extremest vengeance should be wreaked on certain human foes, cried aloud, "KILL THEM VERY OFTEN !" And *that*, my friend, as regards the worst enemies we have got, is precisely what you and I must do.

If we are possessed of common sense to even a limited amount, we must know quite well who are our worst enemies. Not Miss Limejuice, who tells lies to make you appear a conceited, silly, and ignorant person. Nor Mr. Snarling, who diligently strives to prevent your reaching something you would like, because (as he says) the disappointment will do you good. Not the human curs that gnarr at your heels when you attain some conspicuous success or distinction ; which probably you worked hard for, and waited long for. Not these. "A man's foes," by special eminence and distinction, are even nearer him than "they of his own house : " a man's worst enemies are they of his own heart and soul. The enemies that do you most harm ; and probably that cause you most suffering ; are tendencies and feelings in yourself. If all within the citadel were right : if the troop of thoughts and affections *there* were orderly and well-disposed and well-guided : we should be very independent of the enemies outside. Outside temptation can never make a man do wrong, till something inside takes it by the hand, and fraternizes with it, and sides with it. The bad impulse within must walk up arm in arm with the bad impulse from without, and introduce it to the will, before the bad impulse from without, however powerful it may be, can make man or woman go astray from right. All this, however, may be taken for granted. What I wish to impress on the reader is this : that in fighting with these worst enemies, it is not enough for once to cut them down, smash them, bray them in a mortar. If you were fighting with a Chinese invader ; and if you were to send a rifle bullet through his head, or in any other way to extinguish his life ; you would feel that he was done with. You would have no more trouble from *that* quarter. But once shoot or slash the ugly beast which is called Envy, or Self-Conceit, or Unworthy Ambition, or Hasty Speaking, or general Foolishness : and you need not plume yourself that you will not be troubled any more with him. Let us call the beast by the general name of BESETTING SIN : and let us recognise the fact, that though you never willingly give it a moment's quarter, though you smash in its head (in a moral sense) with a big stone, though you kick it (in a moral sense) till it seems to be lying quite lifeless ; in a little while it will be up again, as strong as ever. And the only way to keep it down, is to knock it on the skull afresh every time it begins to lift up its ugly face. Or, to go back to my first figure ; you have climbed, by a hard effort, up to a certain moral elevation. You have reached a position, climbing up the great ascent that leads towards God, at which you feel

resigned to God's will ; and kindly disposed to all your fellow-creatures, even to such as have done you a bad turn already, and will not fail to do the like again. You also feel as if your heart were not set, as it once used to be, upon worldly aims and ends : but as if you were really day by day working towards something quite different and a great deal higher. You feel humble : patient : charitable. You sit down there, on that moral elevation, satisfied with yourself ; and thinking to yourself : Now, I am a humble, contented, kindly, Christian human being ; and I am so for life. And let it be said thankfully, If you keep always on the alert, always watching against any retrogression, always with a stone ready to knock any old enemy on the head, always looking and seeking for a strength beyond your own,—you may remain all *that* for life. But if you grow lazy and careless, in a very little while you will have glided a long way down the hill again. You will be back at your old evil ways. You will be eager to get on, and as set on this world as if this world were all : you will find yourself hitting hard the man who has hit you : envying and detracting from the man who has surpassed you : and all the other bad things. Or if you do not retrograde so far as *that* : if you pull yourself up before the old bad impulse within you comes to actual bad deeds : still you will know that the old bad impulse within you is stirring ; and that, by God's help, you must give it another stab.

Now this is disheartening. When by making a great effort, very painful and very long, you have put such a bad impulse down, it is very natural to think that it will never vex you any more. The dragon has been trampled under the horse's feet : its head has been cut off : surely you are done with it. You have ruled your spirit into being right and good : into being magnanimous, kindly, humble. And then you fancied you might go a-head to something more advanced : you had got over the *Pons Asinorum* in the earnest moral work of life. You have extirpated the wolves from your England : and now you may go on to destroy the moles. The wolves are all lying dead, each stabbed to the heart. You honestly believe that you had got beyond them ; and that whatever new enemies may assail you, the old ones, at least, are done with finally. But the wolves get up again. The old enemies revive.

I have sometimes wondered whether those men who have done much to help you and me in the putting down of our worst enemies, have truly and finally slain those enemies as far as concerns themselves. Is the man, in reading whose pages I feel I am subjected to a healthful influence, that puts down the unworthy parts of my nature, and that makes me feel more kindly, magnanimous, hopeful, and earnest than when left to myself : is that man, I wonder, always as good himself as for the time he makes me ? Or can it be true that the man who seems not merely to have knocked on the head the lower impulses of his own nature ; but to have done good to you and me, my friend, by helping to kill

those impulses within us : has still to be fighting away with beasts, like St. Paul at Ephesus : still to be lamenting, on many days, that the ugly faces of suspicion, jealousy, disposition to retaliate when assailed, and the like, keep wakening up and flying at him again? I fear it is so. I doubt whether the human being lives in whom evil, however long and patiently trodden down, does not sometimes erect its crest, and hiss, and need to be trodden down again. Vain thoughts and fancies, long extinguished, will waken up : unworthy tendencies will give a push, now and then. And especially, I believe it is a great delusion to fancy that a man who writes in a healthy and kindly strain *is* what he counsels. If he be an honest and earnest man, I believe that he is striving after that which he counsels ; and that he is aiming at the spirit and temper which he sets out. I think I can generally make out what are a moral or religious writer's besetting sins, by remarking what are the virtues he chiefly magnifies. He is struggling after those virtues : struggling to break away from the corresponding errors and failings. If you find a man who in all he writes is scrupulously fair and temperate, it is probable that he is a very excitable and prejudiced person : but that he knows it, and honestly strives against it. An author who always expresses himself with remarkable calmness, is probably by nature a ferocious and savage man. But you may see in the way in which he restricts himself in the matter of adjectives, and in which he excludes the superlative degree, that he is making a determined effort to put down his besetting sin. And probably he fancies, quite honestly, that he has finally knocked that enemy on the head. The truth no doubt is, that it is because the enemy is still alive, and occasionally barking and biting, that it is kept so well in check. There is just enough of the old beast surviving, to compel attention to it : the attention which consists in keeping a foot always on its head, and in occasionally giving it a vehement whack. The most eminent good qualities in human beings are generally formed by diligent putting down of the corresponding evil qualities. It was a stutrer who became the greatest ancient orator. It was a man who still bore on his satyr face the indications of his old satyr nature, who became the best of heathens. And as with Socrates and Demosthenes, it has been with many more. If a man writes always very judiciously, rely upon it he has a strong tendency to foolishness : but he is keeping it tight in check. If a man writes always very kindly and charitably, depend upon it he is fighting to the death a tendency to bitterness and uncharitableness.

A faithful and earnest preacher, resolved to say no more than he has known and felt ; and remembering the wise words of Dean Alford, "What thou hast not by suffering bought, presume thou not to teach ;" would necessarily show to a sharp observer a great deal of himself and his inner being : even though rigidly avoiding the slightest suspicion of

egotism in his preaching. And it need hardly be said that egotism is not to be tolerated in the pulpit.

After you have in an essay or a sermon described and condemned some evil tendency that is in human nature, you are ready to think that you have finally overcome it. And after you have described and commended some good disposition, you are ready to think that you have attained it ; and that you will not lose it again. And for the time, if you be an honest man, you *have* smashed the foe ; you *have* gained the vantage ground. But, woe's me, the good disposition dies away ; and the foe gradually revives, and struggles to his legs again. Let us not fancy that because we have been (as we fancied) once right, we shall never go wrong. We must be always watchful. The enemy that seemed most thoroughly beaten, may (apart from God's grace) beat us yet. The publican, when he went up to the temple to pray, expressed himself in a fashion handed down to all ages with the *imprimatur* upon it. Yet, for all his speaking so fairly, the day might come when, having grown a reformed character and gained general approbation, he would stand in a conspicuous place and thank God that he was not as other men. Let us trust *that* day never came. Yet, if the publican had said to himself, as he went down to his house, Now, I have attained an excellent pitch of morality : I am all right : I am a model for future generations : that day would be very likely to come.

It is a humiliating and discouraging sight to behold a man plainly succumbing to an enemy which you fancied he had long got over. You may have seen an individual of more than middle age making a fool of himself by carrying on absurd flirtations with young girls, who were babies in long-clothes when he first was spoony. You would have said, looking at such a man's outward aspect, and knowing something of his history, that years had brought this compensation for what they had taken away, that he would not make a conspicuous ass of himself any more. But the old enemy is too much for him : and oh how long that man's ears would appear, if the inner ass could be represented outwardly ! You may have seen such a one, after passing through a discipline which you would have expected to sober him, evincing a frantic exhilaration in the prospect of his third marriage. And you may have witnessed a person evincing a high degree of a folly he had unsparingly scourged in others. I have beheld, in old folk, manifestations of absurdity all very well in the very young, which suggested to me the vision of a stiff, spavined, lame, broken-down old hack, fit only for the knacker, trying to jauntily scamper about in a field with a set of spirited, fresh young colts. And looking at the spectacle, I have reflected on the true statement of the Venerable Bede, that there are no fools like old fools.

But here it may be said, that we are not to suppose that a thing is wrong, unless it can bear to be looked back on in cold blood. Many a word is spoken, and many a deed done, and fitly too, in the

warmth of the moment, which will not bear the daylight of a time when the excitement is over. Mr. Caudle was indignant when his wife reminded him of his sayings before marriage. They sounded foolish now in Caudle's ears. This did not suffice to show that those sayings were not very fit at the time: nor does it prove that the tendency to say many things under strong feeling is an enemy to be put down. You have said, with a trembling voice, and with the tear in your eye, things which are no discredit to you: though you might not be disposed to say the like just after coming out of your bath in the morning. You needed to be warmed up to a certain pitch: and then the spark was struck off. And only a very malicious or a very stupid person would remind you of these things when you are not in a correspondent vein.

And now that we have had this general talk about these old enemies, let us go on to look at some of them individually. It may do us good to poke up a few of the beasts, and to make them arise and walk about in their full ugliness: and then to smite them on the head as with a hammer. Let this be a new slaying of the slain, who never can be slain too often.

Perhaps you may not agree with me when I say that one of these beasts is Ambition. I mean unscrupulous self-seeking. You resolved, long ago, to give no harbour to that: and so to exclude the manifold evils that came of it. You determined that you would resolutely refuse to scheme, or push, or puff, or hide your honest opinions, or dodge in any way, for the purpose of getting on. You know how eager some people are to let their light shine before men, to the end that men may think what clever fellows those people are. You know how anxious some men are to set themselves right in newspapers and the like: and to stand fair (as they call it) with the public. You know how some men, when they do any good work, have recourse to means highly analogous to the course adopted by a class of persons long ago, who sounded a trumpet before them in the streets to call attention to their charitable deeds. I know individuals who constantly sound their own trumpet, and that a very brazen one: sound it in conversation, in newspaper paragraphs, in advertisements, in speeches at public meetings. But you, an honest and modest person, were early disgusted by that kind of thing: and you determined that you would do your duty quietly and faithfully, spending all your strength upon your work, and not sparing a large percentage of it for the trumpet. You resolved that you would never admit the thought of setting yourself more favourably before your fellow-creatures. You learned to look your humble position in the face: and to discard the idea of getting any mortal to think you greater or better than you are. Yes: you hope that the petty self-seeking, which keeps some men ever on the strut and stretch, has been outgrown by you. Yet if you would be safe from one of the most contemptible foes of all moral manhood, you must keep your club

in your hand; and every now and then quiet the creature by giving it a heavy blow on the head. St. Paul tells us that he had "*learned to be content.*" It cost him effort. It cost him time. It was not natural. He came down, we may be sure, with many a heavy stroke, on the innate disposition to repine when things did not go in the way he wanted them. And that is what we must do.

As you look back now, it is likely enough that you recal a time when self-seeking seemed thoroughly dead in you. You were not very old, perhaps: yet you fancied that (by God's help) you had outgrown ambition. You did your work as well as you could; and in the evening you sat in your easy chair by the fireside: looking not without interest at the feverish race of worldly competition, yet free from the least thought of running in it. As for thinking of your own eminence, or imagining that any one would take the trouble of talking about you, *that never entered your mind.* And as you beheld the eager pushing of other men, and their frantic endeavours to keep themselves before the human race, you wondered what worldly inducement would lead you to do the like. But did you always keep in that happy condition? Did you not, now and then, feel some little waking up of the old thing: and become aware that you were being drawn into the current? If so, let us hope that you resolutely came out of it: and that you found quiet in the peaceful back-water, apart from that horrible feverish stream.

There is another old enemy, a two-headed monster, that is not done with when it has been killed once. It is a near relative of the last: it is the ugly creature Self-Conceit and Envy. I call it a two-headed monster, rather than two monsters; it is a double manifestation of one evil principle: Self-Conceit is the principle as it looks at yourself; Envy is the same thing as it looks at other men. I fear it must be admitted that there is in human nature a disposition to talk bitterly of people who are more eminent and successful than yourself: and though you expel it with a pitchfork, that old enemy will come back again. This disposition exists in many walks of life. A Lord Chancellor has left on record his opinion, that nowhere is there so much envy and jealousy as among the members of the English bar. A great actor has declared that nowhere is there so much as among actors and actresses. Several authors have maintained that no human beings are so bitter at seeing one of themselves get on a little, as literary folk. And a popular preacher has been heard to say that envy and detraction go their greatest length among preachers. Let us hope that the last statement is erroneous. But I fear that these testimonies, coming from quarters so various, lead to the conclusion that envy and detraction (which imply self-conceit), are too natural and common everywhere. You may have heard a number of men talking about one man in their own vocation who had got a good deal ahead of them: and who never had done

them any harm except thus getting ahead of them : and you may have been amazed at the awful animosity evinced towards the successful man. But success, in others, is a thing which some mortals cannot forgive. You may have known people savagely abuse a man because he set up a carriage, or because he moved to a finer house, or because he bought an estate in the country. You remember the outburst which followed when Macaulay dated a letter from Windsor Castle. Of course, the true cause of the outburst was, that Macaulay should have been at Windsor Castle at all. Let us be thankful, my friend, that such an eminent distinction is not likely to happen either to you or me : we have each acquaintances who would never forgive us if it did. What a raking up of all the sore points in your history would follow, if the Queen were to ask you to dinner ! And if you should ever succeed to a fortune, what unspeakable bitterness would be awakened in the hearts of Mr. Snarling and Miss Limejuice ! If their malignant glances could lame your horses as you drive by them with that fine new pair, the horses would limp home with great difficulty. And if their eyes could set your grand house on fire, immediately on the new furniture going in, a heavy loss would fall either upon you or the Insurance Company.

But this will not do. As you read these lines, my friend, you picture yourself as the person who attains the eminence and succeeds to the fortune : and you picture Miss Limejuice and Mr. Snarling as two of your neighbours. But what I desire is, that you should change the case : imagine your friend Smith preferred before you : and consider whether there would not be something of the Snarling tendency in yourself. Of course, you would not suffer it to manifest itself : but it is there, and needs to be put down. And it needs to be put down more than once. You will now and then be vexed and mortified to find that, after fancying you had quite made up your mind to certain facts, you are far from really having done so. Well, you must just try again. You must look for help where it is always to be found. And in the long run you will succeed. It will be painful, after you fancied you had weeded out self-conceit and envy from your nature, to find yourself some day talking in a bitter and ill-set way about some man or some woman whose real offence is merely having been more prosperous than yourself. You thought you had got beyond that. But it is all for your good to be reminded that the old root of bitterness is there yet : that you are never done with it : that you must be always cutting it down. A gardener might as justly suppose that because he has mown down the grass of a lawn very closely to-day, the grass will never grow up and need mowing again, as we fancy that because we have unsparingly put down an evil tendency within us, we shall have no more trouble with it.

Did nature give you, my friend, or education

develop in you, a power of saying or writing severe things, which might stick into people as the little darts stick into the bull at a Spanish bull-fight ? I believe that there are very few persons who might not, if their heart would let them, acquire the faculty of producing disagreeable things, expressed with more or less of neatness and felicity. And in the case of the rare man here and there, who says his ill-set saying with epigrammatic point, like the touch of a rapier, the ill-setness may be excused, because the thing is so gracefully said. We would not wish that tigers should be exterminated : but it is to be desired that they should be very few. Let there be spared a specimen, here and there, of the graceful, agile, ferocious savage. But you, my reader, were no great hand at epigrams, though you were ready enough with your ill-set remark : and after some experience, you concluded that there is something better in this world than to say things, however cleverly, that are intended to give pain. And so you determined to cut that off, and to go upon the kindly tack : to say a good and cheering word whenever you had the opportunity : to be ready with a charitable interpretation of what people do : and never to utter or to write a word that could vex a fellow-creature, who (you may be sure) has quite enough to vex him without your adding anything. Perhaps you did all this : rather overdoing the thing : ill-set people are apt to overdo the thing when they go in for kindness and geniality. But some day, having met some little offence, the electricity that had been storing up during that season of repression, burst out in a flash of what may, by a strong figure, be called forked lightning : the old enemy had got the mastery again. And indeed a hasty temper, founding as it does mainly on irritability of the nervous system, is never quite got over. It may be much aggravated by yielding to it : and much abated by constant restraint : but unless the beast be perpetually seen to, it is sure to be bursting out now and then. Socrates, you remember, said that his temper was naturally hasty and bad ; but that philosophy had cured him. I believe it needs something much more efficacious than any human philosophy to work such a cure. No doubt, you may diligently train yourself to see what is to be said in excuse of the offences given you by your fellow-creatures ; and to look at the case as it appears from their point of view. This will help. But though ill-temper, left to its natural growth, will grow always worse, there is a point at which it has been found to mend. When the nervous system grows less sensitive through age, hastiness of temper sometimes goes. The old enemy is weakened : the beast has been (so to speak) hamstrung. You will be told that the thing which mainly impressed persons who saw the great Duke of Wellington in the last months of his life, was what a mild, gentle old man he was. Of course, every one knows that he was not always so. The days were, when his temper was hot and hasty enough.

And thus thinking of physical influence, let us remember that what is vulgarly called nervousness is an enemy which many men know to their cost is not to be got over. The firmest assurance that you have done a thing many times, and so should be able to do it once more, may not suffice to enable you to look forward to doing it without a vague tremor and apprehension. There are human beings, all whose work is done without any very great nervous strain: there are others in whose vocation there come many times that put their whole nature upon the stretch. And these times test a man. You know a horse may be quite lame, while yet it does not appear in walking. Trot the creature smartly: and the lameness becomes manifest. In like manner, a man may be nervous, particular, crotchety, superstitious: while yet this may not appear till you trot him sharply: put him at some work that must be done with the full stretch of his powers. And then you will see that he has got little odd ways of his own. I do not know what is the sensation of going into battle, and finding one's self under fire: but short of that, I think the greatest strain to which a human being is usually subjected, is that of the preacher. A little while ago, I was talking with a distinguished clergyman: and being desirous of comparing his experience with that of his juniors, I asked him,

1. Whether, in walking to church on Sunday to preach, he did not always walk on the same side of the street? Whether he would not feel uncomfortable, and as if something were going wrong, if he made any change?

2. Whether, when waiting in the vestry, the minute or two before the beadle should come to precede him into church, he did not always stand on the same spot? Whether it would not put him out of gear, to vary from that?

My eminent friend answered all these questions in the affirmative. Of course, there are a great many men to whom I should no more have thought of proposing such questions than I should think of proposing them to a rhinoceros. Such men, probably, have no little ways: and if they had, they would not admit that they had. But my friend is so very able a man, and so very sincere a man, that he had no reason to be afraid of any one thinking him little, though he acknowledged to having his little fancies. And indeed, when you come to know people well, you will find that they have all ways that are quite analogous to Johnson's touching the tops of all the posts as he walked London streets. They would not exactly say, that they are afraid of anything happening to them if they deviated from the old track: but they think it just as well to keep on the safe side, by not deviating from it.

Possibly there was a period in your life, in which you had no objection to get into controversies upon political or religious subjects with other men: which controversies gradually grew angry: and probably ended in mutual abuse, but assuredly not

in conviction. 'But having remarked, in the case of other controversialists, what fools they invariably made of themselves: having remarked their ludicrous exaggeration of the importance of their dispute, and the malice and disingenuousness with which they carried on their debate (more especially if they were clergymen): having remarked, in brief, how very little a controversialist ever looks like a Christian: you turned, in loathing, from the whole thing, and resolved that you would never get into a controversy, public or private, with any mortal, upon any subject, any more. Stick to that resolution, my friend; it is a good one. But you will occasionally be tempted to break it. Whenever the old enemy assails you, just think what a demagogue or agitator, political or religious, looks like in the eyes of all sensible and honest men!

Perhaps you had a tendency to be suspicious; and you have broken yourself of it. Perhaps your temptation was to be easily worried by little cross-accidents; and to get needlessly excited. Perhaps your temptation was to laziness: to putting off duty till to-morrow: to untidiness: to moral cowardice. Whatever it was, my friend, never think yourself so cured of any evil habit, that you may cease to mow it down. If Demosthenes had left off attending to his speaking, he would have relapsed into his old evil ways. If St. Paul, after having learned to be content, had ceased to see to that, he would gradually have grown a grumbler.

I am going to close this little procession of old enemies which has passed before our eyes, by naming a large and general one. It is Folly. My friend, if you have attained to any measure of common sense now, you know what a tremendous fool you were once. If you do not know that, then you are a fool still. Ah, reader, wise and good, you know all the weakness, the silliness, the absurd fancies and dreams, that have been yours. I presume that you are ready to give up a great part of your earlier life: you have not a word to say for it. All your desire is that it should in charity be forgotten. But surely you will not now make a fool of yourself any more. There shall be no more now of the hasty talking, the vapouring about your own importance, the idiotic sayings and doings you wish you could bury in Lethe: and which you may be very sure certain of your kind friends carefully remember and occasionally fecal. But now and then the logic of facts will convince you that the old enemy is not quite annihilated yet; and you say something you regret the moment it is uttered. You do something which indicates that you have lost your head for the time.

Let it be said, in conclusion, as the upshot of the whole matter, that the wise man will never think he is safe till he has reached a certain Place where no enemy can assail him more. I beg my friend Mr. Snarling to take notice, that I do not pretend to have pointed out in these pages the worst of those old enemies that get up again and run at us after they have been knocked on the head once.

and more than once. If this had been a sermon, I should have given you a very different catalogue; and one that would have awakened more serious thoughts. Not but that those which have been named are well worth thinking of. The day will never come, in this world, on which it will be safe for us to sit down in perfect security; and to say to ourselves, Now we need keep no watch; we may (in a moral sense) draw the charge from our revolver because it will not be needed; we may fall asleep and nothing will meddle with us the while. For all around us, my friend, are the old enemies of our souls and our salvation: some aiming at nothing more than to make us disagreeable

and repulsive, petty and jealous; others aiming at nothing less than to make us unfit for the only Home where we can know perfect rest and peace: some stealing upon us more stealthily, silently, fatally, than ever the Indian crept through the darkness of night upon the traveller nodding over his watch-fire: some coming down upon us, strong and sudden as the tiger's agile spring. Well, we know what to do: we must watch and pray. And the time will come at length, when the pack of wolves shall be lashed off for ever: when the evil within us shall be killed outright, and beyond all reviving: and when the evil around us shall be gone.

A. K. H. B.

THE CURATE OF SUVERDSIO.

BY THE LATE D. M. MOIR (DELTA).

I.

THE ancient Chroniclers of Sweden give a melancholy account of the state of that country under the oppressive tyranny of Christiern the Second, King of Denmark, who, stung to frenzy by the generous spirit of independence that actuated the Senate in opposing the degradations to which he was continually endeavouring to subject it, gave reins at length to the bloodthirstiness of his disposition in the awful massacre of Stockholm.

Before the perpetration of this merciless act, which clothed one half of the nation in the garments of mourning and plunged all in sorrow, murmurs were heard from many a tongue in many a quarter; half-stifled imprecations and threats of vengeance mingling themselves with the voice of lamentation; and all seemed only to await a signal, looking around with impatience for some one whose sense of wrongs or natural hardihood might stimulate him to be the first in throwing down the gauntlet of defiance and sounding the trumpet of rebellion. Yet so paralysed was the common mind by the horrid spectacle which had been exhibited, that amazement and terror conspired to keep all in check; and while the more enterprising began to regard the revolution they meditated as hopeless or desperate, the more wavering abandoned altogether the scheme of taking up arms as one fraught with utter desolation and necessary ruin.

To render the misery of the country complete, an immense number of names blackened the roll of proscription, and almost certain death was the fate of every fugitive who did not succeed in effecting an escape. At the time about which our historiette opens, this began to become an almost impossible matter, from the exposed nature of the country, the dangers of travelling among the hills, and the general poverty of the peasants, combined with the dread they entertained of harbouring those over whose heads hung the Damoclean sword of Danish vengeance. The approach of winter rendered the

sum of their miseries complete,—for what more dismal can be conceived than for wretches who have no home, to be obliged to wander over the frozen hills in the darkness, and to hide among the forests during the daylight, subsisting on whatever means the chance goodness of Providence might afford, paying when it was in their power, or trusting, in penniless poverty, to the gushing forth of human benevolence, a spring which, to the honour of our nature, is not always frozen up in the bosom of man? For such was the panic struck into all hearts by the massacre of the nobility in senate assembled, and the butchery in cold blood of the crowds who thronged the streets of the capital, without respect to sex, age, or person, that almost none on whom suspicion of independent principles rested, dared show their face in the towns, from fear of military violence, or the hazard of being informed on, and delivered up by the harpies in whom the love of money extinguished every noble principle,—who not only submitted quietly to the tyranny of Denmark, but betrayed for wages the patriotic children of their own land.

The province of Dalecarlia, from its mountainous and almost inaccessible nature, was one of the principal places wherein the fugitives sought shelter; and not the less from its being the last division of Sweden that had submitted to foreign tyranny. The population was necessarily thin, and scattered over a vast extent, there being scarcely a place worthy the appellation of a town in the whole district, and the villages being widely dispersed over the edges of the boundless forests of pine, larch, and fir, and over the banks of the lakes and rivers that intersect the country. These villages, moreover, were not, like those in the other provinces of Sweden, under the control of some particular nobleman or gentleman; but were governed by the peasantry, who exercised among themselves the right of choosing governors, either to lead them to the field of battle, or to settle disputes in the case of civil

differences. So high had they carried this spirit of independence, that no government dared send either troops or garrisons into this province without giving sufficient pledges to the natives for the preservation of their immunities; while, from the dread of their discovering that obedience on their part might be, if they so willed, only a matter of choice, a few skins formed the solitary tax ever levied; and no attempt at innovation was ever made on their ancient customs; being thus what La Vendée has been to France, or the Tyrol to Switzerland.

It was towards nightfall that a traveller approached the hamlet of Suverdsio, among these ragged and sequestered hills. The sun had just sunk beneath the horizon, and the thick fir-woods that stretched as far as the eye could reach over the mountains and down into the valleys, were beginning, especially in the lower grounds, to wear a blue and sombre aspect. The clouds, drifted by the sharp winds, hurried over to the west; and flakes of snow came whirling down upon the rocks, in the angles of which the withered leaves went eddying round with a desolate noise. The stranger felt accordingly that it was no time to stand on ceremony; so, walking through the little grass court in front of the parsonage, a high-roofed, antique-looking building, at the hither extremity of the little village, he tapped at the deep low-browed door, and begged quarters for the night. Fortunately for the success of his request, the curate himself chanced to be at home, else the only other inmates of his house, his pretty daughter, and a young woman that attended them, might have hesitated about receiving under the roof, during such dangerous times, any one who petitioned for what, in more peaceful days, no one within would have dreamt of refusing.

Without any but mere general questions being asked, the evening passed on, and supper was spread for their guest of the best that the house afforded, which was dried deer's-flesh broiled, and a dish of groute. As is generally the case in savage or mountainous countries, hospitality was a virtue among the Dalecarlians, the neglect of which infallibly entailed disgrace. But the curate was not of those who are actuated more by the dread of displeasure, than by the delight which the exercise of the gentler feelings brings to their possessor. Far removed from ostentation and the bustle of active life, his care was the preservation of the flock whose souls had been consigned to his keeping. Though possessing talents, he looked not around for the passing dignities of this life, but forward to the unfading brilliancies of the next. The scion of an unambitious family, he had taken root in his native spot, his father and his grandfather having preceded him in the same cure; and already the silver hairs of age were mingling with the natural black, to warn him that another generation was springing up around him, before which his own must necessarily pass away. Yet what needed he to care for a wider sphere, when all for whom he bore regard in life were around him?—his beloved and loving flock

—his beautiful and dutiful daughter—the moss-grown tombs of his fathers—and the more recent and carefully-preserved grave of his wife. This last relic was not the one that had least influence over his mind in knitting it to the loneliness of Suverdsio, for to Grethe Hannson he had been early attached; he had married her in pure love, and had lived with her in almost perfect happiness till the arm of death had been suddenly outstretched between them, leaving him, while yet in the maturity of life, a mournful widower. But she had not all perished; for a daughter, the very image of her whom heaven had taken away, grew up at his feet, and soothed his solitary hours; while sorrow at length gradually softened down into resignation, and he looked abroad on nature with a more cheerful eye, delighting in the society of a child whose buoyant disposition filled his solitude with delight, and rendered even the bare rocks around him a type of Paradise.

When supper was over, and the crescent moon shone down on the dewy window-sill, the daughter retired from table, leaving her father to entertain their guest and enjoy his conversation. She went into the adjoining kitchen, where, by the light of a lamp, her servant, or rather female companion, was busied in knitting; and seating herself by the fire, opened a book of old national songs and stories, which she took an especial delight in conning over, as her young fancy rioted among the wars, and loves, and superstitions of the olden time. She was in the act of reading one of the legends relating to Holger Danske, the great ogre of Northern romance, and her friend Katherine sat listening in delighted attention—the wind sighed, but only from without—the faggots crackled—the kitten gambolled on the hearth, and all was cheerful—when Katherine, stopping her by putting her finger on her arm, said, "Hist! did ye not hear something?"

On listening a moment, they heard louder words than those of ordinary conversation proceeding from the room where were the curate and his guest; ever and anon the tread of feet, as some one leisurely measured the apartment; and then a hushing sound, as if silence had been imposed on their conversation, from the probability of its being overheard.

Margaret, whose love for her father was surpassing, was not a little anxious in mind, especially as the person admitted to the house was a perfect stranger, and might conceal designs under specious appearances, which, in the existing troubled state of the country, might eventually be calculated to bring them into distress. Personal harm to her parent she dreaded none—for, beholding the reverence in which he was universally held, and the respect paid to his every word and action—her innocence imagined that the fame of his virtues and sanctity pervaded the world, and that the injuring a single hair of his head would be regarded as an atrocity amounting almost to sacrilege. Above her father she seemed always to behold the arm of protecting Omnipotence stretched out; and rejoiced in the in-

ward confidence that no breathing creature could harbour a malicious design against one the sound of whose name was wafted like a healing balsam to the cottager by his valley fireside, and to the solitary mountaineer watching his straggled flocks on the hill of storms.

A short time elapsed, in which some feeling of suspense was indeed predominant; but at length, the door opening, the curate was seen standing on the threshold with a light in his hand; and he called to Margaret to bring him the keys of the church, and his hat.

The stranger followed, muffled up in a large woollen cloak with which he had been supplied; and carrying over his arm a coverlet, which Margaret had brought at the command of her father. The curate led the way, with the large rusty keys of the church in one hand, and a spacious circular horn lantern in the other. The night was still gusty, and white clouds were fleeing like evil spirits across the sky, dimming the radiance of the declining moon. Having opened a postern door which led through a small garden, at the foot of which rippled a clear streamlet amid its bordering willows, and crossing a narrow wooden bridge, whose whitened planks glittered with the sparry lustre of hoar-frost, they found themselves on the pathway that terminated at the neighbouring church.

The church itself was an old, fantastic-looking Gothic structure of inconsiderable extent, with a conical spire at the western angle; buttressed walls, with oblong diced windows in the interspaces; and a large low-browed door in the eastern gable. All around wore the melancholy aspect of hoar antiquity; and amid a scene so solitary and deserted, life and living things seemed to have passed away, and the sharp-horned moon looked as if setting in the last night of the world. Everything was silent, except the savage winds, tossing in transitory gusts the dry branches of the black pines, or moaning with unearthly voices through the crevices of the grey building,—whose shadows, falling like a black mantle over the silent field of graves, might have shaped it out to the eye of fancy as Loke, or some of the other monstrous impersonations of the Scandinavian mythology, keeping guard, with malignant scowl, over a region desecrated to their dominion.

II.

The vicar led his guest through the body of the building into the sacristy, where was a small fireplace, supplied with dry faggots ready to be lighted. The blankets were spread out over some deal seats, which made a tolerable substitute for a bedstead. In a little while the hearth crackled and began to blaze cheerily, lighting up the gloomy walls and dispelling the damp, mouldy smell of the atmosphere, while the stranger began to feel himself in a situation more secure and comfortable than he had experienced for a considerable time before. So when the curate, after some little stay and conversation, wished him a good night, and locked one after an-

other the great creaking doors, he wrapped him in his coverlet and lay down, glad, after the fatigues of his many wanderings, to enjoy a sound and refreshing slumber, and little scrupulous where that slumber visited him.

When the curate approached his own door, he found his child anxiously awaiting him in the doorway, and as she took the light from him, she said tenderly, "Bless thee, my father; oh how glad am I that you have come safe back to us!"

"Margaret," replied the curate, taking her by the hand, "Margaret, my dear child, there needed no such violent expression of affection. I have been running no risks; I have been encountering no dangers, farther than showing a noble houseless fellow-creature to a very miserable bedchamber: but it is the best—at least the securest—we have to offer. May he have a sound sleep. But harken to me;" and so saying he preceded her into the parlour.

"Well, father?"

"While that stranger is in our keeping," said the curate, "the utmost secrecy must be preserved. Hint not of having seen any one; mention not to a creature that we have a strange man in hiding. Would that I could do him service; his cause—our cause, for it is the cause of Heaven and humanity—demands it; and, Margaret, as I am often called on holy errands from home, great part of the duty of attending upon him, and supplying his necessary wants, may devolve on thee, for I would not for a world's wealth that—"

"Oh, assuredly, father," answered Margaret, kindled as it were by a sudden emotion, whose glow lighted up her beautiful features; "I trust you shall never find me wanting in charity to the distressed."

"Call it not charity, daughter," said the curate. "It is, in this case especially, duty—imperative duty. Know you that our guest is one of the persecuted patriots—one of the men of whom our dastardly tameness is unworthy."

At mention of these words her cheek paled, and she pressed her hand to her side, as if some pain at her heart impeded her breathing, which, in a moment after, heaved her bosom more tumultuously. "Sure then, father, he does not come from this quarter of the land," she said; "at least I do not remember having ever seen him before."

"Oh, I daresay not," was the reply. "But whether stranger or not, you know your duty, and I need not repeat my instructions to you. Say nothing on the subject to any one, and see that you have breakfast ready for me betimes to carry to him in the morning; for not kings themselves, nor even enthusiasts, can live entirely on air. See, then, that you attend, child."

"It was lucky, father," said Margaret, "that he came not to us sooner. If he had been in the house the other day, when the wild Copenhagen horsemen came rummaging about, turning the world upside down, perhaps,—but there is no saying!"

"That is the most inconclusive remark, Margaret, that ever flowed from the lip of man or maiden," said the curate, smiling. "If you had been living at the time of the flood, with Noah and Shem, then, perhaps,—but there is no saying!"

"Ah, father, you are hard upon me; for you know he might have been taken—dragged from our hearth—and hanged on the first tree; as was done with Ulric Staaden's lodger the other week!"

"Well, Margaret," said the curate, "I heartily rejoice with you that he has thus far escaped them; and let us hope the best for the future."

"Did he not mention Regner Beron?" added Margaret, with somewhat of a sheepish look, as if the question did some little violence to her bashfulness. "Ah! father, you might have asked somewhat about him; you know that he is somewhat related to us by blood; that he was born in our district, and was my playmate when we were young, very young, and happy creatures. To be sure now he is a soldier, or lately was, and it is difficult to say for whom, or against whom, he carries arms. I hope, for old acquaintance' sake, that Heaven has directed him."

"Tuts, child," said the curate; "have you not forgotten that idle forester yet? It were better for him to have kept at shooting his snipes and woodcocks, his white hares and brown foxes, than to have taken up a trade about which he knew less; when his only likely reward was the getting his neck in jeopardy, whichever way he decided. Don't you think so?"

"Then you think he did wrong, father?"

"Come, come," said the curate, as he turned from her with a smile; "'tis but an hour from midnight; let us prepare for rest,—and let us mind our own matters; leaving others to judge for themselves, and committing the care of our state to Him who sent the ravens to Elijah; and armed with destruction the pebble that, slung from the arm of a shepherd boy, smote the forehead of the deriding Philistine."

III.

If the sleep of the stranger in the chapel, surrounded with many a ghastly monument of human decay, was soothing and sound, full of refreshment, that of Margaret, in the endearing home of her parent, was far from being so. She now dreamt of the stranger,—of his tall and portly appearance, of the impressive dignity of his countenance, undimmed by the cloud that overhung his brow,—of the mysterious altercation, for so it seemed, with her father,—and of his sequestered abode in the old church. Now she dreamt that Regner Beron was returned to the home of his childhood; and that she wandered with him amid the woods, beside the old castle of his ancestors, on whose tall grey tower, as of yore, the wallflower sprinkled its yellow blossoms, and the wild-pigeons cooed, basking themselves in the pleasant sunshine. Anon she thought that she stood by her own door, in the

mellow glow of autumnal evening, watching his return from his sylvan sports, with his heavy game-pouch at his side, and his faithful black hound Grotten trudging behind him. Again the vision changing, she sat with him in her father's church, while now and then his eloquent glances told her that her image divided the empire of his thoughts with better things; while suddenly, the figures dying away, she beheld him with his sword buckled upon his side, and his staff in his hand, as on that morning when he bade adieu to her at the door of her home, and lingered, with the latch of the gate between his fingers, to cast a last fond glance on her, still loitering at the threshold-step.

So passed over the greater portion of the night. The early flush of dawn tinged her eastward-looking lattice with crimson, and the salute of the already awakened thrush greeted her ere her feelings were more completely quenched in slumber. This quiet repose she did not, however, long enjoy, for the abrupt opening of her chamber-door in a short time startled her.

"Not yet awake, child?" said her father, as he entered, buttoning his large shaggy cloak, with a broad-brimmed hat slouched over his ears to protect him from the chill air. "I am sent for to visit old Magnus Vere, who, it seems, has been wantonly wounded by some villains who, in the name of the Danish government, have been overnight searching his house, in the hopes of discovering some particular Stockholm fugitives whom they have traced to this neighbourhood. Good morrow, Margaret. It seems I must hurry on, if I wish to see him in life, for he cannot last above a few hours."

"Oh, monsters!" said Margaret; "to murder a good, harmless old man, who must have been innocent of all crime against church or state, in the mere wantonness of disappointed bloodthirstiness. Who knows, father, what may yet be our own fate!"

"Let us do our duty, Margaret; trusting in heaven. Let us fear God, and have no other fear."

"Poor old soul! Poor old Magnus Vere! shall I, then, never see him more? It was but last week he brought me branches of evergreen to deck our dwelling! All last summer he brought me bunches of beautiful flowers from his garden—such flowers as are not to be found elsewhere all the country round. And the pot of honey last September—Ah! the kind old man, he never forgot us, father; he was always finding out something he thought would please us!"

"Well, Margaret, let me not forget him. Nor do you forget to carry breakfast betimes to our stranger in the church. Make not the smallest ado about the matter; but let silence and secrecy go hand in hand."

"Oh! stay but for a moment, father. How shall I communicate this dreadful business to our poor Katherine? It will go far, I fear, to break her heart, for she loves her old parent most tenderly."

"That misery is saved you, Margaret, as she herself received the messenger, and is by this time at her father's bedside. So, good morrow, again,—and again see that you neglect not our guest. Tell him the cause of my absence. I will be back betimes. Good morrow, child."

Margaret lay for a little, absorbed in melancholy, pondering over the terrible vicissitudes of mortal life. She realised the slenderness of our hopes of happiness, and felt how, in an hour, the paradise of this world may be left to us desolate. Her mother was with the dead; she had small remembrance of her, for she had been summoned away while yet she was but four summers old; but she took a delight in the mournful duty of keeping her grave-turf free from weeds, and scattering over it the earliest flowers of the spring. Her father was now rapidly declining into the vale of years; and, in the course of nature, a separation might not be very distant; but the troubled state of her native land filled her bosom with additional fears. "Last night," she said to herself, "Katherine chatted and laughed with me, a merry creature. She lay down on her pillow in happiness; she hath risen up from it in sorrow. She had then a father, as I have now—alas! how fares it with her at this present moment!" and here she wiped away the large drops that rushed burningly over her cheeks.

The good curate was in the meanwhile pursuing his journey; but ere he reached the cottage of Magnus Vere, the wife and daughter were looking along the road, wearying for his approach—and no wonder; for immediately on his entering he perceived, from the features of the old man, that the wounds he had received were mortal, and that a few hours must probably terminate the struggle. Magnus was, however, still sensible, and told his story with simple distinctness.

It seems, on the previous afternoon, one well known to them both, Regner Beron, the son of Magnus' old master, had, in disguise, come to the cottage, soliciting a night's lodging. This having been freely granted, he had in the course of the evening disclosed himself, informing the family, in whom he reposed the strictest confidence, that he had travelled for a long way over the mountains in company with another fugitive, whom he had brought to that part of the country for greater security, and directed for shelter for the night to the dwelling of the curate. It fell out, however, just as they were preparing to retire to rest, that the sound of horses' feet approaching created an alarm; and that Beron, stealing cautiously to the door, had recognised the party, though in the dusk, as the Danish dragoons, who were in search among the hills for the proscribed fugitives, particularly for some of the nobles who were presumed to have taken that direction—and his ready perception saved his life; for he had succeeded in concealing himself amid a rick of hay by the side of the door, till the entrance of the pursuers enabled him to make off unperceived to the woods. Unfortunately,

however, for the fate of his host, he had, in his precipitation, left his cloak behind. It was recognised, and the search proving ineffectual, the party threatened instant death to Magnus if he did not on the instant give up the refugee into their hands. On finding that this could not be accomplished, the ruffians in dastardly revenge had wounded the old man in several places with their swords and the butts of their pistols, leaving him on his own floor for dead, weltering in his blood.

The curate found that he had come just in time to administer the last consolations of religion, for in a little while he remarked the long-drawn, heavy breathing, the paling cheek, and the glazing eye of the old man; and as he felt the fluttering pulse, he observed the cloud of death mantling him around silently and almost imperceptibly, as the dews of night congeal, harden, and crust over the green leaf in the early frost of morning.

The latest request of the old man before he died was, that the curate should exercise the same care over his daughter as he had hitherto done; and that, in her young and inexperienced years, he should be her guardian and protector.

Before the event had taken place which left the wife of old Maguus a widow, and his daughter an orphan, Margaret had been busying herself in preparations for breakfasting their hidden guest. She felt a degree of timid reluctance to set out on her walk, but her scruples were overcome by a sense of duty, though when she turned the key in the old grating lock of the church door, her heart fluttered like that of a newly-caught bird.

The stranger, who was already engaged in looking over some papers that lay scattered on the little table before him, crumpled them up into a heap at her approach, and rising from his seat wished her a good morning with a smiling countenance, which showed to Margaret at once that neither Kirkegrim, the spirit of the church, nor any other of the unearthly wanderers of night, had paid him a visit in his lonely sleeping-place. His erect and gallant demeanour, the nobleness of his features, the portliness of his step, and the grace attendant on every movement, made her conscious at once that the person before whom she stood was no common man, and awed her in a moment into a reserve that was scarcely in keeping with the gentle openness of her nature. But the breath of a few passing words served to clear away the chilling cloud of restraint, for the stranger was one in whom benignity of disposition was conjoined with gentility of manners, a conjunction which is often to be met with, and ought always to be inseparable; so in a little she was asking questions, and he answering them in the flow of conversation, with the unrestrained confidings of old acquaintance.

There was one topic, however, which she kept aloof from, though it more than once trembled on her tongue. Sometimes she hoped he might stumble upon it, and sometimes she resolved to question boldly. In this she was disappointed; in that she

disappointed herself. Need we say that the subject was Regner Beron ?

IV.

Some hours passed over in solitude, and save the murmur of the daws that fluttered about the roof, in the crevices of which they had probably nestled their summer young, all living sounds were silent. The only light of the sacristy flowed in through two narrow slips near the roof, so that it served only to show him the progress of time, as the lazy sunbeams crawled slowly from west to east along the opposite wall. Communion with his own thoughts was, however, a subject with which the stranger had been long and intimately conversant ; and he was lost in a reverie of the past or the future at the instant when the grating of the church door wakened him up, with the warning that some one approached. It was the curate.

"Good day," said the reverend man, on entering. "I am late in coming to you, and I fear you have been somewhat impatient. But I have been delayed in the execution of a mournful office. I have been closing the eyes of an honest and old friend"—and then he repeated the catastrophe which had happened, and the escape of Beron.

"Then he has escaped safely?" cried the stranger, starting from his seat, and looking anxiously at the curate. "I trust in Heaven it may be so."

"So it is hoped—at least no harm has overtaken him, so far as is known. I know his acquaintance with the mountain passes hereabouts ; nor can he be followed in them by his pursuers, without the assistance of our native guides, whom they shall find unwilling, or find not at all. He has taken to the hills, I doubt not ; and if so, I entertain no fears of his having eluded them."

"I rejoice at it sincerely," said the stranger, resuming his seat with more composure. "Should it be otherwise, I vow to Heaven—"

"Make no rash vows," said the curate, interrupting him ; "especially when the blood of man is so likely to be spilt in their fulfilment."

"Ah !" resumed the stranger, "you think me impetuous—probably I am so. But know you how valuable the life of Regner Beron is to our cause? Know you the importance of the commissions with which he is entrusted? Know you that the soul of our country may in a manner be said to be at this moment in his hands? you would sympathise in my irritability, and overlook my rashness.—Speaking with regard to myself, I, too, have a deep personal interest in his fate ; for he was once the means of rescuing me from destruction at a moment of the most imminent peril, when we fought together under the standards of the same regiment."

"I rejoice to hear, sir," said the curate, "for the honour of our poor district, that one of our sons has been conducting himself as he ought."

"It was he, too," continued the stranger, "who conducted me to this comfortable asylum, where

I have found more indeed than he even promised me."

"Talk not of that," said the curate. "Heaven prospers the right cause, and all may yet be well. You said that Beron was to journey to Mova ;—I have no doubt that he is already far on his way thither."

"And the poor old man who has innocently suffered in our cause!" said the stranger, not a little affected. "It is dreadful that our safety cannot be effected but by throwing our protectors into danger, making the exercise of hospitality a risk, and Christian charity a crime beyond the pale of forgiveness."

"Terrible, terrible indeed," said the curate. "But let us live in the prospect of better days. Winter lasts not all the year round ; and the volcano ceases to rage when its fires have burnt themselves away.—You say that you have seen service in the army : but tush—I fear my curiosity is impertinent. We mountaineers are proverbially fond of prying into other folks' business ; but—"

"No, no—free shall be my answers ; as your questions are free and friendly. Perhaps you may have heard of Gustavus Vasa, one of our generals of horse? Beron and myself belonged to his regiment, and have seen some service with him."

"Oh, yes," said the curate, "I have heard of him, and well. 'Tis said he is yet but a young man. Is he not?"

"Much about my own age, I dare say. Poor soul ! he is no doubt, like the rest of us, a fugitive among the hills ; grieving in soul to see Sweden in fetters. Perhaps we may yet hear his trumpet-call!"

"I trust we shall," answered the curate. "He is well spoken of by his true-hearted countrymen—and may the names of the loyal ever sound like echoes of terror in the ears of our oppressor.—I must be gone for the present, but shall see you shortly. In the meantime I have brought, to amuse your solitude, two books. One of them is the early chronicle of Sweden,* the other the old ballad legends of our native north."

"They are most welcome, my kind sir," said the stranger ; "and I shall be glad of your company at your convenience, though I fear that I am a most troublesome lodger. If any one come to your dwelling at nightfall, by the token of his asking for Eric Voss shalt thou know that he is my friend—and admit him, for his business is urgent."

V.

The sun had sunk placidly—like the benignant eye of heaven—beyond the great hills, whose ragged fringework of larch, pine, and fir yet glowed in dark outline against the pavilion of the west, while the evening star, peeping from behind a pale grey cloud, heralded the galaxy of night, as a tall youth, wrapt up in his cloak of furs, solicited at the

* Probably either Eric of Upsal's "Chorographia Scandinavia," or Adam of Bremen's "Tumbe Veterum apud Sueones Gothesque Regum."

curacy of Suverdsio for leave to warm himself a while by the hearth ere he proceeded on his further journey amid the mountains. The curate was absent, having gone out in the afternoon to visit the mourners at the cottage of old Magnus, nor was his daughter without anxiety for his return. But Margaret made bold to admit the traveller, even though quite alone in the house, and conscious of the distracted state of the times; informing him that her father, whom she expected home every minute, would, she was quite sure, make him perfectly welcome.

After the offer of some slight refreshment, which was duly accepted, Margaret, in her usual affable way, began to enter into conversation with the stranger, and the massacre of Stockholm being still the theme upon every tongue, she inquired if he had recently come or had heard anything from that quarter.

"Oh, yes," answered the youth, "and bloody work they made of it. But I have come up among the hills in search of an old comrade in arms of mine, one Regner—I forget his name just now."

"Regner Beron can it be?" asked Margaret, eagerly.

"Aye, that's the name—you have not, I find, forgotten. But let me ask you, Margaret—"

"Heavens! is it you, Regner? ah! Regner, do I see you once more, safe, safe, safe!" and springing across the floor, she threw herself upon his neck, while he pressed her to his heart in an ecstasy of affection; then as suddenly withdrawing herself, like a wild bird from the grasp of the truant school-boy, she said to him, while her bosom heaved, and her cheek glowed with the flush of maidenly modesty, which in the irresistible vehemence of her emotions she had somewhat over-exerted,—“Oh, fly—fly, Beron! do you not know that the horse-men are in our dales in search of you—may be even at this moment at our gates—and how could I survive your fate? But I talk simply; perhaps you have forgotten me!”

"Forgotten you, Margaret!—but you are jesting."

"Nay, nay, but I am not jesting of your danger. Have you not heard that your protector, Magnus Vere, poor old white-haired Magnus, has been slain by your pursuers, in their rage at not finding you? Grasp not round for your pistols—alas! it is now too late."

"Impossible!" said Regner, starting to his feet, soul-struck at the intelligence he had received.

"Then I swear—"

"Swear not at all, Regner," interrupted Margaret. "The thing is past, and you are blameless. Let thy care now be for the living—for thyself."

"Be not dismayed, Margaret, on that score. Well know I these my native hills, and I have a sword-arm to protect my head. Ah, poor Magnus! and hath thy charity paid the penalty of blood! rather had I fallen into the hands of my enemies. How can I repay such loss?"

"His cause was thine," answered Margaret;

"and if he has perished at his post, like a loyal Swedish mountaineer, scarcely is his fate to be lamented, seeing the degradation to which the living are subjected. Were I a man, Beron, we should conquer or fall together! In the meantime, see to yourself, and fly for refuge.—But whither fly? no—no—remain here. You cannot be safer than with my father, and if perish we must, let our house fall together. Like Saul and Jonathan we have been united in our lives, and in death let us be not divided."

"My dear kind Margaret," said Beron, seizing the hand she faintly attempted to withdraw; "it must not be so at present. Yet, credit me, matters are not so desperate as your solicitude pictures to your fears. Cheer up, my sweet one; I have undergone many hardships, encountered many dangers, but I have held them all lightly, compared with the simple sorrow of being separated from you. We have known happy days, Margaret, and may yet. How grows the hazel by the Mill-stream? Does the declining sun never invite you to a saunter there now?"

"Ah, Beron, do you ask that?" said she, with a sorrowful playfulness. "But whither go you this evening? You must not stir before my father returns."

"I promise you I do not, for I have business with him. Have you no other visitor?"

"Why do you ask?"

"So, Margaret, you are careful not even to open yourself to me!—but I applaud your caution. Where have you hidden him?"

"I am a trusty housekeeper, Beron, and divulge not family secrets, so shall not implicitly depend even on you. Could you have thought so, Beron? But how would you judge of me, were my idle openness to endanger any one who reckoned himself secure in the character of our guest. But listen!"

"What do you hear, my faithful Margaret?"

"Yes—'tis my father's footstep," and she rose to hurry to the door, when Beron, interposing, snatched a first fond kiss, and ere she had breath to chide him, he laid his hand on her arm, saying, "Stay, Margaret, stay; I, too, have reasons for privacy, and perhaps even from him, for I journey in the character of a special messenger, and know not yet how his heart stands affected regarding our cause. Fear not, however, Margaret, that I have embarked in any enterprise wherein my honour may be compromised. If we succeed, we reap a harvest of glory: if we fail, it is after having acted the parts of true men. We shall hope the best, Margaret."

At this moment the father, entering, retreated a step in surprise at seeing a muffled stranger seated by his hearth; not that the thing was uncommon, or that any traveller of the hills had ever received other than a kind welcome; but because, in the existing troubled state of Dalecarlia, he was in danger of having the pursuer and the fugitive under his roof together.

"Good even, sir," said Beron, rising and bowing respectfully. "I presume you are the Curate of Suverdsio. If so, I bear you a confidential message."

"From whom?" asked the curate, a little anxiously, as Beron, in the act of pushing aside his cloak to draw a packet from his breast, displayed two pistols stuck in the broad leathern belt which girdled his doublet.

"From whom I may not say," replied Beron; "but to Count Eric Voss bear I my message. Perhaps you may direct me where that nobleman is to be found."

"Have you had any refreshment?—I shall lead you to him immediately."

"Thanks to your kind daughter," said Beron, giving Margaret a gentle look unobserved by the curate, "I am abundantly refreshed, and ready to follow you, as I doubt not my presence is anxiously wearied for by the count, though I am yet an hour earlier than I appointed."

The curate resumed his hat, and led the way to the door, followed by Régner; while Margaret came up behind with the ostensible purpose of seeing it closed. But perhaps she might have some other object equally in view—and what guess you, reader, might that be? Perhaps a parting squeeze of her lover's hand—and in this she was not disappointed.

VI.

By sunrise on the succeeding morning Count Eric Voss and Régner Beron departed from the sanctuary of the hospitable curate, who accompanied them a short way on their route. They made a halt, however, at the small wooden bridge thrown over the river Leissac, about a mile and half from the church of Suverdsio, and standing beneath the immense trees of pitch-fir, whose dark branches overhung the sharp rocks on the left bank of the stream, they conversed together for a little while on the state and prospects of affairs around them, promising that, either in weal or woe, their host should soon hear of them.

Before parting, the count unbuttoned the coarse shaggy cloak in which he was clumsily wrapped, the better to disguise his quality; and cut with his penknife a golden button from the curiously embroidered tunic he wore underneath, saying to the curate, "Money, my kind friend, I have not to offer you, the which I less regret, knowing as I do that your hospitality flows not from base thirst of gain, but from pure benevolence to your fellow-creatures. Preserve this button, which I have now cut from the left breast of my tunic. Its value is insignificant, but it may serve you as a memorial of one whom you relieved from urgent distress, and set on his path rejoicing. When I came to your hospitable door, but two days ago, my prospects were black as the shade these rocks cast on the water, now they are brightening like yon skies beneath the influence of the rising sun."

"You think of me," said the good man, "much

more warmly than my supposed merits claim. Though my holy profession forbids my joining in scenes of warfare, yet the religion I profess blinds not the human conscience to the sense of right and wrong; but commands us to do our duty, and be not afraid. I rejoice for your own sakes and for the sake of this oppressed realm, that you leave my door with better hopes than you approached it. Take with you my parting blessing—my prayers be ever with your noble cause; and if the day arrive when you unsheath your swords for our country's freedom, be assured that my heartiest petitions ascend to Heaven in your behalf."

VII.

Sharp were the winds and piercing, and the clouds showered snows over the fading hills, when Count Eric Voss and his trusty attendant Régner Beron hastened from the cottages of Suverdsio to join Gustavus at the first great insurrection, which was appointed for the Fair of Mova: and now the tints of autumn were again pervading the woods, the acorn fell from the oak, the pine-tree began to drop its leaves, and the fir shook down its dark cones upon the moist turf, while the skies waned like the lower world, and amid the shortening days, the shorn grain disappeared from the plains into the granary of the farmer. It was in this season of melancholy fruitfulness, that the curate, while amusing a vacant afternoon in pruning some creeping plants, that greened over the front of his secluded dwelling, paused to behold a company of horsemen, whose arms glittered in the flood of mellow sunlight, approaching on the steep road which formed the southern approach; some riding before, and some behind a calèche, or little carriage, drawn by four horses. In the multitude of his thoughts within him, his mind could not otherwise feel than somewhat perplexed at the unexpected unfolding of a spectacle so uncommon among his old native hills; and when we consider the irritated and unsettled state of the country at this juncture, and the consciousness of the curate that his actions might be tortured to his ruin, the momentary qualm which came over him will not form a ninth wonder of the world. Of battles fought, and battles won, much had he heard; but, from the conflicting state of party opinion, little worthy of reliance in those days when newspapers were not, could be gleaned from any quarter. So though he still inclined to hope, in the absence of all positive information, that success was still attendant on the patriotic efforts, yet his nerves received a shock when, on the nearer approach of the cavalcade, he perceived that the soldiers were in light green uniform, and wore in their caps the badge of King Christiern. He immediately supposed, on second thoughts, that the vehicle was the travelling conveyance of some of the Danish nobility, and that they were probably attempting their escape from Sweden under the protection of an armed band; but his dismay was renewed when, on the carriage halting near his

THE CURATE OF SJVERDSIO.

gate, he observed that it was empty. The leader of the party dismounting from his horse, first assured himself that he addressed the Curate of Suverdsio, and then informed him that he had orders for carrying him and his daughter away as prisoners; while he acknowledged that he had positive commands to treat both with every leniency which interfered not with their chance of escape.

"What may I have done," asked the curate, "to bring upon me the so-much-marked attention of your government? Can I be informed, sir?"

"Oh," replied the commandant, "as to that, it is not my province to inquire. The soldier does the bidding of his sovereign; and the civil laws of the kingdom take cognisance of right and wrong. That is a subject on which it is not my duty to enter."

"Well, since it is so," said the curate, "let the righteous will of Heaven be done! For myself I care little—comparatively nothing. What I have said, I have said as conscience, the oracle of the soul, dictated: what I have done, I have done as my strict duty to God and my fellow-creatures dictated. But my daughter—oh, my daughter!—let not what she knew nothing of—knows nothing of—bring down a punishment she deserves not. Take me—take me—I am ready, willing to go with you; but, as you have wives, as you have daughters, spare her, and let her remain behind. Whither am I to be carried?"

"Our orders command us to carry you to the castle of Westeras, the palace of the Viceroy; where a Council of State sit, giving trial, and awarding just sentences to such as have rebelled against the government or despised the edicts of the King. In this thing it causes me regret that I cannot attend to you, being positively enjoined to bring your daughter along with you, and with all due speed, to the appointed place of examination; the court being about to remove for a like purpose to a more remote part of the country."

"Are your orders, then, positive?" asked the curate, sorrowfully.

"Imperative—and I trust you will immediately see the duty of submitting voluntarily and without hesitation, knowing that resistance would be madness, and that escape is out of the question."

"Well, then, I submit freely," said the curate, fervently clasping his hands for a moment together, and looking upwards, whence comes the aid of the righteous.

By this time Margaret, at first surprised at the unwonted approach of such a cavalcade, had her surprise changed into terror at perceiving the Danish uniform: she beheld from the window the exultating attitudes of her father; and on coming to the threshold, she heard the broken and elevated tones of his voice.

At once the whole truth flashed upon her soul, and rushing forward, she threw her arms around his beloved neck. "He must not go," she cried. "Oh, no, you shall not take him from me. I know—yes, yes, I know well what you have done to

others, and would do to him!" she screamed, in an agony of affection and fear. "But where my father goes, nothing shall hinder my going also, and whatever his fate is so shall mine be; that, surely, you will not refuse—that, if you are men, you surely dare not refuse."

"My sweet young lady," said the commandant, in as soothing a tone as his military habits could be supposed to assume, "do compose yourself, you shall go with your father as you desire; and I pledge my honour on this sword, that while you are in my keeping, no harm shall be allowed to happen to either of you."

With heavy hearts, but nerved with the fortitude which only conscious virtue can bestow, the curate and his daughter in a short time declared themselves in readiness to accompany their captors; while Katherine Vere, a girl in the beauty of eighteen, scarcely less fair than her fair mistress, wiping her eyes with her white apron, and weeping half-aloud, saw the hearth by which she had often sat singing in joy, extinguished, and the doors of hospitality locked, changing what had once been a home of cheerful peace into a house of desolation.

At the door her master shook hands with her cordially, bidding Heaven bless and protect her; and Margaret, as she gave her a parting kiss, said, in a voice whose tremulous accents belied her smiles, "keep a cheerful heart, Katherine; we will be back to you ere long."

They were then conducted to the calèche, and the cavalcade proceeded, Katherine following it greedily with her eyes, now and then looking back at the deserted vicarage, and again forward at the rapidly disappearing horsemen, as, solitary and sighing, she sauntered homewards to the cottage of her widowed mother. In her hand she carried a cage containing the linnæus, which had with its clear, shrill, happy pipe so often enlivened the tasks of her young mistress, gazing at every tree and rock she passed, as if fate had forewarned her that she was never to traverse the same road again.

VIII.

After a journey of two days, during which every attention was paid to the wants and wishes of the curate and his daughter consistent with their security, the commandant arrived with his charge at the hamlet of Waddersteine, about half a mile from the castle of Westeras, where the Danish assembly was then sitting.

It was evening: and the commandant, who in the afternoon had left his charge under sufficient guard, returned to escort the captive mountaineers to the great assembly, already meeting or met for their trial. To the questions of the curate he returned no satisfactory answer, but re-mentioned his injunctions as to secrecy. He ventured however to express the hope that things might yet turn out more favourably than was anticipated.

When the father, dressed out in his best sables, and the daughter in a white robe as pure as her

innocent heart, lingered a moment at the door for the drawing up of the carriage, far borne through the silence of evening came, like a sepulchral voice, the toll of the great bell summoning them forward to the hall of trial.

Halting by an immense arched gateway, they passed through the vestibule of a building whose quadrangular turrets seemed to support the weight of the louring sky. Neither of the two had ever known more of the palaces of the great than the apocryphal testimony of books had conveyed to them; so that on being suddenly ushered by folding doors into the midst of the hall of assembly, it was no wonder their eyes were dazzled, and their hearts died within them. The stupendous vaulted roof, covered with grotesque paintings, and an infinitude of stuccoed imagery—the tall Gothic diced windows, with their magnificent traceries—the walls groaning under their load of gorgeously embroidered tapestry of Arras—the curiously carved benches—the velvet cushions—the marble floors—and the flaming cressets, that depended from on high by silken cords, struck on their bewildered imaginations like the visions of some fancifully distempered dream, as for a little they felt themselves as it were in the enchanted habitations of the Eastern Genii of whom romancers had written; and it was some time before they perceived, or at least regarded, before them the large assembly of nobles and leaders, some in their rich costly robes, and others in coats of glittering armour.

With the greensward under his feet, the rocks scowling, the trees flourishing, and the mountain winds whistling around him, the curate could think like a man, and feel as a patriot; but in the midst of such a dazzling assemblage, his spirit drooped like a caged bird, and he dwindled away in the overwhelming consciousness of his own insignificance. Conviction might or might not follow; but he had reckoned on at least making a defence which should neither be derogatory to his character as a Swede, nor his faith as a Christian; when put to the trial, however, he now felt that he might as well be at once led out to death, as attempt any defence of his conduct. As the stars in their beauty look as if they could brave the daylight, yet are put out on the uprising of the effulgent sun, so his many noble emotions,—the vigorous arguments which his reason had suggested, the open manifestation of virtue which he was sure his traducers—all, all vanished before the talisman of magnificence, and the curate gave up everything for lost; but at that desponding moment he was startled by the touch of something from behind, and turning his head half round, he discovered Margaret, who, clutching hold of the skirt of his coat, had shrunk to his back, and with a blood-forsaken cheek, pale as the white lily of April, seemed ready to sink down on the floor. Then, as by force of magic, “the bowstring of his spirit” regained its elasticity, and the free blood of undaunted man-

hood came gushing back into his veins, for nature is superior to art, and the strength of paternal affection deeper rooted in the soul than awe for power or bedazzling pageantry. He beheld the being more dear to him, for her own sake and for her mother's, than all other breathing things, clinging to him in the hour of tempest, as the ivy clings to the oak, and the strong sense of the duty he owed himself and her came to his support.

When he had reached the area in front of the judges, one from the centre stood up and addressed him, saying, “Are you the Curate of Suverdsio?” and, in a firm voice, he replied, “I trust, my Lord, I have done nothing to make me ashamed to say I am.”

Margaret was now offered a chair by the side of her father; and the interest that her youth and beauty had excited in the court was visible on every countenance; but alas, Justice is blind, and her scales are allowed not to be freighted with the load of pity.

“We shall see that immediately,” said the spokesman of the assembly, in reference to the curate's answer; “meanwhile, let me ask you this simple question—do you confess, or do you not, having harboured sundry of the rebellious subjects of King Christiern, when your allegiance bound you to deliver them up to justice, knowing them to be outlawed for their rebellion against his supreme authority or for their personal crimes?”

“That I have given shelter to my countrymen, when travelling among the hills they required rest and refreshment, I do not deny—even to this time backwards for the last thirty years have I done so. If my word be gainsayed, let the traveller that hath been refused admittance at my gate be brought forward to testify against me. Had I withdrawn from the call of the wayfarer in these troublous latter days, I might, I confess, have been enabled to repose on my pillow in greater security; but strong was the voice of nature within me, and the duties of that religion which it is my glory to profess, compelled me to feed the hungry and to clothe the naked.”

“Do you deny the authority of King Christiern?” asked the president.

“Before I answer that question,” said the curate, seeing the dangerous turn that things were about to take, “methinks it were better to produce my accuser. You cannot, surely, wish to extort confessions which may ruin me from my own lips. But before we proceed farther, my lords, let me implore you to send back this girl, who is my only daughter, to her native hills. It must have been through error that she has been summoned here; she being a simple maiden, who knows nothing of the ways of the great world, and who has had no other object or delight in life than in rendering my declining years comfortable, or in visiting the orphan and the widow in their afflictions. If your hearts allow you to listen to the prayers of a distressed fellow-mortal, send her home, put her out

of this danger, for she is blameless ; and whether accused or without accuser, I will freely tell all, wherever my confessions may lead me, though it be from this hall to the scaffold !”

“No, father,” cried Margaret, springing from her seat, her recollections seeming to come back at the allusions to her own situation ; “I must not, dare not, shall not leave you. Shall it be said of me that I fled from my father in the hour of distress ? Shall the finger of scorn be pointed at me ? Shall the voice of the good mock me and say, ‘Behold the woman that has a heart of rock !’ No, no, father, ’tis in vain. Whatever you are doomed to suffer, none on earth shall prevent my sharing !”

“Hush, hush, silly girl,” said the distracted father, stemming the torrent of her affectionate eloquence. “Speak not in that rash manner, you know not what you are saying.” Then turning to the court, he continued aloud, “Justice, my lords, denies that you have the power of extorting confessions from me, especially when confessions of any sort may be tortured into treason, and may end in the spilling of my blood. I stand before you ready to abide your doom ; let him, then, who hath aught to say against me, be brought before me face to face.”

“Assuredly,” replied the judge, “your request is most reasonable, and can be momentarily complied with.” Then striking his rod on a large bell which hung suspended from the ceiling, he ordered to be summoned into presence “the Count Regner Beron.”

The curate looked as if he had heard the knell of doom rung in his ears ; and Margaret—but we shall not attempt to describe her sensations.

IX.

“Regner Beron !” at length cried the curate, starting back, pale and faltering. The same syllables died on the lips of Margaret. The cloud of despair settled down upon them.

A side door being opened by the attendant officers, a person in a rich dress proceeded forward to the end of the council-table, confronting that where the curate and his daughter stood ; while, as surely as the sun sheds the light of day, they perceived that it was no other than Regner Beron !

“For a moment, halt,” cried the curate, recovering himself, and calling in the whole vigour of his soul to brave a fate which he now saw unavoidable ; “for a moment, halt ; and allow not that man to bow down his soul with a greater load of perdition. Regner ! attend to me. I knew thee once, poor—the sole relic of an honourable house ; and I hear thee this night addressed by the title of count. Better had it been for thee to have been earning thy bread by the sweat of thy brow, like the lowest hind on our native Dalecarlian hills, than to stand in this assembly, arrayed in purple and fine linen, as the betrayer of thy country.”

“Halt—halt !” said the judge ; “know ye not that you are speaking treason ?”

“Perhaps I may,” replied the curate, dauntlessly ; “perhaps it may sound so to the ears of men, but, before Heaven, I am speaking truth !”

“He asks not gold,” said the judge ; “but we have promised him your daughter as a reward for his services to the State.”

“My daughter ! My pure child, Margaret, to become the mate of a perjured villain ! The earth would sicken at such a union. In the nature of things ’tis monstrous—’tis impossible ; and Heaven with its lightnings would strike dead the offerer of such profane violence. Ah, Regner ! Regner ! dare to lift up your eyes and look on me. Happier had it been for thee, both in this world and that which is to come, hadst thou contented thyself with thy sequestered home, and continued a hunter of the roebuck on the hills. Thou hast bartered thy peace for gold, thy conscience for a jewelled robe ; but think on thy injured country, and tremble ; remember Judas, and look to thy latter end. Remorse shall haunt thee as a spectre, and the array of thine evil deeds pass before thy visions of the night, rendering existence bitter as the waters of Marah, and recollection the torments of those who have gone down to the pit.”

So fervent was the curate in his admonitions to Beron, and so absorbed in his subject, that for a little the court seemed to vanish from his eyes ; and looking round to soothe his fainting child, he was about to recommence his address to the assembly, when to his surprise, on looking up to the judgment bench, he observed the seat of the president empty. A few seconds after he, however, resumed his seat, having put on the black silk robe in which it is customary to pass sentence.

“It is needless,” said the president, rising to address the assembly, “to waste the time of this court by a further examination of the case before us. The witnesses have already given their evidence, and so convincing are the proofs, that you perceive the reverend gentleman has not a single word to say in his own defence. From his own lips, indeed, he is condemned ; as you have this night heard him utter treason, and pronounce the lawful evidence of the witnesses against him a betrayal of his infatuated country. You have heard how he has been in open rebellion against King Christiern in word and deed, having openly preached insubordination, and having aided and abetted in the escape of outlaws whom it behoved him to deliver up to justice. More especially, my lords, it becomes us to remember that he harboured under his roof that arch-rebel, the Count Eric Voss, and was the principal means of his not falling into the hands of his pursuers when a price was set upon his head, and when, so strong was the scent of his track, that he could not otherwise have escaped. Recollect, my lords, that had his capture at that moment been effected, the bloodshed of this awful rebellion might have probably been averted.

“Of these facts, and more especially of the latter, there can be no doubt, as the Count Regner Beron

hath this day borne testimony before us in a manner at once explicit and incontrovertible.

"Of his daughter, the young lady now before you, it hath also been clearly proved that she aided and abetted her father in the same course of treasonable proceeding, by carrying food and other necessaries to the church wherein the said count lay concealed.

"But not only, my lords, has the curate been convicted of treason against the State, but he has trampled under foot the authority of Mother Church, by open laudations and commendations of the conduct of Luther, the German heretic, whose damnable tenets he hath exhibited a strong forwardness to adopt.

"As there can be no division of opinion on such a case, I shall now, my lords, proceed to pronounce judgment in your name."

After whispering for a few seconds with the nobles more immediately around him, and gathering, as it were, their various opinions on the sentence to be pronounced, he advanced to the centre of the hall, where the curate and his daughter were now standing up—the one thoughtful, yet calm and resigned, as if he cared less for his own fate than the misery he was about to entail on others; the other, pale and languidly beautiful, like a flower that has been vainly contending with the strong wind of the tempest; her bright black eyes cast despondingly on the floor; her hands clasped together, and hanging down before her; her bosom heaving slowly and oppressedly, as if a cumbrous load hung around her heart; and her lips apart, as if her spirit fainted for lack of free air.

"Curate of Suverdsio," said the judge, "out of respect to the memory of Count Eric Voss, that mistaken nobleman who hath already reaped the harvest due to his crimes, I am commissioned by my brother judges to inform you, that the count requested, in the event of your ever being taken, our asking the production of a gold button which he gave you as a token of remembrance; and that if you could show it, we should deal more mercifully with you, for the sake of one who had seen the end of his folly. Rememberest thou aught of such a thing?"

"It is here! it is here!" cried Margaret, startled from her Niobe-like reverie by this unexpected glimpse of sunshine breaking through the hitherto impenetrable cloud of her father's misfortunes, and producing from her breast a button, which she held up between her finger and thumb.

"Indeed," said the judge, "this is an unexpected circumstance, and will go some way to alter the features of the business; but let me see if it be the real one," he added, throwing off his gown, and applying the button, which he had snatched from Margaret's hand, to a vacancy on the triple row which ornamented his own tunic.

The curate started back in astonishment. "It is he!—it is he himself!" cried the daughter. "It is Count Eric Voss!—it is the Count! Stand away

—stand away, father, and let me throw myself at his feet!" and so saying, she rushed suddenly forward, and throwing herself down on the floor, seized hold of the under hem of his garment.

"This must not, cannot be," said the count. "Come hither, Beron; and since you have had the audacity to appear this day as a witness against those who hospitably received us both, you must make atonement to the injured feelings of a father, by thus taking from me the hand of his much-loved child. Her heart is already pledged; and she dares not say me nay. Henceforth regard her as your own. The Castle of Othorstone has as yet no mistress; let this day that deficiency be supplied."

"No—no;" cried Margaret, springing to her feet, and half-bewildered in the perplexity of her feelings; "if he be not a true Swede, though he were the Emperor of Allemaine, he should be no husband of mine!"

"Ah, but, Margaret," said Count Beron, soothingly, and still holding by the hand she had but half-withdrawn, "in this I fear you have but little choice, since the Administrator commands it."

"The Administrator!" cried the curate, still more and more perplexed.

"The Administrator!" cried Margaret, her cheek blushing, and scarcely deigning to believe her ears, which tingled as if all the great bells of Moscow had rung an alarm!

"Yes!" said the Count Eric Voss; "in me you behold Gustavus Vasa. I came to your door, my worthy friends, hungry, and ye gave me food; naked, and ye warmed me; friendless and a fugitive, and ye visited me in my solitude. Pardon the whimsical way I have taken to show my gratitude; but, believe me," he added, laying his hand on his heart, "that it is not the less sincere on that account. I could have adopted no other method of bringing you before the assembled representatives of Sweden, in whose presence I now profess my obligations to you; and thus, taking you by the hand, declare myself proud in calling the Curate of Suverdsio my friend.

"I have ventured to unite before you the hands of a pair whose hearts, I understand, have long been united. Do you proceed in cementing more securely, according to the law of the Church, what I have done merely in outward form. Bear no scruple towards your intended son; for, believe me, if he is a renegade, it has merely been in deserting from the phalanx of oppression, to risk his blood under the standard of a few seemingly inefficient revolutionists. He has proved a true man, and a brave; and scarcely hath the gratitude of his country deemed the title of Count a sufficient equivalent for his many and important services.

"I rejoice at the same time to inform you of a resolution not yet publicly promulgated. This honourable assembly, not resting content with merely emancipating our dear country from the manacles of civil bondage, have decreed its release from the tyrannical dominion of Rome; and ordain

you, henceforward from this day, to preach the doctrines of the Reformation!"

We shall not attempt any description of the ecstasy of the honest curate. The sincerity of his heart he had shown in adversity, and this sincerity was unchanged and unaltered in his more prosperous hour. To all the pressing offers of dignity which Gustavus made, his only reply was, that he had found real happiness to consist in inward consciousness, and not in external parade; that he trusted he would not be enticed away from the charge of his mountain flock. With them he had been born and bred—on him they looked as a father—among them had glided away the happiness of his youthful days—to them he had expounded the doctrines of eternal life—and now that a clearer light had been permitted to dawn on their souls, he could find no earthly satisfaction equal to that of being permitted to communicate it to them.

Why lengthen our joyous narrative? Suffice it to say, that preparations were made for a magnificent wedding; and that the whole Court of Sweden were invited to behold the nuptials of the curate's daughter—who had preserved the life of Gustavus Vasa—and of Count Regner Beron, one of the best and bravest of his generals. The curate pronounced his paternal blessing over them.

Need it be told how, returning, honourably escorted, and basking in the sunshine of the Administrator's favour, the curate became the most distinguished man in his native district; nor how unto this day the mountains of Dalecarlia have not beheld a curate honoured like him of Suverdsio.

After this, the curate had many happy years added to his life; beholding his family honoured and flourishing around him; his country independent, happy, and prosperous; and the bright sunshine of the Reformation scattering from the face of the land the Cimmerian darkness of papal superstition.

Generations have passed away; centuries have revolved since then; and our historiette is but a leaf torn out from the bye-past volume of human transactions, having for its moral, that "purity of life hath for its reward the promise of the life that now is, as well as of that which is to come." To attest its truth, the parish church of Suverdsio, among the Dalecarlian hills, still bears on its top the large gilt copper crown which was placed there by order of the Swedish Senate; and its revered walls are still pointed out to the traveller as those within which Gustavus Vasa found an asylum from the pursuit of his enemies.

LETTER TO A WIDOW.

DEAR MADAM:

I am not able to dismiss the thoughts which have engaged my attention this morning, in connection with your loss. I must continue and, if possible, perfect this train of thought. God alone can give it power and render it effectual; He will bless it, this is my hope; he will bless also these few lines which I address to you.

We have both come to the conviction, that the separation over which you sorrow is more apparent than real; the visible bonds have been dissolved, but the spiritual continue to exist, nay, have become even stronger; your husband and yourself are in truth more intimately united and in closer communion than you ever were before.

You know the secret to render this communion, which the eye of sense cannot perceive, but which is visible to the spirit and felt by the heart, more real and intense; it will become so, the more the tendency of your thoughts and feelings coincides with the unchangeable direction which the thoughts and feelings of your husband have taken.

Bear in mind the state of heart in which he closed his life. Did he not commit with humility the future of his immortal soul into the hands of a Saviour? Did he not refuse every other stay than Jesus Christ? Did he not submit with resignation to a separation which cost his heart as great pain as yours? Did he not bow with adoring submission to God's purpose concerning him? With

such feelings he went out of this world to his Father, and in such consists his new life, for as he died, so he lives now. You do not doubt it: and the only difference which can possibly exist between the last days of his earthly life and the days of his present life is, that in his present existence, everything which filled his heart here below and which he took with him out of the world,—humble submission, adoration, peace,—is increased in strength and purity. His love to you and to your children is now permeated by these pure and divine principles; he loves you, as an inhabitant of heaven ought to love. Could you, or, would you ever, dear madam, think of your husband in any other way? Do you not see, even now, that he bows down before the will of God, and that he adores this will even in the providence which separated him from his dearest possession on Earth?

Tell me yourself: to be united with him, does it not mean to think, feel, and love, like him? Without harmony of feeling there can be no true union, not even on earth. It is the harmony of feeling which united the souls; and I am sure that, after the unspeakable bitterness of these first days of mourning, when God, moved by your application, will have gently overcome nature in the inmost depth of your heart, when you will be able to say Amen to the bereavement with which you have been visited,—with sincerity, though it be with tear-filled eyes,—you will experience that you have

entered into a sweeter fellowship with your husband; you will rejoice to think and to feel as he now thinks and feels; you will be happy in the consciousness that your souls are in harmony, and that you both are living the self-same life; nothing will come between your heart and his, both devoted to God, and in the same measure as you yield him to God, God will restore him to you; the more love you have to God, the more will you be able to cherish love for the friend whom he has given you.

Permit me to express all I think. How much more painful might have been your trial; how much more difficult the task imposed upon you! You have now a most precious assurance of your husband's blessedness; but what if, like so many others, you were without a pledge of his salvation? Would it then not be equally your duty to submit and adore? Would the right of God to demand such a sacrifice be in that case less sacred and sovereign? Would it not be your duty to love God above all, and to submit to his will? But compare such a sacrifice to the sacrifice that was imposed on you, and praise the Divine mercy which is sheltering you under its wings. Give to God not less than he asks; to your husband not more than he desires; he does not expect from you an affection which converts his memory into an idol and a snare; he wishes to be a link, but not a barrier, between you and God. His life, I know, edified you; but his death is part of his life, and a most vital part of it,—it was its last act, its crown and key; his death is an essential part of the counsel of God concerning you; it was doubtless preordained to be unto you a means of grace and progress, as it is unto him the means of liberation and transfiguration. Honour the decree of God by co-operating in its fulfilment! Accept this bereavement, although you cannot yet fully understand its mystery, and say to yourself, in resignation and hope, "except a corn of wheat fall into the ground and die, it abideth alone, but if it die, it bringeth forth much fruit."

I praise God for what I saw. I saw that, in the fearful moment of first grief, your soul cried not so much after human consolation as after truth; you desired the one thing which includes all, for truth cannot but bring consolation, and consolation can be found only in truth. The friends also, who had the melancholy privilege of witnessing your tears and praying with you, experienced no discouragement on your part in their endeavours to present before you the Gospel in its full purity. You did not wish to be soothed in your sorrow, and lulled into sleep like an unreasoning child; on the contrary, you wished to be roused by the words of truth, and to expose your wounded heart to truth, in its severity as well as its gentleness. Continue to derive profit out of this important time of sorrow! May it yield you a permanent gain! Listen to the voice of the Lord in the storm! Let the impressions and teaching of these memorable days be the firm

foundation of your future life. Your future belongs to your children. How useful to them would their father's life have been! But God willed it otherwise. May his death be to them what his life would have been, and, if possible, still more. May the remembrance of his death, cherished faithfully by you, become the germ of true life. Instead of fighting against a fact and loss, which cannot be altered, use your strength in resisting the spirit of the world and of the Evil One, and do not allow him to reap the pernicious fruit which he expects to gain from our losses and our pains. Make the will of God yours, and only think of one thing—to change your loss into gain, your sorrow into glory, your separation into a true fellowship! May God Himself supply the unmeasurable need of your soul! May He help you to pray: may His Spirit Himself pray in you! May He give you strength to empty the cup of suffering with gratitude and praise! May He keep from you all the temptations of affliction, and enrich you with all its blessings, not only for yourself, but also for all who shall see in you the goodness of the Lord.

This is the wish of him, who remains, with high esteem and Christian affection, yours faithfully,

ALEXANDER VINET.

Although this letter is long, I cannot refrain from adding a few words, in order to anticipate an effect which it may produce, and which is not in harmony with my intention, and doubtless your sentiments. In the preceding remarks I constantly appeal to your will, and yet, on a subject like this, I have no right to count on your will. You may possess a firm and energetic will in the sphere of common life; but we are here speaking of things in which the strongest are weak, and where our strength may even be hurtful to us. The great thing here is not to give, but to receive; not to act, but to suffer; not to command, but to obey. I believe you have viewed the difficulty of the task with a salutary feeling of awe. I believe you have already found from experience how difficult it is to subject spirit and heart to the discipline of Jesus Christ. May it please the Divine Friend of your soul to preserve in you this conviction and consciousness of your weakness. May He create within you such poverty of spirit, that your soul may constantly turn to Him to be fed, clothed, and sheltered. May His riches be your only riches. Live on His bounty! Ask of Him daily, hourly, the bread of His mercy. Pray to him, that he may bring low all that is proud and lofty within you. Then you will be strong, possessing a strength which the world doth not know, and then all the power which Providence has bestowed on you will, without danger, be used in His service, having received the consecration of humility. This is the price you must pay to obtain the victory, and it is God who gives you the means of paying that price.

A. V.

HOW JOHN HUSS BECAME A SAINT IN THE ROMISH CALENDAR.

THOUSANDS of people pass every day between the grey files of statues on the old bridge of Prague without much noticing those rude wind-beaten saints and heroes. Nor, indeed, is there much to notice save where, about the centre, a figure habited as a canon of St. Augustine, stretches out one hand in placid benediction over the hurrying human river above and the calm flow of the Moldau beneath. In the other hand there is a cross, and when the sun shines five stars of gilt bronze make a fair aureole overhead; and at his feet lie wreaths of fresh flowers and bays and pots of rosemary, the offerings of the maidens of Prague, who

“Into this well throw rosemaries,
And fragrant violets and paunces trime :”

And to the stranger curious about such matters all Prague is ready to answer, with one voice, that this aureoled, wind-beaten saint, is St. John of Nepomuk, patron of all true lovers and their secrets, and, therefore, worthy of perpetual garlands; guardian, moreover, of silence and discretion, and, therefore, painted with his finger—or in quaint old German prints, with padlock, as surer than the mobile finger—on his lips; tutelary god of rivers and bridges, sender of rain and dew, and national saint of Bohemia. Nay, he reigns beyond Bohemia, and over more statues than any other saint, is painted in Italian churches, and sung in Spanish heroics. “I lived,” says Mrs. Jamieson, “for some weeks under the protection of this patron saint and *Protomartyr of the Seal of Silence*, at the little village of Traunkirchen (by the Gmunden-See, in the Tyrol), where his effigy stood in my garden, the hand extended in benediction over the waters of that beautiful lake. In great storms I have seen the lightning play round his head till the metal stars became a real fiery nimbus—beautiful to behold!” And yet this wonderful, beautiful, bountiful, national saint turns out to be an imposition, a myth, a two-centuries’ mistake, and is not St. John of Nepomuk at all, but plain saintly John Huss, *Protomartyr of the Reformation*—John Huss, with a dim background of the old Slavonian heathenism.

But that is impossible, say the men of Prague; for John of Nepomuk was a living man, and no myth: and was not this statue raised on the very spot where he was flung into the river by that King Wenceslaus, whose father had built the bridge five-and-twenty years before; and have we not that precious silver shrine that covers his tomb in our cathedral, and his own body resting quietly among us, as was discovered to all and proved by great miracles when the grave was opened nigh a hundred and forty years ago; while as for this Huss, was he not burned, and were not his ashes borne into the lake of Constance; and was he not almost a Protestant, and how could the pope make such a mis-

take? Now, I admit that the hazarded assertion requires confirmation, that there is a strong presumptive case against it—that the story is one of the most singular, perhaps unique, in the lives of saints. And so it will be wisest and fairest to hear the version of the men of Prague first; and it is this:—

Our St. John was born at Nepomuk, or Pomuk, about 1320-30; and on the night he was born tongues of fire streamed from the sky and settled on the house; and when he went to school, he got the service of the mass by heart, and used to run off to the Cistercian Chapel to help the priest, which was a clear proof of his piety; and from school he went to the university, and was master of philosophy and doctor of theology, and became the greatest preacher in Bohemia, and from the pulpit lashed the licentiousness and irreligion of the times and the court, and with such bold eloquence that even Militz was forgotten. Moreover, like a true saint, he refused a bishopric and a probstship that was the wealthiest in the country, and would only accept the place of almoner and confessor to the Empress. But Wenceslaus, King of Bohemia and Emperor of Germany, was a wicked and cruel king, who hated good men and fought with the church, drunken and fierce and riotous; and his wife was a pattern of virtue and sorrow, of whom he was one day tipsily fond and the next madly jealous. And in some jealous fit he insisted that Nepomuk should reveal the confessions of the Empress; and being refused, grew maddened, and smote him with bitter wounds. As soon as his wounds were healed, Nepomuk preached in the cathedral, and prophesied through his sermon all the woes that two centuries would pour out upon the true faith in Bohemia. Then, having bade sorrowful farewells, he departed on a pilgrimage. Now Wenceslaus, sitting in a window of his palace, towards evening, espied him returning to the city; and being filled with sudden rage at his sturdy disobedience, ordered guards to bind him hand and foot and throw him over the parapet of the bridge into the Moldau; and this was done on the 16th of May, 1383. Whereupon the tongues of flame returned and streamed up and down the river, and shone on the water like a crown of five stars, so that the city flocked out to see the wonder, and beheld, in the morning, the mild face of their beloved preacher. Then the canons came out and took up the body and dug a grave in the cathedral. Grateful even then, the saint guided them to a spot that was filled with treasures of gold and silver and precious stones. But Wenceslaus ordered it to be closed up, and the body thrown into a corner; which also being done, there came forth of that corner so sweet and diffusive an odour that the spot could no more be concealed, and the body was borne to its true resting-place with state, and pomp, and ring-

ing of all bells, and marvellous healing of many that were sick. And ever since St. John has been honoured for his fidelity to the confession and his duty to the church, and has helped those that believed him and punished those that did not.

For do we not know that for very shame at the royal insults to our saint the Moldau dried up, and famine and plague came upon the land?—and how, when we had been given over to heretics for two centuries, a pious man, on the eve of the battle of Whitehill, saw St. Wenceslaus, and St. Adalbert, and St. Nepomuk, as they rose out of their graves and held council together? And does not every woman and child know that when three Calvinists went to scoff at St. Nepomuk's grave, one was struck dead, another died soon after, and the third became an idiot; and that when two women of our town walked upon his tombstone, as they went back over the bridge one began to swim as though she were in deep water, and the other struggled as though a storm would carry her over the parapet; and when Father Chanowsky himself, who thought it was all a story, walked upon the stone, as he recrossed the Moldau he measured his length in the mud before the crucifix on the bridge? And on that same bridge did not the brazen statue of St. John visibly turn itself round as the Prussian infidels beleaguered the town in 1744, so that it remains turned round as at this moment? Moreover there was little Anna Zahovzanskiana, that was blind, as everybody knew, but brought clay from the grave and mixed it with water, and rubbed her eyes, and in six hours saw; and there was Wenzel Buschek, who fell into a deep well over-night, but, calling on the saint, leaped out unhurt; and Theresia Krebsin, who the doctor said must lose her arm, and she went to St. John and he threw a paper into her hand about fasting nine days and praying; and she fasted, and the saint appeared to her by night, and she was healed; and when Rosalia Hodanckidna fell into the mill-stream, and was swept below the wheel, and had been half an hour under water, she was drawn up unharmed, and given into her parents' arms, for St. John appeared to her under the water and kept her safe, seeing she had prayed before his statue every day as she went to school. Then there was Kralik, the brewer that had killed his man, and lay in prison, where he learnt a prayer from a fellow-prisoner, and prayed it to St. John with his face to the grave, and when he was tried was let off with a petty fine. So when a young man of good blood was to be prosecuted for a gross crime, his father dreading the shame of his house, fled to the saint, and on the day of the trial the prosecutor had disappeared. Nay, there was even a certain smith out of Mähren that had murdered his wife, and as they led him off to prison he cried vehemently to St. John, and sprang at once out of the grasp of his captors: for it is a very proverb in our country, that he who would be kept from shame must pray to St. John!

So far the men of Prague, and indeed I might

run on much further, and tell about the saint's house that he was born in, and where decent folk dwelt for some hundreds of years after, till there began a racket one night that seldom stopped until the house was emptied, and in the saddest way; for the honest potter Gelinek that was in it did not understand these rappings and plain hints, and so was found dead one morning, after which there was nothing left but to build a church on the spot, according to the saint's desire, though it might have been more plainly expressed. Then the saint's tongue, that had been so guarded in life, remained inviolable after death, and is yet manifestly fresh; so that when search was made into the matter by papal bull in 1725, before the gaze of all, the tongue began to swell, and change its colour into the purplish red hue of life. Finally, should any one presumptuously doubt what has been said, let him take warning by the sceptical archbishop whose arm bore the mark of the saint upon it down to his grave. Therefore all Prague and Bohemia believe in St. John of Nepomuk; and after this mass of evidence, what wonder, since these narratives, it is clear, are not legends but facts, else how could they be written down, with many more, by such excellent men as Balbinus, and Berghauer, and Navajo, and Krüger, and in all Lives of the Saints down to the latest edition of Alban Butler; and how else could everybody know them? And as for King Wenceslaus and the Battle of Whitehill, and the pope's bull, they are in every history; and there is the statue on the bridge before our eyes.

But unfortunately for saints as well as other men, there are people that cannot take everything on credit, but have an awkward habit of sifting freely for themselves, and more awkward still of drawing their own conclusions; and this altogether irrespective of what is everywhere believed, and of "respectable authority," and the "shock to the national mind," and anything short of the truth itself; intermeddling people, who come between us and the quiet old historical faiths of our boyhood; men who would not be shocked if St. George of England turned out to be really the Arian Bishop who thrust Athanasius from his see, who might affect to disbelieve even the Seven Champions of Christendom; and for such men, and the raising up of a school of right historical criticism, let us be profoundly thankful, and that the light is scattering the dense fable-clouds of the past. If we lose the tints and gorgeousness of cloud-land, we see the real living landscape. It is a noble gift these men exercise—a noble profession—of truth-seekers; all the more powerful that it be not degraded into a mere profession; that the search for truth do not become—as it has threatened to become—a mere clever and ingenious inverting of the judgments of the past; that it be reverently, and even solemnly, carried on, not with scepticism, but faith at heart. Carried on: this generation has declared it will be carried on into the highest regions, flippantly even where men before moved softly or knelt, because it was sacred ground; and

carried on it ought to be : for the truth has nothing to fear from the light, and we have everything to gain. After fifty years of scientific inquisition into the creation, that earliest chapter of the Bible still "soars away on the wings of the morning." And the Bible, as the Truth itself, not only defies, but rejoices in the keenness of criticism. It is unworthy of it to hide it, unworthy to tremble for it, unworthy to call up the fears of possible consequences, and place *them* against the certainty of its inviolable truth ; unworthy, and paltry, and unrighteous, to think it needs the shelter of abuse, theological or other. It, indeed, is independent ; and to irreverent and captious investigators may almost assume the awful words : *He that sitteth in the heavens shall laugh : the Lord shall have them in derision.* Reverent search, from whatever quarter, it invites ; wherein it is to be remembered, "that they that are of the truth hear my voice"—they, and no others ; and that we need not be troubled about the truth, which will never pass away, but about those that cannot hear it. And so we may be thankful, and not vexed or timid, as their "historical criticism" sweeps across our path ; even when it sweeps clean away such an ancient and national belief as that of Bohemia in St. John of Nepomuk ; for it has become very plain that St. Nepomuk must be given up, and consigned to the limbo of all unhistorical personages. Not but that a John of Nepomuk really existed and that he was really drowned, and this is his life. His father was one Welfin, a citizen of Pomuk. He himself joined the clergy, and signed to his name in 1372 that he was "clergyman of the diocese of Prague and notary public." In 1380, he was preacher at the church of St. Galli ; in 1381, canon of the cathedral, archdeacon and vicar-general ; in 1393, he was drowned by order of King Wenceslaus. His death (to use a bull) is the only part of his life on which history for a moment lingers, and that seems to have occurred in this wise. King Wenceslaus, it has been said, was not one of the best of kings ; and possibly, had Petrarch been his tutor, as was intended, it would have been just the same. He was a rough, rude-spoken, fierce-tempered monarch, with strong opinions upon his royal prerogative, and a strong dislike to the meddling and encroachments of the Church, a forerunner of our Henry VIII., and with much of that prince's jealousy and unhappy family life. His name has come down as the *Slothful* : his character is blotted by his feeble interference for his friend Huss ; and there are more ugly blots on it than one. But the evil-looking picture that has been accepted as a portrait has been proved by M. Palacking to be the work of the Jesuits, to whom his cardinal faults was resistance to the spiritual power. For all that, he was rough, if not furious, in temper ; and often, we may conceive, sorely provoked by the arrogance of his ecclesiastics. At the head of them was Archbishop Genzenstein ; and with Genzenstein was his archdeacon of Nepomuk, at whose suggestion, it seems,

an abbot was appointed to a new monastery without consulting the king. Wenceslaus wrote this archbishop a letter. "You Archbishop, give me up Castle Rudnez and all my other castles, and pack out of my kingdom of Bohemia. And if you undertake anything against me or my people, I will drown you. Come to Prague." The message was not courteous, but the prelate came with John of Nepomuk in his company, and as prelates in those days thought most prudent, with an armed retinue. The king's wrath rekindled as he saw him ; and he ordered him with his household forthwith to prison, saying, pointing to one and another : "I will drown you, and you, and you." Archbishop Genzenstein fled to Saxony. His household were brought into the torture-chamber, when the king flew upon them with a burning brand. All except the archdeacon escaped by unconditional submission : and he, indeed, was so severely burnt that it may have been better for him to have been murdered outright by being flung over the bridge into the flooded Moldau. This, then, is the historical John of Nepomuk ; for history produces but the one, and that there were two contemporary Johns, both born in Nepomuk, both canons in Prague, both under the wrath of Wenceslaus, and both drowned in the Moldau ; and that the chronicles should mention only the one, who would never have been heard of, but for being in the household of the archbishop ; and yet omit the other, whose fame threw the great name of Militz into shade, this is unlikely enough to be incredible. It must be granted also that the historical Nepomuk does not answer to what we must now call the legendary. The fame of a preacher, the posts of almoner and confessor to the queen do not belong to the archdeacon ; nor was the archdeacon a martyr to the secrecy of the confessional, but to the conflicts between Church and State. The legend is right as far as it points to a real John of Nepomuk and a real martyrdom under Wenceslaus IV., Emperor of Germany ; may it not also be right in its mention of a former preacher, who was also confessor to the queen ? May it not either confuse or blend some other name with Nepomuk ? For legends are seldom pure inventions, and in their simplest and earliest form are only the rude poetry of history, out of which it becomes the historical critic to eliminate what is fact. It is round the fact that the legend grows ; because of its fact that it is accepted ; on this basis—whatever it be—of fact that it flows down securely into the hands of historical critics. And if there is fact in this legend for the name, may there not also be for the character ?

Now there was one man contemporary with Nepomuk and Wenceslaus whose ecclesiastical standing and reputation were precisely that of the legendary John,—and this was Huss. Huss was almoner and confessor to Wenceslaus' second queen. Huss was the preacher who would most naturally suggest Militz to men's minds. For Militz, unlike Nepomuk, was not a strict church-

man, but one who inclined to the simplicity of the Gospel, whose heart was grieving for the worldliness of his brother ministers, who shrunk from mere ecclesiastical power, and saw the true power of the church in faithful preaching of the Gospel and godly living of the clergy. And Huss went far beyond Militz in the same direction, and preached more boldly than even he against the corruptions of the time, and was equally ready to attack false miracles or the drunkenness of the court. And with the fame of his preaching there spread his doctrines, until in Bohemia he grew to be the hero of a party, and that party, zealous for purity of doctrine and the national life; and it may fairly be said that more clung to his name than even to John Militz. So putting these two together, John Nepomuk, martyr in the Moldau, and John Huss, the famous preacher and royal almoner and confessor, we have pretty nearly this legendary and otherwise altogether apocryphal saint, and in the union it must be manifest that Nepomuk serves, merely as the date, while the real figure is Huss, that the name and the martyrdom are the mere framework on which the character of the saint is raised. But how could the Church of Rome commit an act so absurd and suicidal as to canonise the proto-martyr of the Reformation? An impatient question, since it has not yet been asserted that the Church of Rome did canonise John Huss; but not an impertinent question, as may presently appear.

For that Huss was burned, and that the flames of his stake lighted a mighty fire in Bohemia, and that the Hussites established themselves, as the national and scriptural party, until, after two centuries of almost ceaseless conflict, they were vanquished at the great battle of Whitehill, this is common history. In those two centuries Huss was the national hero, as much the political as the religious champion, for all through the religious struggle the Czechs were asserting their independence and national life. He was the genius of the country in those its brightest and most vigorous days, the man whose memory was sainted even where his doctrine made little way,—just the sort of name round which the legendary stories of the country side would gather. This was the power that fought against the Jesuits when the country lay at their feet. Could it not be made to fight with them? Why disturb traditions so deeply honoured? Why uproot them? Why not give the traditions a Catholic colour? Such questions are not unfamiliar to Jesuit fathers, if we may believe the history of Jesuit missions. In China, Japan, and India they have been started, and answered in their own fashion. Mythologies, and temples, and great names, and ancient legends have not been torn out of the hearts of the people, but consecrated to a Catholic sense. It has been the policy of the Church of Rome from the beginning. *Santa Venere* is still powerful in Italy; Juno is scarce concealed in the Madonna; the Pantheon raised by Augustus to all the gods is dedicated by the same name to all

the saints. In Servia the old god of thunder has been christened Elijah, and St. Nicholas is the new name for the god of the rivers and the sea; Woden appears as the archangel Michael, and the ancient Slavonian Suantewit migrated into St. Vitus. It is but one example out of many; hundreds of years after, Bishop Dubrav complained that the people still worshipped their old deities in the habit of the new saints. So let them keep Huss if they like; let them honour his festival; laud his character; cherish his patriotism; mourn his martyrdom; only let it be under a new name and in a Catholic sense. And so they went to work, cunningly, and in the end successfully. This drowned archdeacon came happily to hand. He became a martyr to the confessional—for it was all important to establish the authority of the confessional over Hussite Bohemia. Huss was the watchword of the independent party, and so Nepomuk became the champion of independent rights and liberty of conscience against a tyrant, whereby there was a double gain: the struggle for freedom was linked with a devout Catholic, the king who dared resist the encroachments of the Church was painted with the blackest colours on the Jesuit palette. The places of trust about the Court were easily transferred, and with them the clerical oratory; nay, in the sketches of character, it has been observed, the very defects of Huss's vanity, obstinacy, and the rest, are almost carelessly reproduced. Then having settled the saint's death to be on the day that the Hussites remember their founder, there remained nothing but to produce a supply of the stock church legends that are the recognised property of a saint, and spread the tale of St. Nepomuk in every parish. And in all this they were abundantly helped. For it must not be supposed that, clever as they were, they invented everything for themselves. Most of it was ready to hand in outline invented centuries before. The life of Archbishop Wenzenstein, written soon after his death, mentions the martyrdom of his vicar, and vaguely certain accompanying miracles. In the middle of the fifteenth century it was noticed that nobody would tread upon this Nepomuk's tombstone. In 1471, Paul Zidek relates that he was confessor to the queen. Early in the next century the cathedral authorities placed a railing round the tomb to protect the unwary from mischief. In 1341 Wenzel Hajek records additional particulars of this story, all, indeed, that were wanting. There was some prospect, therefore, that but for the Hussite war, Nepomuk might have merged into a minor saint. He was not altogether unfamiliar to his countrymen. Since the character of Huss was inevitable, it could not have been tagged to a better name. There was but one mistake, and that was helpless. If Nepomuk was confessor, it must have been to the first empress, since Huss undoubtedly was to the second; and as his martyrdom could not thus be 1393, it became 1383; and that was unfortunate, since there was no drying up of

the Moldau in that year, while in 1393 there undoubtedly was, following hard upon the great floods which closed the year preceding.

The saintship of Nepomuk properly began with the re-establishment of Catholicism in Bohemia. The battle of Whitehill was lost in 1620; the first regular life of Nepomuk was put forward by the Jesuit Balbinus in 1670. It was "an expansion of Hajek's single chapter into sixteen;" it was the foundation of whatever was written after. The saint was thus already canonised, but he never had the sanction of the pope, and this was only granted after special sifting and a judicial process. This sifting—*Acta utriusque processus in causa canonisationis*—was published in 1722. Balbinus gave as authority for his biography various unspecified "contemporary manuscripts," that existed in his own brain; these Acts bring forward various "independent" witnesses to repeat the manuscripts of Balbinus. Count Zynsky, of 74, had heard it from his father of 69. Dr. Alsterle had it from his parents, who had it from theirs, and the family had been "for 500 years true to God, the king, and the Catholic Church." Count Wratislaw's huntsman, being 118, gave ancient testimony: and Dr. Hawliczek, of 70, had heard it from his grandmother, who had heard it from her mother, an old lady of 100. Unfortunately, these ages, though respectable, were not enough, and "a contemporary great-grandmother of 300 could not be found." Nevertheless, the sifting was satisfactory and the saint proclaimed in 1729; to which let us not demur, seeing saints have been proclaimed with less reason. There is a charming story of a St. Philumena, a beautiful Grecian princess that fell into the hands of the Emperor Maxentius, and refusing to marry him, was flung into the sea tied to an anchor and on the anchor refusing to sink was beheaded. But all that was ever found of this saint were three small bones in a tomb of the Catacombs, where was written Philumena, with a palm branch and an anchor and a flask of the wine of the sacrament—Christian symbols then not uncommon; whereupon the Jesuits took the wine for blood and the anchor for an anchor, and canonised a saint, and their own ignorance or worse together. So that this judicial sifting may be taken for what it is worth.

Nepomuk was now canonised, but it was needful to have his portrait, and place him beyond suspicion. This also was discovered with the statement, "Painted from nature, 20th May, 1383;" and the crucifix is in his hand and the five stars are above his head. Stubborn, unbelieving criticism is not even yet satisfied, and proves that the five stars were never seen about the saint till after 1736, and that the date of the picture, in other respects, must be about the same time. Neither portrait nor statue of Nepomuk appears until Balbinus is spreading his legends and writing his book in the middle of the seventeenth century. But there were ancient pictures and statues of Huss; as old, at least, as the century in which he was murdered.

Iconoclasts as the Taborites were, they could not prevent the national hero-worship taking this direction. It is a curious proof of the change from the true saint to the false, that such statues of this sort as have been found are cunningly altered for adding the symbols of Nepomuk. And one recently discovered in a remote village, and which represents Huss with the Bible spread open on his knees, and his eyes uplifted in prayer, has received its five stars upon the breast, because they would fit in nowhere else. While as still more singular proof of the interchange of Huss with Nepomuk, there are statues unquestionably of the latter, but with the Bible in his hand and other symbols of the Reformer.

There remains one point more. St. Nepomuk is more than national saint: to the superstition of the people he is national god; it is not pretended for a moment that this was copied from Huss. This much indeed lay in the heart of the country, lay over out of old heathen times, and was preserved by the ignorance and conservatism of the countryfolk. There is not a land in Christendom where relics of the ancient heathenism do not linger on under the proprieties and respectabilities of modern life, sturdily surviving in traditional beliefs. There is probably not a county in England that will not furnish stories of its peasantry confirmatory of this fact. And, what better could be expected of Bohemia? Since this faith was strong, let it clasp the legend round like ivy over a new wall; give it that antiquity and sacredness that would gain it reverent acceptance in the minds of men. So the old river spirits play beneath his statue on the bridge; and the old faith in the powers of nature invests him with control over showers and dew and fruitfulness and famine; and the old laughing mischief of the Scandinavian fays peeps out of such stories as of the two women who crossed his grave, and then so lamentably crossed the bridge: and the old dualism of the Northern gods steals into his character, mild and good-natured in their strength, when not provoked, but otherwise malignant and terrible. Like a "very Kobold," as Dr. Abel says, (and his little tract—*Die Legende von heiligen Johann von Nepomuk*, contains the fullest information on this and on all other points of the story), he twitches the chairs, and sours the milk, and slams the doors, and pinches the sleepers, to eject the unhallowed potter from his birthplace. Like Thor in wrath, he smites the wicked Calvinist upon his tombstone. There is the background of heathenism; but the foreground is prominent with the saint.

And so John Huss, the defender of Wickliffe, the preacher of the Word, the foe of the confessional, parent of the great Utraquist Church, of the Taborites, and Calixtines, and Bohemian Brethren, watchword of Bohemian Protestants, and Protomartyr of the Bohemian Reformation, has become a lawful saint of the Church of Rome, and guardian of bridges and cloud-compeller and rain-giver to his native country, and has a Society "for spreading his

honour," and is worshipped by maidens of Prague, and by all the peasants of the Czechs, and with masses in every chapel* under infallible authority of the very Pope. And "the whirligig of time brings round its revenges," surely none more curious than this. In 1719, ninety-three silver lamps were found at the grave; from 1722-37, a multitude of hands, feet, heads, eyes, ears, foreheads, fingers, teeth, breasts, hearts, stomachs, and children, of silver and gold (one from Princess Schwarzenberg of fourteen pounds weight), was poured into his treasury. To whom do these and their successors belong? To Huss and the Protestants, or to a saint that never existed, and cannot claim them? And the millions of masses and prayers, are they invalid, being offered to a heretic under ban of the Church? Or are they more valid if offered to a saint that either never was born, or if born was drowned ten years before his death? These are questions of some interest, but there are others of a very profound significance.

What influence will this memory of Huss have upon Bohemia? The worship of St. John, we are told, is decaying. Year by year his adherents de-

* 7034, in the cathedral of Prague, in the year 1716. 50,672, in the same place, in the year 1721.

crease. Even the feeble tide of political life in 1848 threatened to sweep away his silver shrine. Protestantism is on the increase; in some places doubling its numbers within a dozen years. An entire village has been known to come over to the Protestant Church of its own accord. The Protestants, who are near a hundred thousand, have been granted a constitution. The *Gustav-Adolph* Society has planted its standard in the country, and the religious life and religious freedom are not slow to rally round it. The Bible is preached with enthusiasm and purity in crowded churches, by men of a rare simplicity, faith, and godliness.

Has Huss been preserved to become in his own name the watchword of a new crisis? As the legends of St. John of Nepomuk decay, will the true John stand out in his true light? Already there are some curious facts. Bohemia is erecting a huge pile of granite where Huss was burned at Constance; the present archbishop is holding up the example of Miltz, and striving to unite men by their love of Christ and the Truth; and this year Protestants and Catholics will be keeping the thousandth anniversary of the introduction of Christianity among them. Will Huss or Nepomuk be the word of power?

WILLIAM FLEMING STEVENSON.

THE WOOING AND WEDDING OF QUEEN DAGMAR.

TRANSLATED FROM THE OLD DANISH BALLADS.

BY MARY HOWITT.

THE Christian name of this beloved Queen, whose history is lost in the splendour of the traditional halo which encircles her memory, was Margrethe. She was born about 1186 and was the daughter of King Premysl Ottokar I. of Bohemia, and Adela of Meissin. When Margrethe was about twenty her hand was sought in marriage by King Waldemar Seier, or the Victorious, of Denmark. The remainder of the life and the memory of Queen Dagmar are enshrined in a set of rude, though beautiful ballads. She is the best beloved of all the old Danish Queens, and still lives in the heart of the people almost as a saint. Her name, which was changed by their love and gratitude to Dagmar, expresses to them daylight, or the beauty of the early morning which seemed ever to beam around her.

The following version of the wooing and wedding of this beloved lady is very rude and uncouth. But so are the original ballads themselves, the true character of which I have scrupulously endeavoured to preserve. They resemble old pieces of wood-carving of the middle ages; nor did I wish either to polish or to smooth them, but simply to present them in all their rude strength, their simplicity and abruptness of detail.

The boon by which good Queen Dagnar benefited her people, and which she craved for them on her wedding-morning, was repeated on her deathbed, under circumstances of great solemnity. But for our present purpose the joyous incidents of the happy wedding are all we need.

King Waldemar and good Sir Strange
They sat together at the board,
And talk'd with right good will, and spoke
Full many a pleasant word.

"Now hear, Sir Strange, what I say to thee,
Thou shalt travel far and wide;
Thou shalt travel far to Böhmer-land
And fetch me home my bride."

Sir Strange Ebbeson answer made,
And wisely answer'd he,

"If I must go to Böhmer-land,
Who then shall go with me!"

"Take with thee the Bishop of Sjelland,
For he is a learned man;
And also Sir Albert of Eskelsö,
Who will help thee all he can.

"Take with thee young Sir Limbek
And Sir Oluf Lykke, beside,
The rich Sir Peter Glob, and more
If so thy will decide."

QUEEN DAGMAR.

It was young Sir Strange Ebbeson
Went down unto the strand,
And with him King Waldemar himself,
And all his noble band.

And over the briny sea they sail'd,
Thrice seven days, the briny flood,
On the next they came to the frontier bounds,
And all were joyous of mood.

They struck their sails and anchor cast,
And hasten'd to the land,
A gallant and lordly company—
Sir Strange the first of the band.

And being assembled in good array
An embassy sent he then,
To tell the king of Böhmer-land
"That they were King Waldemar's men ;

"That they in private with him would speak,
As best beseem'd this thing."—
With that silk stuffs on the ground were spread,
And they were brought to the king.

"All hail to you, king of Böhmer-land,
A prince of honour clear ;
King Waldemar of Denmark sends to pray
The hand of your daughter dear !"

"My lords ! Take napkins and water pure,
At the board be seated, each one ;
"You are welcome to this good land of ours,
And answer shall have anon !"

The king went into his chamber high
To speak with the queen ; and said,
"Here are lords from Denmark's king who asks
Our daughter dear to wed."

"If Waldemar king of Denmark
Seek our daughter for his bride,
We will give her unto that mighty man
And many a gift beside !"

They laid on her the red, red gold,
And brought her into the hall ;
Sir Strange Ebbeson rose from his seat,
A handsome man and tall.

They clothed her in the blue, blue silk,
And brought her before his face,
"Here you may see the maiden herself,
In virtue and noble grace."

Then in they carried the chess-board
With the golden dice thereon,
That good Sir Strange and the royal maid
Might play and talk alone.

They play'd and play'd, and the third time,
In the moves of the golden game,
Sir Strange he won the Atheling
In brave King Waldemar's name.

"Now tell me, Sir Strange Ebbeson,
On your honour and knightly truth,
Is the king of Denmark brave and good ?
Is he handsome and true, in sooth ?"

With that Sir Strange look'd up to heaven,
And answer made again,
"The Danish king is brave and true,
And handsomer than all my men !"—

These silken stuffs were spread on the ground
And the maid went down to the strand ;
She bade good-night to her parents dear,
And the ship put out from land.

It was the good king of Böhmer-land,
He counsel'd his daughter dear,
"When thou art come into Denmark
Act ever with truth sincere !

"If thou be pious, God-fearing, and good,
Thy soul will have comfort alway,
And unto thy people, my daughter,
Thou wilt be a hope and a stay !"—

With this the lords put out from land,
All joyous as well might be,
And away they sail'd to Denmark,
A two months' voyage free.

They hoisted aloft the silken sail,
Upon the gilded mast,
And so they came to Denmark
Ere two long months were pass'd.—

It was the mild Queen Dagmar
That look'd out first to land ;
And it was the king of Denmark
That was riding on the strand.

"Now tell me, Sir Strange Ebbeson,
Before we reach the land,
Who is that gallant, handsome youth,
Who rides on the snowy sand ?"

"You are welcome, welcome, Queen Dagmar,
The truth is easy to say ;
That is King Waldemar of Denmark,
Three kingdoms own his sway.

"My gracious lady Dagmar, good,
A brave prince is he and bold ;
He has castles many, and fortresses,
And kingdoms three to hold."

"Shame on you, Strange ! I tell you, shame !
Why seek me to beguile ?
I believe that the king of Denmark
Rules only one little isle !"

"Now listen, my handsome lady !
My king is a man of might ;
He has won, for the crown of Denmark,
To the northern lands his right !

"A man he is, and a wise, good prince,
Who ever faces the foe ;
They flee before him, both east and west,
For his deadly ire they know.

"Now listen, my handsome lady !
Rejoice, and give God the praise !
You will never repent this voyage
To the latest of your days !

"And long as my life endureth,
I will be your servant true,
And all the nobles in Denmark
Will love and honour you too !"—

The seamen cast their anchor
Into the snow-white sand ;
Then took they the lady Dagmar
And lifted her first on land.

Then took they the lady Dagmar
And lifted her first on land,
And Waldemar king of Denmark
Reach'd forth to her his white hand.

And silken stuffs and scarlet
Along the earth were spread,
And Dagmar, with all her ladies,
To Riber House was led.

So the wedding was held with pomp and joy,
With mirth and bridal cheer,
And King Waldemar and Queen Dagmar
Were each to the other dear.—

Now early in the morning,
Before the risen sun,
It was the lady Dagmar,
Who craved her morning boon.

"One boon, my gracious Lord, I crave,
And let me not crave in vain—
That you forego the peasant's plough-tax,
And release each prisoner's chain !"

"Go fetch the good Sir Strange ;
The squire Knut also call !—
You must ride away to Oringsborg
And free the prisoners all !"

Great was the joy which Dagmar brought,
Great joy all Denmark thorough !
Both burgher and peasant lived in peace
Without tax or plough-pence sorrow.—

Christ bless the youthful Athelings,
And together long may they live !
God's word and His righteous justice
That all men may receive !

A VISIT TO THE AGRICULTURAL COLONIES FOR THE POOR IN HOLLAND.

BY A SPECIAL COMMISSIONER.

ONE morning in March of this year I took my place on board the steamer which plies between Amsterdam and Zwolle. A trip across the Y, that splendid harbour of the Dutch metropolis, and the well-known Zuiderzee, was a great pleasure in itself. But I had another object in view than the mere enjoyment of an excursion. I wanted to see the Agricultural Poor Colonies about which so much has lately been said and written in Holland.

The title itself, *Agricultural Colonies for the Poor of the Society of Beneficence*, excited my sympathy. At all events, I thought it expressed a noble idea. I had seen and heard too much of the poorhouses and workhouses in the cities not to know that they, far from diminishing pauperism, tend rather to feed, consolidate, and increase it. God's world is wide ; and though there is room enough in it for us all, yet the narrow cities are overcrowded with poor, wretched, half-starved people, clustering together in dark, damp, misty lanes and closes, like herrings in a barrel ! Why do we keep them there, where they are neither wanted nor happy ? Is it the case that the commandment with which the Creator pointed out man's destiny : *Replenish the earth and*

subdue it, is not applicable to the poor people of our large towns ?

Some fifty years ago, there lived in Holland a nobleman of high standing in society who loved both his country and the poor. He possessed the rare privilege of uniting a clear head with a warm heart, and with an uncommon amount of general information. This man was the General J. van den Bosch. Upon inquiring into the social condition of his fellow-countrymen shortly after the battle of Waterloo, he found that thousands of families who had formerly been in a thriving state, were reduced to utter helplessness and poverty. How to help the immense number of poor people scattered chiefly through the towns, was the question which the good and talented General pondered over day and night. That it would be as pernicious as impossible to support them by mere almsgiving, was quite clear to him. He felt that they would only be truly helped by being enabled to support themselves from their own labour. He took the map of the country and observed that there was a vast district of barren uncultivated heath, about fifteen miles long by three broad, in

the centre of the kingdom, north-east from the Zuiderzee, just at the spot where the three provinces of Drenthe, Friesland, and Overijssel meet. He resolved to use his knowledge, talents, wealth, and influence, in establishing a colony at this quarter. The best plan seemed to be to found a philanthropic society.

It was as early as the year 1817 that the General founded the *Maatschappij van Weldadigheid* (Society of Beneficence), of which, for an annual subscription of fifty-two pence, or one penny a week, any one could become a member. The enthusiasm with which the plan was received by the population was so great, that within a short time about 21,000 people subscribed. The grounds were bought, premises built, and in the following year the Society commenced operations.

The plan of the General seemed to be very plausible and promising. The sort of paupers who were to be admitted should not be, properly speaking, beggars, but indigent people of good character, who, taken from the over-peopled towns, would be taught to till the ground, and, during the winter, to occupy themselves with some manufacturing work. The children should be provided with religious and secular teaching at the schools, and thus, trained in the wholesome country atmosphere, grow up as a fresh generation of able-bodied and well-principled people. At the same time, thousands of acres in the very heart of the kingdom, which from the days of the creation had been fruitless, would be changed from a wilderness into a garden. To support and to carry out all this, the annual subscriptions of course would not be sufficient. Nor did the General look forward to State support. The Society was intended to be thoroughly "voluntary." But at the same time it was intended to enter into contracts with the municipalities of the towns, with other philanthropic societies, or with individuals, for taking families or single persons at certain sums, to be paid either as capital at once, or in annual instalments, which might be extended over sixteen years. The calculation was, that the Society would cover all expenses by charging for a family (six or seven persons) seventeen hundred florins (142*l.*). For this sum the family should obtain a farm-house, the required furniture and implements, one or two cows, and three *Morgens* of ground,* to be worked under the direction of the Society. It was expected that the family thus established would not only be able, after a couple of years, to earn its own support, but also to pay back about ten florins (16*s.*) a year. To further the sending in of suitable families to the colony, sub-committees were established at the various towns, and these sub-committees were considered as the patrons of the families sent in by them, and had to provide for the seventeen hundred florins, or at least for the annual interest of that sum, with annual in-

stalments for paying up the capital within sixteen years. Consequently it was estimated that the head of such a family would, within sixteen years, be able to become entirely free; and could keep on living at his farms as if it were his own property. Not that he would have a right to sell or to bequeath his farm after his death. It was to remain the property of the Society, but the commune or party which once had paid the seventeen hundred florins would, after the death or removal of the family, have a right to use the farm for another family without paying again, except an entrance fee of about 4*l.*

These were somewhat the main features of the foundation upon which the Society was based. The colony was divided into three chief districts, called, after members of the Royal family, *Frederiks-oord*, *Wilhelminas-oord* and *Willems-oord*. Added to it was an establishment for training young agriculturists, called *Wateren*. Churches for Protestants, Romanists, and Jews, were built, together with manses; also school houses and dwelling houses for the teachers, with bakeries, shops, barns, and houses for the office bearers &c., &c. A director, sub-directors, managers, and overseers were appointed, all according to the rules of a well-organised society.

No sooner, however, had the colony started than a great calamity befel it. It occurred to the Government that this institution might fairly be entrusted with the care of beggars and vagabonds. The law of Holland requires the imprisonment of a person found begging or vagrant, but it was resolved to commute this punishment into a deportation to the colony of the Society of Beneficence. The directors of the Society, together with the General, little aware of the ocean of misery and grief into which they were plunging, entered into contracts with the Government for the reception and maintenance of beggars, foundlings, and orphans, at a fixed rate per head. Two new colonies were established by the purchase of land in the province of Overijssel and in that of Drenthe. The one, called *Ommer-schans*, was situated at above thirty miles from the three original colonies; the other, called *Veenhuizen*, at no less distance in the opposite direction. They were to be distinguished from the three *free colonies* by the title of *Beggars' Colonies*, but of course to be kept under the general administration. No sooner were the beggars and vagabonds sent in, than it was found that the evil which the colonies were to put a stop to increased to a fearful extent. People took to begging in order to be punished with a deportation to those "nicely situated" places. It was a cheap trip into the country. Of course that would not do. It was then determined that the beggars should be imprisoned first, and afterwards be sent to the colonies to perform forced labour for a certain length of time. This measure, it is true, helped to check mendicancy, or at least to keep it within its former limits, but at the same time it struck a fatal blow at the Society of Beneficence.

* The Dutch or Rhineland *Morgen* is equal to 2 acres, 16 square poles, and 435 square feet English measure.

For the Society now became, in the opinion of the public, a Society of *Police*. People took very little notice of the distinction between the *free* and the *beggars'* colonies. They treated both alike, and all came to be known by the name of the "Beggars' Colonies,"—the great "dunghill of Holland," the place where the scum of society and the dregs of the nation were gathered. Thus the Society of Beneficence and its colonies got into public disgrace. Besides, its original character was quite changed. The excellent General had founded it as a voluntary corporation; it now became to a certain extent a State institution. It was meant to act *preventively* against pauperism, by protecting sinking families through timely assistance; it now acted *repressively* against this class. The effect of all this was most calamitous to the Society. Having lost the sympathy of the public it lost its support. The number of subscribers soon sunk to 4000. Moreover, the Society was now compelled to work its fields with people who were not only unable but were unwilling to labour. This of course caused an immense loss to the annual revenue. To complete the misery, the Society was under the necessity of keeping up a very cumbrous and expensive administration, in consequence of its contracts with the Government. In short, everything turned against the Society, and everybody wanted to leave it to its fate.

From this moment the history of the Society became a history of difficulties and calamities. It soon became evident that the original plan of the founder, namely, to raise the colonist to the rank of a small landowner by dint of his own labour, was utopian. Even if it had been possible for the colonist to save annually the required amount, the Society would have been ruined, as, in that case, it would have lost all its cultivated ground, and been compelled continually to struggle on with the barren fields. The plan was soon dropped, but to encourage the colonist the prospect was held out to him of becoming a "free farmer," *i.e.*, after having cleared off a sum of from 150 to 200 florins (from 12*l.* to 17*l.*), he would only have to pay a small annual rent to the Society, and for the rest be his own master, working his farm on his own account, and entirely to his own profit. But this plan, too, proved in most cases a failure. Even as late as 1859 there were not twenty-five free farmers among 434 families! The Board of Curators found that most families, instead of paying anything, had to be assisted by subsidiary help. This caused an annual expenditure far surpassing the means of the Society, which was besides under obligations with regard to its shareholders and mortgages. Soon after the contract with the Government was made, the board felt compelled to apply to it for help. This was repeated nearly every year, till the amount of debt incurred became so immense that the curators, being at their wits' end, resigned. This was about the year 1843. The Government then wisely stepped in to save the Society from

bankruptcy. A fresh contract between the Government and the Society was made, which seemed to promise the most happy futurity, so much so that the curators who had resigned were prevailed upon to resume their office, especially as the King's brother, the Prince Frederic of the Netherlands, accepted the post of president of the board. Indeed, this wealthy and generous prince proved not a mere *figurant* on the list of the names of the curators; he contributed large sums from his privy purse to succour the Society. The Government also bestowed upon it every favour it could dispose of. Thus all the coffee-bags which the *Netherland Handelmoetschappij* (a kind of East India Company) wanted for its trade were ordered to be made at the colonies. But this artificial measure threatened to turn the agricultural colony into a weaving establishment. Besides, the Government could not continue paying such high prices as would be required for the profit of the colonists; yet, notwithstanding all these exertions and favours, the Society soon again found itself in the most awkward financial predicament, so that in 1856 the Board of Curators again resigned, and the Society once more was brought to the point of bankruptcy. The Government again stepped in, but this time to adopt more decisive measures. It was now seen that the union of the Beggars' Colonies with the Free Colonies was an arrangement by which neither the State nor the Society had been benefited. It was consequently arranged that this union should be dissolved, and that the Government should keep the Beggars' Colonies and the Society the Free ones. Thus the Society would be restored to its original state, as a purely philanthropic corporation, founded upon an exclusively voluntary principle. To carry out that plan, the Minister of Inner Affairs brought a bill before Parliament, by which the separation was to be regulated. From the Explanatory Memoir which accompanied that bill, it is shown that, besides large sums granted on former occasions, the Society had received from the Government:—

In 1846, about	£6,600
" 1847, "	13,460
" 1848, "	7,166
" 1854, "	5,830
" 1855, "	8,330

The whole debt of the Society amounted to about 604,537*l.*, of which considerably more than one-half was due to private creditors, and the remainder to the Government. To give the Society a fresh start after the separation of the colonies, the Government presented the Board of Curators with a sum of about 304,000*l.* to pay off the private creditors with 65 per cent., while the debt due to the Government was considered as cancelled.

Thus the unhappy history of that disastrous period was brought to a close, but it failed not to leave its injurious effects behind. Both in Holland itself and elsewhere the idea of an agricultural colony for the relief of the poor meets with little

sympathy, since it is taken for granted that the experiment has proved a failure. Before this time three deputations visited the colonies from foreign countries, viz., one from France, in 1851; one from Austria, in 1852; and one from Scotland (Sir John McNeill, president of the Board of Supervision for the relief of the poor), in 1853. Their reports are all more or less unfavourable. Nor could it be otherwise. Even the staunchest friends of the system in Holland were in those days in despair about the colonies.

But on the 15th of September, 1859, the separation between the Free and the Beggars' colonies took place, and the Society of Beneficence was thus restored to its original footing. I wanted to see the free colonies in their present condition, and accordingly steamed off to Zwartzluis, a nice thriving place on the brink of a canal that leads from the eastern shore of the Zuiderzee to Zwolle. The stage coach that waited upon the arrival of the boat, took the passengers along a brick road to the town of Meppel, and farther on to Steenwyk, one of the pretty towns of Overijssel, upon the bank of the Zuiderzee. Here a private conveyance was waiting to take me to the colonies, which are nearly five miles from the town.

A good macadamised road led me to the colony of Frederiks-oord, which, though the smallest of the three, yet ranks the foremost, as it is the residence of the director, and contains a very good hotel for the accommodation of visitors. Nearly half an hour before reaching the hotel we entered the colony through an avenue of oak trees which lined the road on both sides. I was very agreeably struck with the cheerful rural appearance of the whole scenery around. According to the declaration of the coachman, who was born at the place, it was a large tract of barren heath some forty years ago. As far as my eyes could see I discovered nothing but cultivated land. Every five minutes we passed a trim little farm-house peeping through the trees to the right or to the left. Their uniform structure showed that they belonged to a common system; their clean and tidy appearance, that they were under good control. I was sorry indeed that I was alone; I wished friends were with me to enjoy a trip to this truly charming and interesting spot. "At any rate," I thought, "whatever the system of colonisation may or may not be for the people, for the country it is a boon, turning wildernesses into gardens and deserts into little paradises."

The director, Mr. Jongkindt Coninck, who lives in a pretty little house close to the hotel, received me with the kindness of a friend. I found him a man of about thirty, sitting by the side of his young wife in his parlour, where two little children completed the happy family circle. He appeared quite pleased with the visit of a stranger, an event which, he was sorry to say, belonged to the rare occurrences of the year. Evidently that man, whom I found that people both within and without the colony held in the highest respect, was conscious of the

important and heavy responsibility resting on his shoulders. It is true, a committee of five commissioners or curators, elected by the general assembly of the members of the Society, and belonging to the aristocratic class, have the supervision and control, but they only meet occasionally, and leave the actual management to the Director, whose labours and obligations are summed up in not less than twenty-one heads in the regulations for the administration of the Society. He must conduct the correspondence, guide the income and expenditure, keep a double account with the branch societies in the different towns of the country, provide for the maintenance, liberty and safety of the roads, bridges, waters, plantations and squares, control the public health, inspect the school teaching, care for the external interests of public worship, appoint or discharge the officers of the second rank, make up the balance of the past and the budget for the ensuing year, visit all the institutions and manufactories of the colonies at stated times, and, according to regulations specially got up for the purpose, arrange the affairs of the colonists, the number of whom amounts to not less than 2550 individuals, scattered over an area of 2000 Dutch *bunders* or 4940 English acres. In this work he is assisted by a secretary, a book-keeper, an adjutant director, and two sub-directors, who again are assisted by the officers of the second rank, namely, seven district masters (*Wykmeesters*), and six overseers and foremen of the mills. There are two Protestant, one Roman Catholic and one Jewish church, with their respective clergymen; shops at different spots, where the colonists may buy their coffee and tea (strong drink being prohibited), their thread, needles and pins; and workshops for the carpenters and the smiths, who are salaried by the Society.

When glancing at that extensive sphere of labour one cannot be surprised to learn that the director, however energetic and active, found scarcely a moment's time to devote to me. Yet his kind information and that of his assistant directors, with one of whom I afterwards walked through the colony and visited several colonists in their houses, enabled me to obtain such a view of the whole institution, as was fully sufficient to convince me of its great value, both in a philanthropic and in a financial point of view. I found that the method of administration followed up by the former board was all but abandoned. Before the separation, the colonists were as much as possible kept in the service of the Society as day labourers; the present committee tries to raise as many as possible to the rank of free farmers. Formerly a minimum of wages was appointed for every labourer, which he was sure to receive every week, no matter whether he worked much or little. This measure is altogether abandoned, and so is the conventional coin, which prevented the colonist from buying his wares outside the colony, even though he could get them cheaper there than inside. The wages which the

Society pays are the same now as those paid in the neighbourhood, and every attempt to keep the colony in an artificial, unnatural, and compulsory state, is discarded.

The soil of the three colonies varies considerably. On the whole, it is of a sandy, dry quality, which requires a considerable amount of manure. As it is the object of the Society to find work for a great number of people, the rearing of cattle gives place to the growing of crops, which consist chiefly of rye, potatoes, clover, and grass. The colony Willemsoord is the most fertile of the three; it is even said to contain many excellent pieces of land, but it affords no peat, which is found in abundance in the other colonies, where the bog or moss is lying in layers, at from 1 to 5 feet in depth. When cut and dried it yields an excellent fuel, which enables a family at Frederiks-oord to pay about 2*l.* a-year less for fuel than a family at Willemsoord. Of the 2000 *bunders* which constitute the colonies, only 1200 (2964 acres) are cultivated, the rest being still covered with heather. These cultivated acres are dotted, at tolerably regular distances, with small farm-houses, capable of giving accommodation to a married couple and four children, one or two cows and a pig, and leaving room enough for a loom. To each farmhouse about 2½ *bunders* or 7½ acres—which, according to the original estimate of General van den Bosch, was deemed sufficient for the support of a family—are allotted. This, however, was a mistake; at least it proved so in most cases. That quantity of land might do for a family, if cultivated to the highest degree of productiveness which arable soil may be brought to, but it will take years before the soil of the colony reaches that stage. At present, I was told, the best acres scarcely yield 50 per cent. of what old-cultivated and thoroughly-worked acres of the neighbourhood yield. The consequence is, that the family requires to devote too large an extent of its lot to crops, and too little to grazing for the cow, which again bears upon the production of manure.

The colonists are all sent in by the communes or philanthropic bodies of the various towns, or by private individuals. Wherever the annual contributions for the society amount to fifty-two florins (*fl. 6s. 8d.*) a year, a branch society is formed with its own board of direction. This branch society, on paying the required 1700 florins, is entitled to the use of a farmhouse with its allotted quantity of 7½ acres, and consequently has a right to send in a married couple and four children; or, if there should not be so many, their number may be completed by orphans. Should there be more, the family must try to get on anyhow. Single persons may also be sent, to be boarded at the rate of sixty florins per head (*5*l.**) with families, who receive *fl. 3s. 4*d.** All these arrangements were made before the separation in 1859. The present committee was obliged to continue those contracts, however unprofitable they had proved to the Society. It is a pity that the committee was not permitted to make *tabula rasa*,

and to take a fresh start with the communes and branch societies. The conditions of the old contracts are so unfavourable to the Society, that the committee since 1859 has not permitted any of the branch societies to establish a new farm.

The colonists are divided into two classes, viz., Labourers and Free Farmers. When a family enters the colony, it is placed in the first class. A house is given it with a garden and a cow, and those members of the family who are able to work are taken into the service of the Society at a fixed tariff of wages.

If the question is put, whether a master of a family is able to support himself and family without running into debt, the answer to that question varies according to the circumstances and the ability of the family. If his children are few, and if those few are able-bodied, he of course can get through much easier than if he has to provide for a large number of little ones, and has to do all the work himself. But even though those circumstances should be very much alike, yet one master of a family may thrive much better than another, in consequence either of greater skill or of greater activity. It needs no argument to prove that a colonist who is born and trained up in the colony may get through very well; while another, who spent twenty or forty years of his life as an artisan—piano-maker or paperhanger in one of the back streets of Amsterdam, and hardly knows which end of the spade ought to be put into the soil—has a hard struggle, at least for the first period of his colonial life. Such a man requires a weekly subsidy, which is paid out to him by the director, and put to the account of the branch society that sent him in. If the branch society, or the commune, should refuse to pay the subsidy, the family is sent back to the place they came from. Thus, a week previous to my arrival in the colony, twelve families were returned to Amsterdam, that community declining the continuation of the subsidy. I found, however, that they were mostly Jewish families, who never will thrive in an agricultural colony. It seems that those wandering children of Abraham lost the talent for cultivating the earth when they were driven from their native soil. Though Holland numbers about 60,000 Jews (*i.e.*, one-fiftieth of the whole population of the kingdom), yet there is, as far as my inquiry went, but one Jewish farmer known in the country. It is a strange and anything but edifying sight to witness that man sowing and ploughing away on Sunday, while the country people are going up to worship.

To get a true idea of the way in which the colony works with respect to labourers, I took a copy of the statistics of the payment (during the week March 22—29) of two families, which, as to their number of children, were very much alike, and yet differed greatly as to their weekly earnings. The one, of the name of Kooi, numbers seven members, viz., four above fifteen years, two above ten, and one under five. This family earned in that week ten

florins and ninety-one cents (18s. 2½d.), which was paid out to them as follows :—

	s.	d.
For the use of the cow and the garden	1	8
House-rent	0	7
Medical service	0	2½
Clothing	1	2
Bread (the family did not take from the Society, but bought somewhere else).		
Ten per cent. reserve for the use of the family in time of need	1	9½
Potatoes	2	7½
In cash	10	1½
	18	2½

The other family, of the name of Klingers, numbers likewise seven members, viz., three above fifteen, one above ten, two above five, and one under five. It earned five florins and ninety cents (9s. 10d.), and received two florins and fifty cents (4s. 2d.) as subsidy from the community of Haarlem, so that its weekly income amounted to fourteen shillings. These were paid out :—

	s.	d.
For the use of cow and garden	1	8
House-rent	0	7
Medical service	0	2½
Clothing	1	2
Reserve (ten per cent. of the earnings)	0	11½
Potatoes	3	1½
Bread	2	6½
In cash	3	8½
	14	0

It appears, from these two statements, that Klingers, notwithstanding he received 4s. 2d. subsidy, only got 3s. 8½d. cash in hand, and that he put only 11½d. to his reserve, whereas Kooi, who received no subsidy, put 1s. 9½d. to his reserve, and got 10s. 1½d. cash in hand. Suppose he paid 3s. for bread, i.e., 5½d. more than Klingers paid, because he has four members of his family above fifteen, whereas Klingers has only three, 7s. 1½d. are left, so that he, at any rate, could dispose of 3s. 4½d. above what Klingers could dispose of; a difference which, during a period of twelve months, would amount to 8l. 15s. Now the cause of the difference only lies in the difference of ability. Both families are alike respectable, but both Kooi and his wife were born in the colony, and from their childhood trained to agricultural labour; whereas Klingers came to the colony only a few years ago from Haarlem, where he in vain tried to earn his bread as a house-painter.

Still I must not forget to mention that Kooi's account does not always stand so favourably. This (March) is the best season of the year for the labourer. In the winter there comes hard days and meagre weeks. I visited Kooi's family. On entering the parlour I was struck with its tidiness. Kooi had just gone away to his work. His wife, a strong, healthy-looking woman of forty, was trimming up a little girl of three, who sat on her lap. Beside her was a woman of her own age, engaged in sewing. The under-director, who guided me,

introduced me as a gentleman who came to see the colony.

"Ah, that's right," said Mrs. K., apparently pleased with my visit. "And isn't this a nice spot, sir?"

"Well, I really think it is," said I, taking the chair which the under-director offered me. It was a clean matted chair with brown polished back. The table was nicely painted, and not a single speck of dust upon it. Mrs. K. was dressed in a red-flowered cotton jacket, tied up to her chin, and a black camlet gown, under which her feet, covered with black stockings and shoes, peeped out. The woman who was sitting next to her evidently enjoyed a less favourable position, as her very plain blackish cotton jacket indicated. The walls of the room were whitewashed, and as bright as if they were done with milk. An iron stove, capable of receiving a large iron pot on its top for cooking, lifted its form, in the shape of a large three-legged flower-pot, before the chimney. A brown polished chest of drawers occupied a portion of one wall, while two beds were built as recesses in two other ones. A nice Dutch clock with glossy brass weights was suspended in a corner, and a gilt tea-set, placed upon a couple of japanned trays, adorned the top of the chest of drawers.

"Are you happy here now?" I asked, after having permitted my eyes to do their work round the room.

"Yes we are," answered she, with a smile of content. "We are but too happy to be back in the colony again."

"So you were not always here? I thought you were born here."

"So we were; but when I and my husband married [the good woman seemed not to remember that according to Paul's declaration, "Adam was first formed, then Eve," a want of memory which I have sometimes noticed in ladies outside the colony] we left to try our fortune as labourers in the neighbourhood, but we found we could get on much better here."

"I was told," said I, "that the labourers and small farmers round about, who cultivate the heath outside the colonies, could all of them thrive without obtaining any support or privilege whatever, such as the use of a cow, cheap medical assistance, &c., while many of the colonists require help and prove unable to support themselves."

"What!" cried she in a voice of surprise, "the hutters thrive!—[I here learnt that the name of *hutters* was given by the colonists to the small farmers round about]—the hutters thrive! Not one, sir! They lead a poor miserable life, and are all to be helped by the communes. They are but too anxious to get into the colony."

Here a conversation ensued between the two women and the under-director about several hutters whose condition was quoted as a proof of the correctness of Mrs. K.'s assertion. Meanwhile the little girl jumped from her mother's lap, and placing

herself before me, asked me, with a look indicative of great satisfaction, "Am I not nice now, sir?"

Indeed, I could not help acknowledging how pretty the little thing was. Her nicely combed fair hair shone as a mirror, and her little frock fitted her puny form as if she had been born in it. She then leaped away, happy as a queen. I could not help regretting this token of vanity in a child so young; but by and by it appeared to me that perhaps it might be considered as an effect of that same spirit of cleanliness, tidiness, and respectability, which characterised this family, and to which it owed, under God's blessing, its present prosperity.

"Well," said I, turning to the woman who was sewing a jacket by Mrs. K.'s side, "are you also a colonist?"

"I am not," answered she, "but I wish I was. I have rented the house next door to this, but my husband does not work for the colony."

The under-director now explained to me that to some poor people of good character living on the heath outside, the favour was granted of hiring one of the unoccupied farm-houses at sixty florins (5*l.*). This poor woman had to provide for four children under ten. Her husband was away all the week at the bogs, digging peats. After paying his board at the spot, he brings home two florins (3*s.* 4*d.*) every Saturday evening.

"And are you, with your four little ones, to live upon those two florins all the week?" asked I, in a voice of amazement and compassion.

"I try to earn a little by sewing for the colonists," replied she, "but it is not much I am able to make in that way. But for the twenty-five florins (2*l.* 1*s.* 8*d.*) which we receive every year from our commune, we should have starved long since."

"She is just sewing for me," said Mrs. K., "as Easter is approaching, and I cannot get ready in time without help. I pay twopence a-day, and, of course, her food."

I remembered that from time immemorial it was the custom of the Dutch people to renew their wardrobe before Easter, in order that old and young might celebrate the feast of the Resurrection "clothed upon with new clean garments." This custom is still preserved in the country; and among the peasantry a master of a family must be very poor who does not present his wife and children with new dresses on "Still Saturday."

"But Mrs. K.," said I, in a rather jocose voice, "are you not a little stingy there? I thought you could give four or five pence at least, for you are a rich woman, I understand. You'll get about ten shillings cash in hand this week."

"Me a rich woman!" cried she, with a loud laugh. "Dear, dear! Yes, to be sure, so rich, that sometimes we must be content with only dry bread and salt. It is true we are in good earnings just now, but this is the best season of the year, Sir. If you came in winter you would find things quite different."

"Still you keep aloof from asking help?"

"Thank God, we do, Sir. We only once were helped for seven weeks, when my husband was laid up with a serious illness. This was the only time in our life. We hate those helps, Sir. We ought to contrive to support ourselves."

"But how is it you are sometimes compelled to eat dry bread and salt?" asked I. "I thought that you could save as much during the summer as to be able—"

"Why, Sir," said she, interrupting me quickly, "it is when our cow is dry, you see. Then we have no butter on our bread, and no milk in our coffee, and must do without them till our cow gives milk again."

"Ah, but mind, Mrs. K.!" said the under-director, "you could have butter and milk even then if you liked, I'm sure. For even in winter your earnings are pretty good."

"Well then, Sir, please let us reckon," said the sharp woman. "You know that my husband and son do not earn above five florins (8*s.* 4*d.*) a-week in winter."

The under-director nodded in the affirmative, while taking a pencil to put down the woman's calculations.

"Very well. Of this you keep back one guilder and a half (2*s.* 6*d.*) for the cow, the house, the garden, and the doctor. We pay the same sum again for potatoes. So that's three guilders (5*s.*). Then we pay seventy cents for clothing. That's three guilders and seventy cents (6*s.* 2*d.*). Now we at least need forty-two pounds of bread for seven of us. That's one florin and seventy-five cents (2*s.* 11*d.*). Adding this to—how much was it?—to three guilders and seventy, that's—"

"That's five florins and forty-five cents (9*s.* 1*d.*)," said the under-director.

"There now," cried the woman triumphantly, "you see yourself that we are already ninepence beyond our income. What then are we to buy our butter and milk with when our cow is dry?"

"Ah, but you have your reserve-fund, which you then may take refuge in," observed the under-director.

"True," said the woman, apparently a little puzzled, "but then you see there are so many other articles besides."

"I know, I know," said the under-director, with a smile. "To tell the truth, Sir," he continued, turning to me, "Mrs. K. might have butter on her bread, milk in her coffee, and fat with her potatoes, all the year round; but then, you see, she would not be able to buy such a clock as you see suspended over there, or to decorate her chest of drawers with such a nice coffee pot and gilt cups. And then, you must know, Mrs. K. likes her husband and children to appear decent, and so she rather does without butter and milk for a couple of months, than be unable to present her husband with a new coat at Easter, and to trim up the little girl with a new jacket."

Mrs. Kooi looked down on her sewing with a face crimsoned all over. I took leave with a feeling of deep respect for that good woman, and thought it proved not a little for the colony, that such people deemed it a privilege to be permitted to live in it.

I also visited other labourers' houses, which did not manifest so much prosperity or such a spirit of cleanliness. Still the people all manage to get on without running into debt, except for a few months occasionally.

In some houses I saw individuals who were boarded with the family. Besides the sixty florins (5*l.*) for boarding, a surplus is paid to the Society in proportion to what the boarder comes short in his earnings. This surplus, however, never exceeds twenty-five florins and fifty-two cents (2*l.* 2*s.* 6½*d.*) a year for a person above twelve, nor fifteen florins and fifty-two cents (1*l.* 5*s.* 10½*d.*) for a person under that age. If a boarder above twelve is able to earn from two to five pence a week, the surplus is only ten florins and fifty-two cents (17*s.* 6½*d.*); and if he earns from five to ten pence, five florins and fifty-two cents (9*s.* 2½*d.*). The family with which he is boarded receives one florin (1*s.* 8*d.*) a week for boarding. Further, the boarder pays two cents a week for medical service, and twenty-four cents for clothing (together, fivepence and a farthing). Twenty per cent. of his earnings are left to him as pocket-money; the rest is put to his reserve fund, which remains his exclusive property, and is paid out to him when he is unable to work.

The second class of colonists is that of the "Free Farmers." Once a year the director hands to the Board of Management a list of such labourers as he deems fit to be promoted to the rank of Free Farmers. The free farmer receives from the Society a house and two-and-a-half *bunders* (7⅞ acres) of land, a cow and fodder for the first five months. For the first year he also receives rye, sown out on his farm over an extent of eighteen *Nederland poles* (2½ acres), twelve *muds* (thirty-three bushels) of potatoes for planting, and a sufficient quantity of rye-grass and clover seed. He pays ninety-five florins (7*l.* 15*s.* 4*d.*) annually to the Society—viz., for rent and taxes, fifty florins (4*l.* 3*s.* 4*d.*); for the use of the cow and medical service, ten florins (16*s.* 8*d.*); and for manure, thirty-five florins (2*l.* 18*s.* 4*d.*). The latter sum, however, he is freed from if he is able to keep a second cow. For the rest he is his own master. He tills his own ground, and sells the fruits of his land and the produce of his cow to his own profit. He is also permitted to labour outside the colony, which the labourers are not allowed to do, as they are in the service of the Society. This liberty is taken advantage of by nearly all the free farmers, as the extensive bogs outside the colony afford them an opportunity of earning better wages than the Society can pay—peat digging being always paid better than agricultural labour, since it requires more skill and greater bodily strength. The fact is, that the quantity of

land (7⅞ acres) allotted to them is insufficient to support them and their family, and they are compelled to make up for the deficit by going about for handicraft. They work at their own land as much as they can in their leisure hours, but prefer employing a labourer for their own farms, to giving up their work at the bogs. Thus they manage to get through the year without very great difficulties; but this state of things has the drawback that they are too much away from their own farms and their wives and families. So all their energy is bent upon saving enough to enable them to keep a second cow, which allows them to take more land into cultivation, and thus to find their support within the bounds of their own farm.

Nor is the number of free farmers who have succeeded in arriving at that point insignificant. I found that at *Frederiks-oord*, which is the smallest of the three colonies, out of seventy-eight houses, fifteen were inhabited by labourers and sixty-three by free farmers; out of these, thirty have more than one cow. At *Wilhelminas-oord* the proportion was—twenty-two houses unoccupied, eighty-six inhabited by labourers, ninety-one by free farmers; out of these, fifty-three have more than one cow. Some even have four, and there is one very prosperous farmer who has fifteen, head of cattle. This man seemed to be a real puzzle to the under-director. The statistics of *Willems-oord* are—twenty-two houses unoccupied, fifty-seven inhabited by labourers, ninety-two by free farmers, out of whom thirty-one have more than one cow.

It does not often happen that the director has to reduce a free farmer to the class of labourers. They pay their rent pretty punctually; for instance, at *Wilhelminas-oord* only 1391 florins 72 cents (116*l.*) were unpaid on the 31st of December, 1862, and of this sum nearly 50*l.* were cleared off as early as February, 1863.

A considerable source of income to the colonists, and more especially to the women, the children, and the less able-bodied individuals, are the manufactories of the Society, for which five buildings are erected, viz., one at *Frederiks-oord* and two at each of the two other colonies. They are chiefly employed for the weaving of cotton, and of jute for coffee-bags. As I formerly mentioned, the Government and the Netherlands Trades Company used to favour the Society with large orders, so that, in 1862, material to the value of about 18,300*l.* was worked, which yielded the Society a clear profit of nearly ten per cent. Much has been said against the principle of introducing manufactures into an agricultural colony. It was considered as a deviation from the original idea of the General van den Bosch. Perhaps it is; but then it is, in my opinion, a deviation in the right way. Looms may be heterogeneous objects in the houses of affluent farmers; in those of the poor agriculturists they are in their right place. You find them everywhere in the houses of the small farmers of *Overyssel*, *Drenthe*, *Westphalia*, and *Rhenish Prussia*. Those people are self-supporting,

but only through the addition of manufactures to their agricultural labours. If they were to live upon their five or six acres of land alone, they would starve, as this extent is not sufficient to fill their barn and cellar all the year round, nor to give enough labour to their children during the winter. Now the colonies of the Society of Beneficence are not a system of model-farms for the science of husbandry, but an assemblage of small farms exclusively adapted for poor people, to whom the opportunity is given of trying to arrive at self-support in the same way as hundreds and thousands of other poor farmers arrive at it everywhere else. And as all the other poor farmers show that the loom, or some other manufacture, is indispensable to their success, so the loom, or whatever manufacture it may be, should be considered as an indispensable element in a poor colony. To try to maintain a poor colony in Europe solely and exclusively through agricultural labour is, I fear, trying to realise too much.

The American crisis is, therefore, a great calamity to the Society, especially as at this time the contracts with the Government for the supplying of cotton goods for the East India colonies and the Militia have expired. Of the 450 looms which the Society used to employ, I saw only some fifty at work, and it is expected that even these will stop working within a month or two. Nor does the weaving of coffee-bags afford a better prospect for the present. There are still 25,000 bags in the Society's stores waiting for orders. The making of mats is now being tried, but it is to be feared that it will require too great an expense to get the young people educated to this work. Then the Society is still severely suffering from the effects of the bad management of the former Direction. Many acres were fearfully wasted, implements neglected, houses left unrepaired. The loss to the Society during 1860, the first year under the present administration, is estimated at 23,696 florins (1,974*l.*). In 1861-62, it only amounted to 4,668 florins (389*l.*). The value of the Society's property on 1st January, 1861, was estimated at 844,723 florins (70,393*l.*). It is to be hoped that the balance in July, 1863, will prove more favourable still, though, on the other hand, the stopping of the manufactures gives ground for serious doubts. Indeed the manufactures hitherto have been the only profitable part of the work of the Society. The agricultural branch showed a considerable loss every year. In 1861-62, on the crops, nearly 66*l.* were lost, on the cattle about 310*l.* As causes of this, the following facts were brought forward: First, the soil, having grown poor and foul through neglect, had to be forced by excessive manuring. Second, the fruits which sprang up in consequence were not used by the Society, but by the free farmers. Third, the Society will always carry on farming with less success, so long as it is under the necessity of *employing people unfit for the work.*

Now, this last point touches the matter at the

very root. The supposition of the General van den Bosch, that the Society would enable the poor people of the towns to support themselves within a few years, and thus relieve the country from the evils of pauperism, was founded upon another supposition, namely, that labour was the only thing which the poor wanted. Now, this supposition was incorrect. What most poor people in our great cities lack is not only *work*, but *ability* for working. They have never learnt to work, or, at least, to work well. I do not speak now of the regular beggar, or the systematic vagabond. Those people are not only unable, but unwilling to work; they hate labour, and cannot be got to do it, except by compulsion. Colonies may be excellent for them, but then let them be kept under the direct control of the police. Free colonies will not only not do for them, but they will ruin the colonies. The kind of people I am now speaking of are indigent people of good character, who, from want of training, from want of talent, from want of sufficient nutriment, or from other similar causes, are destitute of the means of self-support. If they know a trade, they only know it imperfectly; not sufficiently, at least, to be able to compete with others. They have lived for twenty, thirty, forty years in a constant struggle to keep the wolf from the door. They have from their childhood mostly depended upon church alms or help from the poor-box. They have got into the habit of idling and loitering about—thier time never being filled up with regular labour. Yet they are ashamed to beg on the public road. On the contrary, they would like to work, but they never learnt how to do it, nor are they possessed of sufficient energy to teach themselves. In short, they are unfit for work, and, unless young and capable of being trained, they will never become fit for it.

The question is not how to make those people self-supporting, for this they can never be. They will always continue a burden upon the shoulders of society. But the question is, how to make that burden as light as possible. And to this question the system of free agricultural colonies, as carried on by the present Direction of the Society of Beneficence, is sure to give a satisfactory answer. The original idea upon which the Society was founded, namely, that it would be able to relieve a town from the care of a pauper family of six persons for the sum of 14*l.* 18*s.* 6*d.*, has proved impracticable. Parties who send in such a family should never expect the Society to make the parents perfectly self-supporting. But they may be sure that, in most cases, the *children* will become self-supporting. Experience has shown that nearly all those colonists who are able to maintain themselves, were either born in the colony, or came to it at an early period of life. This is an important fact which should not be overlooked. If the Society of Beneficence is not able to take the present generation of paupers from the shoulders of the communes, it will at least enable the greater portion of the following generation to stand upon its own feet.

One only needs to spend a day at the colony to be convinced that the condition of its population differs as much from that of the paupers in our crowded cities as the day differs from the night. It is not a small thing that among a population of 2300 people, a case of immorality or even of drunkenness seldom occurs. I saw the prison, but it was used as a lumber-room—only one prisoner, and he a boy, having occupied it during the last two years. There is not one child above twelve in the colony who cannot read and write, while in the neighbourhood lots of children are untaught. I approached one of the weaving establishments just at the moment the young people were passing out to dinner. I was

struck with the decent look of all of them. I could not notice anything of that ragged, savage-like appearance which characterises the poor population of the manufacturing districts. The directors of the establishment told me that it was considered a point of honour among the colonists to keep up perfect decency and respectability in their dress and behaviour. I left the place with the most gratifying recollections. I felt that if there is any institution worth the sympathy of the philanthropist, the study of the social economist, and the support of the practical Christian, it is these Agricultural Colonies for the Poor established by the Society of Beneficence.

MEDITATIONS ON CREATION.

BY THE DEAN OF CANTERBURY.

I.

THE subject of *Creation*, as it presents itself to the religious mind in connexion with our actual circumstances and habits of thought, is one which, it seems to me, we may profitably meditate on. It is especially important in our days to take an account of the great truths which we profess to believe: to put them side by side with what we know and daily feel: and thus to keep ourselves ever in a condition, so to speak, of familiar intercourse with them; that we may not have first to make their real acquaintance when we ought to be defending them against the faith's enemies, or making use of them in our own hour of need.

GOD CREATED THE HEAVEN AND THE EARTH.—This is our central fact. First, let us look on it as a *fact*. It is in every one's mouth: but what do we mean by it, and how does it look when we realise it? Regard it which way we will, it is a thing entirely removed from our experience, and passing our comprehension. For, what do we know of Creation as an act? All that is ever made here on earth is nothing but a new arrangement of previously-existing material; and this is true not only of that which we make, but of all outward objects of the senses that God makes now, in this existing state of things. This globe, in all probability, does not now contain one particle of matter more than it did when it was first created. Animals and plants have sprung up and decayed, and their material has passed into the substance of the earth, and thence into new animals and plants, and so on through the series of ages. But there has been only one work of material *Creation*, properly and strictly so called: and that is the act related in these words, "In the beginning God created the heaven and the earth." This act is entirely distinct from most of those that follow it in that wonderful story in the first chapter of Genesis. For most of those that follow are not so much acts of creation, as of arrangement, and endowment with power of production out of given
