5326. So that the relative value of physical training very much exceeds that of training in games?—Well, I think the physical training would fill up the gap and supply the deficiencies in games, to put it like that.

5327. So, in the case of games, do you think that any games might be introduced which they might practise in place of physical exercise or gymnastics?—Yes, but luckily, in girls especially, and boys too, you can combine both the games and the physical exercises, and I think it ought to be the duty of the teacher to try to combine the two—to reduce the physical exercise to a game, if he could.

5328. And all this you could carry out in every part of your district, both in Dingwall and the remotest district, in the buildings as they at present exist?—With the exception that there is a certain amount of covering in a playground, but it should be extended.

5329. Would you consider that, say, in the most rainy district of the Hebrides, there ought to be some covered shed in which the children could exercise?—I think it is more important that there should be covering in the Lewis in the rainy portion than in the dry portion; it is more important.

5330. And that physical training cannot be well carried out as a branch of national education without some such provision?—I am sorry to say that it is not possible, but on other grounds I think it is advisable.

5331. *By the Chairman.*—I just want to ask you one question. You say that there has been an improvement since physical training has been in use. What was wrong with children thirty years ago, and also, how is that evidenced by the present class of more or less middle-aged people?—I am not sure that thirty years ago, as I said, it was so necessary—physical training—because my recollection of it is that we were not so much tied to the school, and that we had more games, and I look upon physical training as filling up the gaps, or supplying the want of games and the want of outdoor exercises. Then I was a country boy. I hold that country boys have not the same need, at any rate for it, as town boys.

5332. The country boy has not the same need?—The country boy has not the same need.

5333. Not even now?—I am not going to say he has not got the need, but he has not the same amount of need. I tried to look into that a little, and I think myself that a good deal of the rheumatism and stiffness which affect the ordinary ploughman and makes him short-lived—because he is short-lived—is from want of the exercise which he had not learned when he was a boy.

5334. Then you would not allow, I suppose, the

fact that, as the result of considerable muscular exercise and development, rheumatism follows?—The very opposite.

Physical development: after effects.

5335. That is your opinion; I mean from your experience?—I have a special experience of rheumatism, I may say, and my experience is that rheumatism is much more crippling and has a much worse effect upon people that have more or less neglected the use of their muscles than in the case of people who actively use them.

5336. I did not mean people who are actually still using them, but people who had used them and then had disused them?—I say 'go on using.' I do not think that any man, however old he is, should disuse physical exercise. That is one of the great reasons for teaching him early.

5337. Still, knowing the fact as you do, that people are inclined to disuse them, you still say that although they have had physical training, and muscular development has come to them thereby, they are none the worse for it?—I say, positively, they are all the better.

5338. When they begin to disuse it?—I say they are all the better, because you have got the man into the way of using his muscles, and I need not say to you here that it is a pleasure to a man to use his muscles; and I think that the chances are that he will keep it up; and I am quite sure if he does that he will be less subject to rheumatism.

5339. You say Ross-shire is your only district?—Yes, Ross and Cromarty.

5340. You do not go into Inverness?—No.

5341. Have you any experience of Roman Catholic school establishments?—No.

5342. You would have if you had been in Inverness-shire?—I have been at Fort Augustus.

5343. But you can tell us about them?—No; I do not know the working of Roman Catholic schools.

5344. In your own district there is no Roman Catholic school?—In my own district there is no Roman Catholic school.

5345. You have the Black Isle, too?—No.

5346. Are there none there?—No; not nearer than Beaully, that is Inverness-shire.

Cooking.

5347. *By Sir Thomas Coats.*—Talking of cooking in the schools, you thought cooking was at present taught with comparatively little advantage; am I right in thinking that that is what you expressed?—Well, I did not want to express an opinion; I would not like to say that, but I am not convinced that it is an advantage.

5348. Is one of the reasons that you are not convinced the kind of cooking taught or the appliances by which it is taught?—I think it is like this, the fault lies here, in my opinion—but it is a mere matter of opinion—it is not kept up long enough or go far enough. It is unfortunately, like many other things, a smattering; I do not think it is wrong in the kind of things they cook; with us it is not in Dingwall, at any rate.

5349. Then in your district is there any necessity to teach the young women cooking, so that when they become mothers they can give suitable food to their children?—Oh, the greatest necessity, of course.

5350. But you do not think that the teaching that they would get in school is of much advantage at the time they get it; they are perhaps too young, or else they have not sufficient time devoted to it in school?—I am afraid of that.

5351. Is it because they are too young or because sufficient time is not devoted to plain cookery?—There are so many things in school life begun and not kept up; it is because they do not keep it up.

5352. And you do not think they would keep it up if they had a little more time devoted to it?—I am afraid not.

Accommodation: generally inadequate for health reasons. More floor space desirable.

5353. *By Sir Henry Craik.*—I wish to ask you a question upon two points that you raised. You said that you thought the accommodation in schools was generally inadequate?—Yes.

5354. Have you paid attention to the exact requirements of children?—I have.

5355. As you are aware, we require eighty cubic

feet?—Yes, it is so; what I rather desiderate is the want of floor space.

5356. Ten square feet?—I do not think it is enough. I want to say that, but I want to qualify it. I do not want an impossibility, but I want to say that, looking at it from the medical officer of health point of view, you get a great many children with dirty clothes, and perhaps with incipient disease, congregated together, and if you could get what you would like, you would spread them out more, and no doubt the fact that they are there, more or less close together, and kept there for some time, unless there is some distinct provision outside for counteracting that, I think it has a bad effect upon the children.

5357. Do not suppose that I am at all going against your view?—Oh, no.

5358. Because, as you know, the Department is progressive far more; but I want to have the support of your opinion in regard to that, that you do not think that the demand of the Department of ten square feet is adequate?—That is my deliberate opinion; I have taken some time to think over that.

5359. And yet, of course, we have great difficulty in getting School Boards to fulfil that demand?—I am aware of that, and the School Boards have difficulties in finding the money.

5360. But it is floor space especially which you agree with the Department in thinking is what is most required?—Yes, that is so.

5361. Then with regard to the Saturday work; you think it is desirable that we should claim the time of the pupils for a certain portion of Saturday; that it would be for their advantage?—If you are to claim it, it must be for physical training.

5362. For physical training; I quite understand;—Not for any more books.

5363. For physical training?—For physical training.

5364. And that a considerable number of hours on the Saturday forenoon or afternoon given to physical drill would be for their advantage?—Well, say two, or, at the outside, three hours.

5365. It might bring them together in a large field outside the town—a number of schools together?—Yes.

5366. And the only objection to that is that it would place too much of a strain upon the teaching staff?—Of course, if it is to be physical training, and if you were to get the boys together—which is an excellent idea—then I think it would not be the ordinary teacher at all, it would be the physical teacher.

5367. Quite so, that is what I wanted to come to; really that objection which is raised to it on account of the strain upon the teaching staff is not a real objection at all, because the teacher that we would want would be the physical exercise teacher?—That is so, Sir Henry.

5368. And that otherwise, looking to the advantage of the pupils alone, it would be distinctly a good thing to claim a certain part of their Saturday?—I have not the smallest doubt of it with regard to the poorer children.

5369. You quite agree with the view we take in the Department, I may say?—Quite so.

5370. *By Mr Alston.*—You said that any system of physical training should be a well-thought-out system?—Yes, sir.

5371. And that it should be under proper control, and wisely regulated? There are, as you know, a great many systems of physical training?—Yes, I know.

5372. Is there any objection to that if they were all well thought out, and properly controlled; is there any objection to having six or seven different systems as we have now?—Of course that comes to be a question of organisation. I should think it would be a good thing that the Department should give some hints about it; it should be more or less uniform, but it is a matter of detail.

5373. You mentioned a part of physical training which I think is called 'breathing exercise'?—Yes.

5374. Do you know any system which is conducted

entirely upon the exercise of breathing?—Not in any system that I have looked into; it is a part—and a very considerable part—of the Swedish system, which I have more particularly been in a mild way studying.

5375. Another point is this; from your long experience in that district—an experience common to the west of Scotland—has there not been a great change in the diet of the people?—Yes, a great change.

5376. They have now given up porridge and broth, which used to build up the constitution, and gone in for tea and slops and such food?—Yes.

5377. Do you notice any change in the population in consequence of this?—Yes, that is a remark I wanted to make—perhaps it might be of some interest to the Commission, and that is that many of the children, as children, are what a medical man calls anæmic—bloodless, and ill-fed looking; but I am bound to say—and I have been very much struck in Lewis with that, where children are very miserable—when they grow up to be men you could not find stronger, healthier, more buirdly-like fellows. In Lewis a great many children die, but they breed as fast as they die.

5378. The fact is you do not think there is any deterioration in the race?—I do not think it is so in the country. I cannot say much about large towns—I know next to nothing about large towns; I do not think there is any appreciable deterioration of the general standard of the adult population.

5379. But have you noticed a considerable amount of anæmia? That would indicate a deterioration?—Yes, but I have also said that when you get them at a later age that has all disappeared.

5380. And of course physical training in schools duly regulated would help that largely?—Oh, no doubt it is bound to help it.

5381. Then as to the whole holiday on Saturday, would it be of any advantage to have two half holidays in the week. In England I understand that is often the practice?—It is there again I think that that is a question that must be worked out with the schoolmasters. It is a dangerous thing to get children off, and get them on again as it were. Further, I should think as a measure of experience that one day a week—one half holiday—would be enough for children.

5382. Would there be any danger in the use of free gymnastics or the ordinary use of applied gymnastics with apparatus?—I think it should all be done by some man whom the Board can trust, as far as my experience goes there have never been any bad results.

5383. And you think the qualified teacher who has been instructed in physical training would clearly see when the exercise should be stopped?—Yes, but I have said to Professor Ogston that I think it would be a good thing if he could appeal in the case of a particular boy whom he might think lazy. The doctor might say, 'No, he is not lazy, he is sickly.'

5384. *By Mr Ferguson.*—You said, I think, that physical training should be under proper control, the 'wise advice of the trainer,' I think, were the words you used; did I understand that you look forward to the time when you could do without the special instructor—altogether. I mean the time when the ordinary teacher of the school could do all the physical training?—Oh, yes, I think it is quite a thing to look forward to.

5385. Do you think you could do without the special physical teacher just now?—It is like every other specialisation; I think most men of ordinary intelligence, if they had to teach it and had to learn it, would learn it and would teach it.

5386. But you do not think that it would be desirable that every now and then a specialist should come round and see what was being done, and correct any faults, both in the teacher and the taught?—I have said that I think physical education is as important as mental education, and should be equally inspected by a person who knows how it should be taught.

5387. Then you must have a special inspector?—

Not necessarily; it might be the ordinary school inspector.

5388. If he had been specially taught?—Exactly.

5389. If you do away with the special inspector, who is going to teach your children on Saturday when you have collected them as you said to Sir Henry Craik?—I think if you are going to collect the children on Saturday, as he suggested, you must have a special teacher.

5390. These two things do not work quite well together; you abolish your special inspector, and then you bring him in as your teacher on Saturday?—Let me explain; I believe in what you can get; I do not believe in impossibilities; if you cannot get your special man and you cannot get them together on the Saturdays, you must get your ordinary teacher to put them through their physical training or drill, and he must learn to do it, and let it be part of his work—of course I see your point.

5391. You said that a special dress was indispensable for girls?—I did.

5392. Why?—Well, it is an *ipse dixit*.

5393. Do you mean for any exercise at all. I see hundreds of girls in all the schools doing physical exercise in their ordinary clothes; I do not mean gymnastics, mind you, just the ordinary physical exercise?—You do not mean to say you train the muscles of the legs in that way. I think they are as important as the other muscles.

5394. There is no special dress?—You could hardly train a girl's legs without some special dress.

5395. Well, we saw them being trained yesterday with no special dress?—Unless it be dancing.

5396. I did not quite understand; do you mean you would have to put every girl into a special dress?—In order that she may be able to kneel and spread her legs, and all sorts of things; that is my idea.

5397. You do not think that the teachers could be trusted to see the defects of teeth and eyes and ears and so on?—I hardly think so. As I said a little while ago, he might be taught many things. I do not think he could be taught that.

5398. He does not do it now, but he is not told it is his duty to do so?—I have no doubt there are teachers who could learn to do it, but, take the ordinary run, that is going a little too far; that does require specialisation; I think some of the other things could be done without specialising.

5399. He might see and afterwards call in medical advice?—That is true, but I do not think that is enough; I think it is so important that it should be regularly inspected.

5400. An inspection every school time?—Well, no; I should think periodic inspections.

5401. Have you had much experience of underfed children in your district?—Yes, a good deal.

5402. What do you do with them?—Well, they are there; you cannot help it.

5403. It is not, I suppose, conducive to mental or physical training?—No. We have done our best, and I have taken a very large interest in getting up school dinners in several parts of the country; where I have seen the thing started it is going on, and I think it has had a great effect and a good effect on the health of the children.

5404. How is that done; do the parents pay?—I always hold that if possible it should be made to pay, and in one school that I know of, it just almost pays; by contributed gifts of produce, at a penny a week.

5405. You think if arrangements can be made that it is very desirable that they should be made?—I think most desirable from the health point of view.

5406. What about coming wet to school; what effect has that upon their health?—Well, it has a very bad effect, and as medical officer of health I have tried as far as possible to get some arrangement for drying their clothes, but it is very difficult.

5407. Do you consider wet feet—sitting with wet feet—of importance?—Well, it never did me any harm when I was a boy, but I do not think it is a good thing. I think the wet upper garments especially are

bad. I think if there could be some means of drying their over garments, such as they could remove when they came to school, it would be of great advantage.

5408. You never tried anything of that sort?—We have tried a little, I think; in one or two schools they have got a little stove and enlarged the porch so that they can dry an upper garment—a cloak or something.

5409. Do you make them take off their shoes and stockings?—No; they do not do that.

5410. I suppose one reason you might suggest for saying that you did not see any great harm in middle-aged people from the want of this training thirty years ago is that the conditions of life are very different now to what they were thirty years ago?—Yes, they are.

5411. And these extra precautions are required to deal with the changed conditions of life?—Yes; and, as I said, you insist upon keeping them longer in school and giving them longer lessons and so on.

Universities.

5412. *By Professor Ogston.*—Do you think it would be advantageous or practicable to introduce physical training into the Scottish Universities—compulsory physical training into the Scottish universities. It has been suggested by a witness; I wish your opinion about it?—I have said before—and I have the very strongest opinion—that opportunities should be given; I have not considered the question of compulsion with regard to boys at college.

5413. My second question is this—Is the number of village halls and their situation in your district such as would enable you to dispense with covered-in playgrounds in connection with schools?—No, I do not think it is.

Continuation
Schools:
compulsory
attendance up
to seventeen
or eighteen
strongly
recommended.

5414. Is there any other important point that you would like to lay before the Commission?—If I have not wearied the Commission—and I have tried to be short—there is one thing I wish to say in just two or three words, and that is about continuation or evening schools. We have tried these schools at Dingwall, and it has been a great failure, and it has been a great disappointment to us as a School Board that they have failed; and I was inclined for a time to put the fault upon the masters of the boys, that they did not allow the boys sufficient leisure, but I have come clearly to the opinion that the fault lies with the boys themselves; and I am quite sure that if this system of physical training is to begin in schools—I think that to be right—it should continue in the evening or in continuation schools, and I also think strongly that children should be compelled to attend those schools up to a certain age—seventeen or eighteen. I just want to say that.

5415. *By the Chairman.*—For physical education only?—Oh, no; not for physical education only, but for physical education as part.

5416. Compulsory attendance at continuation schools?—Compulsory is what I ask; I am speaking from practical experience as Chairman of a School Board.

5417. *By Sir Henry Craik.*—Can you give any opinion as to what would be the feeling of parents with regard to that or the community generally?—One must be cautious in expressing an opinion, but my feeling would be that the parents would welcome it. I may say that parents have lost control of the children as they grow up, and this is a thing that is increasing day by day.

5418. For the advantage of the pupils you have no doubt whatever?—Not the least; and I believe myself that the parents would welcome it.

5419. *By Mr Alston.*—And physical training should certainly have a place in the continuation classes?—Yes, certainly a part.

With the consent of the Commissioners, I wish to supplement my evidence as regards (1) the health of Lews children, and (2) on the question of compulsion in continuation classes in schools.

(1) While the extraordinary improvement in the physical health of the Lews young man as compared with the schoolboy may be partly explained by the fact that a fisherman becomes at an early age a journeyman so to speak, earns good wages as a hand in a boat, and is thereby better fed than apprentices of the same age in towns, and perhaps better nourished even than an agricultural labourer of the same standing; I do not think it can be gainsaid that his physical training as a soldier or sailor, to which the great majority of the young men are subjected, does not only set him up in manly appearance, but largely contributes to his general well-being and bodily health. All this is a potent argument in favour of physical training generally to young men of our working population.

(2) In regard to continuation classes, and the advisability of enforcing compulsory attendance in the evenings on young persons attending the same, it seems to me that if a hold is to be kept on these lads up to eighteen there might well be *pari passu* extension of the rules in regard to 'half-timers.' This relaxation would meet the objection of farmers, crofters, and others who grudge the time spent by young people at school, and are naturally anxious to get boys and girls, living it may be on farm and croft, to help at light jobs, particularly at certain busy times of the year; while to my knowledge many parents desire to have boys and girls at home *through part of the day* in chronic cases of sickness, while the husband is otherwise engaged earning his livelihood.

The witness withdrew.

Adjourned.

ELEVENTH DAY.

Wednesday, 28th May 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr EDWARD ROBERTS, examined.

Mr Edward Roberts.

28 May '02.

5420. *By the Chairman.*—What do you appear as? —Headmaster of Kingussie school, my lord.

5421. You have your notes before you; would you go through them, please?—The system of physical training which obtains in this school is one which has been evolved by the peculiar circumstances and requirements of the school. Although the number of pupils in the whole school is not large (less than 300), the number of boys in the senior and advanced departments is comparatively large (there being over thirty boys beyond the age of sixteen years), and the whole system of physical training in this school has been formed and graded with the idea of proceeding from simple physical exercises in the elementary parts of the school to the regular military drill in the higher forms. Several circumstances have contributed to the success of the system we have adopted. For the military drill we have the services of an ex-army sergeant, and, during the last two years, several of our senior boys, while attending school, were also members of the local corps of Volunteers, the captain of which is a member of our School Board. There is thus a direct connection between the school and the town Volunteers, so that each boy undergoes during school life a system of training which aims at true physical development, and culminates in the ordinary drill and discipline of a volunteer. *System in Elementary School*—The system of physical training for pupils up to the age of eight years is similar for boys and girls, and consists of simple exercises, ensuring the free action of the whole body. Attention is paid to the correct placing of the feet in walking, while marching to music forms a considerable part of the exercises. These exercises are of short duration, and occur frequently as breaks in the ordinary work of the day. Correct and healthy attitude of the child while sitting, standing, etc., is strictly enforced. After the age of eight, boys and girls are taught separately, boys receiving a course of training in dumb-bell exercises, girls in bar-bell or hoop exercises. At this stage boys are taught the more simple evolutions, such as turning, etc., care being taken that these motions are the same as taught by the drill instructor at a later period in the pupil's education. The time devoted to these exercises is one hour per week, as a rule, divided into three lessons of twenty minutes' duration each. *System in Senior and Advanced Departments.*—Girls in this department continue the exercises with bar-bells, the primary object being that these exercises be simple, and calculated to call into action the less exercised muscles of the body, and thus counteract any injurious effect of close study. These exercises are gone through to the accompaniment of music, and are very popular with the girls. After the age of eleven, boys take ordinary military drill

in the playground, the time given being half an hour twice a week. The number drilled at each time is between sixty and seventy, and the sergeant, as a rule, is assisted by one of the senior boys. Last session a pupil, who was a corporal in the local corps of Volunteers, acted in this respect, and the effect was admirable, as a stimulus to greater precision and smartness amongst the other boys. In addition to the ordinary evolutions in turning, marching, and forming companies, etc., pupils are drilled in the physical developing exercises for recruits in the army. These exercises, however, are carefully graded, and, as there is a great disparity in the ages of the pupils, two companies are formed, as a rule, and drilled simultaneously. *Suggestions.*—(1) With the exception of military drill, which has to be taught in the open playground, very often under unfavourable weather conditions, all the above exercises have to be carried out in the ordinary classrooms of the school. These rooms are, as a rule, ill-suited for such purposes, and any encouragement or help that could be given to school boards to erect small drill halls would enable any system to be carried out with greater comfort and thoroughness. With the exception of buildings erected within recent years, few schools in the north of Scotland have any part of their buildings suitable for drill purposes, and the majority of School Boards hesitate to incur the expenditure entailed in making additions to existing buildings. (2) In 'Centre' schools, that is, schools which undertake the advanced education for wide areas, it would be desirable if junior posts in the army could be offered for competition among senior pupils. At the present time a well-educated youth, even with a strong predilection for soldiering, will hesitate before joining the ranks as a private soldier. *Remarks.*—Physical training, as a subject for continuation classes, has not been adopted in our school, as the circumstances do not seem to call for it. The number of boys who leave school in this district between the ages of fourteen and sixteen is too small to warrant any continuation classes being formed for their benefit. The volunteer movement is very popular in the town, and of the boys who remain here after leaving school, all, almost without exception, join the force.

5422. What experience have you had in physical training yourself?—I have studied the subject as taught by Colonel Cruden in the Aberdeen Physical Training College. *Cruden's system.*

5423. How long have you been in your present position?—Six years.

5424. When you began did you teach as much in the way of physical training as you do now?—No, we did not give it the same prominence as we do now.

5425. Have you been given a free hand in settling

Mr Edward
Roberts.
28 May '02.
Inspection.

your course of physical training or has it been prescribed for you?—I have had an entirely free hand.

5426. Who inspects the results of this physical training, His Majesty's Inspector?—We had a special Examiner from the Department this year, Mr Johnson. He came specially from the Department, I understand, to examine this branch of school work.

5427. Do you know whether the examination was satisfactory?—Mr Johnson and Mr Robertson both expressed themselves as well satisfied.

5428. *By Sir Thomas Coats.*—Do you consider the one hour a week that you give to physical drill quite sufficient; would you rather take more time or not?—I would hesitate to give longer time considering the present state of the school curriculum, seeing that it is already over-crowded with subjects. The recent demands of the Department, make it almost impossible to devote more than one hour per week.

5429. But I mean, suppose you took another hour, do you think it would be to the advantage of the children, both boys and girls, say, if you could give them twenty minutes every day for five days a week?—Well, considering our case in Kingussie, where the boys are enthusiasts at their sports, I think that it would not be.

5430. It would be quite sufficient?—One hour would be quite sufficient, I think.

5431. I did not quite catch what you said about the physical drill of children after eleven. You said you gave them ordinary drill after eleven, but do you also give them physical drill?—It is a combination of both. In the open playground they get the ordinary military drill and also the physical developing exercises of the recruits in the army.

5432. Yes, but the girls do not march and that sort of thing?—No, the girls are taught inside by their own teachers; the boys are taught in the playground by the sergeant.

5433. And they continue to get the same physical drill that they have been getting inside?—Yes, with hoops and bar-bells.

5434. Are the different standards brought on gradually from the smallest exercises to those which are more intricate?—That is so.

5435. And in your experience have you noticed great advantage to the children from the physical drill?—Yes, certainly in smartness and in carriage.

5436. They hold themselves better?—They do.

5437. And it smartens them for their school work?—Yes, obedience is more ready and their movements throughout school are smarter.

5438. *By Sir Henry Craik.*—You made a suggestion that there might be offered for competition amongst the scholars in your school certain posts in the army; do you mean those of commissioned officers?—Well, I am not thoroughly versed in matters relating to the army, but I should think that the War Office might find junior posts.

5439. But what do you mean by junior posts—subalterns?—Yes, something of that kind.

5440. That is commissioned officers; but are there many in attendance at Kingussie school who would be in a position to take commissions in the army?—A considerable number, if we regard age and mental ability as sufficient qualifications.

5441. But have the scholars attending this school means that would admit of their taking commissions in the army?—No, that is just the point, they have not.

5442. But what posts had you in your view when you suggested that?—When I made that suggestion what I had in my view was that their education might possibly entitle them to some post, even if it had to be created to suit such cases. They are the sons of poor men as a rule and are going to the University from school.

5443. What practically had you in view—what practical proposal had you in view?—I had no practical proposal beyond that the War Office might find some junior posts for them—create the post.

5444. In what sense—as non-commissioned officers

or as officers? I do not quite understand. Subaltern officers are surely the most junior posts in the army. What are the young men over eighteen doing in the school?—They are studying with the view of entering the University.

5445. Do they not go before eighteen to the University?—They are peculiarly situated. They have not had good opportunities to begin with. They have possibly had to work several months during the summer season, and they lag behind. Then they get County Bursaries which enable them to come to this central school in Kingussie. There they work on until they are able to pass the entrance examination of the University.

5446. They do not go to the University till they are twenty or twenty-one?—Some of them are that age.

5447. Do you think it is an advantageous career?—I think it is better than not going at all.

5448. How many have you over eighteen in the school?—I should say about twelve.

5449. There were some commissions, as you are aware, last year offered for schools. I do not think the Department had any applications from Kingussie? No. I only heard of these cadetships in connection with another school.

5450. No, they were not cadetships, they were commissions that were offered to schools; but the Department did not have any applications from Kingussie?—There was not.

5451. *By Mr Alston.*—You say that there are twelve young men over eighteen still in the school?—Yes.

5452. And 40 between fifteen and eighteen still in the school?—Not between fifteen and eighteen. I said between fifteen and nineteen, and there are only one or two over nineteen; the 40 cover all over fifteen.

5453. And out of a total number of how many?—About 250.

5454. Am I right in taking you up that a very small number leave school between the ages of fourteen and sixteen?—Very few boys.

5455. Then is it a peculiarity of your school that after the well-known school age of fourteen you have a number of scholars still remaining?—Yes, that is a feature of our advanced department. We have over 60 merit certificate pupils out of a total number of 250.

5456. Then I think I understood you to say that between 60 and 70 boys had drill?—Yes.

5457. As distinguished from the classes at physical exercise merely?—Of course the 60 or 70 at drill include our senior division over and above our advanced department.

5458. This total number of boys—60 or 70—had military drill—did you say it was military drill?—Yes.

5459. Under a drill sergeant?—Yes an ex-army instructor sergeant.

5460. Assisted by?—One of the senior boys. There are at present five or six of those members of the local volunteer corps, who are practically perfect in their drill.

5461. The boys?—Yes.

5462. And are they in any position of authority over the company of 60 or 70?—Yes. We often split up the company into two, and one of the boys takes one of the companies. Of course there is a great disparity in the ages, ranging from eleven to nineteen.

5463. You find the discipline is well maintained under these circumstances?—Yes; I am always there personally to supervise.

5464. But nevertheless the military drill produces the discipline?—Yes, inside the school it has a marked effect.

5465. Then the ex-sergeant, is he an army man?—Yes.

5466. And a perfectly competent instructor?—A perfectly competent instructor.

5467. Then after eight, I think, you told us that boys and girls are drilled separately in physical exercise?—Yes.

5468. Is that because the nature of the exercise

Curriculum ;
time given
sufficient.

Physical
exercise plus

begins to alter?—Yes, the boys are able to take exercises of greater difficulty than the girls after reaching that age.

5469. Then you do not require any expert examination from outside?—We have had none up to now.

5470. You studied under Colonel Cruden, I think?—Yes, I have studied his system.

5471. Would it be an advantage that an expert from Colonel Cruden's school or some similar school should examine you at intervals?—Well, it might perhaps help to create more enthusiasm, and assistance might be given in drawing up curricula suited to different schools.

5472. Then you have no difficulty with these older boys in getting them to attend the drill?—No.

5473. None?—They seem to be quite anxious to go to it.

Drill:
actions. 5474. In the neighbourhood there is no objection to military drill?—No, except in the case of one or two smaller boys who are physically unfit.

5475. That is a different point; but is there no objection from the outside on the part of parents or residents in the neighbourhood?—Not in the case of those who are physically fit, only in marked cases of unfitness, where there is a bodily defect.

5476. But there is no objection on the ground of drill tending to militarism?—Well, not pronounced; one hears talk sometimes, but not a direct complaint.

5477. Not worth noticing?—No.

for
sities. 5478. *By Professor Ogston.*—How many lads have you studying for the University?—I should say about twenty in our two senior classes.

5479. That is a very exceptional position for any school to occupy, is it not?—Yes, perhaps it is.

5480. Your school is a favourite one, then, for lads preparing?—It is what we call in Inverness-shire a centre school. There is a system of bursaries which bring boys from the outlying districts. These bursaries are not tenable except at four centre schools in Inverness-shire, of which Kingussie is one.

5481. Yes, I follow. What career do they intend to follow at the University?—They go to all the professions, but I should say, the majority of them go to the church, and the rest to teaching and medicine.

5482. Do you think those lads would be able—in addition to their studies—to take physical training?—These do get physical training.

5483. Without impairing their preparation?—The extent to which they get it at present does not in any way seem to impair their studies.

5484. You spoke of hoop exercises for girls: what are they? The hoop exercises?—You mean what form of exercise?

5485. Yes?—General bending of the body with the hoop in the hands.

5486. Where did you adopt that system from?—Colonel Cruden has been the pioneer of that all over the North.

5487. *By Mr Fergusson.*—Do I understand that these boys who stay with you to eighteen have taken bursaries and come in that way; they are not natives of your district?—A few of them.

5488. Not necessarily natives?—Not necessarily natives.

5489. They have not been with you from five years old?—By no means; they come about the age of fifteen or sixteen.

5490. Your school consists of a higher school as well as the elementary school?—Yes.

idea. 5491. In this physical training that you give you have a distinctly military idea from the beginning; you seem to train them up with the idea of their being volunteers?—Yes, it is directed towards that.

5492. And you would like further accommodation

or your drill?—Yes, for the military drill especially, because in Kingussie the winter is often very severe.

5493. If you covered in a part of the ground, would that be sufficient; that would not be very expensive—if there was a part of the playground covered in, would not that be sufficient for your purpose?—In winter when there is much snow, it would require to be covered in on all sides.

5494. You said you would not like to do more than an hour a week; you are afraid that it might have a bad effect on the book work?—Yes.

5495. We were told by another witness that he gave the boys three hours a week of physical training, and the other subjects of instruction did not suffer, but rather benefited, by this extra time devoted to physical training. You do not agree with that?—It would largely depend upon the number of subjects taken up.

5496. But as the Code at present stands?—Of course there are different classes of schools. There is the literary school, the commercial school, and the technical school.

5497. I am talking of an elementary school, up to fourteen?—I would not object so much there.

5498. But you have never tried; you are afraid to try?—I have never tried giving anything like three hours weekly; but I do not say that an addition of one hour would not help.

5499. You are a great believer in physical training, are you not?—To a certain extent, in so far as it helps mental activity.

5500. When the girls are doing their physical exercises, do they have any special dress?—No. *Girls: special dress.*

5501. Have you ever found any necessity for such a dress?—I do not think so.

5502. *By Mr Shaw Stewart.*—You spoke of your school being one of four centre schools in Inverness-shire?—Yes, sir.

5503. What are the other three?—Fort-William, Portree, and Glen Urquhart, and one of the Inverness Burgh schools.

5504. And a certain proportion of the scholars of these centre schools take up the teaching profession afterwards?—They do.

5505. Supposing it became necessary, for being teachers to obtain a certificate of proficiency in physical training, do you see any difficulty in scholars who intend to be teachers—do you see any difficulty as to their time, supposing that facilities are given them for being thoroughly trained by experts?—If they went through training colleges afterwards, of course they would be submitted to a curriculum including a course of physical training.

5506. But I was rather trying to get at whether it would be possible for them to accomplish their physical training while they are at their centre schools, before they go to the training college?—You mean, to be thoroughly qualified to give instruction afterwards?

5507. Yes?—I am afraid it would be too much to expect that during the time they are studying for the University.

5508. They could hardly give sufficient time?—I should say not.

5509. *By the Chairman.*—These lads over a certain age, who you say come to you; there is a certain number of them who have not been educated with you from the start?—Quite a number.

5510. When they come at the age of fifteen, do they attend just the regular hours—the same hours as the ordinary elementary pupils?—Exactly the same.

5511. Just as if they were small children?—Yes, exactly the same.

5512. The same hours?—I take these classes myself, and devote the greater part of my time to these twenty or twenty-five lads.

The witness withdrew.

Mr RICHARD J. WILSON, examined.

Mr
R. J. Wilson.
28 May '02.

5513. *By the Chairman.*—You are the headmaster of the Kent Road Public School, Glasgow?—Yes, my lord.

5514. You have been headmaster in Dobbie's Loan Public School, Glasgow, from 1874 to 1876?—Yes.

5515. You were in Greenside Street School (850 to 900 pupils) from 1876 to 1883; you were at St George's Road School (1500 to 1600 pupils) from 1883 to 1897, and you have been at the Kent Road School since 1897, where you have from 1800 to 1900 pupils?—Yes.

5516. You were headmaster of all those schools in succession?—Yes.

5517. In the first two schools you taught physical exercise in the classrooms, that is from 1876 to 1897?—Yes; and I might say to 1897 I also taught it in the playground; preferably in the playground.

Special
instructor.

5518. But since 1894 the drill in the schools has been in the hands of a specially-appointed drill instructor, who gives from twenty to thirty minutes' drill or physical exercises per week to each class, infants excepted, either in the school hall or in the open air?—Yes; that is so.

5519. And lately you have only been generally superintending?—Since the specially-appointed drill instructor.

5520. Have you your notes there; would you begin at 'Provision for Physical Exercises and Drill'?

Facilities.

Provision for Physical Exercises and Drill.—The School Board of Glasgow has taken up the subject of physical training and drill, and have not only erected halls attached to one school—which serve as a centre for three or four schools in the vicinity—but they have encouraged the teaching, by the appointment of specially-qualified drill instructors, to practically all their schools, and have also provided apparatus.

Halls.—There are three halls in connection with this school where drill can be taught, which are respectively—(a) 45 feet by 33; (b) 51 by 27; (c) 56 by 27.

Chesterton's
system.

Drill as presently taught.—What is presently undertaken in Kent Road School is chiefly physical exercises and drill on the lines laid down in Chesterton's book—*Manual of Drill and Physical Exercises*—and with the exception of infant section, is undertaken by the drill instructor. Each class receives one lesson of twenty to thirty minutes' duration weekly. The scheme of work carried on in this school is mainly that suggested by the author referred to.

In order that the drill should have its proper effect in producing physical development, more time must of necessity be devoted to it. This can only be done by the sacrifice of some of the time presently given to other subjects.

Advantages.

Advantages claimed for Physical Training and Drill.—That it greatly tends to promote self-reliance, attention, obedience, alertness, civility, responsibility, habits of comradeship, manual dexterity. Teaches pupils to act in unison, and gives them a smarter bearing. They must act in conformity to a general order. They must act in uniformity with one another. In a word, should promote health and all-round development of the body.

I may add it is a most popular subject with almost all pupils.

5521. Then you go on to say the objects of physical drill you consider as those tending to general improvement; physical as well as mental?—Yes.

5522. And you are very much in favour of a uniform scheme?—Yes.

Uniform
system
desirable.

5523. You mean to say by that you have not a uniform scheme at present?—We may have a uniform scheme in Glasgow, but children coming from a country school, or from another district out-with Glasgow, suppose they are in the Fifth Standard, they are not able to take up the drill that the other

children have already received, therefore they do not receive the same benefit; whereas, I hold if there was a uniform scheme over the country, the children would be placed at no disadvantage if their parents move from one locality to another.

M
R. J. W.
28 May '02.

5524. And you are also in favour of the erection of gymnasia of a small kind?—Yes.

Gymnas
children
thirteen

5525. Limited to children over thirteen years of age?—Well, I speak, of course, not being a medical expert; I would leave that practically to a medical man; but I am only judging from my experience that I am afraid that children under that age might injure themselves.

5526. You rather praise military drill?—I do.

5527. You say military drill of a simple kind is specially calculated to secure good, marked or permanent benefits?—(1) The proper development of the physical side of the child's nature. (2) The inculcation of habits of order, attention, self-reliance, precision and obedience.

Military
benefits.

5528. And you recommend that after the age of twelve the drill given to boys and girls, so far as it refers to marching, wheeling, etc., should be mainly of a military character?—I do.

5529. You say boys take naturally to military drill?—Yes.

5530. This is evidenced by the success of the Boys' Brigade; then we will go on with your suggestions?—

Suggest
cadet co.

(1) The establishment of a cadet corps, or semi-cadet corps, or something of a similar nature to Boys' Brigade in connection with every school. Such a corps to consist of boys over twelve or thirteen years of age.

(2) Military drill should form part of the curriculum of all continuation schools, and grants should be paid as for other subjects.

Continu
schools.

(3) As a large number of lads leave the day school at the age of fourteen, and do not attend any continuation school, some arrangement should be made whereby they could be kept attached to the cadet corps of their school until they have reached the age of seventeen or eighteen.

Cadet co
volunta

(4) This continued connection with the cadet corps or semi-cadet corps of the school should be voluntary, at first at least, and every inducement compatible with effective drill should be given to secure it.

5531. Would you explain that a little?—I should prefer that some inducement should be given. The promoters of any scheme should take the parents into their confidence. Let them be thoroughly aware it is not to make soldiers of the boys, but to give them a smart bearing and train them in politeness. I am extremely anxious that all should be polite, and that they should not take civility to mean servility, and probably their connection with drill would secure this. If it were possible to have, say, a newsroom or a lending library, or, perhaps, some little recreation or games of various kinds, it might be an inducement for the boys to meet together to have a kind of comradeship; and I do not see any hardship in boys having one or more hours, as might be suggested, per week, during certain months of the year, at physical drill.

Attracti

NOTES.—One uniform scheme might be arranged to suit—(a) Smaller schools; (b) Larger schools.

The physical exercises and drill given to boys over fourteen years of age should, in my opinion, be on lines in conformity with, and correlated to, those given to volunteers. This would in a large measure tend to assist our citizen army, for lads would be more easily induced to join the Volunteers, seeing they would not have to undergo all the training of a raw recruit.

Volunte

City Schools.—Having regard to the generally admitted physical improvement of girls of the upper classes through outdoor exercises and games, it must be conceded that physical exercises are beneficial. The inability to obtain fields, other than public parks, in which children of seven to fourteen could engage in games renders it almost necessary that more should be done to assist in their physical development.

Physical
exercises
beneficia

Playing at ball, throwing of ball, running, jumping, hopping, skipping and other games should be encouraged in city playgrounds.

Continuation Schools.—Boys over fourteen years of age should not be struck off the roll of day drill classes till they have been transferred to evening continuation classes, and should be got, by inducement or otherwise, to attend such until they reach the age of seventeen or eighteen. There should be no break between the day and continuation classes. In the case of removing from one district to another, 'transfer notes' should be passed into the hands of attendance officers, or other agencies, so that these boys may not be lost sight of till they are placed in another school.

Classes in gymnastics should be held in connection with continuation schools and under competent instructors. Where there are day school gymnasia they should be open to continuation pupils.

Special grants should be paid for efficiency in these subjects.

Swimming.—Swimming baths are provided in various districts of the city by the Corporation of Glasgow. There are in each building separate swimming ponds for boys, girls and men. The School Board of Glasgow has arranged for a large number of pupils of the senior classes of day schools attending for instruction in swimming during the summer months.

5532. *By Mr Fergusson.*—What class of children are yours? Are they poor?—The better class; I may say they are the class of children of artisans, shopkeepers, marine engineers, and a better class still.

5533. Perhaps you do not come much into contact with underfed children?—I may say, sir, that in my earlier career, in my first two schools, especially the first one, I had a very poor class of children; at Dobbie's Loan, which was the first school that the School Board of Glasgow opened, they were underfed.

5534. You had a lot of underfed children there?—Yes.

5535. How did you deal with that?—Well, the agencies then were not so extensive as now; I used to send to some of the parents and instruct them, especially in Glasgow, to see whether they could not get a little lime water for their children, and then to ask them to give them food that I thought would assist in bone production.

5536. If you found a child coming manifestly underfed, were any steps taken to see why it was not properly fed; to look up the parents and try to put things right?—I have looked up the parents and tried to put them under Church agencies.

5537. The School Board did not do that?—Not at that time.

5538. Do they now?—Well, I think they are in touch with all agencies of that kind.

5539. Do you approve of that?—Oh, yes.

5540. You think that it should be part of the School Board's duty to take whatever steps they can to see after the feeding of the children—I do not mean to feed them, but to see why the children are not properly fed and to do what it can?—I would approve of the School Board co-operating with the existing agencies, because we have in Glasgow a large number of ladies who are only too glad, in many cases, to be philanthropic.

5541. All your physical instruction, you say, is given by a special instructor; you yourself have nothing to do with it?—Not since a specially qualified instructor was appointed.

5542. Do you approve of that, in physical instruction, that you—the headmaster—should be entirely outside physical training?—I am not exactly outside of it, because I go along with the drill instructor to certain classes, certain weeks.

5543. You are always there when your classes are being taken?—I do not take each class each week—it would mean probably a whole day or more of my time, and then I am liable to interruptions from callers, but I contrive in the course of a fortnight or so to see all the classes at drill under the instructor.

5544. Would you prefer to give the physical instruction yourself?—I am afraid, now, that I would not care to undertake that—the whole drill of 1900 children.

5545. Oh, no; but of course you have got assistants?—Perhaps I did not understand your question.

5546. I do not mean that you should instruct the whole 1900 children, but your own particular class, and the other teachers should instruct their classes?—I think perhaps, if it were possible where the physical condition of the teacher is such that he is able to give physical drill, that the teacher should do it under the superintendence of an expert instructor.

5547. Do you find that the experts can keep as good order as the teachers can?—There the influence in one way perhaps may not be so beneficial. I would prefer that the class teacher should be alongside of the expert instructor when he is giving the drill, and then should practise the drill at other times when the expert is not present.

5548. You say the drill should be mainly of a military character, but from an observation you made you seem to have some fear that parents might think that you were trying to make soldiers of the boys?—Well, I think it might be well to let the parents know what we were after—take them into our confidence.

5549. Would not one of the best ways to do that be to avoid calling it 'military drill,' and call it 'school 'drill'?—I think so; I think if you keep away that term military; some people read into it more than may be actually meant.

5550. And the practical result would be the same so far as the drill is concerned?—Exactly so.

5551. With regard to your continuation classes after fourteen, what is your idea about continuation classes; should they be made compulsory?—Well, personally I have no objections to them being made, so far, compulsory. We find, just now, that the better class of boys readily go to physical drill, physical exercise and join the Volunteers, but there is a class of boy, perhaps, who is the very one you want to get at, to set him up, who does not go.

5552. Quite so; but is it not the case that in Glasgow an enormous number of boys whenever they leave the elementary schools—that is to say, after the age of fourteen—go to work?—That is so.

5553. There is plenty of work always for them to do?—There is a great demand for boys over fourteen.

5554. While these boys are at work have they got time to attend the continuation classes?—Of course I cannot speak for all the works; but I should imagine that the majority of these boys are free at six o'clock in the evening.

5555. But then they have had a very hard day's work?—That may be, of course, but I am only judging from observation, and seeing them in certain districts loitering about at street corners.

5556. You would be prepared to compel a certain number of attendances at continuation classes at which physical training would be one of the subjects?—I think if there could be some inducement made whereby they could be encouraged to come, if at all possible, voluntarily.

5557. You think that making it compulsory would be unpopular?—I am not prepared to say. In speaking to certain people, they say that there would be no hardship. If I might just say, in speaking to men of various political opinions—I should not introduce politics—but we find that they are nearly all agreed that something should be done.

5558. *By Mr Shaw Stewart.*—You believe in the Chesterton system?—I do.

5559. Chesterton himself would say that half an hour a week devoted to physical exercise under his system would be an extremely inadequate amount of time; you agree with him there?—I quite agree with him there.

5560. Can you give us an idea as to the amount of time that could be devoted to physical training in schools without interfering too much with the other subjects; would you say that it would be possible for the lower classes to have twenty minutes a day,

Mr
R. J. Wilson.
28 May '02.

Teachers :
ordinary staff
supervised by
expert.

Continuation
classes :
voluntary
attendance
preferred.

Time.

Mr R. J. Wilson. and so on, up to forty minutes a day in the higher?—I am afraid that that could not be without taking it off some other subject.

28 May '02.

5561. Granted that you would have to take it off some other subject, would that interfere injuriously with the mental work of the school?—I think physical drill is calculated to assist the mental. I say I taught it from 1870, when it was not compulsory; but I neglected to mention here that it was taught by one of my masters—even up to single-stick drill—when it was not even mentioned in the Code, and I simply began physical exercise, because I found that the children wrought better afterwards mentally.

5562. *By the Chairman.*—Was that after school hours?—No, in the middle of school hours; they were stopped in the middle of a subject and took a little exercise, and then resumed the subject again.

Curriculum :
more time
impracticable.

5563. *By Mr Shaw Stewart.*—Now, taking the present Code, would it be possible to get the results required under the present Code by devoting half an hour a day to physical training; would it be possible to get the desirable results on the whole?—I do not think it would be so bad in the very lower classes; but in such a school as I have just now, they aim at getting the Merit Certificate as soon as possible, so that children can get into the higher grade department; and if we are to take the Leaving Certificates in the higher grade department, our time would be curtailed there. I quite admit that if all schools that were going in for the leaving certificate had the same time for drill they would stand equal at the examination.

5564. Then do you think the Code should be modified?—Well, I am not prepared to say.

5565. Well, you are an educational expert, and I should like your opinion?—We have got so much relaxation lately, and I have found the inspectors ever ready to assist in any matters when asked them; but I would prefer, seeing they have a wider grasp, to leave suggestions of change to them, as I have only the experience of my own school.

Manual
dexterity.

5566. You speak of manual dexterity being one of the many advantages which can be derived from physical training, and I have no doubt you are perfectly right. Well, now, if that were made clear as being one of the objects which this Commission was appointed to obtain, would that remove, to a considerable extent, any opposition on the part of the general public to the extension of physical training?—I think it would, sir.

5567. Manual dexterity, of course, would be of great advantage to boys and girls who were afterwards to engage in handicrafts?—Yes.

5568. Quite apart from anything military?—Exactly so.

5569. And, therefore, if that were thoroughly understood by the general public, much of their objection would be removed?—I am sorry to say that unless boys have had a course of manual instruction, or some such thing, they are very bad in using their hands, and particularly in using the left hand.

5570. Naturally, like everything else, it requires training?—Quite so.

Swimming.

5571. One question as regards swimming; you say that instruction in swimming is given in summer, but in cities such as Glasgow would it not be possible to give instruction in the winter in the swimming in heated baths?—In heated baths it would; but children leaving school, and going to the baths, and coming back to school again—the drying of the hair is a difficulty just now. Of course at present, I understand, the Glasgow School Board cannot get their baths after 4.30. If the baths were obtainable after 4.30, it would allow the children to get their hair dried and prevent any cold accruing.

5572. That would be a more suitable time?—Yes.

5573. *By Sir Thomas Coats.*—You said, I think, that in the Kent Road School, where you are at present, the children were of a better class than the average of the Board School children in Glasgow?—Yes, I would say so, taking them upon the whole.

5574. They are the sons of marine engineers?—Yes, and shopkeepers and others.

5575. And other mechanics?—Yes; some of the parents are the foremen of some of the engineering works, and sea captains and so on; that is the class from which the children come.

5576. Will a large proportion of these boys after leaving your school become apprentices in the engineering shops?—A great many of them do, sir.

5577. Do not the employers make it compulsory that these apprentices attend the technical classes, or continuation classes, at night?—I am not certain that they do. In some instances I know they do, and many of the boys, looking to their future, attend classes. I mean to say, as a school, Kent Road is very well attended in the evenings, but I cannot say that employers make it a condition.

5578. I would ask you, in connection with these technical classes in the evening, do you think it would be possible to have physical training as a part of the course they were taking, making it obligatory on them to take up physical training as well as mechanical drawing and things of that sort, or what they take in the evening classes?—Well, I think it could, and if, as you already suggested, the employers were to make it a condition of apprenticeship, that would get over a great part of the difficulty.

5579. That would be in your school particularly?—I think even generally, where apprentices were.

5580. But the sons of shopkeepers who are not going to follow out mechanical life there would not be the same interest for their taking technical education there would be a good number. If you took for granted that they were going to become mechanics afterwards, that they would go to the evening classes, there would still be a large proportion of boys who, unless they were obliged to go, would not go?—Quite true.

5581. Very possibly their parents would not oblige them to go?—Yes.

5582. Well, you would require to deal with them?—Well, that is just the point that I find in conversation that most people say something must be done. There are certain boys who will attend of their own free will; there are others who will not attend; the very boys who you would desire should attend do not attend.

5583. Then do you think the parents would object to these boys being obliged to attend evening classes after they had passed out of board schools, say at fourteen. Do you think there would be a strong objection on the part of parents to make training in the evening schools compulsory, say up to seventeen?—It would depend probably on the hour or number of hours per week, or the number of hours throughout the year. I do not say that there would be any hardship in any way if there were to be a certain number of hours per annum.

5584. There is just one other question I would like to ask you. In reply to Mr Shaw Stewart, who asked you about manual dexterity, and that being improved by physical drill; in what way would you obtain manual dexterity; I could not quite follow you in regard to that?—With the handling, perhaps, it may be of a rod, or, if you like, miniature gun, but a rod will do, and moving from hand to hand and training the left hand—putting it into certain positions.

5585. But would not sloyd work do more in that direction than in physical drill?—Sloyd does; but sloyd does not, in my opinion, train the left hand. The left side is left weak. I have observed it with a boy who even has been taught with sloyd, if you put a hammer into his left hand he seems not to be able to use it.

5586. *By Sir Henry Craik.*—Your duties in a large school like yours are those of superintendence?—Generally, and somewhat of examination.

5587. You do very little in the way of teaching yourself?—I do teach, for the purpose of showing my pupil teachers how to teach, or any teacher who may be weak or inexperienced.

5588. But, of course, your time is fully taken up with the duty of the general superintendence of the school?—It is.

Mr
R. J. Wilson.
28 May '02.

Physical
exercises
encouraged by
School Board.

Teachers,
under expert
instructor.

5589. And you find that you trust the different sort of teaching to your different subordinates?—We have to do that; more markedly in the higher grade department.

5590. And you find that amongst your subordinates those experts in physical training do their work generally as well as ordinary teachers, so far as discipline is concerned?—Since our drill-instructor was specially appointed, I have not put it specially to any of them.

5591. You have not entrusted any of the general teachers with this physical work?—Except the infant teachers, since a special expert instructor was employed by the Board.

5592. You draw a certain distinction, do you not, between physical exercise and drill, whether we call it military drill or not?—I have not hitherto.

5593. But the manuals that are drawn up generally do make such a distinction?—Yes.

5594. Is there more obedience to order and the discipline inculcated by the drill than by the exercises?—I think there is.

5595. And the drill would more naturally lead a boy on to more responsible service, in the way of joining a Volunteer company?—I think it would; that would be my object, to assist Volunteers.

5596. Certainly; then that being our object, you speak of your desire to take the parents into your confidence; I think you used these words?—Yes?

5597. Is not the best way of taking the parents into your confidence to tell them distinctly what you mean?—Certainly.

5598. Not simply to cover it by physical exercises, if you really mean something else—something which is to show a moral effect as well as physical?—Yes.

5599. About the Code; you were asked whether you would suggest any changes in regard to the curriculum. Now I do not want to ask you what changes you would make, but would you suggest any change in regard to the curriculum of the Code; it prescribes no curriculum, I think?—That is why I said it was only—

5600. So it is only a question of your not agreeing with what the Code enforces; but the Code enforces nothing except what you choose to take up, except the most elementary subjects?—Quite true. That is why I suggested that it should only be in consultation with the inspectors.

5601. But you have it in your power to shape your curriculum at present?—Yes.

5602. You told us that you had charge of Dobbie's Loan School earlier in your career; a very poor school?—Yes, it was.

5603. Was there any practice of taking the children into the country in their holiday time?—No, so far, except in connection with Sunday schools for a day now and again.

5604. That, of course, has no effect upon them physically at all—the single day's excursion?—No.

5605. Harmful, I should think, perhaps, rather than the reverse?—Yes.

5606. But there was never any attempt to camp out these poor children in country places?—Not until a later period, when there was a fresh-air fortnight.

5607. And that is now done?—That is now done; there is a fresh-air fortnight.

5608. Have you ever heard of any attempt to take the children of a town school to camp them in country schools during the holidays, somewhere near the sea?—No, not except in connection, as I have said, with the fresh-air fortnight, and there may have been—I am not prepared to say—in connection with the Boys' Brigade.

5609. But you think that would be a very good way indeed of giving them some physical exercise as well as fresh air?—Perhaps in the very poorest, but I might say, even with Dobbie's Loan, it was not for the want of money in many of the cases; it was simply the misuse of money by the parents.

5610. Yes; but just as you would take a cadet corps out to camp for a week or ten days, would it not be a very excellent thing to take some of these

children from the poorer districts of Glasgow to do the same thing?—I think it would.

5611. Recognising it, I mean, as part of the school curriculum, and paying for it as such?—I think it would be very beneficial.

5612. But you are not aware of it being done as a part of the school work in any school in Glasgow?—Not that I am aware of.

5613. *By Mr Alston.*—You have told us that the Physical Board of Glasgow encourages the teaching of physical exercise?—Yes.

5614. How do they manifest that encouragement?—By supplying drill instructors and by giving us various kinds of apparatus, and providing gymnasia in certain schools.

5615. How many instructors are there?—I could not say, but I think instructors visited all schools with the exception of two.

5616. But all these schools have not suitable drill halls?—No.

5617. How many drill halls have you in Glasgow?—Well, I cannot say.

5618. There is one in St George's Road School?—There is.

5619. Is that considered the model?—I do not know that it is; that was erected after I left; I do not know that it is the model.

5620. Which is the most recent hall?—I am not certain, unless there is one at Provanside, but I cannot say.

5621. That is the method which the School Board is using to encourage physical exercise; giving the apparatus and giving the halls and providing instructors?—Yes, I think they promoted drill halls since the erection of the schools, in many cases; the schools were erected first and then the drill halls have been afterwards erected.

5622. The drill hall is generally in a central area in the building in many cases?—In many cases, yes.

5623. Then I think you told us that the teachers in the schools do not instruct in physical drill?—I am speaking of my own school only—for Kent Road School.

5624. Then do you approve of that?—No.

5625. Would you like all these teachers to be capable of imparting physical instruction?—Yes, and I think they would be when they were put, so to speak, under an expert instructor. Many of them have a diffidence; they are afraid they are not able in many cases.

5626. But they could go to the proper centre, for instance, and come back with certificates that they were competent?—Many of mine are certificated.

5627. In physical training?—Yes.

5628. Then of course they are competent to instruct?—They are competent.

5629. But would you like supervision by an expert, say the Department sending an expert to supervise the instruction given?—I would not. I would prefer the School Board, as they are doing now, sending what I call a drill instructor—an expert.

5630. You call the drill inspector an expert?—I do.

5631. And have you noticed the work of the drill instructor?—I have.

5632. And is it perfectly satisfactory?—Well, the present one has only been with me for a short time, but I have had several of them, one of them notably particularly good.

5633. What is his name?—Mr Macdonald; he went into business some two years ago.

5634. And are they all satisfied with Mr Macdonald?—They were all satisfied; the children were thoroughly earnest with their work; he was a splendid musician as well as a drill master, and they had music.

5635. I was going to ask you that question. Does Music Sergeant Macdonald always instruct with musical accompaniment?—He has only been little more than a month with me; to certain exercises he takes music.

5636. Have they expressed any opinion as to the necessity for teachers using musical accompaniment?—

Mr
R. J. Wilson.
28 May '02.

Some of them said to me that sometimes in taking music, unless you watched particularly, the children perhaps were not so expert.

5637. But they had nothing to say as to the movements having been thoroughly practised before music was used as an accompaniment?—No.

5638. We have had evidence before us which seems to point to the fact that you must thoroughly train in these movements by physical drill without music, because there is a danger that in using music always the movements become slovenly; you have noticed that?—Yes; but the movements were taken without music first until they knew them thoroughly, and then in rehearsal, or in practising them regularly, they were taken with music.

5639. Then, while the School Board encourages, and takes means to encourage, the teaching of physical exercises in their schools, they draw a line, as we have seen from these papers, at military drill?—Yes.

Military drill.

5640. You have a great belief in military drill?—I have; but then, on the other hand, the School Board themselves—I am not saying one word derogatory of the School Board, I want to be loyal to them—they have formed a cadet corps in the High School which has turned out extremely well; and if it is good for boys of the better class, surely it is still more necessary for boys of the poorer classes.

Cadet corps :
expense of
uniform.

5641. How would they meet the expense of the cadet corps in a general school?—Well, I cannot say as to School Boards doing that, but I think if there was a semi-cadet corps attached to our schools, so that perhaps the expense was not too great; I think if some small uniform were given, such, perhaps, as a coat, that would cost only about a few shillings, and so on, I think it would have the effect of assisting the boys to have a little *esprit de corps*.

5642. Would you get the boys with such a small amount of uniform?—Well, I think if they had a jacket of some kind, something like a Norfolk coat—with, perhaps, facings on it—a cap and belt, and so on; I think if they were to be told that it would become their own property, perhaps at the expiry of two or three years, and they paid perhaps one-third to one-half the sum of it.

5643. That might perhaps do in schools such as yours, where the parents are really well-to-do; but generally, over the city, could you conceive a cadet corps being added to each school, and the parents consenting to pay for anything like a uniform which costs about £3?—But I mean instead of that, if it were possible, when a uniform of any kind, a jacket, that would not, perhaps, cost the parents more than about 2s. per annum; supposing the boy were three years in the school, and the uniform would not cost more than about 2s. per annum, and become the property of the boys at the end, the other agency providing the other half—the whole costing 10s. 6d. or 12s. or so.

5644. You think it would be such an advantage to the school discipline and general work of the school that it would be worth trying the experiment?—I think in the general appearance that it would put upon children a very smart bearing; that it would have an effect upon boys; I said for boys just now.

5645. Then as to continuation classes; upon the

whole you do not think they should be compulsory?—Practically, or semi-compulsory.

5646. If not compulsory, you would require to attract the boys to attend after the age of fourteen?—Yes.

5647. What attractions would you propose; would you advocate the introduction of fencing?—I would.

5648. Single-stick?—I would.

5649. Perhaps sword exercise?—Yes.

5650. Bayonet exercise?—Yes.

5651. And applied gymnastics?—Yes; and, if it were possible, perhaps have a reading-room or library in connection with the school. I can fancy that in country schools many country lads are simply at a difficulty what to do with their time.

5652. But we are talking of a city like Glasgow, where we know the lie of the land so well?—Yes.

5653. Now many of these boys are in occupations which make them very tired at the end of the day?—But I think if they were once or twice a week for a very short time just as an experiment, as could be best arranged.

5654. And you think that it would be a very great advantage in continuation schools to have military drill introduced as one of the subjects?—I think military drill and physical exercise to assist in the general development and building up of the body, and setting up, so to speak, physically.

5655. Then, as we know from the report of the last meeting of the School Board, even in continuation classes they disapprove of military drill under that name?—Yes.

5656. We have got these facts publicly now?—Yes; I have seen the newspapers.

5657. Then to go back to another point, uniformity. You think that would be a good thing in the instruction; you said the want of uniformity would be a disadvantage to children coming from other places. The disadvantage would be in coming from other schools having another system; if they entered Kent Road they would not be on a level with your children there?—Unless there was a uniform system throughout Scotland.

5658. Would their not being on a level with your children arise from want of uniformity, or inferior quality of instruction elsewhere?—My object was to equalise, so that the same system of drill was taught throughout Scotland, however simple.

5659. You would advocate that?—I would advocate, however simple it should be taught.

5660. Have you formed any idea which is the best system of the many which are used?—I have not; but I have formed the idea that I think some simple exercises should be introduced of some kind; perhaps got up by experts in physical training. After the expert had got these up he might produce them practically before some special anatomist or medical man, who would then say whether the children were overtaxed in certain muscles, or undertaxed in other muscles, so that each muscle and each side of the body should have its due proportion of exercise.

5661. You think such a uniform system could be constructed under expert opinion?—I think so, put simply, but so that it could be varied.

The witness withdrew.

Miss
C. Cowan.

Miss CHRISTINA COWAN, examined.

5662. *By the Chairman.*—You are headmistress of Possil Park Public School, Maryhill, Glasgow?—Yes, my lord.

5663. And how long have you been so?—For about fourteen years.

5664. You say it is practically a typical town school?—Yes, my lord.

5665. Except for its being on the outskirts of the city; its pupils have more advantage in the matter of fresh air and unoccupied ground to play upon. There

are 1200 places in the whole school, and the infant department 350 places, boys and girls?—That is so.

5666. And there are four large classrooms on the sunny side of the school, with half of the floor space galleried and desked, and half of the floor space left free?—Yes.

5667. Then you say, as regards the physical training, that you do not claim that it is based on hard and fast scientific principles, but simply that it has come about as the result of experience and study of child

Miss
C. Cowan.
28 May '02.

nature. Do I understand from that, that the physical training is more or less arranged by yourself, not on anybody's system?—Not on anyone's system; no.

5669. And not from a printed book?—Not from any book.

5670. Nor manual?—Not as to the vocal part of the training. When we come to the apparatus drill it is practically the same as given in any ordinary drill book. I mention that later on; I begin with singing.

5671. You begin with singing?—Whenever I get them in I begin right off with songs, and combining songs with actions; I make them turn roundabout, and even dance. By turning to the right or left instead of always facing the front the children are enabled to give their arms free play in a great variety of actions.

5672. You say that you would like to state briefly from your experience what you have been led to consider adequate means of securing that children of say from five to seven years would not only not suffer physically from enforced attendance at school but derive positive benefit from such attendance, and you say that this is apt to be overlooked; that all the good results from regular physical exercise may be wholly—and perhaps more than—counterbalanced by want of care at other times; for example, their being compelled to assume certain positions for writing, arithmetic, or other occupations, or carelessness in ventilation of the room?—Yes, a cramped position.

5673. So that you look upon physical exercise as very instrumental to the general health of children?—In every way.

5674. You divide your physical training into two parts, I see?—Yes.

5675. You say in this connection that you wish to insist that the physical training of the children should receive careful attention throughout the whole length of the school day?—Yes.

5676. And not only during short fixed periods, and, therefore, you ask to be allowed to make at times what may seem a digression; do you mean in your notes?—In the notes, just in describing it.

5677. Then you proceed to give a day's programme; you say on the paper the children in the lower and upper infants?—Whenever we get the little children into the school we have two rooms set apart—the two lowest infant rooms, and while sitting or standing in their desks, they go through any amount of hand-drill and kuce-drill and breathing—inhaling and exhaling, they do not require to be brought out of their desks at this stage. They go through it regularly every day; for about twenty minutes every forenoon they are drilled, play and drill being combined.

5678. Now would you mind reading from your notes?—I would now ask to be allowed to make some observations with regard to the part of the reference, 'and to suggest means by which such training may be made to conduce to the welfare of the pupils.' It seems to me that the requisites for securing the best possible results are mainly three:—1. Suitable accommodation and apparatus. Room cheerful, well-lit, well-ventilated. Important though the matter of accommodation undoubtedly is, yet too much may be made of it. In my experience excellent results have been attained in temporary premises, which many might have considered altogether unsuitable. These results were testified to by two Inspectors—the late Dr Ogilvie and Mr Munro Fraser. ('Physical exercises are of superior merit.'—Dr. Ogilvie.) It was a temporary building that was condemned by Government. 2. Good teachers.—Without these nothing else is of any importance. Any success which has attended my efforts must be attributed to the zeal and hearty co-operation of my staff. For the teaching of infants special qualifications are necessary, and no one who has them not should be employed in the work. Scholarship of high degree is not essential, neither, perhaps, is a deep knowledge of scientific theory. But what is essential is, that the teacher have sympathy with children, a love of her work among them, and be bright, pleasing and attractive in manner.

Young children are most impressionable, and anything like harshness or coldness makes them withdraw within themselves, so that although exercises may be gone through with mechanical accuracy, they are robbed of much of their value. The training which many of the younger generation of teachers have received as pupils and as pupil teachers should result in good in the future; but the essential thing is not a knowledge of theories, but active sympathy. Therefore, no one should be engaged among young children if she feels the work a burden—no matter what her scholarship or degrees may be. In the conduct, too, of a large infant department, it is desirable that there should be if possible a proportion of younger teachers—pupil teachers and others, who being, in a sense, still children, link the budding intelligence to the mature mind. Young teachers, too, have less dignity to maintain, and, moreover, for physical reasons can put into their work that 'abandon' which is characteristic of children and which they so love. In many schools there are many old teachers. In the infant room, if there are four or five mistresses, they are nearly all pretty old. Instead of that, in our school we move them on. Whenever a mistress has been two or three years in the infant room we move her on to a standard, and a young fresh teacher comes in. 3. Musical accompaniment.—Wherever possible good music should be provided—it gives interest and stimulus which nothing else can. Under its influence the dullest and most lethargic child is roused to activity. Besides, experience proves that exercises can be continued for a much longer time without fatigue if music is employed. Any kind of music can be employed; I have heard of a concertina being used. In short, harmonious motion and harmonious sound are complementary, and a harmonious whole is the aim and object of all training.

5679. *By Mr Fergusson.*—I see you make the boys whistle an accompaniment for the girls, and the girls sing for the boys?—Yes.

5680. Is that an invention of your own?—Oh, well, that is a common thing.

5681. Is it?—It is when there is no piano in the playground. We often give them their drill in the playground, and they enjoy it very much.

5682. *By Mr Shaw Stewart.*—You say that you have attained very successful results in temporary premises, so I suppose that would point to this, that if a teacher is really enthusiastic about the physical training, much can be done?—In any circumstances.

5683. In any circumstances?—I think in almost any school at all a great deal can be done.

5684. But I suppose one of the things that would conduce to make teachers enthusiastic about physical training would be that the Inspector should be very particular about that branch of his inspection?—Well, it was a remark of the late Dr Ogilvie that led me first to make a sort of specialty of the singing and drill combined. He said it made the children so bright, intelligent, lively, alert, and all the other inspectors have noticed the same.

5685. Therefore we may take it from you that if Inspectors paid particular attention to physical training, that would react very markedly on the teachers?—It would. It has done so on me. But I think they do it; I have found that they have all done it.

5686. But many witnesses come and tell us that there should be more physical training, therefore it would point to this, that Inspectors should pay even more attention than they do now to that branch of work?—Well, I spoke just for what I have found, that they have paid particular attention, every one of them that I have had.

5687. Perhaps you have been specially fortunate in that particular?—Yes.

5688. *By the Chairman.*—How often, as a rule, are your classes examined in physical training?—By the Inspector, just twice a year.

5689. But are they examined by yourself?—Every day; every child in the infant department is put through a certain amount of drill.

Miss
C. Cowan.
28 May '02.

5690. Do you teach yourself, or do you examine?—
I just superintend.

5691. You do not examine them?—Well, I am
always there when they are doing it; I am just really
examining them to see that it is gone through properly.
The teachers are very enthusiastic as a rule when it is
thrown on their own shoulders to do.

5692. Your department, as you have already stated,
I think, is 350?—Yes.

5693. What sort of average attendance?—That is
the average attendance; it is really about that; we
are overcrowded. The attendance is sometimes greater
than the accommodation.

5694. Do you ever see any of the School Board?—
Oh, yes, occasionally.

5695. Do they often come round?—Not very often.

5696. And when they come do they ever go in
for any examination of the physical training?—
Never.

5697. Simply just walk round and examine the
premises?—Usually on examination day, as a rule.
They do not visit the school much at all.

5698. *By Sir Henry Craik.*—You spoke of your
accommodation being rather overcrowded?—Yes.

Accommoda-
tion.

The witness withdrew.

Mr J. Cantlie,
M.B.,
F.R.C.S.

Mr J. CANTLIE, M.B., F.R.C.S., examined.

5705. *By Professor Ogston.*—Lord Mansfield has
asked me to put to you the questions that the Com-
mission desires to hear answered. To begin with, you
are an M.A., I think?—Yes, of Aberdeen.

5706. And you have also special medical degrees;
they are M.B. and C.M. of Aberdeen, F.R.C.S. Eng., and
the Diploma of Public Health, London?—Yes.

5707. And you are a surgeon and lecturer in
anatomy to Charing Cross Hospital?—Yes, and surgeon
to the Seamen's Hospital.

5708. You have had experience of general practice
for a number of years?—In the East I had a general
practice, at home here I have had, before I went to
China and since my return, a purely surgical practice.

5709. A purely surgical practice in this country, and
considerable experience in China?—Yes.

5710. Before you give your evidence in detail, if
you have the notes of your intended evidence with you,
would you mind reading over the headings under which
you have placed it, so that we may have a general idea
of the direction of your evidence, and then we can go
over the individual points?—

Suggestions.

1. Country children in various parts of the King-
dom are deteriorating. Urban children in the larger
towns of the poorer classes are deteriorating.

2. Country children require no systematic exercise,
except military drill, provided they are not confined
after school hours at indoor work.

3. Urban children require artificial forms of exer-
cise.

4. Games are necessary for both country and urban
children. The discipline many games engender are
useful in teaching principles of truth and honour.

5. The principles of exercise for children should be:—

(a) Every exercise or game which calls into play
the lower extremities of children under fourteen should
be encouraged, if the child's physical strength is not
overtaxed.

(b) Every exercise or game which calls into play the
upper extremities of children under fourteen is to be
viewed with suspicion, and when the upper extremities
are developed whilst the development of the lower
extremities is neglected, that game in exercise is to be
condemned.

6. Boys until the age of sixteen or seventeen should not
be allowed to indulge in exercises with heavy dumb-
bells or severe gymnastics.

7. Girls should never be allowed to employ their upper
extremities in exercises requiring anything but the
slightest physical strength.

8. Gymnastics, trapeze, cross-bar, etc., are not to be

5699. What do you think of the rate that is required
per head by the Department; is it sufficient, do you
think?—Oh, it is quite sufficient.

5700. That is only eight square feet for infants?—
Whatever it is it is sufficient, because I could easily
put more into a room than the Government allows me
to put in.

5701. Would the air be good enough to keep the
children in good health?—We are not built round
about in the infant department. We are free, and it
is very bright. The rooms are very bright. It is a
modern school, and I think what Government allows
is quite sufficient.

5702. Insists upon, rather?—What they insist
upon; yes. While, for example, I had 370 present
on Monday, and the accommodation is 350, I could
easily have put other 20 in, and it would have been
quite fresh and nice; so that the accommodation is,
I would say, ample. What they insist upon is
ample.

5703. How long do the children stay in your infant
department?—On an average, two years.

5704. And when do they leave; at what age do
they leave?—Seven is the average age for leaving.

recommended to any boy under sixteen or seventeen,
and to girls never.

9. Swimming should not be permitted to boys or girls
under sixteen, except under strict supervision.

10. Cycling should not be allowed for boys or girls
under sixteen unless some person in authority is with
them to restrain them from over-exertion.

11. Football, hockey, etc., should only be allowed for
young persons under sixteen when those who take part
in the game are of the same age, or not more than of
two years' difference. This is not so much on account
of the danger of being hurt as on account of the danger
of over-exertion.

12. Military drill for boys and girls should be daily,
and not last longer than twenty minutes.

13. Children should never be condemned to go 'walks,'
except for a distinct purpose. They should be allowed
to go-as-they-please, and not to walk in step or keep
line.

14. Constant medical supervision is necessary at
schools and universities. Young men at universities,
and indeed everywhere, should when 'training' be
compelled to produce a 'weekly' certificate that they
are physically fit to proceed with the training.

5711. You have thought a good deal upon such sub-
jects as those?—Yes.

5712. And you have written upon kindred subjects?
—Yes, I have written a good deal upon this very sub-
ject, exercise in health, in a book called 'The Book of
Health,' and also recently an article called 'The Health
of the People,' in *The Practitioner* for March, which
has been copied into several of the daily papers.

5713. And you have also directed attention to many
new points. I believe you were the originator of the
statement that no Londoner survives beyond the third
generation?—Yes, I published that statement some
time ago in a lecture given at the Parker Museum of
Hygiene, under the title 'Degeneration amongst
Londoners.'

5714. That your experience has led you to?—Yes,
my experience has led me to believe the same statement
still.

5715. Then, turning to your notes of intended
evidence, that the country children are deteriorating,
have you any data that you would like to bring before
us in regard to that?—The observations in regard to that
were chiefly made in Essex and Hertfordshire, and part
of Buckinghamshire, which represented, as far as I could
understand, a very average condition of the state of the
rural population; and for some years past I have made
careful enquiries of the doctors in the various places in

Cantlie, I.B., R.C.S.
 connection with different parts of England, especially Hertfordshire, in regard to the children, and remarking upon the children that they looked rather miserable. 'Oh, yes, of course, they are miserable, they are suffering in most of these villages from rickets.' 'What is that from?' 'From want of proper food; that the wages are so low and the families are so large that rickets is one of the commonest ailments we have to treat in some of the country villages of Hertfordshire,' and that having been brought to my notice I extended my inquiries in different places—Surrey and part of Kent, and again in the neighbourhood of Manchester—and I find that rickets is not at all an uncommon disease in the country, amongst country children, say within an area of forty miles from London, and unless it is attributable to want of food, or insufficient food, or wrong food, I do not know what else it can arise from, and in that sense the children, there is not the least doubt, are deteriorating in that particular way.

5716. On what period of years would your observations bear?—Only during the last five, since I came back from China.

5717. And the deterioration is both mental and physical?—I cannot speak positively about the mental qualities.

5718. Second, that country children require no additional exercise, except military drill, provided they are not confined after school hours at indoor work: have you any detailed observations to make regarding that, or is it sufficient as it stands?—I think that is sufficient, sir, as it stands.

5719. Well, the antithesis to it that urban children require artificial forms of exercise is also sufficient as it stands?—I think so.

5720. Then the fourth heading, games: you approve very much of games?—I do, as a form of exercise for children.

5721. And for the reason also given here that they engender principles of truth and honour?—Yes, and fairplay, and regard and respect for each other's word. I think games are the chief means of teaching them discipline amongst each other.

5722. Do you advocate the organisation of games under the teachers or a spontaneous employment of them by the children?—I think it should be spontaneously by the children. I do not think it is a good thing for the schoolmaster or the schoolmistress to interfere much with the children's games. The games become, then, a duty. It is not what you call a spontaneous game then, and I think, if the schoolmaster is there regulating the code of honour, it does not have the same effect on the children. The principle of honour is almost instinct in children if they are allowed to have their own way. There may be one or two bad ones amongst them, but I think the general instinct of the children will be towards fairplay and uprightness in games. If children are left to themselves, I think, it is much better than for the schoolmaster or anybody over them to control them, except it may be senior children or senior boys or girls; but I think the schoolmaster should have nothing to do with the children's games.

5723. Have you any views that you would wish to express regarding playgrounds or play-halls or covered sheds?—Recently, last March, in the article that I referred to in *The Practitioner* in connection with the health of the people, I advocated there that in large towns covered playgrounds should be instituted so that no covered playgrounds should be further away from any individual house than say half a mile, so that children need not have a further walk than say ten minutes to get to any covered playground in any part of the city—that would be one covered playground in an area of a mile in circumference. These covered grounds should be made to pay by charging a fee from children of parents who are well off; they are in just as bad a condition living in the centre of a big town as the poor children are. There might be one or two or three different classes in these covered gardens or covered playgrounds the same as we find in our public swimming baths. I

firmly believe if they were conducted in that very way, but that the covered playgrounds should be at the disposal of all children, they would prove successful. In winter time the parks in our large towns are perfectly useless for about seven months in the year as recreation grounds for the people. For adults it may not matter so much, but for children it is a very serious thing that they are shut up for five, six, or seven months in the year with no place to go to play, and unless we have some covered playgrounds of the kind, our parks do not, except for five months in the year, exercise that useful object, and there is only one way out of the difficulty, namely, to get some covered playgrounds for them. If necessary, as in bad weather, they might be used in the summer time as well, although I think there are enough parks in the various towns and cities in Great Britain now to allow children to play in during the summer time.

5724. Do you consider that suggestion capable of being applied to all the wilder districts of Scotland?—You mean the covered playgrounds?

5725. Yes?—I think they are only necessary in large towns.

5726. Referring next to the fifth paragraph, and to the first clause of it (a), would you mind telling us why you think that games which call into play the lower extremities of children under fourteen are the only ones that should be encouraged?—Well, I think that as the primary use of the lower limbs is to walk with, the lower extremities ought to be exercised most. Artificial exercise of the upper extremities, or any extraordinary development of the upper extremities, I think is artificial, and I think is not consistent with physical strength. We see at the present moment, almost in all our towns, that men are developing their upper extremities, and leaving the lower extremities to take care of themselves; the same thing has happened in rowing, not so much now in the modern form, but in the older form. When men use the upper extremities constantly they get stale, but the men who take long walks, and use their lower extremities, do not get stale in the same way, and that the number of men who fail in rowing, who break down either from heart trouble or diabetes, or albumen in their urine, of which one has seen a good deal lately, is almost entirely due to the use of the arms, throwing a great strain upon the heart and the circulation, and leaving the lower extremities completely out of training. If they are proportioned there is not so much danger, but there is a great danger of overdoing exercises that are devoted to the upper extremities, and most of our exercises for children, physical exercises and drill, are almost all devoted to using the upper extremities and not the lower. It is not natural; the lower extremity is the one that is meant for exercise for performances of that kind, and any artificial exercise thrown on the upper extremities should be quite subsidiary to the other, and certainly a very much less degree of strain should be thrown upon the upper extremities than upon the lower. If the two are worked together, there is not so much danger, yet the upper extremities should be used rather as an auxiliary than as the primary means of developing a child's strength or anybody else's strength, but especially a child's.

5727. But the grounds on which the conclusions of paragraph 5 are drawn, are from those things that you have stated, not from any abstract theory that man must develop further in proportion as he departs from the climbing type; it is not on any Darwinian theory that you go?—No, no, it is absolutely from observation of what happens to people who use their upper extremities to the exclusion, or not necessarily to the exclusion, but out of proportion, to the exercise which is thrown upon the lower extremities. But any excess of development of one part of the body to the exclusion of the rest is fraught with danger. Especially one sees it in cycling; nothing is more common. I have sometimes opportunities of examining recruits for one of our Volunteer regiments, and sometimes have the painful experience of rejecting men on account of some heart trouble, and all the rejections that I have had to deal with have

Mr J. Cantlie, M.B., F.R.C.S.
 28 May '02.

Games: lower extremities of children under fourteen must be exercised.

Upper and lower extremities: equal development necessary.

Mr J. Cantlie, M.B., F.R.C.S.
28 May '02.

been from cycling. You ask a man how far he has gone in a day. He says: 'Oh, I have gone 100 miles.' I consider a man who has done 100 miles in a day is never the same human being physically again; he is not such a good man after his 100 miles as he was before, and he never will be. It is a fact, I believe, although it may be a little foreign to the subject, that none of the cyclists in the French army at the last examination were physically fit to be admitted into the ranks, that their hearts had been so strained from their exercise in connection with the cycle work, that none of them were capable of admission into the ranks of the army. And in the German army I believe it is pretty nearly the same. Strain of that kind which is thrown upon the heart, without a proportionate development of the upper or lower extremities, is very dangerous, and seems to cause a number of heart troubles which incapacitate a man from doing his work in various ways. Any very special use of the upper extremities to the exclusion of the lower is still more likely to cause heart trouble in various ways. One particular form that one sees it, especially in rowing men from either Oxford or Cambridge, is hypertrophy of the heart, and also frequently albumen in the urine, when a man has gone in rather strongly for training. And the same in physical drill of children with heavy dumb-bells; in them the heart gets hypertrophied, and albumen in the urine is not at all uncommon; it is really almost, I would say quite, a common thing in children who are training for severe physical exhibitions, especially for the stage. My experience in connection with the physical exercise of children for the stage is not very much; I can only mention four cases that I know. Of course they happened to be brought because the children were not well. I cannot go beyond that, because I have not had an opportunity, though I have been trying to get it, to examine children, young children who are being trained for physical feats upon the stage and so on. My experience is that they get hypertrophy of the heart, and that they also pass albumen in the urine very largely from the use of lifting weights, and using heavy dumb-bells, clubs, &c., in connection with stage performances, and I also extend the same thing to children in schools when I see them using their upper extremities over much.

5728. These observations regarding athleticism, you think, should be kept in mind in regulating the principles of exercise for children?—I do.

5729. What is the reason why sixteen or seventeen is fixed by you as a minimum age for dumb-bells or gymnastics?—Well, it is partly on account of the sense of the boy as well as his strength, because at sixteen or seventeen especially boys grow. I think if they are going to grow at all, they grow at that age much more rapidly than at any other, and with a very quickly developing heart, or very quickly developing physique, to begin to throw a strain upon it at that age I think is dangerous; at the same time, after that age the youth has generally more sense, and if you tell them that they may hurt themselves if they do this thing, they are more apt to listen to you, but before that they have no conception of it, so that it is partly from physical observation and also partly theoretical, namely, that I think the child would be better able to follow your advice at that age than before.

5730. Next, regarding paragraph 7, what evil would you anticipate might occur if girls were allowed to employ their upper extremities in exercises requiring anything beyond the slightest physical strength?—Well, it is a long subject. Girls are peculiar as compared with boys in regard to the use of their upper extremities, or even women as regards men. If a man uses his upper extremities much, you find that the muscles of his arm grow; his forearm grows to a great size, and especially his biceps in his arm you find developed to an extraordinary size, but no woman that I have ever seen has been able to develop the muscles of her arm to anything like the same extent. You see a woman on, perhaps, the cross-bar: what strikes you is the absence of muscle in the upper extremities. She is incapable

of developing the arm to the same extent as a man; and a woman upon a trapeze in a public performance or in any gymnastic performance, one always has wondered how she does so much with such a minute amount of size of arm, and that her biceps muscle is only like a boy's, almost like an undeveloped boy's—even in one of the best-trained women for performances of the kind. It seems to me, partly theoretically from that very consideration and observation, that the development of the arm in women is not natural; it seems abnormal, physiologically considered, to develop it, and that it is not capable of being developed up to a very great extent. Of course, one may say, 'Well, of course, it is the 'lightness of the woman's frame that does not necessitate her biceps growing to such a size,' but, taking weight for weight, you will find that while the man's biceps develops to a great size, and the woman's to nothing at all almost, still she seemingly can do a great deal with what is apparently a small arm, which, I think, is not calculated for the good health of the whole physique—that she cannot do the same as a man with a less amount of muscle; it is impossible. Given the same weight she ought to have the same developed arm, but she does not develop her arm in the same way, and I do not think it is natural to ask women to go through physical exercises of that kind to try and develop a member which evidently nature never intended them to develop. Besides, there are some other reasons for women not using their upper extremities, that their strength does not lie in their upper extremities apparently, but in some other part of their body, so I think it is against nature altogether to do it, and also experience, I think, has taught one that a woman using her arms in certain conditions does something very detrimental to her welfare.

5731. And all of these facts refer also to paragraph 8, concerning gymnastics, trapeze and cross-bar to any boy under sixteen or to girls at any age?—Yes.

5732. The next one is swimming: for what reason should swimming not be permitted to boys or girls under sixteen?—I only know, of course, from experience of myself and other boys that there is nothing so exhausting as learning to swim, and I do not know anything in which one is inclined to overdo it more than in swimming. If you leave boys to themselves of a summer day, they will go in before breakfast, go home to their breakfast, go back and swim in the water all forenoon, now in the water and now out, and the same in the afternoon. Boys left to themselves spend the whole day on the river bank, partly with their clothes on and partly with them off, and I think it is very dangerous to allow children to go swimming by themselves partly on that account. There is not the least doubt that swimming is a very great tax upon the upper extremities; it is a greater tax upon the upper extremities than it is upon the lower. The temperature of the water has a great deal to do with the exhaustion. If the water is very cold, the child loses so much heat by swimming in the water for twenty minutes, an hour, two, or three or four hours, if you allow boys to do it. I do not know much about girls in swimming, but I know that is how boys behave themselves; and if it is cold water, the amount of heat that they lose is very detrimental. If it is cool water, or water about the temperature of 65°, the loss of heat is not so great, but still it is very great compared with the temperature of the body. Anyone who has seen children living by the side of a river—boys and girls who have had a holiday by the side of a river—cannot but be struck with the state of anæmia that they are reduced to. Very often you find it is very lamentable. I have known girls who have practised swimming to a great extent in the Thames; they have been rendered anæmic; they have lost several of their natural functions, and out of a family of five that I recently observed last summer, three of the children, from an abnormal amount of swimming, had albumen in their urine, and all of them were rendered anæmic. I cannot speak for the albumen in the urine in many cases, because I have not had the opportunity much of examining it, but as regards the anæmia that is prevalent in children who are doing much swimming

Mr J. Cantlie, M.B., F.R.C.S.
28 May '02.

Swimming strict supervision necessary

Apparatus for boys of sixteen or seventeen.

Girls: gymnastics undesirable.

in fresh water—I am not speaking about salt water—I think it is very dangerous to allow it to any great extent. Swimming every day for an hour for a child going on for three weeks will render that child anæmic and lower his physical strength. If it is a question of a child staying in under supervision for twenty minutes or a quarter of an hour once or twice a week, then I think the swimming will do good, but unless it is under strict supervision, I think the children are frequently very, very seriously affected by being allowed to swim without supervision.

5733. Then, from what you have said, we quite understand your conclusions in 10 and 11; we may therefore pass them over?—Yes.

5734. The twelfth paragraph refers to military drill. Do you consider that twenty minutes per day of five hours is about the proper proportion that should be maintained between physical and mental instruction?—Yes; of course I do not quite know to what military drill is intended to be limited.

5735. Take it as meaning physical training?—Instead of military drill?

5736. Yes?—The physical training, consisting of movements of the arms, like the Swedish movements; I understand that is the style.

5737. Yes; that and walking, and perhaps bar-bells, wooden dumb-bells, slight things of that kind, short of gymnastics?—Short of gymnastics, yes.

5738. In paragraph 13, at the end, what is your reason for thinking that children ought not to walk in step or keep line?—Well, it is not natural for a child to walk at all; a child either runs or skips, but children, as they get a little older, are condemned to walk at a particular step. Two people's step are very seldom the same; and the idea of a walk, walking two and two, the girls a sort of chained together, seems to me not to be a very pleasurable performance. It is certainly walking the children about, but they look upon it as being part of their school duty and not an exercise at all. By an exercise one rather means, perhaps, a pleasure; but certainly they take no pleasure in it, and they look upon it as being part of the discipline they have got to go through, this walking out two and two. And they have almost all got to keep step, and they have got to walk at the same pace. The children may not be the same age; the children in front may be older children, fifteen or sixteen, while the children coming behind may be of the age of seven, or eight, or ten, and these are sometimes compelled to keep the same step; at any rate they are compelled to keep the same pace, because they are walking through the street generally. The pace is set by the older ones, the ones in front, and it is not an exercise that is likely to do any good; there is no pleasure in it, and I do not think it is a good thing to see children walking through our streets two and two; they should be allowed to go as they please rather.

5739. Then in your concluding paragraph 14, your remarks regarding training and a weekly certificate, I suppose, refer entirely to those who are being trained for sports?—Absolutely.

5740. Do you advocate physical training in the Universities for every one?—Not in the Universities; I mean a man after seventeen or eighteen should not be compelled to take part in games except what he himself feels inclined to do. I would have them all compelled to undergo military training.

5741. *By Mr Alston.*—Professor Ogston might supplement his question by referring to rickets. I think Dr Cantlie has said that a good deal of rickets prevails within forty miles of London?—Yes, sir.

5742. The remark has been made in reference to Glasgow that rickets were very prevalent on account of the absence of lime in the water of Loch Katrine. I suppose that is not a defect of the water round London?—No, it is not the defect of the water in Hertfordshire, which is a chalky soil, and the water is very hard.

5743. How do they come about then?—Want of sufficient food or improper food.

5744. In Glasgow this ailment might produce a

considerable number of children unfit for physical training; the question is what remedy could be found for it?—I think the chief cause of rickets is want of proper food, not always the want of sufficient food. The children you find about Hertfordshire, of the farm labourer there, are brought up on tea and bread and butter; they cannot afford to get milk; they occasionally may get an egg in the summer time; they have got a hen or two perhaps among the whole family, and they sometimes have a kitchen garden, and they generally can get cabbages, and the chief food the children have consists of bread, no butter, and tea and cabbage, and now and again cheese. In some of the outlying districts they may have a herring, bloater, and so on occasionally, but no fresh fish, and fresh meat of course is totally beyond them. Bacon you find occasionally, but fresh meat is absolutely impossible for them.

5745. And in addition to improper food being the cause of rickets, would bad accommodation in stuffy, small dark houses also produce it?—Absence of fresh air would cause rickets in addition to want of food.

5746. Have you found any deterioration on account of modern conditions as to food, the old diet being given up in favour of inferior diet?—Do you mean Australian mutton instead of English mutton? Deterioration: reasons for opinion.

5747. No; I am rather thinking of tea instead of broth and porridge?—Oh, I have; yes. I do not think you can rear a healthy race upon tea and bacon in the country, but that is what they have been attempting to do for some time, and sometimes tea and no bacon, and it is impossible to raise a healthy race upon food of that kind.

5748. Have you noticed any deterioration in the present generation which I suppose is now the product of the tea-drinking and slops?—Well, it is difficult to know and to compare. In England they have been doing it for some time, but from what I have observed lately in Scotland they have taken very largely there to drink tea instead of milk; the farm servants indulge in tea, etc. more, instead of taking the porridge as they used to, and I think the children there are suffering very much more from bad teeth, and from adenoids at the back of the throat, and that they are much more inclined to anæmia than they used to be say forty years ago, when they used to have porridge and milk as much as they could get for their breakfast, and in the same way milk at all their meals, which I think was a very important staple food. In Scotland the quantity of milk had more to do with developing the children well than the oatmeal they ate. We find in many parts of England around large towns, they cannot even get the milk, it is so expensive; it is impossible for the children to get milk.

5749. Your first paragraph holds good, that country children in various parts of the kingdom are deteriorating, and that urban children in the larger towns of the poorer classes are deteriorating too?—Yes.

5750. Then without the food, without the air and the other good conditions, no amount of physical training in the schools would effect all that it might do?—In regard to the air there is not the least doubt that the physical training, if it is done out of doors, will do some good, but that much physical training within, say, a radius of three miles of Charing Cross, is likely to do anybody any good, I do not think so. We cannot get fresh air in the Strand; we have not had any fresh air in the Strand for, say, 100 years; you cannot get fresh air when you have got 1,000,000 people between you and the outskirts. The air coming from any direction has to sweep over that 1,000,000, and they not only take the goodness out of the air, but they add their own breath to it, and that of their horses and cattle, and the air out of the drains, and then it is sent over the central part of London. It is doubtful whether physical exercise would do people much good in such an atmosphere. The proposition may be stated thus: Would a man live longer in such an atmosphere as that of the underground railway if he were to sit still or take violent physical exercise? My impression is that in a bad air like that of the Physical training without fresh air of no value.

Mr J. Cantlie,
M.B.,
F.R.C.S.
28 May '02.

underground railway the more you take of it the worse you will get. Of course London is differently situated to all other cities. I do not think in the Scotch towns, except perhaps central Glasgow, the same rule would hold good.

5751. Apart from the air and the other good conditions the poor children have in the country Board Schools, if you found they were insufficiently fed would you make it a rule that good food should be procured for them in some way?—I should in some way, certainly.

5752. *By the Hon. Thomas Cochrane.*—I should rather like to ask you how you form the conclusion that children both in the country and the towns had deteriorated; what data have you fixed upon?—Well, some fifteen years ago I took a considerable amount of trouble over the question of the town children.

5753. In any of the towns?—In London, and inquired in various directions, and got the history of about, I think, 1500 or 1600 families.

5754. How did you make your inquiries?—From the families themselves.

5755. Personally?—Personally, oh, yes; I took a good many years to do it, and it was published in the work that Professor Ogston referred to—called *Degeneration amongst Londoners*, in which I failed to find what was called a third generation, and that I never found a third generation of pure Londoners; that is to say, a pure Londoner is a man whose opinion of a holiday is an occasional run on a bank holiday to a seaside place; if he does not have enough money he does not get away that year, and he is living within the radius of, say, three miles from either the Bank or Charing Cross. Within that area there are about two millions of people who had never got a holiday at all, beyond an occasional run upon a bank holiday, which likely did them more harm than good. Amongst those people there was no such thing as a third generation; that is to say, that the father and mother might both have been born in London, but it was impossible to find anybody whose grandfather and grandmother had been born in London; that the nearest one comes to it is to find, say, was a grandfather born in London and a father and mother born in London, but with a grandmother coming from the country; the specimen of human being born of such antecedents is not an ornament to the race. I described then—at some length—a number I met whose grandfather or grandmother came from the country, but whose people afterwards belonged to this area, that I defined, in London; that these creatures, when they married, had no health or physique and they never had a child, that there was no such thing as a fourth generation. Of course this has been cavilled at in many articles; it has been sketched in the comic papers and so on, and a great many replies have been made to it just lately within the last six weeks—on account of the article which appeared. I wrote to each one of those men who said that his grandfather and grandmother had all lived in London, and I found that these people and their fathers before them had been able to afford three weeks' holiday at the seaside in the year, or get away at other times when they were not well; they were not Londoners. There is a number of poor people, however, who never get out of London except for an occasional holiday; these people cannot go beyond the third generation. In regard to the country, of course, it is different; they are always coming and going there, and I have no data of that kind to go on in connection with the country—only just simply personal observations in regard to the condition of the children that one sees about country villages.

5756. Then from your general experience gained in pursuit of a different object, you came to the conclusion that the children were deteriorating in the towns?—That class of children; the middle class children are going up, I think, in every way—the girl and the boy.

5757. Did you make any similar researches in the country, or only formed a general conclusion?—Only what I saw in the country, and not in regard to the parentage.

5758. In one county you examined you found the children were suffering from rickets?—Yes.

5759. But you infer from that that the children generally were deteriorating in the country?—Well, one pretty large district in Hertfordshire which I know; another was a district in Kent, and another was a more limited experience in Buckinghamshire, but they were all near London; I cannot go beyond London or the South of England.

5760. You have not made any special inquiry into the condition of the children of the poorer classes throughout the United Kingdom?—No, not personal enquiries; the area is too large.

5761. This is merely your opinion gathered from special local inquiries in particular districts in the neighbourhood of London?—In the neighbourhood of London.

5761A. The Commission are not to take it as your mature opinion regarding the United Kingdom that the children are deteriorating?—No, I cannot affirm what I have not seen for myself.

5762. You place it down as if it were a fact?—Yes.

5763. I should like to ask you one or two points as to the exercises and games. I gathered from the general remark that you made that it depended on the moderation with which these exercises were used?—Yes.

5764. The instances you brought before the Commission of Inquiry were from the excessive use?—Yes.

5765. But that on the whole you think a certain amount of physical exercise is an advantage to every child?—Yes.

5766. And you do not really differentiate between exercises of the upper or the lower extremities so long as they are carried out under due supervision, and with moderation?—No.

5767. You instanced cases of over-rowing and over-bicycling which would apply equally to the upper and lower extremities?—Yes.

5768. On the whole you think moderate physical exercises are of advantage to the child?—Yes.

5769. The same would apply to paragraph 6, in which you say that till the age of sixteen or seventeen dumb-bells should not be allowed; but suppose the dumb-bells be of a moderate weight—a few ounces—you would have no objection to them?—No; not with these light wooden things.

5770. You object to a man being a Sandow at sixteen?—A Sandow at sixteen.

5771. You would not object to his going into physical exercises on right instructions?—No.

5772. You thought that girls should never be allowed to employ their upper extremities in exercises requiring anything but the slightest physical strength, and you gave us a most interesting account of the physical development of the arms in the two sexes, but I did not gather what evils from your large experience had resulted from women using their arms—their upper extremities?—Well, mostly women's diseases, I think, come from such strains, that they get their womb misplaced; that is one very common evil, and that the strain in a woman is from her pelvis more, and her focal points of strength is from there, and that the strength that she is asked to exert starts from there more than in man, and consequently there is more strain upon these parts, and they are the cause of sterility in the female and various troubles one finds in connection with female organs.

5773. That again would apply to women who over-exerted themselves?—Yes, of course, to produce over-exertion in a woman does not imply much physical expenditure.

5774. Women who went in for gymnastics?—Yes.

5775. But not in the physical development of a girl who went through the ordinary course of properly supervised physical training?—No.

5776. You would anticipate no disadvantage to a growing girl from any well-regulated course of physical training?—Provided that her upper extremities are not over-taxed.

Mr J. Cantlie,
M.B.,
F.R.C.S.
28 May '02.

Physic
exercis
under
superv.
benefic

Girls.

5777. Are not over-taxed; if it is done under proper instruction and proper supervision?—Yes.

5778. And the same would apply probably to swimming?—Yes.

5779. For boys, you have instanced the case of a boy being in the water for long periods, half an hour to three or four hours?—Yes, but boys do; it is one of the dangers of teaching them swimming that they go and do that.

5780. They do if they are not under proper supervision; still a short exercise of ten minutes in the water is very beneficial to most boys?—Very beneficial to most boys, teaching them a useful thing to do; the danger is only when without supervision.

5781. *By Sir Thomas Coats.*—I think you said in reply to Professor Ogston that you would not advocate compulsory training of youths above seventeen or eighteen; was that correct?—Yes; compulsory games; military training, yes.

5782. Is your reason for that that you do not think it necessary, or do you think that it would be detrimental to the health or the development of the boy?—I do not think it is becoming necessary for men to indulge in boyish games.

5783. You think that they would do it themselves?—A boy of that age ought to know himself; he ought not to be allowed to go and do what he likes after that age, but that he should be driven to play games after eighteen I do not think is necessary.

5784. But in the army recruits have got drill after that, and there is wonderful development in strength?—Well, I was referring more to games; I was not referring to such a thing as military training. In regard to games, a boy should not be compelled to turn out for football or to go to the cricket field after eighteen. I think it right below seventeen that he should turn out in the football field and the cricket field under the direction of his teachers, but after that age he ought not to be compelled to play games. It is a different thing with physical training, such as military exercise. I think he ought to be compelled to take it.

5785. *By Mr Fergusson.*—In the second paragraph you say country children require no additional exercise except military drill; why?—Well, if they get a good walk to school in the country, I think that is quite enough without anything more.

5786. Do you consider that a walk to school is as good as, say, the Swedish exercises, in which every part of the body, and especially the weak parts, are attended to?—I think the child who has got two miles to walk to school and two miles back has done enough for the day; I do not think Swedish exercises or anything else should be imposed upon it after that.

5787. May not special exercises counteract an inclination to be pigeon-breasted or flat-footed?—Yes, if the child is pigeon-breasted it would likely do good, but I should think if it is walking a considerable distance every day in the open air and it is getting a fair amount of food, its condition would be just as well improved. But there is no reason why they should not have Swedish exercises.

5788. You do not attach much importance—I am not speaking of exercises designed to make a child an athlete?—No.

5789. But simply mild exercises such as in the Swedish system?—Yes.

5790. All the lower and upper extremities, tip-toe and stepping, and teaching a child to walk and carry himself properly, and so on?—Oh, I think they are very desirable so long as you do not over-tax a child. A child living in the village and going to school next door would require a different amount of exercise to a child that has to walk a good distance to school; that was my idea of it.

5791. It is more easy to overdo it, I suppose?—A child has only got so much physical force to expend, and perhaps it expends as much as it can afford in walking to school two miles there and two miles back, four miles altogether.

5792. Does not the mental exercise fatiguo a child;

if you lessen the mental work and increase the physical work, you do not arrive at any very serious result do you?—No, I suppose not; but I think if it has got its fair amount of mental work, and then has got some training as well, and then a considerable distance to walk to school, and a considerable distance to walk back, I think you take too much out of it.

5793. You are dealing with training that was designed to make athletes, and not simply attention to rules of health, making a child physically fit without developing his muscles in any particular way?—Yes.

5794. Is that not so?—Perhaps I was; yes.

5795. One other thing, you said in Scotland the modern diet led to anæmia in children. We were told by a medical witness that that was so. But he said that though that was so in the children, his experience was that they grew out of it, that it did not do the grown-up men and women any harm. The man was as good a man still. What do you say to that?—I do not agree with it.

5796. *By the Chairman.*—I just want to ask you, Boys at public have you any experience of the upper class preparation schools and public schools?—A little.

5797. You know there that almost everything that you have condemned is extensively practised, and has been so for many years past?—At upper schools?

5798. At what I call upper schools—preparatory and public?—Yes.

5799. Do you know that everything that you have condemned has been practised there for years and years?—I have been condemning only over-exertion and exercises without supervision.

5800. And what deterioration has occurred owing to that?—I do not think boys have advanced as they ought amongst the upper-middle classes.

5801. I am not talking about the middle classes. I am talking about the upper classes?—You mean the boys at public schools?

5802. And preliminary preparation schools?—Like boys at Eton?

5803. I am going far back—younger children than that, children from the age of ten, or even nine?—Boys I am mentioning—boys and girls.

5804. No, I was not mentioning girls?—Well, I do not think the boys are advancing. I think the girls are. I think the amount of exercise that has been given to girls lately has improved them, but I do not think the boys are improving in the sense they ought to be—they are not improving in proportion to the girls.

Girls improving in physique: boys not proportionately.

5805. I ask you what deterioration have you noticed having occurred from almost everything you have condemned having been practised say for the last twenty years with those upper class of schools?—That those who overdo it break down, and a great many of them break down between seventeen and nineteen, just when they are entering say at Oxford, when they take especially to rowing. They are these men or lads who, having been overdoing it, break down very frequently, and that at schools they are not likely to be allowed to overdo it—there they are superintended more.

5806. I am going beyond that. I am saying that they actually do from my knowledge exactly what you are saying, as they are doing and have been doing for twenty years, that they are not superintended, they are not looked after, they do the very thing which you condemn, and I want to know what deterioration you see from that in the upper classes?—The deterioration you can only take as proportionate.

5807. I am rather contending that there is no deterioration, and I should like to know from you whether you think there is, that is all?—My only idea of it is by comparison.

5808. Yes?—Namely, that girls are improving in physique and boys are not; that boys in the upper classes are not improving in physique to the same extent as the girls are.

5809. I do not know whether you know it, but will you take it from me that as a general rule most of the officers who enter the army, their standard is higher than it used to be?—Yes, boys are improving, but

Mr J. Cantlie,
M.B.,
F.R.C.S.
28 May '02.

Mr J. Cantlie,
M.B.,
F.R.C.S.
28 May '02.

they are not improving to the same extent as the girls, because, in the first place, I think the boys are improperly clad, and that they very frequently overdo it in some ways. But especially I think it dates further back. It dates from a younger age than that. The clothing of our boys has changed lately. The clothing of our children has changed within the last fifteen or twenty years. It is not at the period of college or school that the trouble is; it is before that. The boys used to be kept in frocks up to the age of six and seven and eight. Now at the age of two-and-a-half or three they are put into the lightest clothes possible—generally a little light cotton jacket, a sailor jacket, with little cotton drawers, or something of that kind, or knickerbockers open at the bottom.

5810. Brittany trousers?—And that was not the custom some time ago. Girls are clothed much more sensibly than boys at the present day, and the exercise which the girls have been allowed to get during the last fifteen years, *plus* their wise clothing, has developed them much more than the boy. I do not think they are overdoing in many schools. You say that they are not superintended. I do not know enough about different schools to say they are; I thought they were, but I do not know enough. In regard to their clothing, there is not the least doubt, I think, that the clothing of our boys has changed within the last twenty years. They are made little men of long before they used to be, and their mothers like to see them dressed in these clothes. If one weighs them, one finds a boy's clothing, say of three, and a girl's clothing of three, that the girl's clothing weighs 1½ lbs. more than the boy's clothing of three. The boy is insufficiently clad. He is starved, and it is at that date that the trouble begins, not later. The teeth trouble is a great trouble. It is too big a subject to go into the question of hand-fed children and mother-fed children; that is too big a question; I think

Boys and
girls:
clothing.

the reason, that our men are not developed, our young lads are not developed in the same proportion as our girls are, is very largely due to the fact of insufficient clothing in boys. I suppose it was national prejudice; but I advocated very largely that a boy should be continued in the same sort of dress as a girl was up to a certain age, and that if he could not be content to be kept in frocks, that he ought to be put into a kilt, and kept in a kilt till he was seven or eight, which was practically an identical dress with girls. That would keep his loins warm, and other vital places that ought to be kept warm. I think the trouble dates before school life, the trouble with men; but there is not the least doubt that about the age of sixteen or seventeen, a boy, if he is under good conditions then, can recover even from physical deformities or physical detractions that they are afflicted with at an earlier age. They do seem to recover if they are well looked after about the age of fifteen, sixteen or seventeen, and they are able to throw off some of the ailments of childhood or inferior development of childhood which look as though they were bound to go on. When one takes a boy of ten or twelve, he looks very often a physical wreck, and very often at the age of twenty he has recovered. I have not the least doubt the care and nourishment and physical training has had a good deal to do with it; but to start a child with carious teeth, or starve a child by improper food or insufficient clothing, and think he is going to grow into as good a man at twenty as another boy who has not been through that severe ordeal, is, I do not think, quite to be supported, although they do recover in a most marvellous way.

5811. *By Mr Shaw Stewart.*—On the point that girls have improved in so much greater proportion than boys, is it not the fact that girls have within recent years had more physical training and exercise than they used to have?—Yes, and I think that is the reason that they have improved.

The witness withdrew.

Mr
Wm. Hunter.

Mr WILLIAM HUNTER, examined.

5812. *By the Chairman.*—You are a builder, residing at Marionslea, Rothesay?—Yes, my lord.

5813. You have been a member of the Rothesay School Board for seventeen years, and Chairman for five years?—Yes.

5814. Perhaps you would kindly read your notes?—The population of Rothesay is 9323. There are two schools under the management of the Rothesay School Board—the Academy and the Public School. There is also a Roman Catholic school, and one or two small private schools. The number of pupils on the roll of the Academy is 343, and of the Public School 963, and the total number of pupils on the rolls of all the schools is 1518.

A fully-equipped gymnasium has been provided in the Academy. There is a large hall in the Public School in which the pupils get physical exercise. The gymnasium in the Academy is made use of for ground physical exercises. In the Academy each class—boys and girls—from infants to the second highest class, has a course of drill and physical exercises under their respective teachers. From Class V. the boys and girls are exercised separately. In the Public School military drill is given to the boys, from Class III. upwards, by the drill instructor of the Rifle Volunteers. The girls in the same classes get physical exercises under their respective teachers. The infants and Classes I. and II. have physical exercises.

Gymnastic classes are held in the Academy for pupils from Junior Class III. upwards on Friday evenings and Saturdays. These classes are quite separate from the ordinary school classes, and a fee is paid by the pupils who attend. There are about 60 pupils attending these classes at present.

Some years ago a class was held in the Evening School for a special American drill. The class was

very successful and beneficial, but could not be continued owing to the teacher's return to America.

The beneficial result of the physical training in the schools seems to be largely minimised owing to the want of continuity. The training should be continued by the formation of cadet corps, by attendance at special classes for physical training in connection with evening continuation classes, but free from the present Code restrictions.

5815. *By Sir Henry Craik.*—In what hands is the physical training in these schools—that is, of the ordinary teachers or special experts?—The ordinary teachers.

5816. You have no special experts?—No.

5817. Where have the teachers obtained the instruction necessary?—Well, it is difficult to say—such instruction as they have. A large proportion of them reaped considerable benefit out of this winter class that is referred to.

5818. Where is that referred to?—It is referred to in the second paragraph.

5819. That was a class for teachers, was it?—Yes; it was a class for rough boys and girls in the town; that was the origin of it, taught by a former pupil who might be called an expert, and the teachers, thinking it was a possible advantage to them, asked a few nights and got them very readily.

5820. Can you tell us what were the special features of this instruction?—I do not think I could verbally describe it—it was an exact copy of what was drawn up by a professor that was employed regularly by the Young Men's Christian Association in Harrisburgh, Pa., U.S.A. They had a first-class gymnasium there, and employed a professor, and he had developed this system from his life's experience—probably it would be British and American, a mixture.

Physical train-
ing described.

Mr J. Cantlie,
M.B.,
F.R.C.S.
28 May '02.

Mr
Wm. Hunter.

Mr
Wm. Hunter.

5821. But you cannot pronounce as to any of the many systems that are at present in use in England and Scotland as to their merits?—No, I cannot.

5822. You cannot even say which of them is followed in your own schools?—I do not think there is any particular system followed; that is my impression.

5823. And the teachers have really, so far as you know, no means of learning in your system?—They have no special means of learning a system; but still a number of them have got up what they do teach very well, but how they got it up I do not know.

5824. You do not know how they have got it up?—No, I do not.

5825. Have you never as a School Board thought of employing an expert instructor on this subject?—No.

5826. You have no janitors who are retired non-commissioned officers?—No. We have sufficient of these men, but none with sufficient capability to interest grown-up lads and maintain it.

5827. But the janitor?—The janitor in the Academy is a military man.

5828. Does he do any drill?—Not now.

5829. But you have never thought of establishing, with the aid of the grant of the Department, classes for your teachers where they could obtain such instruction in the most approved system?—No, because we never could see where the grant came in appreciably.

5830. Are you not aware that the Department offers grants for classes for teachers under the Code?—Yes, for teachers.

5831. Why would you not have the classes for the teachers under the Code and receive grants for them in this subject?—Because it would, as we are situated, involve a considerable amount of expense.

5832. But you are aware the Department would pay three-fourths of that expense?—If you say it I am aware of it, but I would not have been inclined to think it before.

5833. Are the Circulars from the Department brought before the School Board by your clerk?—Yes; they are regularly, and we give them the best consideration we can.

5834. Are you not aware that a lengthy Circular was very carefully addressed to the School Board explaining this some time ago, and inviting you to propose classes for teachers?—No, I do not think that we understood that for this particular subject the Department would be prepared to pay three-fourths of the expense. On the strength of that Circular, the Board has carried on a Special Class for Teachers in Free-arm Drawing, Brush Work and Clay Modelling.

5835. Of course it is regrettable, is it not, that the School Board did not inquire, because many other School Boards have used this, and are obtaining grants to a large extent for it?—Of course our difficulty is that it means an enormous amount of money to send teachers to a centre where it is obtainable.

5836. But you do not want to send them to a centre?—Well, but we would require an expert.

5837. Certainly?—And that all means expense.

5838. But, as I say, the Department would pay three-fourths of the expense. We need not pursue that, but you feel that your teachers are in want of some extra training in this subject before their teaching can be very thorough?—No; I think they are quite equal to all that we are attempting at present; but I think that if more were desired, they would be much the better if the interest was to be maintained to get a more thorough grasp of it. That is what I mean.

5839. But the School Board have not turned their attention to the various systems and attempted to judge which of those is best, or how far their teachers are trained to give instructions in any special system; you have not turned your attention to that as yet?—No, because we are under the impression that even if the teachers had the qualification, they have not time. We have not been able hitherto, even with the help of the teachers, to devise a plan whereby we could devote more time than we are giving them at present, even if we had more fully qualified teachers.

5840. But the education of these children being entrusted to your care, you would not exclude physical training more than mental, would you?—I think we are not doing that.

5841. You think that time must be found for the physical as well as the mental?—Not necessarily.

5842. You think that the mental comes first and the physical must take second place?—Yes. We have the impression that the Code requires so, of what I understand you to mean by mental work, that it demands nearly all the time we are able to give it; that is what I meant.

5843. Perhaps you are not sufficiently acquainted to point to the Article in the Code that lays that burden upon you?—No; but we have a more useful and more practical thing in some of the inspectors three or four times in the year that insist upon these requirements, and they are really the interpreters of the Code.

5844. And do you find that they do not ask for any physical training?—They have not asked for any more than we are giving, and they seem to be well satisfied both with its amount and quality, and they have never indicated that we were able to give them more.

5845. You found much interest in the parents in this part of the education?—No, not much, I think.

5846. Have any of them objected to it?—No; we have an annual exhibition on the part of public school children.

5847. Do they take much interest in that?—Yes; the largest place we have in the island is packed, and it is mainly through the interest in this demonstration—the physical demonstration—and it is really well done. I do not think that any amount of training could make it better. Of course a special effort, you quite understand, is made, and special time devoted, perhaps, for a month just before the demonstration comes on.

5848. Your Academy is a higher class school?—A higher class school.

5849. A fee-paying school?—Yes.

5850. And attended by the better class of children?—Well, it is mixed.

5851. But better than the others?—Yes. Yes, a good deal better than the others.

5852. And has it a playground?—Yes.

5853. Better than the public school?—No.

5854. Not better?—No; not nearly as good; bigger, but it is badly situated for the purpose of playing. It is a picturesque thing; it lays on a beautiful slope. It is nice to look at, but for playing it is middling only.

5855. That is the playground in the better class school?—Yes; just built on the side of a hill.

5856. Are the games carried on both in the Academy and in the ordinary Code-aided school?—In the playground.

5857. Are these games carried on in both equally?—No.

5858. In which?—The Academy rents a field for Playing field, cricket and football, etc.

5859. How is the expense of that field met?—Well, we just meet it among us.

5860. You do not meet it out of the school funds?—No, we have not paid a fraction to it.

5861. When you say 'we meet it,' does that mean members of the School Board or the parents?—And friends; yes, I mean that, all three.

5862. But there is no such opportunity for those attending the public school?—Well, there is just this, they are not so exclusive, and there is a large park in the immediate neighbourhood, and they have not the same need. There is a large public park fit for any ordinary purpose of that kind, and quite conveniently situated, and their playground is really good for the purpose of ordinary play.

5863. So that you think that for games both the schools are equally well situated?—Yes, I think so.

5864. You are in favour of having physical training in connection with the evening continuation classes. What are the restrictions in the Code which raise a difficulty as to that?—The class that would receive the greatest

amount of benefit is what you might call the lower class of the lads and girls—the least educated; they drift off at the earliest possible chance that they can get. Well, the requirements laid down for them in the first course seem to be quite full enough without physical training. In addition to that, it is not one of the optional subjects in that course.

5865. Have you never attempted it under the fourth section or auxiliary classes in the Continuation Code?—No, because we have not a man to do it—not to do it well enough.

5866. Quite so; but that is more from the want of a teacher than from the restrictions of the Code?—We think this first course mentioned renders it absolutely impossible. It would require to be modified somewhat, because there is sufficient in this single course to take up all the time that these lads would be willing to give to anything in the shape of physical training.

5867. I understand it was the difficulty of finding a teacher that prevented you taking up the auxiliary class under the fourth part of the Code?—Yes; it was too small an affair to make it worth our while to go into it.

5868. You do not think that the grants for those auxiliary classes are enough for the need?—Oh, they would be no use for all we could get; we would only get a mere handful unless we could by some means bring in this large section.

5869. But you take classes under the first part of the Code?—Yes, I think these are the parties that it is most desirable to get in. We have the impression that that is so.

5870. *By Mr Shaw Stewart.*—Have you any evidence to give us as to the beneficial results of physical training of lads who come into the building trade?—Oh, yes, I have in a general way, but I could not specialise, I think.

Physical
training and
games
compared:
more of former
desired.

5871. Could you tell me, when you find a lad who has done well in physical training, whether he makes a better tradesman than one who has not been so well physically trained; perhaps you have not had sufficient chance of comparing the two?—Oh, yes, I have had, and I am afraid I am a little prejudiced.

5872. In which way?—Not in favour of the lad who is fond of a lot of that kind of training.

5873. Oh, but that is rather important?—Yes, but it is unfortunate that it works out like that in practice.

5874. Would you kindly amplify that answer a little?—Our most strikingly athletic young men, footballers for instance, and runners, do not turn out any more useful tradesmen, scarcely quite so useful, in practice as the more ordinary lads. I am just stating what is a fact, and what I am quite conversant with.

5875. Let me emphasise physical training as apart from games?—Yes.

5876. Is it your experience that physical exercises help dexterity of hand and discipline to a certain extent which come in useful in after-life?—I am quite sure it will do to a large extent; but I could not say that my experience would lead me to pronounce in favour of the lads of to-day as compared with those of twenty years ago, who got next to nothing of it; but it is not because of the physical training of to-day; no, I want to differentiate.

5877. It is owing to other circumstances?—Yes.

5878. Changes of modern life?—It is so, I believe, and that in spite of their physical training they are less useful lads than they were twenty years ago, by a good deal.

5879. But you would not, by any means, wish to diminish physical training?—No; quite the reverse.

5880. You are alluding more to exaggerated love of games as against work?—That is what I am alluding to, and I do not want it understood that I am insinuating that it is because of that; but if we were going to do anything more in the shape of physical training, I think we would require more money, and more time because we could do nothing better than we are doing without a specialist, and no matter what amount of training our teachers get, they could not be brought up to the mark, I think. I am speaking advisedly.

5881. *By Sir Henry Craik.*—But you did find that this special American drill was very useful, and you were obliged to give it up because he left?—Well, he was an old scholar, that is actually living in America, and he was home for a winter; but it answered the purpose first-rate to maintain the interest if we could get anything like it. I think we could hold the lads. There was dumb-bell exercise mixed up with it.

5882. *By Mr Shaw Stewart.*—One more question; as a member of the School Board are you in favour of compulsory attendance at continuation classes?—Yes, I am far more in favour of that than of compulsory attendance at day schools up to fourteen. I confess that frankly I would readily compel to the fullest extent possible lads to attend continuation schools until they reached a certain standard of excellence, no matter what their age was.

5883. You attach great importance to that?—So long as it did not deprive themselves or their families of their aid of living; but I am sorry I am not strong on the idea of keeping them to the very last moment at the day school; I would rather see them away earlier; I would rather compel them to come back three years than keep them one year extra clear of earning. That is my own feeling.

5884. *By Mr Fergusson.*—I rather gather you do not care much for the enthusiastic football player?—Well, perhaps I know too much about it. If you have five apprentices, or six, all enthusiastic footballers, and you are at your wits' end to know what to do with them, you can readily understand that you are not very unprejudiced.

5885. I quite agree with you, but are you not confusing physical training and games? What I think you were being asked about was exercises which were to promote the health of the mind and the body of growing children, not games such as football which takes apprentices away, exercises which are designed to develop and make the boys and girls physically fit for their work in life, whatever that may be?—I think as I understood it I answered that question fairly, and I think the way the question was put to me led me a little further, and I may have exceeded. I thought it led me on to lads, because the question was really, did I find lads who were fond of that kind of thing not turn out better than the other lads, and I thought it led on to that.

5886. Do you find lads who had physical training—who have had these exercises and been made healthy and strong, do you find them more useful as workmen than lads who go slouching about and have had no discipline knocked into them at all?—I do not say that I have an opportunity of forming an opinion on that score—I doubt it.

5887. How long a time do you give in your schools to physical training?—Oh, from about one hour in the week in some cases, but in some cases not more than half an hour.

5888. Are the members of your School Board as a body well affected towards physical training?—Oh, yes.

5889. They do not object to the drill?—To what kind of drill?

5890. What is called military drill?—No; but they think that the other is a greater attraction, and is actually more useful.

5891. But they are afraid to devote any more time to it in case they do not get such good results from the book work?—Yes; there is something in that, and the inspectors state that they are more than satisfied with the results of the military drill that they are getting. They examine them very carefully.

5892. They do not encourage you to do any more?—No; not so far as we understand it.

5893. You have special displays which are very popular?—Well, we have one every year—at least one.

5894. Of course you see there again they are not designed to promote the health of the pupil. This is rather a subject got up for show?—It is just a development of what they are doing all the year round, just a little more of it packed in.

Time

5895. You put on a little special pressure for a month?—Just beforehand, and that goes over the whole school.

5896. *By Professor Ogston.*—I want very seriously, Mr Hunter, to have your opinion upon this aspect of the question. Do you think it is possible, where excessive football mania and rowdyism and hooliganism in young men are an expression of a natural desire for physical exercise coming on at a certain age, it might have been prevented had those lads been judiciously trained to employ their physical activity during all the years of their school?—I think that it might have some effect in that way; I think so, if it were sufficiently good and enough of it.

5897. *By Sir Thomas Coats.*—Have you a technical school in Rothesay?—No.

5898. You have no technical teaching?—Well, no, in the ordinary sense of the term, but in the evening continuation school we have a large and most successful

class for Building Construction, and we have an advanced department.

5899. My reason for asking this is, I wanted to put another question. You employ several apprentices, do you not?—Yes.

5900. Do you make it a condition when you take these apprentices on that they go to continuation schools?—Yes; at least I stipulate one class. Of course I follow a particular branch, and I stipulate that they attend every class held where Building Construction is taught. I make that a part of their indenture of engagement, and they are as much bound to attend those classes as they are to perform any ordinary duty connected with their trade. Of course it does not entail any expense on them, because the Board, while they charge a small fee to begin with, return it at the end of the session if the pupil attends fairly well; and we do not insist on great things, but if they attend fairly well and manifest interest in the class, it costs them nothing.

The witness withdrew.

Mr J. BANNATYNE, examined.

5901. *By the Chairman.*—You are Chairman of the Kilbride Parish School Board?—Yes, my lord.

5902. Perhaps you will kindly read over your notes to the Commission?—I beg to state that the only existing opportunities for physical training as at present carried out in the schools under the Board of Kilbride are, the teaching of musical drill, and physical drill of an elementary character, meeting the requirements of the present Code.

The schools of Corrie and Lamash are taught by the teachers, while the schools of Whiting Bay and Brodick receive instruction from Mr Robert Allan, who holds a school music teacher's certificate, and is appointed an examiner.

So far as the Board are aware, there are no schools or colleges that hold examinations for certificates for teaching drill. The late Mr Bathgate, H.M. Inspector of Schools, expressed himself as highly pleased with the result of the instruction given by Mr Allan, and the other schools under the Board made a very good appearance.

At Lamash, during the session of 1900–1901, a few local gentlemen formed a Boys' Brigade; they were instructed in drill by a local party who had been in the army for a short time. The following winter the Brigade was taught by a coastguardsman who was stationed at Lamash, and the Chairman of the Board was personally interested in the Brigade, and is of opinion that an arrangement of a similar nature, where the services of an efficiently trained coastguardsman could be made available, would be most beneficial. If such instruction was available, continuation classes for physical and military drill might be maintained under the supervision of a committee appointed by the School Board, and if an annual inspection could be made, and a grant given according to results, it would contribute to the success of such a scheme. But the isolated position of some parishes would demand a higher grant than that given to towns or large centres. The Board would also suggest that an allowance might be made to provide apparatus, etc.

5903. How many schools have you under your School Board?—Four.

5904. Are they a long way apart?—About eighteen miles from the one in the south to the farthest in the north.

5905. Well, that is a considerable distance?—A considerable distance.

5906. Does the School Board make a practice of visiting these different schools in rotation?—Yes.

5907. Just to see what is going on?—There are five members of the School Board, and in each district the member takes an interest in the school next himself and visits the school regularly and signs the log book occasionally.

5908. Then you have not anything in the way of continuation schools, I suppose?—Not in the way that we in Arran are situated. As soon as the young men are quit of the schools, they are off to town to business.

5909. The young men as soon as they are quit of the school?—They go to the city to learn trades, or as clerks or something of that sort; there is no employment for them in our district.

5910. And they do not remain there doing nothing?—They do not remain there doing nothing; they are off to business of some kind or another.

5911. *By the Hon. Thomas Cochrane.*—What is your profession in Arran?—Hotel-keeper and farmer in Lamash. I am situated about the centre, very near the centre of the school district.

5912. *By Sir Henry Craik.*—You spoke of the instruction as being given by Mr Robert Allan, who holds a school music teacher's certificate and is appointed examiner; how does that qualify him for giving instruction in this subject?—In musical drill, sir.

5913. I say what do you mean by his being appointed examiner?—He has got a certificate, I understand, from some musical association to be able to teach the musical drill in schools.

5914. Of course in your neighbourhood the boys get plenty of fresh air, and I suppose a good deal of healthy exercise out of doors?—Oh, they do, outside, and a great number of them are employed on very little farms; during the season, harvest time and spring time, they get lots of physical training.

5915. Do they learn to swim?—Very few of them. Swimming.

5916. Why is that, with the large opportunities that you have?—Our former teacher at Lamash took a great interest in teaching the boys to swim, but somehow or other he never could get a very large class. The visitor boys that come from the cities are all good swimmers, but the boys about our own doors are not good swimmers; they seldom take to the water even in the hottest of weather; I cannot explain how it is.

5917. Does not that look as if they were not trained to the use of their muscles?—When the boys get a holiday with us we find they are more inclined to roam about just on shore, and go in for a little football or cricket or something of that sort, more than swimming or aquatic sports. But they have very fine pure air; they have plenty of that in our country.

5918. But you really have not found any defect from the want of systematic and thorough drill or physical exercises being given?—No, sir, no, I cannot say that there is anything of that. Taking the whole population, they are particularly healthy and strong; the children are all very healthy and strong.

5918A. And, of course, they are a well-to-do population?—Fairly well.

Mr
Wm Hunter.
28 May '02.

Mr
J. Bannatyne.

Mr J. Bannatyne. 5919. You have a very small poor roll?—Very small, sir, very small indeed.

28 May '02. 5920. There are no tenants allowed to stay there who are not pretty well-to-do, are there?—The tenants are all fairly well off, sir.

5921. Do you find that in after life, when they go to the towns, they are healthy?—Oh, generally, sir; yes, they keep their health; the most of Arran lads that have gone go either to Glasgow or other towns or then go abroad; they seem to keep their health very well indeed, sir.

Boys' Brigade. 5922. *By Mr Alston.*—With what church was the company of the Boys' Brigade connected, can you remember?—Just with the village; the whole district.

5923. Was it a combination of churches?—A combination of churches.

5924. They all take their share?—They all take advantage of it.

5925. Is yours the church that is referred to as being specially interested?—Yes.

5926. And you found that it did good?—It did a lot of good; the boys were very much interested in their drill.

5927. Did you manage to get officers for the company?—Well, they were in a sort of a way; they were very junior, of course, but there were officers just amongst the boys.

5928. Amongst the boys?—We had no officers—seniors at all.

5929. Was there any difference made between the officers and the rank and file?—One or two of the larger boys were really taken and selected out.

5930. What knowledge of drill had they?—They had none whatever.

5931. You depended upon the coastguardman?—The coastguard officer.

5932. Would it be possible in Lamlash to get suitable men to be officers; some of the deacons of the church, for instance?—Well, I do not think it would be possible, sir. The population of Lamlash is not a large population, and I do not think we could.

5933. Perhaps from what you say of the company as it stands you think it is a move in the right direction?—I do, sir.

5934. And it was a real benefit to the boys?—Quite a benefit to them.

5935. Do you conform to the Brigade age—twelve to seventeen?—Well, they would be from about eleven up to fourteen, I think, the Boys' Brigade.

5936. Do you happen to remember whether you are enrolled on the strength of the Brigade, or was it a free-lance company?—Oh, a free-lance company.

5937. We do not know of your existence at headquarters?—Oh, no.

5938. *By the Chairman.*—Does the company still exist?—Well, they have not been in training for nearly a year.

5939. *By Mr Alston.*—You are not a Boys' Brigade company in that sense?—No.

5940. It would very much strengthen your hands if you were. Apparently you cannot get the young men to act as officers?—That is the difficulty.

5941. If you could, I believe it would be of great value to you?—Yes.

5942. Then it was really the military training of a few boys—that is practically what the company had?—That is just what they do, sir.

Military drill: parents interested. 5943. Is there any objection to military drill in the island of Arran?—Not so far as I am aware of; not in our district, which includes a good broad area.

5944. Not even in the remnant of the Free Church?—I do not think so; not so far as I am aware.

5945. And the parents of these boys, I suppose, had no objection to their being drilled?—Oh, none whatever; they seem to be quite pleased, and the parents often visit the hall; we have a fairish hall in Lamlash, and the parents often came to see the boys put through their drill; they seem to take quite an interest in it.

Swimming. 5946. You were asked by Sir Henry Craik about swimming; would it be possible in Lamlash, seeing

you have these coastguardsmen on the spot, to get up swimming lessons; moor a raft in six feet of water off the pier?—Oh, I think it would be quite possible, sir; that might be taken in as one of the lessons they would receive.

5947. Part of the necessary training of a boy?—It is just requiring, perhaps, a little attention; I know that our late teacher, Mr M'Phail, took a great interest, and a number of the boys did join them, and he gave them lessons, and they got proficient swimmers, but some way or other we cannot get the interest of the boys so far as the swimming goes.

5948. Would they not take to pulling?—Oh, plenty of it; they are very fond of the boating, but very little bathing.

5949. Then is it a fact that all the steamer hands, the yacht hands, and the fishermen are all unable to swim?—The great majority of them, sir, so far as I know personally.

5950. *By Mr Fergusson.*—Do you have music with Music. all your exercises?—Yes, sir.

5951. The whole of the physical training?—Well, with the exception of one of the schools; there are three of the schools they have really music.

5952. I see you call it the physical drill of an elementary character. Do you work on any particular system; any book?—At Lamlash and Corrie they do. Mr Davidson, the teacher from Lamlash, who is to come before this Commission, will be able to tell you, but Mr Davidson, of Lamlash School, and Mr Hay, of Corrie, work upon the same system. I understand it is Mr Allan that we mention here who teaches the Whiting Bay School and the Brodick School; the teacher in Whiting Bay School and the teacher at Brodick do not take the drill up. Mr Davidson does the teaching himself at the Lamlash School and Mr Hay at the Corrie School.

5953. *By the Hon. Thomas Cochrane.*—Do not any Arran boys join the army and navy?—Very few; one or two in the navy I have known within these last three years.

5954. Since a training ship came up there, I think?—None have ever joined here.

5955. None have ever joined here?—No, none, so far as I know, from any part of the island.

5956. Where do they go to join the navy?—There were three taken away from Arran, and they joined through the coastguard officer at Lamlash.

5957. *By Sir Henry Craik.*—Taken away?—He took them. I think they were sent to the ship at Greenock, the guardship at Greenock; but it was Mr Austin who is the chief coastguard officer at Lamlash, and I know it was he who got all their papers prepared and took the boys up to the ship.

5958. *By the Hon. Thomas Cochrane.*—I should also like to ask you what other connection you have with the military forces—no militia company, I think?—No militia company.

5959. Do any of them join any of the other militias from Arran?—Not that I am aware of.

5960. Of Ayrshire?—No, sir, none of them.

5961. And Volunteers or Yeomanry?—No Volunteers.

5962. No Volunteers in Arran?—No Volunteers.

5963. Well, I am surprised; there is some splendid material there?—I have one boy myself that joined the army, and he has been out at the front all this time, since October; two-and-a-half years.

5964. Where is he now?—He is in the Second Mounted Infantry—my only son.

5966. *By Sir Henry Craik.*—Is he in the Yeomanry or the Army?—He is in the Second Battalion Mounted Infantry. He went out two years last October, and he still keeps well. He has been through a lot of hard work.

5967. If you preferred it for your own son, do you not think such a career would be a very good one for a good many others?—I do, sir.

5968. But they do not seem to turn to it?—They do not seem to take to it.

5969. *By Mr Shaw Stewart.*—At what age do the boys leave your district?—About fifteen.

5970. Do any of them go to sea?—Very few of them, very few of late years.

5971. Do you think if a mast and yards were provided in the schoolyard, and proper instruction given in the elementary handling of a ship, would that be taken advantage of?—I have no doubt it would. It would interest the boys for a time. I have no doubt of that, sir.

5972. And do you think if a shooting range were provided that would be taken any advantage of, a Morris tube range?—Well, I am afraid that the boys leave us before they are really at the age that they

The witness withdrew.

Mr A. P. DAVIDSON, examined.

5975. *By the Chairman.*—You are the headmaster of Lamlash Public School?—Yes, my lord.

5976. And have been so for the period of twenty years?—For twenty years; yes.

5977. It is a small country school containing 120 pupils?—Yes.

5978. Perhaps you would kindly read your notes?—During that time I have watched carefully the beneficial effects of physical training on the physique, deportment, and manners of the pupils. For several years to begin with, little more than the preliminary stages (dressing, turnings, etc.) of military drill, with a few free gymnastic exercises, was attempted. About four years ago, however, when the pupils through their own exertions provided a piano and the apparatus necessary for carrying on their training effectively, a fresh impetus and interest were given to the whole thing. Now a regular course, suited to the different ages of the pupil and to the development of the different parts of the body, in free gymnastic, musical bar-bell, hoop, dumb-bell and Indian club exercises, obtains throughout the school. The want of a hall or shed for drilling purposes prevents the carrying out of our plan very well in the winter, but during the spring and summer months we drill in the open air. Two years ago I secured the loan of a few boys' rifles, and was struck with the enthusiasm and delight which the senior boys (ages fourteen to sixteen) manifested in the exercises. Improvising bayonets, they fixed them on the rifles, and to 'The Soldiers of the Queen' performed, after some training, the movements with wonderful precision. These exercises, I find, not only develop the muscle, improve the carriage, and enlarge the chest capacity of the children, but brighten their school life, and afford them a splendid training for meeting with and efficiently fulfilling the demands of the future on their energies.

5979. *By Sir Thomas Coats.*—Do you know anything of the Corrie, Brodick and Whiting Bay districts, or is it more Lamlash that you are acquainted with?—Well, it is more Lamlash. I was making a little inquiry as to the other districts, but I found that physical training was not carried out to any great extent there, simply because of the want of the apparatus necessary for the carrying of it out.

5980. Among the children who come to your school, more especially among the younger children, do you find many weakly children?—No, sir, I cannot say I do.

5981. Are they mostly robust looking?—Mostly robust and strong. I may say that in all my experience I would be right in saying that there have not been more than three deaths among the junior children of the school; those who have been in attendance at the school, I mean.

5982. But you are rather subject to epidemics, are you not?—Yes, on account of scarlet fever, whooping-cough and measles being brought down from the towns. And then, from the nature of the district, being a watering-place, we are inclined rather to shut the school than allow the disease to spread. That is

would take advantage of it. As a rule they generally go direct from the school, say, to the city.

5973. *By the Chairman.*—Do they ever come back again?—Very seldom, my lord.

5974. *By Mr Shaw Stewart.*—You have not got the problem of finding anything for the boys to do between fifteen and eighteen in your district?—No, sir. There is really nothing for them to do, and of necessity they have to go to town, and so many of them having left year after year, they have a great many friends in town and can get employment very readily, and can get good lodgings with those friends in the cities. The great bulk of them go to Glasgow.

Mr
J. Bannatyne
28 May '02.

largely the reason why I think we are so ready closing the school.

5983. Does that interfere much with the schooling; is the school frequently shut up on account of that?—Well, this last year it was closed for a period of over six weeks; however, it seemed not to interfere much with the general efficiency of the school.

5984. I think the people who let their houses are now provided with better summer houses than they had before?—Yes, they are now.

5985. They are living under better conditions?—Under better conditions, certainly.

5986. Do you have physical training throughout the schools amongst children of all ages, boys and girls?—Boys and girls. Amongst children of all ages, from the infants upwards.

5987. You do not have many changes; the children that you get in as infants mostly remain in the school till fourteen?—Even to sixteen. One feature of our school is the senior class in it, which is really a sample class, considering, I mean, the size of the school—sometimes as many as twenty forming a senior class between thirteen and sixteen years of age.

5988. How long have you conducted systematic physical training in the school?—Well, I have done more or less at it since I was appointed. I was always fond of it, and carried it on with the free-arm exercises largely from my appointment, but of course the enthusiasm increased a little, and then we went in for apparatus.

5989. Was the exercise you carried out in accordance with any known system, that is, for the gradual development of the muscles of the body, chest and neck, arms and legs?—The book from which I took the system was largely Cruden's, of Aberdeen, which gives an organised system of work. I went on the lines of it. Previous to it I had a handbook—I do not remember the name of it—but largely of military drill.

5990. Have you noticed the marked development of the children while they are going through the school?—Well, I should say I had, because in their general appearance I find quite a difference. I took some notes as to measurements. I find that the measurements I took before coming away as to height and to chest expansion were considerably above the average of boys and girls of their age. Of course I had not taken any notes at the beginning, or previous to entering upon this system, but I calculated from the average over the country; I took the average of pupils over the country and compared them with the average of our children at certain ages, and I found in most cases that we were over the average, considerably over the average, as to height and as to chest development.

5991. How many hours a week do you give in your school to physical training?—Well, strictly adhering to the time-table, we have only half an hour each time, that is half an hour a week, but I trespass, I daresay, a little on the time, simply because I was preparing for these exhibitions of which I spoke. We had in all five demonstrations, I think, which brought us somewhere about £60, and with that we provided the necessary apparatus.

Mr A. P.
Davidson.

Measurements of children.

Time allotted: more would be beneficial.

Mr A. P.
Davidson.
28 May '02.

5992. Do you consider half an hour per week sufficient, or would you rather devote more time to it?—I should think, from the interest the pupils take in it, and the brightness and heartiness with which they go on with it, that an hour would not be misspent in it.

5993. And you consider that extra half hour would not be missed from the book knowledge?—Oh, I do not think so. I find really after a little break of that kind they work even more heartily at the ordinary book knowledge.

5994. I will put it in another way. Do you consider that the mental training of the children, or their book knowledge, would be better with an extra half hour of physical training during the week?—Yes, I should say so; their book knowledge would be better of an extra half hour's physical training.

5995. *By Sir Henry Craik.*—Have you had experience of other places besides Lamlash?—I was second master for two years in the Vale of Leven.

5996. And how would you compare the physique of the children there with that of the children of Lamlash?—I should say that the physique of the children of our village is very much better than in the Vale of Leven.

5997. You say they are a healthy set of boys?—Yes.

5998. But up to four years ago there was very little drill at all?—Very little, unless free-arm exercises. What I mean was, there was no proper systematised drill with apparatus.

5999. That is to say that the physical education of the children was very much left to take care of itself?—No, not quite; I would say that the free-arm exercises were given more largely, marching exercises were given more frequently, and the movements, the ordinary military movements, were given previously; but when we got apparatus, of course we had the same performed with the apparatus.

Improvements: costs. 6000. The pupils got the apparatus, including a piano, from their own exertions?—Yes, sir.

6001. But was there no piano in this school?—No; there was no piano in this school.

6002. Is not that nearly always a common part of school apparatus?—Well, I should say so; but in Arran our difficulty is in getting our Board to move in that direction, to supply a piano.

6003. Is the rate a very heavy one?—Yes, it is pretty heavy.

6004. What would be the whole cost of what you wish to have?—Oh, I do not suppose it would cost very much, especially just now, as they are talking of making some alterations on the shedding outside, a little additional building with a cheap covering would suit.

6005. Particularise a little; how much; name a sum—within £50?—Well, you know I am not a practical man in that way, but I should think less than £100 would do the whole thing, more especially if they are in the way of building anyhow.

6006. That would mean a charge of about £4 a year for thirty years, because, of course, they would get a loan for it?—Yes, sir.

6007. That is not a very heavy burden if it is to help materially the education of the children?—No, not heavy.

6008. It cannot really be a thing that stands in the way and prevents the School Board doing it, that they are to spend for the next thirty years £4 a year?—Well, other expenses they take into consideration, no doubt.

6009. Yes, but there is almost no part of the instruction which must not cost as much as that?—Well, I daresay not.

6010. *By Mr Shaw Stewart.*—Is there any tendency among your boys to go to sea?—Yes, slight.

6011. Would it be of an advantage to boys who thought of going to sea, and also to the discipline of your school, if there was a mast and yards and ratlines and so forth provided in the schoolyard, and instruction given perhaps by a qualified coastguards-

man; would you be in favour of that?—I would not be in favour of anything that would tend to develop any feeling on the part of the parents in that respect. A coastguardsman savours of the navy.

6012. Would you be in favour of a mast and yard being set up in the schoolyard to teach school children in the elementary art of the use of ships?—Yes, of course; a great many of our pupils go to sea in after life, but not to the navy.

6013. I do not mean with an idea of recruiting for the navy, but to help lads to go on into the mercantile marine?—Yes; well that would be an advantage I should say.

6014. Then it would be of great assistance to those lads?—I should say it would.

6015. To get grounded at school?—Yes.

6016. And do you think it would have a good effect on their school work, also being brightened up and getting a change of work?—Yes; well, I should say it would introduce a little variety in the way of school life.

6017. It would be one form of physical exercise rather appropriate to a place like Lamlash?—Yes.

6018. *By Mr Fergusson.*—You said, I think, that most of the other schools in Arran did not have quite so much physical training as you?—That is my impression, sir.

6019. For want of apparatus?—Yes.

6020. What is this apparatus that you have beyond the piano?—Well, musical bells, bar-bells, hoops, Indian clubs and dumb-bells.

6021. Did that cost £60?—Oh! no, no, no; but it cost part of the £60. The piano, of course, cost over £20, and the apparatus cost somewhere about £6, and then I took ninety of the older pupils up to Glasgow Exhibition, which you know means practically a few pounds.

6022. You can do a good deal of physical training without apparatus; the expense of apparatus should not to prevent them doing a considerable amount of physical training, should it?—No; I should think they could manage well enough if the teachers have the inclination to go in heartily for it.

6023. But you are rather afraid of trying more than half an hour a week?—Oh, no, I should be very pleased.

6024. But why do you not?—We have been doing it, preparing for these exhibitions.

6025. Why not as an ordinary everyday work?—Well, it is only recently that we discovered that it could be done without interfering with other subjects on the time-table.

6026. Let me read you this from a school that looks at you from the other side of the water, where they do three hours for the boys and two hours for the girls: 'The other subjects of instruction do not suffer, but are benefited by the extra time devoted to the 'physical training.' You have not been bold enough to try as far as that?—No.

6027. Would you recommend it?—I should scarcely say that is in keeping with our ideas of work.

6028. *By the Chairman.*—You should scarcely say that is in keeping with your ideas of work?—Well, not to giving everything its due time.

6029. *By Sir Henry Craik.*—You do not think three hours out of thirty hours a week, one-tenth part, is more than a fair share for physical training?—I should think it is just rather much. My own personal opinion is that. It becomes tedious, and you might make what is really a delight a burden, and a thing somewhat undesirable. Three hours, I should say, a week, is a little too much. I should think two hours would be quite sufficient for all ends and purposes to make it a pleasure and a delight as well as educative.

6030. *By the Chairman.*—What is the object of physical training in schools, if I may ask you?—The object of it is to develop all parts of the pupil—body, intellect and will.

6031. It is not of such paramount importance as the mental part of course?—It is not of such paramount importance as the mental part.

Marine apparatus desirable.

Mr P.
Davidson.
28 May '02.

Appa

Tim
hour
suffi

6032. Is it of paramount importance as assisting the mental part?—I should say it is; it helps the mental activities.

6033. But you think it should be administered in small doses?—Well, of course other things being equal, it might get more attention. If you allow other subjects which possibly are as important, and more important, to suffer, then it is just the question which you will accept, whether you are prepared to take the one or the other. If you can make more progress in some other branch of education than in physical training, then the question arises, is it your duty or is it not your duty to take it? It is a question in 'Profit and Loss.'

6034. You do not look upon physical training as a part of education, but merely as an aid to education?—As an aid to education. As education itself, a means to an end—namely, to make a man.

6035. Not a part of education?—Yes, I consider it a part of education, that part commonly called physical, which assists in fulfilling the great object of all education, namely, to develop the various faculties—Physical (body), Intellectual (cognition), and Practical (will).

6036. *By Professor Ogston.*—Have you the figures there on which you depend for the statement that physical education has brought your boys and girls above the average of the country?—Yes, I took a note of them.

6037. Would you just give us the most important one, the one on which you most rely?—I have the different ages. The average at nine years of age is, height 4 ft. 1 in.

6038. Of boys or girls?—Of boys, while our average is 4 ft. 2 in. The average at ten years of age is 4 ft. 3 in.; those I took were 4 ft. 5 in. Then at eleven years of age 4 ft. 4½ in. and 4 ft. 7 in.

6039. What do you mean by both 4 ft. 4½ in. and 4 ft. 7 in.?—4 ft. 4½ in. is the average throughout the country, and then the average that I took from our boys' measurements is 4 ft. 7 in. Then at twelve years of age 4 ft. 5¾ in., and our average is 4 ft. 8 in. Then at thirteen years of age, 4 ft. 7 in., and our average 4 ft. 8½ in.

6040. Did you take any weights?—I did not take any weights, sir.

6041. Did you make any observations regarding

females?—No; it is only the boys that I took the measurements of.

6042. Do you know that the average stature of an inhabitant of Argyllshire is normally above that of the general population of the British Isles?—I was not aware of that. Did you say Argyllshire.

6043. Argyllshire, yes; it stands fourth in the list of nine separate values?—Yes, I was not aware of that.

6044. That might somewhat invalidate your figures, would it not, that you are measuring a population who are normally taller than the average?—Yes, but then, how does Argyllshire apply to Buteshire, sir?

6045. This includes Buteshire?—This includes Buteshire.

6046. I beg your pardon, it is my slip, it includes Buteshire, it is the same as Argyllshire in these statistics?—And are the statistics over those that I have given?

6047. Well, no; it has reference to the tallness of the population generally?—I was not aware; I simply took the facts as I found them in the school.

6048. Would you mind leaving me those figures so that I may test them as to their real value, as I am not certain that I have taken them down correctly?—I will give you a note of them.

6049. You have no other physical observations than those you have just given?—Well, unless chest measurements.

6050. We need not waste the time of the Commission; I can get those afterwards. Will you supply me with those to-morrow?—I will. There is one thing I might be allowed to say in regard to the Indian club exercise. We find it really perhaps does more good than any of the exercises we have had in the way of helping the pupils to use both hands. I did not mention it in my statement, simply because it is all included 'in the demands of the future.' In this exercise, making them not only dexterous but ambidexterous, we have a system or exercise introduced almost as educative and as useful as free-arm drawing in our schools.

6051. *By the Hon. Thomas Cochrane.*—Were those measurements taken with the bare feet?—Yes.

6052. In all cases?—Yes, allowance has been made for that.

The witness withdrew.

Adjourned.

TWELFTH DAY.

Thursday, 29th May 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT :

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr GEORGE M^cCRAE, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr JAMES KERR, M.A., M.D., examined.

6054. *By Professor Ogston.*—Regarding your qualifications, are there any others which would add value to your evidence besides that of being M.A., M.D. of Cambridge, Medical Officer to the London School Board, and formerly medical superintendent to the Brad-

ford School Board; it would be important that we should put in anything?—I have a diploma of Public Health of Cambridge, and I was formerly honorary surgeon to the Bradford Eye and Ear Hospital.

6055. And your experience extends through a

number of years?—Nine years I was medical superintendent to the Bradford School Board.

6056. And to the London School Board?—Two months.

6057. Then, of course, you have made a very profound study of the subjects regarding which your evidence deals?—I am afraid it has not been very profound, but it has been very general.

6058. Very general and careful?—Yes.

6059. May I ask you to read your evidence?—If the reference does not exclude the consideration of actual existing hindrances to good physical condition in the earliest years of active vegetative growth when future structures are being laid down, we may take these hindrances as roughly: A. Home influences.—

(1) Maternal ignorance as to their own health before birth of child, working to the last moment, and so on; and also as to actual hygiene and feeding of the child. Most of the blindness now seen in schools the result of neglect of first week of life. Much neglect and even active opposition to treatment of unhealthy conditions of throat, nose, ears, eyes, and so on is made on the part of teachers and doctors too. Ignorance of infant feeding, producing rickets, anæmia, diarrhœa, and debility. (2) The effect of infectious disease in producing debility from toxic effects on developing cells of body is exceedingly important in towns. Whooping-cough and measles are endemic in large towns, outbreaks occur every other year, particularly in infant schools, and the majority of children suffer before five, probably one-third of the children in an infant school have measles before coming to school. Either disease causes more deaths than scarlatina, diphtheria, or smallpox all put together, and yet they are frequently neglected as trivial by parents. The sanitary effect of notification would be almost nil, but its educational effect might make it worth the cost. (3) There is the deprivation of natural methods of education which town life ensures; this we can consider with the school effect in this direction. B. School influences hindering physical development may be chiefly arranged as—(1) Absence of hygienic knowledge in teachers. Most teachers are exceedingly ignorant of hygiene, but there are exceptions to the rule, where teachers have almost a thirst for information, picking up every scrap wherever possible, and doing whatever they can for their children. This applies more particularly to the better class of infant teachers, who generally reach a higher pitch in the care of their pupils than most teachers, due probably to the spread of Froebel Societies, Child Study Associations, Teachers' Guilds, and similar influences. Women teachers generally are the most indifferent to health conditions, and many firmly oppose such measures as opening of schoolroom windows, for fear of catching colds, personal comfort, and other trivial conditions. School hygiene is a study of great educational value which could be usefully acquired by every teacher fit to be in a school if it was regularly required as a part of their training before a certificate was granted. Once started on it, the study presents so many points of practical interest that teachers spontaneously follow it up, and the effects soon show in school. Bad breathing, neglected catarrhal conditions, adenoids, open mouths, and resulting poor nutrition are a group now so well known as a cause of low vitality and mental inefficiency that they need only be mentioned. (Results of examination of school children—Bradford Tenth Triennial Report, 1900, pp. 136–139.) Standards of height and other measurements vary much with differing conditions. Age and sex distribution of any group of children has to be attended to, or statistics of particular qualities assessed, as, e.g., hearing, vision, and so on may be almost valueless. Standards of chest girth are of doubtful value, for the care required to make the measurements, and the ease with which they are modified by slight training, e.g., the question of whether a school stands on a hill or a plain, will, I believe, affect the results. Spirometry, too, with school children is very variable in result. Breathing exercises modify these results;

they do not increase the capacity of the chest to fill with air, but they do speedily increase the capacity of emptying the chest. I have done some work on these lines, but gave it up as not giving results commensurate with the trouble taken. A physical census of school children might give valuable data, but the work could scarcely be done to be reliable. Here again I think the game is not worth the candle. What can be done, however, is the examination and measurement of various groups carefully and thoroughly, to give data for study; a census is hardly necessary, as it is unlikely to give results equal to detailed study of small but sufficient numbers, say not less than a thousand in each group. The question of medical inspection should have been thought of thirty years ago; hundreds of thousands of pounds in furniture and buildings alone would have been saved. All schools should have regular medical inspection, the teachers confer with the school doctor regarding many parts of their work, and his influence in modifying school tasks and conditions through this means is most valuable. He should have had a considerable and extended experience of treatment in general medicine, and with children; he should also have had an actual acquaintance with ophthalmic, aural, and nervous disease, and have had sufficient scientific training to deal in a simple and practical way with any hygienic problem that may crop up. Wherever a school doctor has been appointed with more than nominal duties, he has been well appreciated. Bradford was the first place, in 1893, to arrange for a regular medical oversight of every branch of school work, and the Board there has since doubled and trebled the original salary of its medical superintendent. The School Board for London has appreciated the importance of medical oversight and reorganised its medical department on a more comprehensive basis this year. The comparison of town and country children is very difficult, as it depends on many factors, of which physical exercise is only one; possibly nutrition and the wages of the parents are the most important factors. School influences are practically similar; the foulest atmosphere I was ever in in a schoolroom was at midday in an infant room almost on the slopes of Snowdon. Having been in the fresh air before going into the school it may have affected me more strongly, but it certainly was the foulest one to smell that I was ever in. With regard to such a quality as vision, my own testing of several thousands (sufficient to eliminate statistical error), analysed as regards age, sex, and standards, showed a difference between town schools and suburban schools in the city of Bradford. Vision reaches its best average value in the town schools at ages eleven to twelve, but the same acuteness is reached by suburban school children at ages eight to nine. On the other hand, in inspecting schools in small country towns and villages, one found that very local conditions, such as small, narrow streets and dark schoolrooms in a country town of a few thousand inhabitants, seemed to have a retarding effect on the development of visual acuity. That was particularly marked in Otley and Keighley, and the vision of the children was exceedingly bad there. The town child seems sharper in what one may term sensory reflexes; he can use phrases of which mayhap he has little idea of the meaning, in a pert way; he is more precocious in a certain variety of sensory experiences than the country child; but I doubt whether this applies to other qualities; it does not to vision, may not to hearing, certainly does not to vegetative qualities or organic functions such as growth, capacity to resist colds, nor probably to endurance of adverse conditions, resistance to disease, or to continuous change of circumstances. On these points, however, one is only judging from impressions, and not from actual records. *Physical Exercises.*—As regards physical exercises, they may be divided according to two different purposes—(1) Those designed to promote nutritional change by stimulating circulation of blood and lymph, and developing respiratory (air) exchange. (2) Those which are purely educational and designed to develop neuro-muscular mechanisms to perfection. All

exercises when first performed are educational. The key to considering anything regarding education of children is its action in regard to the process of development of the nervous system. The brain is the chief organ to be considered in nervous development. Its action may be regarded as built up of a large number of separate but much interrelated mechanisms, each of which has two aspects. There is the receptive mechanism (or sensory part), which may or may not put into action the forwarding or executing mechanism (the motor part). The earliest functions in the history of the species are the earliest developed in the history of the individual. —Mere vegetative functions, breathing and so forth, are first, the perception of lights and sounds, the capacity of twisting the body, of swallowing and sucking, which are congenital. Inheritance from a remote ancestry ensures early and rapid attainment of these capabilities without training, provided actual destructive disease does not intervene. Education cannot directly modify such functions. Next in order of development appear somewhat higher functions, as the distinguishing of colours, recognition of different sounds, speech and capacity of holding the body upright, of walking and gradual assumption of human characteristics; these are later, but develop by natural education; control of the coarsest muscles of the limbs and coarse sensory appreciations are the attainments of the child coming to school. Some can hardly walk; they must all be taught to stand to or to walk along a straight line. Most cannot talk except imperfectly; many only learn this with much trouble; a few remain imperfect. The control of the fine finger muscles is only attained after the child leaves the infant department. They cannot do any complicated movements. The order of development is entirely from the general to the special, from coarse muscles to fine muscles, from simple movements to the most complicated and elaborate movements, and premature working of the nervous mechanisms of such implies rapid nervous exhaustion. On the other hand, occasional working of the developing parts by short, rapid and violent action does not unduly exhaust, and at the same time stimulates function. I need not trace this out, but it suggests, as work for infant schools, avoidance of all continuous fine work of hand and eye, breaking up lessons as much as possible, as early fatigue is the great characteristic of developing nervous mechanism. Much special work done in infant schools, and habits of holding work near eyes resulting, conduces as much to overstrain and bad school habits as anything else. For organic nutritional purposes, as well as for the best educative results, we want the simplest and the coarsest muscular movements, not involving fatigue, and as actual experiment demonstrates the reinforcement of even involuntary reactions by other nervous stimuli as sound, all infants' work of a rhythmic nature, as marching, where mere circulatory effects are to be got, should, if lasting more than a few seconds, be accompanied by musical rhythm to save nerve fatigue; for effect on young children especially to develop reserve powers (chest capacity, heart muscle, and also for educational value) there should be thrown into the ordinary work every now and then, for exceedingly short intervals of not more than ten or twenty seconds, the most violent efforts of which the child is capable. Games, but not half-hearted games, games with moderate exercise, involving now and then a few seconds of the most violent racing to catch each other, struggling to get free, and so forth, are of the utmost value to young children; otherwise they do not develop reserve capacities, and are in the condition of a warship without powers of forced draughts, unequal to emergencies. The Poor Law School is where the children under the Poor Law are taken in and housed and everything is done for them. There are large institutions in London of that kind with hundreds of children in them. The Board School is the school where the children go from their own homes under the Board to be educated, go there every day to be educated and come away again. The children who live in the Poor Law Schools are protected in every way; they get practically no exercise; they are always in a warm atmosphere; they

gain no power to accommodate themselves to varying conditions, as it were, and other children get this natural education, and have these reserve powers to a great extent. The result is, Poor Law children in winter get chilblains if they go out in the cold, whereas the other children can go out and not be attacked. If measles broke out among the Poor Law children it caused a large mortality. I am judging that more from French statistics, where in some of the Paris schools the mortality has been enormous from measles, but in the ordinary population the mortality from measles is something like two to five per cent. In the case of infection of the eyes there is a contagious disease of the eyelids, an ophthalmia which has been a tremendous curse in London among all the Poor Law Schools nearly, but in the Board Schools one sees very little of it. You can hardly consider it contagious; the one child reacts to it, the other does not. The Board School children do not have the disease amongst them, but the poor law children do, from their lowered vitality, as it were. The extreme examples of this want is in the institution-reared Poor Law children, who look sleek and healthy, and yet are so tender that they do not react healthily to cold, but get chilblains. Contagious disease, as measles, cause excessive mortality among them; or infection of the eyes spreads all over a school, when in the ordinary Board School it is trivial. In the older children the drill can be increased in complexity to some extent, but for mechanical or vegetative effects it should be as automatic as possible, aided by music to prevent tiring and fatigue. It should be frequently repeated for short intervals, not more than ten minutes, and should again have one or two violent efforts of short duration thrown in. Town school children, as a rule, are in poor physical condition, girls worse (from less exercise in their games) than boys. Up till about twelve they need not be considered as differing in their requirements for exercise. After about twelve and on towards puberty a new set of conditions and nutritive pressure begins. The control of all the muscles and senses is fully developed, but now co-ordination and complexity of grouping, elaboration in an intellectual and muscular sense, is going on, and ends in the gracefulness of the young woman, and full-grown litheness of the man, replacing the gawkiness of the hobbleddehoy. At such a period of growth too much heavy work may do harm; the heart often is behindhand in its growth at about sixteen, especially in boys, and this has to be watched; it is unequal to the demands on it, and may get irregular in action or even strained; smoking at this age, from its action on the heart, is probably deleterious. The cases I have seen have been generally boys who smoked. Transition period, ten to fourteen, increasing the proportion of nerve work gradually by a well co-ordinated scheme, but still simple (quick) work, which easily becomes automatic. The proper drill from, say, twelve is not automatic, music-accompanied work, but the slower, more uninteresting, and more exhausting, from the complicated muscle grouping required, Swedish style of drill; such work is necessarily exhausting, and should not be applied to ordinary school children, in whom it would amount to fatigue; its place is distinctly in the higher grade school and the pupil teacher centres. I have been contrasting the work of infants with the work of the older children, but I do not mean that the infants should only have the one kind and the older children have only the other, but that there should be a transition period, as it were, from ten to fourteen, and a regular scheme which is passed on from the mere automatic work that you get in the infants' until you get into the fully developed co-ordinated, what is called the Swedish movements of the older ones. One has to accentuate these points to bring them out strongly. Pupil teachers are in a very poor condition physically—defective chest capacity, bad strained voice production, awkwardness and gawkiness; an absence of ideas of deportment are apparent in appearing before a committee, or even in sitting down on a chair. They are generally anæmic and flabby, getting palpitation and breathlessness on the slightest exertion above the usual. I tested a con-

siderable number at Bradford by sitting them quietly on a chair, then at the word of command making them start a race to the bottom of several flights of stairs and back—64 six-inch steps—taking on an average 59 seconds, and then keeping them on a chair and taking the pulse at intervals. None had returned to the normal within the half-hour that I could spare each. Boys, girls, and a team of boys who had been specially trained for six weeks for a tug-of-war competition, were tested by racing them from a chair round a playground and back to the chair, averaging 17 seconds in running. Half a minute after stopping this mild exercise the average acceleration of pulse was in the girls 30 per cent., in the boys 19 per cent., and in the special boys who had had six weeks' physical extra work 10 per cent. In two and a half minutes it was—girls 11 per cent., boys 7 per cent., trained boys normal; and four and a half minutes after, girls 9 per cent., boys 3 per cent., trained boys normal, showing that girls, probably from want of exercise in games, are worse physically than boys, and that six weeks' regular practice makes much difference in the capacity of lungs and heart to respond to an emergency. There may be an error in that the team of tug-of-war boys would probably be better physically, boys selected on that account apart from their training. Life is made up of the functioning of healthy or unhealthy cells. The care of the body implies everything else. To emphasise the importance of physical condition, its value should be taught as a religious duty, especially to pupil teachers. There should be a set of simple exercises, not more than a dozen, which they should be taught to repeat daily in private, quite apart from school, to maintain and develop body muscles, expand the chest, and brace up the muscles of the shoulder girdle, all of which the average pupil teacher neglects. Deportment and physical culture have a most important educational effect on their pupils, and should be assessed in any pupil teachers' reports or examinations of as great value as, say, a knowledge of French or shorthand. Unless some such means is adopted pupil teachers will not attempt the moderate amount of work which they are quite capable of doing effectively out of school time. In the work to be distinguished under various headings, swimming is best for young children, the movements taught on dry land or in school for short periods frequently, then the bath till they can swim. Once they can swim it ceases to be of educational use, but still will have bracing and tonic effects on the general circulatory system. Walking I personally regard as very poor exercise. Running is hard work, if too continuous might cause death from poisoning by fatigue products accumulating, such has been known in paper chases. Marching is good, especially for infants. I want children to do a minute or two marching round the schoolroom every hour of the school day simply as a nutritive stimulating action. Games are good, furnishing the infrequent but exceedingly valuable very high pressure work temporarily, and also involving intellectual work which mere drill does not. Intermittently violent games the best. There is also considerable intellectual effort in good games. Gymnastics, military drill, boxing, self-defence, and shooting are educational to those of fourteen and over, and might be insisted on in continuation work, although to make such things compulsory often makes them resisted as objectionable. With regard to various diseases enumerated, exercises which promote general health and tone of body tend to prevent eye diseases, and the bone diseases associated with tuberculosis. Causes Making for Tuberculosis in Schools.—I wrote a short paper in *Tuberculosis*, Summer, 1901. I concluded it was to a great extent prepared for by want of exercise and of bad ventilation of the school. Ear disease is the result of neglected colds or catarrh, or infectious disease in infancy. Sinus disease is one of the ordinary terminations of ear disease, and it may be added that suppurative ear disease is not yet appreciated in its full significance, as of the cases returned by the Registrar-General as dying in England from otitis there are 70

per cent. under the age of fifteen. Dr McEwan, of Glasgow, says that to have a suppurative ear is about as serious as to carry a dynamite cartridge about in your pocket, and I think that is a good estimate of its risks. Heart troubles from overwork in rapidly growing boys (chiefly) we have spoken of. Other heart troubles exercise would in rare cases cause damage, breathlessness is the warning there. The seriousness of heart diseases in children, from what I have seen myself, tends rather to be exaggerated by doctors, in regard to school work. Rupture and other accidents occasionally happen in gymnasium or football, which last is good game for boys, bad for heavy men. First aid for apparently drowned can be taught to any children who learn to swim. Two quite young swimming boy scholars in Standard III., I think, at Wapping Road School, at Bradford, about a year ago saved life by artificial breathing methods in an apparently drowned child. The method of putting out fire by a rug can also be applied effectively by a child of eight or nine. I remember a successful case where a little girl acted effectively by school-taught methods. Physical training in English schools, as a rule, has one hour a week, or rather sixty minutes, as about the scheduled time given. There should be thirty minutes daily allowed for breaks of a few minutes and change. Such a lesson as writing should never be continuously allowed without at least three breaks per hour of as many minutes each for some arm movements. I would cut out much sewing to get that time in. I do not know what to take out for the boys. One hour a week in two formal lessons, drill or extension movements, must be added for instruction and practice. Including swimming I would give 180 minutes weekly to physical exercises. Then I go on to some ideas of my own. The Hooligan as a product of the Education Act.—Education in the past has aimed in school at mostly stimulating the sensory side of the nervous system. Children have been lectured to and filled with facts. Eye and ear instructed until the corresponding nervous centres must be well developed. Practice in reading, writing, and arithmetic until it has reached almost reflex perfection, but the higher mental and intellectual faculties have never been fully exercised. There has been a minimum of reasoning and thinking which involve effort. Trouble and effort has been eliminated by having everything analysed and explained, till children leave school with their faculties for learning undeveloped, and the lower qualities of merely hearing, seeing, and feeling without thinking almost perfected. The motor side of their development has also been neglected, and its full attainments never attempted, so that even the level of their organic functions remains low. At the usual period of growth the dormant nerve centres may try to assert themselves, as in the violence of the hobbledehoy Hooligan, but they settle down to a life of a sensory nature, which is of little use to others or to the State. Instead of the young man delighting in 'something accomplished, 'something done,' or attacking doubts and difficulties for the sake of reasoning them out himself, he wants without the bore of mental fatigue to have sensory enjoyment, to watch a football match, and suck at a pipe, to appreciate a variety entertainment, to enjoy the excitement of gambling, but not to make an effort to think or reason. He has to fill up spare time by meaningless, almost reflex, reading of tit-bits and such stuff, and loathes all physical exertion. The obvious treatment for this tendency is that schools should provide not so much knowledge of facts, but capacity for using the highest parts of the brains in thinking, reasoning, learning, and doing for oneself, in self-education under guidance. This is the chief duty in the second half of school life. Plenty of physical work, at least three hours weekly, with a raising of its prestige by marks or prizes, not for individual excellence as much as for general school or class excellence; this continued after school life into the most complicated games, drills, gymnastics, and all the arts of self-defence as the training of men and older boys. The children I have seen most of are the offspring of people who are

scarcely regarded as human beings, they are simply hands in the manufacturing centres, at least I think so. Therein Scotland differs much from England, for every Scotch boy has in him a pride of race and the memory of Bannockburn. The chief duty of school is to turn out pupils, to whom the feeling of citizenship is the greatest gift their country can offer. They should go into every action of life inspired with the creed of the State schools, that 'England this day expects that every man will do his duty.'

6060. Your *précis* of intended evidence is so very full and clear that I would only put some explanatory questions regarding certain points of it. Beginning as before at the words 'If the reference,' and taking up 'home influences,' you say, shortly, underneath No. 1 that most of the blindness now seen in schools is the result of the neglect in the first week of life?—Yes.

6061. Would you mind explaining?—Well, I am judging from blind classes; in England we have a Blind and Deaf Act. Any child who is too blind or too deaf for ordinary education has to be provided for separately in a blind or a deaf school, and in the blind schools most of the cases of blindness that one sees are the result of *ophthalmia neonatorum*, that is inflammation of the eyes from contagion from the mother at birth, if that is neglected at the first week of life, as it very frequently is—I have seen very frequent cases where a doctor has not been in attendance and the midwife has neglected it, or the parents and nurses have neglected it—in the course of a week or ten days so much damage is done that the child is left blind.

6062. So that clause refers to total blindness or very serious blindness, but not to errors of refraction and minor?—No, not at all to these; these, I think, are enormously exaggerated in school; my note refers to total blindness, to children in blind schools.

6063. Then take the next clause, those conditions of the throat, nose and ears that you refer to are subjects of comparatively recent recognition?—The last twenty-five years.

6064. But you regard them as of very great importance?—Very considerable importance in town children.

6065. And their importance is such that they would require almost the presence of a skilled medical man for their adequate recognition?—The trouble of these things is that when they are recognised, and when the parents are apprised of them, they object to have anything done; in the majority of cases it is with the greatest difficulty that you can bring these conditions home to the parents. In Bradford I knew the children in the schools, and I saw them afterwards in the hospital, and it was a matter of operating on hundreds in a year for those conditions.

6066. And that statement almost necessarily implies that the recognition of them ordinarily is unusual?—No, the recognition of them is fairly easy in bad conditions; I mean the teacher recognises a child with an open mouth, besides, the child snores.

6067. You think that teachers should be taught to recognise open-mouth breathers and adenoids?—I think so; the bad ones, at any rate.

6068. Could you tell me in a word what percentage of defective eyesight you consider usual in schools that you have had charge of?—It depends on what you mean by defective eyesight.

6069. Including every form of it?—Children who have not the normal visual acuity?

6070. Who have not the normal visual acuity either from refraction or other defects?—It depends on the age of the child.

6071. Would you say overhead 50 per cent. suffer from defective vision?—In children of seven, 50 per cent. will have normal visual acuity; in boys of ten to fifteen, 10 per cent. will be the outside number who have not.

6072. And regarding throat and nose and ear diseases, what percentage would you think of school children are ordinarily affected with them?—That is an exceedingly difficult question to answer, because it

depends upon so many things—on the social conditions, on the amount of looking after; it also depends on the time of year you examine them, whether it is cold or not.

6073. Could you give us any guidance—5 or 10 per cent. or higher?—I should think 5 per cent. at least have their hearing injured by it. In Chicago they have been working a great deal on these things, and they say 30 per cent. have their hearing defective. In all school work you have to allow for the personal equation of the child, and I do not think they have done that sufficiently in America. I think 5 per cent. is about the number.

6074. We just want working numbers?—Five per cent. is about the number—between five and ten.

6075. Take the next clause marked with the figure 2. You speak at the end of it of the sanitary effect of Notification. Will you explain to us what you mean by Notification there?—Well, certain infectious diseases under Acts of Parliament are made notifiable. If a case of disease occurs, the doctor who sees it, as the case may be, is compelled to notify it at once to the medical officer of health, and the exposure of people affected by these diseases is against the law. They can be prosecuted for it.

6076. And whooping-cough and measles are not notifiable diseases?—They are not generally notifiable diseases. In some places they have been made temporarily notifiable diseases, but generally they are not notifiable, and there are great difficulties in the way of making them notifiable.

6077. But the medical officers of health often do include them in their list of notifiable diseases?—In some places they do. They did at Edinburgh for some time; they have at Newcastle.

6078. They have found no opposition, but rather help, from the medical profession?—No, but generally the sanitary authority drops it, as they think the cost is too much. But, on the other hand, if these were made notifiable diseases, parents would become aware of the risks, and they would prevent them spreading as they do.

6079. There are some points of explanation under 'B.' The number 1 there makes the statement that most teachers are exceedingly ignorant of hygiene?—Yes, I think so from my experience of teachers.

6080. And how would you remedy that?—I think that it is becoming almost a necessity that all school teachers ought to have a knowledge of hygiene, that it ought to be insisted upon before they get their certificates. That is the thing that is most wanted of all. Now, in most schools the hygienic knowledge on the part of the teachers is very limited.

6081. And in the next sentence you say that women teachers generally are the most indifferent to health conditions, and many firmly oppose ventilation?—Yes.

6082. I suppose you recognise that there are various climates that require ventilation to be carried out in different ways?—Yes.

6083. That in a wild district in the Hebrides the necessity for open windows would vary from what it would be in a perfectly built school in the Metropolis?—Well, probably in the Hebrides it would be very much worse than in the Metropolis. I mean they would keep the windows so well shut, would they not?

6084. But of course the risks of cold, of wet sea fogs?—Oh, yes, I am quite aware of that.

6085. And also the ricketiness of the buildings allowing of ventilation otherwise; all that has to be considered in considering the ventilation; it requires a good deal of judgment to apply?—Yes. In America, where they have tried to legislate for every place, they issued some years ago a book about the ventilation of schools in which they tried to arrange for what one may call the 'mechanical ventilation' of every room, however small; some arrangement with stoves up to the most complicated system of appliances; I do not think you can ventilate any schoolroom without some means of ventilation quite apart from doors and windows; I think nearly every school requires ventila-

tion quite apart from door and window method, either by stoves or by some other appliances.

6086. Now pass on next to the standards of height and other measurements ; do you consider those of very great value if properly collected?—Oh, if properly collected these might be made useful, I think.

6087. But it would require a medical man of special skill and knowledge of the subject to collect them so as to be really valuable?—Yes, and it would require a medical man who had special interest in the subject too, because it is a most tedious and uninteresting work to begin collecting these things.

6088. Pass on next to the physical census ; that I suppose could scarcely be done by the ordinary parish doctor?—The ordinary medical man has not paid very much attention to this kind of work. There is nothing in the work itself which he could not acquire in a comparatively short time, and I think almost any qualified man who turned to it could give you good results after a time ; a little experience is necessary.

6089. Could it be done by the teachers?—The teachers would require special training, and I think probably that the ultimate method of doing all this kind of work will have to be through trained teachers, the cost of medical men being too large. Medical superintendents and a certain number of teachers ; either the schools grouped for a teacher to take so many, but teachers with special training, especially in regard to such things as testing eyesight, and so on. I hardly think it wants a medical man, but it does want special training of individual teachers probably.

6090. And in that way you think it could be adequately done, and done at a reasonable expense, and would be worth doing?—I believe they are doing it in that way at present in Chicago, but I cannot give you details of it.

6091. Passing on next to the clause regarding the medical officer of Bradford ; what is the salary at present of the medical superintendent of the School Board?—In 1893 I was appointed at a salary of £100 ; that was raised to £250, in 1896 I think it was, and it was raised to £350 about eighteen months afterwards.

6092. Have you a staff of medical men under you in the London School Board?—In London there are ten oculists and two assistants who have to do with defective and feeble-minded children—blind.

6093. Are any of these consultants, or are they all your subordinates?—These are all subordinate to the medical officer ; they give half their time, all of them.

6094. Passing on in your notes you analyse the statistics regarding age and sex concerning vision in Bradford?—Yes.

6095. Did you find the schools in the town or the suburban schools the better?—At the earlier ages the suburban schools were the best.

6096. You think, therefore, that in arranging a town school, its halls, its windows, its playgrounds, its vicinity, they should aim as far as possible at the type of the country school?—Oh, no ; I think the acuteness is due to extra causes out of school.

6097. Quite so ; they have to look at more distant objects?—That is so.

6098. Therefore that ought to be considered, that the child's eye should not be confined to resting merely upon a neat point?—I have not developed that point here at all.

6099. But you agree with it?—I agree with it thoroughly, and towards the bottom of the next column, I speak of infant schools. I think that is one of the most important school problems—the work done there—the eye work of infant schools ; I think it is excessive.

6100. You speak of adverse conditions in the second clause promoting or hindering resistance to disease?—Yes.

6101. You consider that physical training would reduce the vulnerability of children to ordinary diseases?—I think that it would ; I do not know that it would to the infectious diseases, but I think that it would to the results of them.

6102. It would render them less prone to take

colds, tuberculosis?—Distinctly as regards tuberculosis ; oh, yes, diminish the chances of that, and in regard to a condition like measles, a child who has adenoids has a great chance of having suppurative disease of the ear follow that, and if it has not adenoids it gets through measles fairly well as a rule, or scarlatina and various other catarrhal diseases.

6103. In the paragraph headed 'Physical Exercises,' Phy about five or six clauses down, you come to an import- aut point about the functions. 'The earliest functions ' in the history of the species and the earliest develop- ' ments in the history of the individual'?—Yes.

6104. I suppose from that and the neighbouring clauses you regard a child as being like a prehistoric man with slightly developed limbs and faculties?—To some extent.

6105. And has to be guided by the teacher through the same education that nature submitted man to in his development to the present condition?—Yes ; I think so to some extent.

6106. And that physical training and mental training to some extent must follow the lines that nature has marked out in raising man?—Yes.

6107. That is the idea that runs through this?—That is an important guide in education, I think.

6108. At the foot of that page comes another very important point which we have met with for the first time, the question of violent action in physical exercise. I see that you systematically approve and make a strong point of the value of violent action occasionally?—Yes ; I think so.

6109. You think it necessary for the well-being of the child that it should be submitted now and then to some form of training which shall develop its reserve power?—Yes, that is the point ; that is where I think that games excel ordinary drill and ordinary work, in that a child there spontaneously exercises itself to its very utmost for a period that it can stand, and also that it uses its intellect to a certain extent.

6110. We may take it that that point, which is a very important and unusual one, is the result of much thought, much consideration on your part, and that you abide by it as a very important thing?—I think so ; it is my own idea entirely.

6111. To such an extent that if a system of physical training were suggested to you which excluded altogether violent effort, you would condemn it on that account as imperfect?—If a system of physical training for infants, say, which excluded running altogether, running two or three—well for 40 or 50 seconds at top speed—a system which did not include some running like that I should think would be defective.

6112. And that in your estimation is one of the main values of games such as football?—I think so ; I think the two points in games are the occasional violent work and the intellectual part of it—that the child uses its choice, as it were.

6113. Another point in your evidence that we would wish your opinion very distinctly upon is the question of music. I notice that you conclude that exercises ought to be accompanied with musical rhythm to save nerve fatigue?—In the young children?

6114. In the young children?—That is rather a difficult point, for this reason, that it is a question there of balancing up whether the teaching of young children without music is better ultimately. It certainly saves nerve fatigue in the young child, and the only question is whether the teachers can get as good results if they do their drill without music entirely in the young children. The teachers object in London at any rate to drill with music.

6115. But your opinion as a scientific expert on this subject is distinctly, that in younger children the rhythmical influence of music is of great benefit?—I think so.

6116. Pass on now to where you talk of schemes and Swedish style of drill. You consider, I suppose, that some regular scheme is desirable?—I think so.

6117. And practicable?—Yes, I think so.

6118. I suppose you think it should be adaptable to

all the varying circumstances of town and country weather and so on?—I do not know very much about the practical application of drill. Of course I have seen it and I have judged it, but I do not know that I could draw up a scheme myself for it. If someone else drew up a scheme, I daresay I could criticise it, but by Swedish style of drill I mean those slow movements which are exhausting.

6119. And you disapprove of the Swedish style of drill if it is too exclusive?—If it is too exclusive, I disapprove of it. I think it is all right for the older people, after twelve say, but for Swedish drill exclusively all through school life, I think it is bad.

6120. You think it is bad for children under twelve?—Yes, exclusively. I think you want smart drill for children.

6121. And an ideal drill, therefore, would take consideration of that fact?—Yes, I think so.

6122. But you also think that an ideal drill should have certain adaptability about it?—Yes, it must have. I think drill is like religion; there are different styles, and each professor says his is the best, and they all have good in them.

6123. Now concerning pupil teachers; you think, I suppose, that a medical officer could be of very great value to them in regard to those defective points that you have indicated; defective chest capacity?—Yes, I may say that the teachers themselves, they are chiefly girls, of course, object to the medical man very strongly.

6124. They do?—They do, and they object to any one talking to them about their physical condition, either men or women.

6125. Do you not find that they come and consult you regarding themselves, having a kind of confidence in you?—No. Of course in Bradford there were no exercises insisted on till recently. They now have a good system there too, but until recently they had none, and it was their obvious defects that called my attention to them, and caused me to make those enquiries that I have mentioned.

6126. Are those defects in the teachers such as could be recognised by an ordinary school inspector, or would they require the presence of a medical officer?—A school inspector would know that they were of poor physique and so on, but it would require some skilled training to make a proper estimate.

6127. Somewhat higher skill than that of an ordinary school inspector?—Yes, it wants medical knowledge to do it.

6128. Did you find a large proportion of them defective in Bradford amongst those you tested?—Well, I should say that at least two-thirds of them require a considerable amount of physical training, at least two-thirds.

6129. And could you give us any short indication of what the exercises would be that you would advise, and which would be adequate to maintain and develop the muscles and chest in school teachers?—I think, roughly speaking, the exercises such as are down here in the higher grade girls' school in London would be excellent for pupil teachers.

6130. Which may be practised in their own rooms?—Then I think some of these could be selected; I mean any teacher of this work could draw out about a dozen exercises and teach them. There are all sorts of systems for practising at home, but they could have some simple exercises drawn up, about a dozen for that purpose. The important thing is to make them realise the value of it; they do not do that, and their teachers do not either.

6131. Passing on, under the heading of games, you also lay weight upon the value of games as involving intellectual work?—Yes.

6132. And on that account also you would include them in your curriculum of physical exercises?—Yes; I think games are of great advantage to the children.

6133. Passing on, there are one or two phrases that I should like if you could make more clear to us. In the fourth paragraph you speak of the Hooligan as a product of the Education Act. At

the end of that paragraph you say: 'The motor side of their development has also been neglected, and its full attainments never attempted, so that even the level of their organic functions remains low.' Could you elaborate that thought?—Well, the thing which I speak about before the reserve capacities of very many town-bred people are exceedingly poor. Now in London I see very many of the teachers that come up as candidates, and they are flat-chested, poor individuals, and if you put your finger on them you see there is poor circulation, it remains pale where you press, ever so long. Their general functions, as it were, their general vitality is poor because they have never been developed.

6134. And if they attended more to exercises developing the motor system, you think it would improve such things as digestion and circulation?—I am quite sure of it.

6135. A little further down you speak of the capacity for using the highest parts of the brains in schools?—Yes.

6136. Now how would you suggest that schools should provide for using the highest parts of the brains in thinking, reasoning, learning and doing for one's self?—The teachers have not yet got out of the way of having everything that they teach their children analysed down to the very lowest work; everything is done by rule nearly, and by imitation, and by copy, instead of the children having to think it out for themselves. Of course, the tendency nowadays in the higher grade schools is to make the children do everything for themselves; they make their own apparatus, they reason it out, and that is intellectual work, but the ordinary school curriculum seems to cut out as much intellectual work as possible, and appeal almost entirely to the hand and eye and ear. Hand and eye and ear training which is thought so much of for younger children, I think is positively bad in the older children, because there it is excluding what I call the higher intellectual centres.

6137. As a medical expert, do you think that the Saturday holiday is a necessity?—Yes, I think so for children.

6138. And that in it neither physical nor mental training should be enforced?—I think that all children want a clear day to themselves.

6139. Can you give us any suggestion regarding the management of physical training in cripples?—No, I have not thought of that point at all.

6140. Or incurables?—I have not thought of those points at all, but I must think of them.

6141. *By Sir Henry Craik.*—When you speak of infants, what age do you mark by that?—Well, in England we have children at school very much earlier than is the rule in Scotland; they begin at three. The attendance is compulsory from five, but it is very general in the towns from three, and there is a difficulty in Yorkshire towns at any rate in keeping them out until they are three. Then the rule varies under different boards as to when they leave the infant school. In London they allow them to stay until their seventh birthday. In Bradford they turn them out as soon as possible after their sixth birthday. It varies, the practice in different schools, but you may call all children under seven infants, roughly speaking.

6142. The special sort of education that you would give the infants you mean should be extended to children up to about seven?—Of course, that is for school purposes; I would even make it a little later if I were drawing up a fresh scheme.

6143. Well, that is rather what I would like to know, because that would be useful for us. How late would you carry on special instruction suitable for infants?—You see in Scotland you have children coming to school later than in England, and you probably translate your infants a year older than the English ones, so that I should call it seven to eight.

6144. And the special type of physical instruction that you refer to as suitable for infants is for children up to about eight years of age?—Yes, the sort of rule that I speak to teachers about, the way I make that

clear to them, is this, I say the brain increases in weight till about the age of nine, and from that age there is practically no increase in weight, but it is an increase in elaboration, so that up till seven or even nine you must allow the child's brain to grow, and after that you can elaborate it as much as you like.

6145. Then it is up to about nine, is it?—I think if you put it eight to nine, you are putting it too late; I should say up to eight at the outside.

Physical instruction in London schools.

6146. Have you inspected and examined the system of physical instruction in the London schools?—Yes, I have seen something of it, and, speaking generally, it is a good one.

6147. But do you think that it tends too much to this sort of what you call slower, more uninteresting and more exhausting style of drill?—There are difficulties with different teachers. I have seen it where I considered it thoroughly bad, and I have seen it also as an excellent work. It depends, I think, partly on the teachers. I have seen the slow movements done in an infant school where the children were yawning in a few minutes. Slow movements, of course, should never be done by infants. On the other hand, where it is done quickly, as it is done in most of the schools, it is a good exercise. They call it Swedish drill in London, but I do not think it is Swedish drill. You can call it an eclectic system based on the Swedish, but the slow movements for the younger children are distinctly bad on account of the nerve exhaustion, and also because the music is left out of most of them.

Skipping.

6148. Is the skipping-rope used much?—It is not used as it ought to be for the younger children. It cannot be where a teacher has to manage seventy children.

6149. But it seems little used in the playgrounds; less even than it used to be?—It is a most excellent thing for the younger children.

6150. And it is used in the French army, is it not, for boys even?—Yes, I think skipping-rope exercise is one of the very best exercises. It fulfils the condition of having intermittent violent work.

Board and higher school children: comparison: social condition.

6151. Have you had any opportunity of comparing the pupils in the Board Schools with the pupils in higher schools?—In Bradford I did a little of that. The result was that the pupils in the higher schools were somewhat better physically than the pupils in the ordinary Board Schools, and, of course, the pupils in the poorer districts were worse still; it is simply a matter there of social condition, I think.

6152. And the feeding?—Well, that, of course, is part of the social condition, better parents and better feeding.

6153.—But also better opportunities for exercise?—And better opportunities, yes; and better education out of school.

Blind children: physical training.

6154. *By Mr Alston.*—In your answers to Professor Ogston you have cleared up what was a little obscure. Your reference to blindness in school did not refer to defective vision, but to absolutely blind children?—Yes.

6155. Then it is also the case, is it not, that blindness from birth is due to ignorance and neglect?—The blindness which is due to birth, which is a diminishing quantity, I think, is due to neglect in the first week of life, and want of cleanliness.

6156. Do you know that it is the case that some authority in Liverpool issued a circular for the guidance of working-class parents in that particular?—That circular, I think, originated in Bradford, with the late Dr Edwin Bronner, and it has been used and is used in many parts of the country yet.

6157. Do you think it has produced a good effect?—I think so.

6158. Is it not the case that blindness from birth is generally found to be associated with very low and unwholesome physical conditions?—Yes; well, the whole thing, of course, goes together—dirt.

6159. Is it the case, from your knowledge of the blind, that the blind are particularly liable to sexual emotions and sexual indulgence?—That is a difficult question; that is, of course, more with the grown-

up people, and I have not had much to do with them. Both blind and deaf are very prone to that kind of thing.

6160. And that particularly points to the necessity for institutions to prevent that kind of thing?—That is one of the great things against deaf institutions as deaf institutions—the troubles of that sort.

6161. Then is it not also the case that the blind generally marry the blind?—I have found that happen. I have records in my book regarding both blind and deaf, and even in the case of the blind I have found their children blind.

6162. Under our remit I think we are entitled to consider the condition of the children both in the Board School blind classes and in the Blind Asylums?—Well, I do not know much about the asylums, in fact I know nothing about them, and it is on the Board School classes I have had to deal with.

6163. There you advocate a full course of physical instruction for blind children?—In the case of blind children you cannot have too much physical instruction to give them self-confidence. The first blind school I went into in London I thought things were wrong. I spoke to the teacher about a boy there who was walking about the room in a very bad way. A blind child can go about almost like a normal one if properly trained.

6164. In view of the probable marriage of blind persons, it is desirable that blind children should have the benefit of physical instruction when in school?—Yes.

6165. That would tend to the improvement of the race?—Yes.

6166. And the children of the blind are not necessarily blind?—Oh, no.

6167. Would you say the same in relation to the Poorhouse children. You have spoken of them as living under exceedingly depressing conditions, and that they do not get a fair chance of child life?—They do not. They will now; in many parts of the country they are boarding them out in little homes.

Poorhouse children: physical exercise desirable.

6168. Would you approve of that?—Oh, thoroughly; they then approximate to the general population; that is all right.

6169. In their case also would you approve of physical exercises?—Yes.

6170. Under proper supervision?—All children want physical exercise.

6171. Apparently. In the case of Blind Asylums I know the blind children do get it, but I do not know that it is so in the Poorhouse, but it would be very desirable?—It is desirable.

6172. Would you advocate full ambulance instruction for boys over fourteen?—Oh, yes, I think so; that is almost necessary nowadays.

Ambulance instruction.

6173. Have you ever seen ambulance classes of boys?—I have taught them.

6174. Did you find the results good?—Excellent.

6175. More than one would expect?—Those were lads, of course, that I taught many years ago.

6176. Fourteen to seventeen?—Yes, fourteen to twenty, and I got excellent results with them.

6177. *By Mr McCrae.*—There is one point where you speak of the Swedish style of drill as being exhausting, and then you go on to say that it 'should not be applied to ordinary school children, in whom

Ages of children: exercise different.

'it would amount to fatigue; its place is distinctly 'in the higher grade school.' Do you by that infer that the physical capacity of children of the same age in those schools are different, or is it that the higher grade school child is of a greater age?—No, it is the age. If I may put it this way—the younger the child the more easily exhausted it is; and in the older children they are coming to the period of development where they can stand it with advantage; the young child gets tired out with it.

6178. In your statement of evidence you apparently approve of physical education which would give a few minutes' exercise at different periods of the day rather than one half hour per day?—What I mean here is, that you want to get two purposes by your

Physical education suggested.

Mr J. Kerr,
M.A., M.D.
29 May '02.

physical education; you want a few breaks of a few minutes in the course of every school lesson simply for the nutrition and stimulating purposes, and then you want your hour in two formal lessons for the educational value as well.

6179. Do you think the one hour a week in two formal lessons, and then other short periods, would be better than half an hour per day all through the week?—Well, twenty minutes twice a day would not be too much, I think, but you could not afford it on account of other things.

6180. Then you say that physical exercise should be continued after school life; have you had any experience at all of evening continuation schools?—No, I have had no actual experience of it, but I think it would be beneficial myself.

6181. Then what is your idea in saying that it ought to be continued after school life; how would you propose that this ought to be done; by any system laid down, or do you just put it in as a recommendation that boys and girls after they leave school should have exercises?—Well, they leave school between thirteen and fourteen most of them, and they still want exercise on to seventeen and eighteen, especially the complicated exercises and the exercises in which they have to use their brains.

6182. Yes, but have you any scheme in your mind as to how that should be done?—No; I have no scheme about that; it would have to be some evening continuation schools or something of that kind, but I have no definite scheme to recommend.

6183. *By Mr Fergusson.*—We were told by a medical witness that he did not consider there was very much use for physical training for country children, because they had a certain distance, perhaps on an average two miles, to walk to school, and he thought that was sufficient; do you agree with that?—No, I do not agree with that. I think that country children probably want physical training to a considerable extent in addition to their natural training which they get. Of course they do not want it as much as town children.

6184. But merely walking along a road will not make up for what you mean by physical training?—No, I do not think so; they do not need it as much as the town children, but still they need it, especially the older children.

6185. You said you were against children being given any work on Saturday because you thought they must have a clear day, but Sunday is a clear day, is it not?—Yes; but still I think that the child gets great benefit, both what one may call socially and otherwise, from having a day which it can devote to itself for play and what not.

6186. Supposing you were on Saturday morning to bring children together from a number of schools and give them a couple of hours or three hours of some sort of drill or games, or so on, would you object to that?—Would you give them a half-holiday in the middle of the week to make up for it? I mean I do not like the idea of their having five and a half days of school; my own feeling is strongly that a clear day is of great advantage to a child.

6187. We were told that the children were 'out of a job,' and they did not appreciate their Saturday holiday, for they had nothing to do; they loafed about, and they would be very pleased to have something found for them. You would not approve of that?—I would not like to ask children to go to school on Saturday.

6188. I am afraid I am not quite so ignorant of the poor law children as the Chairman suggested, but what you said is rather a strong indictment against poor law schools?—Yes, it is.

6189. I think we have the advantage there in Scotland, because, as far as my knowledge goes, the boarding-out system prevails all over the country?—Well, you do not know of the huge barrack schools that we have.

6190. You approve of music for physical exercises?—For young children, yes.

6191. From the teachers' point of view we have been told that they prefer to teach the exercises without music, and give music after the children have learned them?—Yes; well, there is something in that, but that is the detail of teaching, as it were, which I do not know so much about. Looking at it merely from the physical condition, I would prefer music for all the rhythmic work of the infants.

6192. Do I understand that you do not approve of the Swedish system?—Well, the Swedish system, what is usually understood, means very slow movements, into which the mind is put.

6193. The Swedish system is what is taught in the girls' schools under the London School Board?—I should say not; it is based on the Swedish system. That system is a good one.

6194. Do you prefer the system taught to the boys—the Chesterton system?—There is not very much difference between the two systems.

6195. You think they are both good?—They are both good. I mean in the infant schools under the London Board I think that might be modified somewhat, more especially in the direction of using music; that of course is matter of opinion.

6196. Did you mean to imply when you were talking of the infants that you thought they had too many lessons, is there over-pressure in the infant department?—No; I would have to go into that in some detail. The kind of work that is done in infant schools generally involves very considerable nerve pressure on the child; I mean a child that is set to work with a pencil or a pen has to use its fingers and its finger muscles at a period when it is unfit to do it. You cannot get children to hold their pen properly in an infant school. The task is too great for them. They hold it that way (*showing*), and then again when they are taught to read or when they are taught to write they bring their eyes—the infant's eye is shorter than a normal person's—and it would require a great effort of what is called accommodation to see clearly, they have to sacrifice that and bring the thing close up to their eyes. They see in a very blurred way and very broadly; if they are set to do any work they tend to do it about four inches from the eyes.

6197. Still you must teach them to write?—You can teach them with chalks on blackboards. You can eliminate a pen and pencil from every infants' school, and it has been done in every infant school that I know of, and you ought also to eliminate needles and thread from them.

6198. You wish to change the system of teaching?—In the infants' school needles and thread and pens and pencils should be abolished.

6199. *By the Chairman.*—And slates?—Well, chalks on boards are the most economical things. Slates, of course, go with the pencils.

6200. *By Sir Henry Craik.*—Have you seen the free-arm drawing in practice, and do you think that is a very good thing?—It is a good thing in infant schools.

6201. *By Sir Thomas Coats.*—In talking about statistics of chest measurement, you say that it is difficult to get them because there are several things which influence these measurements. You also say at the beginning of that paragraph: 'Breathing exercises modify these results, they do not increase the capacity of the chest to fill with air, but they do speedily increase the capacity of emptying the chest'?—Yes.

6202. You know the exercises, I suppose, that singers go through for the purpose of being able to continue the breath?—Yes.

6203. And also have you heard of it in the case of stammering children and young people, quickly inhaling to the full extent and then gradually letting the air out, and continuing that for some time?—That is to get a control of the breathing as it is called.

6204. Do you not think that strengthens the chest and develops the chest?—It will do to some extent. It develops the power of emptying the chest. If you take the chest measurements of children who are trained in similar ways, and one group gets breathing exercises and the other does not, you do not find any

Infants' education.

Singing exercises.

Mr J. Kerr,
M.A., M.D.
29 May '02.

difference in the development of the two groups; they both develop at the same rate, that is when the chest is full, but you do find a difference in the amount that they can expire in those who have had the breathing exercises.

6205. Would not that naturally strengthen the chest?—Oh, I think so.

6206. Or strengthen the lungs?—Oh, I think it does; it strengthens the control and it increases the respiratory exchange as it is called.

6207. Would you advocate exercises of that kind?—I think there ought to be some little breathing exercises; but to attach any great importance to breathing exercise as part of school work I should not do it.

6208. You would not do it?—No great importance, but I think there ought to be some simple breathing exercises just put into the other exercises to be used occasionally.

6209. You have great experience of children who work in factories in Bradford?—Yes.

6210. Is it your opinion that these children after they leave school, and having done a full day's work of ten hours in the factories, could beneficially attend evening classes both for physical drill and continuation classes?—A lot of these children do have other work in Bradford, large numbers. I do not know about the physical drill, but the work in the factory is not very heavy work; the work they do is very monotonous work, and they rather need physical work at other times, I would say.

6211. But would you advocate compulsory evening classes?—No; I do not think I would, that is a different matter, compulsion.

6212. You say that you would give up a certain amount of sewing for physical drill. Is that because you think sewing is bad for the eyesight, or do you consider that the amount of instruction in sewing learned in schools is so little as to be of comparatively little value afterwards?—I do not think that sewing is of very much use afterwards, and I do not think it has very much educational value. I think that the sewing that is learned in school in the last years of school life is not of very much educational value, and I think the time might be utilised in a much more advantageous way.

6213. Then would you apply the same idea to cooking in schools?—No; cooking is useful; they are using their brains there; cooking is a thing that has educational value.

6214. Do you think they can get such a comparatively large knowledge of cooking while they are in the Board Schools as to be of advantage afterwards?—I do not know about the amount of knowledge that they get, but I think the educational value of making them reason out things is very useful; the actual results in knowledge as a technical subject may not be large.

6215. Then you talk of the absolute ignorance of the parents with regard to hygiene that is in many cases?—Yes, the objectionable ignorance one might almost call it, the harmful ignorance to the children.

6216. If there is no time to teach hygiene and domestic economy, say, during the time devoted to the ordinary work in the Board Schools, would you not advocate that being taught in continuation classes?—Yes.

6217. Would you not make it compulsory?—But a good deal of the school work can be modified to be used for teaching that as well. The greatest improvement would be in teaching hygiene to the teachers first, and then if the teachers get to know that, they will modify their school work to be hygienic.

6218. Do you think that probably there might be enough time found in the time-table to give instruction in this?—Oh, it is for the teachers, I think, to work it in. At present they will be teaching a child the history of a lump of coal when they might be teaching him something of more use.

6219. Then you do not think it would be absolutely necessary to teach them this in the evening, to have evening classes for domestic economy and hygiene?—

It would be useful. I do not say it would be absolutely necessary.

6220. Then with regard to boys. I think you said you would not make evening continuation classes compulsory for the teaching of physical exercises and other subjects?—I am afraid my ideas would be rather revolutionary on that point. I should like to take the boys at the age of fourteen and put them to something for twelve months' hard labour, as it were. I think it would do them good, but I am afraid it would be worse than vaccination on the public.

6221. Just one other question. You talked about Shoo the value of shooting; where would the shooting come in?—I do not think I mentioned shooting. Oh, yes, military drill, boxing, self-defence, and shooting. It is accurate work shooting, and teaches them a great many things. I think they would pick up a great many things in that, and they take an interest in it. Shooting I mention because I think there is something to be attained there, and aiming after some ideal standard always increases the efficiency of the work.

6222. With safety ranges, I suppose, Morris tubes?—Yes.

6223. *By Mr Ferguson.*—Might I ask one question about tuberculosis. You have turned your attention specially to tuberculosis in children, have you not?—I have considered it chiefly in relation to children.

6224. That refers only to tuberculosis of the lungs?—Yes.

6225. Is it not a fact that the dust caused by the use of chalks gets into the lungs and predisposes to tuberculosis?—It predisposes.

6226. Because it is an irritant, is that the reason?—Anything that depresses the health generally.

6227. One of the great objections to the use of chalk in schools is the enormous amount of dust. That is the complaint we hear against free-arm drawing, and you have been advocating chalk. Is there any possibility of that being harmful to the lungs of the children?—Well, the dust which causes harm to the chest is dust which is insoluble, as a rule, coal dust for instance, stone dust; but chalk is soluble, and it may cause their mouths to feel dry if there is too much of it, but if it is properly used in school there will not be too much. Teachers at first when they began free-arm drawing in schools complained very much of that, but as they gained experience and learned to use small dusters and things of that kind that almost vanishes.

6228. But if they use them wrongly, and there is a great deal of dust, is there any chance of that causing tuberculosis?—I do not think that it would make any appreciable difference in regard to tuberculosis.

6229. *By Professor Ogston.*—Is it the duty of the medical officer to the School Board of Bradford, and in London, to examine all intending teachers in regard to their health?—Yes. They are all examined. In Bradford they are not examined as they are in London. In Bradford we simply fill up the Form 42 of the Education Department, which is a very poor thing indeed.

6230. They examine both pupil teachers and other teachers, men and women?—Yes. All candidates for employment under the London Board are examined. The women are examined by a lady doctor, and the men are examined by myself.

6231. And a pretty rigid examination?—Yes.

6232. Do you think it is important that all intending teachers should be examined by a School Board medical officer?—I think that all intending teachers should come up to a certain standard both as regards height and other things, vision and hearing.

6233. Would you be satisfied with the report of an ordinary general practitioner regarding their health?—Well, the reports of the ordinary general practitioner as a rule are very scanty in relation to many subjects, and they are generally his own patients, and he has to stretch a point in their favour if anything.

6234. All these papers here that you hand in refer, I suppose, to the examination of all intending teachers, both pupil teachers and others?—Yes; all these are the

Breathing exercises: not of great importance.

Continuation classes: physical training desirable: compulsion disapproved.

Sewing and cooking distinguished.

Hygiene: useful subject for continuation classes.

Tube chalk

Teac medi exam

Kerr, M.D. 1902. Education Department's forms which they require for every pupil teacher to be filled up twice in the course of their training, but it is very slight.

6235. Does it form a large part of your work; does

it take up a large share of your time?—I think there are about 1400 a year filled up in London, but chiefly by the woman doctor who examines the females.

Mr J. Kerr,
M.A., M.D.
29 May 1902.

The witness withdrew.

Mr JOHN A. SUTOR, M.A., F.E.I.S., examined.

Mr J. A.
Sutor, M.A.,
F.E.I.S.

6236. *By the Chairman.*—You are headmaster of Fraserburgh Public School, in the County of Aberdeen?—Yes, my lord.

6237. You have been teaching since 1862; you are sixty years of age, and you have been in your present place for thirty-one years?—That is so, my lord.

6238. The number on the school roll last year was 1124?—Yes, my lord.

6239. You have always taken a special interest in the out-door games and the exercises of the pupils, and you had military drill taught for several years in the early 'seventies,' but it was discontinued on account of the want of encouragement and pressure of other things?—That is so, my lord.

6240. Until it was revived in 1895, when the Education Department, for the first time, encouraged physical training in schools by adding the following Article 19 (b) to the Code: 'The higher grant (1s. 6d. for discipline) will not be recommended unless drill, or some form of physical exercise approved by the Inspector, be included in the curriculum.' Again in 1899, Article 19a (4), provides that 'The scheme of work for all divisions of the school shall make provision for adequate physical exercise, according to an approved system. In the senior division this exercise may take the form of military drill'; and again in 1900, Article 19b (2) of the Code says that the normal Block Grant shall not be increased 'unless the arrangements for physical exercise or military drill are satisfactory.'

6241. Since the Code of 1895 came in force, physical drill accompanied by music has been systematically taught in your school by your school staff, who hold certificates of competency from the Aberdeen Physical Training College?—Yes, my lord.

6242. Is that Col. Cruden's?—Col. Cruden's; we are not all certificated at the present moment, but at that date we became certificated. When the 1895 Code came out I instituted a class on my own responsibility for training my own staff and training those teachers in the district who might care to attend the class, and the result was that they all became certificated, and four of us took the highest form of certificate, called the diploma, issued by the training college.

6243. The time devoted to this subject is half an hour a week to each class, and in your opinion that is far too little?—Far too little, my lord.

6244. Then you go on to say the teaching of physical drill has not interfered with the advancement of the pupil, but, on the contrary, has brightened them up, improved their physique, and instilled into them habits of prompt and regular obedience, and it is looked forward to with pleasure. It would be attended to with still better results if it could be given more frequently?—That is so, my lord.

6245. The teaching of this subject has been discouraged in both evening continuation schools and continuation classes by the offer of smaller grants for it than for other subjects, and in your opinion this should not be?—That is so, my lord; and I would add a little more, that the grant for physical training in a continuation school is not paid to any pupil unless he takes a class in one of the other divisions. A grant for that subject alone is not paid unless the pupil who takes the physical training takes in addition another class in one of the other divisions.

6246. Then you say, no pupil should be allowed to leave school without a junior leaving physical certificate?—That is a suggestion, my lord.

6247. It should be punishable for a man to engage as an apprentice a lad who is not possessed of such a

certificate. Every young man in this country should be compelled to have in his possession by the time he is seventeen years of age a Senior Leaving Physical Certificate, that is to say you wish a certificate given, both while a boy or a girl?—Both while a boy or a girl

6248. Or a girl is at school—an ordinary elementary school—and further that you wish every young man to have a Senior Leaving Certificate?—A Senior Leaving Certificate.

6249. Does that apply to girls too?—No, my lord.

6250. With a proper syllabus of work for each of these leaving certificates—with suitable accommodation and apparatus—and with competent instructors, every young man in the country would in this way receive such a thorough physical training as would fit him for taking up arms for his country in a much shorter time, and with much greater efficiency, than he can under present arrangements. Would you explain that a little?—I mean, my lord, that if this were done, no young man could escape receiving such a training as would better fit him for his work in life, whatever that might be, and in the case of those who ultimately became volunteers, not much additional training would be requisite to enable him to bear arms.

6251. That he would be physically fit, and he would have good lungs, and be able to run, and possibly to shoot; you include all that?—I include everything.

6252. And you consider the mania for football, and the administration of justice by our present police courts are prejudicial and detrimental to the welfare of our youth and of our country?—Football: police courts.

6253. By mania for football do you mean the playing of football, or the looking on at football?—The playing of football and the looking on at football matches both.

6254. Because I mean one is exercise and the other is not; I want to know your opinion about it?—My opinion is that these scenes are attended with an immense deal of coarse swearing, and rough work, and coarse language.

6255. You have no objection to the actual physical exercise; the actual playing of football?—Oh, no, my lord.

6256. It is to the looking on that you object; to the people who are loafing about, looking, doing nothing?—The coarse swearing and the scenes that take place at the matches that are held all over the country—scenes of drunkenness and dissipation are injurious to players and onlookers.

6257. And what about the administration of justice by our present police courts?—I mean simply by that that the young men are not looked after after they leave school. They pretty much do what they like, my lord. I will give you a case in point; I was walking along a street in the town in which I live a few months ago, and a lot of lads of about fifteen, sixteen, or seventeen were playing football in the street, and one of them came running up against myself, knocked me into a door and pumped me out. I spoke to him about it. 'You have no right to be playing here,' and his whole attitude was that I should not have been in the way. I went into a shop and took the merchant out as a witness, took down their names, went to the police court and charged them; they pleaded guilty, with the result that they were sent away with an admonition. Next day they were all at the same thing; I saw them. That is quite a common occurrence.

6258. Was that a bailie court?—A bailie court, my lord.

Mr J. A. Sutor, M.A., F.E.I.S.
29 May '02.
Continuation Classes.

6259. *By Mr Alston.*—You spoke of continuation classes, and one of your difficulties was that you could not get in physical drill which you desired so much to encourage because they had to choose another subject along with that, and there are many who would take only physical exercise or military drill in a continuation class?—I think often there would be a large number.

6260. And they are obliged to take another subject in order to get the grant from the Department?—Yes, sir.

Military drill. 6261. You yourself have, apparently, no doubt as to the value of military drill; do you find many objections to it in your neighbourhood?—Long ago in the 'seventies'—perhaps you will kindly allow me to read this answer: 'Witness has always endeavoured to give what time and attention he could to the subject of physical training—long before the Department inserted it in the Code as a subject of instruction—as far back as the early "seventies." The training took the form of military drill.' I employed a volunteer sergeant in connection with the Artillery Local Volunteers, and I got 100 wooden guns made, and the local man was employed as instructor, and capital work of its kind was done; I have never seen better. It was a matter of public comment that the drill of the children was infinitely superior to that of the local companies of Volunteers; but in this case the instructor was an exceptionally good and suitable man. I do not know that ever we had a man in Fraserburgh—we have two such men—that would have been so successful as this man was; he was an exceptionally good man, polite with the children, able to keep order and not rough, as many of these men unfortunately are.

6262. That was the first instance of introducing military drill amongst the boys, and it was quite successful?—Quite successful.

6263. Then you have all along been in favour of it. Then as to the feeling of the parents of these boys or of the general public in the neighbourhood of Fraserburgh?—I have heard a talk on the part of some parents that they did not want their boys taught to be soldiers; but I do not think it prevails to any very great extent. I think it would be cordially adopted.

6264. Then you think military drill could be introduced in the continuation classes, and that it would have sufficient interest in itself to bring the boys without making the continuation classes attendance compulsory?—I think so, sir.

Physical training: hindrances. 6265. *By Professor Ogston.*—You have found that the bad weather and want of training sheds and halls have not prevented you carrying out the physical training well?—Oh, yes, sir. I have found these things have been serious obstacles. You see we have only half an hour given in our time-table to physical drill, half an hour a week to each class, and there were two difficulties in the way of our having more; in the first place we had no place to take them to; we had no drill hall. I have such a thing now, because, as Sir Henry Craik knows, our infants have been removed to an infants' school, and the old infants' room is now at our disposal, and we can at any time now take a class there for the purpose of physical drill, but before this year that was an impossibility.

Halls. 6266. Could you suggest any really practical remedy for the inclemency of the weather in such spots as schools around Fraserburgh—and in the Buchan district?—I would suggest that a hall should be had in every place for the training of boys and girls in the elementary school, for the training of them after they leave school, and also for the training of the local volunteers.

6267. Is not the expense prohibitive?—I do not know, sir; I am not aware, sir.

6268. *By Mr Fergusson.*—In fact, you would like co-operation in halls; you would like all who have need for a hall to unite?—One hall for all purposes.

6269. One hall for all purposes; volunteers and others?—Yes, sir.

Time. 6270. You think half an hour is too little; but how

much time would you like to devote to physical training?—I think it ought to be done daily.

6271. For how long?—Or three times a week.

6272. For how long?—Well, it should not be very much less than half an hour.

6273. Every day?—There are preliminaries; you have to take the class to the hall and to take it back again, that means a little time, and you need a little time to get under way, to get a beginning, to get all the apparatus ready, and so on.

6274. But could you spare that time from your other subjects?—No, sir, not as things are at the present moment.

6275. Why not?—We have so many subjects under the Code.

6276. Not so many compulsory subjects?—They are all compulsory. You have sewing and singing and drawing; drawing is, perhaps—for the moment I cannot remember if drawing is compulsory, but I think so, yes, and then you have nature knowledge, and so on.

6277. We know all these things, but we have been told by some who have tried it that they can give three hours a week to physical training, and the other subjects do not suffer; you have never liked to try?—I do not think; I am persuaded that cannot be done.

6278. Then you have not much faith in physical training, because the reason given is that physical training makes all the other work so much easier, and your children are brightened up, and it makes them do their other work in less time?—Quite so; that is quite true should you have time; you have not time.

6279. Well, you have not tried, in fact?—No, there is not time.

6280. *By Mr Shaw Stewart.*—Do many boys go to the sea from your neighbourhood?—A good few, sir.

6281. Do you think that a mast and other appliances of a ship erected in the playground would be of any value as a part of physical training for the boys?—It would be an advantage and would do good, of course provided there was a qualified instructor at hand.

6282. To teach them the elements of the use?—There are several exercises, such as rope-pulling up hand over hand, that are highly beneficial. A good deal of the physical training now practised, some of it at least, is spectacular; but exercises connected with boats would be very beneficial, no doubt about it. Those fishermen, for instance, on our coast are powerful men; you never see a fisherman bowed or slouching; you may find him lying flat on his back, with both shoulders touching the ground—or touching the deck—but you will never find him slouching; we have full-chested men as the result of over-hand pulling and such-like exercises.

6283. And if a boy intended to take to the sea, his early attention a few minutes every day in the playground might be of use to him in after life?—No doubt of it, sir.

6284. With reference to your notes, in which you state that a physical certificate should be required from every boy or girl leaving school, that is the first time we have had this suggested by a witness. Could you just amplify your statement as to that; how would you carry it out?—I would have an examination on certain things, and make the boy go through an examination on this subject just the same as he does on any other subject.

6285. Who would examine him—a teacher or a special instructor?—A special instructor. Teachers, as a rule, I think, should be entirely relieved, except in the junior classes of this kind of work. A very large number of our teachers, sir, are ladies. My experience is rather that they are not competent to teach physical drill to children who are over nine or ten years, or thereby.

6286. You would like to have a special instructor for the older children?—Yes.

6287. And how would you get that special instructor to work in with the teacher?—He would be there all day long, taking class after class during the day.

6288. There would be no friction, do you think,

Mr J. A. Sutor, F.E.I.S.

29 May '02.

between the instructor and the teacher?—Oh, none whatever.

6289. One question in regard to your last paragraph, in which you speak of the drunkenness and dissipation which can often be seen at football matches, and so forth. Do you think if a lad had gone through a good system of physical training he would be less liable to fall into drunken habits as he grew up?—He would not have the same opportunity; it would be an attraction away from the public-house in the evenings; that is what I mean.

6290. Quite so; and if physical training were extended in schools—if a boy began early to learn physical exercises—do you think that would have a beneficial effect upon him in after life?—I have no doubt of it; he would be disposed to continue it, because it is a subject that boys and lads are fond of.

6291. *By Sir Thomas Coats.*—How long do your children or young men remain at school?—Till about fourteen in the elementary school.

6292. Not beyond fourteen?—Well, some might be beyond fourteen, but not many.

6293. You do not have them going on to sixteen, seventeen, or beyond that?—Not in an elementary school; they would be in an advanced department.

6294. You have evening classes, have you not, in Fraserburgh?—Yes, sir. This is the first year of the continuation classes, and I thought our class was to be a great failure, because they are failures to a very considerable extent over the country; but it was the very opposite, we had a very capital class.

6295. Are these classes encouraged by the fact of your giving physical training in the evening?—They would be encouraged.

6296. Is physical training given in the evening in the continuation class?—No, sir.

6297. Not at all?—Not at all; those who would take physical training object to take the other classes

necessary to fulfil the conditions requisite to enable us to obtain grants.

6298. But do you not think that it is a good thing to oblige them, or to tempt them I would rather say, by giving them physical drill, and, perhaps, applied gymnastics in the evening, to encourage them to take other classes as well; they cannot be thoroughly educated at fourteen?—No, they are not thoroughly educated, many of them. They are far from it, sir. There is a large number who will come back to other classes.

6299. But could you not induce them by encouragement of that kind, say, if you went in for a gymnasium, that would be a great inducement, would it not?—Yes, it would be an inducement, but still I do not think they would do it.

6300. They would come for the gymnastics but not for the other classes?—Yes, that is so.

6301. *By the Hon. Thomas Cochrane.*—As the Games: result of your rather painful experience of the football playground. in the streets, I should like to ask you whether there is any opportunity for football—any playground for the boys?—Large links on which anybody can play—a large common open to the public.

6302. They have plenty of room to play games?—Oh, ample room; very few places have such room as we have.

6303. They are very fond of physical exercises—the boys?—Oh, very fond of it.

6304. And you would rather encourage it in a legitimate way than allow it on the streets?—Yes, but policemen complain that in present circumstances they are powerless.

6305. You mention that your own early efforts failed for want of encouragement?—I had so much else to do; there was so much else to do in the school that I could not spare time and do my other work.

6306. That was in the days before the School Board?—Before School Boards, and also in the early 'seventies.'

The witness withdrew.

Mr DAVID M. J. JAMES, examined.

6307. *By the Chairman.*—You are the headmaster of the Huntly Public School, Aberdeenshire?—Yes.

6308. How long have you been so?—I have been so for twelve years.

6309. Where were you before that?—At Forres.

6310. You call Huntly Public School a town school, or do you call it a country school?—It is intermediate.

6311. Therefore you may be considered a representative of both town and country?—A little, yes. Might I explain: it is one of three schools in Aberdeenshire which are recognised as centres for secondary instruction in Aberdeenshire.

6312. Would you kindly read your preliminary note?—Physical training in this school has been hitherto most seriously handicapped by the want of a gymnasium or other room affording sufficient floor space. It has been necessary to use the infant room (when disengaged) for the physical drill of most of the classes, and the accommodation there is insufficient in extent, as well as objectionable in other respects. In summer some of the drill is done outside, but the want of the regulating and enlivening influence of musical accompaniment is much felt.

6313. You proceed to recapitulate the nature of the physical drill done, which, I presume, is from your time-table?—Yes.

6314. Taking that altogether, how much is done per week per pupil?—Well, on an average just half an hour.

6315. Half an hour per week?—Yes.

6316. Is that because you proposed that in your time-table, or was that time assigned to you by the inspector or other authority?—No, I may say it was my own doing, as being all I thought we could afford under the circumstances, but I have always thought it perfectly inadequate, and I have always regretted it very

much, and I may note that this want of a gymnasium is at present being repaired—a gymnasium is to be erected.

6317. Under what authority is the gymnasium to be erected?—By the School Board.

6318. And entirely paid for out of the rates?—Yes.

6319. May I ask what rates, the rates of the Huntly what?—The rates levied by the Huntly School Board.

6320. What is the Huntly School Board; is it simply the Huntly parish?—The Huntly parish, yes.

6321. And Huntly parish includes what?—Oh, a radius of a mile or two round about the town.

6322. What is the population?—Huntly town is slightly over 4000, and the parish comes to somewhere about 4700—the whole population.

6323. Do you happen to know what a penny rate brings in?—The rating is 5d. per £1 at present; I am not sure what sum it brings in.

6324. I did not know whether you happened to know each additional penny brings in so much?—Yes, I am not quite sure.

6325. You say that drill is taught by the ordinary Teachers: teachers of the respective classes?—Yes. ordinary staff

6326. For a few months a specially qualified instructor was employed, but the results were on the whole less satisfactory than with the ordinary teachers. Not having the same 'grip' of the pupils, he did not seem to get the same work out of them?—That is the experience we had; of course, it was a short experience.

6327. Then who examines the pupils in physical Inspection. exercise?—The ordinary inspector.

6328. What did he say the last time he examined them?—When he has remarked on the subject he has always expressed himself as well pleased.

6329. Had you any special exercises ready for him

Mr J. A. Sutor, M.A., F.E.I.S.

29 May '02.

Mr D. M. J. James.

- Mr D. M. J. to see, or did he just take the classes as he found them?—Just as he found them.
- James. 6330. Just saw each doing what they were accustomed to do from day to day or from week to week, I should say, rather?—Yes.
- 29 May '02. 6331. Then continuation classes; there has been no physical training in connection with those hitherto?—None.
- Continuation classes. 6332. But private classes in physical drill and gymnastics are held in the town every winter. These have been fairly successful in point of numbers, and could be developed to some purpose in connection with the continuation classes. How are they arranged for?—Well, it is simply a private enterprise. It is this same instructor who holds classes on his own initiative at his own risk.
6333. When you say the same instructor, do you mean the same instructor that you have dismissed as it were?—Yes, the same man.
6334. But you have dismissed him from the elementary school?—Well, he left for South Africa, and he was not taken on again when he came back; it was not found to be satisfactory.
6335. But the same instructor, on his own hook, as it were, has started continuation classes; what are virtually continuation classes?—Yes; you may call them so; yes.
6336. And how are they paid for?—Oh, the pupils themselves just pay a certain sum to him.
- Boys and girls. 6337. Is there much readiness among pupils, do you find; there are boys and girls also?—Yes, both.
6338. What sort of size would his class be?—Well, he has different classes. He has them at different ages from those of school age up to young men.
6339. And is it within your knowledge that he grades his classes according to age?—No, he does not.
6340. I mean his further classes?—No, he does not.
6341. How does he grade them then?—I am afraid he is hardly able to grade them.
6342. He takes every one who comes?—He tells me he must just practically give them what they want.
6343. They all come to him in a body?—They all come to him in a body.
6344. And he gives them something for their money?—And he gives them something for their money.
6345. There is no examination?—There is no examination.
6346. None whatever?—No.
6347. And they get nothing in the way of a grant?—Nothing.
- Mental plus physical training. 6348. Have you any strong opinion as to the advantage of physical instruction of children?—Yes, yes, I have; I think that it is quite as essential that they should be trained physically as that they should be trained mentally.
6349. And the two things go together?—Yes.
6350. One helps the other?—I should think so.
6351. Perhaps I should not say one helps the other, but the physical exercise helps the mental?—The physical exercise helps the mental; I should certainly say so under proper circumstances.
- Health. 6352. What sort of state of health obtains generally among your pupils?—I may say we are a country district as a whole, and good health prevails.
6353. There is not much smoke about you, is there?—Oh, no, no.
6354. Do you find any complaints from parents or otherwise as to physical instruction being given; do they think that in giving physical instruction in your elementary schools that the mental instruction is retarded in any way?—Oh, no.
- Militarism. 6355. Is there any cry in your district against what they call militarism?—No; I have heard none.
6356. Is there any instance of militarism?—I do not know that there is any occasion for the cry.
6357. What do you call militarism; it is a word very much talked about?—It is a difficult thing to define.
6358. But it is mentioned very frequently in the public press at present?—Properly considered, I do not see any objection to militarism; we should all of us be potential soldiers, and in that view I do not see any objection to it.
6359. Have you any Volunteers in your district?—Yes.
6360. Any Boys' Brigade companies?—There is a Boys' Brigade company.
6361. How many?—About eighty.
6362. Eighty companies?—Oh, no; about eighty in the company.
6363. Oh, one company?—One company; yes.
6364. And what denomination is that under?—It was begun by the Episcopalian clergyman with a committee—there is no official standing, just, you may say, private enterprise.
6365. Do I understand you that all religious denominational authorities join in that?—Oh, yes.
6366. But they do essentially join in it?—They do.
- School numbers of pupils. 6367. By Sir Henry Craik.—What is the size of the school of which you are headmaster?—The number of pupils on the roll in the summer time, when it is the largest, amounts to about 900.
6368. When was the school built?—In 1841 originally; the original Duchess' School was founded in 1839.
6369. But surely there has been a good deal of building since the School Board came?—Yes; that is the original building.
6370. From first to last the cost of the building must have been perhaps £10,000 or £12,000?—I should think so, probably.
6371. What would the cost of a drill gymnasium be?—Well, the idea was we are wanting room, our classrooms are insufficient, and the present idea is to have it along with an additional building, and the additional building, which was to contain six classrooms and a gymnasium, is calculated to cost about £4000.
6372. How much of that do you ascribe to the gymnasium?—Well, perhaps it is a little difficult for me to say—perhaps £1200.
6373. Yes; about one-twelfth part of the cost of the school?—Yes.
6374. Your rate is under the average in Scotland?—Yes.
6375. Considerably?—Yes.
6376. So that really no great burden would be placed upon the School Board by building a gymnasium at any time?—No.
6377. Probably the fact was that they really did not attend much to this subject?—Oh, that is the fact.
6378. It was not the difficulty of raising the very small sum required, but the fact that they had not when that school was constructed thought it was an important part?—Quite so, and even yet.
6379. You speak about the enlivening influence of musical accompaniment?—Yes.
6380. Why is that wanted; why have you not got that?—We have it inside; I mention that in connection with the outside, when we take it outside, that is an objection to having it outside.
6381. You never tried anything like a school band?—No.
6382. Going on to the next point, you attach much importance to this physical drill?—Yes.
6383. I observe that as your classes go on from three-quarters of an hour it drops to half-an-hour as the week?—Yes.
6384. Why is that?—Just the pressure of subjects in we go upwards.
6385. Whence does that pressure come?—Well, I suppose we may put it, partly the pressure at the end is, of course, to make a good appearance at the merit certificate.
6386. Something else; you send a good many boys for the bursary competition at Aberdeen, do you not?—We used to, but that has rather dropped; our clever boys are rather giving that up and going in for the Civil Service work rather.
6387. Then it is not anything that is required by the Department, but it is the competitive pressure in brain subjects amongst the boys?—Yes; partly that.

I. J. 6388. What else?—Well, another point is our classes are very heavy at present; they are understaffed. We have, for example, an average of 100 in a class or standard, with a certificated teacher perhaps and an ex-pupil teacher or pupil-teacher. That is of course quite understaffing. That also, I am glad to say, is being remedied.

6389. That understaffing as well as insufficient premises has been the means by which your School Board have got its rate considerably lower than the average of Scotland?—It is; that is so.

6390. The want of being able to overtake this extra work is not then due to anything in the Code, but to the unwillingness of the School Board to make the proper provision?—Well, I should at least be inclined to say that; under favourable circumstances—that is to say, with a proper staff and with a gymnasium, there would be no impossibility in our case in giving physical training daily. I should at least go that length.

6391. There would be no impossibility?—There would be no impossibility of giving it daily.

6392. And, of course, from what you have told us just now of the appreciation you have of the importance of physical training, you cannot possibly be satisfied with one-sixtieth part of the week given to it?—Certainly not.

6393. That is all that you give, I think?—Yes.

6394. Out of thirty hours, you give half an hour a week?—Yes.

6395. How do your ordinary teachers get the instruction that is necessary in the absence of a qualified instructor?—Well, we usually have five or six qualified by having attended those classes under Colonel Cruden in Aberdeen; those classes for teachers in Aberdeen.

6396. And you think that is sufficient?—No, I do not think that is sufficient. When I say I should prefer the ordinary teacher, I am thinking rather of what should be, that is to say, that I think the teachers should be trained also—thoroughly trained, physically as well as mentally.

6397. What amount of instruction have they from Colonel Cruden's Institute?—It means three weeks three or four hours a day.

6398. And then with regard to the last paragraph, you speak of those private classes of physical drill; those private classes are paid by fees?—By fees.

6399. Then presumably they are confined to the well-to-do class in Huntly?—Yes.

6400. I mean to those who can pay a fee?—Yes.

6401. The poorest class are excluded?—The poorest class are excluded.

6402. And there are not evening continuation classes for physical drill open to the poorer classes without fees?—No, there are not.

6403. Do you think that they would avail themselves of it if it were open?—I should think so.

6404. The School Board has never turned its attention to that or sought to get a grant for that?—No; I do not think it has ever seriously considered the subject.

6405. *By Professor Ogston.*—Do you consider that your teachers and inspectors are competent to detect in the children all the defects that bear upon their fitness for physical drill?—Well, that is a point undoubtedly; no, scarcely.

6406. Would you desire that they should be trained by the advice of a medical officer?—Oh, I think certainly; harm might be done, instead of good.

6407. *By Mr Fergusson.*—You say you are going to have a gymnasium?—Yes, sir.

6408. Is that for teaching gymnastics with appliances, or is it to be used as a drill hall?—It is with the idea of just carrying on this same drill, only in a more efficient manner, I think, and probably there will be apparatus—that is not mentioned here—for the higher pupils.

6409. You mean when a class is going to have physical training of any sort, it will be taken into the gymnasium?—Yes.

6410. When you have got that, do you propose to

increase the time devoted to physical training?—I should like to give it, say a quarter of an hour a day, or, say, twenty minutes each day—daily.

6411. That would not come to two hours a week even?—No.

6412. But why not more?—Well, I really do not know if we could afford more.

6413. You are afraid of its having a bad effect on the other subjects?—Partly, and I think if twenty minutes—if it were really done every day and were taken advantage of to the full—would be fairly satisfactory.

6414. At anyrate, you look forward to more?—Oh, certainly.

6415. Is your Board much interested in physical training?—I cannot say that it is much interested. Some of the members are, but on the whole the attitude is one of scepticism as to the good of physical training. They say, of course, 'We are very well off for playing grounds, and our boys and girls could have ample opportunity for games,' and many of them hold that that is quite enough.

6416. In what way did you find your instructor 'less satisfactory,' as you have expressed it?—Well, he did not have the same command over them; he was excellently qualified himself; but I could see that they themselves did not seek to exert themselves.

6417. Then you entrusted him with the whole teaching of the class?—For the time, yes.

6418. He did not come in the way of just supervising the work the teachers were doing?—No.

6419. What would you say to that plan of doing it; that the teachers should do all the ordinary teaching, and that the expert should only come now and again to see that everything was going on right, and to point out with his expert eye any fault in the teaching or in the scholars?—Well, I daresay there might be no objection to that.

6420. Would you like to see physical training carried on after the age of fourteen?—Oh; I think it is a thousand pities it should be stopped at the age of fourteen, which is when I think really it is beginning to have some effect.

6421. Would you be prepared to make it compulsory?—Well, rather than not see it, I would.

6422. Would you make it a subject by itself, or would you include some other form of learning in the continuation classes?—I do not think I would associate it with any form of learning—of mental work.

6423. You would make some form of education compulsory, and let physical exercise be one of the subjects?—Yes; I think we all of us should be prepared to serve—if in no other capacity—as volunteers, and along with that a system of physical training might be combined.

6424. You have got the idea of a volunteer as the end of it; but consider it solely to make the male population—or the whole population—physically fit?—Physically fit; yes.

6425. Without any reference to whether they are going to be volunteers or not?—Oh, certainly; yes.

6426. *By Mr Alston.*—In the word 'grip' how much do you include; you have hardly answered Mr Fergusson's question?—Well, control over the class; they felt that he had not, as it were, the same authority over them that their ordinary teacher had, and, therefore, they did not exert themselves in the same way.

6427. Even in his giving the commands; did they not recognise the authority in giving the commands?—Not with the same alertness and smartness that you would have considered indispensable for physical drill.

6428. And yet a professional instructor of that kind generally gets all he wants?—I suppose so; I am just telling my experience.

6429. Is he the only man you have come into contact with?—Only this man.

6430. So you cannot speak generally?—No.

6431. Then on the whole you distinctly advise that the teachers of the schools should be qualified to instruct?—I distinctly understand that.

6432. And they would have the grip and control?—

Mr D. M. J.
James.

29 May '02.

Board's
attitude.

Physical
training
after fourteen:
compulsion.

Expert
instructor.

Teachers:
ordinary staff.

Mr D. M. J. They would have the grip and control. A specialist perhaps is inclined to drive his own hobby too far.

James.
29 May '02.

6433. What kind of hobby?—Suppose a man comes in for physical drill, he might perhaps drive the physical drill a little too hard; the teacher would probably have more sympathy with the pupils, and more knowledge of their separate individualities, and constitutions, and capacities; and be better able to make allowances for them.

6434. It would have the double advantage of the teacher being competent to instruct, and also of knowing the individual pupil?—Yes.

Boys' Brigade.

6435. Then the other point is about the Boys' Brigade company. If I am right, Huntly is one of the examples in which several denominations joined together in raising a company?—Yes.

6436. There is only one company in Huntly?—There is only one.

6437. The strength is about 80?—About 80.

6438. Where are the officers drawn from, do you remember?—The officers are drawn from the Volunteers.

6439. In connection with more churches than one?—Oh, yes.

6440. What do you consider the value of the Boys' Brigade company is in connection with physical and military drill in the school; you have boys from twelve to seventeen, and therefore many of them are within school age?—Many of them are within school age.

6441. Has it any effect on the school, either in the matter of discipline or the desire for exercises of that kind?—Well, I should certainly say it was good.

6442. Could the Boys' Brigade company fulfil the conditions of the further teaching of physical drill and military exercises in continuation classes?—No, I do not think that would be sufficient; I think it would need to be more regular and systematic than their meeting.

6443. Throughout the whole year do you mean?—Yes, or at any rate throughout the whole winter.

6444. Instead of merely during six months?—Yes.

6445. Are they very efficient?—They are considered an efficient Boys' Brigade company; yes. They have very good officers.

6446. Then upon the whole you would say that their influence was good in the direction that you desire, in view of the importance of physical exercise and drill?—Yes, the influence is good so far as it goes.

6447. *By the Hon. Thomas Cochrane.*—I see you refer to the drill having taken place in the infant department?—Yes.

Ventilation.

6448. And that was objectionable in some respects?—Well, ventilation.

6449. The ventilation was bad?—Well, although there is an interval, still the place cannot be so thoroughly ventilated as a physical drill hall should be. You will want, of course, very good ventilation when physical drill is going on.

6450. Is it generally an ill-ventilated apartment?—I cannot say that it is well ventilated—the ventilation has not been a success.

6451. Is it in the winter necessary for infants that they should have a well-ventilated room to do their ordinary work in?—Oh, certainly. I do not say that it is badly ventilated, but it is not what I should like to see it finally.

6452. And has anything been done to improve the ventilation?—Yes, many things have been done.

6453. Has it been reported on by the inspector as being an ill-ventilated room?—Yes.

6454. And yet the defects have not yet been remedied?—Yes, the board have done a number of things, but I cannot say with complete success.

Classes :
overcrowding
and
understaffing.

6455. And are your classes—I gathered from what you said that they were overcrowded?—Yes, I think they are.

6456. And under-staffed in the elementary classes?—Yes, but that has been set right; that is what the building is for—to allow of greater room—a new building.

6457. You intend to have more assistance in the elementary classes than in the past?—Yes, more room and more assistance.

6458. Did the Inspector make any remarks upon the general animation of your pupils; do they suffer from these ill-ventilated rooms and want of supervision; are they animated in manner?—There has been no complaint on that score.

6459. Not that they appear to be in their oral work?—No complaint has been made.

6460. I see a report here that was handed in—1901—in which the Inspector remarks that 'Standard V. boys are doing good work on paper, but are without sufficient animation in their oral work'; that had nothing to do with the ventilation?—That remark did not bear on the ventilation.

6461. I see that apparently in this report what I infer want to get at is that in the earlier classes—the infants and so on—you give more time I think to physical drill than you do in the later classes?—Yes, that is so.

6462. You did not exactly explain why it is in the later classes?—Well, in the infants you scarcely have an infant class without giving them considerable relief from mental work; you must do that in the case of infants especially; there is not the same absolute necessity, perhaps, in the upper class, although it is certainly highly desirable.

6463. You think it is very desirable they have physical education in the upper classes?—Oh, certainly.

6464. I see in your upper classes that you go in for rather high subjects, rather, I should have thought, beyond the scope of an ordinary elementary school; you go in for Latin and French and German?—Yes, but you see we have a secondary department, with a separate building and a separate staff.

6465. It does not refer to your ordinary elementary classes?—No; it is a different department.

6466. What length of time would you suggest as being sufficient for physical exercise for boys up to fourteen years of age?—Well, I have mentioned a quarter of an hour daily.

6467. A quarter of an hour daily as being a minimum?—As being a minimum.

6468. You had a specially qualified instructor not successful, I think?—Well, he had not that grip, as I say; he had not that control. He did not get the same work out of the scholars as their ordinary teachers do.

6469. How was he qualified?—He was at Aldershot; went through a six months' course at Aldershot.

6470. In the gymnasium?—Yes.

6471. And was it more in manner that he failed?—Yes; he was a young fellow, and they just seem to think, 'Now we are not under our ordinary teacher, now we are not supervised in the same way, and we will rather take it a little bit easy.'

6472. And he had not got the moral qualities?—No.

6473. Could the teacher not have been present to support him?—Well, there is a little difficulty of divided authority there, perhaps.

6474. Was there any jealousy between the teachers?—Well, a little bit; yes, a little difficulty. I do not think they could work well with him.

6475. Perhaps he was not of sufficiently high calibre to influence the teacher. If he was a man obviously thoroughly acquainted with his subject, the teacher would be willing, perhaps, to take hints from him?—Oh, certainly.

6476. If he was a man of lower social standing than the teacher he might not be so ready to submit to his teaching; was that the point?—I do not know that that was the point; that may have had something to do with it.

6477. I want to get what you would suggest for the future. The teacher would be perhaps the better with some skilled supervision from time to time?—I think so, provided that there was a provision that the teacher was thoroughly trained, or as thoroughly trained as

physically as they are at present mentally—went through a thorough course of instruction.

6478. If your elementary teachers in the schools were thoroughly trained?—Were thoroughly trained; yes.

6479. But you think they should be supervised from

time to time by a professional expert?—A professional expert; yes.

6480. Not of the calibre you have had, but rather superior?—Superior.

6481. A kind of superior education and intelligence?—Yes.

Mr D. M. J. James.

29 May '02.

The witness withdrew.

Mr E. NOBLE SMITH, F.R.C.S., examined.

Mr E. Noble

Smith,
F.R.C.S.

6482. *By Professor Ogston.*—You are F.R.C.S., Edinburgh?—Yes.

6483. And L.R.C.P., London?—Yes.
6484. And senior surgeon to the City Orthopædic Hospital, Hatton Garden, London?—Yes.

6485. And you have had very great experience regarding such a subject as we are dealing with just now?—Yes, I believe so.

6486. Disease during the development age?—Yes.

6487. From developmental and other causes, and from long experience?—Yes, about twenty-five years.

6488. Would you mind just going on now with your notes of evidence?—The first question is in regard to the standards of height, weight, chest girth, spirometry, and biceps girth of children, at various ages from six to eighteen years. The standards of height, weight and chest girth have been already much discussed by medical men, and the facts elucidated are no doubt of great value. Height, weight and chest girth have a distinct value in estimating physical development, but they do not give much information as to physical strength. The points which I consider of much greater importance are—the ability of the individual to maintain an upright spine and an expanded chest. Even a weakly child may hold himself upright with the chest expanded for a few moments, during which measurements may be taken, but he will droop again directly afterwards to his habitual posture—to his habitual stoop in sitting, and his habitually protruded abdomen and flattened (or depressed) chest in standing. We meet with various conformations of bodily structure—tall, short, stout and lean—and often the height is much in excess of the breadth of body for physical perfection, but the object being, not to select the strongest figures, but to do the best for all, it becomes the more important factor to direct our efforts to making the best of each individual. For instance, if a child exceeds in height, we cannot reduce that height, but we should endeavour to keep him upright, by strengthening his back and developing his breathing powers, and thereby developing his chest. This leads us to the subject of spirometry, which was long ago extensively experimented upon by the late Dr. Hutchinson. The details of Dr. Hutchinson's work are highly interesting and instructive, and I think it would repay the trouble to examine children and youths in this way to discover their powers of respiration. However, we have a more practical indication of these powers in observing the ability of young people to hold themselves erect and keep their shoulders back, and their chests expanded without throwing their abdomens forward. (*Witness then showed some photographs illustrating young people with severe stoops and other spinal deformities arising from weakness, in combination with bad postures in standing and sitting.*) The methods by which these results are to be obtained certainly include systematic physical exercises, but they also demand attention to other points. These points are in my opinion:

1. Suitable clothes.—The majority of children being prevented from developing naturally by clothes which restrict chest development.

2. Postures in school.—Stooping and twisting the body, being caused by unsuitable chairs and desks. In this respect upright handwriting and ambidextral work are very helpful as preventives.

3. Nutritious food.—Want of power being engendered by want of sufficient nourishment. Growing

children require as much nourishing food as they can take.

Upon all these questions I could enlarge very much, but I have concentrated them as much as possible. The biceps girth of children I consider to be a matter of almost absolute indifference. I should depend upon general appearance of physique, firmness, not size, of all muscles, and the ability to sustain exercise without unnatural fatigue. My observations in regard to suitable clothes refer to children up to any age; there is no limit to it. Certainly from perhaps two to twenty. You might apply it to any age. As regards estimating the physical strength by measuring the biceps muscle, if we only had the biceps to go by, you might get some indication as to general strength, but to take a biceps measurement as a standard test is to my mind a very uncertain method. You might develop the biceps, and a child might be taught to use one arm only and develop the biceps of that arm, and yet he might be feeble and weakly everywhere else. It is the general appearance, the general physique, which is the best guide. A healthy child is naturally active, and any want of disposition to activity I should take as an indication of weakness of system requiring medical supervision. As to the particular age, we should not expect nor desire great muscular development in young children, certainly not under twelve years of age, or even under fourteen years. Up to the time of puberty a child is developing—in plain words, growing—and is not qualified to endure any great trial of strength. Therefore the exercises during this period should be moderate in extent and well within the powers. Many children are deformed by too great a strain being put upon their physical powers during the age of growth. During this early period well-ordered games, such as cricket, fives, football, hockey, etc., are the best exercises, although systematic drilling is also beneficial if kept well within the powers of the pupils.

Points requiring attention.

The proportion of physically and mentally defective children, from such causes as nerve deafness (incurable), diseased ears, blindness (myopia, hypermetropia, astigmatism), tubercular glands, tubercular joint or other diseases, rupture, diseased teeth, deformities, general weakness, etc.?—I am not prepared to state the proportion of children who suffer from tuberculous diseases, such as diseased glands and joints, deformities, general weakness, etc., but I consider that such diseases emanate chiefly from the following causes:—

Diseases: causes.

1. And foremost, insufficient nourishment.—I am told by Scotch medical men that in the Highlands tuberculous diseases were rare while there was plenty of animal food for children, but during more recent years, when they have had to depend more upon farinaceous food, tuberculous disease has greatly increased. And this statement is quite in accord with my own observations of children generally.

2. Good Hygiene.—Fresh air is very important, and although the air of Scotland is phenomenally healthy, yet the homes of the poorer classes in all countries are often unhygienic, and children have to sleep in close ill-ventilated rooms.

Are country children physically or mentally superior to urban children? Do statistics exist bearing on this? Are country children improving or degenerating? Statistics? Are urban children improving or degenerating? Statistics?—As to country *v.* town children in respect to physical and mental development, I consider this is generally a matter of detail. Granted equal

Town and country children.

Mr E. Noble Smith, F.R.C.S.
29 May '02.

advantages as to food and hygienic surroundings, the country is undoubtedly superior to towns in respect to general health, and therefore as to physical and mental capacity. I use the word capacity advisedly, because the influence of town life may unduly develop the mental capacity, and the extra advantages often obtainable in towns for systematised physical teaching may unduly develop physical strength.

Exercise for country children.

Does the work or exercise of country children dispense with the need of systematised exercise for them?—As to the work or exercise of country children being calculated to dispense with systematised exercises, that depends entirely upon details. We must be guided by general principles. And under both circumstances the physical exercise should take a prominent place in the daily work.

Physical and mental development: relation.

Does improved physical development entail improvement in brain power and in acuteness of the faculties? Do limits as to this exist, particularly at any age?—Physical development if not carried to excess will improve the brain power and acuteness, or I would rather say ability of the faculties. As regards age it must always be remembered that in the young (certainly under fourteen) we must not force the powers either physical or mental. We do not aim at producing phenomenal children, but strong and able adults, and therefore all development, either physical or mental, must be allowed to take place gradually.

Morals.

Does improved physical development imply improved morals? Does improved physical development promote morality?—Whatever conduces to health also conduces to a sound morality, and therefore if a child be physically developed in a healthy and not too forced a manner, his morality will be improved.

Physical census.

Is a physical census of children desirable or necessary? In what ought it to consist?—It would be useful, but would require a great deal of work by well-qualified medical men.

Medical inspection.

Is inspection of the health of school children by a medical man necessary at present? Will it become necessary if physical training be increased and rendered more systematic?—Most desirable. It is impossible for a layman to estimate the physical capacity of his pupils. The medical diagnosis of disease, for instance of the eyes, cannot be undertaken by anyone but a medical man, and such inspection would be very desirable whether 'physical training' be increased or not.

Girls: special clothing.

Is special clothing required for girls undergoing physical training?—Yes and no. Yes, if the present unsuitable clothing be persisted in. No, if all children were so clothed that they had free use of their lungs and limbs.

Physical training: forms.

Distinguishing the following forms of physical training, viz.:—Ordinary exercise; ordinary work; walking and running; games; exercises of the trunk and limbs; musical drill; gymnastics; military drill; self-defence; boxing; shooting; swimming.—All the exercises named are good in their way. There should be a judicious adjustment. There is one method of physical development which I would suggest has been omitted, that is the workshop, and I think that in physical training a great deal might be done by making the physical exercise of a useful character. I think that use of a workshop might be added to the gymnastics and military drill, etc., and become a very valuable and important physical exercise as well as a useful instruction. I should very much like to add that kind of physical exercise to the others.

Workshop.

What is their absolute and relative value to children aged from six to twelve; from twelve to fourteen; from fourteen to eighteen?—From the ages six to twelve, exercises should consist almost entirely in play. Nothing which entails continued strain upon any set of muscles should be permitted. Therefore long walks are objectionable, and games which entail long-continued strain. Systematic exercises such as are now called Swedish, or musical drill may be introduced, but regular daily gentle exercises should predominate rather than occasional excessive drills, that is at the earlier age. Then from twelve to fourteen greater

latitude should be observed according to the peculiar aptitude of individuals. Here medical advice would be very useful. From fourteen to eighteen the pupil should, if healthy, be able not only to undertake the regular systematic exercises, but also and with advantage to take part in trials of strength—such as racing across country, etc., but even at this period of life the weakly should be restrained.

Do they, in the healthy, prevent eye disease (short-sightedness, astigmatism), joint diseases, spine diseases, tuberculosis? Do they, in weaklings and those predisposed, cause or favour rupture, heart disease, joint and spine disease, tuberculosis, fractures, dislocation, or other injuries, brain and sinus disease in ear cases?—Physical exercises which develop the body healthily will ward off the tendency to disease, but can hardly be considered curative or even preventive of some of the diseases named. If any of these conditions exist, a medical man's opinion must be obtained before any rules as to physical exercises can be safely given. Weaklings and those predisposed to rupture, heart disease, etc., ought to be examined by a medical expert, who should define accurately what kind of exercises are suitable to each particular individual. The next question is:

Are (1) exercises required by the present race of children? Are (2) games required by the present race of children? Are (3) gymnastics required by the present race of children? Is (4) military drill advantageous to the present race of children?—I do not see how the present race of children differ from former ones sufficiently to make us differentiate as suggested. The chief difference that I see is that in the present day the nervous system is more developed than the physical, and we see rapid growth in excess of robust growth. Undoubtedly modern requirements tend chiefly to develop the nervous system.

To what extent is (5) first aid and ambulance instruction desirable, if at all, in children, and to what extent should it, if desirable, be adapted to their ages, intelligence, and circumstances (e.g., six to fourteen, and fourteen to eighteen years)?—It is a question as to whether such instruction is of much practical use to any non-medical person, but as regards children, I think it had better be left alone. A general knowledge of physiology and anatomy is doubtless useful to non-medical persons, and especially useful if they can put such knowledge into practice by applying first-aid to the injured, but sometimes an imperfect knowledge of this kind may do more harm than good. A knowledge of first-aid and ambulance work may be very good for adults, but is hardly applicable to young children.

Is instruction in self-defence, boxing, shooting, Boxi advantageous or otherwise?—Decidedly beneficial, and especially single-stick and boxing. I do not know anything which is more likely to develop quickness of sight, and also we have the benefit of the physical exercise.

Is instruction in swimming beneficial; and to what extent?—Every child should be taught to swim, unless medically incapacitated.

What system of physical training is best?—My Best previous remarks answer this question to some extent. Almost any physical training that is not carried to excess will be beneficial. This training must differ with different conditions, different schools, different places, the opportunities and so on, but I should again like to call attention to useful recreations, and especially the workshop. Generally workshop work means indoor work, and also bending over benches. But that might be obviated in some way. I should not consider indoor exercise so good as outdoor, but it might be substituted for outdoor exercise in wet weather.

What are the respective merits of physical training, as practised (1) out of doors, and (2) within doors. Is the schoolroom adequate? is the playground adequate? are special fields for its practice necessary?—Certainly out of doors as much as possible. The schoolroom should not be used if possible, unless in very bad weather and another place being unobtainable. The

Swimming

Best

Merits of physical training out of doors and within doors.

Noble exercises should always be considered by the children as recreation, and should be away from the place of their work, which requires free ventilation in the intervals of school work. As regards the exercises being considered by the children as recreation, that again may have to be modified, because there are some children, irrespective of disease and weakness, who are disinclined to activity. I do not think that occurs very often. Generally, if a child is disinclined to take some active exercise, there is some cause which requires attention.

What is desirable in a proper gymnasium? Are any precautions needful in gymnasia? What is desirable in a proper swimming bath? Are any precautions specially needful in swimming baths?—I have not considered these matters, and do not offer any remarks upon them. Of course I could easily have filled up answers, but really they seem to me such obvious things that would occur to any one that I did not think it was worth while. I would say this with regard to gymnasia: I think the more simple the apparatus the better, but that is a matter for a careful teacher. If you have a careful teacher, the exact regulations had better be left to his discretion. One teacher might use certain exercises which another teacher might not be competent to control with safety to the pupils. Of course in all gymnastics a certain amount of risk must be incurred. I should say the advantages of gymnastics are well worth the risks.

In what should the physical training of girls consist? What games are best adapted to them?—Systematic drill, and so-called Swedish exercises are very suitable for girls, but care must be taken not to cause overstrain, and especially during the earlier years. (See also answer to next question.)

Are any particular games (*e.g.*, football) injurious to boys or to girls?—Football is very good for boys, and might even be played by girls, but cricket and hockey are particularly suited to girls. Cricket was introduced at my advice many years ago at the Princess Helena College for girls at Ealing, and found so successful that it has been continued ever since. Of course with regard to football, as boys play it, it may be rather a rough game, and if you were to imagine girls playing it the same way, you could easily find objection to it, but in all these things, if girls take it up, they do it in a very different way to what boys do, and if they were to attempt to play football, it would probably be a very gentle game. The same may be said with regard to cricket. They might be injured by rapid bowling and by long-stopping, but then you will not get that. The girl bowls in a gentle way; with girls there is no hard hitting to injure the others. Objections, which would very reasonably arise if boys and girls were playing together, do not apply if girls are playing by themselves.

What is a just proportion of time to be devoted to physical training in relation to study?—This must vary with circumstances, age, health, and opportunities.

Is physical training most advantageous if carried out daily (or frequently) in connection with school work? Should military drill be carried out in periodic classes or daily?—It depends entirely upon what facilities are given for games. Special physical training, such as drilling, should alternate with games, and should be made pleasurable to the pupils. It might suffice to have a skilled instructor once or twice a week, and the elder scholars or the teachers might learn to superintend the exercises on other days.

Does the instruction of children in physical training require an improved dietary? Will it, if introduced into schools, require any special provision to be made in this respect? Should an improved dietary be required? Can any suggestions be made for carrying it into effect?—This is a most important question. The majority of illnesses (apart from zymotic diseases) arise from errors in diet or insufficiency of nutritious diet. A growing child requires as much good food as he can assimilate, which means as much wholesome food as he is inclined to take, to produce the best physical strength, and I consider that physical development

and strength depend more upon this one factor than upon any other. Certain it is that if any increase in physical exercises be put upon insufficiently nourished children, it will do more harm than good. It should be realised that it is not the actual exercises which give strength, but the reaction after exercise, and unless there is ample nourishment in the child's body to furnish material for the growth and development which are thus set up, the tissues will degenerate instead of becoming stronger. A very large proportion of the cases of spinal curvature, whether due to weak joints or diseased bones, can be attributed to weakness, or, I may say, insufficient nourishment. The question regarding improved dietary is a very large subject, and I will only now make one remark upon it. I consider that the dietary of children is generally deficient in animal food, of which eggs and bacon and milk as well as butcher's meat take an important place, and also often deficient in hydrocarbons or fats—oil, fat, butter—and excessive in farinaceous food, such as various starch foods and meal, including oatmeal. I daresay I shall run counter to a good many opinions upon this subject—oatmeal contains, no doubt chemically, a great deal of nitrogenous element, but then there is a starchy element, and the question is whether the child can digest it. If oatmeal can be digested, well and good. It contains all the elements wanted, but so far as my experience goes, and it is supported by many other observers, there are few of our southern children who are able to digest it thoroughly. Probably the fine air of Scotland may help children to digest oatmeal, but in England one frequently observes indigestion and malnutrition accompanying a too liberal supply of oatmeal in place of other food. Rickets is a disease of malnutrition resulting from irregular feeding, and often from excess of farinaceous over animal food, and tuberculosis also attacks those who are deficient in strength from deficiency of strengthening food.

What are the results of experience regarding physical training, athletics, etc., in secondary schools and universities?—My experience as a surgeon dealing with bodily deformities is that in public schools athletics are often carried to excess, that not enough discrimination is exercised in respect to the physical condition of the scholars, and this is often in opposition to the advice of school doctors, who are placed in a difficult position as receiving their appointments from the school authorities. This points to the desirability of more freedom of opinion being given to school medical advisers.

Is it ever found to be adverse to the intellectual development or progress of the scholars? Is there any fear of its becoming so?—It is quite possible that physical training and athletics may be, or at least might be, allowed to predominate to such an extent that they would be adverse to intellectual development, but it should be recognised by all school authorities and others that for the development of a sound mind (using the term liberally) we must, in the first place, take care to have a sound body.

6489. Would you allow me to ask one or two questions in elucidation of one or two of the points in your evidence. I see that in the first place you attach very great importance, as a practical test of health, to the ability of the child to assume and maintain for a prolonged period an upright spine and expanded chest?—Yes.

6490. In fact, a healthy child ought to be a well-set-up child, and a well-set-up child is likely to be a healthy child, and this maintenance of the posture, indicative of health, ought to be maintained till the period of full growth, I presume?—Certainly.

6491. It ought to be encouraged by exercises until the period of full growth?—Certainly.

6492. Until the bones have assumed their permanent form. Up to what period, therefore, would you advise that physical exercise should be either compulsory or enjoined?—So long as such pupil is under school supervision, until he is able to undertake his part in

life, so as to regulate those things for himself; there is no period of life at which anyone can be quite independent of some sort of physical exercise. There is no age at which anyone is free from the influences of bad postures.

6493. And would you think that system of physical training imperfect which neglected the maintenance of this position after fourteen and sixteen?—Certainly.

6494. You would continue it up to, if possible, what age; what age does a person cease to grow at?—Well, their bones do not cease to be ossified, as you know, till thirty; but I should say during the time in which they are under school teaching. That, however, being conditional upon their being in a fit state, medically.

6495. The next point is about the suitable clothes, where you speak of these you say the majority of children are prevented from developing naturally by clothes which restrict chest development: what form of clothing is most obnoxious in that way?—The clothes worn by the majority of children are faulty in the way I refer to. The arms are drawn forward, the shoulders depressed, and the chest has not room for full expansion. With such clothes it is impossible to draw back the child's shoulders into a good position unless the clothes are unbuttoned in front of the chest, and even then the shoulders may be drawn down by braces and shoulder straps. It often happens that two or three or more inches are required in breadth across the chest to allow full expansion of the thorax. Quite four-fifths of the children who are brought to me on account of their stooping habits, are wearing such clothes. Then, again, the custom of letting nearly all the garments hang from the shoulders is harmful, as it interferes with development of the chest. Clothes should be fitted close to the neck, and should not hang on the tips of the shoulders. Petticoats should hang from the waist. No clothes which prevent free expansion of the chest should be allowed.

6496. Can a system of physical training be fairly well carried out in schools without the adoption of a special clothing?—Not if that clothing is such as I have described, because such clothes constitute a permanent obstruction to the child ever getting into a good position; if that child is bound down by his clothes you cannot expand his chest; that is impossible.

6497. Are girls worse in that way than boys—worse situated in regard to clothing?—I should say that they are.

6498. Would you advise us to consider a special dress for girls during physical training?—It is no good having simply a special dress for exercises only; because if you have a special dress, the pupils will go back to their other dress at other times. I should think it much better to have all clothes made so as to allow the children to attain a good position at all times.

6499. At the foot of the first column on the first page you say 'many children are deformed by too great a strain being put upon their physical powers during the age of growth.' You would therefore adapt any system of physical training to that particular fact?—Certainly.

6500. Do you think that teachers could be trained to examine the children sufficiently to detect any incapacity of eyes or limbs which would interfere with their getting the proper advantages of physical training without a medical man being specially charged with the duty?—I do not see how it is possible to depend upon such training. We find different degrees of intelligence amongst teachers, and some would learn to notice defects in the children, and probably upon the whole you would have to depend to some extent upon the intelligence of your teachers; but for exactitude you ought to have the help of a qualified medical man. Constant medical supervision would probably be impracticable, but if the children could be periodically examined, to determine, for instance, as regards such physical deficiency as a diseased heart, or defective eyes, then I think you would meet the chief necessities of the case. No lay teacher is capable

of understanding the importance or the nature of such diseases and defects.

6501. Do you approve of the system of physical training—the so-called Swedish—or musical drill which is carried out in the Board Schools of London?—I believe it is very good. From what I have seen of the Board Schools' management I believe it is good, but I cannot speak from personal experience.

6502. And regarding your opinion that physical exercises which develop the body will tend to ward off disease, but can hardly be considered curative, or even preventative of some of the diseases named, I suppose that we might consider generally that it is your opinion that physical exercises properly applied, developing the body healthily, render children less vulnerable to ordinary diseases?—Certainly.

6503. What particular train of thought led you to recommend cricket as so suitable for girls?—I was asked the question many years ago, and as it is an outdoor game—of which girls have not many—I thought it might be substituted for lawn-tennis, which game was very likely to cause strains. My observations are made in accordance with the cases that come before me, cases chiefly of delicate girls with certain weaknesses of the spine, or of limbs, and I suggested cricket, because it gets girls out of doors and it involves alternative periods of exercise and rest. Perhaps I should not have laid so much stress upon cricket had it not been brought particularly before me. I think it is quite likely there are some better exercises.

6504. My last question is this; you allude at the end of your evidence to deformities produced by athletics carried to excess. Do you consider that if a judicious system of physical training were introduced into schools, and made compulsory for school children of all ages, it would lessen the risk of athleticism being carried to excess in the higher schools and universities?—I should think it would have that tendency.

6505. Probably I might elaborate my thought a little more?—Yes.

6506. My idea was to put it to you whether children enjoying the natural exercise which nature demands in the way of physical training would be less apt, when they grew older and were emancipated from school restrictions, to carry the natural tendency to an extreme in the way of athleticism?—I do not think so. I do not see why that should make them carry it to an extreme. I think if they have never had anything of the kind, when they get an opportunity they are more likely to carry it to an extreme, whereas if they have been taught it as a regular part of their education, they are much more likely to carry out their athletics without going to extremes.

6507. By Mr Ferguson.—There are just two points I should like to ask you about. You have laid great stress on the feeding and clothing of children; these are two matters which you consider of very great importance?—Yes.

6508. You know many of the Board School children are not very well fed; do you think that it is of such importance that it should be the duty of the educational authorities to do everything in their power to see that children are as well fed as possible? that it should be considered their duty to look specially into the food question; I do not say to feed them?—Well, I think it is; but as to how far such interference upon the part of school authorities should be carried is very difficult to determine.

6509. Still, it is a very important matter?—Very important, undoubtedly.

6510. You would not leave it to chance?—If it can be done, I think it ought to be done, certainly.

6511. And the same as to clothing; you do not advocate any special dress, but you rather think that attention should be called to dress that is not suitable, and an endeavour made to get the ordinary dress made suitable?—Yes; I have drawn up in a little pamphlet certain rules with regard to this subject, which I give to mothers and try to get them to attend to. It is very difficult to make mothers understand the necessity of the alterations, and so I rather try to teach the

principles to be followed than insist upon any special dress.

6512. You said it was very improper to do work before breakfast?—Yes.

6513. Of course you know that not a few children in large towns come to school without any breakfast?—Yes.

6514. Therefore I suppose you would say the educational authority should do all in their power to remedy that?—Unquestionably.

6515. *By Mr Shaw Stewart.*—May I ask the title of your pamphlet?—*Growing Children: their Clothes and Deformity.*

6516. *By Professor Ogston.*—For the laity?—Quite for the lay mind.

6517. *By Sir Thomas Coats.*—In regard to the ambulance classes for children, do you not think they would make a pleasing variety of the physical training?—That might be desirable. My previous remarks were upon general principles. As far as I have seen, I can hardly understand a child deriving much benefit from such instruction. It might be easy to teach them a certain amount, but when you speak of 'first-aid,' that generally involves a complete training in ambulance work, which does not seem to me to be adapted to children. There are certain things that might be taught them with benefit, but I think it would be rather dangerous to attempt such teaching as a regular course.

6518. I will just continue that; do you not think that a certain amount of instruction in ambulance work would encourage the children, after they grow up, to take regular ambulance lessons, so that they could give first aid in case of accident?—I am afraid I am a little bit sceptical upon the whole subject. I have seen so many mistakes made, even by quite matured people, that I have come to look upon this ambulance and first-aid as doing, very often, more harm than good.

6519. I happen to be connected with a large factory, and we have an ambulance corps. Time after time the members of the ambulance corps have been complimented by the surgeon of the infirmary for the way in which they have presented the case to him?—Now I understand better what you mean. That I take it to be quite under special circumstances. If you have to deal with large factories, I can quite understand the advantage of an ambulance corps, but I doubt if it would help much to train the younger children. I can quite understand the men in the factory doing what is necessary very well where they have plenty of experience, but I have known young women who have attended ambulance and first-aid classes get an imperfect knowledge, and apply it wrongly, instead of calling in a medical man; but a class in a factory, I can quite understand being of the utmost value. Perhaps children who are to work in a factory might be given some instruction in ambulance work under those circumstances; they ought to be selected children; it ought not to be made a general system. Children will sometimes show an aptitude for that sort of thing, and I should not discourage it; but with the majority such teaching would, I think, be better left alone.

6520. *By Sir Henry Craik.*—I am asking you only as a person quite ignorant of the subject; there is only one point I would like your opinion upon. You say amongst the causes of general weakness, that you put first and foremost insufficient nourishment?—Yes.

6521. And you adduce the case of the Highlands, where tuberculous diseases you heard were rare while there was plenty of animal food for children?—So I am told.

6522. Very well, but if we go back forty or fifty years, or even more, animal food was hardly used at all in the Highlands?—Is that so?

6523. It certainly is the case that a century ago animal food amongst the poor classes in Scotland was very rare indeed?—Then what did they live upon?

6524. I should say chiefly oatmeal and milk?—Well, milk.

6526. Yes?—Milk and eggs are animal food, and are of the utmost value under those circumstances.

6527. But is it not the case that a certain abstinence from food—a certain limitation of diet—may sometimes have rather a healthy effect?—Not with growing children. There is a great difference between development and the maintenance of the body. I should say, speaking generally, that a great many children are under-fed, and a great many adults over-fed. When once our bodies are formed we have simply to keep them going, and very often, probably a majority of people over fifty eat too much meat. They only require sufficient to keep up their tissues to provide for the waste, whereas a child has to be supplied with nourishment, not only to make up for waste tissues but also for growth, and that is why most children have good appetites. My observations upon that point are based chiefly upon the hundreds of cases of the poor people with deformities who come to the City Orthopædic Hospital. In the last fifty years we have had over 88,000 cases, and during my connection with the place (over twenty years) we have had about 10,000 attendances of patients annually. These patients, chiefly children, come from all parts of England, but mostly from London and its neighbourhood. Their deformities arise chiefly from tuberculous disease affecting the bones and joints, and from general weakness. When we inquire into the cause of such disease and weakness we can trace it to want of proper nutrition. We then inquire as to the food they live on, and it becomes evident that there is a deficiency in this respect. We take these children into the Hospital and give them plenty of good food, and they rapidly improve, and the majority recover perfect health. This experience has made a very firm impression upon my mind. Then we know from experiments of different kinds as regards the necessary amount and quality of the food. All good authorities on the subject agree that nitrogenous food is most important, and next come the hydrocarbons—that is the fats—and there are the minerals; but the starchy foods (carbohydrates) are of less value, and if given in excess they are not digested by young people. The excess of starchy food over the others is one of the causes of rickets. Children with rickets have generally been brought up on some artificial foods, which contain a great quantity of starch. I do not think any medical man will differ from that view. With regard to the quantity of butchers' meat, of course, there are differences of opinion, and I think very often a child is much better with other sorts of animal food, such as eggs, and plenty of milk, and things of that kind, and a certain amount of vegetable nitrogenous matter, such as what is to be got out of some of the meals. All these foods should be judiciously combined.

6528. Do not suppose that I am at all disputing your position; I am only asking for information; but we have in Scotland, of course, for many generations, and personally I have myself come across many men who spend years at the University in their youth, who certainly have had what one would be inclined to call insufficient nourishment, and grow up particularly strong men. You think that a certain restraint upon the nourishment can never be anything but harmful?—I should say that such cases were unusual. Some people will thrive under almost any circumstances.

6529. If one is drawn into contact with the class of children to whom you allude, is it wrong to be struck with the fact that the parents are always feeding the children, giving them something to eat. It is not so much the defect of food as wrong feeding, is it not?—Certainly. That is often so.

6530. Travel with them in a third-class carriage, and half an hour is not allowed to go by without their having something to eat?—I quite agree with you, and that is one of the points I urge as a fault—improper as well as insufficient feeding.

6531. Improper feeding?—As well as insufficient. It is probable that food which could be assimilated in

*Mr E. Noble
Smith,
F.R.C.S.*

29 May '02.

Proper classes
of foods.

Improper and
insufficient
food.

Mr E. Noble Smith, F.R.C.S. a climate like that of Scotland would not be digested in London.

6532. We heard from two witnesses—one of them a medical witness—that in the Hebrides of Scotland, although the children at times looked rather weakly when young, and perhaps did not have sufficient nourishment, yet they grew up particularly strong men, and that you would not notice any evil effect. How would you account for that—good air?—It would not be all the air. In the Japanese navy, one of their chief medical officers told me that formerly they lived chiefly on vegetable food, had very little animal food, and they were always sick; and they had suffered from a disease which was something like what used to be called scrofula. It was represented by himself and some of his friends to his Government that if they would only make the navy men eat animal food, it would make a difference as to health. An order was subsequently given that meat was to be introduced into the diets, and within a month or two this disease had disappeared. It cleared up entirely, and the Japanese navy is now perfectly free from it.

Animal food

6533. But there are races, are there not, that carry on great physical exertion with very much less animal food than is the average with the Englishman?—Yes. But I do not think you would find, if they were really put to it, that they could compete very long with any animal-fed man. We know from the structure of the body what is required in a diet, and we know from the teeth alone, for instance, that man ought to eat a certain amount of animal food.

6534. *By the Hon. Thomas Cochrane.*—I should like to add to what Sir Henry Craik said about the animal food; I think from my experience there is more animal food used now?—In the Highlands?

6535. No; I do not know about the Highlands?—In the Lowlands, I was told.

6536. I was told that there was very much less

porridge now, and instead of porridge they were eating wheat bread and drinking tea, and that accounts to a certain extent, I think, for any deterioration in the Lowlands of Scotland. More meat, I think, they get, but they are giving up porridge; it is too much trouble to make, to make it well?—Yes. I should like to add this one thing. I spoke about the methods of detecting strength or estimating strength. I would suggest that the proper eruption of the teeth ought to be taken as a sign of strength and proper development. There are many other ways in which a medical man would estimate the strength; but if a child is backward in cutting its teeth, it shows a want of nourishment. There are many obvious indications of feebleness of bodily strength, but the proper eruption of the teeth, and the power to hold the spine straight, may be taken as two of the most useful for general purposes. I have brought several tables of statistics.

6537. *By Professor Ogston.*—Would you mind leaving them with the Secretary for a day or two, so that we could consult them?—I will do so.

6538. *By Mr Alston.*—Just one question before you go. I think I am right in saying that you regard manual instruction as being very desirable in the schools?—Yes.

6539. Meaning by that, shall we say, carpentry for these boys?—Yes, anything where their physical exertion can be employed, so that they can, instead of simply playing a game, be learning something useful.

6540. And if it were possible, cooking and laundry work for girls?—Yes.

6541. You think that would be an advantage for both sexes?—Yes, certainly; and you might even go further, and add agricultural work; in fact, any occupation that is useful and involves physical exercise, so long as it is looked upon not as a labour—in a measure a sort of recreation.

The witness withdrew.

Mr G. Cheyne, M.A.

MR GEORGE CHEYNE, M.A., examined.

6542. *By the Chairman.*—How long have you been headmaster?—Four and a half years.

6543. And how many children have you?—We have 125 on the roll.

6544. Is yours a country school or a town school?—A country school.

6545. Purely?—A country school; no village at all.

6546. Do your children come to school from a considerable distance?—Some of them come three miles.

6547. The legal limit?—Some of them would come about that as a limit.

6548. Now please go through your notes on the system of physical training?—1. System of physical training in Kennethmont Public School. (1) In the Day School.—The system which obtains in the above school is mainly according to the manual of musical drill prepared by Colonel Cruden, Aberdeen. The school is furnished with the following apparatus:—Dumbbells, bar-bells, Indian clubs, hoops. (2) In Continuation Classes.—No physical drill has ever been on the time-tables of our Continuation Classes. Dumbbell exercises were given to the members of continuation classes 1898–99 and 1899–1900, who came up before the hour for opening the classes.

2. Extent to which use is made of existing opportunities?—The time allowed for drill in the time-table of the school is, in the senior department (children over ten years) thirty minutes per week, and in the infant and junior division (children under ten years) one hour per week of 27½ hours.

The floor space in the school is such that not more than sixteen children can be doing dumb-bell exercises simultaneously, and in some exercises (e.g., Indian clubs) the number is much less, so that, according to the time-table, no child gets more than ten minutes' drill per week of 27½ hours.

This is the full extent to which I can use the existing opportunities under the present conditions.

3. Means whereby physical training may be made to conduce to the welfare of the pupils.—The great difficulty in making physical training in country schools (where the staff is generally a headmaster and a certified female assistant) conducive to the welfare of the pupils is want of time, apparatus, and the necessary qualifications by teachers.

Before physical training can be a source of national strength, every parish must have a school gymnasium, where exercises could be taught, which would tend more to develop the muscles of the body and less to mere show. Children are very fond of physical exercises, and were local authorities compelled to provide gymnastic apparatus, I am confident that children would improvise appliances at their homes, and thus practise out of school hours.

Gymnastic exercises, however, tend to a spirit of emulation, and weak children may be discouraged. To guard against this I would, in addition, advocate the use of expanders, such as Sandow's, and class exercises in inspiration and respiration in fresh air.

Once a gymnast, always a gymnast; if boys are taught gymnastics at school there is no doubt but that they will attend continuation classes for a similar purpose.

My experience has been that, unless a youth has been taught gymnastics and manly sports as a boy, he will never take kindly to such recreations, and, therefore, the root of the matter lies in getting at the children while in school.

6549. *By Mr Fergusson.*—You are altogether very favourable to physical training?—Yes, sir.

6550. But you cannot give very much of it, not so Tim much as you would like, at present in your school?—No, we have not the floor space.

Physical training : system described.

Use of opportunities.

Mr. S. A. F. 29 May '02

Manual instruction

Mr G. Cheyne, M.A.

Hind

Sugg

Tim

6551. I see you go in for the exercises which take the largest amount of floor space—Indian clubs—you take more floor space for that than for any other exercise?—Well, we do not go in much for Indian clubs, we go in a great deal for dumb-bells.

6552. I do not quite see how you can only manage ten minutes a week for each child?—The fact of the matter is, that practically no drill is taught within the limit of the time-table. I said according to the time-table. Really drill is taught out of hours.

6553. Why?—Because in a country school such as mine, if I were to take drill, I disorganise the work of the whole school; the whole work of the school must be stopped.

6554. You cannot teach more than one class at a time, and you can teach drill just as much as you can teach arithmetic?—I have to teach four classes at one time in my ordinary work, and more than that, I teach standard III. to the Merit Certificate.

6555. Then you are under-staffed in your school?—Not according to the requirements of the Code.

6556. No, but according to the requirements of education. You do not admit that?—Well, of course that is for the Department to say.

6557. That is all that you find possible, but you would like to do more if you could?—Yes, I think everybody would like to do more drill.

6558. Even a central hall or a covered playground or anything would be no use to you?—Yes, great use.

6559. I thought your difficulty as a teacher was that you could not devote the time to it?—The time could be devoted if we had apparatus. I mentioned that as another of the grievances or hindrances.

6560. If you had a special teacher for drill, that would help you, I suppose?—Yes.

6561. He could take that class off your hands for drill and physical training, and so relieve you?—Yes, that would help.

6562. You have never tried a special instructor?—It is impossible to get one.

6563. At present?—Yes, under the present conditions it is impossible.

6564. *By Mr Shaw Stewart.*—A question or two further on that point; if you had a covered space in your playground, that would assist you, I suppose, in teaching physical drill, getting the children out?—Yes.

6565. And exercising them there?—Yes, even if I had space such as that I could take all the senior pupils and could use my pupil teacher for playing the piano.

6566. A covered space in the playground would be of great advantage to you in teaching physical training?—Yes, I think it would, such as a shed of some kind.

6567. Would you have any advantage in movable desks that you could clear away and get more space?—No, it would take up too much time to clear away movable desks and get them into position again.

6568. You would find a covered space in your playground more practicable?—Yes.

6569. In your concluding paragraph, when you use the word 'gymnastics,' I suppose you intend to mean physical drill of all sorts?—Of all sorts.

6570. That is to say, free movements apart from apparatus?—Yes.

6571. Perhaps you should have used the words 'physical exercise,' instead of 'gymnastics,' because by the word 'gymnastics' we generally understand apparatus implied?—I think that before physical exercise, or whatever you like to call it, will be of advantage to the pupils, and before pupils will take to physical exercise, there must be apparatus.

6572. Cannot a great deal be done in physical exercise with free movements?—Yes, I am referring now more to continuation classes.

6573. *By Sir Henry Craik.*—What training college were you at?—I was at no training college.

6574. At the University only?—Yes.

6575. And of course at the University there was no opportunity for training in physical exercise?—No.

6576. How did you learn the system?—At a special class, a special summer class.

6577. Under Article 91 (d)?—No, before Article 91 (d); at my own expense.

6578. Col. Cruden's?—Yes, Col. Cruden's.

6579. Where do the pupils come from to your continuation classes at Kennethmont?—Well, from farm service, all apprentice lads about the shops and smithy, and distillery workmen.

6580. I thought you said it was purely country; is there any employment of that sort?—Well, there is a distillery in the district which employs about a dozen hands.

6581. They are not large the continuation classes; only a small class?—Just about 20.

6582. You never attempted any physical instruction there?—Yes, I say that we had.

6583. Dumb-bells you had?—Yes.

6584. *By Mr Alston.* You get a whole holiday on Saturday?—At present I am attending a class under Article 91 (d) of the Code.

6585. I refer to the children?—Yes, the children do.

6586. Would it be an advantage to take half of it from them and put them on to some of this work?—I find in the summer time the children get very much run down coming to school five days.

6587. So it would not be an advantage. It has been brought before us by one witness that he would have no difficulty in recommending that there should be only a half holiday on Saturday. He thinks the children find it very difficult to know what to do, and they are glad to have something in hand, and their mothers particularly would be glad that they should be occupied. Now, if there were no other objection, perhaps you could get in some more physical drill on that day; but you would not recommend that?—No, I would not, because I find the children get run down enough; they need Saturday for recreation.

6588. And the teachers also?—Oh, well, the teachers would not be fit to go on.

6589. *By the Chairman.*—Have you much sickness in your school, as a rule, or do you have just your periodical turns of it; I mean have you had bad luck in that way?—Oh, no; not beyond the usual thing.

6590. Is your attendance pretty good?—Yes, about 87 per cent. last year.

6591. Nothing to complain about?—No, nothing to complain about: 87 per cent.

6592. What does your School Board think about this physical exercise; does it take any interest in it at all?—No; they leave it pretty much to the teacher.

6593. They do not take any interest in it more than any other subject, or perhaps not so much as any other subject?—It does not pay so well; the School Board likes something that pays.

6594. Then do you think it ought to pay as well, because that is a point that I should like to have your opinion upon?—If we are going to build the bodies of the children as well as the minds.

6595. You do not see any reason why on earth it should not be made as paying a subject as any other?—Well, if there is much time to be devoted to it, I think it is only fair play to poor parishes.

6596. As a matter of fact, as far as you have told us, and from what we have been able to judge, you yourself are largely responsible for the amount that is being done, and the efficiency with which it has been done, and you have taken a personal interest in the matter yourself?—Yes, I have always taken a personal interest in the matter.

6597. And you have done really more than you have been compelled to do?—I really do teach it all after school hours.

6598. You really do teach?—What drill is taught is taught out of school hours, that is after school, a quarter of an hour each day.

6599. That makes the children later in getting home?—Yes.

6600. Do you give them work to do at home?—Very little; a little memory work.

6601. Always the same; always very little, or

Continuation
classes.

Saturday:
whole holiday
desirable.

Grant.

Home lessons.

Mr G. Cheyne, M.A., sometimes more than at other times?—It depends on the children.

29 May '02. 6602. In the fresh air, or they are preparing for any particular examination, they get a little more.

Leisure time. 6603. You say you like the children to get a day off on Saturday. Do you not think it is a good thing for them to have as much spare time out of school, or do you think so?—The more spare time the children can get in the fresh air the better.

6604. In the fresh air, but in the winter time, when they get home; if they have to walk two miles they get home about five o'clock in the afternoon, some of them?—Yes, about five.

6605. Then it is dark. You think it is better for them to have something to do during the remainder of the time they are out of bed than to do nothing?—Yes; I scarcely know what you mean.

6606. I rather want to put it from their health point of view. What did you do yourself when you were a child; had you to do work out of school?—No; I had to prepare lessons.

6607. When you got home?—Yes.

6608. You had to every day, practically?—Every day, practically.

6609. Did you like that, or did you think it was a bore?—I do not just particularly remember whether I thought it was a bore or not.

6610. Simply it had to be done; it was no use thinking about it?—It had to be done.

6611. You do not remember that, therefore, you have not paid particular attention to this point, now you have no longer to do it as a child; but you have to do it as a teacher?—What I think about home lessons is that in many families, poor families especially, a child might have to write an exercise sitting at a chair on his knees, and perhaps his younger brother coming in about, and pushing the chair away; there is no opportunity for it in poor families.

6612. You do make a difference between summer and winter. You do not see any harm in winter, but in summer you think it would be a great shame not to let a child run about as much as possible?—As much as possible.

The witness withdrew.

Mr JAMES ELPHINSTONE, M.A., examined.

6613. *By the Chairman.*—You are M.A., certificate of first class, headmaster of King Edward Public School, Aberdeenshire?—Yes, my lord.

6614. Is that a country school?—Yes, my lord, purely a country school.

6615. And how many pupils; about what is your average attendance?—Last year it was 77; this coming year it will probably be a good bit higher.

6616. What is the total number of pupils?—100 on the roll just now.

6617. The Parish is the Parish of King Edward?—The Parish of King Edward, but it has two School Boards, one for one end of the Parish, what is called in Scotland a *quoad sacra*, which has a School Board for itself, separate from King Edward.

6618. But you are the *quoad ecclesiastica* school?—Yes.

6619. Would you read from your notes?—During the past year physical exercises have been given to the infants, the junior department, and the girls of the senior department, in weekly lessons extending an hour over all. That is to say, when one division had finished the next was taken. These lessons were mainly given by the assistant mistress (Art 79a), who has no qualification other than that got from her own training as a scholar and as a pupil teacher. The music was supplied by the pupil teacher. When new exercises were being set or a new drill introduced, the headmaster devoted considerable time to starting it, as well as laying down the lines to be gone on, and giving the assistant some instruction in the exercises.

The senior boys, and such boys of the junior division as were sufficiently advanced, got military drill in the playground, which is a large quadrangle, and well suited for drill when the weather is favourable. Exercises in drill of any kind in school are hampered by lack of floor space. All the desks are fixed. The space between the desks and the wall in the senior room is 12 feet, and in the junior room it is 9 feet. This space, of course, is largely occupied by the school furniture. The physical training given is that taught in the Aberdeen Physical Training College conducted by Colonel Cruden and approved by the Department. The headmaster holds the diploma of the college, and has a certificate of efficiency in military drill. In order to the further development of such training more time would be required, but in rural schools it is difficult to see where such can be had. Perhaps, now that Drawing has been fairly established, the Department might consider whether the imperative time might not be reduced to one hour per week. The imperative time I mean for Drawing, which is at present one and a half hours. At present also Nature Know-

ledge makes considerable demands on the available time. That the Commission may see how rural teachers are hampered for time, I may be permitted to indicate shortly what has to be overtaken. The headmaster has to superintend and conduct weekly examinations of all the school. He has to teach all the classes of the senior division, with the help of a pupil teacher who gives assistance for two hours daily. He has to conduct the advanced department, whose stages of advancement often range over three years. The subjects taken are Latin, French, Mathematics, as well as English for Leaving Certificate, and Botany for the Dick Bequest Examination. The pupil teacher is taken from 8 to 9 a.m., and has to get suitable lessons with the advanced scholars. The examinations to be prepared for in addition to the merit certificate are, the Dick Bequest Examination, County Bursary, and Leaving Certificate, and also there is the local bursary examination for bursaries held in King Edward Parish. Some attention also has to be given to Scripture, which, of course, entails the finding of the time and adds in its degree to the day's work. There is also arising a desire on the part of parents for more attention to commercial subjects. In King Edward School, as yet, time has not been found for any manual training in addition to the Drawing.

As regards the continuation classes, the conditions of the Code were felt to be such as to make it difficult to hold them last year. The young men were unwilling to come out for a session of twenty weeks. Farm servants are slow to join before the term, as they do not know where they may be located. If the classes are started after the term, then the course cannot finish until seedtime is well in sight, and the pupils refuse to turn out. I understand that this obligation of a twenty weeks' session has affected several rural localities. In these districts, too, the only available instructor is the teacher, and such a long winter session is more than many care to face. The difficulty of a suitable drill hall does not arise in King Edward, which has a large parish hall, but even if a class for physical exercises or military drill were held under Division IV. of Continuation Code, Article 39 requires that as a condition of the payment of grants, attendance must be given at a class in one of the other Divisions for at least one meeting per week. This may help the other subjects, but does not help drill. Also pupils in an advanced department who could attend such a course with profit are excluded from earning grants under Article 46.

In conclusion the system of physical training as practised in my school seems to carry out in its degree the desires of the Department, but if full benefit is to be derived from the military drill given, School Boards

might be encouraged by special grants for outfit such as is supplied to the Boys' Brigade, on the same principle as grants are given by County Councils for apparatus, or grants might be given under Article 21 (e) of the Scotch Code. In all districts there are military instructors, in connection with the volunteer battalions, and under these, classes might be formed for teachers, under Article 91 (d) of the Scotch Code.

6620. You seem rather labouring under a press of work?—Yes, that is so in rural schools, such as mine.

6621. You seem to have rather—well, I will not call it actually a grievance, but some sort of ground for complaint?—The rural schoolmaster has a distinct ground of complaint at present; the rural schoolmaster is the hardest-worked teacher.

6622. We do not want to go into any complaints in general, but as to any complaints there are as to not having sufficient opportunity, time or whatever the reason may be, for physical training?—Quite so, my lord; well, all the rural schools which hold the Dick Bequest in Aberdeen, Banff, and Moray must maintain a certain standard, and the Department is taken bound to keep up that standard by the Education Act of 1872. The Scotch Education Department is taken bound to keep and maintain the standard in existence at the time of the passing of the Act of 1872, by Section 67 of that Act. Now, we in these three counties, who are teachers of Dick Bequest schools as we call them, have the higher work to do whether we will or not, otherwise we should fall behind what was the standard of education before the passing of this Act, and should not be eligible for the Dick Bequest.

6623. Are you on a permanent salary?—No, I have one-fourth of the Government grant just now; but that is the smallest proportion of Government grant I have ever received. Salaries are tending to be fixed more and more, but mine has not yet been dealt with.

6624. Yours has not been fixed?—Not yet.

6625. When you say the physical training given is that taught in the Aberdeen Physical Training College, conducted by Colonel Cruden, approved by the Department, do you mean the college is approved by the Department, or the physical training is approved by the Department?—The college is approved, and the course given by Colonel Cruden is approved as qualifying teachers to give what is called physical drill in school.

6626. It is the college, not the physical training necessarily; I mean the physical training is approved by the inspector?—Yes. And any certificate that Col. Cruden gives is accepted as a qualification.

6627. You prepare a time-table, do you not, for the inspector—Yes.

6628. And he approves the physical training put down in that time-table?—Quite so.

6629. Or does physical training not come into the time-table?—Oh, it comes into the time-table.

6630. You do teach it during school hours?—During school hours.

6631. And not after school hours?—Not after school hours. We may, if we like, but it must also be in the time-table; I take it during the time marked on the time-table. The course that Colonel Cruden has given has been accepted by the Department for many years.

6632. When you mention about the farm servants, the term, I suppose, is the 28th November you mean?—Quite so, the winter term.

6633. The removing term?—The removing term.

6634. And do you rather suggest that the Code might think a little more about the conditions of farm servants than it does?—I suggest that they should reduce the number of weeks required for a session.

6635. I mean you rather put forward an idea that the country schools are very different from the town schools?—Quite different.

6636. And yet the same Code obtains for both?—Quite so, my lord. Many of my lads would have to come several miles to a winter evening school, and they will not come twenty weeks for a whole winter, two nights each week; they might come if they lived in a rural

village—a country village—but they will not come to a school for a session of such length, where they have long distances to walk.

6637. Have you much difficulty, as a rule, in your attendance?—Not more than ordinary country schools.

6638. Do you keep a school officer or anything of that kind?—We have a school officer, but he is the clerk of the Board just now; I do most of the officering myself by just urging regularity of attendance.

6639. What I want to know is, supposing there was to be a compulsory attendance at physical training after the boys left school at the age of fourteen, would there be much difficulty in compelling the attendance, supposing such a thing were made by law?—Well, I do not think so; if you did not hold the class always in winter. You could get a good many to attend a summer course.

6640. But you would not be so likely to get young chaps to attend in the summer time, would you?—They will attend a dancing class.

6641. In the summer?—Oh, yes, they will attend a dancing class in the summer with great regularity, and, therefore, if it were compulsory, I do not see why they should not attend drill.

6642. Or gymnastics?—Or gymnastics; supposing it were gymnastics, I do not see anything to hinder them; but as long as it is voluntary, they will not come twenty weeks in winter or summer either.

6643. On account of the distance they have to come and the bad roads; is that the reason, or what is the real reason?—Well, in the winter on account of the bad roads and the distance. Twenty weeks is rather a prolonged session for a winter term; you see they shift.

6644. Say you began the 1st of December?—Then we are well into seedtime before the course ends.

6645. Your twenty weeks carry you till when?—It would carry us well on, with New Year holidays, to the end of April. Then the work of the seedtime has commenced, and the men flag, and we have no compulsion to make them attend. Therefore grants fail; the teacher has to be paid; and School Boards, not teachers alone, but School Boards, will not open classes at a loss.

6646. Are you aware whether that view has ever been represented; have you ever complained about it to your School Board?—That view has been put before my School Board.

6647. Have you ever remarked on that state of things?—Oh, yes.

6648. Do you know whether your School Board have taken any action in the matter at all?—My School Board wrote to the Department at the beginning of last session, pointing out the difficulty of starting a class at all last year because of the twenty weeks' session. I called the young men of the district together, and pointed out to them that we must keep open for twenty weeks, and they refused to come. They would not attend.

6649. So there was no class?—There was no class, but there was the previous year, when there was not a twenty weeks' session exacted, and I think we could get a nice class for physical drill.

6650. Do you teach the drill yourself?—Yes.

6651. Who taught it you?—I was taught at the Training College, partly in 1876-77, and then I had a liking for it and always did it in school, and when Colonel Cruden started his college I had a course from Colonel Cruden.

6652. By Mr Fergusson.—Your school being a Dick Bequest school, you have more work than other teachers?—I would be compelled to have more work, for instance, than Mr Cheyne, who was in last, owing to having a Dick Bequest school. He need not necessarily go beyond the merit certificate stage.

6653. That is extra work, is it not?—If it is a Dick Bequest school it has to remain a Dick Bequest school.

6654. When do you begin school—nine in the morning?—Yes.

6655. And go on till four?—Yes.

Boys after fourteen :
physical training :
compulsion.

Continuation classes :
reasons of failure when voluntary.

Time-table :
subjects :
Dick Bequest school.

Mr J.
Elyhinstone,
M. A.
29 May '02.

6656. Well, all schools do that, do they not?—Quite so, but they have to provide a certain time-table for the advanced department, and it is a very much heavier thing. We cannot give so much time to the elementary work, you see we have to divide up all our day so as to give everything fair play.

6657. And you have more subjects to teach?—A great deal more to teach which has to appear in the time-table, and therefore must be taught.

6658. Is not the remedy for that having extra teaching staff?—Yes, sir, extra teaching staff, or the Department reducing the number of pupils for each teacher. At present, for instance, I am held to be able to teach fifty, being headmaster. If I got a certificated assistant, that is held sufficient for a further average attendance of sixty scholars.

6659. Yes, quite so; but you think you have got so much work to do that you cannot do anything more?—I do not see you ought to put in any more.

6660. But still it would not give you any more work to devote an extra hour to physical training, if that extra hour were taken off what is now devoted, let us say, to reading and writing?—But, sir, we could hardly take off anything from any of the subjects.

6661. Why not?—I think all the time is required to do them efficiently.

6662. You could do it, but you think it would interfere with the efficiency of the other subjects?—Quite so.

6663. Is it not really that you have too much work, and you do not feel that it would be an advantage to take it off the other subjects and put it on to physical training?—We could not take off anything from the other subjects.

6664. Other schoolmasters do it, and say that they find the advantage of it; are you aware of that? They give more time than you do and do not find that it does any harm to the other subjects. You have never tried. You are afraid to try because you think it might interfere with the other subjects. Is that so?—No. I do not know how the other schoolmasters can manage to put in all the subjects we have to teach, with equal efficiency, and find time for more. Efficiency is a relative term.

6665. You have no trained instructor to help you?—No.

6666. Would that be of assistance if you had some one, not for all the drill perhaps, but to come now and again to your school and put your classes through their training, would that be of any use to you?—Oh, undoubtedly, if you had a well-qualified instructor, but I would be against any sort of instructor simply because he could teach drill or was a military man.

6667. We are talking not of a military man but of a competent physical training instructor?—I think it would be difficult to get any one other than a military man.

6668. Never mind about his being a military man; if he was a good physical instructor he would be of use to you?—He would be if we could find him.

6669. He would be if he was provided for you?—Yes.

6670. You never tried to get one?—Well, I once suggested that we should, but it has never been taken up.

6671. Was the expense too great?—I do not think the expense was too great. What I suggested was that the King Edward Board should apply for the caretaker of the Turriff School Board, who was a military man and could do it, but the matter was never pressed.

6672. They seem to put a good many duties on you. You are attendance officer?—Yes, I am practically all the attendance officer, that is to say, I am not the attendance officer, but I attend to the regularity of attendance myself mainly.

6673. *By Mr Shaw Stewart.*—We have had a good deal of evidence from town and city schoolmasters, and they are practically all in favour of the teachers instructing in physical exercise, with that work occasionally supervised and examined by qualified instructors. They would prefer to keep the teaching of the physical

training in their own hands. Would you, as representing country schools, be in favour of that?—Most distinctly if we were qualified.

6674. The teachers should be qualified, yes, of course, before they can teach physical exercise?—Yes.

6675. But if it were obligatory that they should qualify, you see no objection to their taking the teaching?—I rather think they should.

6676. Even though the teaching should be much more frequent, at least half an hour a day we will say?—I do not know how they could find half an hour a day unless there is a considerable re-arrangement of the subjects.

6677. Still, if the Inspector were instructed to consider physical exercise as of equal importance with other subjects, time would have to be found?—No doubt, sir, of course, but then the whole trouble has been that our education is being said to be not so good, not so sound as formerly, and if we interfere with what we are doing just now, we do not help that, I do not think.

6678. Then shall I take it from you that before we can afford an extended system of physical daily training, something must be taken off the other work?—Yes, we must lighten the ship.

6679. Lighten the time-table in other directions?—Yes, and I should certainly prefer that the teachers should do the training themselves.

6680. *By Sir Henry Craik.*—When you said you could lighten the curriculum in other directions, what subject do you think may be taken off from the instruction of the boys?—Well, sir, I have considered that, and the subjects are all so valuable.

6681. You think they are all so valuable, you are not willing to give up any of them?—Not willing to give up any of them.

6682. Unless you can give up something you cannot take up this physical instruction. Is there not another remedy for that, viz., that you should have further teachers?—Yes.

6683. Then you do not wish to lighten the curriculum, but you wish to have a more adequate staff to overtake your curriculum as well as the physical instruction?—Yes, I think so; I think that would do it.

6684. You say that yours is a Dick Bequest school?—Yes.

6685. A certain payment is made to you by the Dick Bequest Trustees?—Not to me directly, sir.

6686. Made to the School Board?—Made to the School Board, and paid over to me.

6687. Do the School Board pay, in addition to that amount, the full salary to their teachers, or do they use that grant for the lowering of the rate?—Well, sir, the Dick Bequest Trustees insist that if a school is to be upon their list, there shall be a certain fixed minimum salary.

6688. The School Board reduces that salary to the minimum, I presume?—The minimum is £135 for a school like mine. My fixed salary is £140; they keep pretty near the minimum.

6689. But you said they do not pay you by a fixed salary, they pay you a proportion of the grant?—£140 and one-fourth of the grant.

6690. That, I hope your School Board know, is not in accordance with the Code?—I have told them that they may expect that to be looked into.

6691. As soon as we know it, we certainly shall look into it. Then you spoke of the evening classes, and you used a phrase in regard to them that was rather noticeable. You said the School Board will not open evening classes at a loss. Do they contemplate that these evening classes should be profitable?—I do not think, sir, that we can ever get evening classes from any rural School Board that I know of—I would not like to be too strong in my statements—that were conducted at a loss.

6692. You mean to say they will not spend any of their own money at all?—They are very unwilling to rate, if I may put it that way.

6693. That they will take the taxpayer's money or

the services of the teachers, but they will on no account spend any money of their own, even though they think these continuation classes may be very beneficial to the young men?—Well, I am afraid that is about what it is.

6694. That cannot be too clearly understood as the view of the public generally. If that is the view of the School Board, it cannot be too well understood what their view is?—The School Board are anxious that there should be no loss upon evening classes, and they arrange the salaries of the teachers as near as possible to prevent loss.

6695. About the duration of evening classes, surely if they are to have any educational effect, you would say that the normal length should not be shorter than twenty weeks, if possible?—Well, sir, I would rather go on this line, that I would make the normal session shorter, and I would make some arrangement so that there would be courses, say, of three years.

6696. But there are courses, say, of three years?—But then they are all voluntary; there is no compulsion in the matter.

6697. I only want to ask you again this question. Do you think that if a lad has neglected his education when he was under fourteen, that twenty weeks a year is too much to ask him to give as a normal thing to the continuation classes?—I do not think it is too much for the lad, but there is no compulsion.

6698. Very well, then; you said that your Board had communicated with the Department; what reply did you get to your communication?—I think the reply was that no exception could be made in the matter, so far as I can remember.

6699. But you know that the Code permits a certain exception if good reasons can be assigned?—I advised them, and I gave as good reasons as I could find.

6700. You have not satisfied the Department?—The reasons did not satisfy the Department.

Mr J. Elphinstone, M.A.
29 May '02.

The witness withdrew.

Adjourned.

THIRTEENTH DAY.

Monday, 9th June 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT.

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr GEORGE M^CCRAB, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Professor MATTHEW HAY, M.D., C.M., examined.

Prof. M. Hay, M.D., C.M.
9 June '02.

6701. *By Professor Ogston.*—Would you allow me to bring out some points which would emphasise the value of your evidence. You are Professor of Forensic Medicine (including Public Health) in the University of Aberdeen, and Medical Officer of Health for the City of Aberdeen?—I am.

6702. You are M.D. of Edinburgh?—Yes.

6703. And I think I am not mistaken in saying that you were the most distinguished graduate of your time?—Yes, I obtained the award which goes to the man who takes that position.

6704. And you have devoted the whole of your professional career to studies of questions regarding health?—Practically.

6705. And your professional career has extended over a certain number of years?—Since 1878; I took my medical degrees in 1878.

6706. The city for which you are Medical Officer of Health is a large city?—The population is about 160,000 at present.

6707. There is a very large number of schools in it?—That is so.

6708. Could you give us any idea how many scholars there are?—I think about 25,000 at present.

6709. Will you read over your notes?—I attend at the request of the Commission, but I do not pretend to speak from any special knowledge of the subject of physical training. As an officer of health I am, of

course, thoroughly in favour of the extension of physical training among the youth of the nation, believing that it would distinctly promote the health of the people. In Aberdeen, chiefly owing to the enthusiasm and leadership of Lieut.-Colonel Cruden, physical training was early introduced into our schools, and is being carried out, with the available means, and under existing school arrangements, so satisfactorily on the whole, that there has been practically no occasion for my urging its necessity officially, or taking an active part in its promotion. Perhaps the educational institution in Aberdeen with least provision for physical training is the University, which, though possessing an excellent field for outdoor games, has not as yet a gymnasium, but under a building scheme at present in hand a good gymnasium is to be provided. Regarding the points enumerated in the memorandum for medical witnesses, I have to state:—

Standards of height, weight, chest-girth, etc., of Scottish children.—I am not aware of any published records of the standards of height, weight, chest-girth, etc., for Scottish children; and so far as I can ascertain no exact records of this kind have been kept in Aberdeen. I may say I asked Colonel Cruden, who ought to know more about this than anyone else, as he is the head of the Physical Training College in Aberdeen, whether he had kept any record or anyone else had kept a record for him,

Physical training in Aberdeen.

Measurements of Scottish children.

Prof. M. Hay,
M.D., C.M.

9 June '02.

and he said that he regretted no such record had been kept. If the Commissioners are willing to make a small pecuniary allowance for the necessary assistance, I would be willing to undertake to procure among Aberdeen children the required measurements of say 100 children at each year of certain stated ages. Such measurements exist for England, the most detailed and complete of which are to be found in the Report of the Anthropometric Committee of the British Association, 1883, and preceding years.

Proportion of physically and mentally defective children.—I am not aware of any reports on the proportion of physically and mentally defective children in Scotland, except of a very partial character. In the city and county of Aberdeen some years ago a young oculist, Dr Ferdinands, examined systematically some fourteen schools for defects of vision, and published the results in a thesis for the Doctorate of Medicine. The substance of the thesis was published in the *British Medical Journal*, September, 1891. By the courtesy of the author I am able to submit a copy of this paper. It reveals, I think, an unexpected proportion of vision defects. For example, 13·4 per cent. of the city scholars showed myopia, and 10 per cent. of the country scholars; 16·5 per cent. of all the children showed hypermetropia, the proportion among country children being about half of what it was in city children; also about 4 per cent. suffered from inflammation of eyelids, and there were several cases of other eye diseases, such as diseases of cornea. As to the other defects referred to in the memorandum, perhaps I may be permitted to give my general impression, based chiefly on my experience as physician of the Fever Hospital, where, during my tenure of office, I have had under treatment for scarlet fever, measles, and the like, about 10,000 children of all ages, drawn chiefly, however, from the working classes. From such experience, I believe the proportion of physically and mentally defective children in Aberdeen to be small, at any rate in any pronounced and noticeable degree. For I have not made a point of ascertaining the finer degrees of defects. For example, diseased ears and deafness are rare; tubercular glands and joints are not common, and are, I think, becoming more scarce; rupture is very rare. Diseased teeth are, however, fairly common. Deformities are rare—an occasional club-foot being perhaps the commonest form of deformity. I may add with regard to this that in Aberdeen a deformity, about which Professor Ogston knows very well, is rather common, flatfoot, but I would reckon it as among the finer degrees of defect. General weakness among quite young children—say from a month or two old to two or three years—is not uncommon, and dependent largely, I think, on improper feeding; but it is much less common in older children.

Country and Urban children.—I share the general impression that country children, especially of the working classes, are physically superior to urban children of the same class—I mean in general health and robustness. In Aberdeen, however, the difference is not, I think, great, unless in the case of children of the very poorest class. As to mental superiority, I am in doubt as to the actual facts. His Majesty's Inspectors of schools ought, however, to be able to give reliable information on the point. The results of the examinations for the leaving certificates of the Education Department should also throw light; and some interesting information might be procurable from the results of the Arts bursary competitions in the Scottish universities, for which, in Aberdeen, nearly all intending Art students enter. I would undertake to procure an analysis of the results of such competitions in the Aberdeen University, if desired. I may add to this that I have looked through our records in order to ascertain who took the first position in the Arts bursary competition throughout a number of years in respect of the place from which they happened to come, and I found that in the earlier years by far the largest proportion of them came from the country. In later years I think the town rather has it. But that, I do not think, is a sufficient comparison. One

would require to go through the whole of the bursary list, and not deal only with the one at the top.

With regard to the improvement or degeneration of children (town and country), what I have now to say is based very largely on statistical material in two papers, copies of which I have already sent to you. Taking all the children in Scotland of the ordinary school ages—say five to fifteen years—there has been a marked lowering of mortality since about 1875. In these papers which were published in the *Sanitary Journal* this is clearly brought out, though I regret that, as the papers appeared a few years ago, they are not now quite up to date. I have, however, in the copies of the papers submitted, written in some figures bringing certain of the tables up to the date of the last issued material. The earlier paper is on 'The Vital Statistics of Children of the School Age in Scotland,' and was published in 1890, and the later is on 'Mortality Rates in Scotland,' and was published in 1895. They both show that there was a great fall in the mortality among children of the school age after 1875, up to which time the mortality had been, if anything, increasing. By 1890 the mortality among children five to ten years old was only about 60 to 70 per cent. of what it had been prior to 1875, and the mortality among children ten to fifteen years old had fallen to 75 to 80 per cent. of what it formerly was—the reduction at both periods being somewhat more pronounced among boys than girls. The decline at both age-periods has been continued since 1890, so that during the last few years the mortality rate at five to ten years was less than a half of the rate in the quinquennium ending 1875, and the rate at ten to fifteen years was slightly over a half of what it was in the earlier period. It may be of interest to add that though the fall was mainly due to a decline in deaths from zymotic diseases, it was not entirely due to this cause.

It is also interesting to note that in so far as the decline was not dependent on zymotics, it chiefly affected boys. In other words, the diminished mortality among girls was almost entirely due to fewer deaths from zymotics; while in the case of the boys there was a distinct decline from other causes as well as zymotics.

These statistics also show that while up to 1875 the death-rate from lung diseases had been rapidly increasing, it has considerably diminished since. This is also true of deaths from nervous diseases among children from ten to fifteen years; though in the case of children of five to ten years there is scarcely any diminution. Deaths from diseases of the circulatory and urinary systems have rather been on the increase throughout the period dealt with in my papers as published, that is, to 1890.

It is also of interest to note, with regard to children between the ages of five and ten years, that up to about 1885 the mortality, from all causes, among boys was always higher than among girls, though the difference was tending to decrease. Since 1885 the mortality has been greater among girls than boys. At the ages of ten to fifteen years the mortality among girls has, since 1860, exceeded considerably the mortality among boys, and the excess appears to be steadily increasing. In the quadrennium ending 1899 it amounted to nearly 15 per cent. The health of girls at the later school ages evidently demands greater care than that of boys. The difference is not unlikely to be largely due to the smaller amount of outdoor and physical exercise which girls undergo. That is my impression. It may also be of interest to observe that at the ages of five to ten years the group of diseases which causes the largest number of deaths is the zymotic, and that next to it comes the tubercular group, followed at a considerable distance by the respiratory and nervous groups. At the ages of ten to fifteen years the most fatal group is distinctly the tubercular, and more especially among girls, and the next most fatal is the zymotic. It is likewise an interesting fact that there is a decided difference between England and Scotland in respect of the death-rate at the school ages. Previous to 1860 there was apparently little difference, but since 1860 there has been a distinctly higher

mortality among Scottish children of these ages than among English, the difference reaching its acme in the decennium, 1871-80, when the mortality was as much as one-third greater among the former than among the latter. But the difference is not yet much diminished. Out of every 10,000 children of the age of five to ten years, in the period of nine years ending 1899, there died annually on an average 24 in England as against 33 in Scotland. At the ages of ten to fifteen years the corresponding numbers of deaths were 42 and 50 respectively. The difference may be in part due to the greater development of outdoor sports among English school children. I put that forward tentatively as an opinion. It is not of so much interest to you, but looking at the diagram in the paper, you will observe that in regard to children under the age of five, it is the opposite way about. The death-rate among children under five is higher in England than in Scotland; but after the age of five is passed, and on to fifteen, the death-rate in Scotland is decidedly higher. In Aberdeen itself there has been a large decline in the death-rate among children of five to fifteen years—a decline which has continued up to the present time. I submit a table extracted from my last annual report for the city, which shows that whereas in the decennium, 1866-75, the average annual death-rate among such children was 7·4 per 1000, it had fallen to 5·7 in 1876-85, to 4·6 in 1886-95, and in 1896-1900 to 3·5. That is to say, it had fallen from 7·4 in 1866-75 to 3·5 in the last quinquennium. The mortality rate is, therefore, less than one half of what it was thirty to forty years ago. At no other period of life has there been so marked a declension of mortality. The reduction of the zymotic death-rate has, no doubt, been a considerable factor; but it does not account for the whole of the fall. Various factors have probably been operative, but improved school accommodation, with improved ventilation, which is now mainly mechanical in the Board Schools, and in more recent years, the introduction of physical training into the schools, must, I think be assigned important places. Physical training was introduced into the Aberdeen schools, I think, about 1889. Comparing town children with country children, reference to Charts IV. and V. in my paper on 'Mortality Rates in Scotland' will show that in the quinquennium ending 1875 the mortality among children of five to fifteen years in the eight principal towns was about twice as high as among children of the same ages in what the Registrar-General terms the mainland-rural districts. Mainland-rural districts, I may mention, consist of all the rural parts, excluding towns and villages of 2000 inhabitants and upwards. These charts also show that these ages, together with the ages immediately under five, were those which, among all ages, exhibited the greatest difference in mortality between town and country. In other words, children are more susceptible than others to the physical influences of town and country. In the quadrennium ending 1889, or about fourteen or fifteen years later, there was still a marked difference in mortality between town and country children, but it had become considerably reduced, especially for children between ten and fifteen years. Among these, in 1871-75, the death-rates among country and town children were as 10 to 18 respectively; in 1886-89, they were as 10 to 13. In the quadrennium ending 1899, I have recently calculated that for the same ages they were also as 10 to 13. For the ages of five to ten they were in 1871-75 as 10 to 23; in the quadrennium ending 1889, as 10 to 17; and in the quadrennium ending 1899, also as 10 to 17. Judged by mortality rates there can be no question as to the decided physical improvement of town children. The mortality rates also show a considerable improvement of country children, and in the last ten or fifteen years a *pari passu* diminution with that of town children.

Does the work or exercise of country children dispense with the need of systematised exercise for them?—This raises the important question as to the necessity or benefit of systematised exercise, where there is ample natural exercise. I am of opinion that system-

atised exercise will even in such a case be a benefit to the majority of children, if not to all. Systematised exercise, as I understand it, is distinguished from ordinary natural exercise or work by the fact that it is so arranged as to bring into play, by different movements, the greatest possible number of the various muscles, so that all may be duly exercised and developed. I think it is possible to attach too much importance to this. The natural exercise, if sufficient in quantity, of a healthy child, will, I think, quite suffice for the maintenance of good health, though some muscles may, as probably Nature intended, remain to a large extent undeveloped. But some children are largely inclined to sedentary habits, and systematised exercise will prove in some degree a substitute for the natural exercise which they ought to be taking. Other children may have ill-developed chests, with defective expansion of lungs, which systematised exercises may materially correct. And as country children are often defective and slouchy and slow in their gait and deportment, all of them are likely to gain from the benefits in this direction. They will be able to cultivate a more rapid response between the brain and the muscular system, with a more precise ordering of muscular action, and acquire a smarter gait and bearing—all of which will, in later life, be of advantage.

Does improved physical development entail improvement in brain power and in acuteness of the faculties?—In so far as improved physical development implies improved health, there can, I think, be no doubt as to the effect on brain power. It will help in securing the fit union of the *mens sana in corpore sano*. Good health also undoubtedly promotes mental clearness, and, therefore, acuteness. It has also to be kept in view that organised exercise of the muscles necessarily involves organised exercise, with a corresponding development, of the associated nervous centres and fibres which can scarcely fail to promote the acuteness of the faculties, although such promotion must chiefly depend on the purely mental discipline which the child undergoes in school. Although the degree of effect of physical development on brain power may vary at different ages, I think the effect is not a-wanting at any age.

Does improved physical development imply improved morale? Does improved physical development promote morality?—I am of opinion that it does. Boys and girls who take little exercise are, in my experience, more likely to be the subject of exaggerated or perverted instincts. About that I am quite clear.

Is a physical census of children desirable, and in what ought it to consist?—Such a census would undoubtedly provide a more scientific basis than is possessed at present for dealing with the physical and mental education of children, and, if repeated at suitable intervals, would offer, along with the ordinary vital statistics of the Registrar-General, a fairly safe criterion of physical progress, if any. It could not, of course, be made without skilled inspection by medical men, and might be a somewhat expensive undertaking if attempted for the whole country. But it would not be difficult to sample, as it were, the children of different districts and classes. Of course, if regular medical inspection among schools were introduced, such census material would rapidly accumulate. The census should deal with the physical and mental formation or development of the child, such as weight, height, and other corporeal measurements; physical defects of sight, hearing, speech; physical deformities; pronounced mental dulness; and diseases, if these happen to be present.

Is inspection of the health of school children by a medical man necessary at present? Will it become necessary if physical training be increased and rendered more systematic?—I answer both questions in the affirmative. Medical officers of health have long held that every School Board should have the skilled assistance of medical men for the inspection of children even under present conditions, and it would be still more necessary if physical training became more general. Every school child should be medically

examined at least once a year for physical defects. The first examination would, of course, be the most thorough. Defects of the senses would then be ascertained and corrected, if possible, or allowed for in subsequent school training. The presence of certain contagious diseases, such as itch, ringworm, and various hair diseases, would be ascertained, and steps taken to ensure treatment. I may mention that in Aberdeen these contagious skin diseases are very common among children, much more common than one would care to see them. The medical inspector would also at all times be available for any special examination required on account of suspicions of the occurrence of any ordinary zymotic disease in a child, or of infectious diseases generally. In well-regulated physical training, the training ought to be under medical supervision, both as to the fitness of children for it and as to the nature of the training. But for this purpose it would be desirable that the medical inspector should himself have undergone a course of instruction in physical training so as to be sufficiently familiar with it.

Is special clothing required for girls undergoing physical training?—It is highly desirable so long as the present custom continues of girls wearing stays, and tying their clothes tightly round their waists. The full benefits of physical training cannot be obtained under such conditions.

Girls' clothing.

Physical exercises: value of different forms.

What is the absolute and relative value to children at various ages of the different forms of physical exercise?—We must trust largely to ordinary exercise for children of all ages. To methodise all exercise, or even to methodise it largely, would be a sure way of making it distasteful and ineffective. This really goes without saying. But as I have already remarked in regard to ordinary exercise for country children, it does not meet every want of the body; and this is truer of town than of country children. For among the former, the facilities for exercise are more restricted.

Ordinary work.

Ordinary work, if outdoor, may, like ordinary exercise, keep the body in excellent health, but sometimes from its nature it may lead to very unequal development of the body, and even, sometimes, to positive injury. Witness the message boy, who has often to carry far too heavy loads in a basket slung over one arm, which, besides injuring the arm, distorts the trunk. Where the work is indoor, and mainly sedentary, physical exercise in one form or another is imperative.

Walking and running.

Walking and running.—Walking is excellent, if undertaken with something of an object, and especially if it requires somewhat more exertion than is necessary in walking at an ordinary pace on the flat, as, for example, in mounting a hill. The ordinary constitutional along an ordinary road, especially within a town, is often far from refreshing, though doubtless much better than no exercise. The mind should, if possible, be pleasantly occupied, as in conversation with a companion, or in the active observation of nature, or, as in hill-climbing, in the contemplation of beautiful scenery.

Running—I mean sustained running—affords excellent exercise for boys above twelve years of age, but where the runs are long or are fast, they may do much and permanent harm to boys with a weak heart. Having regard to this danger, which is not altogether to be obviated by previous medical examination, I am rather opposed to the very long runs so much encouraged in some public schools. The exercise of games is, I think, much safer and more natural where, as in cricket or football, there is no call to continuous running.

Games.

Games should be encouraged at all ages. I refer especially to outdoor games. All fit children and youths—male and female—should be compelled to take part in games and sports. Most persons do so with great avidity, for there is no form of exercise, which, on account of the elements of rivalry and liveliness, are so liked by young and old. But there are always a few who are indifferent to games unless distinctly encouraged to take part. A liking for games acquired in youth, especially if accompanied by some success, is likely to continue throughout manhood.

Musical drill.

Exercises of trunk and limbs. Musical drill.—

Very useful at nearly all ages, but especially up to fourteen years. The exercises may be continued at later ages, if necessary. They are, sometimes, almost the only exercise available in a school, when outdoor games are prohibited by the weather. When accompanied by music they form a pleasant relief to the tension of ordinary school study. Besides promoting general physical development, they can be used to correct defects of development, as weak chests, etc. Gymnastics should, I think, unless in a mild form, be principally confined to youths who have passed the age of thirteen or fourteen. Gymnastics should always be under skilled supervision, and should not be undertaken, as a rule, without previous medical examination—at least in any case of doubtful fitness.

Military Drill.—I approve of this for boys of fourteen or fifteen years, and upwards. Not only will it assist deportment, and increase readiness of muscular response, and inculcate lessons of deference and obedience, but it will teach every fit lad the use of firearms, which may afterwards be of national service. But the mere drill should not be too prolonged so as to be tiresome, and actual shooting, in which the boys would be certain to take keen interest, should receive a prominent place.

Self-defence, boxing, shooting.—Fencing forms an interesting and exciting exercise, and quickens the eye, but it is, physically speaking, a one-sided exercise largely, and does not equally develop both sides of the body. Boxing, though a good test of endurance, tends to round the shoulders and flatten the chest.

Self-defence etc.

Swimming should be encouraged, but should not be obligatory, and should be under supervision, not only to prevent accidents, but also to regulate the length of time in the water. Harm is not unfrequently done by a too prolonged stay in a cold swimming bath. I had recently occasion to notice that, particularly in Aberdeen.

Swimm

Does physical training in the healthy prevent eye disease, joint disease, spine disease, tuberculosis?—Yes, to some degree. The paper of Dr Ferdinands already referred to shows that defects of vision are less frequent among country children—that is, children in the full enjoyment of outdoor exercise—than town children. Everything which promotes good health will tend to prevent tuberculosis and joint diseases, which are often of tubercular origin.

Benefits of da. gers

Does physical training, in weaklings or those predisposed, cause or favour rupture?—Rupture?—I think not, unless where rupture is already imminent, and exercise too violent. Heart disease?—No, unless where heart previously weakened, or exercise too violent. A weak heart may be greatly strengthened and improved by judicious exercise. Joint and spine disease, tuberculosis, eyes?—No, but the training should be under medical supervision. Fractures, dislocation, or other injuries?—Practically, no. Brain and ear disease?—I think not, but there should be medical supervision or advice.

Requirements of present race of children?—I think that exercises, games, gymnastics, and military drill should, according to age and sex and physical fitness, be made more or less obligatory for all young persons. First-aid and ambulance instruction would, no doubt, be of advantage, but I should hesitate to insist upon it, if it were to burden too much the work of school life. Considerable means of instruction already exists for this among persons, such as railway servants and policemen, who are most likely to be in contact with persons requiring first-aid.

Exercises games, military etc., shd be obligato

Advantages of instruction in self-defence, boxing, shooting.—I have already referred to the advantage of shooting, with a view to national defence.

Benefit of instruction in swimming.—It ought to be an advantage, but it is often said that more persons are drowned who can swim than those who cannot, because of the greater temptation to the former to enter water. But even if this were true, I would approve of every person being taught to swim.

Swimm benefits.

What system of physical training is best?—I am not an expert, and cannot give a well-informed opinion.

Physical training

ay, I would only say that the system should be recreative and attractive as well as physically educational, that the attainment of good health should be its principal aim, accompanied by an all-round physical development, and that it should be carried out whenever possible in the open air, and at all times in thoroughly well-ventilated rooms.

Respective merits of outdoor and indoor training.—I would prefer all training, if the climate permitted, to be out-of-doors, so that the lungs would be filled with pure and unpolluted air, especially as during the training the lungs are more active than usual. Pure fresh air is Nature's principal tonic, and its value was never more fully recognised by medical men and sanitarians than at present. If it can cure phthisis and kindred diseases, it will be still more potent in preventing them.

Adequacy of schoolroom and playground.—All depends on their size and condition. Usually the schoolroom would be inadequate. A room for physical exercise can stand to be much more freely ventilated than a room for teaching, and those who are undergoing the exercise can stand far more of wind blowing in upon them when they are undergoing physical exercise than they can when occupied with their ordinary school lessons. Exercise rooms or gymnasia ought, as a rule, to be specially constructed with very freely ventilated roofs. Playgrounds are usually too small for proper outdoor games. Playing fields should be available for all schools, or combinations of schools. For schools in towns these fields may have to be got at some distance from the town.

Precautions in a gymnasium.—Every gymnasium ought to be under the supervision of a properly-qualified instructor.

Physical training of girls.—There is no reason why they should not undergo, though in moderate form, every variety of physical training to which boys may be subjected, except, of course, military drill. I highly approve of the introduction (already witnessed) into some secondary schools for girls of almost every form of outdoor exercise. There is no reason to believe that vigorous outdoor exercise will do girls any harm. On the contrary, it is the opinion of many doctors, who are expert in female ailments, that the difficulties of puberty and subsequently of maternity are much more easily surmounted by females who have had abundance of physical exercise. The difference between town and country women in the matter of ease of child-birth is well known, or between women in regular physical work and those who are not.

Proportion of time devoted to physical training.—I will only remark that for young persons, consistently with the proper performance of their ordinary school work, there can scarcely be too much of physical exercise. How much of this should be of the nature of organised physical training is more difficult to answer—perhaps an hour or half an hour three times a week, or daily. I would prefer a little every school day.

Dietary.—With very few exceptions, which could be attended to through the usual charitable channels, children are so well fed nowadays as not to require any special dietary on account of physical training. I am keeping in view what I know of the Aberdeen children.

Results of physical training in secondary schools and universities.—Such training does not, in my experience, interfere with intellectual development or progress, and I have no fear of its doing so. On the contrary, by materially assisting in the maintenance of health, it will rather promote intellectual progress, although I must admit that too many of our best students in the Scottish universities are inclined to neglect it. But this is mainly due to want of proper facilities and of proper organisation. It should not, as at present, be left to the students themselves.

6710. Would you allow me a few questions in corroboration and in amplification of the notes you have just read? You mention here that there has been an improvement in the mortality of children since certain dates; can you connect that in any way, more

than you have generally done in the second page of your evidence, with the improved school arrangements?—You mean the improved school arrangements under the Education Act, more particularly.

6711. Under the Education Act, yes?—All I can say is, that the Education Act came into operation in the early 'seventies,' and that up to 1875 the death-rates among the children of the school ages remained unaltered, in fact, if anything they were rather going up till 1875; but since that time they have come down very considerably; they have fallen to about half of what they used to be, and I think it is not unlikely that the better schools in which the children are now placed have something to do—and perhaps a great deal to do—with this lowering of the mortality.

6712. The other influences, such as the increased wealth of the population and the better sanitation in regard to houses, would not entirely, in your opinion, explain the improvement in the mortality?—It would be very difficult to answer that definitely. Of course these must have had considerable effect. There is no doubt that the standard of living has improved immensely during the last thirty to forty years. The wages of the working classes now are a great deal higher than they used to be; in Aberdeen I should say they are about from 50 to 60 per cent. higher than they were forty years ago, and the purchasing power of money for ordinary food stuffs has been increased.

6713. Well, you think that the improved sanitation in schools, and the conditions of children's schools, have been a contributing factor?—That is my opinion; I think it cannot help having had some considerable effect.

6714. You do not think that at present the school curriculum injures children in Scotland? You do not think that the amount of mental culture is too great for the strength of the children?—Well, I am inclined to think that in some cases there is rather more pressure than there should be.

6715. Would you say that the present curriculum of study is excessive in regard to the health of the average child?—Of course a good deal depends upon how it is carried out in the different schools; but speaking of Aberdeen, I have certainly heard it said by persons of good sense with children at school that they thought that the children were being rather hardly pressed, particularly in the way of evening work. It bulks more largely now than it used to—at any rate in my school days; and so far as there is much heavy evening work, I think it is rather a mistake and against the health of the child. But as regards the work during the day, it seems to be well proportioned and not excessive.

6716. And that evening work to which you refer would be very contributory to the weakness of the eyesight that you refer to in your evidence?—Yes, too much of it.

6717. And might also affect the bodily condition, such as producing flat-foot and so forth, though less directly?—Well, it might under certain conditions.

6718. In your evidence, under the heading 'Does improved physical development entail improvement 'in brain power,' I think the general effect of your answer there is that you consider it does?—Yes.

6719. That physical development does distinctly improve brain power?—That is so.

6720. And in regard to the paragraph below—a very important one—regarding morality and morale, your opinion is very clear upon that point; that it is beneficial in regard to those two subjects?—I have no doubt about it at all.

6721. Then taking the next paragraph, the physical census of children. I suppose it would be a very expensive thing to take such a medical census and periodical medical examination as is referred to?—It would, but of course it would be unnecessary if medical men were appointed in connection with School Boards to do the ordinary routine medical inspection required by the School Board. This material would

accumulate in their hands, and would form the material for a census without having a special census.

6722. And you think it absolutely necessary that if physical training is introduced and elaborated in the Scottish schools, some form, at any rate, of medical examination and supervision should be instituted?—Yes; I think so. It is even necessary now, without that physical training, and it would be still more necessary if there were physical training, that is, if the physical training were not to do harm in certain cases.

6723. Does your experience as a medical officer of health lead you to see any way by which it might be carried out at a reasonable cost? Is there any public medical officer, say, for the sake of argument, medical officer of health, or other, who could be charged with this as an addition to his duties, with an addition to his salary, and without injuring his present work?—Well, I think that most medical officers of health are already so fully occupied with their ordinary duties that they could not do more than merely undertake the supervision of the medical inspection of schools. The actual inspection would require to be performed by medical men specially appointed for the purpose, or, perhaps, by some of the ordinary medical practitioners, who might be attached to the several schools and make the necessary inspections for a modest remuneration, while permitted to make their daily living by ordinary practice.

6724. Probably at a small cost?—I feel sure in Aberdeen you could get medical men in town to undertake this work at a comparatively small cost under some central supervision.

6725. And in remote country districts some similar method might, you think, be found?—I think so.

6726. The next point is a minor one. In your evidence, under the question of 'special clothing required for girls,' could you suggest what special clothing could be required of such a practical shape that it could be used in Board Schools?—All I meant was that the clothing ought to be loose, like ordinary boys' clothing very much. As to how the clothing is to be constructed, that is, perhaps, rather a matter for the dressmaker than for me; but I apprehend no difficulty.

6727. But you think that perhaps a moderate reform in the system of clothing at present used, or perhaps an improvement in regard to the clothing as at present constructed, might meet all the difficulty, without providing special suits for everything?—Oh, I think so. I think the reform is desirable, not only for physical training, but at all times, for the general life of the girl. It is desirable that she should not be wearing, at any rate in these earlier ages, whatever she may do later on, clothing which would constrict the body where vital organs are contained.

6728. And the question of propriety would not enter in if girls had exercises suitable to their sex and age?—No; I do not think so, not with suitable clothing.

6729. The next point is as to the absolute and relative value of the different forms of physical exercises. We have had a witness before us who advocates, of course, the introduction of a systematised physical training, but insists that on purpose to get the utmost benefit of it it must be at times pushed to excess, that exertion must be carried so far as to reach the limits of tolerance, that a physical training by which the limits of endurance are not reached is not of the same benefit as one where exertion is often forced?—Well, I think there is something in that.

6730. Would you approve of that as a principle moderately applied?—Yes, moderately applied. I think, for example, that one of the unsatisfactory effects of ordinary walking as a means of physical exercise is because one has not one's tolerance in this respect sufficiently pushed. Unless the exercise puts a certain strain upon one, and increases rapidity of respiration or the depth of it, and also increases the heart work, I think as a rule one does not get the fullest benefit out of the exercise.

6731. So that a reserve fund of power, as it were,

should be cultivated by all good systems of physical exercise?—Yes, in moderation.

6731A. The next point is in the next paragraph, headed 'Exercises of Trunk and Limb Musical Drill.' We have had conflicting evidence regarding that, some advocating that physical training should be carried out without musical drill, that otherwise it does not confer its fullest benefit, and other witnesses have asserted that musical drill is so advantageous, fits in so well with physical drill and renders it more easy, and altogether more applicable, that it is a necessity; can you give us any opinion on that point?—Well, as I have already said, I am not an expert upon these matters, but my feeling would be that musical drill has a distinctly advantageous place, particularly in the physical training of the very young. It adds an interest to the training which otherwise it might not have. Of course I quite understand its disadvantages in making the exercise more mechanical in a way, and with less mental attention being given to what is being done, but I think the musical drill ought to be included in the physical training, particularly of the younger children.

6732. There are three other questions. Should girls be taught swimming by a man or a woman?—I think, preferably by a woman, although I do not see any great difficulty in their being taught by a man, especially when large numbers are being simultaneously dealt with.

6733. The second question refers to the effect of physical training in weaklings or those predisposed, causing or favouring rupture. I suppose that some of the diseases that you mention there, like heart and rupture, are capable of being found out by an ordinary teacher?—That is so.

6734. There are some forms of heart disease and some forms of rupture that would require a very skilled medical man?—Yes, and even then he might not be able to notice the mere imminence of these things and the unfitness of a child, for example, for severe exercise who happened to have a weak heart. It might be made evident only after the exercise had been commenced; but if a medical man were charged with the supervision of a school, any unusual breathlessness, of course, would be pointed out to him by the instructor, and the child would be medically examined, and if the heart was not exactly what it should be, the exercise would be regulated accordingly.

6735. And that strongly enforces your opinion that some form of medical supervision will be necessary?—Yes, I regard it as absolutely necessary if considerable harm is not to be done in certain instances.

6736. The last question is one which you have answered in your notes, but I ask it again for the sake of emphasising your opinion with reference to the physical training of girls; you do not consider that physical training properly applied, that is, without excess and suitably regulated, does any harm to girls at the periods of puberty and maternity?—No; if the training has been begun before these critical times have been reached, the general strengthening of the body and the muscles which results from it is rather an advantage when these times come, and enables the girls to pass through them more easily—I refer especially to the period of puberty—and to continue the exercise subsequently without disadvantage to themselves. On the other hand, if the physical training is only started at or after puberty, and with bodies that have not been braced up by previous exercise, there may be some chance of doing harm; but if it is begun early it is quite different, it rather improves their chance of getting through these periods satisfactorily.

6737. I suppose you have heard that some medical men hold a different opinion to that?—Yes, I know that some do.

6738. But still you consider that they are in error in some way in regard to the conclusion with reference to physical drill properly regulated?—Yes, I think the error probably has arisen in the way I have just suggested. If a girl is asked to undertake, for the first time, rather heavy physical exercise about the age

Hay, of puberty, when the organs are rapidly developing, then there is some chance of harm being done; but it is otherwise if the girl has not been previously undergoing physical training, and having her body, as I have already said, braced up for what is going to come later.

6739. But I suppose the very existence of such critical periods in regard to girls would still further render it desirable that some medical eye should be watching over a national system of physical training?—That is so. May I recall a question that you asked me a short time ago. This would no doubt rather favour the appointment of female instructors for the physical training of girls, especially of those who had reached the age of puberty, because they are much more likely to be made acquainted with complaints—if girls had any complaints to make—than a male teacher would be.

6740. I suppose there are female instructors in almost every Board School in Scotland?—Oh, yes, for the younger children.

6741. Then in the country schools there are generally female assistants?—You mean female teachers for all purposes?

6742. Female teachers?—Oh, yes, practically all, I think.

6743. So that the machinery is there in regard to that?—Yes, if the female teachers happen to know themselves something about physical training.

6744. Then I would like to ask you to guide us in regard to this: suppose we mix, as you advocate, mental training and physical training, what are we to aim at, where are we to stop; what is to be the standard of health that we aim at in the balance between the two; are we to make athletes, for instance, on the one hand, or are we to make book-worms on the other; if not, could you indicate what the line of proper balance between the two is?—Well, of course there is no necessity for making athletes of school children; what one wants to do is to give them enough of physical exercise to secure that their health would be maintained at a proper level, and also that they would acquire that physical smartness—that proper deportment which one likes to see in young people, and which, let us hope, they would retain in later life.

6745. And a proper mixture would produce a state of health in a typical individual beyond which physical training should not be pushed?—That is so.

6746. Athleticism you would disapprove of as an aim in a system of physical training applied to the whole country?—Oh, certainly I think there would be no advantage from it; on the contrary, it might seduce boys and girls away from their ordinary school work too much.

6747. Do you think that systematised physical training at an early age and continued would diminish the tendency of lads to hooliganism and rowdiness at a certain age?—I think so.

6748. One of our witnesses said that he considered that by having exercise properly directed, the tendency to run to excess at the period after school is left would lessen?—Well, I think so; they would have acquired certain habits which probably would not leave them. I mean if they had been trained in outdoor sports, and even in certain indoor exercises, they would in most cases feel for some time afterwards an appetite for these things which would, no doubt, be satisfied in legitimate ways.

6749. Referring next to country schools, you have seen, I suppose, many of them in the poorer districts of Scotland?—Yes, I have seen several of them.

6750. Do you know of any in which physical training in some fashion could not be carried out?—No; there would be no difficulty about it, provided some of the teachers were familiar with physical training.

6751. Even the roughest of playgrounds could be utilised as at present for some form of physical drill or physical training?—Certainly.

6752. And the question of bare feet is not prohibitive?—Not at all; not so far as I know.

6753. And the question of weather, even in the

most rainy districts of Scotland, is not prohibitive of a reasonable amount of exercise—training carried on even partially out of doors?—Not unless it is very wet at the time that the exercise is being taken.

6754. But from the beginning of one year to the beginning of another enough could be obtained in even the most remote and most inclement?—Oh, that is so—an abundance of it.

6755. Do you approve of gymnastics for girls?—Girls: I think in moderation they are also good, but they should not be taken too early, at any rate in any violent form.

6756. From a point of view of health, do you think the Saturday holiday—complete holiday—is a necessity, or might part of it be given up for physical training?—Well, I think that apart from the Sunday, one day in the course of the week is wanted, whether you give it in one whole day, as on Saturday, or as a half day in the middle of the week and another half at the end of the week, as is the custom in some schools; but either plan works well; perhaps I rather favour half a day in the middle of the week and another half day at the end of the week.

6757. You think it would be no harm to the population if part of the Saturday were given up to physical training, the loss being counterbalanced by a half holiday in the middle of the week?—Well, I would look upon the physical training as a good deal of a holiday for the children—a relaxation from their routine work, which is, after all, what a holiday chiefly means.

6758. We have had the other view advocated, I may say, that a Saturday holiday is an absolute necessity for the whole of the population. I wish to know your opinion regarding it?—If it is meant that there should be a whole holiday in the week entirely free from physical training, as opposed to a holiday which might for an hour or two hours be occupied with some form of physical training, I cannot say I have much sympathy with this view, if there would be difficulty, as I apprehend there might be, in getting a sufficiency of physical training in the other days of the week.

6759. You do not profess to speak as an authority on the question of what the proportion of physical training to mental training should be, but could you tell us whether half an hour per week is too little?—I think it is too little. I think there ought to be more than that.

6760. A little every day?—Yes, I would prefer a little every day.

6761. Do you think that ten minutes every day would be too little to be of any service?—Ten minutes would, of course, do good, but I think it ought to be twenty minutes, or half an hour if possible.

6762. The last question I have to put is, can you give us any help in regard to the application of physical training to cripples and incurables. Is it likely to be attended if properly applied with benefit to cripples?—I think so; of course it depends a good deal upon what the crippled condition is due to, but I think in most cases it would do good after the disease has become quiescent. Of course if the disease producing the crippling is still active, one could not, as a rule, venture upon anything which would be ordinarily called physical training.

6763. And could you tell us whether there are any children that come under the category of so-called cripples or incurables to whom physical training might be beneficial?—Well, I am not quite certain of what you mean by incurables.

6764. Say those in the incurable hospital?—Do you mean tubercular incurables, for example, or not?

6765. No; paralytics, for instance?—These would, of course, be benefited to some extent by a certain amount of physical training or physical exercise, in so far as it could be brought about by certain suitable methods.

6766. Do you know whether any such children receive any such training at present?—Not that I am aware of, except medically; but I have made no inquiries on the point.

6767. But if they do not, do you consider that they

Mortality
among
children.

have a right to it?—Oh, I think so, if it would benefit them, and improve their health; I think they have a right just as much as the other children.

6768. *By Mr McCrae.*—You make a very important distinction of the period from 1875 onward, and you say that the mortality has greatly diminished among children from five to ten years of age?—Yes.

6769. But that difference is not so distinct in Scotland as in England; in Scotland the critical period is evidently from five to ten, because in England there was a difference—24 died in England to 33 in Scotland?—Yes.

6770. But in children from ten to fifteen years in that period mortality is very much decreased?—Yes.

6771. Can you give us any further reason why there should be the decrease amongst the older children?—I think I said they had decreased in both; both at the ages of five to ten, and at the ages of five to fifteen.

6772. 'Though in the case of children of five to ten years there is scarcely any diminution'; that is in the first page of your evidence; you are speaking more especially of lung diseases and nervous diseases?—That statement is entirely with reference to nervous diseases, and you will find a special chart in my paper relating to these diseases, and it is only with regard to them that I say that there has been scarcely any diminution at the ages from five to ten, though there has been a diminution at the ages of ten to fifteen.

6773. Well, that is exactly the point I am leading up to. Do you think that the reason for that might be that what is commonly known as the system of cram has had any effect on the children from five to ten, though it had not had the same effect on children from ten to fifteen?—No; it would be rather the other way about. I think the cram begins at ten, and continues until the close of school age in connection with preparation for various examinations, Leaving Certificates, University Entrance Examinations, and the like, and when I prepared the chart for nervous diseases I was quite prepared to find from all that had been said about the effects of cramming nowadays that at the ages of ten to fifteen the mortality had gone up. On the contrary, it has gone down somewhat, whereas, at the younger ages, where cramming can hardly be said to come in, it has gone up.

6774. I am speaking of the Code as it previously existed; modifications have been made on it since?—Yes, from time to time.

6775. Then the same difference in the diminution of mortality does not apply equally to girls and to boys—No, that is so, speaking generally, of course, with regard to all kinds of disease.

6776. Then would that not seem to show that notwithstanding the improved sanitation and improved ventilation in schools the decrease in mortality could not be attributable to that so much, perhaps, as to the increase in physical training?—That is a point. I think you are right in saying that one might legitimately infer that as boys had been taking more physical exercise than girls during that time, the greater lowering of mortality amongst the boys had been to some extent brought about in that way.

6777. Then with regard to the comparison between England and Scotland, would you say that the difference was entirely the result of different conditions, or would you go further back and say that it was the difference in the physical condition of the parents in the two countries?—I do not know; it is a very difficult question to answer. The difference is a very striking one. What the causes are it is very hard to say. If there had been a general difference in the mortality at all ages, one might have put it down to some general difference in the mode of living—to the supposed plainer feeding of Scotch people; but, as matter of fact, the total death-rate at all ages in Scotland has been practically the same as in England. The death-rate from all causes in both countries went on for a number of years without any decrease, until in 1876, or thereby, when it began to fall in both countries, and the rate has almost always been about the same level in

Decrease of
mortality :
partly due to
more physical
exercises.

Differences
between
England and
Scotland.

each country; nevertheless, you have these remarkable differences with regard to the mortality among children, whatever be the particular cause.

6778. Then I notice you say between ten and fifteen years the mortality among girls has since 1860 exceeded considerably the mortality among boys, and the excess appears to be steadily increasing?—Yes.

6779. Among children from five to ten years, since 1885 the mortality has been greater amongst girls than boys?—Quite so.

6780. Well, you think that might be mitigated by increased physical training for the girls?—Yes, I think so. Girls have not participated to the same extent as boys in the greater attention given in recent years to physical exercise, except where the physical training has been fairly well organised, as, for example, in the Aberdeen schools.

6781. Then, speaking generally, are you against home lessons?—No, not altogether. I do not think that children would get on very well without a certain amount of home lessons; but I think sometimes too much is exacted of them in that way.

6782. You think they are excessive?—Yes, I think they are occasionally excessive, especially for the younger children.

6783. Then with regard to the question of compulsion, do you think that the parents would willingly submit to a certain amount of compulsion with regard to physical training?—Oh, I think so, especially if it were done under medical supervision, and they knew that some responsible medical man would examine the child from time to time, and see that the training was adapted to its strength and physical fitness.

6784. *By Mr Fergusson.*—What exactly is myopia?—Myopia and hypermetropia are defects of vision at a distance—myopia at a near distance, and hypermetropia at a long distance.

6785. You have told us of the change that has been taking place in the death-rate of Scotch and English children since 1860?—Yes.

6786. Can you account for that in any way; has the English mortality decreased or the Scotch increased, or how does the difference come about?—You will see it represented graphically in this diagram in my paper on the vital statistics of children of the school age.

6787. The mortality amongst Scotch children began to increase after 1860, did it, or was the English mortality diminished?—The one began to fall and the other began to rise somewhat.

6788. The Scotch began to rise and the English began to fall?—That is so.

6789. And you do not know how to account for that?—No, I really do not know how to account for it, unless one assumes that there was much more physical exercise among English children than amongst Scotch children. I believe that used to be true, at any rate with regard to the larger public schools. It has often been said that the English public schools differ very much in that respect from our Scotch schools, with certain exceptions, just as our universities differ very much. In our Scotch universities very little indeed is made of athletics, whereas, as everyone knows, in Oxford and Cambridge athletics occupy a very important position.

6790. That affects such a very small number that it would have very little influence on the statistics of the whole of the children of the country?—I am putting that forward as exemplifying the different feeling with regard to athletics in the two countries, which may extend down to the ordinary school children—the fact of the importance attached to athletics in the universities and higher schools of England.

6791. Then as to the inspection of school premises, is it part of your duty as medical officer of health to inspect such buildings?—That is so.

6792. There seems to have been some misunderstanding about that; I understand there are special instructions to medical officers of health to inspect all school premises and report on them; is that so?—You mean from the Local Government Board, or where?

6793. From some official source?—Well, it is part

of our duty under the Public Health Act to inspect all such buildings from time to time.

6796. Was there not a special circular issued about the burghs and towns?—I am not certain whether we received a special circular about it or not.

6797. At any rate you did it?—We invariably do it as it is wanted from time to time.

6798. The system of physical training that, as I understand you, you would like, would be one designed to counteract any physical defects?—Yes, in so far as these physical defects exist: but for others, again, where physical defects do not exist, it would be simply a question of general physical training.

6799. But in your scheme of training you would like particular attention to be paid to children that had any particular defect?—That is so.

6800. That is the design of the Swedish system, I believe?—Yes.

6801. Have you ever known any harm in Aberdeen where the children had a good deal of physical training without medical supervision; have you ever known cases of harm being done?—Well, I may mention that I have put the question to the Clerk of the School Board in Aberdeen, and to the headmaster of Gordon College, and I put it also to Colonel Craden, whose name I have referred to in connection with physical training in our city; and they all say that they are not cognisant of any harm resulting from the physical training that they have had in Aberdeen; but at the same time I think I have myself seen amongst children who have been undergoing what I thought to be rather heavy exercise for them certain effects which were a little unsatisfactory, but I have seen no very bad effects.

6802. You say, 'with very few exceptions, which could be attended to through the usual charitable channels, children are so well fed nowadays as not to require any special dietary on account of physical training.' In Aberdeen is any official notice taken of underfed children in the schools?—I do not know that there is any actual official notice taken, but there are agencies in Aberdeen for the feeding of starved children, and no doubt a teacher would call the attention of the officers of these agencies to the fact that the children were underfed, and try to secure better feeding for them.

6803. May I say that you think it is desirable that attention should be called to children who are underfed; they should be dealt with, if possible?—Undoubtedly, and some means should be provided for dealing with them where agencies do not already exist; but in Aberdeen the number of underfed or badly-fed children is not large.

6804. Have you formed any opinion as to the possibility of having compulsory physical training for lads from fourteen to eighteen?—Yes, I think physical training should certainly go on after fourteen.

6805. Would you be prepared to make it compulsory?—Yes, I would be quite prepared to make it compulsory; I think it would be a great advantage if it were made compulsory for all who are able to undertake it.

6806. *By Mr Alston.*—May I refer once more to the difference between, first of all, the mortality amongst girls, and then the mortality amongst English children as compared with Scotch. Would you say that if a properly-devised system of physical training were introduced into the schools, that it would have an effect in altering these conditions, first in the case of girls who do not get as much exercise generally as boys, and then in the case of Scotch children, who do not take as much physical exercise?—I certainly think that it would tend to reduce the difference between the two countries. I feel sure it would improve the health of Scotch school children, and particularly the health of girls, as there is at present more scope for improvement in them than in the boys.

6807. Of course you would say it is the duty of the School Boards—first in the interest of the nation, then in that of the schools—to improve the health of the children in schools; to take every proper means to im-

prove that health?—Yes, I am strongly of that opinion; it would be a distinct advantage to the health of the children, and later on to the general health of the community, because the children become the men and women of the nation.

6808. You draw the line at the school age in both sexes for physical exercises?—Well, if I draw the line, it is merely because my attention was directed more to that age by the wording of the memorandum sent to me.

6809. I also think you said that gymnastics and military drill would be more suitable after school age?—Military drill is rather a formal thing; you cannot practise it with very young children, and in the case of gymnastics, the exercises are somewhat too heavy and violent for quite young people; but I see no reason why military drill and gymnastics should not be introduced into the later periods of school life.

6810. Then would it be desirable to limit the exercises during the school age to what we know as physical exercises—free movements and Swedish drill, and so on?—Up to the ages of ten or twelve, what you suggest would probably be desirable, but after these ages one might introduce the more severe forms of exercise.

6811. You would not postpone gymnastics and drill till the age of fourteen?—Not necessarily; in the case of gymnastics, certainly not; military drill perhaps might be postponed, but there is nothing, of course, sacred about a particular age.

6812. Then by gymnastics do you mean applied gymnastics—the vaulting horse, travelling rings, parallel bars, horizontal bars?—Yes, I mean the more heavy forms of indoor exercise. There are some gymnastic exercises which could be undertaken by quite young children if done under proper supervision, and in a gentle fashion.

6813. How far would you go with gymnastics of that kind in the case of girls?—I think girls could go practically as far as the boys. I do not see any reason for making any difference between them and boys, except that they are not quite so powerfully built as boys, and not so capable of undertaking very heavy exercises, but otherwise what they have got to do, if tempered to their strength, girls could undertake as satisfactorily as boys, such as parallel-bars, horizontal-bars, travelling rings, and, indeed, practically all forms of gymnastics, provided they have had sufficient other physical training before beginning these gymnastic exercises; but it would be a great mistake to begin these gymnastics at the age of puberty with girls without previous physical training of a milder type.

6814. *By Mr Shaw Stewart.*—I think you have sometimes seen signs of effects of over-exertion in Aberdeen?—Yes, I think I have sometimes seen it.

6815. Do you think that if the system which you favour, of twenty minutes or half an hour a day being devoted to physical training in schools were established, would that make children less liable to suffer from over-exertion later?—Undoubtedly.

6816. With regard to your last paragraph, am I right in taking it that you are strongly in favour of organised physical training in the universities?—I am.

6817. One question with regard to the present state of playgrounds in Scotland. I think you said that there was no need for any change or any additional facilities for physical training in schools at the present time?—I think in what I read at the commencement of my evidence I took rather the opposite view—that the playgrounds were usually too small for outdoor games, and that playing fields should be made available. In answer to Professor Ogston, who was asking whether one could not carry out some sort of exercise even in the worst-equipped schools; I said yes, there was no school so situated where a certain amount of physical training of a kind could not be done; but it could not be done, of course, in the best possible way.

6818. What I wanted your opinion upon was the question of covered sheds and playgrounds?—Yes.

6819. Which some witnesses have said would be very useful?—Yes.

6820. Especially in the North of Scotland, where

Playgrounds:
covered sheds.

Prof. M. Hay, they have sometimes to contend with drifting snow?—
M.D., C.M. Yes.

9 June '02.

6821. Then you would be in favour of covered sheds?—I would, undoubtedly. I think the exercises should, as far as possible, be taken outside the school.

6822. There is a great virtue in the exercise being done in the fresh air, and not in a room, however well constructed, where one has to breathe the expired air of other parties?—That has been made very evident to us in recent years, from the analogy of the great efficacy of fresh air in the treatment of phthisical cases.

6823. In some parts of the North of Scotland, perhaps the West too, it would be necessary to have covered sheds in the playground?—I think those covered sheds would probably be wanted everywhere. I do not know that there is one part of Scotland that suffers much more from snow than another. The temperature does not vary much throughout the country. In Aberdeen our average temperature is only about one degree lower than the average temperature of Edinburgh. Sheds would be wanted fully as much to protect the children from strong wind, or even from rain, which is perhaps the most serious thing.

6824. I think it was a witness from Kingussie who spoke of the driving snow?—Yes, it would be rather more in these upland places than in a lowland place, such as Aberdeen.

University :
volunteer
corps :
physical
exercise should
be obligatory.

6825. *By Sir Henry Craik.*—Is there any attempt in the university to have a volunteer corps?—They have a volunteer corps; they have had one for a considerable number of years.

6826. The proportion of students who join it is small?—It is not large.

6827. Would you anticipate difficulties in the way of pushing physical exercise amongst the university students?—Well, there would be some a little disinclined to be compelled to undertake it, but I think that the benefit would be so great to all of them that they ought to be obliged to undertake it.

6828. Would you anticipate any difficulty from those who grudged the time?—Well, there are some at present, and including, I daresay, a few of our best men, who might look upon it as a waste of time. So serious are they in their studies that they might regard any time taken up in this way as a waste of time, but I think they would be quite wrong.

Examinations
and over-
pressure.

6829. That proceeds from something of the same source as you have spoken of in regard to the ordinary schools, viz., preparing for competitive examinations?—Yes, of course, in the university they are almost constantly in preparation for some kind of examination or another—class or degree.

6830. Then that defect of over-pressure in the curriculum is not due to any regulations, but to the keenness of competition?—Largely, yes.

6831. No demands that are made under the regulations of the Code, but the anxiety to pass examinations on the part of the pupils?—Yes, that is so; I do not think we could, in Aberdeen, lessen the number of our examinations very much in the university, and at the same time secure that we were satisfied that the men we were sending out knew their subjects sufficiently.

6832. Yes, but amongst the younger boys, before they go to the University, surely you can impose some sort of limit upon the strain of competition?—Oh, yes, I think it is very desirable to limit it; I think it is a great misfortune that we have so much strain, particularly amongst lads who are preparing in the North for our University bursary competition. Many of us in the North think that in place of its being a blessing the bursary competition is rather a curse to education.

6833. Are you aware that the Department has attempted to limit the number of entries in the Leaving Certificates Examinations?—Yes, I know you have been working in that direction.

6834. And you think the Department would be justified in saying that a well-organised school was not one which overpressed its scholars?—Oh, most certainly, I think it is the greatest possible mistake to overpress boys and girls at the ages from twelve to sixteen, or, indeed, at any age.

6835. I am very glad to have your support in the attempt the Department is making to do so?—Yes.

6836. You visit the schools, I think you said?—
Yes.

6837. Have you ever examined the amount of accommodation that is required, and, may I ask, whether you think it is sufficient?—I believe that the Scotch Education Department lays it down that there must be a minimum of 120 cubic feet for each child, or they will not give a grant for building purposes.

6838. The Department only asks 80, but, of course, everyone knows that the amount given is very much larger. Our real measure is 10 square feet of floor space?—Yes; well, a good deal depends on the system of ventilation. If the ventilation is good you can do with a comparatively small amount of cubic space. If the ventilation is defective you require more cubic space. My opinion is that the amount of cubic space in the schools is often far too small, and that, generally, in such cases the air is not good. I have examined the air in certain of the Aberdeen schools which have mechanical ventilation. They are supposed to be rather better ventilated than the schools of many other places, and yet, even with mechanical ventilation the air is not always all that one would like it.

6839. The Department is quite aware that the 80 cubic feet, which is one of the remains of the old type, is not fit at all?—No.

6840. It is not the limit really; the limit is the 10 square feet of floor space?—Yes, but I am referring to the 10 square feet of floor space just now when I say that in my opinion it is somewhat too little.

6841. Too little?—Yes; it does not err upon the side of being too much.

6842. It is too little, you think?—I think it is too small, if anything.

6843. With regard to the ventilation, do you think it would be justifiable to require mechanical ventilation in the case of all schools?—Well, it raises a very important question as to which is the most satisfactory method of ventilation, and it is a very difficult question to answer; of course, one knows that those persons who invent apparatus in connection with natural ventilation maintain that natural ventilation is the better method, and the same thing happens with those who invent mechanical ventilating apparatus. I have examined schools of both kinds, and I agree with others who have made similar examinations, and have arrived at the conclusion that mechanical ventilation, as things are at present ordered, gives better results than natural ventilation.

6844. And in Aberdeen you have advanced very far in mechanical ventilation?—That is so; but I may add that ordinary mechanical ventilation has its drawbacks. For example, we have introduced it into our new university buildings, but have not been completely satisfied with it; for one thing, it carries in a large amount of dust, in spite of filtration of the air through wet screens. We are about to make a further extension of our university buildings, and we are at present considering whether we shall not alter the system of ventilation for these buildings. We expect, however, still to have recourse to some method of getting fresh air other than by natural means.

6845. By natural means you mean the pulling down of a window at the top?—Yes, or by ventilating tubes or ducts.

6846. You speak of the dress required for girls, but do you think it is a desirable thing that these physical exercises should be performed even by the boys without some slight change of clothing?—Oh, no; I think they generally want a change of clothing. The clothing, as a matter of fact, in Scotland in winter would be too heavy; they would be apt to sweat under it. It is not desirable, unless a change of clothing is available, to have physical exercises accompanied by much sweating, as if a boy goes back afterwards to sit in his damp clothes, and is a delicate boy, he may get chilled.

6847. A very small expense would enable a boy to have some light garment which he could wear in place of his coat?—That is so; or if he simply threw off his

Prof. M.D.

Accor-
tion :
space
ventil

Mech
vent

Cloth
chang
gart

coat and vest altogether, he might carry on the exercises satisfactorily if the place were sufficiently protected in winter against too much exposure to cold.

6848. The fact, I think, you will admit with me is that it is a very rare thing in Scotch schools; they very rarely remove their clothing for any exercises?—They do not do it generally; but in some schools they do.

6849. Do you think it would be desirable?—Yes. Of course one has got to keep in mind the kind of exercise they are undergoing at the time; the more active the exercise the less clothing they require. But in all cases light and loose clothing greatly adds to the freedom, and, no doubt, to the benefit of the exercise.

6850. *By Sir Thomas Coats.*—There are just two questions I would like to ask you, to take you back to the startling difference between the death-rate in England and Scotland of the children between five and ten; might I suggest that it might be owing in England to the greater cleanliness in the houses of the average working man and the greater appreciation of ventilation shown by their opening their windows much more frequently?—Well, I think there may be something in that. I confess in many parts of Scotland the standard of cleanliness amongst the working classes is not what it should be. I am quite willing to admit that, but I am scarcely prepared to admit that it would account for that big difference; but still it is one of the things that would tend to bring about a difference.

6851. You find a difficulty in accounting for this enormous difference?—Yes, I have certainly found a difficulty. Of course various explanations may be put forward, but I am not clear about any of them.

6852. Regarding the food, you have stated that the wages are very much higher and the purchasing power of the wages have also increased; it is very self-evident, I think, to anyone; but regarding the quality of the food, we hear a great deal about the deterioration in the quality of the food given to children, that is that oatmeal is now purchased in the apothecary's shop and the weight is less than that of sugar, and that the children are fed so much on white bread and tea or white bread and jam and tea. Well, do you think that the food they get now is producing stronger children; we hear so much the contrary opinion?—It all depends, of course. No doubt in those days of great poverty which existed forty or fifty years ago, many of the children did not get enough even of the ordinary substantial, and what they had was almost all of one kind, and did not tend to tempt their appetite. Nowadays they get much greater variety, and though I quite agree with you the change is not always towards better feeding, there has been improvement in some directions. I think at one time, in a town like Aberdeen, or, indeed, any town, milk was consumed to a very small extent. Now milk, which is an admirable article of diet—the best almost of all articles of diet—is far more generally consumed than it used to be, but it is an expensive article of diet, so it could not be bought in those poorer days, but now it can be bought by the working classes fairly freely. Of course, there is also the question of clothing; the clothing of forty or fifty years ago was very indifferent, many children of the poorer classes going about barefooted all the year round. Now in Aberdeen it is quite rare, in winter at any rate, to see a barefooted child.

6853. *By the Hon. Thomas Cochrane.*—There is only one question I wanted to ask you; I think you said that certain physical exercises are advantageous for all children during the growing age?—Yes, I think so.

6854. And that they may be carried out at the school age and also at the universities without much difficulty?—Yes.

6855. Can you suggest any way in which it could be carried out for those children after the school age who do not go to the university, that is, the general mass of the population?—Well, I have not thought of that; but, of course, if it was thought desirable by Government to introduce compulsory military exercise, or what might be paradoxically called 'compulsory

'volunteering,' then in that way for boys you could have this physical training carried on, and for my part I would very gladly see this compulsory military drill imposed on all fit lads above a certain age. I have no hesitation in my own mind about the advantage of it, although I believe there are many persons who would not look upon it with favour.

6856. You think that physical exercises would be advantageous to all lads and girls too, to a certain age?—Oh, yes; it stands to reason that that is so, unless they happen to be getting sufficient outdoor exercise, either from the nature of their work, or because they are boys or girls who take to sports and games.

6857. And that the loss of liberty would be more than compensated by the advantage that they would gain if it were made compulsory?—Yes, I think so; besides, it need not occupy a great deal of time.

6858. There is nothing in the occupation of young men that would really interfere with their getting a sufficient amount of physical training?—No, I think the occupations nowadays, even with working-class people, are becoming more and more sedentary. A man has now less and less of hard work to do with his body; he simply turns a handle and sets his machine agoing and tends it, and when his day's work is over he is still left with a large amount of physical force to occupy with physical training or games, or whatever it may be.

6859. *By the Chairman.*—There are just one or two questions I want to ask. I suppose your acquaintance with the children is in a double capacity, seeing them at home, and also seeing them at school in Aberdeen?—Yes; I see them both ways, although, of course, I am not the medical officer of the School Board, and it is not often that I go round to inspect the children in the schools.

6860. Therefore all that you have been telling us about children at school is principally from having observed them at home?—As I have already remarked, I have charge of the fever hospital. I suppose about half the children of Aberdeen pass through it for zymotic diseases, so that I see them there.

6861. I want to put it a little differently, it is children who are at school rather than school children that you are acquainted with?—I see the school children when they come to us in hospital; they are not, of course, at school during the time they are with me, but they are all school children.

6862. They cease to be school children; they become children who are at school; you do not actually see them in school?—No, I do not actually see them in school, not as a rule.

6863. You say, 'Medical officers of health have long held that every School Board should have the skilled assistance of medical men for the inspection of children, even under present conditions.' Do you refer to any united report by medical officers, to any authority upon that point?—I could not offhand refer to any report.

6864. What are the grounds for your making that statement, if I may ask you?—Well, it is a matter of frequent talk amongst medical officers of health.

6865. Is there any organisation of medical officers?—Yes, we have a Society of Medical Officers of Health for the United Kingdom. There is also one for Scotland alone. I feel sure if you were to ask their views about it they would be unanimously in favour of the medical inspection of school children.

6866. But they have never taken any action or submitted any report?—I would not like to say that they had not; I think possibly you would find they had at sometime or another passed resolutions about it.

6867. But you never heard of the Local Government Board asking for anything?—You mean in the direction of enquiring what our views were?

6868. Yes?—I do not think they have asked that.

6869. Or any public authority, such as the District Council, the Local Authority?—You mean asking for information?

6870. Well, ever mooted the question at all?—No, I do not think the district committees have taken it

up, but I feel sure you will find in the reports of certain medical officers to their district committees, or local authorities, reference made to the advisability of having medical supervision of schools. I think it would not be difficult to find several references of that kind if one chose to wade through the reports.

6871. You do not think it is outside the province of the Local Authority to enquire into a public matter of that kind?—Either the Local Authority as the Public Health Authority or the School Board having charge of the schools—either the one or the other might enquire into it.

6872. It would not be saying too much to say that it was their business to enquire into it?—Yes, I think it is their business; they are the Public Health Authority and they are responsible for the maintenance of good health amongst all classes of the people, whether school children or not.

6873. Have you any opinion to offer as to the advantage or disadvantage to girls of the bicycle?—Well, I know some entertain the view—

6874. I think I understood you to say they do not get as much exercise as boys; have you taken into consideration the large number of girls who use the bicycle?—I think the number is rather diminishing in recent years; with girls the bicycle is not quite so fashionable as it was; these things are very much matters of fashion. I know the opinion of some medical men is that the bicycle for girls is not advisable. I cannot say that any ill effects from it have come under my own observation. On the whole I would say that as girls do not take much exercise, as a rule, I would rather that they took exercise on the bicycle than no exercise at all.

6875. As improving their development?—As improving their development and general health, though it is not a kind of exercise that tends to improve the deportment, as everybody knows; it tends to give roundness of shoulders and stooping gait, and all that sort of thing.

6876. Does it for girls; girls sit up on their bicycles?—They do sit much better than boys, but whether it does tend to improve the deportment I should very much doubt. I should think not, in spite of their sitting up somewhat; it is only by contrast with the boys that one notices it—the boys generally sit so badly.

6877. *By Professor Ogston.*—Allow me to repeat a question, it is of such very great importance that Professor Hay's deliberate opinion regarding it should be on record before us. I think you hold that compulsory physical training in the Scottish universities would not be a hardship on poor industrious students, who aim at the highest university distinctions?—Certainly not.

6878. That is your deliberate opinion?—Yes, my deliberate opinion. I think many of them would be a great deal the better for having a certain amount of physical exercise forced upon them. They go through their examinations well, perhaps as the result of the extra time they are devoting to their studies on account of their giving no time at all to physical exercise; but the ultimate outcome of it is not satisfactory—the final discipline of the man, and his fitness for his ultimate life work has been impaired by it, and one can easily point, in any Scotch university, to lads who afterwards suffer from not having taken sufficient physical exercise. They may have taken very high places in the university, but they have left it worn out physically and mentally, and fit for nothing strenuous in the battle of life.

6879. *By Sir Henry Craik.*—One other question; you say that it ought to be part of the duty of the local medical officer to medically report on the children in schools?—You mean the medical officer of health.

6880. The medical officer of health?—I think I rather said he would have a difficulty in undertaking that work, at any rate in a large town, without assistance.

6881. But do you think that that would be a function

of the Local Government Board at all?—Or a function of the Local Authority?

6882. Of the ordinary Sanitary Local Authority or a matter in which the Local Government Board might propose itself to fall within their function at all?—Well, the subject of Public Health, of course, is such a wide one.

6883. But surely the business of the Local Government Board and the District Council is to look after the fact that the conditions of life are healthy, but not surely to examine into the health of particular citizens of whatever age?—Well, no, not except in a general way, but, mark you, it is the Local Authority which looks after all infectious diseases.

6884. That is disease, but not the promotion surely of health in the individual; they have to take charge of any case of epidemic disease?—Well, they have power to provide public parks and baths, and all kinds of things which are supposed to promote individual health in a general way, but I quite admit that the health of school children, at least in so far as it has got to be attended to within the school, would naturally fall to the School Board.

6885. You are aware that the Education Department fully recognises that the inspection of the premises of the schools, so far as relates to sanitary arrangements, rests with the Local Authority?—Yes.

6886. And is a matter for that Local Authority?—That is so.

6887. But surely with regard to the scholars, that must rest with the Educational Authority?—I am quite willing to admit that that is so as regards the inspection of the scholars, but what I suggested in answer to previous questions was not quite that the Local Authority should take it up; indeed, I do not know that I did say so; I was asked the question whether the medical officer of health could not take it up. I said he was already rather heavily burdened with duties, but that he might, acting under the School Board or the Education Department, undertake, nevertheless, to supervise any inspection of children that was required, in view of the possible difficulty of finding any other suitable officer for the purpose.

6888. But it might be made a condition of a school that receives grants from the Education Department that the School Board should have such medical inspection?—Yes, I think it would be a great advantage if it were made a condition.

6889. *By Mr Fergusson.*—Might I ask one question about the mechanical ventilation in your schools; what sort of ventilation is it?—The air is carried in by fans; it is a propulsive system. The fans are worked by a gas engine or a steam engine, and the air is carried through ducts below the buildings and up into the various rooms.

6890. Was that done at the instigation of the Educational Authorities, or at your instigation, or why?—No, it was done entirely at the instigation of the School Board itself. The School Board in Aberdeen have always had a very open mind with regard to things of that kind, and have been very progressive. It is many years since they began to introduce mechanical ventilation into their schools, and I believe that every school they have put up for a number of years back has been provided with mechanical ventilation.

6891. That could not be done in many schools, probably only in new schools?—In the case of existing schools, it would be very expensive to do it, because the ducts have to be constructed below the building.

6892. It would be expensive to work; you require steam or electric machinery?—It is much more expensive, of course, than ordinary ventilation.

6893. Has it been entirely satisfactory?—Well, it does not accomplish all the results one might wish to have from an ideal system of ventilation, but, as I have already remarked, it is, in my opinion, a better system for schools than unaided natural ventilation, although I quite admit that there are differences of opinion about it, but I think the general feeling on

the part of those who have actually investigated the relative merits of the natural and mechanical systems

for schools is that the mechanical system gives distinctly better results in the purity of the atmosphere.

*Prof. M. Dey,
M. D., C. M.*

9 June '02.

The witness withdrew.

Mr THOMAS D. SAVILL, M.D., examined.

*Mr T. D.
Savill, M.D.*

6894. *By Professor Ogston.*—May I, before you read your evidence, have it put down that you are a Doctor of Medicine of the University of London, and Diplomaté of Public Health of Cambridge; a Member of the Royal College of Physicians of London; a Vice-President and a Founder of the British College of Physical Education; formerly Physician to the Gymnasia of Exeter Hall, the Peoples' Palace, and the Polytechnic; Physician to the Hospital for Diseases of the Nervous System (Wellbeck Street), and the Hospital for Diseases of the Skin (Leicester Square); formerly Examiner in Medicine in the University of Glasgow; Medical Officer to the Royal Commission on Vaccination; Medical Superintendent of the Paddington Infirmary, London, and other qualifications?—Yes.

6895. And you have had many years of experience, and have thought and written upon the subject of physical education?—Yes.

6896. Would you read the notes that you have prepared?—These were rather hurriedly written, because the notice was rather short, and of course they do not deal at all exhaustively with the subject.

6897. In reading over your notes do not consider yourself bound to adhere to those you have supplied us with in print, or those that you hold in your hand, but give us any enlargement of them that occurs to you as being of use to the Commission?—1. That there is a general tendency to a physical degeneracy of the race, which is probably mainly owing to the migration from rural to an urban mode of life, and this is in spite of the improved hygienic environment of the masses. This I believe to be a very serious matter. It is one of these difficult general propositions, difficult to prove, and at the same time there is not a shadow of doubt about it. There may be other causes in operation, but the movement from rural to urban life is, and has been, going on for a very long time. The only proofs that I can offer you of that are first, what we can see for ourselves, those especially of us who are engaged in large out-patient practices, in the difference of the health between the individual in the town and the individual in the country. Secondly, from the known healthiness of the country as compared with town. Thirdly, I am told on very good authority that among the candidates for recruits in the army, there is a larger percentage of rejections among the urban recruits on account of physical unfitness than among the rural candidates. Again, it is a very well-known fact that all the 'smaller' regiments like the Hussars, the drivers of the Royal Artillery, and others where the standard is necessarily less, are filled up with urban candidates who cannot get into the larger regiments, such as the Foot Guards and the heavy cavalry; the latter containing a much higher proportion of men from rural districts. 2. That physical education is as important as intellectual—if not more so—since the intellect cannot be employed unless the physique be healthy; therefore physical, like intellectual, education should be made complete and compulsory. I hold very strongly that a thorough physical training implies and involves also a training for the character and for the mind. Better work is done by the mind after physical education, and the mind ultimately becomes more disciplined, and in general respects stronger by the teaching of the co-ordination and co-operation of the various parts of the body, and of various individuals with one another, and therefore physical, like intellectual, education should be made complete and compulsory. It is in a sense compulsory in the Board Schools of England at the present time, but it is certainly not complete. It is not altogether compulsory in the national schools, or rather, I ought to say, it is still less complete.

3. That the physical training of the young should be placed upon a scientific basis, and carried out under medical supervision. In answer to one of the questions in the remit, I have ventured to draw up a sort of brief definition of what I regard as a satisfactory scientific scheme for training. For elementary schools and children under fourteen, in whom the chief object is the development of the general physique, the ideal system of physical training is one which is military in this sense, that it can be taught to word of command, yet which can without alteration be associated with music, one which inculcates discipline, and which is strictly progressive in its arrangement and scheme; a system which is 'Swedish' (so-called) in this sense that it consists of floor-work only (*i.e.*, free movements, or with very light movable apparatus); a system which is easily learned by both teacher and scholar; and, finally, a system which has plenty of variety, so that the teacher can adapt it to the age and physique of the scholars, the place (indoors or out), the weather, the time of day, and other conditions of the environment.

4. That physical training requires special adaptation to the age-period of the individual—childhood, adolescence, maturity. It should also be adapted to the end in view. For example, in early life every means should be employed to make physical training attractive, and designed to develop the *general* physique—just as our early mental training is designed to develop general ability. In adolescence it should have a more purposive character; and finally, in maturity, by the co-ordination of the senses, the intellect, and the physical powers, it should gradually be directed into those channels which constitute a source of national strength in time of need. My fifth proposition is that, although I can submit evidence on some of the details referred to in the medical supplement to the remit of the Commission, statistics or even accurate information do not exist on a large number of them; and in view of the national importance of many of those details, and of the principles and policy dependent on them, it would be very desirable that the Commission should employ a non-medical and a medical expert in the collection of such evidence and statistics. And I may add that there is a precedent for that in the case of the Royal Commission on Vaccination, where the services of experts were employed to enquire into the various matters on behalf of the Commission, and the blue-book issued by that Commission is now the source of all the best, most accurate, and most recent information that is obtainable upon the subject.

6898. In regard to the first paragraph, you give us a number of proofs of the degeneracy; I suppose in view of the complexity of the subject you would not say that any one of those proofs standing by itself is absolutely conclusive of there being a degeneracy?—I think that the statement that I made about the army recruits is conclusive evidence of the evil effect which town life has upon that class of the community from which the recruit is drawn, which form the mass of the population.

6899. But taking all proofs together, you think they amount to evidence that the degeneracy you speak of actually exists?—I think so; yes, I feel satisfied in my own opinion that it is so. Of course, the recent war is, to some extent, confirmatory evidence, because, after all, the reason why we were beaten was because we could not see so far as they could, nor as well. Of course, it is a military question; but I think anyone who converses with those who were out there, and are thoroughly conversant on the subject, will tell you that that is so.

Physical training should be scientific, under medical supervision. Suggested scheme.

Adaptable and progressive.

No statistics.

Degeneracy: army recruits.

Mr T. D.
Savill, M.D.
9 June '02.

Time:
amount
necessary.

6900. In the second paragraph you attach great importance to physical education; could you give us any guidance as to what would be a just proportion of time to be devoted to physical as compared to mental education?—In the elementary schools one out of six hours is what I generally advise as a minimum; half an hour in the morning and half an hour in the evening is the most advantageous division of the subject.

6901. That is one hour for the physical to six of the mental?—Yes, one hour to five or six.

Physical
training:
period of
adolescence.

6902. In the fourth paragraph could you in any way guide us regarding any other special points or precautions required in applying physical training to adolescence of the male sex or the female sex?—The general purpose, as I have said, in early life up to fourteen should be that of general physical culture, and I very strongly disapprove of the introduction of military exercises and drill as such under fourteen in the same way as I do 'gymnastic'; because the child is not sufficiently developed to stand the strain, and no amount of supervision will prevent harm accruing to them before the bones are set. If they get on to parallel-bars and horizontal-bars and ladders, they do more harm than good in most cases.

Objects:
forms.

6903. Then might I ask, particularly in regard to girls at the age of adolescence, whether you consider that there is anything unfitting them to receive a well-judged physical training?—During school age the object in both sexes is to promote general physical culture, as I have said. That is obtained by games organised properly, and exercises for the trunk and limbs—musical drill, etc. Then from fourteen to eighteen we come to gymnastics, military drill, self-defence, boxing and shooting, all of which should certainly be made compulsory. Swimming is available for all ages, under supervision, and not permitting the element of competition to enter in. As regards ordinary exercise—walking and running—those do not exercise, of course, the whole of the body equally, practically only the lower part of it. All athletics exercise the lower part of the body and generally the right arm. As regards girls up to the age of fourteen, I believe that they are quite capable of doing the same as boys, but not *with* boys. On general principles one should classify one's scholars by their physique, and girls can do, and they do do, very generally and with a very great deal of advantage, both in public and private gymnasia, all the things that the boys do, especially up to the age of fourteen. But they should play by themselves and have classes by themselves, or with the boys of strictly corresponding physique. As regards special dress for girls, that is quite unnecessary under the age of fourteen. The only bar to physical exercise is corsets, and they do not, as a rule, put them into corsets until they are fourteen.

Girls up to
fourteen.

Special dress
for girls.

6904. Do you consider that a special dress is necessary for girls at the age of adolescence and above it when they are being instructed in physical training?—Corsets, if they are reasonable, are not a bar to simple floor work (so-called 'Swedish' movements); at any rate corsets are the only article of dress which needs alteration or omission. Advantages are to be gained by a special change of attire for all physical culture, and for fixed apparatus you *must* have special dress for a girl—horizontal bars, parallel bars, ladders—a special dress is indispensable for 'gymnastics' proper, which, as I maintain, should be confined to girls over fourteen.

Girls over
fourteen:
applied
gymnastics.

6905. Do you advocate those applied gymnastics for girls of fourteen and upwards?—Fourteen and upwards; yes.

6906. You do?—Oh, yes; under adequate supervision. It is a magnificent thing for them. It teaches them how to hold themselves and walk, and carry out a healthy life, and it is more important even in their case than it is in the boys' case. They are the mothers of our future generations, and they bear healthier children. I have known it again and again.

Athletic
games: two
great faults.

6907. Another point; what is your opinion of the value of athletic games?—As a means of physical education?

6908. Yes?—Well, I do not want to be misunder-

stood; but I do very strongly hold that the athleticism of England may be a means of its downfall, if it lulls the nation into a false sense of security and induces men to believe that athletics can promote the general physical culture of the masses, educationally and developmentally. Athletics is extremely well in its way, and I daresay has done a great deal in the past, and may still do a great deal in the future, but there are two great faults. In the first place it cultivates the few at the expense of the masses. You will see in *The Morning Post*, and other papers, from time to time, advertisements from schools that they will take children at a reduced rate if they are athletically inclined. Now, this means that the teachers will 'nurse' those children at the expense of the physical development—and perhaps the mental development as well—of the others in that school. The rank and file of the school cannot get sufficient physical culture from athletics; it is the few who are very good, and who get coached and trained, and for these the many are sacrificed. The element of competition, which has its advantages in some ways, is, to a great extent, inimical to systematic, scientific physical training of the mass. It always engenders a spirit of fostering and nursing a few at the expense of the many. In the second place, anyone who has thought over athletics knows perfectly well that nearly all athletics only cultivate certain parts of the body, and certain muscles, at the expense of others; they leave out the upper part of the body nearly always. Practically, there is only one recreative exercise which brings into operation all the muscles of the body fairly equally, and that is boxing. Rowing, which ranks next, exercises the thighs, the back, and as an illustration of one-sidedness, you can tell which side of a boat a man has rowed when he strips. When he comes up to the 'Varsity you can tell whether he has rowed on the bow side or the stroke side in his school or college boat, and the arms are almost left out; excepting in 'feather-ing' and 'recovery.' Well, then, cricket; it is all the thighs and legs, as anyone knows after playing his first match of the season; it is in the front of the thighs where he feels it. 'Fives,' of course, is played with both hands; rackets, it is all one hand; it is right hand and legs; it all leads to inharmonious and asymmetrical development. Out of the 227 muscles in the body, all but five of these are in pairs, and therefore a large number of muscles and a large part of the body remain undeveloped. Children must first be trained by a general physical education up to ten, twelve or fourteen; after which athletics and military exercises, gradually evolved, will do nothing but good, and they become a source of strength to the nation and the empire. I should be very sorry to appear as an opponent of athletics; but to say that it satisfies all the indications and requirements of a general scientific physical education is absolutely wrong, both from the point of view of the masses and the point of view of the individual.

6909. Have you any experience that would enable you to judge whether the present mental training given at schools is excessive or injurious?—Well, as physician to a Nerve Hospital, I do come across a good many instances where school has *seemed* to do harm, but I could not say that this was really so—because it is very likely that in nearly all these there is a predisposition on the part of the individual. As regards eyesight, they are paying some attention to it, and I think that it is a move in the right direction. I get a large number of children with headaches that are due to eye-strain; but you cannot examine a large number of children and see if their eyes are all right; they come to the hospital and they get fitted with glasses and they are all right.

6910. By Sir Henry Craik.—What was the distinction you drew between the Board and the National Schools in regard to the requirements of physical instruction? I did not quite understand?—In the National Schools, the same rules apply to them, but there is no system of inspection, I believe, or, at any rate, it is an indifferent one.

M
Sav
9 J

Mr T. D. Swill, M.D.
9 June '02.

6911. And in the Board Schools?—It is more thoroughly carried out.

6912. Inspection under the auspices of the School Board?—Of the School Board I suppose, yes, that would be so.

6913. But you think that there ought to be inspection by some Imperial authority of Board Schools, and National Schools as well?—I think that the whole thing should be placed under medical and expert supervision, and inspection to see that it is carried out properly. I do not think that the inspection of the National Schools is sufficient.

6914. I do not quite understand why the inspection should not be as thorough in one case as in the other; the National Schools are the voluntary schools under the Church of England?—Yes.

6915. But they are under the same inspection by the Board of Education?—I do not think Mr Chesterton inspects those, does he?

6916. Oh, no, Mr Chesterton, of course, is only for the School Board; you are speaking of London?—I am speaking of London more particularly.

6917. And you think it is the case that there the Board gives a supervision to its own schools which is not given to the voluntary schools?—Oh, yes; I am almost sure of it.

6918. With regard to this degeneracy that you speak of, do you think that that is due to the absence of opportunities of physical instruction, or to anything defective in the stamina of the children; is it a constitutional defect, or is it merely the want of physical training?—I think, sir, it is chiefly due to the removal from rural to urban life, and to the general increased strain of town life, which should be compensated for, and could be compensated for by physical training.

6919. It is rather the less developed that you wish to attend to by this physical instruction, whom you think would be neglected if merely games and athleticism were the object?—Yes, I think that ninety-nine out of every hundred children would be benefited by it; I might say cent. per cent. I think the weaklings would be made strong, and the so-called strong would be made stronger.

6920. Yes, but the systematic physical training as compared with the games would be for the benefit rather of those "under par"?—Oh, yes; an immense benefit to those.

6921. Do you think that there is the same defect in physical instruction that we find with regard to the intellectual instruction, that it is apt to lead too much into a competitive line?—Yes, I think so, particularly in the case of swimming in the domain of physical culture.

6922. *By Mr Alston.*—Is this degeneracy that you think you detect in the race general or rather confined to the urban population?—I think it is mainly confined to the urban population.

6923. And you seem to indicate that that population is gradually becoming the majority by the influx from the country into the city?—Yes.

6924. So that the degeneracy is tending to be more general than it was?—Yes.

6925. We have had evidence before us, however, that seems to justify a belief that the race is not degenerating; but that is not your experience, is it?—I think in point of stature, if you take that criterion—the stature of the present race—it is perhaps bigger than it was in former times; we are rather taller than we used to be. But our chest measurement, there are good grounds for believing, is relatively less than it used to be in former times. And compare the country population as we know it, and as we have known it all these years, with the town dwellers, the staying power of the latter, which, after all, is the test of stamina, cannot compare with that of the former.

6926. You drew some of your proofs from the enlisting of recruits for the army. I think you said that the artillery and other branches of the force, not requiring stature, get their men from the towns?

—Yes, physique as measured by stature and chest measurement.

6927. When you came to the Guards and the Household Cavalry you had to go to the country?—Yes, they are nearly all countrymen in the Guards and in the Royal Artillery; drivers, and the light cavalry—Hussars—they are nearly all townsmen.

6928. And the line regiments generally, I suppose?—Yes, and consequently this is the second great fact, there are a larger number of rejections among urban candidates for recruits than amongst the country ones, they do not come up to the physical standard—the urban applicants.

6929. The urban do not?—No.

6930. Is that a mere standard of height?—They take the height and the chest measurement as compared with the age of the individual.

6931. And the chest measurement is bound to indicate physical stamina?—Yes, it is the best indication.

6932. Or some important quality?—Yes.

6933. Then you indicated as a proof of degeneracy the eyesight of the urban recruits as compared with that of the Boers. Do you mean to pit them against our soldiers generally, or against those from an urban population; in what was the comparison; was it merely in the measure of eyesight or was it in stature, physical strength, stamina, on the part of the Boers as compared with our own troops?—I should not like to commit myself too much to the statement that that was the only reason, but there is no doubt that was one of the reasons, because they could see farther than we could, and they were trained in the open veldt, and their staying power seemed to be considerably in advance of a great many of ours, because they could always successfully get away from our men.

6934. This perfection of eyesight on the part of the Boers, is it not rather a case of evolution arising from the conditions of their life in the clear atmosphere of the Transvaal? Of course the eyesight was trained to a very large extent. Do you think you get a proof from that ground alone of the inferiority of our men?—Well, I know it is the town dwellers that always seem to have difficulty in seeing the target.

6935. At the range?—Yes, at the range, and of course I quite admit that the Boers were trained in their own country, and they might tell you whether a tree was moving three miles away.

6936. So it is a measure of training?—Well, it is a big subject.

6936A. Would systematic physical training in the schools tend to check this degeneracy of the race?—Oh, I am sure of it.

6937. And you would go the length of making physical training compulsory?—Yes, I would.

6938. And give it a very large proportion of the day's work—one of five or six hours a day?—One out of every five or six hours; it would be impossible to do with less, and I firmly believe from my own experience that the pupils do a much better five hours' work with their brains if they did one hour at their physical education.

6939. That is practically five hours a week of physical training in all the schools, and make it compulsory?—Yes, as a minimum.

6940. Then it should not be left to a School Board or a headmaster to say whether there should be physical training?—No, it is an Imperial matter; it is of vital concern to the whole nation that the children of the nation should be properly trained in general physique. It is quite as important as that they should be taught reading and writing.

6941. It is an Imperial measure; you would like to see it an Imperial matter?—Oh, yes, undoubtedly; I advocate conscription really in a modified way, because I have seen the great benefit which accrues to the individual from training of the army. I have seen it over and over again. Perhaps conscription as one meets with it in Germany is not suited to us; but who can go to Germany and see those fine well-set-up fellows walking—every man of them is physically capable of being, if need be, a soldier, and every one of

Compulsory training desirable: amount specified.
Recruits.

Mr T. D. Savill, M.D.
9 June '02. them well-developed—without wishing for something like conscription.

6942. Then I was going to ask you what you define as athleticism as against physical training, or gymnastics, or military drill; have you any particular form of exercise in your mind?—The term 'gymnastics' should be confined to the work in the gymnasium with fixed apparatus; military drill implies squad and company formation, marching, and exercises with the rifle and sham bayonet of some kind. Then what I mean by athletics are rowing, cricket, football, and all the other recreative games of youth and early manhood.

6943. Not necessarily attended by the evils of professionalism?—No; that, of course, is an additional, a later evil.

6944. Do you want to bring out that athleticism applied to these sports is apt to be injurious because it does not produce an equal development of the body, and produces an injurious development of parts of the frame?—It produces an unequal development; it neglects the upper part of the body and the arms, one or other, or both.

6945. In the school life of children, and particularly of boys, when they take to sports like these that come under the designation of athleticism, would you like these sports supervised by their masters or by some competent inspector?—Oh, certainly, I should, for the double reason that one would like to exclude the very weak who are not suitable, say, for football, and also to group them into physical equality. The great art of making games good for and useful to children is to group them physically.

6946. Still your object would be that the boy and the girl during school life, and for the years immediately afterwards, should have every opportunity of having the body improved, whether by sport, by games, by physical exercise, by gymnastics with fixed apparatus, or by military drill?—Undoubtedly; yes.

6947. *By Sir Thomas Coats.*—When you talk of this physical degeneracy that is going on in the country, how far back do you date this degeneracy; how long; is it a measure of twenty years ago, or fifty years ago, or what?—A process of this sort is very insidious; that is why it is overlooked, and one can hardly give a date; but I should say that the movement practically coincides—that is one of the proofs upon which I rely—with the tendency of the population to move to towns, that is to say within the last half century. If you look at the population of any of the big towns, they have nearly all increased by leaps or bounds within the last half century.

6948. We are told, going back a little further, of the armour that was made for men of that time, that our ordinary men can hardly get into it now; they have increased since that time. I suppose, then, you think they have gradually gone back again?—I find it very difficult to believe in statistics on suits of armour. When I was in Egypt last winter I saw some mummies—some of the Pharaohs—and they were really very big men, all of them; they all seemed to me bigger than we are now; but I do not know whether one can draw very much conclusion from such facts. Practically, sir, in answer to your question, I think I might say the degeneracy has, in my opinion, all occurred within the last fifty years.

6949. Do you attribute that to the feeding of the people?—To the diet?

6950. The diet, yes?—That opens the question of the struggle for existence. I do not think the children would require specially feeding any more for physical than for intellectual education. It is wanted, of course, in some cases in the East End schools. I daresay you know that in London there is what is called an Organised Meal Fund at the disposal of the School Board. It is a philanthropic fund; and it is a magnificent charity, to feed the little ones.

6951. Has it come under your personal notice that many children coming to London schools are underfed and require it?—Oh, yes.

6952. Quite a number?—Oh, yes, a fair proportion. I went down—a few years ago—to enquire into an epidemic of skin disease at one of the Shoreditch schools where there were 1050 scholars, and they practically all of them passed through my hands, and I should say something like 10 per cent.—it is a large number, but I should think something like 10 per cent.—seemed to me to be underfed weaklings, they did not seem to have any active disease, but they wanted nourishment, the poor little things. That, of course, is a very densely populated district, and a very poor district.

6953. You do not think at present charitable organisations are quite fit to cope with this difficulty? No, I do not think so, because I think they want more funds.

6954. And would you advise this being taken up by the State?—It is a very delicate question, is it not, whether in point of principle one ought to do that?

6955. Well, I ask, do you think it is a matter of carelessness on the part of parents or inability to give them food?—I think it is largely a measure of inability, because I went to many of these children's homes, where they really found it most difficult to make both ends meet. One man would be a dock labourer. Well, owing to the strike, he told me, he could not get more than three days' work a week; he had to keep a wife and three children on it. They got meat once a week these children; bread, water, and a little milk for the rest of the week.

6956. Then from what you said I would judge that it is on account of the town children being worse fed that the degeneracy is going on more in towns, not so much from surroundings or not so much what you could help by giving physical training, but on account of the nourishment they get, of the inability of a great number of parents in the large towns to give sufficient nourishment?—I do not think that would account for it; no, I do not think that would account for it altogether; it might partly help to do so.

6957. *By the Chairman.*—You said that you recommended classification by physique of schools for physical exercise; have you ever considered whether this would work, or is it only what you think would be the best thing to be done?—In the case of games very often you can do it; I was speaking more particularly as regards games. I do not see why it could not be done with all forms of physical culture to some extent.

6958. I mean have you considered it from a practical schoolmaster's point of view?—Oh, yes.

6959. Where one child never thinks about his stature, he thinks about his class, his standard?—Oh, I think it could be done.

6960. I mean is it sufficiently important to take children out of their proper standards and put them into their physical classes?—But if you give them two half hours a day—I mean two physical classes a day—one in the morning and one in the evening, you could easily arrange to divide one class into two if in no other way, such, for instance, as physical training at start or finish of their other work.

6961. That may be or that may not be, you will find a great many schoolmasters very much against it?—The schoolmaster is sometimes an obstacle to the physical training of children, I am afraid; I have not found him very amenable to suggestions; they do not like increasing the quantity or altering the quality of work.

6962. One general question, are you in favour of medical inspection of schools and scholars?—Yes, I think it should certainly be done.

6963. Whether it is pleasing to the schoolmaster or not?—Oh, quite so, yes, it is very desirable that that should be done for many reasons.

6964. I only wanted your general opinion; you think really, seriously speaking, that wherever physical exercises are practised in schools there ought to be some sort of medical supervision?—Certainly, by some medical man who knows about the subject, and who has studied it.

The witness withdrew.

Mr W. LESLIE MACKENZIE, M.A., M.D., examined.

Mr W. L.
Mackenzie,
M. A., M. D.

9 June '02.

6965. *By Professor Ogston.*—To enable us to estimate your testimony at its proper value, I should like that it was noted down that you possess the following qualifications:—You are an M.A. and a Doctor of Medicine, both of a Scottish University, a Diplomat in Public Health, also of a Scottish University, and at present your duties are those of Medical Inspector to the Local Government Board of Scotland?—That is so.

6966. And then the following additional qualifications you possess for advising us in regard to the physical training in schools, that you have been a pupil teacher from eleven to fourteen years of age in a Board School in Ross-shire?—That is so.

6967. A country school?—A country school.

6968. That you have been for three years a pupil in the Grammar School of Old Aberdeen?—That is so.

6969. What age were you then?—That is from fourteen to sixteen, going seventeen that is.

6970. What years were those?—1876 to 1879.

6971. That you were for three years a teacher in a secondary school for girls, teaching the subjects of logic, psychology, botany, physiology, physical geography, geometry, and the theory of education, the ages of the girls being from fourteen to twenty-four?—That is so, and I should like to add that the standard worked up to was the Aberdeen University Local Examinations and the St Andrews LL.A. degree.

6972. That you were four years a student of Arts in the University of Aberdeen?—Yes.

6973. And five years a medical student in the Aberdeen University?—That is so.

6974. You graduated with honours, did you not?—Yes, sir.

6975. With highest honours?—Not highest honours in M.B. I had highest honours for the M.D. thesis.

6976. And did you take any honours as an Arts student?—I had first-class honours in philosophy, and second-class honours in classics, and the Hutton Prize, which was given to the best student for double honours, and the Jenkyns prize in classical philology, and the Bain gold medal and prize for mental philosophy.

6977. After that you were Lecturer and Assistant Professor in Physiology at the University of Aberdeen and Gordon's College?—Yes.

6978. Where you had to teach independent classes?—No, at Gordon's College it would be misleading to say that, but at the University. At Gordon's College I gave a series of lectures on the physics of the senses.

6979. That you were Medical Officer of Health for three years in Kirkcudbright and Wigtown, and in Leith for six years?—Yes, that is so.

6980. That you were Examiner in Mental Philosophy for three years in the University of Aberdeen, and Examiner in Medical Jurisprudence and Public Health in the same University for four years?—Yes.

6981. How many years of experience have you had since graduation in those various capacities?—I was three years a teacher in that secondary school for girls; I was lecturer and assistant professor in physiology for two years; I was three years and three months Medical Officer of Health for Kirkcudbright and Wigtown; I have been six years Medical Officer of Health for Leith, and since I have joined the Local Government Board in Scotland, about a year from January last, it is a year and five months.

6982. So that would bring it up to fifteen years or so you have had experience?—Somewhere about that, sir.

6983. Would you now begin to read the evidence that you propose to give us?—1. I have not made it my business to collect statistics of defects, and the like, in children, but I have never lost sight of the educational point of view.

My work as medical officer of health has been mainly among the working classes both of country and of town, and I have had many opportunities of acquainting my-

self with hygienic conditions over Scotland. I have had occasion to deal with infected schools, and to study what hygienic precautions are practicable in them. I am moderately familiar with elementary school drill and physical training. I have endeavoured to keep my generalisations as close to the facts of my personal observation and experience as possible. I regret that I can offer no detailed statistics on certain matters that might be elucidated by them.

2. My main conclusion, in the light of which this statement is written, is that the primary value of physical training in schools is its value as discipline; that its value as a promoter of physical development is secondary, and that the great problem to solve is how to secure for the School Board child the nurture necessary to make physical training in school profitable. I should like to be perfectly exact about my words there, because the whole point of my evidence is that the important difficulty is to combine training in school with sufficient nurture for School Board children, meaning by that those that would be represented by the 14,000 school children in Leith, which is almost entirely an industrial community. The other children in Leith that go to school are mostly educated in Edinburgh, so that I am thinking simply of a concrete instance of an industrial community.

3. As an illustration of a secondary school conducted on lines suitable to continuous and exacting study, I give some facts regarding the Grammar School, Old Aberdeen, as it was conducted in the years 1876-1879, under the rectorship of Dr William Dey. For the information of the Commission I may say that owing to changes incident to the work of the Endowed Schools Commission, among other things the Grammar School, Old Aberdeen, ceased to exist as such some years ago.

4. The primary work of the school was the preparation of students for an Arts course at Aberdeen University. The school subjects included classics, English, and elementary mathematics. The ages of pupils ran from thirteen or fourteen on the first class to any age up to twenty or more on the fourth and fifth classes. Roughly, the ages were from thirteen to seventeen or eighteen. The pupils were drawn from all parts of northern Scotland, and represented practically all classes in country and town. At least 50 per cent. or more of the pupils lived in lodgings in Aberdeen, usually two in a room, or room and half. All the pupils, with very rare exceptions, had every motive for working. They were in considerable part picked men from rural schools, but a fair proportion were drawn from elementary schools in Aberdeen.

The tension of intellectual work was higher than at any other school I have known or heard of. Dr Dey himself taught the two highest classes in all the subjects, and prescribed courses of home reading. His aim was thoroughness of work by concentration of effort—the antithesis at once of cram and of dawdling. He made it impossible for triflers or idlers to remain at the school. None of the work was done in view of examinations; everything was done for its own sake. The results of fifteen years of work at this high pitch are written large in the history of Aberdeen University.

What of physical training?

In the ordinary sense there was none; no gymnasium, no swimming pond, no time specifically allotted to training. But the hours of work were so arranged that no pupil could fail to have two or three hours in the open air after school time, and that without neglecting his home work. This was secured as follows:—

On three days a week, the work on the fifth (or highest) class continued from 9 a.m. to 12.20 p.m.; for two days a week, from 9 a.m. to about 2 p.m. For the three short days there was no play interval. The pupils went home for the day at 12.20. For the long days there was an interval of twenty minutes or so, and the second part of the day was occupied by a test examination of some sort. On no day were the pupils

kept longer than to 2 o'clock. Thus the total school working hours were about nineteen per week of five days, or an average of nearly four hours a day. But on three days the hours never exceeded three and a half. No lesson was longer than half an hour at a time. The home work to prepare normally should occupy three to five hours. This was made possible by the freedom of the afternoons. The recommendation was to spend some time of every afternoon in the open air, and this was done.

The exercise indulged in was very little; occasionally cricket or football, walking, long walks on Saturdays, occasionally rowing. I may say of rowing that my experience was that it was a vanishing quantity. It did not amount to much, but still I think it right to mention it. But exercise did not occupy a large part of anyone's time or thought. When I say exercise I mean systematic physical training.

The lower forms had slightly longer hours. The intention of the shorter hours of the higher classes was to encourage individual reading. But no class was detained after 2.30 p.m.

I cannot recall any nervous breakdown under the strain of work, which continued from October to Christmas, with ten days' interval; from January to March, with ten days' interval; from April to June, with six weeks' interval; and then August to October, with ten days' interval. As a rule no members of the fifth form remained at the school more than the year necessary to pass through the form.

The deductions I make from these facts are:—

(a) That experience had shown that concentrated work, with long rest following, and much individual freedom, favoured high tension of intellectual work.

(b) That the absence of systematic exercise was more than balanced by the time in the open air and the freedom from strain.

(c) That the absence of physical training according to a system was never felt; that the habit of relying on simple walking in the open air conferred staying power for future work at college, and that the distribution of work through the day, with short breaks for exercise, would have tended to lessen the tension and, therefore, the quality of work.

(d) That it is sound psychology to rely on the fresh hours from 9 to 12 for the organising and developing of impressions, and to let a long rest intervene before preparation is begun.

The same principles could be applied, with appropriate variations, to elementary schools, but how far this is compatible with the Code I have not considered.

My main point, however, is that physical training in any systematic form cannot, in the light of these facts, be regarded as essential to the higher work of secondary schools and universities in Scotland.

In the remainder of this statement I shall follow the order of the questions put in the 'terms of reference.'

On the standards of height, etc., the proportion of mentally defective or physically defective children, etc., I have no data of any value. Unless the Commission have already been referred to Sir Frederick Treves' article on 'Physical Education' in Stevenson and Murphy's *Principles of Hygiene*, Volume I., I should like to bring that under their notice. Probably it has already been produced, because it contains an analysed criticism of a great many measurements of heights and the value of exercise, the classification of different pupils, and so on.

Are country children physically or mentally superior to urban children?

On the whole, I think that (a) the staying power, (b) the standard of attainment, especially in width of experience, are in favour of the country children as against the town children. The causes of this are such as the following:—(a) Longer walks to and from school; (b) greater proportion of time in open air; (c) better average feeding—milk, meal, vegetables, etc.; (d) wider experience of life at a slower pace. Whether this means greater ability, on the whole, I am unable to say. A rough test of the quality of ability prevailing in the rural districts of Aberdeenshire may be

obtained by examination of the Aberdeen Bursary Competition lists, where, particularly in the case of girls, the country schools more than hold their own. That fact is based upon an examination of the last three years of the bursary competition in Aberdeen. I should like to add, however, that owing to the recent university ordinances the bursary competition has been separated from the entrance examinations as such, and the result is that it ceases now to be a very fair test—that is to say, it cannot be a very fair test as it was before those ordinances came into force. That is seven years ago. The town schools that send forward pupils are to a certain extent supplied from the rural districts, and thus the comparison cannot be made accurate; but when I taught advanced work in a private school, I got the impression that, on the whole, the balance of faculty was in favour of the girls bred in the country. I have noted many examples of this. Apart from the general causes mentioned above, one cause operates powerfully in favour of the country school, namely, the concentration of effort on few subjects, and the absence of social distractions, which, both for boys and girls, constitute, in my opinion, the greatest obstruction to individual education. Further, I found that even so small a matter as coming from the country to the town by train, though the distance were but a few miles, tended to affect the attention adversely. The cases within my personal experience, however, were too few to justify any general assertion, and the difference between the programme of studies in town and country was always a confusing complication in the estimate. The leaving certificate examinations should offer now some fair indication of the relative proportion of over-average ability in town and country schools. It is, apart from school work, certain that, owing to the openness of country life, to the number of activities accessible to country children as compared with town children, to the comparative slowness of country operations—threshing, ploughing, reaping, hay-making, turnip hoeing, cow-keeping, shepherding, and the like—a country child of the farming and farm servant classes and middle classes (or the rural grades corresponding to the middle classes) has innumerable more opportunities of becoming acquainted from infancy with the processes involved in farming, with the management of animals—horses, cows, sheep, pigs, hens, pigeons, etc.—with the phases of rural nature, the habits of wild animals, the varieties of wild plants, the formation of streams, the appearances of rocks and soils, the making of roads, and a multitude of other matters that normally constitute the primitive basis for future acquisitions in science. And this is not dependent on the fact as to whether the country teacher exploits those activities in his teaching or not. They are the normal environment of a country child, and as the functional development of the brain is affected by environment, I should say that we may reasonably expect the country child, not only to know more of a greater world than is accessible to the town child, but to exhibit the increased capacity that necessarily flows from the larger experience of life. Over the town child the country child has yet another advantage—he has unlimited space for play in the open air, and the police do not interfere with his game of football on the streets. As an example of the kind of responsibility looked upon as normal in the country, I may say that it is not uncommon for a boy of ten or twelve to take charge of a horse unsupervised, and for a girl of the same age to manage all the essential parts of house-keeping. In towns, the responsibilities imposed on boys differ somewhat from those imposed in the country; but as to girls, my experience has been that town and country are fairly matched. A girl of ten to twelve in Leith and in Galloway is usually able to take charge of the house in her mother's absence, and to give the family histories of her younger brothers and sisters.

These considerations, however, must be qualified by the fact that, as a result of the greater stress of living in the town, a certain selection takes place, the alertness typified in the street gamin becomes accentuated, and the nervous capacity is more developed in more

special directions. Hence to the superficial eye the town child is smarter than the country child, and as he usually takes the available infectious early, he may even pass through school life with less interruption from illness than the country child; but I think the greater staying power remains ultimately with the country-bred child, even when he has to face the ordeals of the town infections. This applies, however, to country children properly so called. The conclusion is, on the whole, confirmed by the fact that in Leith, while the infantile death-rate, *i.e.*, the death-rate per 1000 births, is fairly high—running from 117 per 1000 births to 170 or thereby—the death-rates at the school ages are very low, from 3 to 10 per 1000. These I quote from memory, but the averages are accurate enough. I had occasion to make a comparison between Edinburgh and Leith. It was a comparison between different classes of children, and on the whole Leith came out best, that is to say, slightly below at all the different ages. It is not a matter to build very much upon. This I attribute partly to the fact that hitherto the Leith population has been recruited largely from the vigorous families of the surrounding counties, Leith being to a great extent a transit town, where carriers and horsemen of every variety are much in request. My work as a county medical officer of health lay chiefly among the dairy farmers and the villages of Galloway, which is largely pastoral. Of other varieties of Scotch children—for example, miners' children—I have had no experience.

Are country children improving or degenerating?—I know of no Scottish observations on this point. My impression is that the selective action of School Boards in Scotland, and the continued improvement in the administration of the Poor Law, tend rather to eliminate the hereditary degenerates from the country; but in the absence of any sure marks of degeneracy, other than marked idiocy, or imbecility, or feeble-mindedness, or epilepsy, it is difficult to speak with certainty. To judge, however, by a visit I recently paid to some of the lodging-houses and farmed-out houses of Glasgow, I gather that there exists in the large towns a dangerous concentration of the lower loafer classes, who, with the corresponding women, are apt to produce fresh crops of degenerate children.

On this question of degeneration, however, I consider that the possibility of fallacy is very great. I have frequently attempted to estimate in what human degeneration consists, and my conclusion is that, apart from certain gross forms, indicated by the terms feeble-minded, arrested development, idiocy, and the like, the data available for determining the upward or downward tendency of groups of human beings is of the most vague and unsatisfactory kind. What is popularly regarded as the degeneration of the slums—the variety partly indicated in the Glasgow lodging-houses—is largely a 'generational' degeneration, and depends not on hereditary disposition, but on environment. Environment includes housing and nurture. I call this form of degeneration 'generational' to indicate that it is or may be confined to the particular generation concerned, and is capable of removal by the improvement of the environment—improvement, that is, in housing and nurture. It is also capable of arrest by transplantation of the individuals. Such degeneration as I mean is exemplified in rickets, anæmia, tubercular bone disease, and the multitude of diseases that result in deformities, in impairment of physique, in malnutrition of nervous systems, with consequent mental deterioration. If the official list of diseases be carefully examined, it will be found to contain an enormous number of ailments that depend directly or indirectly on the influence of the environment. With the infectious diseases this is too obvious to require proof. One illustration is enough. Within the town of Leith there is a thickly-populated area, with tenements, and there is a thinly-populated area, mainly occupied by villas. In the thickly-populated areas the residents are chiefly industrial—dock labourers, carriers, iron-founders, and so on. In the thinly-populated area the residents are mainly middle-class merchants, or lawyers

or bankers, or shipowners, or others of similar grade. The great mass of infection comes from the thickly-populated areas; it is a comparative rarity to get diphtheria or enteric fever or even scarlet fever in the thinly-populated or villa area. When, however, a milk gets infected—that is when the food environment is interfered with—the susceptibility of the children in the villa area becomes as manifest as the susceptibility of the children in the tenement area. The inference is that the improvement in the environment will result in elimination of the infections concerned. But by eliminating these we at once stop at the source a huge percentage of ear disease, of meningitis, of bone disease, tubercular and other, of rheumatism, scarlatinal and other, of predisposition to heart disease, of nerve degeneration (as in diphtheria), and of all the common complications of the infectious diseases. When the infections and their sequelæ have been thus eliminated, when the malnutrition diseases have been eliminated, when, either by altering the environment or transplanting the children, the organism has become free to respond to the stimuli of light, air, and suitable food, it will be found that much of what has been taken for hereditary or transmissible degeneration is really confined to the individual generation, and is evanescent. I do not say that the transmissible degenerations, such as too thin skins, or tendency to glandular troubles, or certain forms of insanity, can be eliminated by change in environment. These—the transmissible degenerations—involve the question of suitable selection of parents, and I do not offer any suggestion here on so great a problem. What I wish to emphasise is that the scope for improvement by improved nurture is almost unlimited. Consequently, the benefit from suitable physical training is almost unlimited. As an illustration of what regular cleansing and regular feeding can do, I mention only my experience of some 1600 children treated in Leith Infectious Diseases Hospital. The improvement in look, in firmness of tissue, in alertness, in weight, and in general physique was, even in the short periods of hospital detention, so great as frequently to evoke the astonishment of the parents. I frequently noted, however, that on seeing those children some months after, there were distinct evidences of the return to pallor and feebleness. Every industrial school I have visited shows a similar improvement. In such cases the sole difference is a difference in the regulation of the life.

How much can physical training in school do to counteract the effects of bad environment?—Let me state some of the conditions whose effects are to be counteracted. During six years as medical officer of health in Leith, I had to inquire into the housing of some 3600 cases of infection. Two thousand cases were, on account of improper lodging, removed to hospital, and a much larger percentage could legally have been removed. I may add that it is part of my official duty to scrutinise all the reports of the Medical Officers of Health and Sanitary Inspectors of all the Local Authorities in Scotland, amounting to about 320, and these facts are everywhere confirmed; it may be taken as an established generalisation. From observation I find that the children in a family were rarely less than three, and that the inmates of a two-roomed house were rarely less than six. The Census returns give the exact quantities; but the Census must here be misleading, for the number of rooms given in the Census is never the number of rooms habitually used. I do not wish that statement to be misunderstood; it is a necessary effect of the census figures which have to enumerate all the rooms in the house with the population at the given moment; my point is obvious later. For practical purposes, a two-roomed house and a one-roomed house do not materially differ. The kitchen is habitually used as bedroom, washing-house, drying-loft, cooking-room, eating-room, sitting-room, and study. This is the result of economical conditions. In this, Leith is fairly representative of the Scotch towns, being probably better than the larger towns. Consequently, even the good artisans' houses are normally so used as to produce, in some degree, the

Over-
crowding.

same results as overcrowding—namely, anæmia and malnutrition and nervous depletion and irritability, not to speak of minor local disorders, like skin diseases. And this apart from the major overcrowding, of which the instances are legion. Physically, overcrowding means bad ventilation, germ-laden air, too much organic impurity and carbonic acid, too little oxygen. Physiologically, it means perverted nutrition and exhaustion. In summer, these results are to some extent neutralised by life in the open-air. In winter, they are exacerbated. But for a minimum of some ten hours of the twenty-four, and for a maximum of some fourteen hours, the effects of overcrowding are being constantly produced. As a partial confirmation of the summer relief and the autumn exacerbation, there is the seasonal variation in scarlet fever, which falls to low-water mark in April and reaches high-water mark usually in October. Want of sunlight contributes to the same results as want of air. The first necessity for children nurtured in such home is air and light; the second necessity is exercise. Play in the open-air is a counteractive to the overcrowding; but physical training in school cannot be regarded as equally so; for the increased pollutions due to exercise in school put the ventilation even of the mechanically-ventilated schools to a severe strain. Physical drill, except with wide-open doors and windows, or in the open air, cannot in my opinion be regarded as other than a further uncompensated output of work-energy by the child. I may here add that drill of every kind, except, perhaps, musical drill, involves a severe nervous strain on young children. I am informed that during drill of infants—that is the technical Board School infant, five to seven—the requests for permission to repair to the urinal increase perceptibly.

Illustrations.

Consequently, I consider that the only form of physical training that can in any degree counteract the persistent results of overcrowding is play or exercise in the open air—preferably the form of exercise that is not supervised by any teacher or person in authority. Perhaps I should say those not obviously supervised; it may be organised, of course. Wherever a teacher is present the play ceases to be spontaneous, and then involves the same cerebral waste as work.

As illustrations of what can be done by physical training, when associated with radical alteration in the environment, I instance the North Lodge Industrial School for Girls, Aberdeen, as it was some ten years ago. The children were drawn from the Aberdeen slums; but by management and training, they were so improved physically that, in free gymnastics their teams, in open competition with other schools, won the challenge shield so often that they had to be put out of competition. I have seen one of their teams at exercise, and the physical superiority was manifest. The girls wore no corsets. Another instance of the same kind is the Market Hall, Leith, where physical training has produced good results. A third instance was brought to my notice by ex-Bailie Gibson, Leith, who trained a football team from a school in the slums to beat teams from the other Board Schools. During play they were fed on beef-tea, and I understood that some care was taken with their nurture—clothing and feeding—in the intervals between matches.

Country
children :
exercise less
urgent ;
supervision
objectionable.

Does the work or exercise of country children dispense with the need of systematised exercise for them? —From the considerations advanced above, I conclude that with country children systematised exercise is less urgent. But the same effects of overcrowding have

to be counteracted. It is a popular impression that housing in the town is very much superior to the housing in the counties. That is in certain large general respects true, in that the streets are more crowded and badly lit, but in the individual houses my experience is that there is not much to pick and choose between the quality of the houses in the corresponding classes, that is to say, that the rural houses are neither much better nor much worse than town houses. If 'systematised' exercise means 'supervised' exercises, then, in my opinion, the less of system and supervision there is the better for the children.

Does improved physical development entail improve-
ment in brain power and in acuteness of the faculties? —In my observations of hospital children, I have not been able to separate the kind of physical development due to training from that due to nurture—feeding, clothing and cleansing. Up to the age of puberty, the results due to training, as distinct from feeding and play, are difficult to distinguish, and it is not essential to distinguish them, since work does not usually begin until after thirteen. I always found in the hospital children a marked inclination to resume school work and 'play at schools.' The physical development due to nurture does not, in my opinion, interfere with intellectual development. But when physical training is pushed to the point of fatigue, and becomes a conscious and systematic matter, the effect is a certain reaction against intellectual effort, much in the same way as with daily labour. This becomes marked, I think, when adolescence is established. New emotions tend to inhibit the impulse to play, and the voluntary effort to secure the same result—as by volunteering or club sports—is more exhausting and, therefore, less favourable to intellectual interests. More distractions supervene, and, in ordinary life, the brain is apt to be less exercised in specific directions. At this period of life, something is almost certain to be overdone—it may be muscle, it may be nerve, but the condition is always unstable.

Does improved physical development imply improved moral?—Within limits, yes. But, as pointed out above, there is always a danger of reaction from excessive physical toil, whether it be work or merely training. The moral question practically does not arise until adolescence begins. The relation between physique and moral capacity is a very indirect one. The saints have never been conspicuous for good physique. The very conscientious man is usually dyspeptic. The morals of the football field are not strikingly superior in any respect to those of sedentary life.

Does improved physical development promote morality?—The mere animal result of physical training is not, in my opinion, of much importance, either for or against morality. But the methods of securing the result are important. Sensitiveness to the obligations of honour is encouraged by sports like cricket, and, provided the teachers have tact, the same sensitiveness may be established in regard to the major virtues. In Board Schools, to children of six to twelve, morality cannot be secured by anything short of the finest efforts of character, and the bad effects of home life, as I have indicated above, are a constant counterpoise to the influences of the school. I should not wish to suggest that the benefits of home life are always bad, but I mean such bad effects as I have indicated earlier are really undoing a great deal of what is done in the school.

FOURTEENTH DAY.

Tuesday, 10th June 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT :

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr W. LESLIE MACKENZIE, further examined.

6984. *By Professor Ogston.*—Would you be so good as to resume your evidence where you left off—at the Physical Census of Children?—Physical Census of Children.—(1) Is it desirable?—I think it is. It would make possible a more scientific classification of children than the single point of age in years. It would enable the teacher to eliminate the feeble, or defective, or badly-nourished, or deformed. It would make a more scientifically-graded progress possible. When I say eliminate of course I understand eliminate within the conditions of the School Board. I am always thinking of it as the practical problem, and I should imagine that it would enable the teacher to separate these and to advise such special treatment as each particular group of cases might indicate.

(2) Is it necessary?—If the present exactions on the nervous and alimentary systems of children are to be kept from doing harm, I think such a census is necessary. At present, so far as I am aware, there is no systematic effort to distinguish the enfeebled from the strong.

(3) In what ought it to consist?—The following seem to me the main requirements:—

Age, height, weight, employment of parents, approximate age of parents (this would enable the medical man to put a value on any neurotic phenomena in a child's history), eyesight, hearing, teeth, general nutrition, deformities, condition of skin, heart, lungs, joints, vital capacity, size of head, previous illnesses—infections, etc., vaccination, glands, throat. In actual practice, from the public health standpoint, there is no question whatever that the condition of the throat is in my experience much more important than any—throat and glands, because the throat is associated with several varieties of malady, diphtheria and scarlet fever, and these are the most troublesome diseases in school.

Is inspection of the health of school children by a medical man necessary at present?—Yes, I think so, and have long advocated this, chiefly on account of school epidemics. Diphtheria, scarlet fever, measles, whooping-cough, chicken-pox, scabies, ringworm, favus, and several other communicable and common diseases may spread by schools. This could, in my opinion, be practically ended by systematic medical inspection. The same arguments as justify medical inspection of the police and post-office services justify the inspection of school children. I may interpolate here that in Leith, in particular, the School Board were extremely exacting in the application of the Infant School Clauses in the 1897 Public Health Act, with the result that practically since that Act came into force in the beginning of 1898 school epidemics have disappeared in Leith. They found difficulty in applying it to every one of the minor and non-fatal ailments like chicken-pox, and so on, but for the other things

they have done extremely well. For girls' schools and infant departments, lady doctors are now available in many cities. The work of inspecting need not be so laborious as the number of children would suggest. Each school should have a medical man attached. This is the case in industrial schools. The results are good. In these cases, of course, the industrial school is *in loco parentis*; but to the extent that school attendance is compulsory, so is the School Board. Diphtheria is steadily gaining ground in the towns, and this is probably due to the persistence of mild cases without gross symptoms. Medical inspection of throats would go far to reduce this troublesome and very fatal disease. On that question of diphtheria, which is only an illustration here, an enormous amount of evidence has been accumulated by Dr Sims-Woodhead for the Metropolitan Asylums hospital cases, including an analysis of something like 14,000 cases in detail, and on the whole it establishes the same conditions.

Will it become necessary if physical training be increased and rendered more systematic?—Yes. I should make it an absolute condition that no child should be permitted to take part in any drill involving violent physical exercise without medical sanction. In public secondary schools this is even more important. The 'point of honour' is here the real schoolmaster, and a boy should not, in any circumstances, be considered odd or erratic if he declines to take part in severe and continued games like football or long running. But, in any case, I consider that games are better left to the spontaneous organisation of boys or girls by themselves, and the conversion of games into drill is a more than doubtful good. I do not, of course, say that the facilities for games should not be organised by the authorities in charge of the school.

NOTE.—Neurotic children should receive separate attention. There should be no exercise during the week of menstruation. That is a point that so far as I am aware teachers are not really fully awake to in girls' schools. I think it is looked upon with a certain delicacy, and quite properly so, but I do not think that enough allowance is made for it in the teaching of girls. There is no question whatever, from my own experience, having a certain amount of medical knowledge at the time—it was quite obvious—that the whole intellectual processes were more or less interfered with for several days during menstruation of girls.

Spraying of Schools with Disinfectants.—The inspection of schools should be supplemented by the *plus* periodic disinfection of schools. This should be done once a week, or thereby. It can be done very rapidly by means of a spray-pump. All school appliances, such as slates, pencils, pens, and the like, should be as regularly cleaned as the children's hands and faces.

Mr W. L.
Mackenzie,
M.A., M.D.
10 June '02.

No violent
physical
exercise

10 June '02.

Walls and forms and floors can be overtaken by the spray with formaldehyde, or some similar solution. The schoolrooms would thus be kept from becoming miasmatic, and their condition would then favour physical training, which should be conducted in the morning, when children and rooms are fresh, and not, as is frequently the case, when the air is exhausted and the children fagged with two or three hours of brain work. Drill is as exacting on the brain as ordinary intellectual work.

Girls: special clothing advisable.

Is special clothing required for girls undergoing physical training?—It is advisable. For young girls the only precautions necessary are: No corsets, loose neck, loose wristbands. For older girls it is advisable to have close knickerbockers, short skirt, loose blouse, no corsets, free neck, free wrists. I may say that these are the commonly prescribed and actual costumes in the schools where free gymnastics are taught.

Forms of exercise differentiated: respective values.

Forms of Exercise.—1. Children of six to twelve.—In the choice of exercises, a clear distinction must be made between (a) drill and (b) play; also between (a) voluntary exercises and (b) automatic exercises. Drill always begins as voluntary, and may or may not end as automatic. Play is voluntary, but not as at the word of command; play is, therefore, spontaneous, an expression of the child's individual impulse. Drill, until it becomes automatic, involves voluntary attention. This makes it a drain on cerebral energy. The responsibility to an instructor adds to this drain. Consequently, drill cannot at any time be regarded as relaxation from cerebral work; it is only another variety of cerebral work. From the small amount of military drill possible in schools, I doubt whether the operations ever become automatic. Consequently, drill is likely to remain always a task. Its proper use, therefore, is as a discipline, not as a relaxation or recuperative exercise. It follows that the best time to take it is, as indicated above, when the body is fresh after sleep and rest. It may then act as a stimulant to prepare the way for other intellectual exertion and acquisition. With musical drill, it is somewhat different. The rhythmic response to music is automatic; it involves little or no cerebral waste; it is normally pleasurable. Witness the dancing crowds round the street piano. All drill for children up to twelve should be musical drill. That is an obvious impossibility, it is too hasty an expression, and I should like to say that drill for children up to twelve should, as far as possible, be musical drill. A great many school drills can be made musical, or at least supplemented by music, in a way that makes the obvious effort distinctly less and the obvious disagreeableness of it distinctly less. The drill that suits music best—free gymnastics, so-called—are mostly simple movements, easily acquired. The music is itself a subtle stimulus to their performance. But even musical drill has to be done to word of command, and, therefore, retains the main feature of work—fatigue through attention. Hence it is necessarily inferior in nutritive value to play in the open air without obvious supervision.

Musical drill.

Games.

On these grounds I consider that the spontaneous games and exercises are the best for promoting physical development. I should prefer such games as exercise large groups of muscles in a varied and diffused way. For example, games involving running and dodging, skipping, hoops, see-saw, top-spinning, 'hippin' beds, and the like. Skipping is, I think, the best of all, particularly for girls. A young girl (say of ten) will skip 50 to 100 times consecutively, lifting the whole body 4 inches off the ground each time. If she skip 60 times she raises her body the equivalent of 20 feet. To do this in ordinary gymnastics, climbing a rope or a ladder, is a good feat. But the climbing requires concentrated effort of relatively small muscles, and the strain on the heart is enormous. Skipping accomplishes the same amount of work in a more diffused way, and the result is improved respiration, improved circulation, general exercise in rhythm, balance, co-ordination of hand, foot, and eye. I might carry the analysis much further, but this is enough to show the

Skipping.

immeasurable superiority of skipping as a recuperative exercise to feats of strength, as most gymnastics are (e.g., parallel-bars, leaping the horse, climbing ropes or poles, the hanging or rising ladder, the moving or fixed trapeze). On the principles stated, I consider these mechanisms entirely unsuited for any school purpose for children under twelve. That is a very strong statement to make, but I am quite prepared to adhere to it. The lighter gymnastics, such as light clubs, or dumb-bells, or elastic tension bands, and the like are on a different footing. They remain adapted to the strength of the pupil; they are yielding resistances; they may be profitably used to give interest to developmental exercises. But I should like to emphasise the distinction between the value (nutritive) of play and the value (disciplinary) of drill.

As to military drill, I see no great value in it beyond what is included in all forms of drill. The essential points in military drill are the turnings and the forming of marching columns. I speak here subject to correction, because I am not very familiar with army drill. The essential ethical point is automatic obedience to the word of command. For certain limited purposes of discipline this is no doubt good, but I have never found in the soldier or the volunteer any such superiority in conduct as would lead me to attach any special moral value to his particular and, to my mind, somewhat dull form of drill. If I were requested to choose some form of the Service drills as a school model, I should choose the form that shows the most variety, spontaneity, and resource; that, beyond controversy, is the naval drill. And, indeed, I know of no more perfectly-fitted environment for certain types of boy than a training ship. The recent wars offer some confirmatory illustrations of this.

As to self-defence—boxing, shooting—I offer no opinion. They have no place in a curriculum for children under twelve.

Swimming is different. It is an activity useful in itself, pleasant, and not readily abused. Precautions: strict medical supervision from time to time. For girls, instruction of teachers in the dangers during critical periods. I say instruction of teachers, because I should not wish to suggest that the consciousness of girls should be excited at too early a period on matters affecting their sexual development. Consequently, I think it is important that teachers should be taught, but they should also be taught the dangers of interfering too much. Precautions in the pond: a time-limit in the water, avoidance of long diving, no long racing, attention to ears.

I should like to bring under the notice of the Commissioners an article that has just appeared in the June number of *Public Health*, by E. E. Glyn, M.A., M.B. (Cambridge), who made a bacterial investigation of the water of the Public Swimming Baths of Liverpool. It is an abstract of a paper read at the Liverpool Medical Institution, March 20th, 1902. If the Commissioners would allow me I might read a little part of that, or I might hand it in. I shall omit the more technical part of it. He writes:—

'The majority of observations were made at baths which were filled with fresh water every morning always derived from the same source. This water was practically sterile, containing fewer than 3 bacteria per cubic centimetre. An hour after the baths were opened the water gave 46 bacteria per cubic centimetre; these were derived mainly from the air and the walls of the baths, as a series of experiments showed that at the temperature of the baths (21° C.) the organism concerned—that was, those which grew on agar at 37° C.—did not multiply to any considerable extent. During the eight hours of the night the number of bacteria, therefore, rose from 3 to 46 per cubic centimetre; if this rate of increase were maintained, at 9 p.m. the number should be about 200 per cubic centimetre. The examination of the water in the first class plunge bath at 9 p.m. on five different occasions during the months of June and July gave an average of 4,676 bacteria per cubic centimetre, the average number of bathers being 292; samples collected in the

Drill: a and nav compare

Swimm
Bacteri
investi
of Live
Public

second-class baths on three occasions contained an average of 11,970 per cubic centimetre, the average number of bathers being 186. A calculation based on the capacity of the baths showed that the water removed from the skin and hair of each bather between four and six thousand million bacteria, excluding moulds and others which did not grow at 37° C. One source of pollution of the bath arose from a tiled corridor about 4 feet wide running round between the edge and the dressing-boxes; on this both the bathers and those waiting walked, with the result that soon after opening this was more or less muddy. To avoid this a bath should have two corridors—an inner one between the bath and the boxes, another outside the boxes, the latter being open back and front. With regard to the organisms discovered in the water, streptococci were never found; *Staphylococcus aureus* and *citreus* very rarely; *Staphylococcus albus* was abundant in three varieties—*pyogenes albus*, *epidermidis albus*, and *cereus albus*. *Bacillus coli* was present in the bath at the end of the day to the number of 8 per litre for each bather in the first-class, and 48 for each bather in the second. Some who bathed constantly in the open complained of lassitude after swimming in a public bath; this could not be due to the quality of the water, but to its temperature and to defective ventilation. Liverpool was peculiarly fortunate in the number of its baths and the excellence of the water supplied to them.

I may add that in one public bath known to me, in order to reduce the necessary pollution of the water or the rate of the pollution, outsiders, before going into the plunge at all, are requested to have an ordinary bath first. That indicates to my mind that to get the full value out of school baths arrangements ought to be made for specific baths for school children quite independently of the general public. That would be subject to this condition, that in the very well-conducted baths where illimitable sea water is available the objections of course would be very much reduced. I am not able to say whether these are representative statistics, or whether they are very favourable or very unfavourable, because I have no other data.

2. Children of twelve to fourteen.—Special attention to critical period in girls. Absolute avoidance of exercises during menstruation. Instruction of teachers in this. Provision of seats for pupil teachers. That is merely an administrative point, but not unimportant.

3. Children of fourteen to eighteen.—I have already indicated my opinions for the increasing ages. Three instances recently came to my knowledge to show the dangers of indiscriminate exercise without direction:—

(a) A lad of sixteen to seventeen ran, walked, jumped, cycled, swam, shot; member of a private secondary school where 'physical training' is a primary part of the programme. Result: dilated heart. Prescribed rest for a year or so. I may add that he belonged to the aristocracy, and had every possible advantage of good nurture and its concomitants.

(b) A university student, aged twenty. Considerable discrepancy in age between parents—father older. A good runner. Hunted with 'harriers.' Long runs; also fast runs. Attended university classes at same time. Result: nervous irritability; insomnia. Rest for several months.

(c) University student, *etat.* about nineteen. Ran with 'harriers' for a summer. Of nervous history. Result: irregularity of heart, with signs of aortic incompetence. I may add that I saw that young man, who is now twenty-six, only half an hour before leaving home, and although he has had a sea voyage, and taken rest of various kinds, he dare not begin cycling again, and even although he is personally robust and muscular, well-developed—he is a medical man—he must exercise great care.

I am informed by those more intimate with sports than I am that varicose veins and dilated hearts are not uncommon among runners and football players at certain secondary schools. I should like

to add there, however, that as pointed out by Sir Frederick Treves, these conditions may be partly constitutional, and merely accentuated and not produced by running and playing. I think it fair to say that. For special purposes, such as military or naval training, these violent exercises may be justified. My opinion is—and Sandew's exhibitions confirm my opinion—that better results without the sequelæ can be obtained from mild and non-violent exercises. I do not see why the uncriticised ideals of the drill sergeant and the acrobat should be made the model for the free evolution of school life.

As to effects in the healthy.—1. Eye diseases.—I have no observations to make on this. Exercises are certain to result in the discovery of defects, which, however, would be provided for by medical examination and the physical census. As an illustration, I may take my own personal experience. I was not aware that I was short-sighted until I was fifteen. Nobody had discovered it, although it was quite marked, and during the time that I was resident in the ophthalmic department in the Aberdeen Infirmary, I frequently found very bad cases of short sight, where the children were scolded and slapped because they could not read. In one case a boy of nine was so defective in vision that he needed about two degrees from the highest lens used for short sight before he was able to read a letter of three inches at a distance of twenty feet; that is to say, he had tremendously far distant vision, but his near vision was practically not there, and the result was, of course, that he was a nervous, highly-strung boy; a clever enough boy, but quite unable to proceed. A third case came under my notice a week ago, where a mother had been informed by the oculist that her boy was so short-sighted that he could not read at all, and could not be expected to read. He was a clever enough boy, and he always told his mother, 'I could read if I could see.' That boy was at school and making very little progress, and yet the defect was not observed by anybody, because they had not looked for it. No doubt exercise and drill would, in a certain way, be a kind of sieve to find out who could and who could not see. The exercises are certain to result in the discovery of defects. A good deal might be done to develop a form of sensory athletics as opposed to merely muscular athletics. To this end ball-tossing is an excellent instrument. Houdin found it the best exercise for enabling him to preserve his fine touch and for educating the co-ordination of hand and eye for conjuring purposes. I may add here that the education of boys and girls in this respect is very unequal, because while girls are frequently taught the piano and fine work like sewing, and so on, boys have, so far as I am aware, no corresponding exercise unless we could name free-arm drawing as now a substitute. I am not aware of any other school exercise that is a real equivalent to the girls' sensory training. A series of graded exercises from one ball to two, three, and four balls can easily be arranged. I have tried the experiment, and there is no doubt about the educative effect on finger-tips and on co-ordination of eye and hand. The incidental nutritive effects are at least as great as in directly voluntary muscular movements. With some patience several schemes for exercising ear, eye, and hand could be devised. Ball-tossing is in itself interesting. Witness the persistence of cricket and other ball games—ping-pong not least.

2. Spine diseases, etc.—Recently a case came under my notice where, in a girl of sixteen, distinct signs of spine disease were induced by calisthenic exercises in school. I use the word calisthenic to cover the ordinary gymnastics in school. She had to desist. Immediately on resuming she showed the same symptoms. Suitable mild exercises could be applied here, but this is rather for convalescent home than for school.

As to effects in weaklings and these predisposed:—

(a) Rupture.—I have not known of any case.
(b) Heart Disease.—See above: children fourteen to eighteen (a). This lad was of rheumatic and gouty

parentage. I think that becomes a thoroughly good illustration of the reasonableness of taking these violent games under medical advice.

(c) Joint and Spine Disease.—See instance above. As to general tuberculosis, I think this depends more on nutrition and housing than on any varieties of exercise. I cannot recall any case within my own experience.

(d) and (e) Fractures and Brain.—No case known to me, except two, connected with Association football. The innumerable accidents of the football field are proof enough of the danger to grown-up players. I do not think that such persistence in football as is necessary to keep the player in good form for matches is, as a rule, compatible with the highest grade of school or university work. There are, no doubt, exceptional cases of great brilliance in sports associated with great brilliance in classes; but among university students I have found the combination so rare that, out of scores of students known to me, I cannot name one that was at once an athlete and a first-class student. In this I confine myself entirely to Aberdeen students, because my experience of Edinburgh students, although considerable, does not entitle me to say much. I can readily name a score or two that were first-class students without being athletic. My observation is that athletics and commonplaceness of acquisition are, in Scotland at least, oftener found together than athletics and brilliance. All the hard students I have known usually needed some tending at the end of the university session. Athletic form is not, in my opinion, compatible with the high intellectual strain demanded of honours students in arts and ordinary students in medicine. I say 'honours' in arts, because the quality of work demanded is high, and 'ordinary' in medicine because the vast masses of detail to be acquired leave too little time for the necessary training. This, I might add, is to a certain extent relieved by the recent reforms in the medical curriculum, which no doubt is slightly different from what it was. In the heavier years at medicine, exercise of any kind is usually the last thing thought about. The man that does think very much about it has difficulty in raising the necessary tension, even for an ordinary pass examination. This, again, is, of course, subject to occasional brilliant exceptions, and I should like to add in making this statement I do not mean to exclude walking and so on—a reasonable amount of walking, an hour or two per day.

Are (1) exercises, (2) games, (3) gymnastics required by the present race of children?—My replies to these questions are indicated generally above. As to town children, more space for play is certainly required. This is demonstrated by the frequency of prosecutions for playing football and other games on the streets. Any organisation that requires the interference of the policeman is defective. Further, a primary necessity is better housing. This is slowly improving under the presence of the Public Health administration. In the rural districts the question is less urgent.

Is military drill advantageous to the present race of children?—With the limitations already stated, I think it might be made advantageous. But not so long as it is taught by the ordinary drill sergeant. Occasionally, such a man is a teacher; not necessarily so. I should prefer drill to be taught by a trained teacher. This preference is based on the belief that a teacher knows better the ultimate object of the training, and that the army ideal is very abstract, and, in itself, a dangerous ideal to make predominant in early life. It tends to generate an unwholesome elation in destruction, and an equally unwholesome contempt for industrial occupations. Perhaps it is hardly possible to increase the delight in destruction in boys, and I do not wish to put too much stress on that fact, because the normal tendency of boys from five to twelve in imitating one another is destructive.

To what extent is first aid, etc., desirable, if at all, in children?—For girls under twelve, all that is important under this head might be included in domestic economy. For boys of the same age, a few simple rules

could be taught as an adjunct to physiology. For girls and boys from fourteen to eighteen, first aid, as such, might be taught in association with the elements of personal hygiene. I hesitate to suggest the loading of the elementary curriculum with more specific subjects. Much, however, depends on the training of the teachers.

Is instruction in self-defence, etc., advantageous or otherwise?—I think it is disadvantageous on the whole. I think it a decided loss that the ideal of good citizenship should be imagined to require skill in the arts of destruction. Boys have other and many opportunities of learning these. They are not, in my opinion, appropriate to the school training of a citizen for life in an industrial community. They are amply provided for outside the school.

Instruction in Swimming?—I think this beneficial in every respect. Every child should be taught to swim.

System of Physical Training?—Best. A general answer is given above. The essence of a good system is easy movements against yielding resistances; no violent movements. I should like to append to that, that although in actual training violent movements are not to my mind good, ordinary easy exercise may quite properly be looked upon as the training for violent exercise. I would not say that nobody should ever do anything physically violent. That would be nonsense. I think the purpose of training is to fit the body for any emergency of any kind. I should like to make that qualification of that statement.

Out of Doors v. Indoors?—Unless the conditions indoors are approximately the same as out of doors, physical training should never take place indoors. Reasons given above.

Gymnasium?—No special experience.

Swimming Bath?—See above.

Girls' Games?—See above.

Football?—See above.

Proportion of Time?—Approximation to time stated as at Grammar School, Old Aberdeen, seems best for that grade of school. I offer no suggestions as to elementary schools, except that drill proper should not exceed half an hour's duration—that is, at any one lesson.

Physical Training—Daily (or Frequently)?—Provided distinction between supervised drill and unsupervised play is acted upon, frequency would not be deleterious physically; but it is apt to encourage exaggeration of the importance of the exercise, and distraction from work.

Military Drill, Periodic or Daily?—See observations above.

Dietary.—From the instances I have given, it is obvious that increase of exercise means increase of diet in quality and quantity. If increased exercise takes the form of longer allowance of play, the dietary question might solve itself. If it takes the form of more physical drill (which is work) in school, I do not see how extra provision can be avoided. More drill, with the same food, would be, in my opinion, hurtful in the highest degree. I should think nourishing soup and bread would form a suitable ration for children. The experience of soup kitchens offers a model for organisation. As to incidence of expense, that raises a question of administrative principle, and I prefer to offer no opinion. The remaining questions are dealt with above. I should like just to add to that statement one remark upon continuation classes for industrial pupils. In general, in an industrial community, work begins with boys at the age of thirteen or fourteen, and with girls they begin to go into service and so on after fourteen or fifteen, or shops, and there we are faced with an entirely new factor, because with the boys, as a rule, when they take to physical employment like joiner work, or shipwright work, or engineering and the like, their ordinary occupation involves persistent exercise; consequently anything extra required of them, after a ten-hours' day, ought to be as nearly as possible of the purely recreative kind, and it is doubtful, to my mind, whether much

Games :
athletes and
first-class
students.

Games : more
spaces

Military drill :
ordinary
teachers
trained.

First aid, &c.

drill could reasonably be expected from that class of person. With the indoor persons, on the other hand, I think it would be a very appropriate thing. With girls it is difficult to know what to do, because the moment they go into indoor life they become anæmic and have very long hours, and, as far as shops are concerned, the fatigue of standing is so great, that at the end of twelve, thirteen, or fourteen hours of it, the amount to fall back upon for drill, or exercise of any kind, is almost vanishing.

6985. Your volunteered statement is so full that I think I can profitably confine myself merely to one or two medical points. And first, to go over the printed statement, you state that physical training in any systematic form cannot, in light of the facts stated, be regarded as essential to the higher work of secondary schools and universities in Scotland; do you think there are many medical men, capable of judging, who share with you that opinion?—Well, sir, I have not discussed the point with many medical men, and I would not be prepared to mention names; I could not say if I know of anybody specially at the present moment. Possibly my opinion is a little extreme, but I am afraid I cannot add to it.

6986. In the second page of your evidence, you bring in a new idea of 'generational' degeneration; could you throw any more light upon that idea to make it clearer to us, because our information hitherto has been that degeneration is a process, that entering into a race, lasts, and is handed down to future generations?—Well, I think I might be able to give one or two additional illustrations that I really intended to put into this statement, but it was so long already that I omitted them. The reason I have used this term at all is that I think it is necessary to make a clear classification of defects: first, those that can be transmitted to future generations, and second, those that are not, as a fact, transmitted, and possibly cannot be transmitted. I should like to illustrate the difference with a single disease. If you take a case of tuberculosis, it may occur from two possible conditions. You may have a constitutionally very feeble person with thin skin—transparent skin—what is known as the fairy type. Such a person is extremely liable to contract almost any infection, particularly tuberculosis. If you had a family of such children, the probability is that a fair percentage of them would become at some early stage tubercular, not because the disease is born with them, but because they are born with a distinct vulnerability to that kind of disease. If you had two parents of that type producing children, their child would accentuate the same qualities as the parents possessed, and would probably become still more liable. But suppose you have an ordinary person without any such special heredity of thin skin or predisposition, supposing he contracts, say, pneumonia, or is alcoholised, and that upon that pneumonia supervenes phthisis—tubercular phthisis—he might die of phthisis, or live for many years and propagate children, but, unless they were directly infected, there is no reason to suppose that they would be phthisical. That is to say, he, not having had any hereditary predisposition, such as a thin skin or the like to contract the infection, but being very vulnerable from having abused his conditions of life so much as to *make* himself vulnerable, will transmit his normal constitution, and his children will be like what he was to begin with, whereas the feeble constitutions (referred to above) *are* transmitted and the children are like what the father is. That, I think, gives a fair indication that in the one case the phthisis contracted from this constitution debilitated through the abuse of life would be generational degeneration, whereas the naturally feeble constitution would be hereditary; the one can be absolutely obliterated; the other also can be obliterated, but only by the selection of individuals and the choice of parents. That is the point, I think. I should like to illustrate it by another example which came to my notice some time ago. Unfortunately I have not all the facts, but it will serve for an illustration. I had in hospital a child of deaf and

dumb parents—both father and mother being deaf and dumb. The nurse and the resident physician and myself wondered whether this child could speak. It was ill with scarlet fever, but it was at the speaking age, about three and a half, and after the acute illness passed over we found it could speak quite well. Both parents were dumb. Now dumbness might arise from two conditions, either a constitutional defect in the development of the nervous system; it might be transmitted to children or might not, but still might be transmitted, or it may be due to disease in very early life where the hearing is absolutely destroyed. If the hearing had been destroyed by scarlet fever, and the child grows up dumb, that dumbness would not be propagated to the next generation, whereas dumbness due to constitutional defect might be propagated. On the other hand, it might not, because sometimes these physical defects skip a generation, and perhaps appear only in the second or third generation following. Therefore again I think you have a clear separation between the generational defect of dumbness due to artificially produced deafness and dumbness due to imperfect development. Now the point for investigation is, how much of what passes as dumbness and is popularly supposed to be capable of being transmitted to the next generation, or succeeding generations, is really due to artificially produced causes, like disease in early infancy or even intra-uterine disease, which is quite a possibility. I think these two illustrations bring out the points clearly.

6987. It might perhaps bring them more close to the question that we are dealing with in this Commission if I ask you when a healthy man coming from a country district, and carrying into a town his full vigour and strength, produces children who are in a worse environment—au urban environment—and they are small and stunted, and perhaps children in similar urban environments are small and stunted, does it necessarily follow that that stunting is a permanent degeneration of all the future races that those will propagate, or is that a generational degeneration which would pass if the fourth generation were well fed and well trained?—I think, sir, it is mainly, if not entirely, an evanescent degeneration; that is, if the conditions were kept on long enough, ultimately you might get a permanent degeneration, but that would take a vast number of generations to produce, whereas in the third, fourth, and fifth generations I believe that improved conditions of nutrition and environment would restore the same figure as before.

6988. So that what we hear about town degeneration is not necessarily a condition that would be at all difficult to eradicate with proper environment and food?—I think a large part of it could be entirely eradicated; I do not say all. I especially guard myself against that.

6989. Now the next point; have you any knowledge of what numbers are weakly, are maimed?—No, I cannot say that I have any data on that point at all.

6990. In the third page of your evidence you speak of a certain tendency of children to retire as indicating that the mental nerve strain upon them is too great?—Yes.

6991. You think that that is pretty good evidence of nervous strain, do you?—I do think so; I think it is an index of brain excitement.

6992. It is a new point to us, therefore I ask it. Referring to your evidence generally, are you against compulsory physical training in universities and secondary schools?—Yes, I should certainly be against compulsory training in universities. I speak with more hesitation about secondary schools, because schools lay themselves out for particular purposes to such an extent that in one school it might be appropriate, in another not; but in the type of schools, for example, indicated by the Grammar School, Old Aberdeen, and its modern equivalent, I should certainly go against compulsory physical training. Of course I indicate a way of safeguard, that, in any school, such physical training should be done under medical advice. I should say Gordon's College, Aberdeen,

Development of reserve capacity necessary.

Saturday holiday necessary.

Board School curriculum : opinion.

Medical inspection : duty of medical officer of Local Government Board regarding school premises.

would be a fair type of the modern equivalent of it.

6993. The last question—referring to your printed evidence—is : It has been stated to us that a part of a good physical training is to develop reserve capacity, so that while reasonable exercises are ordinarily used, there should for short periods, and exceptionally, be the utmost exertion of say the functions of the respiration ; do you exclude such training of the reserve capacity in your ideals of a good physical training?—No, I do not, because my experience is that almost any exertion that you choose to take becomes, at some point or another, extreme. Take even cycling, for example. It may be made an extremely mild exercise ; it may, quite unconsciously to the individual practising it, become, all of a sudden, a very violent exercise, and every mild exercise that you choose to indulge in may quite well be pushed by the individual children—boys particularly—to a point where it does necessarily evoke the reserve power that you speak about.

6994. Should you, therefore, approve of the reserve power being cultivated to a certain degree under proper precautions?—I do ; I think it is necessary.

6995. Well, here is a different point ; do you think that the Saturday holiday is a necessity?—Yes, I do, sir.

6996. You unreservedly say so?—Unreservedly.

6997. Have you any reason to think that the present School Board's mental training is excessive?—I should like to speak with hesitation about that, because my recent knowledge of School Board work is less than it was ; but my impression is that it is excessive, not so much in the quality as in the variety of the subjects asked from children. Judging by the conversations I have had with business men in Leith, they all tell me that boys learn a little of a considerable number of things, but do not learn anything very thoroughly. I should think it would be a greater advantage to reduce the number of subjects, and to make the culture in them more intensive.

6998. And from the point of view of health, have you ever known the present mental training under the School Boards injure?—I am trying to recall instances within my own experience, and I could not give at the present moment any specific examples of distinct injury.

6999. So that you have no very strong reason to believe that it has been?—No, I must say it has been my opinion ; I speak with hesitation about it.

7000. *By the Chairman.*—In your capacity as Medical Inspector to the Local Government Board of Scotland, do you consider that you have anything whatever of a responsible nature to do with schools, or children at schools?—Well, except so far as they touch the question of public health administration.

7001. I mean on the question of public health?—It becomes a very important public health item in the spread of infection.

7002. Will you please answer what I ask ; do you consider that you have any responsibility in that capacity to do with either schools or school children in Scotland?—Not directly as such, my lord.

7003. You consider you have no responsibility in the measure?—None of an educational kind.

7004. I am not talking about education, I am talking about a question of health?—I do not quite grasp your point, my lord.

7005. With questions of public health of the public school children in Scotland, do you consider that you, as Medical Inspector to the Local Government Board, have any responsibility or not?—Well, I must ask you to excuse me, for I cannot quite answer the question directly, because all schools and school children and so on are subject to the inspection of the Local Government Board, just like all other institutions.

7006. Very well then, the answer is 'yes,' in that case?—Yes, that is quite true.

7007. That is all I want to know?—I did not quite grasp your question.

7008. *By Sir Henry Craik.*—With regard to that, do you consider that your duties as Medical Inspector

lay upon you the responsibility of individual examination of any one school child or other?—No, I do not think so.

7009. Therefore the responsibility that you consider rests upon you would be with regard to the sanitary arrangements of the school?—Quite so.

7010. Not with regard to the individual scholar?—Oh, not with regard to the individual scholar at all ; no.

7011. Now, coming back to the order of your evidence, you refer to the 'Old Aberdeen Grammar School'?—Yes.

7012. That, as we all know, was a school of very high class, of very high tradition. Do you think it corresponds exactly to any class of school that now exists?—Not exactly, so far as I am aware.

7013. Its curriculum was of a very excellent, somewhat restricted, sort?—It was restricted, as I state—the subjects.

7014. There is hardly any secondary school that would now try to take up, whether for good or ill, a good many additional subjects?—That is so, and, indeed, in the later years of the grammar school itself they did take up other subjects, I know.

7015. The pupils of your school were a selected class, I think, rather a picked class, from the country schools of Aberdeen?—Well, I have so stated, but they were selected not in the physical sense.

7016. No, but how?—But as probably more prominent boys in the elementary schools.

7017. Quite so, but they were all boys who had had the advantage of careful and probably more than respectable parentage, and who had special capabilities, physical and mentally ; they were a selected class?—These things are all comparative, of course, but I should not be inclined to say that they were in any sense more selected than the boys who attend, say, the Grammar School of Aberdeen, from the middle-class of Aberdeen taken indiscriminately.

7018. But taking the ordinary State-aided schools, surely they were more selected than these?—Yes, oh, yes.

7019. And, as a fact, you say in your evidence that Dr Dey made it impossible for idlers or triflers to remain in school?—That is so.

7020. Well, of course we cannot get rid of idlers or triflers from the State-aided school?—Well, but I should like to emphasise his method of doing it.

7021. I have no doubt his method of doing it was excellent, and I quite agree with you in the results produced, but still what I wished to bring out was that from one means or another he had rather to deal with the selected, and not with the mediocre class of boys?—That is quite true ; but I should like to say that the method of conducting the school, which was a school conducted without punishment at all of any sort, had the result of correcting a great deal of the trifling and idling. It was only the extreme case that was expelled from the school. I have never known more than two cases in three years, so that the effect of the tone of the school was to correct that tendency, and that, of course, is applicable to any school.

7022. But still you say yourself that scholars when they came were in considerable part picked boys from rural schools?—I do. I admit that ; yes.

7023. Now we take the amount of physical opportunities that were given to those boys. First of all, you had holidays that extended over rather more than ten weeks in the year?—Yes, about that.

7024. That is considerably more than a State-aided school receives?—I am aware of that.

7025. You had never more than four hours' work on an average in the day?—That is school work.

7026. And you had practically the whole afternoon free for walks or open air?—Yes ; subject to this that your work at home required four to five hours.

7027. Quite so ; but still that did not give you a very long day of work?—No ; eight or nine hours.

7028. Therefore you think that the great excellence of this school and the future success of its pupils may not unfairly be said to be due as much to the restriction of work, the large amount of liberty given, and the

Mr Mac M.A.

10 J

Old A. Gram. School meth.

Orth. by c. 1850

abundance of open air, as to the fact that there was very little exercise of a systematic kind?—Undoubtedly, I think that is the point that I bring out.

7029. Very well, in the State-aided schools we have to deal with a class much lower in origin, much more difficult to deal with, having longer school hours and a longer school year, not having the opportunities of physical open-air exercise that you had in that school; for these do you not think that some systematised physical instruction must be insisted upon?—If it is associated with the increase of exercise or play in the open air, yes; but then the conditions you specify make that practically impossible.

7030. You say, and I think we would all agree with you—I was just coming to that point—that you would prefer games, if possible, rather than systematised physical exercise?—I would for children, certainly.

7031. Your duties as Medical Inspector must take you into schools. Do you think that the premises admit in the ordinary State-aided schools of games of the free and open sort that you had at the Old Machar Grammar School?—Some do, and the country schools all do, of course, because one can go beyond the playground.

7032. Yes, but in town schools?—In town schools to a less extent, but some schools are fairly well provided with good playgrounds.

7033. But is it the case that the schools in the more thickly populated parts of Aberdeen, or say Dundee, are provided with playgrounds where 1000 children could carry on a game?—No; there are not many schools, there are two or three in Aberdeen, the more modern ones.

7034. Probably the Grammar School, which is for the better class?—Yes, the Grammar School, but I quite agree that the space is too limited.

7035. And further, even if you had better space do you think that these poor little children, who have not been accustomed to games, who have huddled together in the gutters and back lanes, are likely to invent games for themselves or to carry them on without supervision or encouragement?—They do invariably invent games, and not only so, but it is so irrepresible that in Aberdeen—certainly in Leith—I know scarcely a fortnight passes where they are not prosecuted in some variety or another. The streets are their playgrounds, and they use them most profusely.

7036. And what else can we expect except that the streets should be their playgrounds if they have no opportunities within their schools for play?—I quite agree, but they even desert the playgrounds, when they are available, for the streets.

7037. You do not advocate that they should be allowed to carry on these games in the streets to the danger of the ordinary passers-by?—Oh, no, that increases the dangerous environment that I have mentioned.

7038. Do you not think it would be a very good thing for these poor children if playgrounds of a more extensive sort could be found in the neighbourhood of their schools?—Unquestionably.

7039. Where two or three schools might join together?—Unquestionably; I quite agree with that.

7040. And surely a tateful, not unduly interfering, supervision would be a great aid to them to start them at all events in their games?—I have indicated, yes that it should be done; I do not wish to exclude the teacher entirely, but it can be done with the teacher to be as far out of it as possible. I am quite of the opinion that the teacher is always a wet blanket where there are children.

7041. That, of course, you are aware is not found in the higher schools of England?—No, I should think it does not apply to the higher class to anything like the same extent.

7042. There the teachers do constantly take a lead in games?—Yes.

7043. And help them?—Yes.

7044. But another objection to games—do you not think if you trust the physical training of our children solely to games, that the weaklings will very likely go

to the wall, that the stronger would take possession of the games, and that the others will draw aside altogether?—I think that will be provided for, although it might happen, but it might be provided for in the other provisions that I have made, namely, as to the physical inspection; I think that is the point certainly, and, indeed, I think that that is one of the abuses of games not only in State-aided schools but in secondary schools, where everybody is required to join in instead of a lad being allowed to join in or not as he chose. It would very often be a better thing that he should be allowed to join in if he chose.

7045. You think that for physical exercise a medical inspection is distinctly necessary?—I do think so. Medical inspection.

7046. All the evidence that we have received corroborates that?—Yes.

7047. But if the medical inspection is necessary for carefully conducted physical exercises under presumably a trained teacher, is it not all the more necessary for games where the strong and the weak boy would be trained together under no supervision at all?—Yes, I think it is quite relevant in the games and in physical training too; I would make it all general.

7048. I have only one other question; the paragraph which is before the census of children, there are some remarks that I think perhaps might be misunderstood. You adduce the instance of the saints, and you further say that the great conscientious man is usually dyspeptic. As a general rule of character do you wish to set up the view that dyspepticism will lead to conscientious actions?—No; oh, no.

7049. Is it not, I mean, deducible from the words you used?—Oh, no; I do not think, sir, that would be legitimate inference.

7050. I have no doubt you did not intend it, but I wish only to bring out that. Surely a healthy body is a great factor in producing a good citizen intellectually and morally?—Well, yes, I think my whole evidence would bear on that point; but I am thinking here of the very conscientious man, who is usually dyspeptic; I do think that that is a proposition which can be established.

7051. But surely you mean by the very conscientious man, one who pays a morbid attention to small petty points, and is rigid in his own opinion, rather than the man who takes a broad and liberal view of any question that comes before him?—Yes, I do not mean that, but the very conscientious man is associated with a particular class of individual, as I understand.

7052. The word 'conscientious' denotes a man of a high moral type?—Yes.

7053. You, by adding the adverb 'very' to it, intend to make it the very opposite. You wish to say the man who is conscientious unnecessarily, and who raises scruples?—Yes; well, of course, I would not wish to push it too far, and I am quite willing to admit what you suggest to a certain extent. The point that is really at the bottom of it, to my mind, is this, that a conscientious man, and a very conscientious man—

7054. Are two different things?—Yes, to a certain extent the conscientious man often is particularly scrupulous and sensitive to points that do not touch the character of a non-conscientious man, and the result of the scrupulousness is a certain amount of worry and annoyance, and a tension of mind which does result in disturbing the nutrition of the whole body. I know, for example, prominent, able men, to whom doing a special important duty actually produces such extreme dyspepsia that they have to lie off for a day after it.

7055. Then do you not think that if such men as you have in your eye had had a good physical training, they probably would have been relieved from that weakness?—I am not prepared to say that they would be as conscientious.

7056. But they would be much more pleasant to deal with?—That is an entirely different proposition.

7057. *By Mr Alston.*—I do not know whether the other members of the Commission formed the impression, but my first impression from your evidence was that you laid too great strength upon nurture, environ- Physical exercises : nature ; factors.

ments, healthy free games, supervision of general and individual health, and put these in the first place, and that you did not think so much of physical exercise as applied to school children within school age?—That is so; or, rather, to put it more exactly, the amount of school exercise that is possible within school compass as the counteractive to the bad conditions that are a constant quantity in every industrial community, I mean that you are undoing at home what you would wish to do at school.

7058. But you do not intend us to understand that you thought very little of physical training in the schools?—Oh, on the contrary, I think my whole evidence indicates that I deal with the *nature* of the physical training.

7059. For instance, you give the example of North Lodge Industrial School for Girls in Aberdeen as producing the very highest results from physical training?—Yes, but not for physical training alone. The point I emphasised there was that there was a radical alteration in the environments; the children are absolutely taken away from their homes. They were fed and cleaned and clothed, and then I say exercised. Wherever you produce these conditions you will certainly get good results from physical training.

7060. You include nurture and environment?—Yes, as elements—factors in the case.

7061. In getting the best results from physical training?—I do, sir.

7062. Then you would prefer, we understand, to limit the amount given within school age to the mental development of the child, and rather increase the time given to the physical?—Yes, the freedom, and especially the open-air exercise; but, as I said in answer to Professor Ogston, I do not have much ground for saying, except as a general impression, that the present Board School work is excessive; I mean it is not on that ground alone; it is on the ground of the housing that I base it mainly.

7063. Then you say, 'apart from the general causes' mentioned above, one cause operates powerfully in 'favour of the country school, namely, the concentration of effort on few subjects, and the absence of 'social distractions.' What do you include in 'social distractions'?—Well, I include the epidemic of children's parties that start in the towns between October and April, and the amount of social intercourse there necessarily is in towns where people are drawn so much together as compared with the country, where the school is scattered to different farms in different localities. That is mainly what I meant. There is a vast amount more of social intercourse in the town, illimitably more than in the country.

7064. Everything that at that period takes the boy off thinking of the main thing of his life?—Off thinking of the main thing of his life.

7065. You pointed out the difficulties in attending continuation classes of the boy and girl, the young man and the young woman, who had begun to work hard at their respective employments?—Yes.

7066. And you think that anything in the way of physical training should therefore be purely recreative?—For the hard workers such as the foundry people, and engineers, and carpenters, and so on.

7067. Even message boys?—Even message boys; they have a fair amount of open-air exercise independently; they might be fitter indeed for drill than the hard workers would be.

7068. Then it would follow from that, that you would disapprove of military drill being practised in continuation classes?—One would not like to say disapprove entirely, because to a great many people the complete change in the kind of work is a distinct recreation, and there is no question as to the popularity of military drill in the past as showing that it has attractions that make up for any extra drill, and, of course, it involves going into the open air and the prospects of camp exercise and so on, which would all be in its favour.

7069. But in another part of your evidence you have called military drill rather a dull exercise?—I do

think so. I am speaking from my personal feeling about it. I do think it is rather a dull exercise if persisted in.

7070. Do you mean by that, complete military drill in a company with all its formations?—Well, I think when you get to that point it gets a distinct interest, I quite allow; but when I wrote that I was thinking of its application to children.

7071. The movements and turnings?—The movements and turnings; the specific things; most of these things are involved in all drill.

7072. But the complete military drill as applied to boys in a company properly formed, with its officers, and using the drill of the 'Drill Book,' you think that would be attractive?—It would be more attractive; yes, one feels that.

7073. One minute, to refer to what Professor Ogston noted about generational degeneracy; is it not the case that the insurance offices now find an improved expectation of life in the community?—That, I believe, is the case, though I cannot give you any figures; I think that is so.

7074. And that that is likely to be due to improved conditions of life?—I think so; I think it is.

7075. Would not these improved conditions stamp out the generational degeneracy?—I think they should.

7076. I think that was the argument you used in answer to Professor Ogston?—That was the argument I used in answer to Professor Ogston.

7077. Then, I see there are two points; you cannot see any moral improvement that results from physical training—the last paragraph above 'Physical Census of Children'?—Yes, I see, sir. Well, what I have said is, that the mere animal result is not of much importance, either for or against morality, that is what I have said; but the method of getting it is important; I think that that distinction is worth making.

7078. What do you mean by 'the method of getting it,' then?—Well, it would be a distinct difference in the development of a school, whether a teacher absolutely governed everything that his pupils did in detail in the measure of games, or exercise, or drill, or whether he had tact enough to keep himself in the background and encourage them to develop their spontaneous impulses. I think that would make a distinct difference in the method of getting the same result, or a result.

7079. But in the matter of drill by the same teacher, having control over the pupils, giving the word of command, and getting the ready obedience, he does not stand aside?—No, sir, I would not quite understand that as involved in this particular question,—Does improved physical development promote morality? Physical development may be got at in so many different ways, that you cannot say it is associated with the teacher disciplining a company. That is one element, no doubt, but it is not the whole case by any means, and I should think that belonging to a football club, for instance, or a cricket club at a school, is about the strongest incentive that any boy can have to do absolutely his best, and to get into the most perfect form, and the teacher need never come into it at any point at all; that is what I wish to bring out.

7080. We have had repeated evidence, however, that the teachers lay great stress upon the moral improvement which takes place from the physical training of classes?—Well, sir, I cannot speak of my own knowledge of that; my opinion is not of much value.

7081. Then you say in your evidence that the soldier who has been thoroughly drilled shows no superiority over the layman who has not been drilled?—That is putting it too strongly; I should say moral superiority; for his own purposes the soldier is excellent; he certainly in many respects, to my mind, could not be better, but then it is a very limited purpose. You want endurance and independence of disagreeable episodes, and so on, developed, and that is developed, but I am not prepared to say that you cannot get in any class of the community you choose quite as good character and persistence and readiness to face dis-

agreeable things in the non-soldier public as you will get in the soldier.

7082. Is there not something, however, inherent in military drill that produces results which other methods of training do not?—There may be, but I am not prepared to say that it is unmistakably good. My own feeling is that your ordinary military drill tends to develop strongly, too strongly in some cases, the obedience quality, and too little, the spontaneous co-operation of one man with another; and it is the necessity of life on a ship that makes sailors deal with a moving object that requires to be attended to by somebody spontaneously at every hour of the day to my mind makes the naval drill a superior drill to the soldiers'. It is an accident, I quite allow, but it is a necessity of a ship to be manipulated or manœuvred at every hour of the day while it is moving.

7083. But it is the quality of the soldier in relation to the other members of the public that I was thinking of?—Yes. I am not prepared to say, sir, that by other methods than by physical drill you cannot produce as high moral character in every way as you can by any conceivable soldiers' drill.

7084. Do you get the same smartness, alertness, deference, readiness, self-respect?—Yes.

7085. Out of another method than military training?—Or sometimes out of no method. I do not say that you do not produce these results within limits by military training. I do not wish to run it down from any point of view at all, because I think it is good within its limits, but I am not prepared to say it is the only way of producing manliness and good character and alertness to duty, and so on.

7086. So you think that military drill as applied to boys of school age, or in continuation classes after school age, is not a necessity for producing these qualities?—No; I do not think so.

7087. *By the Hon. Thomas Cochrane.*—There are one or two questions I should like to ask you in going through the evidence. I do not quite understand whether you are in favour of physical training or not, within certain regulations?—I am in favour of physical training, but I am not in favour of making it all a discipline and all a matter of drill and supervised exercises. I think that physical training is a necessary incident of good life in the open air, as country children, for example, although they may never have had any special attention directed to their physical training, become physically trained. They climb trees spontaneously, they run long distances, they ride horses, and all that sort of thing, and that is a necessary result of their life in the country. I think that that is better, on the whole, than the disciplined physical training, especially as you cannot always rely upon judicious qualities of teachers in doing it.

7088. You are in favour, then, of some form of physical exercises for children?—Oh, undoubtedly, sir. I think my evidence bears that out fully.

7089. But you would prefer the unrestrained physical exercise that children would get from climbing trees?—Well, spontaneous exercises.

7090. To any form of well-regulated physical exercise under medical supervision, suited to the individual strength of each child?—On the whole, yes. But I made a distinction that the true use of physical exercise, in the sense of physical drill, is a disciplinary use and for the formation of character, just the same as teaching a child geography or arithmetic; you can make the same disciplinary use of it. To that use of drill I have no objection whatever. I have so stated. But when you are founding upon drill the best results for the development of individual physique, then I think you will get better results if you allow as much as possible to the spontaneous exertions of the children themselves. That is my point.

7091. You think there should be spontaneous play, but at the same time you see certain advantages from physical exercise—regulated physical exercise?—For disciplinary purposes, oh, yes, I see no objection to that; it is part of discipline of development of character just as any other piece of education.

7092. And you recognise it is not open to all children to climb trees?—That is so.

7093. There is a very limited number of children, therefore, who can take that particular exercise?—Yes.

7094. But for the great majority of children some regulated physical exercise is desirable and necessary?—And necessary in some form; but I should like to keep in view what I have stated in my evidence that the problem for physical exercise in school is how to neutralise the bad effects of bad housing. I do not think that an hour's drill a day in school, especially if it is within school, will practically in any perceptible degree neutralise the effects of fourteen hours' breathing of bad air. That is my point.

7095. Your point, as far as I gather, is that with any addition to physical exercise there should be other sanitary surroundings?—That is so, sir; and I think also, I should like to say, that I see no physical reason, no administrative reason why even School Board children in towns should not have a great deal more in the open air on Saturdays and the like, and an occasional holiday in the country more than they have apart from the general impracticable proposition that all schools should be in the country, as I think a great deal more might be done than is actually done even within our present limits.

7096. Referring to your evidence, you say you prefer walking as a form of physical exercise?—I should hardly say I prefer walking; I gave that as an historical example in my own experience of what was found sufficient. Personally I like walking, other people do not, but what I would say is that although I personally prefer it within limits, I do not give it as the only form of good exercise.

7097. You said that it conferred staying power, and so on?—Yes.

7098. I would like to know whether you have ever consulted the children themselves as to what they considered preferable; whether they would prefer physical exercises, such as skipping and calisthenics, and throwing up balls, to taking a walk in the streets?—Oh, they will prefer the exercises of skipping and running about the streets, and so on, and as it happens, I came across an instance three or four weeks before I came here where boys distinctly resented being sent to play for an hour's cricket after three o'clock in the afternoon or the regulation part of this particular school. They said to their mother, 'Will you not allow us to come down home and play by ourselves rather than take the school game.' The statement was given to me by a mother who is particularly interested in this identical question of getting what would not only be good for her children but equally agreeable. They said they all resented doing the thing to order.

7099. Might it not be that the particular game of cricket was not suitable to that particular boy?—Well, he plays it very persistently, when he is allowed, with his own chums; probably it is not that he objects to cricket at all, it is because he objects to it at that particular time, being tired.

7100. That is only a particular instance; you can hardly find much upon one instance of a boy?—No, I should not, but I should be prepared to find it repeated pretty frequently; I should say you may frequently not wish to do a certain thing at the ordered hour.

7101. You mean frequently human nature rebels against doing what is good for it?—To a certain extent a boy may be tired; after four or five hours' work it is not the normal thing to go and play a game according to rule.

7102. You speak very strongly as to the advantages of nutrition for the children, and you lay great stress upon it?—Yes.

7103. But would not reasonable exercise enable the children to digest their food better, and therefore nutrition would be improved?—In Board School children I have never heard that there is any difficulty so much in digestion as in the quality and the quantity of the food. I think it is the poor variety in the food

of children that is rather to blame for their nutrition than the mere difficulty of digestion. In my hospital experiences I have never heard of any such thing as indigestion in children, except during acute illness; it happens, of course. I quite allow in special children's hospitals, and the like, no doubt you get plenty instances; but I think the ordinary normal School Board child can digest anything that it gets reasonably.

7104. You never found that fresh air and exercise give an increased appetite?—Oh, yes, that is a commonplace, of course.

7105. And therefore the food would be better digested in all probability?—Oh, no doubt it would. There is no disputing that proposition; but I was not thinking of it as a difficulty.

Drill and
nervous
strain.

7106. You think that drill of every kind, except, perhaps, musical drill, involves a severe nervous strain on young children; have you any instance of that?—I have already answered that question. I have no specific instance within my own experience, but the illustration I have given, and the nature of the drill itself, is to involve a certain nervous strain. It is as much an intellectual exercise as it is a physical exercise.

Rest: change
of work.

7107. Do you not find in your own work that a change of work is the greatest rest you can have?—Yes. I have stated previously that I think that would be a good reason in favour of military drill, even with the manual occupations.

7108. Change of work is practically rest, and the best rest you can have?—Not always.

7109. Very often?—Well, you cannot apply that indefinitely, of course, to children; you exhaust them; you have to deal not with an adult brain and an ordered and systematised set of habits, but with a growing brain, where the habits are just being formed, so that you cannot quite reason from the one to the other.

7110. That would apply to over-exertion?—Yes.

7111. But if that is carefully guarded against, a change of work you think would be, on the whole, beneficial?—Oh, yes, I allow that.

7112. That seems to be the main point; it is a question whether these exercises are exaggerated or not, or whether they are carried out under proper supervision?—Yes.

7113. I see you give some illustrations which are most strikingly favourable to physical exercise?—Yes, that is so. You will notice I always asserted that the improvement in feeding and cleaning, and so on, for that class of children, of course that would be necessary, because they are taken from the slums—where you can secure these conditions you will get good results from physical training, I quite admit.

Physique and
saintliness;
moral
capacity.

7114. I do not want to take you over the paragraph Sir Henry Craik alluded to—the paragraph of the saints being never conspicuous for good physique; but from what experience do you gather that opinion?—Well, I made it as a general proposition. I think the very conditions of saintliness are not always—I said 'have never been conspicuous for good physique'; I think that starvation and fasting, and the extreme exercises that men like Cardinal Newman, for example, subjected themselves to, are a distinct element in the type of saintly men, and one cannot say that that is fulfilling even physiological conditions of good physique.

7115. I do not think Cardinal Newman would like to be considered a saint?—I daresay not; I took him—

7116. But any of those historic personages who have a right to be considered saints, were they not men, very often, of considerable physique?—Oh, I quite agree with that; but I say that it is not a conspicuous feature. The mere matter of fasting for a day at a time is alone a sufficient index. I do not wish to push it too far—to an extreme.

7117. I do not think that it would be carried out if we went into it very deeply. I think that those who were saints must have had considerable physique; they suffered stripes, often imprisonment—those who were

real saints?—I should not like to push it too far as a scientific proposition. What I wanted to illustrate was the relation between physique and moral capacity. A prize-fighter may have a splendid physique, but he does not necessarily have a fine moral character, except within his own particular round, for which he may be well qualified.

7118. There, again, it is a question between excessive athletics and the ordinary improvement of the physique which physical training might give?—Quite.

7119. You consider that drill is always a dull task?—No, sir; I consider that drill is to my mind—that is, I am thinking of the children, if you observe, from six to twelve. As I went through it myself at school I must say I did find it a little dull.

Drill:
inappl.
for chil-
from s-
twelve

7120. Is that due partly to the system of drill?—I think it was probably in my own case, and it may have been due to the quality of the drill instructor. Of course they are not adapted to boys, they are adapted to men; sometimes you get a very happy illustration of a different type, but it is not a very common type.

7121. You do not want to lay it down that drill is necessarily uninteresting?—Oh, no; I do not lay that down.

7122. You can understand its being made necessarily interesting to children?—Yes; oh, yes.

7123. And it would benefit them from that point of view; they would be interested in it if properly carried out?—Yes, within limits, but the temptation is to carry these things to excess.

7124. Scouting, for instance?—That is open-air exercise.

7125. That is military drill?—Yes.

7126. Camping-out is military drill?—Yes. Still I am not contemplating that for children from six to twelve. That is what I was thinking of in this particular paragraph. I quite agree for the older ages that would be admirable, but I do not think it is applicable from six to twelve years of age.

7127. Certain forms of physical exercise that are included now in military drill are contained in most of the instruction books being used in schools, and are not in themselves uninteresting if carried out?—Oh, not necessarily; but, as I said, these are included in all forms of drill. I was thinking of what is specifically military. That is included, for example, in naval drill as well as in military.

7128. I think you cannot name one student that at once was an athlete and a first-class student?—That is true, I cannot.

Athlet
first-c
studer

7129. Is that from a wide experience or from one particular school?—It is from an experience from the year 1880 till now of Aberdeen students, and that would involve roughly, I think, 300 students a year—say 200 students a year.

7130. Did you ever take any note of their after-careers?—Not specially, although I know the after-careers of a good many of them.

7131. And did you notice at all whether those who were reasonably fond of athletic exercises were less successful?—No, I cannot make any such statement from my own knowledge; that I do not know.

7132. A good many prominent men at present occur; but one, for instance, the Lord Chief-Justice of England, and Sir Robert Reid?—Oh, yes; I quite admit the brilliant exceptions. I would not wish to make it an absolute proposition at all. If you notice, I have stated that in my experience it is a less frequent thing.

7133. By Sir Henry Craik.—Was it not the case that an Aberdeen student not many years ago rowed in the Cambridge eight and was senior wrangler?—That was highly probable.

7134. And took the first place in the Indian Civil Service?—That is highly probable, but that would not disprove my general statement.

7135. But still that was among Aberdeen students?—Yes, it shows that a university without any system of physical training might yet produce an athlete.

7136. By the Hon. Thomas Cochrane.—Do you know

most of the prominent men have been more or less fond of physical exercise in after life?—I do not think that would be largely true in Scotland. I cannot speak for England, because my experience is too limited.

7137. Mr Gladstone, for instance?—Yes, but he would not be counted an ordinary person. The average person—I am thinking of the students of the university level, the ordinary good with the bad; as I said, he would count among the brilliant exceptions. I do not deny that the thing happens, of course.

7138. Only one further question. As an old soldier, I am interested that you consider 'the army ideal is 'a very abstract, and in itself a dangerous, ideal to 'make predominant in early life. It tends to develop 'an unwholesome elation in destruction'; could you give any reason for that rather strong statement?—Well, the only reason I could give is my own observation of children, and so on. They glory in imagining the shooting of imaginary enemies and destroying people. As I said, it is a normal thing in a boy's life to have these tendencies to destruction, and I think it is really accentuating the thing more than is necessary. As I have said, in the hands of tactful teachers I do not see that the thing might not be modified, but my feeling is that I would not look upon the army as the only ideal for a school, and the tendency is to make it that way about.

7139. Do you think that a soldier only takes pleasure in destroying people?—I do not think that is so, sir; I would not wish to—I do not think that is likely; but it is putting that class of ideas in the ascendant.

7140. It is really an abstract idea in your mind, not supported really by any specific cases?—I think it is hardly a proposition that admits of specific cases; it is more a measure of my own opinion than a scientific induction.

7141. Is it an opinion formed upon any wide study of that particular point?—Well, I can only say that it is based on my general experience taking one occupation with another.

7142. *By Sir Thomas Coats.*—Have you had an opportunity of examining children in Board Schools who have been under systematic physical training for a number of years and comparing them with the same number of children in another school where that has almost been absent?—No, sir; I have no such experience, no such opportunities; not in detail; that is except just in the vague general way that I have given.

7143. You have no means of comparing the two?—No.

7144. *By Mr Fergusson.*—There was one point upon which there was some little confusion. You are Medical Inspector of the Local Government Board?—Yes.

7145. At present you have no general inspection duties; you only go now and then in special cases to inspect?—That is so for the moment; but the development of my office will include—

7146. You once were a Medical Officer of Health?—Yes.

7147. The point is this, have medical officers of health any duties with regard to inspections of school buildings?—Oh, of school buildings, yes.

7148. When you were Medical Officer of Health you used to inspect, in the counties of Wigtown and Kirkcudbright, the school buildings?—Yes, along with the Sanitary Inspector.

7149. But you had nothing to do with the individual children?—I had nothing to do with the individual children.

7150. Do you think that could be made part of the official duty of medical officers of health—the inspection of school children?—I should fear, sir, it would entail much too great an extension of their work to make them responsible in counties certainly, and in towns the work is heavier. For other reasons I fear it would be hardly practicable.

7151. Regarding the students at Aberdeen, however good they were, you do not know how much better

they might have been if they had had some physical training?—I am quite willing to put it that way.

7152. In the notes of your evidence you mention some medical inspection that had been adopted in Leith that had had good results; I did not quite catch what that was. At Leith you said some medical inspection had been conducted, and there had been no epidemic since?—I did not refer to medical inspection generally, I referred to the strict enforcement of the school clause of the 1897 Public Health Act.

7153. What is that?—That is that no child shall be admitted to school without a certificate by the medical practitioner, or by the Medical Officer of Health, and also that no teacher shall admit a child without such certificate.

7154. Was there any difficulty in enforcing that?—None whatever in Leith, except, as I said, in mild diseases like chicken-pox and one or two things like that, and whooping-cough, but with the others there was not.

7155. Was this certificate to be got free of cost?—From the Medical Officer of Health it could be got for nothing, but from the medical practitioner, of course, just in the ordinary way, and in at least one county in Scotland they have now made the arrangement that the medical practitioner shall be paid a fee for it.

7156. Further on in your evidence you are speaking of musical drill, and you prefer music?—I do.

7157. We have been told by several witnesses who teach physical exercise, that you cannot teach children properly with music, that it is impossible for a teacher to play the piano and supervise a large class, and they say you must teach without music, and then when the children know the exercise music is all right?—I should not admit that for a single moment. It is quite possible to have a pianist—one pupil teacher or an assistant playing the piano, and the main teacher conducting the drill. I have known that done frequently.

7158. It is possible, but it means an increase of staff in many cases?—No, it means teaching a pupil teacher to play the piano—simple marches.

7159. If you have got such a thing, if there are pupil teachers. In an enormous number of schools there is no staff for that?—I quite admit, under these circumstances, it might be a difficulty.

7160. Then as to the bacilli in the water of Public baths: the public baths, you did not tell us what harm they did being there?—Well, sir, I do not wish to go into it too fully, but the presence of bacillus coli

—which is another name for one of the bacilli common in the intestines—means that human excreta got into the water more or less, with the result that any child bathing in such a pond necessarily swallows a certain amount of the water, or certainly takes it into the mouth and puts it out again. It is not a matter of great importance in my mind. I think one is apt to make too much of those bacilli in water; I do not think it goes for much, but I think it is an index that care should be taken to make the baths as nearly clean as possible, by first making the children wash before going into them.

7161. There were not many of that particular bacillus; the thousands were all other sorts?—Relatively there were not very many, but it is a pity there should be any at all. However, I would not wish to put too much importance on that aspect of the thing; it is more as indicating precautions to be taken. You cannot absolutely eliminate it from any bath; you must have a certain amount of that kind of bacillus.

7162. Of course you advocate very strongly games as a form of physical exercise, but there again you are met with a very great practical difficulty in finding space?—Yes.

7163. You said that this would not be so bad in the country, but is that your experience; do you not think that it is almost more difficult in the country—I am not talking of the Highlands, of course—to find any space for children to play?—Yes, to find specific grounds and fields, and so on; but then the public roads and everything of that kind are available in ways that are quite different from the town.

Mr W. L. Mackenzie, M.A., M.D.,

10 June '02.

Public Health Act 1897: school clause enforced.

Musical drill.

Public baths: water.

Games and spaces.

Mr W. L.
Mackenzie,
M.A., M.D.
10 June '02.

7165. But can you really have any useful games in the public road?—Well, I should just test it by the result, you find that as a fact country children are, on the whole, better physically developed than town children, and the only difference, to my mind, is the housing; I think that it is not individually better, but that it is in the open air and they are more in the open air.

7166. There is more fresh air?—There is more fresh air, that is the main difference, and probably the feeding is slightly in favour of the country children.

Underfeeding.

7167. Then, under the heading of 'Dietary'—the last paragraph—you lay a good deal of stress upon that as an urgent measure?—I think it is, sir.

7168. At present, as you know, School Boards take no official notice of children being underfed?—So far as I am aware they do not.

7169. Do you think that they ought to?—I think so; that it would be quite an appropriate thing to do, because I have known, with the poorer classes of Leith, children that were obviously not having enough food having to go to school regularly with others that were well fed.

7170. You think if an inquiry were made by the School Board that might be remedied?—I think it might, it could be certainly.

7171. You do not suggest that the School Board should feed the children?—I hesitate, as I have said, to make any administrative suggestion about it, because it raises so many difficult questions; but I see nothing against its being called an appropriate thing for the School Board to do if they require this output on the part of children, and some School Boards have, I believe, gone the length of organising soup kitchens at a very low fee.

Manners.

7172. *By the Chairman.*—There is just one question I have to ask you upon that question you were asked before about the morals. You said, I think I am right in saying, that you did not think in respect to the word 'morals'; suppose you substitute the word 'manners,' which is less of animal, or human nature, than actual morals in the natural sense. If you substitute 'manners,' do you adhere to that remark that a certain amount of physical training has no effect upon children's manners?—No, I would at once admit that.

7173. Do you think there is any use in manners in children, as a Scotchman?—Oh, undoubtedly.

7174. It is not common in the North?—No, far from it.

7175. I only asked your opinion?—I quite agree with you.

7176. You think there is something to start with

in manners, and, in the second place, children's manners might be improved by physical training?—Oh, yes, I admit that at once, because I consider manners a measure of discipline, and that is the use of make of drill; you can make a great deal of use of drill; I would not be supposed to be against it, and I am sorry my evidence should have given the Commission that impression.

7177. And you would even go so far as to say the children's success in future life would not be the less assured, if they had good manners?—Oh, unquestionably it is an 'asset.'

7178. *By Professor Ogston.*—I have been asked to put this point to you. An eminent medical witness told us that forty years ago the same number of children died in England as in Scotland; that nowadays, and for the last half of that period, three died in Scotland for two in England. Those are based on the Registrar-General's statistics?—Yes.

7179. Have you any knowledge of the fact?—No, I cannot say that I have any special knowledge of it, though of course one can get access to those statistics, but I have not specially studied it.

7180. You cannot give us the cause of it, whether it is as he suggested, it might in part be due to the greater development of outdoor sports amongst English children?—That is a possibility; I should not like to exclude it as the possible cause.

7181. But you have no special knowledge why three to two die where they used to die equally?—No, but I should think if you took a fair test—a comparison—and took Glasgow and Liverpool say, or Aberdeen and Leeds, and compared them in detail, I doubt if you will get that difference at all; I should say that it is a kind of statistics that it will be very difficult indeed without a very elaborate analysis to come to definite conclusions about; I could not give offhand any reason.

7182. Suppose the Commission required reliable Scottish statistics as to what percentage of children were weakly, and the percentage who were flat-footed, and the percentage who were crippled, or the percentage of who were incurable, have you material at your disposal for obtaining that for us if time and opportunity were given you?—If I had access to the schools of Leith or Edinburgh I could easily get material.

7183. Well, have you access to them, or could you obtain access to them?—I am not aware; I have no official entry to those schools. Of course it would be with the approval of the School Board and the teachers. Of course I have no official right to make those examinations.

The witness withdrew.

Mr FRANCIS WARNER, M.D., F.R.C.P., examined.

Mr
F. Warner,
M.D.,
F.R.C.P.

7184. *By Professor Ogston.*—It would be desirable to put on record your qualifications, so that your evidence might have full weight. I would therefore ask it to be taken down—a Doctor of Medicine of London University; a Fellow of the Royal College of Physicians, and a Fellow of the Royal College of Surgeons of London; Physician to, and Lecturer on Therapeutics at, the London Hospital, and Chairman of the Council of the Childhood Society, etc. I see that you have had experience of special instruction for feeble-minded children, and that you have advocated it, that is to say, at the Social Science Congress of 1884, that you were Lecturer at the Cambridge University for 1888–89, that you delivered the Milroy Lectures at the Royal College of Physicians in 1892; that you were the Hunterian Professor of the Royal College of Surgeons in 1887, and that you have published reports of 100,000 children examined in schools, and, I suppose, have had many years' experience of medical questions and medical life in all forms?—Yes, thirty years.

7185. And have specially directed your attention to this subject?—Yes.

7186. Perhaps the Chairman will approve of my pointing out that we have already had before us a good deal of evidence recording the ordinary well-known facts concerning children and so forth, and that when you read over your evidence you might probably help us most by emphasising especially the points on which your own observations are important, or anything original that you would like to put before us, or anything out of the routine line of things. Then would you kindly begin at the words, 'Order of Evidence,' and tell the Commission what you feel inclined to volunteer regarding the subject of our remit?—The first I have put down, sir, is 'census of children,' and that I understand to be what experience has been gained as to how a census can be taken; that is what I thought it to be.

7187. Yes, that is so?—If so I had better meet it by saying how our census or the report of 100,000 children whom I examined was carried out—sketching the method.

7188. Precisely?—Well, the first thing was to decide what to look at and what to look for, and we found that the points to look at classed themselves

Census of
children
methods

conveniently into four groups what you would call physical signs. Class 'A' we call developmental signs; 'B,' another set of signs which we term nerve signs, conditions of movement, balance of the body, nerve muscular action; 'C,' conditions of health and nutrition, physical health and nutrition; and 'D,' mental dulness. Report as to school work we had to take from the teachers; we could not question the children; we were not allowed to. I would point out that in that work we found it absolutely necessary, for reasons that may become obvious afterwards, to insist on seeing every child in the school. If not I do not think our work would have produced half the value that it has now. Each school and each child present we did insist on seeing. It would have been worth a very great deal more from a statistical point of view if we had been furnished with a list of names, ages, and standards of all children seen. That certainly ought to be done in any future work. Then, as to these four groups of signs as they are printed; perhaps you would like to deal with them, they are described in detail in the **Report on the Scientific Study of the Mental and Physical Conditions of Childhood: based upon the Examination of 100,000 Children*. What I speak of as the developmental signs are given in this report at page 72; then you have definition on pages 72, 73, 74, 75, and 76—half-way down—of forty-two conditions of subnormal development which are noted and enumerated for the children; do you wish to go into them? Then the nerve signs are given in pages 76-7-8; it finished off at 79. That is, twenty of these nerve signs, points in action and balance in body below normal. Then you do not require any definition of health and nutrition. What we specially noted under this heading was the child thin, pale, or delicate. Lastly, there is report as to mental status, that was really in this work the teacher's report. That was the way we set about it. Each child was seen and these points looked to in each case; where there was any condition of defect the case was noted. It was noted on such a card as is given in *facsimile*.† I do not think you want probably the method of using the card, do you? That was the way in which they were recorded. Well, then, of course, if you are going to say anything about a census, a good deal in future work would be added on to it; we have got no anthropometry here.

7189. What do you think the important points in anthropometry?—I think it would be extremely important. Those that have worked with me know that there should be inquiry. I strongly recommend inquiry, and to such work as we have done here I should like to see added on a few anthropometrical points.

7190. Such as height, weight, colour, cranial index?—Colour is very interesting for the anthropologist, and height, weight—that is quite practicable, no difficulty at all. Then I do think that there is very great importance in having circumference of chest and circumference of head; any anthropometrical gentleman will suggest others. I am not sure whether you mention the head, but I can give you evidence presently with regard to the very great difficulties arising from the increase of small-headedness in our towns. I do not think that has been very extensively put forward. Just to take the measure round the head does not take a minute to do, and it is very important.

7191. Is it capable of being carried out properly only by very highly skilled medical observers?—These points do require that whoever is going to see them should be trained to the work, but I do not think there is any great difficulty in training young men. Many of my students have been able to do it after they have worked a while with me. I do not think there is any difficulty. I have known of teachers who have been able to do it.

7192. I think you have sufficiently indicated what the Commission wishes to know in that respect?—Yes.

7193. Would you like to go on with the printed list of intended evidence?—The next point, I think, that you come to is that of the co-relations of the classes of points seen; that is where you get real information. Please do not think that because we have found an individual child, or a certain percentage of children, who have some defect in development, that we say the child is defective; 8 per cent. of school children have some defect. Looking among a dozen children, the chances are that you can find some points below normal, especially of head or nose or the ear, or eye openness, or mouth, large or small. It is in the correlation or association of class of defect that information is gained, one, two, three. The case that has some points below normal in development has, we can assure you, a great tendency to develop nerve signs. I thought that was your point.

7194. And all this would have to be weighed and estimated by an expert?—Yes; all cases that are a little abnormal in their development tend to abnormal nerve signs more than other children. These correlations are given in **Report F*, in Table 16, p. 103, on 50,000 seen in 1888-91, and in Table 24, p. 111, on 50,000 children seen in 1892-94. Then these correlations vary at ages. I should think that would come into your consideration. The tendency of a child of a certain make to mental dulness and nervous disturbance varies at different ages. See the *Journal of the Royal Statistical Society*, 1896, part 1, March, p. 14, Table I. That is for the children seen in 1892-94, and evidence also upon the same is given in a table in my published work called *Study of Children*.

7195. Would it be possible for you to give us the essence of those, your own conclusions regarding them?—Yes; when I use the term correlation I mean what you would perhaps call causation, the effect of one condition in the child on another; or you may put it in another way, and say the tendency of a child with certain conditions born to acquire other and added evils. Take whatever of these main groups 'A,' 'B,' 'C,' and 'D,' the largest proportion, except for nutrition, is among boys. That is a very important fact.

7196. I think if you could tell us what you yourself did it would be of assistance to us in carrying out our remit?—First of all, you must deal separately with boys and girls, as if they were two kinds of children. Then there is another way of practical value in classifying the children, that is into some sort of age groups, male and female. Well, the first thing I have to say is as to the difference between the sexes, there is a very much larger proportion of males than of females who are born congenitally subnormal; and this is important as a State matter; there is no question that it is the great cause of infant mortality, which, as you know, falls in the first five years upon the males, not upon the females, and so great is it that, there being more male births than female births, in adult life it is reversed. There are, of course, far more women than men, and it affects the tables for annuities.

7197. And it has its influence also in the school years?—I am speaking mainly of school life. Certainly, so that in all probability there is a direct relation between infant mortality and all those things which can improve the body, which, I take it, is part of your referendum. Then there is another great point, which I am sure must also concern what you have to do. If you take, for instance, all the children who are pale, thin, delicate, you find something like three times as many girls as boys in school population. I will give you the exact figures, if you like, afterwards. You find something like three times as many girls who are pale, thin, delicate. Then, on the other hand, if you take only normally-made boys and girls, those without any of these defects in development, therefore, cases which you can get to know of easily by a little management in school, the proportion of delicate boys and girls becomes equal. I will put it this way: suppose you have 2000

F.R.C.P.
10 June '02.

children in school, and you want to make some regulations, and you first of all inspect them, that is what you are speaking of, census work, look at all the boys and girls, and you bring out from among the thousand all those who have some of these points of defect in development not quite the normal; slight defects do not matter unless other evils are added on; you will find you have drawn out a larger number from the 1000 boys than from the 1000 girls, and you will find afterwards you have about an equal number of boys and girls who are delicate among children of normal development, there is no more tendency among really normal children to be pale, thin, delicate, among girls than among boys, and that is a very important matter in all school management, and gives light upon much disputation between our profession and school teachers.

Ages.

7198. Could you sum it up for us in such a way as would be most useful to us?—The age groups I have divided them into are seven years and under, between eight and ten, and eleven and over, that is putting together the groups which are to be found in the Registrar-General's tables.

7199. And up to what age?—Whatever age we have them.

7200. Fourteen?—Yes, thirteen or fourteen; I think it was mainly thirteen then—it was some years ago. Well, then, you see that it is the cases that can be seen and known in a school, that we call the developmental cases that have the tendency to become of low nutrition, and if you somehow or other know the developmentally defective cases,—take the case of a school of a couple of thousand, I suggest cards—among your boys and girls, I do not think you have any question of delicacy really left that need concern you. You have got them amongst those that have been picked out as development defect cases, and therefore likely to become delicate.

7201. So that this class you would have to segregate for special management?—Yes, it leaves the teachers free to carry out what they think proper, and make their rules with regard to at least 90 per cent., while there will be about 10 per cent. who can be easily picked out as likely to prove delicate children.

Weaklings :
percentages.

7202. Now, would it be possible for you to let us know among children, say between seven and twelve, what percentage numbers there are of those who are ill-developed, weak, and so forth?—I have not got them under twelve.

7203. Take them for your own groups?—The upper ages you wish.

7204. We want the younger ones?—As to the younger ones, taking cases that have some defect of development, we find in the infant school, practically that is seven years and under, 31 per cent. of the boys and 28 per cent. of the girls also show abnormal nerve signs. The teaching of that is that surely even in the infant school they ought to have physical training, especially the boys, even these cases that we have drawn out.

7205. And above the infants, above the age of infancy?—Eight to ten; of these developmental cases, 43 per cent.—it has risen—of the boys, and 41 per cent. of the girls show nerve signs; it is getting worse. Eleven years and over, 40 per cent. of the boys and 44 per cent. of the girls; the girls go on getting worse. That illustrates very well a principle that I think is of importance. It has been fully proved by much evidence that there are fewer girls than boys made below the normal, what we have termed developmental defects, but in the case of a girl she is much more likely to get abnormal nerve conditions added on, low nutrition added on, and mental dulness added on than the boys. That is a thing of immense public importance. It goes all through a large number of public statistics; it goes through the criminal statistics, the health statistics, the statistics from the Sick Asylum Board, the insanity statistics; fewer females are subnormal, but the female that has any subnormality is almost sure to get every other evil added on to it that can be. Socially, the

Subnormal
females.

woman that once commences to drink is not readily reformed, and gets into the asylum, never gets better, nor does she die, nor does she get cured, but lives on. From those dreadful statistics it appears that many more men die of insanity than women. It gets chronic with the women. A man gets cured or dies within about three years.

7206. Are those all the points that you think our Commission might usefully take up regarding the theory of the matter, and are you prepared now to go on to advise us with regard to the physical training applied to education?—Rickets will greatly interfere in towns, I am afraid, with the work that probably you want done.

7207. But your collection of observations do not Ricket bear upon rickets?—Yes, they do.

7208. Do then give us an idea of the percentage of them, if you please?—Well, as far as I can, with pleasure. Rickets: cases of rickets. When one knew in going round a school that there was rickets we put it down, but I am perfectly certain that we did not get in this record anything like the total number of rickets. We have only got down there 244; there must have been, I am perfectly certain, many more. These facts are not trustworthy with regard to the prevalence of rickets.

7209. 244 out of 100,000?—It must be vastly greater than that. We were not allowed to touch those children; we could only look at them. When we saw an obviously rickety child we put it down as rickety.

7210. The proportion would have been very much greater than that had you examined mild anminorty forms of it?—Certainly.

7211. And yet such minor forms would have been influenced for better or worse by physical training?—My point is rather this; unless along with the introduction of physical training, if that be your recommendation, means are taken to try and lessen the frequency of rickets in towns, I think there will be at once one cause at work acting against the beneficence of your physical training. You cannot carry on these things alone. I should like to speak presently about the febleness which will come in the towns from small-headedness.

7212. Would you take up the point of small-headedness just now. It would come in very well here; it is quite a new point to us?—Definition: No child's head in school was called small unless it was under a circumference of nineteen inches. Small
headed
measur

7213. At the age of?—At any age; that is a perfectly rough test, you know; if it was at any age above nineteen inches we never called it small, even in a girl at fourteen.

7214. Would you prefer to evolve your ideas regarding small-headedness in your own words?—Cranium small. The point of size of head is recorded as apart from the size of the child from its age. That I insist on. A child that is short and may be stunted ought to have as big a head as his neighbour who is taller.

7215. Independent of age?—Yes; the volume should be estimated rather in relation to the age of the child than to his height. This may be determined by inspection, by the open hand placed upon the head, and by the measuring tape.

7216. Pardon me one moment—I suppose that all this matter of small-headedness is specially important in regard to the brains which are contained within?—It is. It is important with regard to the tendency of that body; the whole child, the whole body to fall into a condition of brain disorderliness, and of low nutrition, or becoming pale, thin and delicate, and I bring it forward and rather strongly insist upon it, because it is among the small-headed children and the rickety children that we have dealt with that there will be by-and-bye the complaints of the harm done by physical training. The physical training may be given for the 90 per cent. who are perfectly normal; it is among the 10 per cent., or whatever the figure be, who are not up to

the normal, that there will in the future be the harm ; of course some harm will come.

7217. Might I ask your views with regard to this small-headedness ; is it due to imperfect nutrition before birth or after birth, or is it a faulty development of bone?—First of all it is utterly against the ordinary law of development. I have given, I think, sufficient evidence that most of the conditions of defective development fall upon the male ; conditions of small head fall almost entirely upon the female. That is number (1) it is not the operation of a natural law ; (2) if you come to the question of the nationalities, the children differ immensely among the nationalities, and also the areas or districts. I have noted them down.

7218. You mean the areas or districts of the country, e.g., Wales, England, Northumberland?—Well, I cannot speak of Wales ; I can give you statistics which have been obtained of conditions of childhood in different areas of London. They are quite different in the Thames Valley from St Martins and up through the city to what they are in such parts as Islington. It has nothing to do with wealth. The wealthiest parish in London is about the worst, that is Kensington, and Chelsea, in which I live, and Islington, in which I was born, is one of the best and one of the poorest too.

7219. Can you trace any operative cause?—I think it is the buildings. I have not any doubt that it is a light and air question, and it affects the girls much more than the boys.

7220. And how would the buildings act?—Questions of light and air, I suspect ; I have discussed this with many ; it has been discussed by some societies. I discussed it with Sir George Buchanan, late medical officer of the Privy Council ; he suggested that we might map it out according to areas, level curves, and also according to water supply, but the whole evidence seems to point really to where you have less open neighbourhoods, and where you have those storied buildings in flats, that there you have the smallest-headed children. Now Islington and Bethnal Green are poor ; at the time I was there mostly small house property. The children were ever so much better than in other districts where they had built high six stories, model dwellings. If you are going to let the housing question make great big buildings such as we have got, I am sure you will have a very bad set of children upon whom to try your physical training.

7221. Those observations refer to the metropolis, I suppose, alone. You have not carried them out in the country?—As to London, you have seen the table, showing conditions in the areas of London ; I expect you will think it too long to read. There were great differences in the conditions of development in the different areas.

7222. Could you give us the gist of this?—I would point out that in Kensington, Chelsea and Pimlico, which, next to the City, is the most highly-rated district, there are 15 per cent. of the boys and 9.6 per cent. of the girls in some point below average development. That percentage of children are liable to fall into conditions of ill-health in consequence, and conditions of brain disorder in consequence. They want your physical drill to guide them very much, whereas in contrast Islington has only 8.2 per cent. of boys and 6.6 per cent. of girls with any condition of developmental defect.

7223. And the inference to be drawn from that?—The inference to be drawn from that is, I think, that there is some cause at work quite independent of poverty, which is causing degeneration in portions of towns, and the suspicion is very strong that it is questions of buildings, light and air,—questions of buildings, and I should like to urge strongly that it is a great point in favour of what we began speaking of—the need of making a census of childhood. It will be a big work. In a paper I gave in the transactions of the Sanitary Institute, it is shown from Bermondsey, the percentage of boys with small heads is .1, girls 2.8, contrary to all the other laws of defect in

development—something artificial ; for the Strand, boys 1.4, girls 7 per cent. ; good schools, no poverty. In the City of London Schools, boys 1.2 per cent., girls 6.1 per cent. ; Bethnal Green, 1.1 per cent. of boys and .4 of girls. It is very striking.

7224. And the mental condition corresponds with the physical?—My statement is this, that 7 per cent. of girls for the Strand district are small-headed ; it will be very difficult to deal with them, but you can note them, and you need not stop the work of the general school for anything you recommend, because you have got that number of girls who are delicate. We could find out those delicate girls for you in a few minutes and deal with them separately. That is the suggestion, one reason being that very likely you will do something towards preventing the continuation of small-headedness in another generation.

7225. Now may we quit the subject of small-headedness, or is there any other point in it that you would like to bring before us? Might we go on to your advice about physical training?—I suppose that we may in a large sense call anything physical training that is not mental, but you mean mostly drill, I presume. There are two objects at least of physical training as you would use it, the one to develop the muscles and body, and the other to produce brain power and mental faculty ; do you accept that?

Physical training : objects.

7226. Do you consider that they stand antithetically to one another?—No ; I said those are two objects that you have in mind.

7227. Quite so, yes?—If you recognise that, then I would say with regard to gymnastics and athletics I am not an expert. I highly approve of them, but I have nothing there to tell you. It is with regard to the second that I have developed my work, for the purpose of producing brain power and mental faculty. I thought you would have a body of evidence about athletics.

7228. Are there any points about the first before we dismiss it—about athletics?—There are none that occur to me just now, but we can recur to that. Then with regard to physical training, having for its object and purpose to increase brain power and mental faculty, I think this is a most important thing, which has been far too much neglected. I suppose that wants some proof. I think the best proof that can be given is to compare the condition of children in the school where they have had at any rate some physical training with another where they have had none. I take for that purpose, if a Scotch Commissioner will excuse me, a Scotch school, the only one, I think, that I visited at that time in which there was absolutely no physical training, and I will compare it with a body of facts from the London School Board. This is the statement that I would make, that the good effects of physical training in schools are to diminish the number of cases with signs of brain disorderliness, nerve cases, irregularities in movement, and also to diminish the number of dull children. The evidence I take for the purpose is that we can contrast groups of children as seen in Board Schools where there was good physical training with a Board School where there was none.

Mental development.

Good effects.

7229. Could you give us information regarding that?—Here is the table. Now, for instance, I think that we get the best information by contrasting the London Board schools with the Scotch school that I spoke of ; it was London Road Board School, Edinburgh, upper class.

School in London and Edinburgh contrasted.

7230. Could you give us the essence of that, and let us look up the tables afterwards?—Nerve cases ; that will concern you most. Nerve cases in the London Board schools, boys, 9.7 ; girls, 8.2. Edinburgh boys, 13.67 ; girls, 10.30.

7231. By Sir Henry Craik.—What are these percentages?—Percentages of the children seen.

7232. Defective children?—No, sir ; children who had some irregularity in their movement and action which they ought not to have had.

7233. By Professor Ogston.—Really they were defective children?—Oh, no ; I have not come yet at all to the question of defective children.

Mr
F. Warner,
M.D.,
F.R.C.P.
10 June '02.

7234. By Sir Henry Craik.—Who took those statistics?—I did.

7235. By Mr Alston.—In both schools?—In both schools, yes. Percentage of nerve cases taken upon the number seen; nerve cases with some irregularity in action and movement, just the points that you want to remove by your physical training.

7236. By Mr Shaw Stewart.—Have you anything bearing on the physical training given in either of these schools on that point?—There was no physical training in those days in the Edinburgh school.

7237. Exactly; in neither of these schools?—In London there has been, in the London Board Schools.

7238. By Sir Henry Craik.—When was it taken?—It must have been about 1892.

7239. And were you informed that there was no training at all in the London Street School?—When it was very cold they let them have a little run up and down in the room to warm their hands. They were a very good set of children. I do not think you want the rest of the facts; they are all to be had if you want them.

7240. By Professor Ogston.—Then might we now go on a little; you have told us about this brain power and mental faculty; can you add anything?—I wanted to give some evidence that if you give them good physical training in movements and balance of body, you could do a great deal to remove causes of mental dulness. If we had gone on with the figures concerning the Edinburgh school we should have found that they had got more than their average of dulness according to the reports of the teachers. Improve your physical training, you get better mental results. That is what the statistics say.

7241. And can you give us any further evidence to that effect?—I will just give you the London percentage of children seen, who were said by the teachers to be dull—boys, 7·9; girls, 7·1; in this Edinburgh school, boys, 9·08; and girls, 6·2. It is the boys that suffer the most from the want of drill.

7242. But you infer from that that the physical training in the London Board Schools produces the lesser percentage of nerve cases?—Of nerve cases and, therefore, the lesser percentage of dull cases, or, if we put it in other words, the effect of good physical training in schools is to diminish the numbers who have bad action and movement and balance, and also lessen the proportion of dull children.

7243. Now, then, at the top of the right-hand column of your notes of evidence, training movements, removal of abnormal nerve signs, general character and brain action, measurement, eye movements and power of accommodation, imitation exercises, transfer movements, speech: to what do these refer?—The actual detailed nerve signs, that I have given *en bloc*; you have not taken any evidence of detailed nerve signs, you took them *en bloc*. They consist mainly in action and eye movements, a thing of immense importance, and in eye and hand movement and balance.

7244. Might we, therefore, go on to the heading, 'physical impressions in brain classified according to their origin, sight, hearing, muscular sense in tension, muscular sense in movement'?—I think instead of following that, which is going into psychology, we had better take the question of sight. I should like to mention the immense importance—teachers have found it so—of training movements of the eye. No form of physical training will be satisfactory, or make the children really brighter unless that is done.

7245. What do you counsel in that way?—That in training, one of the objects must be to get eye movements, movements of the eyes by their external muscles.

7246. But you are not prepared to definitely state what movements you would advocate?—In all cases see that the children do not get in the way of looking by simply turning the head. Many children grow up that way, and you will find this in many students. I have seen many of them in Aberdeen who did not move their eyes a bit, just as much as with my own students, and they make such bad observers. A

gentleman, a Member of Parliament and a banker, told me he would not take any clerk in who could not move his eyes.

7247. Is there any practical way in which those movements could be applied in School Board physical training?—I train them in every case that I have to do with, and direct the training. The teacher must see that the child's eyes do move in following a moving object. It is a simple matter. Their attention should be drawn to the matter. If he had not learned to move his eyes, I should know that he had not been properly trained.

7248. Do any of the systems at present in vogue include the eye training?—It is gradually becoming known in London. I have lectured for the London University Extension upon this matter this year, and it is gradually spreading.

7249. It is being incorporated into those systems?—Yes, I have put them forward in all my papers and books, and it is being used here and in America. It is recognised as to not only eye movement but physical training. There is no doubt about the advantage of education in power of accommodation of the eyes; that is to say, looking at a distance, whether it is in town, down a street, or looking at stars. They want the relaxation and accommodation, but teachers ought to train it; it ought to be done. Certainly if these things are not attended to you get mentally bad results.

7250. I may say we have had a good deal regarding that?—Eye movements.

7251. No; accommodation movements?—Yes, I thought you would get that, but the eye movements should be added on, they are just as important as the accommodation movements.

7252. What are we next to take up?—Hearing. I do not know that we can say very much about that. There is an enormous number of children who have difficulty with hearing through neglect of nose and throat obstruction, as you know.

7253. We have had a good deal about that, perforated ears and so forth?—And mouth breathers. The next point I have got down concerns physical training, that is two forms of muscular sense which are greatly neglected by teachers, it is about the only access to the brain in some children, muscular sense in tension and muscular sense in movement. By muscular sense in tension we mean appreciation of weights, which is of the utmost use in training children who are without speech, or who do not understand speech, because they can then learn to make a comparison. Whenever I undertake to superintend the training of a child, I always institute exercises in appreciation of weights and comparison of weights. Then we want also physical training, cultivation of muscular sense in movement.

7254. Is that equivalent to practising movements, or would you distinguish between the two?—You can cultivate the faculty of muscular sense in tension, mainly by weights on fingers and hands. Muscular sense as regards movement is the feeling or impressions made in the brain by causing the child to make movements.

7255. So it comes under the ordinary forms of drill?—I am afraid in the ordinary form of drill they do not understand it, and they mainly prevent it with regard to small parts of the body. The muscular sense of movement is much more educative with regard to the movements of the small parts of the body than large parts. Movements of the digits, and of separate digits, has a much greater effect educatively in the effect upon the brain than movements of the limbs with the closed fists; you get very much less brain impression to improve the mental action when exercises are done with the closed fists, and more than that, your delicate children—I have said there will be some delicate children—most want training such as I am speaking of now. A child who gets too tired and exhausted by the force of movements with closed fists can make movements of the small parts and get the greatest possible benefit from that without the fatigue.

Mr
F. Warner,
M.D.,
F.R.C.P.
10 June '02.

Hearing.

Muscular sense in tension and movement.

Physical training and mental dulness: effects.

Nerve signs.

Eyesight.

Training of the eye.

7256. Would you suggest that that is distinctive in the systems of physical training that at present obtain? —I do most strongly suggest it; I have seen it over and over again, and spoken of it over and over again, and I am sure that a great deal of the educative effect of physical training is lost by the use of apparatus instead of free digits—free hands.

7257. And you would advocate both in any ideal system that was being introduced?—Both; but not to neglect the free exercises, performing movements of the small parts, digits, fingers and thumbs, similar to those performed by the teacher, I regard as of the utmost importance.

7258. Well, I think we are fully impressed with that. Could we now take up the next paragraph? 'School class training, military drill, free exercises, 'children feeble-minded or physically defective,' and so on?—So important do I think the training in movement in order to improve brain and mental faculty that I think it should be used in training—I am quite sure they must be, they ought to be carried out in the school—a portion of it. It is not only the athletics outside, but a portion of it in the school, in the classroom by the class teacher. I think to get the maximum benefit out of the physical training, every class teacher should take his or her class in some imitation of his or her movements for a few minutes at a time. It cannot be done for long. That is what I mean, then, by class training.

7259. And military drill?—I have seen schools, of course, with military drill, and it is very pretty to look on at; it makes the boys quick and sharp; they hold their heads up as long as the master is looking at them, but my experience is, directly you get them into the ordinary movements, they go to pieces as badly as anyone.

7260. And what do you think of free exercises?—I should think that they should be combined with other drill. By all means have military drill where you think it well; where the children are strong enough, by all means, but then they want free exercises as well.

7261. In the younger years?—In the younger years, and afterwards, too. I will quote two cases. Feltham Industrial School, admirable in its military drill, but those boys when they made any movements otherwise were inexact. I would rather not mention the other school, because it is a known public school for gentlemen's sons, where they also go through training for military drill, and the military drill is done under a sergeant, what may be called the manner, the manner of approaching one, the manner of moving, the manner of even shaking hands among these boys, is extremely bad. The only physical training they get in movement is in military training, and they want free exercises as well; both should run concurrently, I think.

7262. And now this next heading of children, feeble-minded or physically defective? That is a new heading with which you have not dealt yet?—No, I have not touched upon it yet. Well, that is the old story; it goes back to about 1884 as regards my public work. The thing has been so thrashed out I thought, perhaps, you would rather have references.

7263. If you please?—I do not know what statistics you really think you would like. First of all the proportion of them among the 86,000 children in public elementary schools.

7264. Yes?—Then, if you will allow me, I will give you the references to it. The report of departmental committee blue-book of the Education Department on feeble-minded children—Mr Sharpe was the Chairman—see page 29. The committee thrashed it all out, and they put it in the form of a table, and I thought that would give you all with regard to public elementary schools. Then with regard to the whole 100,000 that I have seen, they are given fully in the Report F.

7265. And the conclusion—outcome of it is?—The outcome of it is that there is something like 1 per cent. of the child population mentally or physically defective; that is the number the Poor Law Committee came to.

7266. *By the Chairman.*—1 per cent. of feeble-minded?—I think it is too high, myself; it is nearer 8 per 1000, but, of course, I acquiesce; it is a question whether it is 8 per 1000 or 10 per 1000; I am sure it is not higher.

7267. *By Professor Ogston.*—Feeble-minded or physically defective?—Yes; they are fully brought out in the report. Of course, the diagnosis; I do not know whether that concerns you, is a very big question. At any rate if you have anything to do with the feeble-minded you certainly want somebody to make careful selection and report upon each case. That must be done under the Act for the defectives now. Every case before it can receive the grant for the education must be tested in that form by the Education Board, and by a doctor of whom they approve. The Act is an Act for the defective children. It is called 'Elementary Education (Defective and Epileptic Children) Act, 1899 [62 and 63 Vict., ch. 32],' and that gives a grant for the education of these children. I do not think it applies to Scotland; I think it is an English Act only.

7268. I suppose we might pass over the inheritance Inheritance. from feeble-minded parents and take the next one, 'Inheritance in families of high-minded ability'?—Well, I find a considerable number of these cases are the offspring of exceptionally good parents. It is very common among those cases to find that the father is the best of his family and the mother the best of hers, and they have been attracted to one another in their mental lives, and their first child is an imbecile, or defective in some degree of defect—a considerable degree of defect—quite common.

7269. Have you any explanation?—Now we are going into biology. The defect tends certainly to fall mostly on the first and last. I think Dr Matthews Duncan showed that.

7270. A question of comparative sterility?—That was so. The first and the last are apt to be defective, and especially if the first is a male. Then with regard to the cousinship, of course that is known.

7271. You might perhaps state that shortly?—But this is not known that it is quite common where the man is above the average of his family and the mother above the average of her family that there is danger.

7272. Certainly that is not generally known. Have you any explanation or index?—Well, I can give analogies in biology. First of all, where there is evolution going on you always have a certain proportion of defectives. If out of the Jones family one is evolved that is the best of all the Jones family, and he marries into the Brown family, the best of all the Browns, there is considerable danger. It is analogous to what takes place in nationalities. Now the Jews have been a highly-evolved people; they have got the highest percentage of defective children.

7273. Trained teachers needed?—Well, that follows, Trained teachers. I think, from the difficulty we have had in explaining the physical training necessary. I should like to say that trained teachers are absolutely wanted, and for the working of the Act it is a necessity, and they must mainly work by physical training. If you are going to work that Act in Scotland, the Act for mentally defective children—and you need it—although I know they say they have not got them, one of the first needs will be teachers capable of doing good scientific physical training.

7274. We have had a deal about that. I think we might, if you do not mind, pass from that, and take up the last group, the problems concerning childhood?—Might I now, or at the end, take the children of the nationalities. It is so important and so little known; it will not take two minutes. You are for Scotland, but questions may be raised with regard to England. I cannot tell you much about the Scotch children, but I would like to say there is an enormous difference between the English, the Irish, and the Jews.

7275. Figures?—Report F, table 26. It is too important with regard to Ireland not to take the opportunity of putting it forward. Tables 26 and 28, p. 113, and table 28 put it in the form of percentages.

*Mr
F. Warner,
M.D.,
F.R.C.P.*
10 June '02.

Children of nationalities: proportion of defects.

Mr
F. Warner,
M.D.,
F.R.C.P.
10 June '02.

7276. And the essence of it?—The essential character of it is that the Irish children show such a very large percentage with conditions of congenital defect of development. It is an immense question. That is so largely threshed out in the Parliamentary report of the Home Office on certified industrial schools. It was gone into very critically there, because it accounts for mortality in the Roman Catholic schools, which is high in this country. The proportion of developmental cases among the English was, boys, 8·4, girls, 6·8; Scotch, 8·0 (that is better), and for girls, 4·6; for Irish, 11·6 for boys, 8·4 for girls; Jew, 9·2, boys; 6·3, girls.

7277. That really reverses the conclusion that you drew from the Edinburgh schools and the London Board School?—Oh, you have got capital children in that school. Except for the fact that they move and balance badly, they were capital children. You had a smaller proportion of defect in development. You had a smaller proportion who were thin and delicate, but you had not trained them in those days. That is in years gone by, now about ten years ago.

7278. Now might we take up the problems concerning childhood?—Well, I have said already, I think, that the main classes of defect include a larger proportion of boys than girls. You have a larger number of boys with defect in development, a larger number of boys with nerve signs, and the consequence is that the boys want more physical training to remove those bad movements and balance.

7279. And the second conclusion we have also already been dealing with?—Yes. These developmental cases, which were produced largely by sanitary and light and air questions, greatly tend, more than others, to get bad conditions of movement, to be delicate, and to be dull.

7280. So that embraces C also?—Well, C is delicate children. Now there are classes of special instruction for defective children in London. I do not know that you have them in Scotland. We have special schools that are full of delicate children; we have schools, as you know doubtless, for cripple children. For instance, at Fulham every child is a delicate child, and what I have had occasion there to urge, and know to be the point, is the enormous importance, if you collect delicate children, to see that they get physical training. They cannot do the same physical training as the strong boys, the big boys, but they want physical training.

7281. Most important?—Training in movement.

7282. Tell us shortly what movement you would advise for this. We had no evidence at all of that before us?—That I can give you in plenty. First of all, exercises of the hands. The child should first of all learn to balance the hand in the normal, and for that purpose must see what the teacher does. The normal hand balance is with the two arms straight at the elbow, all parts of the hand in the same plane, no thumb down, not bent, all parts in the same plane. If you can, after three months' work, day by day, get the child to balance straight, you have done a great deal to put his brain in a better condition of order. I have tried it with children that I manage.

7283. That would be a little tiresome to go on with. Do you extend it further?—Oh, yes. That is simply the thing first of all. Then the child should learn by gradual practice to be able to imitate with exactness each movement that the teacher makes.

7284. Then?—Well, suppose we pass away from the hand. Then a second point I put is training in eye movements. We have spoken of that. Then I would say training to remove abnormal nerve signs about the face. They are all epitomised in the nomenclature.* For instance, frontal muscles overacting, what you call frowning, that can all be removed by training, to an immense improvement of the child's brain and faculty. There are a number of physical exercises. They have all been described in books that I have published.

7285. What books are these?—One is called *The Study of Children*, and the other is called *The Nervous System of the Child*.

7286. Some of your own writings?—Yes.

* See Vol. I. Appendix III. (No. 6B).

7287. Now we might pass on to paragraph (d)?—The effects of good physical training in school are to diminish the number of cases with signs of brain disorderliness and the average number of dull children. Well, I think you have been through that. We need only go fully into the statistics of a school in which there was no physical training and compare them with the result of schools in London where there is physical training. They are given in the tables to which you have reference.

7288. The result we have?—Children in different schools differ immensely. I refer you to Report F, table 19, p. 106. I think you had better take the next table—table 20, p. 107.

7289. And what does that show?—You will see the column headed 'Group II,' that is to say, children who had some of these signs, and who, therefore, were to a certain extent below normal. It shows that the Poor Law children had a slightly higher percentage of cases that had to be noted than the day school. Of day boys we had to note 19·2 per cent. of boys, and 15 per cent. of girls, and in the Poor Law schools we had to note 21·8 per cent. of boys and 17·3 per cent. of girls.

7290. And you attribute the lesser percentage in the day schools to the physical training bestowed?—I only say it is the difference in the class of children admitted. The schools do not make the child; but I do say where they have, in Poor Law schools, an average of child material less favourable in make—lower class—the necessity of physical training becomes increased.

7291. *By Mr Fergusson.*—As to a system, are you acquainted with the various systems of physical training?—Not greatly; I am no authority upon that.

7292. I rather gather that the Swedish system is the sort of system that you advocate?—Yes; it is very useful. It is not what I have spoken of as a means of brain training; it is not nearly accurate enough; it is useful.

7293. But it is better than mere drill—marching about?—It has more influence upon increasing brain power than mere drill.

7294. And other parts of the body, defects of the chest, flat-foot and other defects?—I should not like to speak to the discouragement of the other forms of physical exercises, but I know of no harm done by the Swedish drill; I think it is a very good thing, especially for girls.

7295. *By Mr Shaw Stewart.*—You lay considerable stress on the movements of the eye?—Yes.

7296. Mr Noble Smith, F.R.C.S., told us that boxing was very good for the eyesight; have you any opinion on that?—It would not be good for girls, I think. I cannot give any opinion upon it. It is a very poor training to get the eyes fit for work: it will not do instead of eye drill.

7297. For small children, but I am speaking now of boys. You have no views on that?—I should not think it is anything like equal to cricket, you know.

7298. Cricket is a game?—Unless the boy's eyes rapidly follow with accuracy the ball, and also estimates the distance, he will not catch it. Cricket is, I am sure, a capital exercise of the eye movements and focussing—both.

7299. *By Mr Alston.*—You said that high and closely-built houses and want of light and air were very detrimental?—I believe so.

7300. To the children in the locality?—I believe so.

7301. Have you any means of comparing one city with another; for instance, Glasgow and Liverpool?—No.

7302. As to population to the square yard?—No; I have compared the children in the different areas. You have seen the table that was sent in.

7303. In London?—In London. I only suggest the problem. If a census is to be undertaken, it is a problem that should be solved. It wants a larger work than any one man can do.

7304. But you are satisfied that it has that serious influence upon the children?—It looks like it. I think

Childhood:
boys and
girls: former
require more
physical
training.

Defective
children:
special
training
necessary.

Movements
desired.

Mr Warner, D. C. P. ne '02. that your census will want to go much further. I hand you a report of a school at Brighton as a sample of a report. If you are going to say that there should be anything like a medical inspection of the schools, you must give some indication of the form of reporting. I take it you are going to get to know your delicate children in a school.

7305. *By Professor Ogston.*—Pray allow me to have the use of that for a time also; I will return it within a day or two?—There is the report and what I should recommend; there is the written report which was sent in, for instance, to the School Board, and the form of card, filled in; you have seen forms of card for each child. Then that card is an indication to the trainer what points he may do and what points he may not do. Those put down here as bad movements are the things he tries to get right. At the next inspection you would like to have your cards altered; what was bad before should now be right. These are the cards corresponding to them.

7306. *By the Chairman.*—Have you much knowledge of the physical exercises that are done in London schools other than Board Schools?—No; not really.

7307. Do you ever go and look at them?—I hardly ever go now.

7308. You used to?—Yes, ten years ago.

7309. At national schools?—Yes; at national schools.

7310. And did you find physical training tolerably common?—It varied immensely.

7311. But there was nearly always some of it being done or not?—Oh, I think so; I think there was generally some done.

7312. And when you say formerly, what date, please?—Ten or twelve years ago.

7313. Was there any authorised physical training in the Board Schools?—In the Board Schools physical training was under inspection. Then, unfortunately, to speak of that, although I have spoken in praise of their general training I must confess they had a great many things that I think did a good deal of harm. For instance, they taught the children to make lordosis, curve the spine back; they teach them to draw back like that, to make an artificial lordosis until it becomes almost a confirmed habit; I have seen that taught.

7314. *By Professor Ogston.*—Do you consider the straight back of a soldier morbid?—No; but he does not make an artificial curve.

7315. I think he does?—I mean a little extra curve more than the normal; I am sure if you saw it you would say it was not the normal.

7316. *By the Chairman.*—You were not very complimentary in your remarks about military drill; I want to know your opinion of that; the benefits of it?—I think it is useful; let us have military drill; I should give my vote for it, but we want a good deal more added on.

7317. I am talking of military drill as applied to boys between the ages of fourteen and eighteen?—Oh, well, I think then it is very good; that is a very different matter.

7318. You have nothing to say against it?—No.

7319. That is part of our remit; part of our enquiry?—Oh, yes; talking of fourteen to eighteen, I should say most strongly it is likely to be useful.

7320. You have no objection to such an institution

as cadet corps or companies of the Boys' Brigade?—I think they are all good; they tend to make them act in harmony, and bring them under discipline and control.

7321. They do not do any damage, but rather the contrary, to health at that age?—I do not think they are likely to at that age; I do not think that any drill of that sort would prove harmful.

7322. And probably would improve habits and manners?—Yes, I think so.

7323. Quite possibly, in some degree, habits and general morality?—I think so; certainly athletics tend to. Our college runs much better with athletics. We support a ground. I subscribe to it in order that we may be able to run our college well and keep our students in order.

7324. If you think that, why should you condemn the effects, as I rather gathered you did condemn them—the effects of military drill?—I do not object to military drill; I object to the harm of leaving the mind of the child untrained by not doing movements as well.

7325. You only apply it to children at that time?—Yes.

7326. Under the age of fourteen?—Yes; I am speaking of the children of school age as needing exact training in movements.

7327. There are various modes, as you know, of military drill; do you object to the mere marshalling of children in twos or in fours and marching them from one room to another, because that is military drill, remember?—I think that is a very good thing; you can begin that in the infant school.

7328. You do not object to that?—No, I do not object to the military drill.

7329. What part of the military drill, as applied to children, do you object to? What do you call military drill; what do you object to in military drill?—I object to leaving out other forms of physical exercise. Give them physical exercise by all means, but give them also free exercises and the training in movements that I have very briefly touched upon.

7330. Then I may take it that it is simply an objection to military drill being solely given?—Yes; I would not say that I object to military drill, I object to that when you give military drill only, and you neglect all other forms of training. I do not suppose you mean to omit other training, but in the school that I quoted they did neglect all other forms of training.

7331. I am very glad to hear you say that; I did not quite understand it?—You have not gone into the question of harm that is done for certain children—harm and cruelty from drill.

7332. Generally speaking, I think I may take it from you that you think no exercises ought to be initiated—I will not say actually carried out, but initiated—without some medical advice in schools?—I think that there ought to be medical inspection of schools, one of the advantages of which would be to say what is to be done, and that particularly applies to resident schools under the State, Poor-Law Schools, and Certified Industrial Schools, and particularly to those under the Home Office, which are, or used to be, penal establishments, and in which some of the drill exercises which I have seen in them, and that is some years gone by now, I thought extremely cruel, fixed positions of the arms held out, causing great fatigue.

The witness withdrew

Mr EUGEN SANDOW, examined.

7333. *By the Chairman.*—Do you call yourself a professor of physical culture?—A professor of physical culture; yes.

7334. You say you have to hand in, to begin with, a few suggestions and ideas on physical training?—Yes.

7335. And you say that the words 'physical culture' convey very little to the ordinary observer?—Yes.

7336. But that you have to look to the medical man or the expert in physical exercises, which is not the same thing necessarily for the true meaning of the words 'physical culture,' and you say it means an education of the whole of the muscles of the body, a thorough and systematic blending of the whole of them; that athletic sports and games are physical culture more

or less; but the disadvantage of them, from an educational point of view, is the localisation of the exercises. Perhaps you would explain that a little?—Athletic sports and games are physical culture, more or less, but the disadvantage of them, from an educational point of view, is the localisation of the exercises.

7337. Then again you say true physical culture will include not only a certain muscular development, but a building up of the whole of the internal organism of the body; in fact, the internal organism is the first aim of physical culture as applied in your schools?—Yes.

7338. A really sound heart, lungs and digestive organs are the first things to be aimed at; muscular development will follow as a matter of course. In fact, with your system of exercises it is a *sine quâ non* that the same exercises that bring about the former will eventually produce the latter. This is what you understand as physical culture?—That is what I understand as physical culture.

7339. There have been various imitations of your system since it was first introduced?—That is so.

7340. But they have all perished?—All perished; yes.

7341. And you remain, and about 9000 to 10,000 pupils on your books. By that you give an idea of the immense strides that your system has made in public favour. You say you give individual attention to each pupil?—That is so.

7342. Yes?—Well, it is under my supervision and my assistants.

7343. And that for a successful result to be attained the brain must be used as well as the body, *i.e.*, the whole of the will power and mental energy that *can* be exercised, must *be* to attain the maximum results. You say that almost anything can be done with the muscles. In all probability it will take from six to twelve months, and perhaps longer, to bring the body to perfection by exercises practised assiduously, and once you get into this state of muscular perfection, it is very easy to keep there?—That is so.

7344. To arrive there it has probably cost the individual thirty to forty-five or even sixty minutes' daily exercise. But he is now able to reap the fruits of his labours by keeping the body in excellent condition by fifteen to twenty minutes only per day. After a time it becomes quite easy to sit and read, write, or do anything necessitating brain power, and at the same time to exercise the muscles?—That is so.

7346. And that, you consider, is the pitch of perfection?—That is so.

7347. That you can do two things at once?—Yes.

7348. You go on to say about the present methods of application in your schools, the pupil is first examined medically; how many doctors have you?—Well, I have one at present, who goes round at present to every fresh place.

7349. Every fresh pupil is examined?—Oh, yes, appointments are made.

7350. And what his state is, is it put down in a book?—Oh, yes.

7351. Measurements are taken and so on. You say the weaker pupils, being always under the instructor's eye, he can with a movement of the hand stop or increase the work as the case may require. By this means the weak may be taken with the strong without fear of exhaustion. Where possible, a better plan still is to have all the weaker ones together in a class by themselves, so that they may be treated still more carefully and individually without appearing weak or done up in front of their stronger companions. The above system has been in use in your schools since their introduction in 1897, that is five years?—Yes.

7352. Not one case of exhaustion has ever been recorded. This is all the more remarkable on account of a great many of the pupils being constitutionally weak on joining, which, of course, is the reason why they come to a large extent?—Yes.

7353. Many cases of heart, lung and stomachic weakness have been through your schools with marked result, and in the majority of cases complete cures.

You have a branch of your system which includes medical cases such as indigestion, dyspepsia, heart, lung or other troubles. These are treated quite individually and with surprising results—many of the best West End physicians sending their patients to you for exercises for the treatment of some disorder. Do you have girls in your classes as well as boys?—Oh, yes.

7354. The exercises consist in one part of a series of movements carried out with or without apparatus in the shape of wands or dumb-bells. The movements are usually gone through to a musical accompaniment, the one idea of the drill instructor being to obtain uniformity and precision. To this end he sacrifices everything regardless of the child's strength, etc. Each child is made to do the same amount, because to stop some while others were working would spoil the whole thing from a spectacular point of view. This, then, is the essence of mass drills as they are called. Of the exercises themselves a word might be said: some are good, others absolutely useless except from a spectator's point of view. Where a few good movements are executed the benefits are considerably, if not altogether, lost by the way they are done. Everything having to be done to time, a good exercise is very often entirely put on one side because it does not *fit in* to a bar of music, or because it does not look pretty. Gymnastics pure and simple on apparatus should at first be avoided for young children. First, because the average child of to-day is not strong enough, and secondly, because the exercise, even though the child is fairly strong, is too much localised. When you say the average child of to-day, do you think he is worse than he used to be?—I want to say generally one boy and one girl is not as strong as another.

7355. You do not say he is weaker than he used to be, to your knowledge?—Yes, I should think so.

7356. You think he is weaker than he was when you were a child?—Well, I will not say that, but as far as I remember he is going backwards.

7357. For instance, a squad of children are in a gymnasium; the instructor sets the exercise and some do it (a very small minority), others attempt it and fail, others, although too weak really, are made to attempt it and fail ignominiously, resulting in, if not a strain, some scathing remark from the instructor. In any case no benefit is obtained. This goes on from day to day, and the only ones to benefit from the course of gymnastic exercises are those who were fairly strong and fit to commence with, and consequently did not need it so much. Those who really need exercises have obtained little if any, and are certainly not benefited organically or muscularly. What is wanted, and what I would suggest, is to give every school child a really thorough and systematic training of the body, bringing first of all the internal organs to a healthy state, and then the muscles of the body. I would suggest starting first on the chest internally by giving every child a short course of breathing exercises. By strengthening and developing the chest, I would give every child a good start in life, the lungs a greater capacity, the heart a stronger action, and the digestive organs a better tone to enable them to perform their functions with greater ease and less inconvenience. By this time the child would have become able to take a keen interest in his or her anatomy, and the muscular development would take place accordingly. The child if educated to this idea from its school days, would look upon these exercises as part and parcel of its daily life, and I am sure enough interest would have been aroused to ensure them carrying the exercises on through life, thereby raising not only their own but the future generations' standard of physique. An additional incentive to carrying on the system after leaving school is that little or no apparatus is required, a pair of dumb-bells being about all that is necessary, together with twenty minutes per day devoted to it. Considering the time devoted to eating, drinking and sleeping, three other necessities of life, this time, twenty minutes, is, I am sure, very small indeed for something which is quite as important as either of the above.

Time.

Suggested methods of application in schools.—I would suggest that a headquarter school be established for the training of instructors, to be under the general inspector of schools. A competent staff would be established to train these instructors, who would in turn be sent to the schools to instruct children. The exercises should take place from four to five days per week, for, say, thirty minutes per day. For some children a proportion of this time should be devoted to running, marching, and some other recreative exercises as the general inspector of schools may direct. In addition to the Sandow or any other system of physical culture, which may be adopted, before starting a course of exercise each child should be medically examined, and the following measurements taken on joining, and from time to time during the course:—Neck, chest contracted, chest expanded, chest normal, waist, weight, height, lung capacity in cubic inches. Where possible the children to be divided into classes of not more than thirty to fifty, varying with the number of scholars in school, the time at disposal and the general physique.

7358. You mean to say classified as to physique?—Classified as to physique in divisions.

7359. And not as to their places in school educationally?—Oh, no, according to their physique in the divisions.

7360. If it could be done?—It is quite simple.

7360A. Special note to be taken of weak children or those suffering from curvature, or any other physical peculiarities—curvature, by the way, being very prevalent amongst school children of to-day, owing to the incorrect positions adopted while at their desks, lack of some systematic exercise, and thoughtlessness of parents in their methods of carrying the children when young. The Sandow system at present consists of twelve different series of exercises, all of which are applicable in some form or other to children. On entering the school and commencing a course of exercise, a child should be examined, and scale of work allotted to suit its strength, the exercise being increased and varied from time to time in accordance with the progress made. I should not recommend any system of exercise of physical culture to take the place entirely of games, or *vice versa*. To dispense with the former would be injurious to the health of the children, to dispense with the latter would be to take away the recreation and diversion from work provided by games, in short it amounts to any 'physical culture' to be taken seriously and systematically, and games as a recreation and a complete change from work. Physical culture is school and games complete?—It is; yes.

7361. Time, place and clothing.—Time.—Where convenient the exercises should be taken before the mid-day meal, say at 11 to 11.30 or from 3 to 3.30, thereby obviating the necessity of exercising immediately before or after meals. Place.—The school playground could be utilised in summer, provided the ground was covered by some suitable material to allow of pupils lying down. In any case, if convenient, it is far preferable to exercise in the open air. In the winter a large room slightly heated, but well ventilated, might be used with advantage. The sexes to be exercised separately except in the case of very young children. By very young children, you mean children under seven years of age?—Under seven, yes.

7362. Clothing.—To have a special dress for exercising would entail too much time being taken up while changing. A light dress, loose at the waist, neck, and wrists, should be worn by females, and ordinary clothing, minus coats and vests, for boys. Shoes to be substituted for boots, when and where practical. The instructor in charge to be responsible to the general inspector of schools for general results, discipline and cleanliness of the children.

Division of districts.—Schools to be divided into districts, each district with a superintendent to be under the immediate supervision of headquarters. The instructors to be periodically examined and tested in efficiency by the general inspector of schools, who

will in turn furnish the directors of schools in general with a report from time to time.

Results obtained.—Appended I beg to hand you a few measurements, etc., showing results obtained by a few of my juvenile pupils at different schools, together with the measurements of boys at the London Orphanage Asylum, Watford. In addition to this I have had numerous pupils who have come to me deficient in chest, weight and height, for army, navy, civil service, and life insurance examinations; in fact, in one school alone, viz., St James' Street, I have during the last four years passed through over 500 such cases. In addition I am in possession of testimonials of prominent medical men testifying to the efficacy of the Sandow system as applied to medical cases, such as spinal curvature, paralysis, muscular atrophy, etc. Also the fact of my having started in St James' Street with thirty-five pupils in November 1898, and now having ten schools in London and the provinces with, roughly, ten thousand pupils on the books, will serve to show the manner in which this system of physical culture has leapt into public favour. I think I am quite right in asserting that once a pupil joins the schools, it is seldom he severs his connection with them entirely. Either he takes a course at the school, attending every day, or working at home, and from time to time attending the schools for further advice and tuition. The necessity for a recognised system of physical culture is, at the present day, more or less obvious to the individual who has the welfare of the physical training of children at heart. One has only to see the average child in the playground. Where not fully strong and robust the child is usually pale, with a very cramped chest, poor limbs, and physique generally. I think that the foregoing remarks will, with the accompanying statistics, go a long way towards inducing you to consider the advisability of adopting a system of exercises which has been the pleasure and study of my life to bring before the public with the object of raising the physical and moral standard of the present and future generations?—These are some of the measurements (*document handed in*).

7363. *By Sir Henry Craik*.—Have you had much to do with the elementary schools for younger children?—No, but I have watched them very closely, because it is my intention later on anyhow to get the position to superintend such a course. Of course I have very many children in my schools, and these are the statements which I have brought along, measurement forms, etc. I have about 600 children in London in my school.

7364. Of what age?—Well, from five years upwards.

7365. You would begin some sort of physical instruction, then, at five years of age?—Oh, yes, I should think you would start from four years of age in a very plain way.

7366. A very much modified form of your course?—A very much modified form, that is all.

7367. And go on to gymnastics of a harder kind at what age?—Well, gymnastics, as I said before, I would use that more as a recreative pleasure, not as exercise. It is not real exercise. You see the body consists of so many muscles; you have about 240 muscles in the body; well, if you do a certain exercise it is only loosening a certain spot; you only bring into play by one exercise twelve muscles, and another perhaps three, and perhaps you always work on the same muscles. You must exercise all the muscles in the body so that you get all the nerves into play, all the muscles into play.

7368. Speaking of that in your evidence, you say it becomes quite practicable after a time to sit and write or read or do anything necessitating brain power and at the same time to exercise the muscles of the body; could you explain to us how that is?—Well, that is done in this way; a man when he wants his muscle developed to a certain extent—the muscles are once developed to a certain extent to the highest perfection, that is to say, the nerve which is connected with the brain which makes the telegraph from the brain to

the muscle and talks to the muscle is strong enough—the man would be so used to do so that he contracts his muscles unconsciously without knowing the same, as I do when I sit by myself and I do nothing. I always keep in condition if I do not do anything for a year; I do no exercise or anything for a year; I do exercise at the very moment I speak; I exercise my muscle by contraction. By contracting the different muscles you get control of every individual muscle in the body, and it is just like a little child lying in the cradle; the child does it unconsciously; you will see a child stretch itself and contract all its muscles. Well, that is nature's gift in that case; later on a man will contract. I can show you what I mean by contraction (*illustrating by the arm muscles*); you exert the muscles each individually while that comes quite in time; if you once develop the muscles you could not help it; you do it unconsciously.

7369. You could not hope to have that in a great number of cases?—Oh, always.

7370. That would be special development?—Oh, no, not necessarily. I dare say if a man practised it as a child; done it for two years as a child or many years, he would not be able to leave it in every case; I have it so in my places here.

7371. Would you tell us how it was that you came first to turn your attention to this subject?—Well, when I was a boy I was very delicate; it seems rather incredible, but it is so; I was very delicate, and I had a very weak chest, and my people took me to Italy—to Rome, because that is the place where they take people when they are weak-chested, and I was very delicate, and when I saw all the beautiful statuary there sculptured and all that, as a child I asked my father, 'How is that man developed to that extent as they were then.' He said, as one would speak to a child, 'Well, you see at that time they did not have all the conveniences; people had to fight with their strength; they had no elevators or lifts to go upstairs, they had to walk up; everything had to be done by labour, and the finest and strongest man was the hero and the king.' That impressed me so that I thought I wanted to be strong too, and then I got my father to buy me some books, and so I studied lots of books and studied medicine, and so I arrived at what I have done to myself.

7372. Have you compared the physical training as it is carried on in the different nations that you have come into contact with?—Oh, yes; well, I have compared them.

7373. Your own country, I think, is Austria?—Germany is my own country. Well, they do more gymnastics there, but the real training in Germany is more the military training. That is why men do not want physical culture so much as they want it here, in England, because a man in Germany, whether he wants to or not, must be a soldier, and he is trained; the foundation is laid in him by the military authorities.

7374. That training comprises more than mere military drill; it comprises some advanced physical exercises?—Of course, all the movements that I do more or less lay the foundation; not quite perfect as physical culture, but it certainly lays the foundation, and that is why the German nation—the men—are in better condition, and are so very much finer, stronger men, owing to the military system there.

7375. Do you know how far it is carried on in the schools there?—Well, it is done now; they are adopting my method in Germany, all the smaller movements, dumb-bell system. I have a very large correspondence with German schoolmasters and so on.

7376. And it is universal some form of physical training in schools in Germany?—Oh, yes, but there has been up till now more gymnastics than anything else.

7377. But they are changing?—They are changing everything now; there are no monkey tricks or anything like that.

7378. And what other nations have you seen?—I think Germany is about the best for physical training.

7379. Have you seen any country schools in England

Physical training in Germany: universal.

Country schools in England.

at all?—Oh, yes; I have followed them up; I have seen all the exercises that they do, and so on, and read a great deal about it.

7380. In Scotland?—Oh, yes, in Scotland.

7381. In the schools?—No, but I have read about it in the different papers.

7382. Have you compared your system with the Swedish system?—Well, the difference between the Swedish and mine is, the Swedish is done more to loosen the joints; it is not a contracting, not a developing system; it is more loose movements, all the joint movements class, and all this turning out movements—which would not add anything to development; absolutely useless.

7383. Your object is not merely to loosen, to make yourself slimmer, but also to lead to the development of muscle?—Of course, to do both.

7384. It applies rather more to boys than to girls? Boys and girls. —Absolutely to women just the same, because it is for the whole body. The whole body is linked together; in a woman, as in a man, the muscles are all linked together, and a woman wants the strength as much as a man, I think; in fact, more so, for the generations' sake.

7385. And you have found just as few cases of any evil resulting from it in the case of girls as in boys?—I find that it is so much better, especially for girls and women. It is only from weakness, talking now from a medical point of view, that there is so much labour in birth-giving.

7386. But you think that without proper supervision, and careful systematic method, there may be those dangers which you found existing in the school?—There would be no danger whatsoever.

7387. But you say without the systematic method there would be danger of those evils growing up?—That is so, for the simple reason, for instance, the method that they have adopted. Now take a child that comes from the school—the teacher shows them something simple on the board to follow this up on the rings; of course he expects the weak child, the same age as the other one, to do the same thing. It is absolutely absurd that they should ask such a thing. The child should be first taken up to a certain point to be strong enough to do such things. I think a child should have about 1 lb. dumb-bells; that is quite sufficient; not to lift its own body straight off, which is a great strain on the heart, and if they cannot do it the child goes away, it is left alone; if a child does it, that one that can do it gets the benefit.

7388. The object of having a system would not only be that it might develop altogether the physique of the children, but also that it would guard them against very great dangers?—Great dangers, that is so, and everybody will have a chance; the weak child will have the same chance as the stronger child; the weaker child will be able to come up to the stronger one, because we work up to it.

7389. In games, of course, the strong child is apt to push the weak child to the wall?—Oh, yes, and in games it is sometimes the weak child hurts itself unless it is prepared for a game through physical exercise; it should not be allowed to play a game unless it is strong enough.

7390. Are you acquainted with any of the physical training institutions in Scotland—Col. Cruden's, for instance?—Not that I know him personally, but I have heard of it; I know exactly the work they are doing.

7391. How does that system compare with yours?—Oh, it is a different thing altogether—absolutely different.

7392. Perhaps you would just explain one or two points of difference?—The difference is this, that every one of my exercises is done on the floor, on the ground; there is no lifting, climbing ropes or anything like that, it is all done on the floor—every movement, and the way I would treat a child is this—he will be examined by the medical man as far as the interior organs, after that he will be examined by the instructor, who will have studied the system and will know exactly what

Cruden's
system

Peu-
of S.
syat

to do, then he will take the measurement and give a muscular test, and from these he will know exactly where that child's weakness is, and so give him the movements calculated to make that child equal in strength. It is just like the strong chain with a weak link—give him only the movements that are necessary to bring him up to that other child; to be equally developed, evenly.

7393. These are the peculiarities of your system?—Yes.

7394. In what respect do the other systems differ from yours?—They do not know what they are doing; they let a child do any exercise. 'Now go and do this.' They do not know what it is for, perhaps they want to make it a bit strong; now exercise the calf and then exercise the arm, or *vice versa*.

7395. What you insist upon is the supreme necessity of a careful, thoroughly-studied and well-organised method before anything is done?—That is so, absolutely.

7396. That it should not be done without expert advice, and without the charge of an expert?—That is so.

7397. *By Mr Alston*.—In one part of your evidence you seem to disapprove of musical accompaniment to the drill?—Yes, I do.

7398. Why do you disapprove of it?—Well, I disapprove because of the attention; as I say in another part, there the brain must be used with the exercises. For instance, if you take, say a blacksmith, of course everybody knows that the blacksmith does very hard work; he certainly does tremendous hard work, for filing away a horse's shoe or making one, wants a tremendous power. His mind is directed upon the horse's shoe, not upon the muscle he is exerting at the moment. If his mind would be directed upon that muscle he would develop a far greater and finer muscle than he has.

7399. Would he neglect the horse's shoe?—I do not say that he should neglect it, but I think he would certainly; he could not pay his attention to the horse's shoe just as well as the muscle.

7400. Some witnesses have objected to the musical accompaniment because it tends to neglect of the details of the drill?—Well, that may be.

7401. Mistakes are uncorrected?—That is a very good point.

7402. You quite think that is the case?—Yes, absolutely.

7403. But you would go the length of saying, that having perfected the drill or the physical training, then musical accompaniment might be added as an attraction?—I would have no objection to that, as an attraction, yes.

7404. Then another point you have advocated, that a headquarters school should be established for the training of instructors, to be under the supervision of a general inspector of schools. Who should these instructors be?—Well, I should think the best men for the purpose, for instance I have army men, men retired from the army, sergeant-majors and so on.

7405. You prefer a retired soldier for this purpose?—Oh, yes, an army man, they are so good disciplinarians.

7406. Would it not be possible to train the school teachers, both male and female?—Yes, there would be a possibility, but it would not be the same, not exactly; you would not have the same benefit.

7407. Would it not be rather an advantage to have a teacher who has the child under supervision the whole day both in mental and physical exercises?—I think the teachers would be always inclined to go on in their old groove. If you start a new thing, start a man with new ideas.

7408. Yes, but they would be passed at this school; I am supposing that they would be passed at this headquarters' school which you advocate; if so passed with a certificate in their hands, you would entrust them with the duties, surely?—Yes.

7409. So it is not necessary to have an ex-military man?—No, not necessarily, but if you want a new man, it would be the ex-army man.

7410. Or a lady?—Or a lady.

7411. Male or female?—Well, female—I do not approve so much of a female for teaching.

7412. You do not?—No, I had a great deal to do in my school in Ebury Street, where I have about 1200 ladies; some of the ladies objected; they did not want men; well, I had a great trouble to get ladies there, and then the ladies were no good; they all wanted to turn back again to the men; ladies cannot teach. It is no disrespect to them.

7413. We had the privilege of seeing over a school, and we saw 270 girls at drill, at Swedish exercises; in each squad it was the female teacher that put them through, and we could see that not only did the children do well, but their teachers did well and were perfectly competent to instruct?—Of course I speak from this system, I do not know what they did there.

7414. But it would be quite possible to instruct female teachers?—I daresay it would be.

7415. To handle children?—I have not been successful; it was not bad; but it was not the same as a man.

7416. Another point, you desire to limit the number of children in a class to thirty or fifty?—Yes. Limits of a class.

7417. That is in order that each might be thoroughly looked after?—They should be absolutely.

7418. That would take more time and more room, would it not?—Well, it would not take much more time; it may take a little bit more room; but it does not take up much room to instruct fifty children.

7419. Still we are considering the existing schools and what might be done in these schools, and we are limited in space and limited in time?—Thirty children, of course you can have twenty, but with thirty you would not take up much room.

7420. But in a school of 1900, as we have sometimes, how could you get over the classes for physical instruction with twenty or thirty in a class?—Get them into three divisions, the stronger ones all equal and one need probably only want two divisions. It all depends on the children whether they have to be divided into two lots or into three lots.

7421. Is it not rather difficult supervising the large number of children you refer to?—That is so; that is what I am speaking about. Say that you have strong, weak, and delicate, you would call them; if you have a delicate class you have the middle class and you have the strong.

7422. You speak in one part of your evidence as to the sexes being exercised separately; is there a necessity for that?—Well, for the simple reason that some movements are on the floor, you see; say about 25 per cent. of the movements, and all done upon the floor by legs raising and movements, and so on. Boys and Girls: clothing.

7423. But if the girls were in a suitable costume, as many girls now are when they take exercise of various kinds, would that remove the difficulty?—That would remove it; I was thinking about the poor, who would not be able to afford a costume.

7424. *By the Hon. Thomas Cochrane*.—You start with breathing exercises, I think?—Yes. Breathing exercises.

7425. Could you explain just what you mean by that?—Well, breathing exercises are exercises, that is, movements where we make movements at the same time and contract certain muscles of the chest, for instance. I could show you one movement. For instance you take this movement (*exhibiting*); of course I have got about 84 of these movements, different movements for the chest, but of course all the children would not have to go through that, it is only for certain defects; one child would have one, one child would have to do this movement, another one another; it is just as they are arranged in groups—in rows.

7426. It benefits their chest—the breathing?—I can show you that children ten years old increased in chest measurement three inches in thirteen lessons. That is, of course, a very big increase at ten years old. I have them of all ages in the statistics I have brought along for your inspection.

7427. You use army instructors a good deal, do you not—ex-soldiers?—Yes; and I have got a headquarters Instructors soldiers.

Mr
E. Sandow.

Female
teachers.

Mr
E. San'ov.
17 June 02.

here; I train them in my school; they are with me about four months before they go out teaching; they are still soldiers, but they are allowed to come and learn the system, and as soon as they are able to pass and get the certificate they go away from the military and I send them for my schools as I want them.

7428. Do they become good teachers for your training?—Oh, yes; because it lies easier on a man who is more disciplined; he does exactly what he is told and takes more trouble.

7429. And able to impart the instruction you give him and teach others?—Yes; and they do not make their own ideas. It is always the case; everyone wants to teach something else and choose their own ideas. That is what a soldier does not do; he carries out exactly what he is taught.

7430. Are they mostly non-commissioned officers that you take?—Non-commissioned officers; I have got commissioned officers too as managers in my schools.

7431. But, as a rule, you prefer a man who has had some education like a sergeant?—A sergeant.

7432. You do not take a private, as a rule?—Not if I can help it.

7433. You are familiar with the system of drill—of physical training in the army, are you not?—Well, of course, it is my system which is adopted in the army; they train the recruits by it for six months; all the recruits are trained in the army at Aldershot and everywhere on my system.

7434. And you think very highly, then, of the military system of drill—of training?—Oh, yes, very much. The physical culture is really my system.

7435. It is really your system, and you approve of it?—Oh, yes.

7436. You find that the recruits develop under your system, as carried out at Aldershot and in the various gymnasia?—If you like just to refer to Colonel Fox. He adopted this system when he was Inspector of Gymnasia about nine years ago. He will tell you what an improvement, the difference it has made since he has adopted it, and you would not believe what it has done. I mean, so far as training recruits is concerned. What he says, and what I have seen with my own eyes, the men that I saw then and the men that I see now at the Military Tournament—it is quite a different thing.

7437. There is nothing in the system that overtaxes the strength of the soldier, if it is properly carried out?—Not at all. For instance, you would want to go, then you would be examined, and every muscle in your body would be tested, and then you will get your movements and your exercises according to the requirements of your body, you see, and in some cases we may not give you anything. The most dumb-bell work that I allow is 5 lbs., so you see that cannot be very much there.

7438. Any one who is afraid of a military system as applied to children, that would, in your opinion, be wrong? there is no harm in the military system being applied to children?—No, not at all; but I think it should be more taken as a recreation or something else.

7439. That it should be modified to their strength?—It is really not physical culture.

7440. But the military system is a good system for children, if it is modified?—I do not approve of the military system alone for children; you want to prepare the children to do military strains and all that; but I do not approve of that at all; I think it is the greatest mistake. You should prepare the body of a child, because there is the same rule coming in again, because you take the strong body and the weak child; you want to prepare it. It is just the same with gymnastics. I myself have never done any gymnastics in my life. I have only done physical exercises in the small numbers. No gymnast can do—the best gymnast cannot do what I can do in strength. There is not a thing that a gymnast can show you that I cannot do, and I have never done it; I will undertake to do it. Now that shows if you have the strength you need not do it. I do not mean agility, and swing or anything of that sort; but take the most difficult thing, pulling

yourself up like that, but I will do it at once, and I have never done it, and I will undertake to do it now. That shows you if the strength is there you can do it; you must prepare a child for the purpose.

7441. At what age do you think children should begin their modified exercises?—Well, I think about four.

7442. Up till?—Well, up till—I think they should always keep them on more or less, you know; but they should be first prepared to a certain age before they do any military or anything, any gymnastics or anything at all; even before they play in games they should be prepared, and get a permission from the school or from the inspector, or from head-quarters, that they can play this game, that they are now strong enough.

7443. As soon as they are strong enough; generally at what age would they be strong enough?—Well, I should think about nine years.

7444. At nine years of age they could do stronger work?—Yes, they can go in for more of this work.

7445. And at twelve or fourteen, could they go into the stronger course—the military course?—Quite so; I think they could go in, but never dropping the physical culture part.

7446. If they had been properly prepared by advancing stages up till twelve or fourteen, they could then take up any course—the military or any other course—with advantage to themselves?—Yes.

7447. Do you know anything of Chesterton's system; it is used in the Board Schools in London?—Oh, yes; well, that is not a bad system, but it is not done scientifically; it is not done properly; it is not done in the systematic way it should be done. As I said, there you cannot exercise all as one man. It is just the same as if all you gentlemen were to come to me; I could not give you all the same exercises; one will be stronger than another, and if I put you through all these different movements I should be sure to hurt one of you or do you some harm; it is no good.

7448. Where could we see your system in its various stages from small children of four years up to eight or nine, from nine till twelve, and from twelve upwards?—The Watford Orphan Asylum, that is one school that has adopted it, and they have won all the prizes; the finest children you ever saw, and you can just speak to Sergeant King about it. He adopted it in the school. In the Albert Hall, when I gave that physical display, they were the biggest success; it was a sight to see them; you must go and see them. Let me know the date, and what time you will come, and I will arrange in one or two of my schools. The children, all the children in my schools, and the ladies and gentlemen; if I only know on what date you will come, we will prepare for you.

7449. Thank you?—And I will also be delighted; it is very interesting to let them show you how they are measured, and how they are tested, and all the books, the increases, and the way the books are kept.

7450. But the Watford Orphan Asylum will show us your system from the earlier ages up till fourteen?—Yes, from the earlier ages; and, of course, I would like you to see it in my schools too—the way it is carried on. The Watford Asylum have not taken the measurements yet. That is what he is going to adopt; they have introduced my system, but not quite scientifically; they have not taken the measurements and so on, although we have the boys in different classes so as to get them not altogether.

7451. Could you answer, do they require more food at the Watford Asylum since they have adopted your system?—I should not think so. Of course, you feel healthier. If you feel very healthy you feel like eating a bit more. I do not know whether they give them more food.

7452. *By the Chairman.*—It is a very important question, that food question; you wish the Commission to understand that the probability will be that children trained after your system would become much more hungry?—Well, I do not know.

7453. You see, you have to look at it in the way of ordinary poor school children, whether there is any

Food.

way in which they can get more to eat if you give them more exercises to do that will make them more hungry than they are; how are you going to get over it?—I do not say it will make them more hungry; but you see it is not exactly the amount of food that they take, it is the amount of strength they get out of the food by digesting the food.

7454. Very well, you do not think that it is absolutely necessary that children, in a course of training such as you recommend, should have more food—not absolutely?—Well, I could not answer you. I have not looked into that question whether they eat more or not; I have not found that out.

7455. You quite understand that it would not do for us to recommend something that we will be told, 'if you recommend that it is not practicable, because they cannot give them enough to eat'?—Well, it would not be as bad as that; but you will find it more stimulates the food, and you get the more out of the food. Your digestive organs are in better working order, and you get more out of it.

7456. May I ask a personal question of you—are you a very fine walker, any distance?—I do not walk very much.

7457. You could?—I could.

7458. If you were told to walk 50 miles, you could do it?—Yes, but I do not walk very much; I can walk.

7459. But the result of your training is such as to enable you to walk?—Oh, sure, I will just let you feel my muscles on my legs, and you can judge for yourself.

7460. *By Sir Thomas Coats.*—You are the first witness we have had who has advocated these breathing exercises?—Well, I am the founder of the breathing exercises; I am the first man who brought them into the schools, my breathing exercises; I think I am really one of the first in England.

7461. I wish to ask you, would you give these breathing exercises to all children; do you think you could safely give these breathing exercises to all children?—Yes; absolutely quite safely.

7462. No fear of straining the chest?—Not at all; only, as I said before, I have got over eighty breathing exercises, and some breathing exercises would be good to some children and some to others; you see, they are arranged in groups.

7463. Can they have any bad effect on the digestion or anything of that sort?—Not at all, just the reverse; because that is the only way to develop the interior muscles only by breathing exercises; I mean your lungs, etc.; it is the only way you can develop them—by the air.

7464. Do you develop the chest largely by these breathing exercises?—Yes; only by these breathing exercises in the interior to open the chest out.

7465. Do you know a breathing exercise that singers use, that is inspiring quickly and then letting the air out very slowly, and practising that so that they can hold their breath for a considerable time?—Of course they breathe abdominally, down here—(showing)—all this flat, and abdominally they are pushed out. That is another set of exercises; a special set that I have got for certain movements for that purpose. I have got another set. This is quite a different thing, you see; it is all done like that—(exhibiting). It is all compressed in the top part. The air is taken. You take first the air, you see. You fill first one, then you compress the abdomen and press the chest and the lungs out by compression.

7466. The system I have talked of, would that be hurtful?—Not at all.

7467. The practice that the singers use, could that be hurtful?—Well, it is more likely to be hurtful, because that is rather a great strain; it is not done naturally, it is quite the thing.

7468. But you do advocate your breathing exercises very strongly, I suppose?—Oh, yes.

7469. *By Mr Shaw Stewart.*—I would like to ask a question about the Aldershot system; would it be correct to say that the Aldershot system is founded on your system?—Well, you may say yes.

7470. But it is not your system complete?—I spoke about the physical drill, the physical culture part, the dumb-bell part, the ground part.

7471. And the free movements?—And the free movements. Of course, I daresay, as I said before, you may add another movement to it, that may be possible.

7472. The reason I ask is because we may have to consider the training of teachers?—Yes. Mr
E. Sandow.
10 June '02.

7473. Would you say that the Aldershot system is a good one for that purpose?—You mean the physical culture part.

7474. Yes, the physical culture part?—Well, it is not complete. It is not exactly carried out as I would like it to be carried out.

7475. Perhaps not for any one that you wished to train specially for physical culture, but for a teacher who has to teach everything to a child, and who would have to acquire only a certain proficiency in physical culture; would you say that the Aldershot system would be a good one for that purpose?—I should think so, yes. It is not very bad; but, of course, it would want to be carried out something like this—each child is treated individually, and measured and tested and arranged in such groups as they should be ranged in, otherwise you would not get the advantage; you would come back on the old; then you put them all up, you let the weak and the strong and the delicate do exactly as they like, and you do not get any further. It is the old thing over again. You only want at once a certain number of children, that is all, where you want to get them all equal.

7476. For boys when they have left school, you say that gymnastics are an amusement?—Yes, they should be an amusement. Training of
teachers.
Gymnastics.

7477. Another expert witness used the expression that gymnastics was a sport, and is the outcome of physical training; he also went on to say that nobody should engage in gymnastics without twenty minutes' of physical exercises beforehand. Do you think that would be a good plan?—Are you speaking about very small children?

7478. I am speaking of boys after they have left school?—After they have left school.

7479. You see, we have to consider what physical training should take place in continuation schools?—Well, you do not find many boys after they have once left school go in for any exercises; they do not do any exercise; very seldom.

7480. Some witnesses tell us that we ought to recommend that gymnasia should be provided for boys between fourteen and eighteen?—Well, I think, if they do physical culture, and did not waste their time in gymnasia, they would do much better.

7481. *By Mr Fergusson.*—On the second page of your paper you mention one of the advantages that the brain must be used as well as the body. Now, applying that to children at school, is not one of the purposes for which you give them physical training, to rest their brain a little? They are using their brain learning their book lessons, and you want an exercise which does not work their brains very much?—Yes; but the brain is used in quite a different direction from learning, because the brain works on different nerves; the nerves do not work in the same way, and you cannot do anything if you learn something, unless you use your brain; if you think on anything else, you cannot learn what you are learning. Body and
brain
exercises: a
difference.

7482. So that it would be rest for the brain as regards bookwork?—Well, yes; they must exercise it, or they would not get any benefit; you can only do it by using the brain. In gymnastics and physical exercises up till now the brain has not been used, and that is why it has come to nothing; it is really nothing.

7483. You speak of the drill instructors that you get. Are they gymnastic sergeants who have been in the military gymnasia?—No, not necessarily; they come and study with me; they have not got to go to the gymnasium; they need not have anything to do with gymnasia. Instructors.

Mr
E. Sandow.
10 June '02.

7484. You certainly insist upon having some well-trained instructor to look after the children while they are doing their exercises?—Oh, yes; there is no question about that.

7485. Because, I suppose, unless it is done under a trained eye, you may be apparently doing the exercise, but just leaving out the very part which is the point of the whole thing?—That is so; quite right.

7486. You said for young children you would not allow gymnastics with apparatus. At what age might you safely put boys into a gymnasium?—I should think up till ten or eleven; it all depends on their strength and their physique. They ought to be guided by their instructor.

7487. You referred to the German military training; has that had a very marked effect for good on the male population of Germany?—Oh, no question about it.

7488. You can speak to that from your personal knowledge?—Absolutely, yes.

7489. Then, as to the form of instruction for children, you have told us you do not quite approve of Chesterton's; you do not approve of the army system. I do not think you were asked about the Swedish system of training?—Well, that is more an exercise, more for the ligaments; all ligament movements, but very little contracting motions, that is, developing movements.

7490. Is it a good system?—Well, it is a system, as I say; but it is not perfect. It is a system that is done, and yet you do not know what you are doing. They do not know what they are doing in these movements.

7491. Then what system do you recommend for children?—Well, physical exercise; a system where all the muscles are got into play, all the muscles in the body, in a short time.

7492. Is that contained in any book? have you got a book of exercises for children?—I have not got it, but I am writing one just now; I am getting one out. Anyhow, that can be got; anything, if you wish to have that.

7493. But at this present moment there is no book of physical exercises for children which you consider right?—No, not for children.

7494. You say a great many of your exercises are done lying down on the ground?—Yes, on the floor.

7495. It would be rather troublesome for schools to apply that system. In ordinary schools you cannot have the children lying about in a muddy playground or the dirty floors. Remember, we are not talking of working in one of your schools where everything is made for the purpose. You

have just got to adapt yourselves to the circumstances, which often mean a muddy playground. No system would be much good for our purpose which necessitated lying down. Is that a very important part of your system?—Oh, very important; that is what I say. Other systems have been adopted to suit the schools, and then there is no result obtained. That is what I say; they are not complete.

7496. Does it not come rather to this, that you cannot carry out what you call a perfect system in ordinary schools?—I do not see why it should not be carried out.

7497. One of the reasons is that you cannot make the children lie down on their backs or on their faces in a muddy playground?—Of course, most of the schools have got rooms, have they not? they have got gymnasia and rooms

7498. No, most of them have not

7499. *By Mr Shaw Stewart.*—Not small country schools?—Well, if it is muddy they would not exercise anyhow, would they?

7500. *By Mr Fergusson.*—Well, you would like a system that you can work in a small space indoors, or out of doors when it was fine, but at any time in the year you would hardly want your children to lie down in the playground?—There are difficulties with everything, of course, if you want a thing complete.

7501. That may be the reason why some of those systems which you say are not perfect have been adopted to meet the necessities of case?—They are only wasting time, that is my idea.

7502. You are strongly in favour of shoes instead of Shoes, boots?—Yes.

7503. Why?—Well, for the simple reason it is lighter, and if they had a pair of shoes on—it does not matter whether they have shoes or boots on in some cases—where they could afford to have shoes it would be much better.

7504. Is it because you cannot get the same action of the ankles and feet with heavy boots on?—Well, no; with laced boots you could get the action, but not as good as with shoes.

7505. *By the Chairman.*—Just one question. Are you thinking of having a branch establishment of your science, if I may call it so, in Scotland?—Yes, I will have a place in Edinburgh and one in Glasgow. I am just arranging for it.

7506. And in the event of our recommending anything about your system, there would be some place to which school teachers could go in the future?—Oh, yes, certainly.

7507. When do you expect this to come about?—I intend to open it in four months' time from now.

The witness withdrew.

The Rev. WALTER WALSH, examined.

7508. *By the Chairman.*—You are the minister of Gilfillan Memorial Church, Dundee, which is an Independent Church?—Yes.

7509. Would you mind reading out your notes to the Commission?—I am asked my opinion upon the existing provision of Physical Training, and I reply—Inadequate. Not always of the most beneficial character.

1. Physical training should be co-ordinated with mental training, as of equal honour, and as an integral part both of elementary and secondary education. Sufficient apparatus and teaching staff should be provided, ample place on the time-table should be set apart, and liberal grants should be made for efficiency. In some Dundee Board Schools fifteen or twenty minutes a week is all the time given. The extra gymnastic instruction in the secondary schools is of the most unsatisfactory character, so that older boys do not care to avail themselves of it.

2. Great benefits might be expected to follow, both to the physical and moral life of the individual and the corporate life of the nation.

3. Such training, however, should be scientific—based upon the physiology of the human body; natural—

should aim at developing all the natural powers in obedience to all Nature's laws; rational—should be adapted to pupils of varying degrees of physical perfectness and constitutional strength; theoretical as well as practical—should be accompanied by exposition of the natural laws under which the various exercises proceeded; universal—as including girls equally with boys.

4. This involves the adoption of a higher, more entirely human type of education, which shall be neither—

(a) Commercial—a system of cram, directed to making us a nation of clerks, in the vain hope of thus securing British supremacy in the markets of the world; nor

(b) Military—a system of drill, directed to making us a nation of soldiers, in the equally vain hope of thus preserving British supremacy amongst the nations of the earth; but

(c) Humane—an all-round culture of the whole boy and girl—the weaker and defective as well as the strong and perfect—with the view of producing a perfect type of the genus *Homo*, bearing in mind that 'the

True ai

'strength of the citizen, not a citizen, is the strength of the State.' (Mr A. Alexander, Director of the Liverpool Gymnasium, in his valuable book *Physical Drill of All Nations*, p. xii.)

5. The work of this Commission should result in the 'real improvement and development of a system of physical training for the youth of the country.'

B.—1. There are numerous signs, however, of a desire to shunt the question of physical education on to the easier, showier, and less beneficial lines represented by military training. Amongst these may be mentioned the following:—

As to day schools:—

(1) The 'Terms of Reference' upon which this very Commission is conducting its inquiry is being construed into a mandate for the formulation of some scheme of military training. This must be my apology for venturing to detain the Commission on this part of my evidence. And it may happen that, in defining the false, I may also outline the true. The Chairman of the Dundee School Board, from the Chair, interpreted the Remit as a movement for 'further instruction in physical exercises, combined with military drill . . . so as to form a national bulwark for home defence in time of danger'—with more to the same effect. (*Dundee Advertiser*, May 6th, 1902.) A member of the same Board, Mr G. K. Smith, in the course of the same discussion, declared that 'one of the first objects . . . was to have the young people in such a state of training as to be ready for military service. There was every reason why this training should begin at as early an age as possible, and it was only fit that the School Boards of the country should take up as a part of their duty, ensuring that the children under their charge were properly trained and disciplined so as to be ready for the army or the irregular forces.' (*Dundee Advertiser*, May 6th, 1902.)

(2) Lord Wolseley, some years ago, expressed a regret that 'when universal education was started in England (Britain?) every Board School had not had attached to it some sort of military organisation, or some military instructor, entrusted with the duty of drilling, and thus to foster among them a spirit of military discipline.' (*Times*, February 10th, 1890.) Some School Boards would appear to be now prepared to supply the desideratum of Lord Wolseley.

As to continuation classes and 'elsewhere':—

(1) Lord Balfour of Burleigh's Memorandum to Scottish Boards on Physical Training, February 1900, has led to the formation of numerous cadet corps.

(2) Private schools are generally forming cadet corps.

(3) Eton and other great public schools send companies every year to the military manœuvres at Aldershot.

(4) The boys of the London workhouses and some rural workhouses are instructed in military drill.

(5) Cadet battalions are being formed in large towns amongst boys beyond school age, and are being diligently fostered by military men on the ground that they feed the various branches of His Majesty's army. 'Out of 500 who have passed through the ranks of the 1st Cadet Battalion Royal Warwick Regiment, 80 per cent. have continued their career in either the Line, the Militia, or the Volunteers.' (Major A. V. Fordyce, quoted by Rev. J. P. Gledstone, in *Boy Soldiers*, p. 3.)

(6) Suggestion of Major Fordyce that 'Cadet battalions be formed in every town and village district in the country, and that every lad on leaving school at fourteen should serve on one till he is eighteen.' Subsequent declaration that 'he would like to see this made compulsory.' (*Ibid.*, p. 4.)

(7) Expressed desire of Lieut.-Gen. Sir Gerald Graham to 'make it a condition of giving you free education.' (*Ibid.*, p. 4.)

(8) Published proposals to make drill compulsory for all boys, the War Office to issue regulations, undertake annual inspection, issue arms and ammunition, provide shooting ranges, etc. (Letter, *Daily News*, November 29th, 1901.)

(9) Testimony of the Rev. E. C. Selwyn, D.D., Head-

master of Uppingham School, that 'all its 440 boys have passed in shooting at the Morris tube range, first or second class, as the result of two years' persistent work.' (Letter, *Times*, quoted by *The Herald of Peace*, February 1st, 1902.)

(10) Correspondence pointing to the readiness with which New South Wales rallied 'to the flag,' and the familiarity of the men with military details, and claiming it as due to their previous training in the cadet corps, which exist so largely in the colony. (*Spectator*, March 10th, 1900.)

(11) Sir George White hails the Lads' Drill Association, of which, I believe, the Earl of Meath is president, as a step towards a 'nation in arms,' and becomes a life member. (Letter in *Daily News*.)

(12) Military men and their supporters diligently try to make military drill appear as the best kind of physical training, and to a large extent succeed in imposing their fallacy on the country. The cry is 'physical training,' but the aim is military service. (See *The Effects of Military Drill on Boys*, by Dudley A. Sargent, M.D., Director of the Hemenway Gymnasium, Harvard University, Mass., pp. 2-3.)

(13) It is clear that a movement, or tendency, exists whose object is to enforce universal military training upon all boys from fourteen to eighteen years of age, and to produce a state of things hardly distinguishable from conscription. Continuation classes are to form a connecting link between the school and the barracks, and an easy method of turning the scholar into a conscript. But the true end of education is to make men, not soldiers.

2. It is certain that strong resentment is felt by many people throughout the country against these attempts to militarise our youth, and that determined opposition would be offered to any action on the part of the authorities to give them practical effect. And for these reasons:—

(1) The agitation is artificial, not rising from the people, but worked up from above—from the War Office, military men, a section of the governing class, and some desperate ecclesiastical leaders who, at the terrible spectacle of a world in arms, have lost faith in the moral power of their religion.

(2) The country does not desire military training for its youth. Parents do not desire it, boys soon weary of it. The Newcastle-on-Tyne School Board, two years ago, 'put its foot down' on a suggestion of its physical instructor to introduce military drill, and restricted that element to some simple marching evolutions. (Letter from Mr Alfred Goddard, Clerk to the Board, June 2nd, 1902.) The Dundee Trades Council, by a majority of three to one, voted against its introduction into schools. (*Dundee Advertiser*, May 15th, 1902.)

(3) Our system of universal, compulsory education would never have passed the nation's bar if it had been weighted with such a condition as Lord Wolseley desiderated. (See B. (2).) An attempt to now graft it upon the Public School would imperil that institution. The Board School originally contemplated a clear way from the school to the university, but never from the school to the army.

(4) Military drill would have the effect of drawing the youth of the country away from the more beneficial field sports.

It is advocated as a counter-attraction:—

(a) 'By the time the lads are old enough to join the Volunteers their preference for field sports has been so confirmed that Volunteering is quite put on one side. I think the extension of cadet battalions will be likely to remove this to a great extent.' (Major A. V. Fordyce, quoted by Rev. J. P. Gledstone, in *Boy Soldiers*, pp. 3-4.)

(b) 'There is only one way to deal with the mania for sports and games, and it is by the expulsive power of a new enthusiasm. I have known excellent boys whose ruling desire was to shoot an enemy in fair fight. Your article will do something to change the venue, to promote a new enthusiasm, and to encourage the art and instinct of national defence.' (Letter of Rev. E. C. Selwyn, D.D., Headmaster of Upping-

ham School, to the *Times*, quoted in the *Herald of Peace*, February 1st, 1902.)

(5) The danger of turning the minds of the workers and thinkers of the country away from industry, agriculture, production, invention, to soldiering is self-evident—and much more serious.

(6) It is reasonable to infer that the increased use of, and familiarity with, weapons of destruction, must lead to a grave increase in the number of homicidal accidents or crimes, and thus foster a lawless and criminal spirit in the community.

(7) Military drill entirely excludes one-half the children of the nation—its girls. The motherhood of the nation is not less important than its fatherhood. And as girls, from their usual occupations, are denied the same opportunities of physical development that boys receive in their daily work, there is the more reason that any scheme of physical culture should give them equal place with the boys.

(8) It is obviously unsuitable for, and therefore entirely excludes, young children. An expert on the subject declares that even 'marching is of next to no use in developing the physique of a child, since it leaves the muscles of the trunk entirely untouched . . . may be too violent an exercise for a child; it is needful to go on quietly.' (Rev. A. W. Jephson, M.L.S.B., personal Letter, June 3rd, 1902.) 'What is needed is a variety of exercises such as will develop all muscles. By such means good results are obtained even where children have a very poor physique to begin with.' (*Ibid.*)

(9) For similar reasons, it absolutely excludes the numerous class of children who are delicate or defective—as where there is malformation, local weakness, or constitutional debility—for in such cases it would only increase the already existing defects. (*The Effects of Military Drill on Boys*, Dudley A. Sargent, M.D., pp. 13-15.) 'At schools where ill-fed children attend, the exercises have to be made less fatiguing. . . . The instructor must be a man of discrimination—able to detect a child who is weak or ill; such children must be given little exercise.' (Letter from Mr Alfred Goddard, June 2nd, 1902.) But this is precisely what a military system would render impossible. Mr Jephson also mentions the case of a boy, well known to him, 'whom no army sergeant would have accepted, who was brought up to a fair standard of physical fitness by (an) all-round training. Even the blind,' Mr Jephson continues, 'can be trained in this way, and given confidence, as well as an improved physique. A class of blind young men, or boys, or both, are thus being trained under his supervision.' (Letter, June 3rd, 1902.)

(10) Even for the residuum of strong boys left from this process of necessary elimination, military drill does not constitute the most beneficial form of physical training.

(a) It is not scientific and natural, but artificial. The figure produced is not the type chosen by either the artist or the athlete. It does not meet the physiological wants of the human body. It is mechanical, monotonous, wearisome, making no high demand upon the moral earnestness, upon the enthusiasms, and unable, therefore, to produce the highest physiological results. It does not sufficiently quicken the respiration, or increase the circulation. It has to be supplemented by a scheme of 'corrective exercises.' (*The Effects of Military Drill on Boys*, p. 9.)

(b) From 'Statistics of the drill and gymnastic training given to twelve boys in the Much Wenlock National School' for six months, it appears that when drill alone was given, the average increase in chest measurement was 11-24th inch. But when drill was combined with gymnastics—including Indian clubs, vaulting horse, horizontal and parallel bars—the average increase was 1½ inches—a result three times better than the other. (Letter, Edward Stroud, Schoolmaster.) The time spent on military drill was therefore time wasted.

(11) The logical conclusion is, that military training would be bad as education, and therefore bad for that

civilisation education is intended to advance. It would foster the delusion that the fighting-man was the highest type. It would encourage the dangerous fallacy that war was necessary, natural, and inevitable. It would feed the presumption that military training was necessary to a nation's strength and permanence, and that a military civilisation was a higher type than an industrial one—a presumption contradicted by every lesson of history and every principle of religion.

(12) It is surely impossible that universal and compulsory military training, in the sense set forth, could be made an integral part of the education of British youth. It is entirely contrary to our genius, our history, our religion. Large numbers of our people would refuse, under any pressure, to submit to it. It would be vain to try to meet their case by means of a 'conscience clause.' We know from experience in other regions of British school life how ineffective such protections are.

C.—I am asked my opinion upon Boys' Brigades as connected with the churches. My opinion is, that considered as war they are not good; and considered as religion, positively bad. The churchman has never been slow to recognise that the child is father of the man; and that as the twig is bent the tree is inclined. Hence he has tried to capture the child early by the glamour of military methods. But the soldier is equally alive to the possibilities of youth, and is indebted to the churchman for a new means of popularising the army. Let the good intentions of the founders and workers be fully admitted; also the excellence of the athletic, musical, and similar agencies carried on. The peculiar feature of the Boys' Brigades—the feature that differentiates them from other religious organisations—is the military element; and it is this element that, like a fly in amber, vitiates all the rest.

1. The charge of militarism is strenuously denied by the supporters of the movement.

2. But is abundantly proved by many facts:—

(1) The Press constantly describes them as 'embryo warriors,' 'boy soldiers,' etc.—proving in what light the journalist regards them.

(2) Military men constantly speak of and to them as if they were a kind of juvenile Volunteers:—

(a) 'The Presbyterian Churches have adopted military organisation for their schools and classes, and no fewer than 17,000 boys are now enrolled.' (Lord Wantage, at meeting of National Rifle Association, quoted by Rev. J. P. Gledstone, in *Boy Soldiers*, p. 1.)

(b) 'Some day, should the Government ever want to raise Volunteers to do barrack duties in this country in the absence of the regular army on foreign service, they could not do better than look to those who had had this early training.' (Mr Robertson, quoted by *Christian World*, February 20th, 1890.)

(c) 'Your corps seem to have two great aims in view,—first, to imbue their minds with real childlike faith in God; second, to drill their bodies in those military exercises that will enable them, as men, to defend our country against the attacks of all enemies.' (Lord Wolseley, quoted by *Christian World*, February 20th, 1890.)

(d) 'I should like to see those of you who have a soldierly instinct, when of a qualifying age, join your county battalion, and show by your devotion to your Queen and country, that you are carrying out the precepts,' etc. (Colonel Hilton, quoted in the *North Cumberland Reformer*, June 2nd, 1894.)

(e) 'Very great national importance was to be attached to the Boys' Brigade movement. He had conducted such reviews in many parts of the country, and was much encouraged by the way in which boys were by this means adapting themselves to military training. He dwelt lovingly on the German military system, which he described to the boys in much detail, and by which every man in good health was liable to military service during a total period of forty-five years. In England (Britain?), he said, the system was different, and, being voluntary, depended

June '02. ' upon such organisations as that he had reviewed that 'day.' (Article by Mr Maurice Gregory, *The Church and the War Office*, pp. 7-8.)

(3) Sometimes frank confession is made:—

(a) 'To him one of the good points in the Brigade was that it did encourage a military spirit.' (The Lord Provost of Edinburgh, quoted in *Our Boys' Brigades*, p. 19.)

(b) 'We are duly in receipt of your booklet containing the Charter of the Knights of Peace, and consider that if its proposals were carried out the Empire would soon be not at peace, but in pieces. I am requested to inform you that it is always a point of honour with our Brigade lads that they should join either Volunteers or Regulars on leaving the Brigade, and we intend to do all we can to encourage the military spirit, and have no sympathy with your movement.' (Letter, quoted in *Christianity versus Militarism*, by Rev. W. Spriggs-Smith.)

(c) The *Boys' Brigade Gazette* speaks of 'the large proportion of the officers of the Brigade who count it an honour and a duty to serve their Queen and country in the Army and the Volunteers.' (Quoted in *Boy Soldiers*, p. 10.)

(4) The step across has actually been taken:—

(a) Lord Wolesley once expressed the hope that they might have real guns that would go off instead of the sham guns they then possessed. But Mr Maurice Gregory describes an inspection at Hillingdon Court, last Whitsuntide, at which 'all boys strong enough to carry them were supplied with second-hand carbines—Enfields, Martini-Henrys, etc.—weighing between 7 lbs. and 9 lbs. each, which the boys showed proudly, pointing out the Government marks on the guns.' (Article, *The Church and the War Office*, p. 5.)

(b) At Leeds an entire Company turned itself into a rifle brigade, with new drill hall, canteen, mess and store-rooms. Also a shooting range. (*Leeds Mercury*, November 26th, 1901, quoted in *Christianity versus Militarism*.)

(c) A company of the Natal Boys' Brigade went into active service at the siege of Kimberley, equipped with Lee-Metfords, bandoliers, bayonets, and blue uniforms. (Mr J. Reid, in *Dundee Courier*, May 22nd, 1902.)

3. Whilst the militarising tendency is thus abundantly manifest, it is not so clear that the Brigades are more successful than other Christian organisations, or that they succeed better than they would do if they put the same earnestness into their work apart from the military element.

(a) It does not appear to have laid hold of the street boy—which was its original intention—but has become merely another part of ordinary church work. The arab and the Hooligan yet roam at large.

(b) Nor does it appear to have produced a higher type of boy. The *Daily Telegraph* (December 7th, 1897) gives an account of some Brigade lads 'at war' with one another—rioting very seriously. The *New York Republican* gives similar testimony of two companies who came into violent collision—the stronger driving the weaker company back into the church building with great violence and howling. Mr J. Forbes Moncrieff (*Our Boys' Brigades*, pp. 5-6) speaks of unseemly behaviour within doors at meetings. Our streets give evidence that the Brigade boys, if no worse, do not present a higher type of manners or morals than the rest of their class.

4. The religious motives of the Brigade movement are very strongly insisted on by its defenders, especially the verbal prominence it gives to the religious qualities of 'reverence' and 'obedience.' But—

(1) In the military sphere these qualities are entirely different from the same qualities in the Christian sphere. In the first case they imply submission to the word of command, to the military regulations; in the second, submission to conscience and the moral law. The first process hypnotises the moral sense, whilst the second develops it. The first produces automata; the second, moral beings—men filled with a sense of responsibility, duty, freedom of will and choice, decision of character.

(2) The large numbers of desertions from the British army, and of suicides in the conscript armies of the Continent, do not favour the theory that military drill produces reverence and obedience in any ethical sense of the terms.

(3) The attempt of the Church—as an institution whose appeal is purely ethical and spiritual—to adopt methods proper only to those who believe in brute force, must have disastrous effects upon the character of the young. For in the Bible class the boy is taught to love his enemies, but on the parade ground how to kill them—for it is impossible to separate drill from the purpose of drill, which is killing. In one place he is taught the virtues of gentleness, forgiveness, peace; in the other, the necessity of violence, revenge, war. One part is given to Christ, the other to Cæsar. He is to hold the Golden Rule in one lobe of his brain, the 'Lex Talionis' in another. Thus two authorities—or rather one authority speaking with two different voices—both claiming to be absolute, and both absolutely contradictory, demand his allegiance. The result must be to create a schism in the youthful mind, ruinous to consistency and faith. By a process like this we can succeed in producing a race of either brutal cynics openly scoffing at the ethical and spiritual, or smooth Pharisees only pretending to believe in them. Whence I conclude that, without necessarily making the boys good soldiers, military Brigades must inevitably make them bad Christians.

D.—I am invited to make suggestions as to the improvement of physical training in elementary schools and continuation classes. Suggested improvements.

1. Military drill and military instructors, as such, should have no place in our educational institutions, as being foreign to their spirit and intention.

2. Physical training should be scientific and natural if we are to reap the greatest possible benefit. Such training alone produces the highest results in character—and it is through character we must get at physique.

(a) Mr A. Alexander thus sums up the 'moral and intellectual' results of good gymnastics: 'Health of body—cheerfulness of mind; strengthening of body—manliness of mind, strength and skill; presence of mind—courage; activity of body—activity of mind, acuteness of the senses, strength of the reasoning faculties.' (*Physical Drill of All Nations*, xv.)

(b) Mr Alexander also earnestly counsels the English (British?) teacher 'to acquire every existing method taught in every country, and thus be in a position to discriminate and use their judgment in those methods which shall best give their pupils that good health, physical symmetry, strength and activity which has been so long our heritage.' (*Ibid.*, p. 153.)

(c) The regular school staff should be—unless in exceptional cases—qualified to give regular class instruction, just as in mental subjects. A trained gymnast should be attached to every school, whose duty it would be to thoroughly inspect every class not less than once a week, supplementing the class instruction as he had opportunity. His duties should include also the inspection of teachers. The Newcastle-on-Tyne School Board (of which I was a member for six years) employs such an instructor, who visits the schools once a fortnight, and supplements the work of the teachers. This is not often enough; neither is the inspection of a school or class *en masse* thorough enough; nor should it be the teacher who supplements the work of the instructor, but the other way. 'The instructor can then increase the number of his exercises, always keeping in mind that one set of muscles should not be worked upon for too long a period.' (Letter from Mr Goddard, June 2nd, 1902.) There is no reason, of course, why such instruction should not include marching—formation of companies, formation of fours, and other evolutions not essentially military—so far as they may give interest and variety to certain movements. But they are of little value in themselves, considered as gymnastics.

3. Scientific and natural training might be included under these four divisions:— Physical training: divisions.

(a) Gymnastics and calisthenics.

Brigade:
object
fulfilled.

ilitary
ning and
ristian
ilities.

(b) Games which promote force of character, freedom of choice, strength of will, judgment, self-reliance, quickness of decision.

(c) The various industrial arts.

(d) Life-saving.

4. Every school should be equipped with a good gymnasium, just as indispensably as it is fitted with a classroom. With our present inadequate provision, boys and girls are frequently (as under the Newcastle Board) exercised together, which is in every way a mistake. 'Certain exercises good for boys are not 'adapted for girls' (letter from Mr Goddard). Yet even thus imperfectly given, the beneficial results of proper training are 'noticed in the fact that the 'children are kept healthy in body and smart in 'appearance. Their gait is improved, and their wits 'are sharpened for their other lessons' (Mr Goddard). All gymnasia should be equipped as thoroughly for girls as for boys.

5. The swimming-bath ought to adjoin the gymnasium as inevitably as the gymnasium adjoins the classroom. If circumstances render it utterly impracticable, the managers of such school should be required to show reason for the omission.

6. The site of every school should include a large garden, or field, planted with trees, shrubs, and the simple flowers. This would be available not only for nature-lessons, but for the outdoor sports, which are even better than gymnastics. Our cramped, concreted playgrounds are a mockery of childhood's pathetic yearning for the fields and flowers. Here also children would be made familiar with the use of the instruments of simple husbandry. The results of spade and hoe exercise would be enormous, and would impart new moral as well as physical vigour to the vitiated children in our cities. Powers to acquire land for public purposes of such vast import for our national well-being should not take long to acquire.

7. The suggestion in this paragraph could only be made effective in certain cases, but I think there are cases which render it extremely desirable and possible. Horse-and-dog exercise should follow naturally, and to as great an extent as possible, on the heels of spade-and-hoe exercise. Riding lessons are not necessarily implied, but that every boy and girl should be taught how to approach, how to handle, how to command, how to make docile and tractable the dog and the horse. Girls might be shown how to soothe a restive, and boys how to stop a runaway horse. In learning how to control and manage these servants of man, the youth of our country would gain a freshness, moral vigour, power of self-control, force of will, decision of character that cannot be computed. A very large number of boys, in town as well as country, are brought into contact with ponies, donkeys, and horses, whilst all boys and girls alike are in constant contact with dogs; yet how few there are who intelligently understand their wants, feelings, natures, or how to intelligently deal with them! Every day the streets of our cities furnish pitiable evidence of the result, both to the tempers of boys and men, and the happiness of the creatures entrusted to their care—the result of a system of education that totally ignores the splendid opportunities of human culture involved in a knowledge of the ways of the animal friends of man.

8. Alongside the classroom, the gymnasium, the swimming-bath, should be built the workshop. The value of manual instruction, considered as physical training, has not been sufficiently appreciated. It is a mistake to regard it as 'technical' instruction, though even in this limited aspect it has been entirely scouted by some Boards, and inadequately provided by the best. In the school my own boys attend, there is no provision whatever for manual instruction; and I am compelled to provide work-bench, tools and skilled instructor at home. But this is not in the power of many parents, and should have an honourable place in all schools, as physical training. It is, in truth, one of the most wholesome forms of physical training. In the school workshop, as carefully ventilated and heated as the classroom, provided

with benches, lathes, seats, and every variety of necessary tools, taught by skilled instructors in wood, iron, tin, wire, and other materials, the scholars would be trained in handicraft, dexterity, eye-measurement, hand-sleight, thoughtfulness, patience, perseverance. Employed in close conjunction with science and art classes, it would constitute a perfect union of the theoretical and the practical. Mr Alfred Goddard, one of the most experienced educationists in the country, thus describes the possibilities of manual training: 'The chief points to be borne in mind in this 'subject are the training of the brain, the eye, and the 'hand, in their natural order, acting in conjunction 'with muscular development, so that in this way all 'parts of the body are brought into play. In physical 'drill, after the children have been taught the first 'movement, there is a tendency for the drill to become 'mechanical. This cannot occur in manual training, 'inasmuch as the brain must be always on the alert in 'order to produce the best results. Therefore, the 'muscles are being developed by the force required to 'drive the tools, and in this the brain is working harmoniously with the muscles. In order that satisfactory work may be obtained, models are so arranged 'that interest is kept up without unduly wearying the 'children, or causing them to work too long on the 'same set of muscles. Another important point is the 'dignity this subject gives to manual labour, owing to 'its being introduced as a school subject. The general 'outcome of the work is brighter pupils, more intelligent work, and a better understanding of the value 'of things.'—(Letter, June 2nd, 1902.) 'Perhaps it is 'unnecessary to add that both these subjects are very 'popular with the day school scholars' (*ibid.*). Not only is there a great love for this kind of training on the part of the children, but a great demand for it amongst parents. The Dundee Trades Council, whilst strenuously objecting to the introduction of military drill into the schools, earnestly called for 'further development of manual training, as being more valuable 'to labour and to the commonwealth.'—(*Dundee Advertiser*, May 15th, 1902.)

9. Grants should, of course, be made for efficiency in all these subjects, for evening continuation schools as well as day schools. The Education Department has taken a step in the right direction by allowing instruction in swimming at public baths to be counted as school attendance.

10. Exercises in life-saving would form a valuable and most interesting adjunct to any scheme of physical training. In connection with the gymnasium, it is easy to see how exercises in fire-extinguishing, or fire-rescue, might be introduced. I believe that in Manchester a boys' fire brigade already exists. The swimming-bath would afford opportunities for life-saving from water, and for resuscitation drill. Rescue and release drill could be arranged which would be invaluable to those who were to be the builders, miners, railway men, horse-drivers of the future. Rocket brigades would be immensely popular to young dwellers by the sea. Ambulance drill suggests itself as a matter of course.

11. Distinction boards should hang on the walls of every school, blazoned with the names of those who had actually saved, or bravely attempted to save, life from fire, water, railway, vehicle, runaway horse, or accident and danger of any kind. This would help to correct the frequently meretricious teaching of the history books—showing who were the true benefactors of their kind. It would hold up a higher type of heroism—showing that it was nobler to save life than to destroy. It would show true heroism to be something more than a strong and agile human body—that it might be exhibited by those to whom strength and agility had been denied.

12. A boys' life brigade actually exists on those very lines, and with those very objects in view. It is affiliated with the Sunday School Union, and has branches in various parts of the country. It is founded on a broad basis, and with means of complete national machinery. It issues manuals of instruction,

and is organised so as to make possible the earning of the Government Grant. The Education Department could not do better for the youth of the country than to foster, in the continuation classes, such societies and such training.

13. It is, of course, in evening and continuation classes that measures like these can alone be fully adopted; and it is precisely here that the best results may be obtained. 'Provided the pupils are healthy, those between fourteen and eighteen years of age may be given any amount of work to do. Mr Blackham thinks between these ages is the best time for 'development.'—(Mr Goddard.) With our parsimonious and perfunctory system, or want of system, in vogue so far, we get but slight results. 'The general experience seems to indicate that unless there is 'gymnastic apparatus, the interest drops. The drill, to be of any use, should be taken *con amore*—not as 'a task. The difficulty in evening school work is to maintain discipline, the attendance of the pupils 'being purely voluntary.'—(Mr Goddard.)

14. It is precisely amongst the youths and maidens of these evening continuation classes—too jaded and tired to care for mere mentalities—that a large and generous scheme of humane culture would tell. It would fill their lives with interest and brightness, and give 'school' a new and delightful meaning in their ears. Round educational institutions so generously motivated and equipped, the interests of the youth of a district would naturally revolve. Round them would be grouped athletic clubs, games, and sports, of an educational nature. The presence, on special occasions, of instrumental bands, trained also as part of the scheme, would impart fresh interest and zest to the whole.

15. Summer camps would also grow out of such continuation work, from which every branch of the work would derive new stimulus; for it would have its sports, its athletics, its spade-and-hoe exercise, its horse-and-dog exercise, its music—all under new and delightful conditions. Every school should be a miniature Chautauqua.

1. Our choice is between the military and the humane ideas of education, and my rough suggestions do, at any rate, point the better way. We can successfully attack the physical only through the ethical. Improvement in national physique is strictly conditioned by growth in national morals. The quality of the mind determines the state of the muscle.

2. For this reason, I suggest, in conclusion, that after we have adopted these or similar schemes, and the other and better schemes that will then come into view, we shall still find ourselves thwarted of the goal unless we go to the root of the matter; unless we straightway demolish the drinkshop—which exists to destroy national character; and proceed to erect homes for our people—which are the true nurseries of character.

7510. *By Sir Henry Craik.*—You say in your evidence, 'The "Terms of Reference" upon which this 'very Commission is conducting its inquiry is being construed into a mandate for the formulation of some 'scheme of military training.' Do you agree with that construction?—My impression is that it includes that construction.

7511. That the construction is justified?—No, I think not.

7512. You think that the construction has been an error?—I think it has been a gross exaggeration.

7513. Are there any words in the 'Terms of Reference' which you would think justified such a construction?—No, not in the 'Terms of Reference.'

7514. In the next column you say, 'Lord Balfour of 'Burleigh's Memorandum to Scottish Boards on Physical Training, February 1900, has led to the formation 'of numerous cadet corps.' You are aware that the Memorandum did suggest the formation of these corps?—Yes.

7515. So that it naturally led to the formation of them?—Yes.

7516. In that respect the Memorandum, of course,

has been acted upon in accordance with its words?—Yes.

7517. *By Mr Alston.*—You are minister of an Independent Church in Dundee?—Yes, sir.

7518. Successor to the Rev. David Macrae, I think?—Yes.

7519. How many churches are there in Dundee, would you say?—Roughly guessed, seventy or eighty.

7520. What would you say was the church membership of Dundee apart from your own?—I know that at the last census 20 per cent. of the population only attended church. I cannot say what the church membership actually is.

7521. Well, I suppose 30,000 or 40,000 would not be far out,—30,000. Be that as it may, what is the number of your own membership?—800.

7522. Would you say that they were representative of Dundee church-going population?—Hardly.

7523. Do they take the same view upon all these matters referred to in your evidence as you do yourself?—I have never asked them, of course; I fancy some do not; I daresay they have their individual opinions.

7524. You will not be offended at my stating that we have before us the account of your sermon the other day?—Of course I do not commit my congregation in any way.

7525. They seemed to approve, however, by cheers, of your views, particularly those about the Boys' Brigade?—Yes, I think the majority do approve.

7526. *By the Chairman.*—So far as you are able to say?—I am sure if the question is regarding my own congregation, I am perfectly certain the majority do approve.

7527. *By Mr Alston.*—I gathered so from their cheering the statements you made; I need say nothing about the sermon itself. Are you a member of the Peace Society?—Yes, sir.

7528. What is the exact tenet of that Society?—I cannot tell you in a sentence, off-hand.

7529. What is the precise view it holds?—I cannot give you its constitution.

7530. Being called the Peace Society, it must have some particular tenet upon which it is founded. Does it object to all war, all military training of soldiers and sailors in defence of country?—I believe the object of the Peace Society is to substitute arbitration for war in all national disputes; but of course, like other societies, there are personal differences in its ranks. For example, one Vice-President of the Peace Society is the Rev. Hugh Price Hughes. I mention that merely to show that there are great differences.

7531. But is it not the case that we are all members of the Peace Society inasmuch as we desire peace?—Some may, perhaps.

7532. As one of the greatest blessings we can have?—I would not say that all, sir, were entitled to be called members of the Peace Society.

7533. In the sense of desiring this greatest blessing of peace?—I think some more than others.

7534. We do not all take the same method of enforcing our views. What I wanted to be at is this: As a member of the Peace Society, does that tincture all the views you have expressed about military training?—No, sir. I am a member of the Peace Society because I hold these views; I do not hold these views because I am a member of the Peace Society.

7535. You make the distinction?—Clearly and strongly.

7536. But you have made some very strong statements here against all military training. Then what is military drill in the sense in which you understand it?—Teaching the use of deadly weapons.

7537. Then, of course, that cuts us off from all defence of country?—Ultimately it will, because there will be no necessity for defending the country.

7538. I mean now; we will get at that condition through another channel, but just now?—Well, I am prepared to take the risks as a citizen.

7539. So that you really take very strong ground when you give evidence like this against all military training?—Yes.

Rev.
W. W.
10 June

7540. And we must value your evidence on the ground that you take?—Still my evidence must be taken, sir, I think, as it is given rather. I am quite willing to state my own personal views, but I am trying to give views which, I think, are of public efficacy.

7541. We quite appreciate a large part of this evidence as a desire to show the best methods of training the youth of the country; but military drill does not necessarily imply the use of deadly weapons. Policemen get military drill, firemen get military drill, and other bodies get military drill, that is to say, military drill in the sense of carrying out evolutions, in large or small bodies, going through various movements for the attainment of one object, namely, unity of action; that is military drill?—Is the witness entitled to ask questions, sir?

7542. *By the Chairman.*—Well, I prefer that he should suggest them by his answers.

7543. *By Mr Alston.*—I put the question in reference to your evidence: 'At Leeds an entire brigade,' etc. I presume, first of all, in speaking of the Boys' Brigades you refer to the companies of the Boys' Brigade?—I mean all associations of boys in connection with churches.

7544. In Scotland?—And England; all associations of boys that include military training in connection with churches.

7545. To be technically correct, the Boys' Brigade is one body; its companies are 'units.' When you speak of Boys' Brigades in Dundee or elsewhere, you mean companies of the Boys' Brigade,—you understand?—I am afraid, sir, I do not quite understand.

7546. Then do you know sufficiently about the Boys' Brigade?—Yes, sir; I know a good deal about it.

7547. It is an organisation that has a great many companies attached to various churches?—Yes.

7548. Well, speaking of the companies of the Boys' Brigade, I find you say:—'At Leeds an entire brigade'—which, I presume, means a company—'turned itself into a rifle brigade,' which, I presume, means a rifle company. Can you tell me anything about that company?—I can produce you the paragraph from *The Leeds Mercury*, and read it to you.

7549. Is any name given as the captain of that company?—No, not in the paragraph.

7550. No mention of the church to which it was attached. If it does not give that, I cannot make any point of it. Have you any exact knowledge of the Boys' Brigade; its principles and its methods?—Yes, sir; I have read the manual, and I have talked with many of its leaders and defenders, and conducted a newspaper controversy on the subject.

7551. Then do you know, as a fact, that the testimonies in favour of the Boys' Brigade, and its results on the religious, moral, mental, and physical conditions of the boys, are numerous and emphatic from clergymen of all denominations all over the United Kingdom?—Yes, sir; I have seen many testimonies like that.

7552. And you disagree with them all?—I think that they are overstated; I think that they desire to read into them a success that is not justified by statistics.

7553. Do you know that those testimonies are given by clergymen in relation to what is going on in their own schools and churches,—the good that the Boys' Brigade company is effecting,—and they do not put pen to paper to give an exaggeration. They are so numerous that really it is not worth enlarging?—They are numerous; one always reads them, but I take leave to think that their opinions are coloured by their prepossessions, and that they see a value in the institutions and in the work done which others looking at them impartially may not see.

7554. And with due knowledge?—Yes.

7555. Of the movement, and what it does?—Yes; I think so.

7556. Do you prefer to believe what the newspapers say and these other writers you quote here?—The newspapers are all in favour of the Boys' Brigade, so far as I have read them.

7557. Yes, but you quote them against it?—I quote certain items of news which the newspapers report.

7558. 'The press constantly describes them as "embryo warriors,"—that, of course, is against the movement, and a misstatement of what the movement is?—I am quite sure the man who wrote it thought he was paying them a compliment.

7559. Further down you quote a Mr Robertson in *The Christian World*,—what Mr Robertson?—I do not know; I cannot tell you.

7560. You do not know the value of his statement?—No.

7561. Then you refer also to 'a company of the 'Natal Boys' Brigade'; where did you get that fact?—In the correspondence letter, Mr J. Reid, in the *Dundee Courier*, May 22nd of this year.

7562. And he called it a company of the Boys' Brigade?—Yes.

7563. That practically went to war?—Yes.

7564. How can that be when the boys are between twelve and seventeen?—Boys of seventeen might have gone.

7565. No; they must be between twelve and seventeen; and boys of seventeen must leave the brigade. There is some mistake there, you see?—I give the name of the correspondent and his address. He was not contradicted in the newspaper by those he was writing about, and against whom he was writing.

7566. That is the worst of a newspaper paragraph; so many of them talk so much nonsense we really cannot attach much importance to it. There are a good many other points in your evidence. I gather you are, generally speaking, so strongly against all military training that you would not allow it to be introduced in any of the Board Schools in any shape whatever?—No, sir. In the sense in which you said that policemen, and firemen, and others had military training, I have no objection to it in Board Schools.

7567. That is military training?—If firemen are being trained, call it what you like.

7568. It is better exemplified in the police. We know that they are trained in military formations, with the object of obtaining the greatest amount of force and effect by union of movement and effective defence against a riotous population, as the case may be. You seem, however, to have thought that the military drill involved the use of deadly weapons?—I still think it does, sir; and that military drill is not a term properly applied to anything that does not include the use of weapons whose purpose is to kill.

7569. Would you say that the model gun of the Boys' Brigade is a deadly weapon?—No, it is not intended to kill, but it is intended to teach the use of another deadly weapon which is intended to kill.

7570. Is it not possible that it is entirely used to put the necessary finish to the drill, the necessary finish to one of the exercises incident to military drill, namely, the manual exercise?—It might conceivably be so.

7571. But it actually is so. If this Leeds company, to which you refer, is the company that I think is indicated, it was struck off the strength of the Boys' Brigade because the officer commanding chose to use a rifle that could be discharged. You see there is a distinct line drawn there; that is why I wanted to be particular about your ideas of military drill?—But, sir, we have distinct evidence of children being armed with Martini-Henrys and Lee-Metfords that have been cast aside by the Service.

7572. But who are these children who are so armed?—Boys' Brigade.

7573. Perhaps you do not know that it is a regulation of the Boys' Brigade that no company shall have a weapon that is capable of being discharged?—They have been discharged in previous days.

7574. They are rendered incapable of being discharged?—I daresay.

7575. It is a very important distinction?—I cannot see the distinction.

7576. Your answer was based upon the use of deadly weapons by children; the instruction in the use of

Military training: no objection to certain forms.

Deadly weapons.

Boys' Brigade.

deadly weapons?—The instruction in the use of deadly weapons; it is that I object to. I say, if you use a broomstick, giving sword or bayonet exercise with the broomstick, it constitutes exercise the end of which is killing.

7577. So that all these exercises, valuable in the opinion of so many, are cut off by you entirely?—I dispute the value of the exercises, sir, considered as scientific training.

7578. The evidence before us has been very considerable as to the value?—I do in my evidence say I favour marching of various kinds to give variety to gymnastic exercises, though they are not of much value as gymnastics.

7579. I do not think I need pursue this branch of the subject, but I wanted to bring out these points in case you should be under a misapprehension as to what this Boys' Brigade is and what it does, and I am afraid you are?—I am afraid I shall have to remain, because I have studied all the facts.

7580. I happen to be President of the whole movement, so I ought to know something about it, and I think it is a pity you should be under a misapprehension.

7581. *By Mr Fergusson.*—I think you said, in answer to Sir Henry Craik, that you did not agree that the Terms of the Reference to us had anything to do with military training?—Not necessarily.

7582. The object of physical training is to make men physically fit, is it not?—Certainly.

7583. That is the idea, and of that you quite approve?—Certainly.

7584. *The Hon. Thomas Cochrane.*—There are one or two questions I should rather like to bring out. I read your evidence, though I had not the opportunity of hearing you read it yourself. Are those your views as to the effects of physical training set out in section D of your evidence?—Yes.

7585. I think you have a very high opinion of the advantages of certain kinds of physical training?—I have.

7586. And you set them out generally in this article of yours?—Yes—too thoroughly, I know, to be adopted for a long time.

7587. A very thorough system that you advocate of physical training for children?—Yes.

7588. You have seen the benefits of it morally and physically: do you hope that by some system of physical training the better qualities of all children would be developed?—Yes.

7589. If scientifically carried out. You suggest that the teachers could acquire every existing method taught in every country, and thus be in a position to discriminate and use their judgment in those methods which shall best give their pupils that good health, physical symmetry, strength and activity which has been so long our heritage?—Yes.

7590. Have you inquired into any of those special systems that you advocate?—Long ago, when I was on the Newcastle-on-Tyne Board, I made a complete study of this book, which, I think, is the standard book on the subject—Mr Alexander's, the Liverpool Gymnasium.

7591. Have you made yourself familiar with, for instance, Cruden's system—Col. Cruden, of Aberdeen?—No, I have not. I am not a gymnast myself; I have only a book knowledge of the thing.

7592. Professor Sandow: have you heard his name in connection with physical exercise?—Oh, yes.

7593. Do you think his is a good system?—I would not like to say.

7594. And on the whole, you favour marching as a physical exercise?—I favour it merely as giving variety and interest to exercises which are in themselves valuable. I think the evidence of experts is that marching is not much use really as a physical development.

7595. You think it has certain advantages in the way of discipline and regularity?—Yes, I think so.

7596. The formation of fours and so on?—Yes.

7597. It all tends to the harmonious working of the school?—And there are other evolutions, which could not properly be called military, to which the same thing applies.

7598. It all helps and aids the discipline of the school?—Such as the maypole dance in infant schools, and things of that sort.

7599. Or trained effort?—Yes.

7600. Then you go on, I think, and give various other forms of exercise that you think would be good, and you consider that the beneficial results of the proper training are 'noticed in the fact that the children are 'kept healthy in body and smart in appearance'?—Yes.

7601. And you approve of swimming?—Very strongly.

7602. And outdoor sports and gymnastics?—Very strongly indeed.

7603. And you even go so far as to think that riding is an advantage?—I do not think riding lessons are practicable, but I do think that some teaching in the management of approaching a horse, the handling of horses, would be of immense moral as well as physical advantage to certain classes of children.

7604. And you go further, I think, and you consider that outdoor exercises are also very advantageous?—I think, on the whole, if properly conducted, they are the best kind of physical discipline for children.

7605. Including summer camps?—Yes, under proper supervision, to see that they do not merely loaf, but do take training in the open air.

7606. But then you stop short in all these at what you call military training. I heard some of the questions that were put to you; I failed to understand what the stumbling-block was?—Well, I will try and make it more clear if I can. I am in favour of all kinds of physical drill that is in itself physiological—in harmony with the laws, I mean, of physiology, and that conduces to the upbuilding of the physique and morale of the person who engages in that drill, and that has for its object, therefore, the strengthening of the body politic and the helping of others; but when training is directed towards destroying the most sacred object, that is, human life, when it is directed towards that, and when it includes the use of deadly weapons, that is, it includes killing as its purpose, I draw the line at that.

7607. You are in favour of such physical training as, in the words of our Reference, would 'contribute towards the sources of national strength'?—Absolutely; I would train the boys to be men, and let the army manage its own business afterwards, as it could. I do not think the school or the church is the place to train soldiers.

7608. But the physical training that would make the citizens better able to contribute towards the sources of national strength, if the same training would also fit them to defend their country, you would not condemn the training on that ground?—Certainly not; it is reasonable to conclude that a nation of physically strong men would, if they went to war, be in a better position to wage war than a nation of weaklings. That is evident, but I hold it is no part of the business of a school to train soldiers.

7609. Yes, I think I understand your point quite clearly?—And I wish to be distinctly understood, sir, that I am not here discussing the question of militarism so far as it belongs to the Army, or the Volunteers, or any regular or irregular force; I am discussing militarism in so far as it may be promoted by school training.

7610. I think that you have taken a strong view on that point, and I think you at various times have given expression to it, especially I think in a sermon that you delivered in Dundee?—It was not the only one, only it happened to be reported more than some others.

7611. And there you took rather a strong view, that you thought the child had been delivered into the hands of soldiers?—I think, wherever school children are being, or if ever they should be, trained specifically for the purpose of afterwards feeding the army, they are being betrayed into the hands of the soldier; I think so still.

7612. What had you in your mind at the moment you said that the child was being delivered into the

Board
deliverance.

hands of soldiers; had you anything special in your mind?—Yes, I referred specifically to the deliverance of the Dundee School Board.

7613. The deliverance of the Dundee School Board, I see?—Some of which I have quoted here.

7614. Not to the appointment of this Commission, for example?—I never referred to it, not the slightest reference; absolutely to the speech of the Chairman of the Dundee School Board and Mr G. K. Smith of the same Board.

7615. They would have only influence in Dundee, I presume; their utterances would not have any unusual weight with the rest of the country?—I would not like to suggest not.

7616. But they do not lay down the policy of the country?—Oh, no; I am afraid none of us do that.

7617. The awful declaration that you made that the children of the country are being betrayed out of the hands of the Prince of Peace into the hands of the Man of War was perhaps stronger than was warranted by the fact that the authority for this statement was merely a member of the Dundee School Board?—Well, that may be so—it may have been. Of course, I felt strongly the speeches made on that occasion by the members of the Dundee School Board; I felt very strongly, and I had not at that time seen your remit, quite possibly, for I never mentioned the remit in any shape or form, or this Commission in any way whatever; it is perfectly likely that I thought the Chairman was justified in his interpretation of it.

7618. And, in fact, now that you understand the remit of the Commission, you are not alarmed as to the militarism that was to be taught in the schools?—So far as anything that has occurred at this table is concerned I am not alarmed, but the utterances of military men that I have quoted, and which influence all classes of the community, do still fill me with some fear.

7619. You are very much alarmed at all militarism I think: you do not like militarism?—I do not.

7620. In any shape or form?—I do not.

7621. You rather consider that a military training as you say, 'by this process we can succeed in producing a race of either brutal cynics openly scoffing at the 'ethical and spiritual, or smooth Pharisees, only pretending to believe in them'?—You see I bring that in, sir, in my reference specially to Boys' Brigades. It is the attempt of the Church to teach the New Testament on the one hand and the art of destruction on the other, as I hold it to be. That attempt is teaching the child absolutely contradictory laws, which will make them either cynics or Pharisees, according as they obey one or other of them. That is my idea in the paragraph.

Soldiers and
Christians.

7622. You do not think that a soldier can at the same time be a good Christian?—I would not like to state any opinion whatever upon that question, because the question that I am discussing in the evidence, and that I am referring to absolutely in this, is the idea of the Church, which exists for ethical and spiritual purposes, the idea of the Church, even to the limited extent of Boys' Brigades, undertaking to teach the art of violence. That I hold to be giving the children a dual code of ethics, which at their early age must injuriously affect their whole moral nature. They do not know which authority to obey.

7623. You do believe that occasionally soldiers are excellent Christians?—In so far as they are not soldiers I am sure they are, but I do not think the act of killing a man is a Christian act.

7624. You have heard of General Gordon, for example?—Yes; I think General Gordon was an absolutely Christian man, but I think when he killed another or commanded others to kill he was doing an unchristian act.

7625. You are opposed to war in any shape or form?—I should say I think he was inconsistent, as we all are more or less.

7626. And this leads you to fear that in one of your statements I have read, that the children of this country might become like the Russians who, upon one occasion that you instanced, made war indiscriminately upon

women and children?—The glory of that was that they refused to do it: they preferred to be shot.

7627. The soldiers refused to do it?—Yes, they refused to do it.

7628. That is perhaps an argument in favour of soldiers?—No, that was only a very small number, five hundred, unfortunately.

7629. But you would be strongly against going to war with women and children, I am sure?—I should hope so.

7630. And supposing the Russians came over here and made war upon our women and children, you would be in favour of the inhabitants being trained up so that they could defend those women and children?—I think if we behave properly they are not likely to come.

7631. That is matter of opinion; but suppose they did come, you would be in favour of every citizen being able, physically fitted, to take his part in defending the women and children of his own country against such an enemy as that?—I am afraid that the question leads far afield.

7632. There are two more questions: You fear that the use and familiarity with weapons of destruction would lead to a great increase in the number of homicidal accidents or crimes. Have you any cause for that fear?—No, except that one reads frequently of accidents at farm places where fowling-pieces are left standing about, and country boys get hold of them.

7633. You speak more of homicidal accidents?—Well, it is the killing; I do not mean murders, I mean homicide, accidental or culpable.

7634. Accidental?—But I include both; I say accidental or culpable, do I not?

7635. 'It is reasonable to infer that the increased use of, and familiarity with weapons of destruction must lead to a grave increase in the number of homicidal accidents or crimes, and thus foster a lawless and criminal 'spirit in the community'?—Yes, well I think it does; I think you see that farm boys frequently take up a fowling-piece and level it at their sister, or something about that, occasionally you read about that.

7636. Is not that rather the want of familiarity with weapons than the familiarity with them. You do not find soldiers and tradespeople committing these crimes as a rule, or having these accidents?—There is something in what you say.

7637. A little knowledge is a dangerous thing?—But then there will always be a very large proportion of imperfectly learned people in that sense grouped round every weapon.

7638. But you do not mean to imply that soldiers and those acquainted with rifles are necessarily of a homicidal tendency?—Oh no, I do not imply that at all.

7639. Then there is a paragraph in which you are speaking of the Lads' Brigade, and quoting Lord Wolseley:—'Your corps seem to have two great aims 'in view—first, to imbue their minds with real childlike 'faith in God; second, to drill their bodies in those 'military exercises that will enable them, as men, to 'defend our country against the attacks of all enemies.' I think you find some fault with that statement?—Yes.

7640. Which appears to me to be a very noble ideal and a very splendid statement?—I cannot agree with that view.

7641. *By the Chairman.*—I should just like to ask: You say you have been in Newcastle and in Dundee?—Yes.

7642. Have you been anywhere else, so as to have a knowledge of other classes of people—all kinds of people?—I lived four years in Pitlochry, a country district.

7643. And have you been abroad?—I have been in Canada and America and in Holland.

7644. And now that you are at home, are you pretty well confined by your work to Dundee, or do you go about; have you an opportunity of going about?—I have not gone about so much since I have been in Dundee as I did in Newcastle. I have been very much confined in my work.

Rev.
W. Walsh.

10 June '02.

7645. I rather wanted to ask you that on account of knowing whether you had any knowledge of public feeling as against physical training. I am bound to tell you that we rather hoped to hear from you a good deal more opposition to the matter of our remit than we have had the pleasure of doing, because you have rather come here like Balaam: you have not only suggested the same very proper suggestions that have been made by a great many other witnesses, but in some cases you have gone far beyond them, and thereby helped us. I do not say that they are all quite practicable?—Oh no, no.

7646. Because there is a deal of expense?—Yes.

7647. But I mean—have you, in your acquaintance with other people, met anyone who seriously objects to physical exercises; have you ever heard parents or anyone else object to their children being given anything to do in schools which was not exactly book work?—Never; oh, never.

7648. Nor in the country?—No.

7649. If we wished to find some such witness, you could not help us to?—No, I could not.

7650. And you do not think that there is, because I think there was opposition some years ago?—I do not know of any; I never heard it. When I was in Newcastle, I was on the Board. I mixed very much with the parents of the children in the school. I never heard it; on the contrary, I heard numerous grunblings that there was not more physical training.

7651. On the ground of health?—On the ground of health.

7652. And on the ground of development?—And on the ground that the children were getting too much book learning and too little of the other. I heard that frequently, and I heard it in Dundee. I never heard the other.

7653. Thank you; it is very interesting to know that; because we had had a certain amount of evidence—a little—just to say that there was occasionally a spirit of opposition, but very little, and you fully back that up?—Absolutely. I do not know a case.

7654. *By Mr Shaw Stewart.*—May I put one question supplemental to that: Are you in favour of a considerable increase of physical training in our Board Schools in Scotland, quite apart from military drill?—Yes, sir; I do not think an hour a day would be too much to give to some form, varied on different occasions day by day, different exercises. I do not think an hour a day would be too much to give to all classes of the children, from the play of the infants' room up to the serious gymnastics of the seventh standard.

7655. *By Mr Fergusson.*—Do you think that some of the erroneous opinions that have been formed as to the object of this training is because of the term 'military drill.' What we have been talking of here is really drill adapted to teach children discipline, and might be more appropriately called school drill, and might not be so liable to be misunderstood. Is it the term 'military drill' that offends some people?—Obviously the term 'military' would make persons who in any way agree with me fear as to what it implied; but if the thing actually did not include training for the ultimate purpose of killing, there would be no harm in it.

7656. Yes; but as Mr Alston pointed out, it is just the same drill that is taught to policemen and many other people who are not being taught to kill; it is drill for the purpose of discipline and exercise?—There is nothing in this book (Alexander's) from board to

board that could be in the most remote sense suspected of teaching to kill.

7657. Quite so. Now, as to boys after they have left the elementary school, after the age of fourteen, I suppose you have got a lot of them in Dundee who have gone into trades?—Yes, we have.

7658. Do you think it would be desirable to continue any physical exercises for these boys? We are told that the good effects are very much lost if you drop them at the age of thirteen or fourteen, and that it would be very desirable to continue physical training and particularly the gymnastic part of it after the age of fourteen. Now what do you say to that?—I agree to it entirely. I think that when we see how the boys and girls,—pray sir, do not let us forget the girls—

7659. When we say boys, I think we all include girls?—In a city like Dundee, where we have a preponderance of females in the factory life, and we see how the girls wander aimlessly up and down our streets in the evenings as well as the boys, I wish, sir, to be most emphatic that any scheme must contemplate the girls equally with the boys, and I am in favour of any scheme that will develop the physique and the morale of those boys and girls; and I think that it should be something in the nature of what is commonly called recreative evening classes, but on a large and a much better type than the sort of—I do not know how to describe it—the recreative classes they have at present.

7660. You are not satisfied with the present?—No; I think very often they are the poorest teachers—there is no staff, there is no apparatus, there is nothing. I think the recreative evening movement has fallen into discredit—I am very sorry that it should—owing to that.

7661. You would like to see physical exercises—gymnastics—made a feature, a special feature?—I should, yes.

7662. Now would you be prepared to make that compulsory?—Upon—

7663. Let us say from fourteen to seventeen or eighteen?—If we were delivered from the fear of—

7664. Militarism?—From the bogey that always comes up? If we were delivered from that, I should be inclined to do it, though I do not quite like compulsion even with boys and girls getting to be fourteen; I would much rather, if we could, find some other way.

7665. Do you not think you would miss the class for which it would be most useful unless there is some compulsion?—There is a danger there; but, on the other hand, I think if at that age we go in for too much compulsion, we are likely to lessen the development of their own will and their own moral choice; I think there is a danger there.

7666. It would be at the most perhaps an hour twice a week, something of that sort; it would not be a very large call on their time?—I think you would probably find you would have a great many evasions of an untruthful nature if you made it absolutely compulsory, and that the moral results would not be satisfactory, but I would make them attractive, by appointing the most skilled teachers, and the best plant, and the best kind of rooms—make them attractive in every way, and give prizes for attendance. I think that in that way, and especially if we could—as this Boys' Life Brigade is doing in connection with the Sunday School Union—direct the exercises towards some specific and interesting end, such as life saving—if it could be done, I am quite sure you would have very successful evening classes.

Adjourned.

FIFTEENTH DAY.

Wednesday, 11th June 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman*.

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr GEORGE McCRAE, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary*.

The Rev. HENRY WILLIAMSON, examined.

Rev. H.
Williamson.
11 June '02.

7667. You are a Unitarian Minister in Dundee?—
Yes, my lord.

7668. And a member of the School Board of
Dundee?—I am.

7669. For how long have you been a member?—
I have been a member for eleven years.

Board schools
Dundee.

7670. Will you please go through your notes?—
The School Board of Dundee has encouraged the
physical training of children of all ages in every possible
way. In every school under the Board, I believe,
systematic exercises are given, which must be of the
greatest benefit to the scholars. The children appear
to enjoy the various exercises. It has sometimes oc-
curred to me that in some cases the exercises may have
been too exhausting for weak constitutions. No com-
plaint has been made. It is probable the teachers are
quite alive to the necessity of care in this respect.
There are varieties in the forms of physical training
in different schools. Probably the course followed in
one school is a fair representation of others. For in-
stance, Liff Road School:—

The ex-VI. boys are trained to use Indian clubs.

Standard VI.—Boys and girls have free gymnastics.

Standard V.—Boys, Indian clubs; girls, bar-bell.

Standard IV.—Boys and girls, dumb-bell exercises.

Standards I., II., and III.—Free gymnastics,
dumb-bell drill, tambourine.

Infants, similar exercises.

All scholars march in and out of the school to music.
Each class takes its line in the playground. An
addition desired is a fully-equipped gymnasium.
The good effects of the training are apparent. One
teacher has expressed the opinion that a system of
physical training proceeding by proper steps would
be of immense advantage, as individual assistant
teachers do not always conform to a regular course.
It is probable the teachers would be disposed to give
more attention to physical exercises if they received
the necessary encouragement. In common with many
people in Dundee, I was very much surprised to learn,
when the proposal was made that a portion of the
school children should take part in a procession on the
occasion of the coming Coronation celebration, that the
teachers declared their inability to manage their chil-
dren for a public procession. It appears to me that
there is room for more being done in the way of in-
fluencing and helping the children outside of the school-
room in the direction of physical training.

Continuation
Classes.

Continuation Schools.—I am specially interested in
continuation classes for elementary instruction. Hitherto
the majority of children have left the day-school on
reaching the age of thirteen, and obtaining the labour
certificate. Special effort should be made to reach all
of these. I have seen excellent results from teaching

physical exercises to girls in the continuation schools.
One head-mistress of a girls' continuation school attri-
butes her success in keeping hold of her scholars to the
drill. I am not aware of a similar effort for boys having
been made. For a long time I have given much atten-
tion to the young girls engaged in an important depart-
ment of the jute industry. From the conditions of their
employment, many of the girls become rough in their
conduct, indifferent to the claims of refinement, and
present appearances to the observer of their moral and
social condition suggestive of terrible evils. It is a
startling fact that only a short time ago they were all
in our day schools. I have tried to arouse the interest
of the School Board in an effort to reach these neglected
girls by means of special continuation classes, and have
succeeded in opening two schools during the winter
months. Although physical exercises have been
attempted, the girls have not taken to them, owing,
perhaps, to the exercises being such as are offered to
children in the ordinary school. I have the hope that
a system of physical training adapted for such girls
would prove an attraction to the class I am most
anxious to influence. They are not requiring severe
muscular exercise. They need a well-directed discipline
under a refined and educated woman to give them the
self-respect so little thought of in their daily work.
Allied to the continuation classes, a mill girls' club
has been instituted by a number of ladies in Lochee.
I am of the opinion that it would be possible to intro-
duce gymnastics and swimming. The superintendent
of the Dundee Public Baths is most enthusiastic in
his efforts to popularise the facilities for cleanliness and
healthful exercise he has under his control. There
seems to be a reasonable ground for hope that good
would result from the introduction of physical exercises
into the boys' continuation schools. The work in the
mills appears to keep back physical development, small-
ness of stature being almost a recommendation where
space is limited. The Town Council has provided
public playgrounds and also an open-air gymnasium for
children under fourteen. The keeper informs me that he
has often to refuse the privilege of the apparatus to
boys and girls over the age. It is obvious provision
should be made under proper conditions for all who are
likely to be benefited. With reference to the Boys'
Brigade movement I have no direct knowledge. The
neglected boys, I am afraid, would not submit to the
discipline at the beginning, though they might be
influenced by a well-regulated scheme. I find no dis-
position in Dundee on the part of any public body to
initiate any effort to deal with the children and young
persons under no proper parental or other control.
Probably a recommendation from the Royal Commission
may arouse local interest and activity.

Rev. H.
Williamson.
11 June '02.

7671. *By Sir Henry Craik.*—You spoke of a backwardness to start those continuation classes; to what do you attribute that unwillingness on the part of the School Board?—Well, one objection is that we have no right to use the ratepayers' money for philanthropic effort.

7672. But surely if it is philanthropic effort of an educational kind, that is really a duty imposed upon you by the Education Act?—Yes, the way I understand the Education Act; that is my view of it, but that is not the view of my colleagues.

7673. The amount of money that it would require would not be large considering the high grant that is paid for these continuation classes?—No.

7674. As you are aware, the Department pays three-fourths of the expense?—Yes, I am aware of that.

7675. And, of course, this subject does come within the sphere of education as defined by the Code?—Precisely.

7676. Could you suggest any means which the Commission might adopt to urge this duty upon the School Board?—Do you mean with reference to these classes of neglected young men and lads?

7677. I mean the continuation classes; you are referring to those who have left school, I suppose?—Those who have left school very imperfectly educated.

7678. Do you suggest any means that the Commission might take to impress upon School Boards their duties with regard to that class?—I am afraid they will not allow that they have neglected their duty; they are unwilling to admit that they have any other obligation than simply to provide continuation schools generally, but not for any particular class.

7679. You have in Dundee a larger body of half-timers than anywhere else in Scotland?—Yes; we have.

7680. Therefore you are very well acquainted by experience with the wants and conditions of that class?—Yes, sir, I have given special attention to the working population of Dundee, especially those who are engaged in the jute industry, and I may mention that I am the president of an association which numbers over 8000 members, nearly all of whom are young women and girls, and I am personally known to a great many of these people, and if I only had the backing, I am hopeful that I could win a good many of them.

7681. What are the purposes of this association?—Of this association that I am president of?

7682. Yes?—In the first place it is to prevent strikes. Young people, comparatively children, have it in their power in Dundee to upset the whole industrial arrangements; perhaps fifty in a mill, boys and girls not more than sixteen years of age, if they choose to stop work they can throw the whole establishment into disorder and stop it all.

7683. And that danger is much increased by the fact that they are not accustomed to listen to advice or to have any supervision, but to act upon their own views?—Quite so.

7684. You think that for that purpose a certain amount of supervision when they leave school, a feeling of comradeship, and of acting with a certain responsibility, should be taught them?—I am sure of it.

7685. And that might be done by these continuation classes?—Yes, I think they are just the very thing.

7686. Then are you prepared to say that it would be really for the good of these young men and young women that they should be required to attend continuation classes?—Certainly.

7687. And there would be no interference with, but rather a great security to, the trade and commercial interests of Dundee?—Of course it is the very thing we need, if we can get hold of these young people and get them educated and refined and brought under influences of a different character from those which they find in the mills. We have evidence of this; we have cases in which girls have been raised from almost sheer barbarism until they are really fit to be companions of any young woman.

7688. Then as we compel those under fourteen to give their whole time at school, you do not think there

would be any wrong to those over fourteen to compel them to give a few hours during the evening to such schools?—Certainly not, I think it would be of very great advantage.

7689. And it would really prevent a great deal of the good work done in the school beforehand being destroyed?—Yes; I am sure of it.

7690. Would there be any strong objection on the part of the community to any such compulsory rule?—Well, of course, they do not like compulsion as a rule, but they would submit to it, and my impression is that there would be no objection.

7691. They would recognise that it was for the good both of the community and of the individuals?—Yes; we have some little evidence of that just now in connection with our exemptions; we are exempting children.

7692. You refer to the exemptions under the Act of 1901?—Yes; we are asked to exempt children under fourteen from regular attendance at school, and we have done it on the ground—we either require a child to attend at a half-time school or an evening continuation school, and we find that the evening continuation school has been attended quite to our satisfaction. The only drawback, perhaps, was that we insisted on their attending five nights a week—Monday, Tuesday, Wednesday, Thursday, and Friday—and they find that the fifth night is not so well attended as the other four.

7693. But even three nights a week would be a very great thing?—I think so; I think three nights a week would meet the case.

7694. And quite equal to the general attendance of these continuation classes?—Yes, it would.

7695. Then you find that one of the subjects in these continuation classes—a certain amount of physical exercise—would both be useful and an attraction?—I think so.

7696. Therefore in the Code the Department might very well make a certain amount of physical instruction a necessary part of the instruction in continuation classes?—I think so.

7697. Just as is done now in the day classes?—Yes, but I think I might add to that, that I think it should be varied from the ordinary day school, because I doubt very much if these comparatively grown-up boys and girls would like to use the same sort of exercises that the children are using in the schools.

7698. Quite so; that it ought to be a system of physical exercise adapted to the wants of the class?—Precisely.

7699. *By Mr Alston.*—Is it not the case that the problem of the young worker in Dundee is a very serious one?—It is.

7700. More than in most other cities in Scotland, I think?—Well, I think so, because it is essentially a young workers' industry. We have a large number of young girls and a large number of lads that can find employment up to about sixteen years of age especially, and then, so far as the lads are concerned, they are no longer of any use.

7701. Is the greater difficulty with the girls?—There are departments in the jute industry that are open to the girls that are not open to the boys. Unfortunately, in Dundee the men have never been allowed, or they have never been encouraged, to become weavers. The weaving in Dundee is entirely confined to women, and a young woman, when she is sixteen years of age, may be tired of what is called the mill, and may aspire to be a weaver, and the line of separation between the factory worker and the mill worker in Dundee is something like the difference between black and white.

7702. When does the girl go to the mill?—Now, of course, she begins at twelve, if she gets exemption. You must understand that I am always dealing in my mind, not exactly with the lapsed masses, I call them the neglected. I always regarded the Education Act as an effort to get at those people who took no interest in education themselves, and for the sake of their own good, and for the sake of the State, it was desirable to get hold of them, so naturally my mind is attracted to that class.

Rev. H.
Williamson.
11 June '02.

7703. Then has your work lain on the side of the girls rather than the boys?—I have had the boys in my mind, but the girls have really been the most neglected.

7704. Is the working population of Dundee a fixed quantity, or do they move backwards and forwards between Glasgow and Dundee?—No, not much. Of course there are a good many Glasgow people in Dundee. They are the most difficult people that we have to deal with—some of the Glasgow girls, as we call them.

7705. It has been said that the intercommunication of these young people between the two cities is very constant?—Yes, of a certain class.

7706. In looking for work; and an immense deal of the danger and damage arises in the intercourse of these young people on the way between these two cities in travelling in large parties?—They do not travel in large parties; I am afraid they tramp from Glasgow to Dundee very often, and the Glasgow girl is a type in Dundee which is regarded with the greatest dissatisfaction. The Glasgow girl is altogether beyond the condition of almost any Dundee girl, and there is also the wretched relationships of young men and these girls that are deplorable.

7707. That is what I was referring to—one of the great difficulties?—Yes.

7708. Are the better classes in Dundee and the authorities rather indifferent to all this?—Although I am called a Unitarian minister, that does not reckon in my work in Dundee; I am really a minister at large, I may say, and I think I have been able to take a more impartial view of the work needing to be done by persons who are interested in the welfare of the community than some religious bodies who are obliged almost to reckon everything from their own organisations; they say, 'Well, if it brings numbers to our missions and adds to our reputation for good work, all 'right.' The Catholic and Protestant systematically neglect those who show no disposition to respond to the influence of religious movements.

7709. I was just going to ask you the question, when you said you had not sufficient backing in your efforts whether it arises from the fact that you are a Unitarian?—I do not think so.

7710. You do not think it does?—Oh, dear, no, I am on friendly terms with all sorts of people, and they look on this as a sort of fad of mine; I must say they think it is a hopeless enterprise.

7711. You spoke of one of the head mistresses having had very great success in the continuation schools with certain scholars, on account of the drill?—Yes, but these are not the class of girls that I specially refer to.

7712. Not these mill hands?—No, you will find, I say, that the mill hands have not taken to the drill.

7713. Are these physical exercises with musical drill?—Yes.

7714. Then it was sufficient attraction, for those girls at any rate, to go to the continuation school?—Yes, so the head-mistress assures me.

7715. And you say that there is some hope that the boys would be equally attracted?—I think so.

7716. A good deal of evidence before us has been rather the other way, that you would find great difficulty in attracting boys by physical exercises or any form of drill, even in continuation classes?—Well, that depends upon the boys, of course; these boys that I have in my mind are boys that would almost go to anything that would offer them an evening's entertainment. If you could say to these boys, 'now, come 'in and we will give you some gymnastics,' and encourage them, I am quite satisfied that many of these boys would do it.

7717. But you would not advocate the introduction of these methods as an amusement; you would put them under proper supervision?—Of course, but still they would not be uninteresting; I do not mean to make them amusement pure and simple, but I would recommend that there should be a proper system, and a proper arrangement of progressive work. I may say, if you will allow me, that the difficulty with

these boys is that they are so rude and so rough that nobody wants to teach them; the same with the girls.

7718. Yes, but what happened to them during school age then; were they equally unmanageable?—No.

7719. It is when they escape from school?—It is the influence of the mill.

7720. Then is that a peculiarity of Dundee?—Well, to some extent.

7721. When the boy and girl escape from the control of school, they come under influences that are highly injurious to both of them from the nature of the work in the Dundee factories?—Mills; you see we keep a distinction between mills and factories. One that works in a mill is regarded as inferior to the one that works in a factory.

7722. Is there anything you would suggest, dealing with the very special young population of Dundee, that the Commission could recommend?—Yes, I have long thought that the manufacturers are responsible. I hold the manufacturers have no right to take possession of these young people and place them in conditions of employment where their morality is injured.

7723. In fact they place obstacles in the way of the School Board carrying out all that it might carry out in reference to these young people?—I think so; it is hardly fair to say that they place the obstacle, but they know, or they ought to know, that they treat these young people as if they were machines, without moral responsibility.

7724. You would like some method by which that could be put a stop to, then?—Well, I think that if a properly qualified matron were appointed to each mill, she would see that there was nothing done that would in any way injure the proper conduct of young girls especially. The girls suffer more than the boys, I think.

7725. Is there any inspection in these mills?—Factory inspection.

7726. Only the factory inspector?—But his work is limited, and the female factory inspector's is limited. She can only complain if she finds any want of sanitary accommodation, or finds that there are any persons engaged who are under age; she complains that she is so limited that she scarcely has any power. I may give you an illustration of the way that these women are treated in the supply of drinking water. It is a very dusty mill, and water is brought in to them, in many of the mills, in a tin can, and this tin can has a tube coming down from the top into the water, and men and women go and suck the water up by this apparatus. The factory inspector has constantly complained about that; and some of the manufacturers have now put a water tap in various places, so that the girls can use a cup and get water themselves, but many girls have told me that they have gone all day suffering from thirst rather than go and get water in that way.

7727. On those points some other members of the Commission will probably put questions with knowledge of the subject, but there is just one other matter; you refer very shortly to the Boys' Brigade movement, of which you have no direct knowledge. We have had witnesses from Dundee who have said a good deal about that movement, and recent occurrences in Dundee have brought it very prominently to the front. Do you know anything of its effect in Dundee upon the younger boys between twelve and seventeen?—Well, as I hint in my evidence, I do not know of any case in which the Boys' Brigade has touched the neglected boy. The neglected boy is not a boy that is in poverty; he is working. A little fellow there—you would think he was not more than thirteen, but he is really fifteen years of age—told me he was getting 11s. 6d. a week, the other day. It is not poverty that troubles them.

7728. He gets the offer of the Boys' Brigade?—He gets the offer of the Boys' Brigade, but he would not remain. My observation leads me to conclude that the members of the Boys' Brigade are good boys before they become members of the Boys' Brigade.

Rev. H. Williamson.

11 June '02.

7729. Their goodness makes them desire to join?—Yes. Now, while I do not object to those boys being members of this Brigade, I cannot bring my mind to think that this Boys' Brigade has any effect upon these neglected lads.

7730. Then, again, it is a peculiarity of Dundee that even this organisation does not get a certain class of the boy population?—I think so.

7731. Though it is successful in other cities?—In getting hold of that class.

7732. Yes?—Well, of course, I can only say that, so far as my observation goes, when I see the Boys' Brigade, and I sometimes see them on the streets, they strike me just as being boys out of a Sunday School.

7733. May they not have improved from a worse condition?—No, no. Of course any boy would be improved by being trained, but it is the moral effect of the Boys' Brigade that I am considering. If it is merely physical training, of course, no doubt, it is an advantage to any boy; but I suppose the idea is that possibly you might get hold of the rough material, and work them up into self-respecting lads, just the same as when a man joins the militia—a very rough specimen of humanity will join the militia, and, being kept absolutely under control, he is made all the better for it.

7734. Then could you suggest any organisation that would produce the results that you desire?—Well, I think the continuation school, with bright and helpful instruction in manual training, and in physical training, and in some gymnastics and swimming; but, of course, it is necessary that you should have great patience with them.

7735. We will suppose them to be under proper instructors, and under proper control?—Yes.

7736. You think the continuation class would get at what you desire?—Well, we have had some experience of them in Dundee already. We started special evening schools for mill lads some time ago under the auspices of the Town Council. They got this grant, which is given for the reduction of rates, and used a large sum of it for opening manual instruction schools, and invited the mill lads especially, and they got considerable numbers of the mill lads; but here is the difficulty—the teachers all have the desire to eliminate the rough element as soon as possible, and the continuation school goes on then with their best scholars, and the very boys for whom the thing was most needed are excluded.

7737. Suppose there were compulsory powers, of course the difficulty of the teachers selecting the pupils would be done away with?—Of course it would.

7738. Then actual compulsion seems to be the only remedy?—Unless we can reach the teachers and the managers, and impress upon them that they must always have the door open.

7739. Then, one more question—Is there anything in the work of these young people during the day that would make it almost impossible to attend continuation classes?—Nothing.

7740. No amount of over-fatigue would prevent them attending such classes?—No; they have a good deal of rest during the day; their work is not really hard.

7741. By Sir Thomas Coats.—I did not quite catch the difference between factories and mills; would you please explain it to me again?—The mill is the spinning department, the factory is the weaving department, or it may be also that the workers who receive day wages, and those who receive wages for what we call piecework.

7742. Then, in regard to half-timers—what proportion of half-timers do they employ in these mills compared with the whole number employed, or, take the mill itself; what proportion would be half-timers?—Well, I could not exactly say the exact proportion.

7743. Well, but roughly, would it be half?—I should think about half of the children you see there are full-timers and half-timers; they are all children. We generally speak of two half-timers for one full-timer, so about half, I should say; but I must give that subject

to possible correction. It is said that in Dundee the number of half-timers is getting less.

7744. But I understand you to say that the proportion would be about half?—That is amongst what we call children.

7745. Well, up to what age?—Sixteen.

7746. Are the children educated in special schools or do they attend regular Board Schools?—We have one special half-time school, and then in some of the mills they have their own half-time schools. I think there are two half-time schools in Dundee connected with the mills, and then we have also half-timers and full-timers mixed in two schools.

7747. What proportion would be educated in that way, that is, in the mixed schools—about half again?—I should think so; about; yes.

7748. Then the half-time system in Dundee is the alternate day system, or the half-day system?—It is both; in some cases one, in some cases the other.

7749. Then from your experience of the children do you notice any difference between those who are employed half the day and those employed every alternate day, and attend the school the other day?—That has not occurred to me; I have not noticed any difference.

7750. Those special schools; are they better staffed than the ordinary school?—Well, I should hardly think it. There is a half-time school under the School Board, and there are, I think, three half-time schools that were managed entirely by the different works to which they belong. I have no knowledge of the staff in those schools; but in our own half-time school we pay, in some cases, an extra salary to our teachers that they may be better fitted for dealing with these children.

7751. Do you know what proficiency they have in their education; are they behind the other Board School children?—Well, generally speaking, it is said that the same child—a half-timer—compared with a child of the full time, the same class of child, belonging to the same social class, that the half-timer as a rule keeps up to the others. Their attendance is generally much better. On the whole, a half-timer belonging to a certain class attends—he is obliged to attend the half-time school—and he attends more regularly than he would have done perhaps if he had been a full-timer.

7752. Then do you consider that in the half-time schools they could give a certain proportion of time for physical training?—I do.

7753. Is it done at present?—I am not so sure about that in a half-time school; I cannot say. I had an impression it was, but I have not enquired into that.

7754. Can you tell me are these half-time boys and girls employed indiscriminately; are they mixed in the mills, or do the boys do a certain class of work—the half-time boys—and the girls another class of work?—It is very difficult to say what goes on in the mill. The employers do not care to have anyone go into the mills, and one can only learn by enquiry. I fancy that the boys are usually employed in what is called the low mill, and the girls are employed in what is called the spinning department; but there are boys and girls employed; but I am not aware that they are mixed in their employment.

7755. In your experience, do the half-time children turn out rougher than those who pass through the school at full-time, and commence work when school-time ends?—Some of them.

7756. But, as a rule, you would say they are rougher?—I perhaps could better let you understand my view by explaining the half-timer who has a good father and mother, and has a good home, and is under proper religious training and influence, appears to pass through the discipline of the half-time and the rough contact with the people in the mill almost unscathed; but the child who has no proper guardianship, and has no person who takes any interest in him or her, in almost every case the child loses what little self-respect the child had when leaving school, and deteriorates.

7757. But surely with children of such tender age there can be very few that do not belong to families, or under the supervision of father or mother?—Well,

Half-time system in Dundee.

Half-timers and full-timers: relative proficiency.

Half-timers: employment of boys and girls.

Dundee: peculiar conditions.

Rev. H.
Williamson,
11 June '02.

if I may explain to you another feature of Dundee life: we have a very large number of children in Dundee whose fathers have deserted them; a great many deserted wives; we have a large number of widows with children; we have a large number of illegitimate children. The morality of Dundee, owing to the fact that we have a much larger proportion of women—and uneducated women—than there are in some other towns, is so serious in its character; and very sad stories are told. It is very difficult to get facts in regard to some of these things; but very sad stories are told of very gross acts of immorality carried on owing to the fact that so many children have no proper parental supervision.

7758. But why should that occur more in Dundee than in other manufacturing towns; is it the nature of the work?—Well, I think that I have already explained that the Dundee industry is almost entirely a woman and child's employment, and it draws women. For instance, men that have lived in the country, and have a grown-up family, move into Dundee for the sake of getting employment for their daughters, and so they manage to make out a living. It attracts people from all parts, and, of course, the trade itself is a comparatively poor kind of work. Jute is a fabric which almost perishes in the using. There is nothing which calls out any great amount of skill or ingenuity.

7759. I am asking these questions from experience of another manufacturing town where a certain number of half-time children are employed. They are almost entirely girls, and when they leave the half-time they go on to full-time, and do the regular work of the place?—So do our Dundee girls.

7760. But there are the same number of boys born in that town, I suppose, as in Dundee?—Yes.

7761. Yet none of these boys are employed half-time; very few boys are employed in the factories, yet we do not seem to have a surplus of boy labour—I am talking of Paisley?—In Dundee the boys are not admitted to the weaving. If we could only get rid of the prejudice which exists in Dundee against boys and men taking to weaving, we should be relieved of a great many of our troubles, because there are many women in Dundee that earn £1 a week in the factories, which is a very fair wage for a woman.

7762. Yes, but neither are they employed in Paisley in that sort of work?—But they go into spinning.

7763. Oh, no?—I imagine that in Paisley there are foundries.

7764. Yes, there are foundries and engineering shops?—Well, in Dundee we have very little of that; we have no employment in Dundee to speak of for the number of lads that pass through our mills, and when they are sixteen years of age they leave the mill altogether, and they have no other employment.

7765. Thank you. I wish to find out the difference of employment between Dundee and Paisley, because I do not think that lax state of morals you talk of as being prevalent in Dundee is prevalent in Paisley?—I am sure I am very glad to hear it.

7766. *By Mr Fergusson.*—You said that the teachers complained of their inability to manage the children in the Coronation procession; what did you mean exactly by that?—Well, I, in common with some members of the School Board—in fact all the members of the School Board—thought we might have our day-school children take part in the public procession, and it was suggested to the teachers, and the teachers said that they would not be able to carry out this.

7767. Do you mean they could not control the children, or they did not know how to march them through the street?—I mean they were quite unable to manage their children in the public streets.

7768. Then it seems that the children in the elementary school are not a very ruly lot either?—It does seem like that, or rather the teachers have very little control over them, unless they were unwilling, and just made that excuse.

7769. About these continuation schools. I did not quite understand when you were answering what Sir Henry Craik asked you. Do the Dundee School

Board carry out the same continuation classes that are common all over the country?—Yes.

7770. They do?—Yes.

7771. But what they object to is to do something which is not done anywhere else; some special schools for special classes of people, is it?—They say these girls, if they like, can be admitted to the ordinary evening schools. They have never been refused admission; but, of course, you may say the girls have their stupid prejudices; but the girls I refer to seldom wear a hat, and sometimes they do not wear boots—and they do not have a dress often. They just have a petticoat and a little shawl over their shoulders, and I have stood at the gate of one of our continuation schools and seen the girls coming in, and I have seen some of these mill girls standing at the gate waiting, and in marched, perhaps, half-a-dozen smartly-dressed girls, just as if they were going to church, with their hats and ribbons. These other girls said, 'We are not going in there with those mashers,' and so I say the poor girl's prejudice is a mistake; but I say, 'We will have a school for you and you shall come, and when we've opened these mill girls' schools they were attended.'

7772. Quite so. Do you advocate making continuation classes compulsory for these girls?—I would make them compulsory. I believe we are entitled to make them compulsory, because I believe the girls are getting into mischief.

7773. Then you would have to make a different school for every class of girl?—Oh, I do not think so.

7774. I mean for the factory girls and the mill girls; they would not go to the same place?—If they were obliged to go they would have to go. Let me just say—without wishing to raise any sectarian feeling about it—the Catholic feeling in Dundee must be always taken into account. My experience of the action of the Roman Catholics is that they pay no attention whatever to a disobedient Catholic. A Catholic who disobeys the Church may go to mischief for anything that they will do. Of course the door is open for them to return whenever they choose; but if a Catholic is disobedient nothing is done for him. But they have the Catholic prejudice, these lapsed Catholics, and it has been said—and I think there is too much truth in it—that a good deal of our low state of morals indicated amongst the mill workers has been owing to a certain element that has come in not altogether from Dundee but from Ireland.

7775. You are not peculiar in Dundee. If you make this continuation class work compulsory, whether it be physical training or anything else, how are you going to enforce it? These girls, for instance, you say, do not like to mix together, do not like to go to the same class; suppose they say they will not go, what are you going to do?—Just as we have half-time schools; I would have a school for them for the purpose.

7776. No; but these girls of sixteen or seventeen will not go to school; how are you going to enforce it?—Well, it is a difficult thing to say; we enforce many things. It is the good of the girl we are after; I am quite as much opposed to interfering with the freedom of the subject as anyone, but I am very anxious to save these girls from themselves, and I think almost any kind of compulsion that could be carried out would be a help.

7777. You say the Town Council provide open-air gymnasia, are they free to anybody?—Under fourteen.

7778. Where are they?—The open-air gymnasium are in a public park.

7779. May not anybody who goes into the public park use them?—No, only persons under fourteen.

7780. But are they in enclosed places?—No.

7781. Then they are open to all?—Yes, but the caretaker will not let them.

7782. There is a caretaker?—There is a caretaker.

7783. Is he always there?—Yes.

7784. Then there is some supervision always?—Oh, yes.

7785. And there has been no accident?—Only very trifling accidents, just now and then. A child has

fallen off a swing. There is no trapeze, but there are some other forms of gymnasties; but the accidents have not been of any very serious nature. The complaint is—and the caretaker feels it very much (he is a very fine fellow, and has great sympathy with the working people)—that there is a restriction by which he is not allowed to give access to the playground to boys and girls over fourteen who very much desire it.

7786. *By the Chairman.*—Just on that point, about the school children being unable to take part in the procession, your attention, as a member of the School Board, has been called, no doubt, to the Circular, No. 347, of the Department; may I ask whether that has been inculcated by your Board on the teachers?—Yes, in a general way, it has been recommended to the teachers, but not this particular clause.

7787. *By Sir Henry Craik.*—May I ask if that Circular was read to the School Board?—Oh, yes, sir, we all had copies of it.

7788. *By the Chairman.*—How did your Board come to know that the teachers were unable to manage the children?—The teachers reported themselves.

7789. Collectively or separately?—Through a committee of headmasters.

7790. And what action did your Board take; did they say the teachers were right in not being able, or did they say they were wrong?—Did nothing; took no further notice of it; simply allowed the teachers to determine; they dropped the suggestion. Of course, we were leaving it very much to the discretion of the teachers; but we were anxious—some of us, at all events—thought that it would do good to bring the children.

7791. I am only asking of the Board, as a whole; of course I do not want individual opinion; but the Board, as a whole, did not think that the teachers ought not to have said they were unable?—There was nothing done; no.

7792. And nothing contemplated, so far as you are aware?—Not in the way of a procession.

7793. No, but anything contemplated in rebuking the teachers for not being competent?—Oh, no.

7794. It comes to that?—I thought I was to give an individual sort of opinion here, and I felt that that was a thing which I thought was rather unsatisfactory.

7795. And the result of it is that nothing has been done?—Nothing in the shape of a procession; but the teachers have, so far, consented to assist in the celebration of the Coronation.

7796. *By Sir Henry Craik.*—The point of importance in that Circular which has been referred to is this, 'that Their Lordships urge that of the two things of school work—that is, intellectual instruction and moral discipline—the second should be regarded as the more important, and it cannot be too clearly realised that the discipline of the schoolroom has failed in its effect if it is not reflected in the bearing and the conduct of the pupils outside of the school precincts'?—Yes, I quite agree with that.

7797. Was it pointed out to the teachers that they entirely failed, by their admission of this inability, to comply with that instruction?—No.

7798. *By Mr McCrae.*—In your view the School Board of Dundee has not fully appreciated the advantage of continuation schools?—In my view, yes.

7799. Does that apply only to these special schools that you consider necessary for boys and girls of a certain class, or does it also apply to the ordinary schools?—Well, I may say that it has been said by members of the School Board that they thought they had too many of these schools and that they were an expense to the ratepayers, and there was no disposition to regard them as of so much importance that they ought to be carried out with any great enthusiasm or confidence.

7800. Can you say what number of continuation schools you have in Dundee under the Board—evening schools?—Well, we have girls; we had last year, Liff Road, South Road (mill girls)—that is the class of girl; I am speaking now of girls' schools; Blackness, Brown Street (mill girls); Rosebank, Wallace Town, and Hill Street—I think that is all.

7801. Are these all girls' schools?—All girls' schools.

7802. And what would be the proportion for boys?—Well, then the boys; we have Ancrum Road, Balgay (mill boys); that is something corresponding to mill girls' schools.

7803. So that you have a special school for mill boys?—For mill boys.

7804. One?—I will give you others; Mitchell Street, mill boys; Hawkhill, Victoria Road, Butterburn, and Ann Street (mill boys). We have three schools for mill boys, and the others are ordinary evening schools.

7805. So that from that answer I gather that you have at the present time special schools both for mill boys and for mill girls?—Yes, we had up to last year, but the Board has now resolved to discontinue the special schools for mill girls, and proposed to transfer these girls into an ordinary evening school.

7806. When was that resolution come to?—Just a month ago.

7807. In your view, these special schools were doing excellent work?—Yes, in my view, that they are capable of doing more, but the girls have so far advanced, those that remain, that they could be treated now as members of an ordinary evening school.

7808. Then I suppose that, with regard to the boys, they leave school, most of them as half-timers?—Not most of them; you see the half-time does not nearly take up the whole of the available children.

7809. Have you an interregnum in the case of the child who continues school to the usual period between leaving school and going to work?—No; oh, no.

7810. He can find work immediately after leaving school?—Yes, he goes to work.

7811. We had a witness who gave some evidence that in certain towns there was an interval of, say, two years after the boy had left school when he was doing nothing. That does not apply to Dundee?—No difficulty at all; there is too much demand for child labour in Dundee.

7812. You said, I think, that the boy generally left the mills when he was sixteen?—About sixteen.

7813. And then what does he do after that?—Well, if he can get into the army he goes, and if he can get into the navy, perhaps he will go; if he can get into the militia he will go; but many of them get associated with girls and set up a kind of partnership of a doubtful character. The girl works.

7814. At that early age?—Well, not at sixteen. The trouble begins at sixteen. The lad becomes a loafer, and you may go through the streets of Dundee, and you will see in the course of half-an-hour's walk, I should think, fifty of such lads.

7815. Can you tell the Commission what time is given to physical drill in the continuation classes?—In the evening schools?

7816. In the evening schools?—Well, I do not know the amount of time. I suppose it would be one hour a week or half-an-hour a week; something like that; but, of course, it is in the time-table; the time-table is prepared.

7817. Do you know whether that is all in one evening, or is it distributed?—I do not know.

7818. Have you ever considered the proposal that there should be a public gymnasium, provided by, say, the Local Authority, for the use of scholars attending these continuation schools?—No.

7819. You have never considered that?—That has never been mentioned; no.

7820. Has it been present to your own mind at all?—Well, in connection with this public gymnasium I say when we find that there is a demand for a gymnasium for boys and girls over fourteen, there certainly should be a place made for them.

7821. And supposing there was such a building, should it be under the control, do you think, of the Local Authority or the School Board?—Well, it would be a question. I should think it would be better under the Local Authority when they got that age.

7822. But if these children were attending the evening continuation schools, would the Educational Authority, perhaps, not have much more power over them?—Very likely, yes, perhaps they would. We have a joint committee already in connection with some of these evening schools.

7823. I was glad to hear you say that the Town Council had been doing good work with regard to technical classes provided out of the Residue Grant?—Yes, manual instruction. Of course, I may say, I think the misapprehension about the manual instruction was that it was never systematised; it was a slipshod sort of thing saying to a boy when he came into the workshop, 'What would you like to make; would you like to make a stool, or a pen tray, or something of that sort,' and no attempt was made to systematise the instruction, so that the boys got to be really the masters of the situation; it was the boy who determined what was to be done.

7824. Was it all arts and crafts, was there no theoretical instruction?—Well, the fact is it was started with this idea; the promoter of it said, 'What I want is for a boy first of all to draw in the school a certain thing, and then go to the workshop and make it.' Well, anyone who knows anything at all about the difficulty of working from a drawing, would see at once that that was rather a big order for this class of boy.

7825. Was there no attempt whatever to train those lads for any particular trade?—Oh, no; of course it was all joinery work.

7826. All joiners' work?—All joinery work; there was no attempt to train them for a trade. It was an attempt to give them occupation, and on the whole I have no doubt it was a good thing to have them occupied; but I saw from the beginning the difficulty would be the want of a systematic course of instruction. Some boy would be starting upon an object which could only be really done after perhaps two or three years' training, that he required the attention of the teacher to know how to work out the details of the object he was making, and, as I have reason to believe, this sort of work has ended in a kind of failure. They are obliged now to adopt some sort of systematic course of instruction. But it was an attraction. I may say that I think the mistake about these special classes has been the charging fees. Our friends in Dundee think that a fee is a good thing even although it is paid back. My idea was to open the door just as wide as the day school and say, 'Here is your school open for you, if you like to come in you are welcome.'

7827. With regard to the conditions of employment in Dundee, in your evidence you seem to think that the manufacturer was to blame; does that apply to conditions of employment?—Yes, that is the conditions of association with his being brought into contact with people of a rough and unrefined nature, not to go any further. There is a kind of language in the relation which is very bad.

7828. Then you mean the different degrees of character in the same sex?—Yes.

7829. You do not mean that the manufacturers can make any regulations for the separation of the sexes?—No, I do not think so. What I have all along advocated is that there should be a matron, a responsible person that any girl can go to and complain if there is anything said to her of an objectionable kind. What the girls tell me is that if a man uses an indecent word to a girl, if that girl goes to the manager, the manager will say, 'Oh, never pay any attention; never let on you hear it.' Now, the manager and the foreman, and they are all, of course, engaged in the driving process, and I may mention I do not know whether the same thing occurs in Paisley or not, but we have a woman in most of our mills who is called a shifter driver. We have heard of a slave driver, but this is a shifter driver. A number of little girls—half-timers—are engaged in shifting the bobbins from the spinning frame, and the object of the driver is to make them do it as quickly as possible, and the one that does it

quickest, of course, gets the approbation, and the one that is last is very liable to get a skelp, as they call it, and even I have heard of a mother going and getting work for a child, and saying, 'If she does not work, give her a skelp.' That is a Scotch expression.

7830. I quite understand it?—That lets you see that it is a question of driving up the whole, from the manager down to the half-timer.

7831. But is there no power under the Factory Acts to regulate such a condition of matters?—Not at all. The factory inspectors' duties and responsibilities are carefully limited, and all he can do is just simply to report if there is any danger from machinery, or any neglect, or any working over hours.

7832. Then your remedy would be further regulation within factories?—Yes.

7833. *By the Hon. Thomas Cochrane.*—Only two questions. You draw a very lurid picture of the condition of Dundee?—Always bear in mind that I am dealing with a class. I could also make a very fine picture of Dundee. If I speak about the other class of young women, some of the finest young women, I believe, in the country are to be found in Dundee, but fortunately they are able to take care of themselves; they do not require any help. There are some women in Dundee—you could not find better women anywhere—working women, working as Sunday school teachers, and working in every kind of good work; splendid characters. But all I want to guard against is being misunderstood—my interest is in these neglected people.

7834. Yes, you speak of the neglected class?—Yes.

7835. And draw a very sad picture of their condition. Do you think that it is entirely due to neglect, or are they naturally vicious?—I think it is entirely due to neglect.

7836. And you draw attention to the fact that all these terrible appearances of moral and social evil exist, and say—'It is a startling fact that only a short time ago they were all in our day school?'—Yes.

7837. Their education, then, has not entirely fitted them to withstand the temptations they have been subjected to?—No.

7838. It has not carried out to the full all that you would wish from it?—No. I think there is some want—some want of oversight that should carry on the discipline of the school.

7839. In their particular case it has failed utterly?—Yes; you do not see any sign of it.

7840. No sign of it after they have left school. No sign of any benefit having been derived from their education?—No.

7841. In other cases where they are not neglected, you do see a distinct advantage?—I know half-timers, personally known to me, that have gone through the half-time department, and they have come out and gone in the factory, and you could not have thought they had ever been as much as smeared with anything offensive.

7842. Then as remedy you would suggest more prolonged control?—Yes, and oversight in the mill over these young people.

7843. And you would try to strengthen their characters by some form of discipline and training?—In the continuation schools.

7844. In the continuation schools?—And I would make these free; I would have no fees.

7845. But you speak of the general apathy of the local authorities of Dundee to the question?—I am sorry to say it is so. For instance, a lady said not very long ago, 'We must reconcile ourselves to a certain amount of that state of things.'

7846. You yourself do not believe that that state of things must of necessity continue?—I do not.

7847. You think under proper care and supervision, and with proper training and discipline, the condition of the young people of Dundee might be very greatly improved?—Very greatly.

7848. *By Mr Shaw Stewart.*—Just one or two questions referring to your paper. In the first paragraph you do not tell us how much time is devoted to physical

instruction:
want of
systematic
instruction.

training in schools, but I take it that it is about an hour a week, or something of that kind?—I may say that is about the time, I find teachers are very unwilling to give more time than they can help to anything that diverts the attention of the scholars from their ordinary work. The inspector is a bogey with us. It is painful to me to find that in almost every school that a week or a month or two before the inspection it is very little use to suggest anything. 'Oh, our inspection is 'coming on,' and that, I think, might be, perhaps, changed.

7849. I take it that your schools are very much like what we have had evidence of in other places, that if the inspector laid more importance on physical training that would be more attended to, and would, consequently, be more frequently practised?—I think so.

7850. Then you say that you have sometimes noticed that the exercises may have been too exhausting for weak constitutions?—Yes; I have been afraid of that.

7851. Supposing these exercises were taken more frequently during the week, that would probably strengthen those constitutions, and the ill effects of over-exertion would not be so apparent?—Quite so.

7852. So that an extended system of physical training in the schools would, in your opinion, benefit all the children, and do you think it would make them more amenable to discipline after they leave school?—Certainly.

7853. For these reasons you are very strongly in favour of extending physical exercises in the elementary schools?—I am.

7854. Then just one question about the open-air gymnasium for children under fourteen. Most of our witnesses have recommended gymnasium work for the

older boys, not for the younger boys. In Dundee you seem to give your younger boys the gymnasium work. Does not that strike you as unusual? Can you give me any reason why gymnasium work is stopped at fourteen?—Because they leave school at fourteen.

7855. Yes; but I should have thought anyone interested in gymnasium work would have made some arrangement to encourage those at any rate who showed proficiency in gymnastics; could go on with the training?—Yes; we have a public gymnasium in Dundee, but then that is under fees and other conditions; it is not open; it is not free.

7856. This open-air gymnasium for children under fourteen is entirely free?—Yes; entirely free.

7857. *By Sir Thomas Coats.*—You told the Commission that the half-time children were fairly well abreast of the full-time children in their education; was I correct in that?—Yes, of the same class of child. You must always bear in mind that there are, perhaps, more than two classes of children. There is the child of respectable parents and the child of no parents at all; you may say so much of a poor waif. Now, if that waif were attending an ordinary school compared with what he would get at the half-time school, his education at the half-time school would be better than he would have got at the ordinary school.

7858. Might we not argue from that that a great deal more time could be given to physical training, and, say, domestic economy for girls, than is now given without interfering with the book learning of the children?—I think so.

7859. That is your opinion?—I think so.

7860. And that is the proof of it, that the children attending half-time do so comparatively well?—Yes.

The witness withdrew.

Colonel G. M. Fox, examined.

7861. *By the Chairman.*—You have no employment specially at the present time?—No; I have no employment.

7862. You are late Inspector of Military Gymnasia?—Late Inspector of Gymnasia for Great Britain and Ireland.

7863. Would you kindly read your notes to the Commissioners?—The object of physical training should be the strengthening of the vital organs, the increase of lung capacity, the symmetrical development of the muscles, and the training of the nerves to act in accord, and instantaneously, with stimuli given to them by the brain. A system having the principles of military drill running through it necessarily contributes more physical, intellectual, and moral benefit than any other. It is commonly supposed that this form of training means physical training only, whereas it actually furnishes a moral culture of no less a value than the bodily exercise it affords. It accustoms young people to prompt and unquestioning obedience, produces orderly habits, and is a most important aid in the discipline of a school. It develops more individuality, invigorates the intellect, both directly and indirectly, improves the carriage and general bearing, and fits the individual for the primary duties of life—*i.e.*, those of a good citizen. All exercises should, during the actual training, be performed to word of command, so that the actions of the pupil are continually under the control of the instructor. This also teaches the pupil to think quickly and to act quickly.

(a) Describe the system, the syllabus, and apparatus.—*Vide* new drill book.

(b) For what age is the system intended?—From eighteen upwards, the infantry recruit, on joining the Army, undergoes a gradual and progressive three months' course of physical training at his regimental dépôt. If, at the expiration of that period, he be found physically fit, he is passed on to his battalion, where he undergoes a further course of 2½ months in more advanced exercises

in physical training, applied gymnastics, escalading, obstacle courses, etc.

(c) (d) (e) What tests are made, and when? Are reports available for the use of the Commission? Describe the average physical progress made.—These questions will be answered by the inspector of gymnasia. I have seen him on the subject, and he said he had been asked by the Commissioners to supply you with that information.

(f) What are the defects usually shown in the recruits, physical and moral?—A very large proportion of recruits enlist because they cannot get on in civil life—from lack of intelligence, from want of grit, or other reasons. The physical defects usually observed in recruits on joining are: Contracted and undeveloped chests, slouching movements, bad carriage, and general want of development. The moral defects are listlessness; want of self-reliance and of will power, and an absence of the power of concentrating thought, and of co-ordinating action—*i.e.*, many of the so-called manly qualities on which our nation prides itself are lying dormant in many recruits on joining.

(g) What portion is due to feeding?—About one-third is due to deficient feeding.

(h) What portion is due to want of physical training?—The remaining two-thirds are due to want of systematic exercise.

(i) How remedied?—By compulsory physical training in elementary schools from ten to fourteen years of age, followed by a more advanced course from fourteen to eighteen. This latter can only be carried out by the construction and establishment of well-ventilated and well-lighted gymnasia, or drill halls, throughout the country—and this more particularly in thickly-populated towns and districts.

(j) What suggestions have you to make as to physical training for those of ages from ten to fourteen years, and fourteen to eighteen years?—The exercises in the 'Model Course' are very varied, and are suitable for children of both sexes—varying in ages from ten to

Rev. H. Williamson.
11 June '02.

Col. G. M. Fox.

Col.
G. M. Fox.
11 June '02.

fourteen—*vide* my introductory remarks. For lads from fourteen to sixteen years of age I would recommend free gymnastics, *i.e.*, exercises without apparatus, and jumping, and from sixteen to eighteen similar exercises to those laid down for recruits of a like age at a military dépôt.

(k) Describe the average measurement taken, of height, weight, chest, arms; and the standards required.—This information will be supplied by the inspector of gymnasia.

(l) What improvement in general health of recruits, and when shown?—This varies according to the individual, but is generally noticeable after the first month or six weeks of training; and at the end of three months there is usually a very decided improvement, both physically and mentally. But it must be noted that the results obtained will always depend very largely upon the efficiency of the instructor. I have had frequent opportunities of comparing the physical development of soldiers who have completed two years' service with that of civilians of all classes and of corresponding age; and the comparison has generally been in favour of the former, to a very marked degree. Now, not only have I seen them at clubs, and other places, but I had an opportunity in the North-Eastern District, when I was A.A.G. there, of seeing the Volunteer Service Corps Companies stripped, and they had no development. They were very often clerks who had done nothing but quill driving, and, compared with soldiers of two years' standing, they were not in it. It struck me also that when they arrived in South Africa, and after a couple of days' hard marching, they would be in hospital. I attribute the superior development of the soldier to the every-day physical training he gets as a recruit, and to the general active work he gets afterwards as a trained soldier. I am sorry to say the Volunteers I have mentioned were passed by their Volunteer doctors, who really squeezed them in. They were supposed, first of all, to be enlisted in the same way as ordinary recruits, and they had to pass the same standard of measurements, and to be examined by the local doctors. Well, having undergone this process, they were then sent to the dépôt to be clothed, and to undergo a course of musketry, before being sent to the front. In one case the military doctor at the York dépôt, out of about 100 of them rejected thirty-five, the result being that the captain, a very keen young fellow, came to me to protest, saying that practically half of his men, two days before embarkation, had been blocked by the doctor for deficiency of chest measurement. I went with him to the hospital, and, for my own information, had all these thirty-five stripped, and explained to the doctor that although I quite agreed with him they were not fit to go to the front, still he had no power to stop them for want of physique or deficiency of chest measurement. Finally, twelve were rejected for varicose and hernia; but, of the others, absolutely there were quite twenty or twenty-five that went out under the chest measurement required of the ordinary recruit on first joining, which is a very low standard. That was the opportunity I had, and I had many opportunities of seeing the Volunteers of the provinces stripped.

Might we ask about those twenty-five that went out? Do you know anything of their history?—I never traced their history; they were lost in the big crowd.

Your moral rather wants its tail?—Yes, it does; but I am speaking now of the very apparent want of development that I have seen amongst these lads who had never had the opportunity of any form of physical training. I cannot prove that they went to hospital, neither can I say that they died; but, if the matter were threshed out, I feel sure that they were but little value as soldiers, for they were physically unfit.

(m) Are gymnastic training and physical exercise preferable to military drill, shooting, etc., for benefiting youth of country, both physically and morally? Give reasons.—The physical training, as contained in the 'model course,' embodies both developing exercises for the body, and also elementary drill. And this, I consider, is all that is necessary for boys between the

ages of ten and fourteen. After this age, more advanced movements—such as company drill, and skirmishing, may with advantage be taught. As proficiency is always the result of constant practice and habit in early life, I think it desirable that at this latter period accurate aiming and shooting at reduced targets should be taught. This, however, should be carried on conjointly with physical training, and on no account as a substitute for it. I do not wish you to think that I recommended shooting as a substitute for physical training.

Then musketry is what you recommend for school children over the age of fourteen?—I recommend that they should have more advanced drill after fourteen, and that they should snap away as often as they can at reduced targets to get into the constant habit of aiming at something and hitting something. I think that our system of cramming the whole of the musketry into eight or ten days, and hurriedly firing away a lot of ammunition, is ridiculous. I think boys are so easily taught anything at an early age. The earlier you get them, the easier they learn, and they never forget what they have been taught when young.

(n) Physical Training in Schools.—Describe systems in force within your knowledge and observation, and suggestions as to improvements and alterations.—I have had many opportunities of visiting elementary schools of every description, and have always done so, with a view to observing their methods of physical training from a practical point of view. I regret to say it has been my misfortune on several occasions to witness the performance of badly thought out and practically useless exercises, and even these carried out in such a perfunctory manner as to be sheer waste of time.

(o) Should there be a uniform system for all? Should it be compulsory? If so, within what limits of age and time, and on what conditions?—Training of Teachers for Schools.—Should men and women be in the same class? What is the system at present? How treated, and by whom?—To obtain any result worth striving for, there must be a uniform system, and it must be compulsory in all elementary schools; and at least forty minutes daily (divided into two periods of twenty minutes each) should be devoted to the work. This sounds a good deal, but when children leave their lessons to do physical training, five minutes is gone in no time, unless somebody is in charge who has got them thoroughly in hand. If I said a quarter of an hour there would be only remaining, perhaps, ten minutes for the actual physical training.

Training of Teachers.—There can be no objection to men and women working in the same class at training colleges. But, as far as I can see, it would be unnecessary. At present there is no system, except in London. But, latterly, a large number of teachers in several counties, both men and women, have voluntarily formed classes, and have placed themselves under the tuition of army gymnastic instructors for training in the 'model course,' and this with excellent results. In future candidates for the post of teachers should be instructed, whilst at the training colleges, at least twice a week in physical training, the instruction to consist of the elements of applied anatomy, physiology, and personal hygiene. The practical work of the course should consist of free movements, calisthenics, marching exercises, voice training, and methods of conducting squads. In addition, carefully selected instructors should, at first, be appointed to every two or three training colleges. It has been proved by Sir Edwin Chadwick, in connection with the Factory Act (see the *Health of Nations*, by E. Chadwick, edited by B. W. Richardson, Vol. 1, Page 228), that 'the receptivity of the minds of the great mass of children does not exceed three hours daily'; and this statement is confirmed by all the leading physiologists. To keep children too long a time at book work, when no impressions are made, and nothing is gained (?) but weariness, is surely not mental training. I think, therefore, that if the time for purely mental instruction were reduced, and it were possible to introduce a sufficient amount of

physical training to break up these periods, the general results of the training of the children would be greatly enhanced. I think most of these little things begin to yawn, and a good many feel sleepy, simply because their poor little brains cannot stand any more work, and I think it is waste of time, and doing them harm, if they are kept longer than three hours; and if they were roused occasionally at certain periods with physical training, I think they would do their work much better.

7864. There is one thing as regards the ordinary private soldier; you say that he has a good deal of physical training which you think improves him, but do you deprecate in any way the many hours of the afternoon and evening during which he does absolutely nothing?—Oh, yes, I think the soldier ought to be better paid; certainly he ought to be paid according to the amount of daily work he performs; he is not paid sufficient, therefore I do not think we can expect too much work from him.

7865. I was not thinking on the point of pay, but on the point of health?—Well, of course they go to sleep in the afternoon, the majority of them, they turn into bed.

7866. They turn into bed?—Yes, and then they have no food after that, bar a very scanty tea, after which they go into town, on empty stomachs very likely, and there they drink beer which does them a vast amount of harm, and they practically starve until the following morning.

7867. Not from want of opportunities to get beer at a very reasonable price in their canteens in regular hours?—They do spend a great deal of money in the canteen on tuck, jam tarts and all sorts of things, but I am sorry to say they spend a lot of money on cigarettes.

7868. But with all that unhealthy part of their lives you must put the healthy part in the morning as it were—the unhealthy part in the afternoon, and yet with all that the training that they get in the morning—the physical training is sufficient to greatly improve them over civilians of the same class?—Certainly.

7869. I mean, provided they had more healthy pursuits they would be even finer than they are?—They would be better intellectually. I do not know that they would be much better physically, because I think they could not stand much more physical work than they get, but intellectually they would be much better if they led a more reasonable life and were better handled.

7870. But still, when they are at manœuvres they have a great deal more physical work than they are usually getting?—Yes.

7871. And their appearance at the end of three weeks' manœuvring is very different, not to speak of active service. I mean at manœuvres, I take it they have prepared for it; on active service it might be or it might not be?—Although at the depôt the recruits' physical training is very varied, his every-day life is a dull one.

7872. It is not an absolutely unhealthy one?—I do not think it is an unhealthy life in any way, but it is a dull life, and I do not think they improve their intellect much; they come, unfortunately, men wanting in intellect, wanting in grit, and I think although physical training does sharpen them very much, a great deal more should be done at the depôt in the way of improvement; they want sharpening up. The physical training does sharpen them up. The old-fashioned idea of drill was to keep them standing in a cold barrack square shivering, and the drill sergeant usually contrived to make them stand still, whilst he spouted half a page of drill-book, of which they never understood a word. But I think the physical training they have now, which is the principal thing they have to do in the new book two or three times a day, two or three hours a day active physical training of great variety, does them a vast amount of good.

7873. Now may I ask, at Aldershot, at the gymnasium there, is there any practice of physical training or gymnastics, as the case may be, in the evening?—They can attend at the voluntary hours.

7874. Are these voluntary classes largely attended?—They are well attended.

7875. I want to put it on all fours with what children would be after the age of fourteen—from fourteen to eighteen?—You see the soldier does get a good deal of work and get tired, whereas children and young fellows who are loafers in the street do sedentary work—quill driving—and they want this physical training very badly; and I am sure they would go to these large buildings that I speak of, drill halls and gymnasia, but the soldier, there is no doubt, does get a bit tired, especially the growing lad who has been taking a lot out of himself. He goes and lies down after his drill and regularly turns in, has a rest, but for the lads that we have in our towns, that live a stuffy life and a sedentary one; I am sure they would be only too glad to go rather than mess about in the streets with the girls. I started that sort of thing in York when I was there, with very good results.

7876. I should like to ask you another thing. A soldier, as a general rule, has not a single thought or a fear about his maintenance?—No.

7877. Therefore he is quite at ease. Do you consider that that helps in any way to keep him in a good state; in a contrary one to the civilian, who is always thinking about the battle of life, and how he is to live; you think that the civilian does not think very much about it; he must very often?—I think the soldier, as a rule, is treated too much as a dummy, and he is perpetually dry-nursed. That is one of the faults, and it does away with his individuality very much; but it never struck me that those lads in civil life think very much about their future.

7878. Still they are bound to think more than the soldier?—Soldiers are so sketchy and light-hearted, I do not think they think about the future, and how they are going to get on. The majority of them do not want to get on, because they hate the idea of responsibility. I have seen a great many very smart young fellows, and I have asked them many a time to go through a course, with a view to being gymnastic instructors, and getting on in the world. They will not do it, because they are afraid of the first step—the lance stripe. The soldier is dry-nursed; he has everything done for him, and when he is thrown on the world he still expects everybody to dry-nurse him and to find him employment.

7880. *By Mr Shaw Stewart.*—Of course, I will not ask you where these schools were that you speak of as having a very bad system of useless exercises, but I suppose I may take it that in them there was no system at all?—No, they had invented their own exercises, and, if it were allowed, I should think some would adopt ping-pong, others skipping, others leap-frog, etc.

7881. I take it that you would be in favour of the teachers being trained on a regular system, and that they should impart so much of their system as they thought applicable to their pupils?—Yes.

7882. That brings us to the question of the training of the teachers. Now, you say that future candidates for the post of teachers should be instructed while at the training colleges, at least twice a week, in physical training?—Yes.

7883. But you do not say for how long?—For two hours a week during the two years they are at the training colleges. The reason I say twice a week is because it is better to spread the training over a long time than to cram it into a short time.

7884. Well, we had an expert witness before us, and he was asked what would be the proper period for a teacher to be trained, and he said two hours a day for six months?—That is practically impossible, I think, for a teacher who has to learn other things.

7885. It is impossible for him to devote that time?—Two hours a day?

7886. Two hours a day for six months, that is what we have had from one witness. Now, I would like to get your opinion?—In answer to this question, I have to consider the question both of expense and efficiency. In my opinion a qualified instructor should be appointed to carry out the 'physical training' of three

training colleges, to each of which he should devote two *days* a week. Each student should receive one hour's instruction twice a week during the whole of the two years' course.

7887. Then we may take it from you that twice a week for two hours is the proper period for a teacher to be trained, and at the end of that time he would be quite qualified to teach on the Aldershot system?—If he were there for two years, and he had one hour's instruction twice a week, he or she would be very good at the end of that time. Women are equally good: some of them better.

Boys and girls from ten to fourteen: time necessary.

7888. Just one other question on the point; what period daily for pupils; you say at least forty minutes daily divided into two periods of twenty minutes each, and you told us that ten minutes would be too short a time. I suppose you are thinking not so much of the smallest children as of boys and girls of twelve?—I say from ten to fourteen.

Boys and girls together.

7889. *By Sir Henry Craik.*—We saw in certain schools the boys and girls trained together, doing exactly the same exercises, and I want to know what your opinion of that was?—You mean with the united squads?

7890. Yes.—Of boys and girls?

7891. Yes.—They were doing just the same exercises as the boys.

7892. Do you think that is a right thing?—Oh, quite right.

7893. And you thought that the results shown at that exhibition proved it to be perfectly possible to train the two together?—Quite. You might say that women and men should drill separately, but in all these exercises there is nothing that could be in any way immodest or injurious to a girl.

7894. You do not think that any of the exercises were over-straining the children?—Oh, no, not the least. I know the results; they never get any strain; they are simply moving their whole bodies in a very moderate way.

Volunteers.

7895. *By Mr McCrae.*—In speaking of the great value of physical training, you instance the case of some Volunteer Service Company whom you examined as being rather under the standard?—Yes.

7896. How would those Volunteers compare with the others who volunteered from civilian life to go to the front? Had you many of those others who joined the Imperial Yeomanry straight from civilian life?—No; I did not see these Imperial Yeomanry that volunteered.

7897. I think you said in answer to the Chairman that you had no knowledge of how these Volunteers stood the strain at all out there?—Well, only from what I heard, that they were rather disappointed with them when they came out and had to do the work. You see they had the uniforms on and they looked all right. I am not speaking of the Metropolitan Volunteers; I am speaking of the provincial ones; the Metropolitan Volunteers were quite different; they all have their athletic clubs—beautiful halls, some of them; the London Scottish have splendid halls, and these are athletes in the true sense—splendid; but I am speaking now of the places where they have no chance of physical training, and they are simply leading a sedentary life; those are the lads you want to get into these drill halls.

Public gymnasia recommended.

7898. Would that apply to our provincial towns generally?—Oh, yes, it applies. They have not got enough of them, and they only want well-lit, well-ventilated halls and good instructors, and these lads, instead of loafing about as they do, would flock there in the evenings. I tried it at York, and we had a gymnasium started for young fellows mooning about in the streets. They used to come there, and we had young women's classes for young women full grown, and they put themselves into it; they worked like niggers.

7899. Do you think that is general over the country?—Oh, yes, the only thing is, these places as a rule are too small and very dark. They are most unattractive.

7900. Speaking from my knowledge of the Royal Scots Service Company—we sent three out from Edinburgh in connection with the Lothians' Brigade—three Service Companies; they had very hard work, and there were hardly any cases—only one or two cases—of sickness?—They vary very much. Putting aside these Volunteer Corps, if you strip civilians of twenty, and compare them with the soldier stripped, you will see a great difference between the civilian stripped and the soldier stripped.

7901. *By Mr Fergusson.*—May I ask you a question under the head 'j' about the Model Course. 'The exercises in the Model Course are very varied, and are suitable for children of both sexes.' Is that the Model Course of Aldershot?—No, I will tell you what the Model Course is; in the drill book, and especially in the new drill book that has just come out, in part one, and in an appendix at the end of the book exercises are laid down for recruits of the Army, and the Model Course is taken almost verbatim from that very course. The only alteration they have made is not to call it 'drill'; they call it 'Physical Training,' which combines drill and physical training.

Model course how compiled

7902. Is that training founded in any way on Sandow's system?—No, I do not think there is anything in it that pertains to Sandow.

7903. We had Sandow here yesterday, and he told us that his system had been adopted in the Army. Then he proceeded to tell us it was absolutely unsuited for children?—Yes, it is. Well, there is nothing of Sandow in it. I must tell you that at one time we tried and experimented; we tried everything; I have been abroad in Germany, Austria, Italy and France. In all those places I have seen their training. I have taken the trouble to go with introductions from our Intelligence Department. I have been to Sweden twice. I have been to France, Germany, Austria and Italy, and seen all their training, the whole of their training, very carefully.

Sandow's system

7904. With all that experience your opinion is that the Model Course in the new drill book is the most suitable for children?—I am sure it is. I will tell you one thing about Sandow just to explain. He may tell you that we are using his exercises in the Army. We did, and we had those exercises; for instance here with dumb-bells, very light dumb-bells, standing up and doing these things of his. Well, now, I am working very hard at the present time, very hard, but if I as a child like to do that, I can go on for an hour doing nothing you see, I can illustrate it in a second (*illustrating*).

7905. I understand exactly what you mean?—It means really that now I am going to do a thing in a limp sort of a way. There, you may work for ever; it is no exercise whatever. Now, if I set my muscles, and, in fact, make the antagonistic muscles fight one another, I am straining myself, I am hard at work, and I could develop my muscles without a dumb-bell. Well, we found that these were useless unless the child likes to work and the recruit likes to work, he can shirk the work and apparently go through the exercises, but there is nothing in it.

7906. This Model Course in the drill book is meant for lads of eighteen?—Well, of course, the Model Course also brings in apparatus work. The Model Course is the copy from the drill book, leaving out the apparatus work for recruits.

7907. It would not be too severe for children?—Oh, no, because it is a mere matter of the size of the dumb-bells; little wooden dumb-bells or nothing in their hands, these exercises could not strain the child in any way.

The witness withdrew.

Mr HENRY DYER, C.E., D.Sc., examined.

Mr H. Dyer,
C.E., D.Sc.

11 June '02.

7909. *By the Chairman.*—You have been a member of the School Board of Glasgow since 1891?—Well, I was elected in 1891, but I was out of office for one term from 1894.

7910. But you have been a member since 1897?—Since then, yes. Before that date some attention had been given to the subject, but not in a systematic manner, too much time being devoted to mere display and insufficient to exercises which were of value for the development of the scholars. I found a great part of the time taken up with what you may call show as distinguished from real physical training, and some of us who took an interest in the subject pointed out that that might be very useful as an amusement in the evening. They gave entertainments pretty often in the evening, which I said, after all, was a physical exercise of little educational value. After discussion we had a special committee appointed for the purpose of superintending physical education, not without a certain amount of opposition from certain older members of the Board, who reminded us that physical training was no part of the business of School Boards, as the subject was not in the Code. As matter of fact it did not get into the Code till 1895. I think I am right as regards the date. Since that date, as Mr Alexander, our clerk, told you, we have made steady progress, but we have had so many other things to attend to that it has not been developed quite so fully as it could have been if we had had more means and time at our disposal. Mr Alexander, the clerk, gave the Commission an account of the present conditions under the Glasgow School Board, so that it is not now necessary to enter into details regarding them. As convener of the Evening Classes Committee I have done all in my power to encourage systematic exercises in the various schools, and advantage has been taken of the gymnasia which have been erected in different districts of the city. Many of the scholars of the evening classes, however, are too tired with their work during the day to be inclined to take up gymnastic exercises to any extent. We have included physical training in our evening schools as far as we possibly could, but of course you understand a great many of the boys are at work all day, getting out at half-past five or six in the morning, and working all day, they are very tired, so that those who are so engaged do not care very much for physical training. We have a considerable number of clients of ours who are engaged in lighter work who like it, and we give them as much of it as they will take; in fact we have a considerable number of gymnasia in different parts of the city, and we utilise these as far as possible, and we give them exercise in the halls of the schools; these are large halls, as you know, where we give a certain amount of physical free exercises. In my opinion, more time should be devoted to physical training in the day classes, short sets of exercises fitted to develop the various parts of the body being given two or three times a day. Greater attention should be paid to exercises in breathing, as experience shows that when these are carried out in a systematic manner they have a wonderful effect on the health and development of the scholars. The ventilation of the schools should be carefully attended to. With some developments, the present system is, in my opinion, sufficient for the scholars of the day schools. When possible, however, they should have the use of a field for games and for free exercises of all kinds. With regard to boys between the ages of fourteen and eighteen years, I believe it would be in their interests if they could be induced to attend continuation classes two or three evenings a week, and a considerable proportion of the time might be taken up in recreative and physical exercises. Whether legislation is either possible or desirable is a point on which there is likely to be considerable difference of opinion, but without legislation a great deal could be done if employers of labour took some interest in the education of their apprentices, and did not employ them simply for their cheap labour. This, of course, opens up many economic and social

questions regarding hours of labour, conditions of work, housing, and food, all of which have a very close connection with the physical state of the scholars. A good system of national education should lead to the solution of these problems, a bad one will intensify them. I agree with the opinion expressed by the late Professor Fawcett, that 'Probably the greatest good to be ultimately anticipated from education is to render possible the realisation of higher forms of social industrial development,' and it was for this reason that I brought the following motion before the School Board of Glasgow:—'That this Board fully recognise the necessity for due attention being paid to the physical training of the scholars in the schools, so that they may grow up with sound minds in sound bodies. The Board have, during recent years, largely developed the facilities and opportunities for such training, and are anxious to adopt the most improved methods and appliances. At the same time, the Board have a most decided objection to any system which introduces all the details and methods of military drill, and tends to encourage a spirit of militarism among the scholars which, in their opinion, is opposed to the true interests of education.' This motion was agreed to, with only one dissentient. The latter part of this motion may provoke discussion and probably opposition; but I thought it very desirable, in the present state of public opinion, that attention should be directed to the educational and economic issues involved. The object of all education should be, not only the realisation of the highest physical, mental, and moral power of the scholars, but also the improvement of the great body of the people as a conscious social purpose. That result is not likely to be reached by the cultivation of a military spirit, which is essentially anti-social, and by the expenditure of a large part of the wealth of the nation on non-productive efforts, which lead to the industry and progress of a century being annulled in a few months. Of course, under present conditions, I recognise the necessity for an efficient Army and Navy. Whatever arrangements are necessary for these should, in my opinion, be made after the scholars are eighteen years of age, and they should be looked upon as necessary evils. It would simply be disastrous to cause them to be looked upon in our schools as the chief ends of education and of national policy. I believe that the spirit which dominates education is of far more importance from a national point of view than either the subjects or methods. Although I have for thirty years taken an active part in technical education, I am more than ever convinced that if our national system of education consisted chiefly of instruction in technical subjects combined with military training, it would only hasten our national ruin. Our object should be to fit men and women for their daily work, and at the same time impart that culture which will inspire them with high ideals of individual, civic, and national duty.

7911. Have you any supplementary statement to make before the members of the Commission ask you questions?—I wrote this out very hurriedly; I had only an hour or so to do it, and I have only given a brief outline of my opinions, and I have stated in my note that I would be very glad to give any verbal explanations that may be necessary. With regard to the last two sentences, I do not know whether you know—Sir Henry Craik probably knows—that thirty years ago I went out to Japan to introduce technical education there, so I have taken a special interest in that side of the subject, and I think what I have said about physical training shows that I am fully alive to the importance of physical training. I have given an outline of my opinions, and shall be very glad to answer any questions that may be put.

7912. *By Mr Fergusson.*—With regard to the evening classes: you think it would be desirable to continue physical exercises after children have left the elementary school?—If other conditions could be made suitable.

7913. Certainly, that is just the point I want to get

Glasgow
School Board
resolution.

Object of
education.

Military
spirit
undesirable.

Evening
Classes:
conditions of
labour.

Mr H. Dyer,
C.E., D.Sc.

11 June '02.

at; is that a very difficult matter to do; would it not interfere, do you think, with the occupations which the children are engaged in?—Well, for those engaged in clerical work there would be no difficulty, but for those engaged in manual work I think there would be a very serious difficulty under present conditions. We find, for instance, that tradesmen, whenever they get busy, have not the slightest hesitation in causing their apprentices to work overtime; and even shopkeepers and others keep the scholars for extra work in the evening, which prevents them coming to our classes. If it could be made illegal to employ apprentices to work overtime till they are twenty-one years of age, probably then you would be able to carry out your wishes with regard to training after fourteen years of age.

7914. Do not say they are my wishes; I want to know what your views are?—I beg your pardon; to carry out a systematic course of training.

7915. Supposing you made physical training compulsory, say from the ages of fourteen to eighteen, in your view you would have to grant a great many exemptions for those who were engaged in occupations which prevented them attending?—Either that, or arrange that the occupations should not be taken up when that was to be done.

7916. Which would you prefer?—Personally I would rather that the physical training—well, I am not much in favour of that being taken up by itself, it should form part of a course of training. You have assumed, of course, that physical training could be made, or should be made, compulsory; I am not sure that that is a very desirable thing under present conditions. I should like to see it encouraged as far as possible. But the question is, how far it is either possible or desirable to make it compulsory. I should rather like to see it made impossible for young people to be worked more than a certain number of hours per day, so that they would have every opportunity and every inducement to take up not only physical training, but mental training.

7917. But still, if you did that, you would not catch the loafer, who is the lad you want chiefly to get at; he would still refuse?—I am afraid the loafer requires very special legislation from many points of view, and physical training by itself would do little to reform him. You must cultivate his brains as well as his body.

7918. Let me suggest the idea of making attendance compulsory, with a wide range of exemptions—all those who were genuinely learning a trade, or who, from the nature of their employment, were unable to take up physical training. Those would be exempted and the loafer would be caught; what would you say to that?—Personally I would have no objection to it, but I am afraid it would raise a considerable amount of opposition to it from the employers of labour.

7920. But why?—Simply because they wish to employ cheap labour as much as they can. Of course it would come exactly to the same thing if you made it illegal to employ the boys beyond a certain number of hours per day.

7921. Do you not think the employers would kick worse at that?—That is the form I would prefer it to be in; it would lead to a more uniform result.

7922. Best for the boys?—Yes.

7923. By Sir Henry Craik.—The Commission will no doubt agree with you in the statement that you make, viz., that whether legislation is possible or not is a question which will arouse considerable differences of opinion; but what they would like to know is, what is your opinion upon the point; are you in favour of compulsion or not?—Well, in the first place, I would prefer to see compulsion applied in another direction—in the way that I have indicated—that it should be made illegal for apprentices and young people generally to be employed beyond a certain number of hours per day.

7924. But you have told us that would not touch the case of the loafer; do you wish compulsion applied to the loafer, yes or no?—Yes, I would.

7925. You say a good system of national education

should lead to the solution of these problems; a bad one will intensify them?—Yes.

7926. We will all agree in that, of course. Would you give us any practical suggestions as to what changes should be introduced in order to solve these very large economic questions?—Well, I am afraid that takes us into a great many social and economic subjects.

7927. Hardly, perhaps, covered by the scope of the reference to this Commission?—I think not.

7928. You speak further of an objection to a system that introduces all the details and methods of military drill; are you aware of any system being in use which introduces all the details of military drill?—No, I am not aware of any system which introduces all the details.

7929. Well, your objection only applies to a system which, so far as you are aware, nowhere occurs?—Well, that is not quite—what I did wish to object to, and what I suppose the Board when they agreed to this motion objected to, was not so much to that as to the spirit and objects and methods introduced.

7930. Introduced where?—Or likely to be introduced.

7931. On what do you found that probability?—Well, I think it is very evident in recent years and in recent months that there is a strong trend of public opinion in the direction of military drill in our schools.

7932. Your closing sentences in your resolution were directed against the trend of public opinion, as you believe, not against any definite system which existed?—The object of the resolution was to help to form public opinion in what I believe to be the right direction.

7933. Taking the last paragraph, have you found reason to think that the arrangements for the Army and Navy are anywhere considered to be the chief ends of education and of national policy?—Well, I think some of the continental countries make that to a very large extent the chief ends of national existence.

7934. And you wish to make a precaution against that?—I do.

7935. It is not anything that exists either in England or Scotland to which you can point as an existing fact?—No, except this, that the tendency of events in this country is in the same direction as those which have occurred on the continent in recent years. You know Germany, of course, and if you compare the Germans of to-day with the Germans of thirty years ago, from an educational point of view, I think the comparison is not very favourable to the present day.

7936. You state that the object should be to fit men and women for their daily work, and impart to them that culture which will inspire them with high ideals of individual, civic, and national duty?—Yes.

7937. That is a view in which, I presume, you have the agreement of all persons interested in the subject?—Without exception.

7938. By the Hon. Thomas Cochrane.—I wanted to clear up, if I could, the point that Sir Henry Craik was asking you about. 'At the same time, the Board have 'a most decided objection to any system which introduces the details and methods of military drill.' I did not clearly understand what system you referred to?—Well, in the first place, I think the system to be introduced should consist largely of what should be called free exercises, apart altogether from the methods or objects of military drill. That could be done without introducing even the idea of military drill into our schools. Of course you would have a certain amount of marching and forming, but it would be largely free gymnastics.

7939. I quite understand the system that you propose should be introduced, but there was some system that you proposed should not be introduced; what system was that?—I think rather that is not quite a fair way of putting it, if you will allow me to say so. For instance, in Switzerland they have, as you know, a citizen army. The work for that is undertaken after the young men are twenty years of age, beyond school years—ordinary school years—whatever may be necessary after eighteen or twenty. That is a matter for further decision

Physical training should form part of a course of instruction: inducements rather than compulsion.

Compulsory attendance, and exemptions.

Compulsion applied to loafers desirable.

Mr E. Dyer
C.E., D.Sc.

11 June '02.

Military Board resolution trend public opinion

Dyer, D.Sc. and discussion; but I believe that, up till that age, it is possible to give, by means of free exercises and gymnastics, all the physical training which is either desirable or possible.

7940. I quite understand that; I thought there must be something in your mind when you moved this resolution. Taking you as typical of people who object to any militarism, I wanted to know what caused this alarm in your mind?—Well, it was not so much alarm as—I explained to Sir Henry Craik—the object of forming public opinion on the subject. For instance, some years ago, when I came back from Japan, I stayed a few months in Paris; I found the boys from ten to fifteen years of age being drilled as little soldiers, marching about the streets with small rifles. That I consider most objectionable in our schools, and I may tell you that it was that, and such things as that, that I had in my mind when I drafted that resolution.

7941. No practical suggestion that had been made for introducing a similar system in this country?—That is not said in the resolution; it was guarding against the possibility.

7942. Guarding against a possibility that you had no reason to believe was likely to arise in England?—I think it is quite a legitimate position for a public body to touch on the trend of public opinion, and to guard against what they believe might be a danger.

7943. You think there is a trend of public opinion, then, in favour of militarism?—Certainly, both inside our schools and out of them.

7944. You mentioned Japan; you were employed, I think, in Japan?—Yes, I was Principal of the Engineering College there; it was I who started it there.

7945. Were you in Japan long?—I was there ten years; Baron Hayashi, who got his D.C.L. at Cambridge the other day, was my colleague; it is thirty years since I went.

7946. Is there any system of physical training there?—I introduced Scotch games into our college. I think I got more credit for that than for the engineering at first, but nothing in the shape of drill. Of course you know that compulsory military service is part of the system there after school years.

7947. *By Sir Thomas Coats.*—You talked of the desirability of apprentices being obliged to take evening classes: is that not general in Glasgow?—Not general; but it is probably more common in Glasgow than almost in any other city; but, though we have made considerable progress, it is still far from being general. Of course, I am a member of the Institution of Engineers, and I have tried to induce the employers of labour in Glasgow to make it part of their apprenticeship system, and a few of the most considerate employers have done so, but only a comparatively few.

7948. Would you consider that apprentices of the engineering shops or shipbuilding yards, after they have done their ten hours at their ordinary work, would be too tired to take physical drill in the evening?—I think a good many would. I am an engineer myself; I have gone through the workshop, and I know exactly what it means. I have attended evening classes too, and it was with considerable hardship, and I should not like it to become universal. Such classes may supplement day classes, but the chief part of the education should be given in the daytime.

7949. But even a moderate amount of it—say half an hour three times a week—would that be excessive?—Oh, no, I do not think so, because, as measure of fact, if it is given in a proper way, even if they are tired after their ordinary work, it will really be a relaxation.

7950. So that would not be a fatal objection to giving physical training in the evening?—No. What I said here was, they did not take to it voluntarily; they were too tired to take to it of their own accord.

7951. You lay stress on breathing exercises?—Yes.

7952. What form of breathing exercises?—Well, probably you may have seen a report by Dr Kerr, now of the London School Board. He was formerly medical officer for the Bradford Board. They have carried out

exercises in Bradford with very great success, and, I believe, in one or two other School Boards; and, of course, everyone who knows anything of physiology, knows that if a child is taught to breathe properly, it has a very great effect upon their physical development, not only on their lungs, but on their physical development generally, and on their speaking.

7953. But have you any system laid down?—No, I have not. There are two or three experts in London who have paid special attention to this subject.

7954. You have no particular system in your mind to recommend?—There are several experts who have made this a speciality, and it is well known that if a little attention is paid to it, apart altogether from drill, simply walking along the streets, it has a great effect on the health.

7955. You said in regard to Germany at the present day you did not think that the education of adults in Germany compared favourably with that of former years?—No, sir, I did not say that. I think if you measured the educational results as they are usually measured by examinations, they do compare favourably. What I meant to say was that the effect on the people was very different from what it was thirty years ago. I heard a well-known authority saying the other day, philosophy and poetry disappeared from Germany on the arrival of martinets and manufacturers.

7956. Do you not think that Germany at the present day is a much more dangerous competitor with this country with regard to manufactures and chemical produce?—I have every report that has been published about Germany. I know pretty well what they are doing, but notwithstanding that fact I think it might lead to very serious national results before long. I admit the necessity for full technical education, but I want a different ideal in education from that we find in Germany at the present time.

7957. They are becoming much more dangerous to this country in the way of competition?—I quite admit that.

7958. Comparing the German with the Hollander, passing through Holland to Germany, one notices a difference in the appearance of the German from the Dutchman; in his smartness, in his physical development, in the way he holds himself?—I admit that; but he may not be a better man, notwithstanding; after all that is not the chief end of life.

7959. *By Mr Shaw Stewart.*—Mr Chesterton, who was a witness before us, said that he thought that military drill might be given after school age. Before that the object should be to improve the physique of children; I take it that is your view?—The evening school age; what was the age that he gave.

7960. I took it to be fourteen?—Oh!

7961. He was speaking of elementary schools—Board schools?—Of course in Scotland, though the age is fourteen for ordinary schools, they look upon sixteen as the normal school age, or even more.

7962. He was applying his observations, of course, to London, which, as you say, is rather different?—Yes.

7963. The groundwork of military drill is founded on the best-thought-out system of physical exercise?—Yes.

7964. For the elementary portion of military drill, therefore—if you approve of physical training—you do not object to physical training being the same as the physical training in the Army?—Not at all; I think it everything that is good. What I wished to avoid was what I call the military spirit of the military subjects.

7965. Therefore in that paragraph from your motion before the School Board of Glasgow you would lay a special emphasis on the word 'all': 'All the details and methods of military drill'?—Yes.

7966. A little lower down, in the last paragraph, you say you recognise the necessity for an efficient Army and Navy, and then you go on to say, 'that any arrangement for these should be made after the scholars are eighteen years of age.' But surely that would hamper the Navy very much if boys were not allowed to be trained before the age of eighteen for the

part approved.

Mr H. Dyer,
C.E., D.Sc.

11 June '02.

Navy; have you thought of it?—Well, of course, the training for the Army is not between the ages of fourteen and eighteen. I quite admit in the special case of the Navy, boys who would think of the Navy would go to special schools; I imagine they would not be trained in our ordinary schools.

7967. But you are not against boys being trained for the Navy; boys who have made up their minds to go to sea?—Who have made up their minds to enter the Navy would naturally go to special schools.

Continuation
schools:
loafers;
opinion.

7968. I would just like you to explain a little further on the question of the 'loafers,' which would be a difficulty in the question of continuation schools. You made the remark that you would be in favour of special legislation for loafers; might I ask in what direction?—Personally, if you want a personal opinion in this matter, I should like to see education in its fullest development compulsory up to eighteen years of age; and under that I would have a due proportion of physical training. And, of course, you would catch the loafer in that way.

Compulsion.

7969. Therefore you would be in favour of compulsory attendance at continuation schools?—Yes, but not necessarily simply for physical training by itself. I should make it part of a course of education.

7970. A due balance between mental training and physical training?—Yes.

7971. *By the Chairman.*—You say you have been member for some time of the Glasgow School Board; have you always been elected unopposed; have there been a great many candidates?—We have all the evils of the cumulative vote.

7972. Have there been a great many candidates; how have you come in as regards the poll?—Well, I have not stood very high on the poll.

7973. I only wanted to know?—Allow me to say I do not think that means much by the present system of election. With a few churches behind you, you can get a large number of votes; if you do not happen to be connected with the Church organisation, you may have a small vote.

7974. You say you were one year or three years out of it?—Three years.

7975. One period?—Yes; of course you are elected for three years. Do you wish to found anything on that, because I am quite willing to make a remark on the subject.

7976. No; it has nothing to do with physical

education, has it?—No; it has not. I merely wished to say that my friends seemed to be so certain that I would be re-elected that they did not trouble to vote—at least they said so.

7977. *By Mr Alston.*—You took part in the resolution of the School Board not to admit military training?—Yes, I moved it. I explained that I did not object to the methods of military drill so far as they tended to physical development. The chief thing to which I objected was the spirit of militarism which made military action the main object, or the chief object of education.

7978. Have you any proof that that is the object of military training?—I simply say—as I explained before to the Commission—that some of us felt that there was a tendency in that direction, and we thought it was right that a public body like the School Board of Glasgow should help to form public opinion in another direction.

7979. You are convinced that that feeling is pretty general, then?—Well, if you judge from the papers.

7980. I think we quite appreciate the position that the Glasgow School Board take up, probably a safeguarding position?—Yes; well, that was the chief object of it.

7981. But the main point, so far as I am concerned, is to see that they do not adopt the wrong impression that the Boys' Brigade tends to a spirit of militarism?—I have not been discussing the Boys' Brigade at all. Sir John Cuthbertson said that while they affected some of the methods of the Army in the Boys' Brigade, they had a higher object in view.

7982. The first object is not military at all?—And, moreover, the Boys' Brigade is a voluntary organisation which uses military drill for a very different object.

7983. *By Mr Fergusson.*—Arising out of what you said to Mr Shaw Stewart, may I ask about one answer which I did not understand? You said sixteen was the school age in Glasgow?—Sixteen is the school age for our higher grade schools; fourteen is the compulsory age, as you now know; but sixteen is a very common age for boys and girls too in our higher class schools, so I merely wished to understand what the gentleman meant by school age, when he spoke of school age. By the Code, I believe, we are allowed to keep them on till eighteen, and will get grants for them, so that school age is an indefinite term in Scotland.

The witness withdrew.

The Rev. ANDREW LAIDLAW, examined.

Rev.
A. Laidlaw.

7984. *By the Chairman.*—You are minister of St George's-in-the-Fields, Glasgow?—Yes, my lord.

7985. And also for nearly twelve years a member of the School Board of Glasgow?—I have been about eleven years.

7986. And have had an opportunity of knowing a little of young life in the city—middle class and poor—and as a member of the School Board have been in close contact with the children of the city?—That is so.

7987. Now, will you kindly read from your notes, beginning with paragraph 1?

1. When I joined the Board it had no physical training committee. Physical drill was not systematically given. Teachers might give extension exercises, etc., and those who had served in Volunteer regiments may have had elementary military drill in their schools, while some of the janitors who had been soldiers may have drilled the children in the playgrounds.

2. In perfect accord with the Education Department and the School Board in their encouragement of physical drill in the schools, and willing to adopt any improved methods. Particulars of the School Board's work in this direction have already been given to the Commission by Mr Alexander, our clerk.

3. With regard to continuation schools: think it would be good to have physical drill in every school, and elementary military drill in halls or playgrounds for lads two or three nights a week, or, if necessary, a

Continuation
schools.

special drill class on an additional evening per week; but, of course, like all other School Boards, we want to do this without laying additional monetary burdens on School Boards.

4. Would be pleased to see cadet corps attached to Volunteer regiments in all the higher schools. Such a corps has been recently sanctioned in our Boys' High School, Elmbank Street, its object being, as stated in circular to parents: 'At the outset it should be observed that membership of this company is not intended in any way as preparatory for, or introductory to, the profession of arms. The positive aims of the Cadet Corps are—

- (a) The improvement of physique.
- (b) The inculcation of habits of obedience, discipline, and self-control.
- (c) A quickened sense of school life and unity, and the development of public spirit.
- (d) A realisation of the responsibilities which must be incurred, and the duties which must be discharged as citizens of the Empire.'

5. I also think that some kind of corps for boys of fourteen and upwards, in the poorer schools socially, would be good. Such corps might have caps and belts, and possibly some simple tunic.

6. Think the simple dress and belts of the Boys' Brigade prove how attractive it is to lads to have some distinguishing garb! Heartily approve of the Boys' Brigade movement. Have had a company in connec-

Cadet
aims.

Boys' B

tion with my Sunday schools for many years. My opinion is that the boys of the Brigade are, as a whole, better conducted and more respectful than the other boys of the schools. They seem to realise the responsibility of being members of a body banded together for 'the advancement of Christ's kingdom among boys, 'and the promotion of habits of obedience, reverence, 'discipline, self-respect, and all that tends towards 'a true Christian manliness.' This is the terms of constitution of Boys' Brigades.

7. While of opinion that such corps as I have suggested in continuation schools would be good for lads from fourteen to eighteen years of age, yet I can foresee that it might do harm to the Boys' Brigade, because the military and physical drill (which is undoubtedly attractive to lads) would be given in the schools weekly; while the connection with Christian organisations, and the careful oversight by the officers, which the Brigade as a religious institution insists upon, would be wanting.

8. I do not give an opinion whether or not compulsory physical or military drill in continuation schools—I mean after fourteen years of age—would be good for citizenship, or add to the sources of national strength, but if it should be introduced, my opinion is it should be by national decree, and not through the medium of educational machinery.

9. The time of a lad's life between twelve to eighteen years of age is one of the most important periods in forming habits for good or ill, but beyond that I think it would be of the greatest good if all lads after eighteen years were induced to serve in volunteer regiments for a few years. Those who need most to do this are that large class in our great cities which are not got hold of by Boys' Brigades, nor would be got at by continuation classes—such as shock one by their rudeness of manners and speech, etc., say at football matches and such-like gatherings. It would be of the greatest good to citizenship, and contribute largely to the sources of national strength, if such could be disciplined to habits of obedience, control, and self-respect.

7988. *By Mr Fergusson.*—With regard to the continuation schools after school age of fourteen—between the ages of fourteen and eighteen—you are in favour of carrying on instruction from fourteen to eighteen, I think?—Certainly.

7989. In all subjects or only in physical training?—Oh, well, of course I am in favour of the continuation schools in all subjects; we have only physical training at the present moment, I believe, in nine of our continuation schools; I could tell you exactly.

7990. Would you make any of that training compulsory?—My desire is not to make the physical training compulsory if you have not the other part of the training compulsory.

7991. Supposing you made some attendance at continuation compulsory and made physical training one of the subjects; would that meet your views?—Of course in order to get certain classes compulsory, even in any education in continuation schools, I suppose you would have to get parliamentary powers to do that; you have no power now.

7992. No, no; I am asking what you would like to see done?—I would be perfectly prepared if it is brought forward fairly before the country, and the country agrees to there being continuation classes, certain of them being made compulsory, including along with them physical training, to accept that most cordially.

7993. But how do you think that would affect the boys who are working; would they be able to attend continuation classes?—You mean apprentices and others who are working. Well, it is rather a difficult question, because those lads, so far as I know, who attend continuation classes have no privileges as to time and labour from their employers. It is just possible if there was one or two classes of that kind, if they were not heavily burdened, they might be able; but certainly if they were to go through the whole continuation curriculum I should be inclined to

think it would be too much for working lads to do it.

7994. That is to say it would not do to make it compulsory, would it?—That is what I say.

7995. You might make it a compulsory system, with wide exemptions given to those who were learning trades and who were genuinely unable to attend?—But I am afraid you would find that those who are attending our continuation schools are nearly entirely learning trades, or clerks all day in business.

7996. Then they can attend the continuation schools?—They can attend the continuation schools, and take so many classes that are suitable, but if you make it compulsory that they have to take so many classes, I think it would have an evil effect upon our continuation schools.

7997. I am only suggesting that two hours or three hours a week should be made compulsory in any subject they chose?—I want to understand your question; does that mean to say that the idea is to have all the subjects at evening classes made compulsory; is that the question you put to me?

7998. No; I mean that it should be compulsory to attend evening classes for say three hours during the week; the subject that was taken up should be whatever the boy chose; physical exercises would be one of the subjects, and mathematics would be another, and so on?—Well, so far as I can at present say, my feeling is not to have any compulsory subjects beyond, at present, those given by Parliament up to fourteen years of age.

7999. Is that because you do not like the principle of compulsion, or because you do not think that the boys could find time to attend?—It is because I do not like the principle of compulsion chiefly beyond fourteen years of age, and in the second place because I think there are very few boys who are working who would be able to take more than one or two classes.

8000. Then how do you propose to deal with this loafer, whom you have described as a rude and ill-mannered person, who will never do anything if it is voluntary. He still will be loafing; how are you going to deal with him?—Well, that is a very wide—a very difficult question. I cannot give any way of dealing with him, except by compulsion. I take it the lad is beyond eighteen years of age. I do not see myself that there is any possible way of dealing with him except by compulsion.

8001. That is why I suggested to you compulsion, with very wide exemptions granted to those who were genuinely learning a trade?—But I do not wish compulsion during the time they are attending school. When I speak of compulsion it is compulsion for those who are beyond school.

8002. *By the Hon. Thomas Cochrane.*—Beyond compulsory school attendance—beyond fourteen years of age?—Beyond eighteen years of age; I speak here largely of the class that are beyond eighteen years of age.

8003. *By Mr Fergusson.*—I am talking of boys from fourteen to eighteen; and how are you going to deal with that large class of loafers who are learning nothing but evil?—I do not think the continuation class will deal with that class. The class that come to our continuation schools are the lads who are apprentices, or clerks, who have some ambition; and that class is not the class that needs compulsion.

8004. No, quite so?—And the continuation school does not touch the class of loafer at all.

8005. But if you compel them to go there you might teach them better ways, and you might keep them out of mischief?—That is quite true; but if you compel them to go to those continuation schools (that class after fourteen years of age) and make it universal, then you will have to have powers for the continuation schools, the same as you have for day schools, up to fourteen, and I do not think that Scotland is prepared to accept that.

8006. *By Mr Alston.*—At the end of paragraph 4 you say—'At the outset it should be observed that membership of this company—namely, the cadet corps

—is not intended in any way as preparatory for or 'introductory to the profession of arms;' and under letter 'd,' down below, you say—'Its aims are the 'realisation of the responsibilities which must be incurred, and the duties which must be discharged, as 'citizens of the Empire'?—I am quoting from the circular which has been issued to the parents, under the sanction of the Board, by the Rector.

8007. Is this not a little contradictory? Letter 'd' seems to imply responsibilities as 'citizens of the 'Empire,' which involve military training, and yet your cadet corps is not intended to have military training with the view to the profession of arms?—Yes. This is a quotation from a circular that has been issued to parents in regard to the formation of this cadet company, for which I am not responsible.

8008. No?—But I do not think the words 'the 'realisation of the responsibilities which must be incurred, and the duties which must be discharged, as 'citizens of the Empire,' points towards the profession of arms.

8009. Is it fair to say that a good many of the public have taken it up, that the last clause of our remit clearly points to the profession of arms?—Not only that; not only the public, but many of the School Boards have taken it up as pointing to that; that is quite true, but I am not sure that they have taken it up quite fairly.

8010. That is your view?—Well—I am rather in the peculiar position of having supported a motion which seems to point straight in that direction, and yet I seem in some way to be opposed to the views of the motion—my explanation has been made in public, and can be found in the *Glasgow Herald* of May 20th, 1902.

8011. Speaking of compulsion, of course, if compulsion were enforced by what you call in one paragraph a national decree, all conditions of work and employment would require to fit in. The difficulty of getting at the boys who are at work would be done away with?—Yes; but I feel that if compulsion is to be brought in at all, compulsory physical training, or compulsory physical education, or compulsory mental education, that it is a thing that should be brought rightly before the people, and not in a sort of side-way; people suspect that is being done.

8012. But you used the phrase 'national decree'?—Well, I meant a national decree very much in the line of a Parliamentary Bill.

8013. If that were done, then you would get rid of all difficulties about getting the boys free from work?—Of course you do.

8014. Perhaps, from a certain point of view, such compulsion would be the cause of great dissatisfaction?—Well, I am not prepared to give an opinion, not being an expert; but I know that there is a strong feeling against it. I am perfectly sure of this, that if compulsion were introduced in that way, we would honourably accept the position.

8015. *By the Chairman.*—As to the feeling in Glasgow on the subject, can you give the Commission any information about that from what you know yourself?—I am afraid I cannot very well. As indications of feeling after the discussion in the School Board, nearly the whole of the Press were against the Board, and in favour of one gentleman who had taken an appeal against the Board's raising a bogey in regard to your reference, as he said. I think all the leaders were against the position that the majority of the Board seemed to take up; but as to what the opinion of the people of Glasgow, as far as one comes across them, I am unable to form an opinion.

8016. I rather want to get away from the bogey;

I want to ask what your opinion is regarding the feelings of people in Glasgow regarding physical training as physical training; have you ever heard one way or the other?—I do not think so.

8017. Physical training being applied in schools to start with, or afterwards, is there any opinion that you know of? You must know the opinion of a good many people in Glasgow; have you ever heard any remarks on the subject; have you ever heard anyone interested in school inspections taking any interest in physical training as exhibited at the examinations?—Certainly there is a very great interest in the exhibitions of physical drill and all that sort of thing that we have had hitherto, but I am not sure that I have heard opinions beyond the fourteen years when we have children in the elementary schools.

8018. No; but up to that?—Up to that most certainly, and I think, if I am able to judge at all of the opinion of Glasgow, that it has shown indications in favour of this—well, they call it military drill. I am sorry for the name, because I think that it is giving a false impression; but in Glasgow it was that the Boys' Brigade began, and it is there that possibly we have the largest number of boys being trained under the Boys' Brigade, greater than any other city in the kingdom. That is the only indication I can give you. My own opinion is that Glasgow as a whole is favourable to such physical training.

8019. *By Mr Shaw Stewart.*—Apart from the military side of physical training, do you think that a system of physical exercise in the elementary schools would help the pupils towards manual dexterity in after life?—I do think so; but I think that the system might be more systematised than it is now. I have before me the training book of the English Board of Education, which, I am told, is pretty much the setting-up drill at Aldershot. I do not see why we should not have a manual very much on the same lines from the Scotch Department.

8020. *By Mr Fergusson.*—What is this side wind which you think is going to bring in all sorts of dreadful things. Anything we like to recommend might be made the foundation of an act of Parliament, but we have no power to make rules as to what is to be done; how do we bring it in by a side wind?—Well, through an Education Commission, through educational machinery, I say.

8021. Still, anything would have to be done by Parliament; there is no side wind in that?—It would have to be brought before Parliament, but my feeling is that it should be fairly put before Parliament apart from education altogether.

8022. *By the Chairman.*—What should be put fairly before Parliament?—The question of compulsion.

8023. Has it been put so before; there has been compulsion hitherto, has there not; there is a difference in the way of compulsion now from what there was in 1872?—You mean the compulsion in regard to elementary education to be applied to education from fourteen to eighteen years; then I should say they should be tested through the educational departments; but if it is to apply to a special subject like physical education only, which is being interpreted military drill, then I fear that the country is not quite prepared to receive it in a gracious spirit.

8024. You find nothing of that sort in the remit?—I do not suppose I am the only one who has told the Commissioners, that such things as *compulsory military drill and service* have been read into the vague terms of the remit. Personally I take a wider view of the remit and its scope.

8025. We have to take a rather close view of the remit.

The witness withdrew.

Lieut.-Colonel W. G. DON, M.D., A.M.S., examined.

Lieut.-Col.
W. G. Don,
M.D., A.M.S.

11 June '02.

Extremes of
development:
reasons.

8026. *By Professor Ogston.*—We should like to put on record in the first place your various titles and the authority with which you speak. I may therefore have it put down that you are a Doctor of Medicine, and a Lieutenant-Colonel of the Army Medical Staff, that you are Honorary Deputy-Surgeon-General, retired pay, Senior Medical Officer, London recruiting district? —Yes, I think that meets all the description that I could give you of myself.

8027. And your experience, of course, has been very large and long?—Very large. It is much larger than any man living or dead; nobody ever had the opportunities that I have had in recruiting.

8028. Many years?—Seventeen years.

8029. And your interest in the subject, of course, has been close in consequence of your connection with that office?—Yes. I retired seventeen years ago from the active list, and took up this appointment. I had previously to that been in the War Office six years, and I had a good deal to say to recruiting there too. I have been at St George's Barracks since 1885.

8030. And you still hold this office?—I still hold it pending the end of the war.

8031. Would you kindly read your written evidence?—I venture to express opinions only upon matters on which I consider I possess special expert knowledge. The following observations are the outcome of extended experience during forty-five years' service, of soldiers, and especially of the physique of boys, recruits, and reservists, of which I have personally examined over 100,000 during seventeen years' connection with the London Recruiting Staff. It should, however, be borne in mind that my experience is not altogether such as would fall to those who may conduct medical examination and anthropometry indiscriminately among the youthful population at large, because recruiting subjects brought before the medical officer have already undergone a rough primary selection by the recruiters, whereby those obviously undersized, or who present visible physical defects, are largely eliminated. I think that provision should be noted. It makes my evidence somewhat different from that of those who would go indiscriminately and measure the population at large. Boys under sixteen, however, undergo much less of this primary selection, and so may be fairly taken as representing the average youth; the following are the general impressions left on my mind through the examination of thousands of them. Boys for the army are nearly all between the ages of fourteen and sixteen, and are drawn chiefly from military schools, charitable and other institutions, and training ships. Their physical development varies to an extent that would not be predicated, and in a degree indeed surprising. I may tell you that in a military sense a boy is one under sixteen, and so may be fairly taken as representing the average youth. I often find boys of the declared and verified age of fourteen or fifteen looking not more than eleven or twelve, while others present the development, including puberty, of lads of eighteen or nineteen years. Some two or three years ago—I do not think I passed the lad—some of my colleagues passed a boy as eighteen. He had a moustache, he had evidence of puberty, he was a great big fellow; I forget what he weighed—about some 130 lbs. or 140 lbs. and he was actually claimed by the School Board afterwards as twelve-and-a-half years of age. Well, I was asked to comment upon that, and I said that nothing under a sworn oath before a magistrate would make me believe such a thing. I firmly believe it was a got-up case by his parents, who produced the certificate of a younger brother or something of that sort. That has often been done. I have seen a mother come to the recruiting office and declare that her son was under age. The son would turn round and say—'Mother, 'you know you are lying; that is not my certificate; it 'is Bob's or Jim's,' or some other, a younger brother. That is the sort of thing that goes on unless you are very careful in verifying an age. Such extremes of

relative development I do not think can be wholly ascribed to or determined by variation in food, environment, or physical training in childhood, but rather to inherent elements of growth in individuals—whether through heredity or otherwise. I found that remark upon this fact: take the Duke of York's School, for instance, here at Chelsea, where they are all the sons of soldiers, and are admitted at a certain age, after nine or ten, and they are all examined before they are taken in to see that they are in good health and afford every chance of growing to fair average-sized men, fit for the service, and so on. Of course the great majority of them enter the service afterwards. Then, again, take the Gordon Boys' Home. For a number of years I have passed to the Gordon Boys' Home nearly all the boys that pass in in London. Of course I do it as a charity. Gordon was an old friend of mine. These boys are passed into these institutions and they all have the same environment, they all have the same food, and they all have the same training, yet I see the very same extraordinary variations in development, so you can hardly ascribe it to anything except individual peculiarity. That is what made me put in that. But it is at the same time very noticeable that boys from training ships and institutions where good food is dispensed, healthy environment secured, and judicious physical training carried out, have superior development, especially in chest and weight, to those less favourably reared. I should expect the average normal development of boys between fourteen and sixteen to range as under:—

Boys fourteen
to sixteen:
average
normal
development.

Between fourteen and fifteen years.

Height, min. 54, max. 60, mean, 57 inches.

Weight, „ 70, „ 85, „ 78 lbs.

Chest, „ (quiescent) 27, max. (expansion) 30 in.

Between fifteen and sixteen years.

Height, min. 57, max. 63, mean, 60 inches.

Weight, „ 75, „ 100, „ 90 lbs.

Chest, „ (quiescent) 28, max. (expansion) 32 in.

Of course we get them above 57 inches sometimes. Among boys, height and weight, the latter chiefly from growth of the lower limbs, increase more rapidly than chest girth. Boys coming within the range of the above figures I should consider fair average specimens, likely to grow into good-sized men. Youths of seven-teen and upwards also show great variation in development, but in a somewhat less degree than boys. The youths of seventeen that we enlist are for the militia chiefly. An eligible militia recruit between seventeen and eighteen should present the following dimensions:—Height, 62 inches and upwards, weight 105 lbs. and upwards, chest, 31 inches minimum and upwards. Tall youths have often defective chests, short lads better ones; it would almost seem as if perpendicular and horizontal growth were carried out at the expense of each other. Youths over eighteen vary considerably in all standards, but if normally developed should have a maximum chest of at least 31½ inches, a weight of 112 lbs., and be 63 inches in height and upwards. Development goes on more slowly and continues longer in some persons than others; increase in height can hardly be expected after twenty, but chest and weight often increases up to twenty-five years. I am convinced that judicious physical and military drill, if combined with sufficient food and healthy environment, will signally contribute to the moral as well as the better physical development of boyhood and early manhood. I have often passed into the militia slovenly, slouching, awkward and poorly-fleshed lads, who, after a three months' training enrolment returned to enlist in the regulars, and found them with not only increased physical development, but smart, clean, and self-respecting, so that, in homely language, 'their own mothers 'would hardly have known them.' I have known a militia recruit increase as much as a stone, 14 lbs., during his three months' training. A militia recruit is trained for forty-nine days—that is seven weeks—usually, but if the regiment is embodied and sent to Aldershot,

he may be three months there, so that for the three months he gets good food and fresh air and all that. It is wonderful the changes that come over them. Militia recruits often gain from 5 to 10 lbs. in weight and an inch in chest girth during a seven weeks' training. The question of physical defects seen in recruits, which might be largely prevented or modified during the period of boyhood growth, opens up a wide and most interesting field. I am decidedly of opinion that much might be effected in this direction in at least minimizing defects.

The following seem a few instances :—

Defects:
feet.

Feet defects.—Such as contracted toes, overlapping toes, bunions, corns, etc., are so common, that perfect feet are more the exception than the rule. These defects and deformities are very largely the result of ill-fitting foot gear, especially the abominable but fashionable boot with pointed toes.

Teeth.

Teeth defects.—The neglect of the teeth among the class from which recruits are mostly drawn is deplorable; I feel certain much might be done to remedy bad teeth by inculcating cleanliness and the evils of oral sepsis, and by skilful dentistry during boyhood and youth.

Eyesight.

Visual defects.—Congenital errors in refraction should be artificially remedied, when discovered, in early youth; but I fear no such remedies can ever bring such eye defects up to the standard of vision required in military service.

Spinal
curvature.

Spinal curvature.—Lateral spinal curvature is largely caused by asymmetry of the limbs; I should say, perhaps, one person in forty has one leg more or less shorter than the other, a defect easily seen in the unsymmetrical horizontal level of the hip bones, when standing erect with the feet together; such congenital defect (often unrecognised in childhood) throws the weight on one side in walking, causing lateral spinal twist, which ultimately becomes permanent in growth. Many a boy and girl could be saved from unsightly deformity by simply raising the boot heel of the short limb sufficiently to bring the hips into a horizontal level in walking.

Military drill:
example of
best form for
children.

The best military drill I have seen for young people is that practised at the Royal Military School, Chelsea, of which an interesting exhibition was lately given at the Military Tournament. I am often asked whether I think the general physique of the Army has deteriorated within my recollection, and answer I do not think so; but I am absolutely certain the moral tone and intelligence of the men have materially increased. While standards in measurements have, no doubt, been lowered, the stringency of medical and military selection of recruits has been much increased within the last decades. Previous to 1879, standard measurements were part of the military, and not of the medical examination; they were then in the hands of recruiters, and carried out in a very loose and unscientific manner, so that statistics of them before 1879 are extremely unreliable. That fact is very often forgotten. I have been much struck with the splendid physique of reservists, and especially of the last batch of Imperial Yeomen, both fully developed men of from twenty to thirty-five years of age. None who have seen them could believe that these men had in any way declined from the standards of their forefathers.

Measure-
ments:
before 1879
loosely taken.

8032. Your statement is so very much to the point, that I think there are only one or two remarks that I should like to make in regard to it. That explanation that you give that the former statistics were somewhat loosely taken is most important?—You mean before 1879?

8033. Yes?—That it is often forgotten. Before, the recruiter's object was to pass a man into the service, and the medical officer was not responsible for chest measurement and height. If the doctor saw a man who obviously had been wrongly measured, he said, 'Poor physique; I will not pass him'; that was the way then. The consequence is, the poor physiques disappeared very largely from the Returns after 1879, and came under deficiency in chest measurement. I have brought with me the last Return of Recruits—the Annual

Return at St George's Barracks; you will see what I mean by that. *(Return handed in.)

8034. I suppose that you are also aware that your observation that the general physique of the Army has not deteriorated within your recollection corresponds with the statistical observations of Galton and others regarding degeneration?—Yes, I think so.

8035. They point in the same direction?—The class of men. There are a great many more townsmen in the service than there used to be; when I joined the 28th Regiment in 1858, a purely English regiment, a Gloucester regiment, we had no less than 300 Irishmen in it. They had come in through volunteering chiefly from the other regiments, after the Crimean War, and were sent out to India; these Irishmen were nearly all countrymen. A great many of them could not read and write. That element has almost entirely disappeared, at all events, out of the 28th Regiment almost entirely. There are no Irishmen in it hardly; it gets plenty of men from Bristol. Owing to the location of regiments in different districts, you now get men of the same class, of the same kind, in each district. At that time, also, the proportion of Irishmen was 350 per 1000 in the whole Army; now it is down by last return to 104. Your Irishman is a countryman, as a rule, not a townsman. A great many of the English and Scotch recruits are townsmen, except perhaps from the extreme north of Scotland, the Cameron Highlanders for example.

8036. In the third page of your evidence, where you state that feet defects, teeth defects, visual defects, spinal curvature, and other defects might be minimised, I presume that you mean that a properly carried out physical training and proper inspection of them would be the means by which those could be discovered?—Most unquestionably, especially in the teeth and asymmetry of the limbs. I have noticed very markedly a great many men have a short leg and a long. If you make them stand up in this way, you can see the hip bones are not in a line. If you take a book say an inch thick and put it under the short leg, the man stands straight. If I noticed a boy or girl of say six or eight with a short leg and a long, if among my own children, I would be very careful about that, and would put a piece on the heel at once.

8037. You think the proportion of those so defective is not greater than one in forty?—Well, I should say, roughly, that among thirty or forty men in a day I find one. It is mere defect, as a rule, and does not unfit a man, but it gives him a slight lateral curvature. It is often very markedly seen in women; their dress shows it off when they are walking behind them.

8038. The figures that you give as to average height and weight that you would accept; I suppose those are from your own observation?—My own observations. I thought I would give them to you as some indication. They are not very easily got. There are not many people who could give you that information.

8039. Yes, that is so?—I have examined thousands of boys, and know exactly, when I see them come before me, what their weight and size is, before I inspect them.

8040. You are more moderate in your estimate than from such tables as Galton has drawn up from the whole population, high and low?—That is so; I put that proviso in the early part.

8041. There is a point which I think your experience would help us to understand. Some experts and others who have been before us have made very startling observations regarding the increase of chest girth in a surprisingly short period. Perhaps you would allow me to put the matter before you in a series of questions, so as to illustrate it. I have been thinking it over how I should ask you about it. I suppose that a good deal depends on the ribs?—You mean chest girth?

8042. As to the size of the chest and the amount of air that can be taken?—The only way in which you could arrive at an absolutely correct estimate of a

* See Vol. I. Appendix IV.

man's lung capacity is by the spirometer, because you see some tall men have long chests. Other men have broad chests, and others deep chests, fore and aft. It is the round man that measures best. You see a square fellow, and you say, 'What a big chest he has'; but if you put the tape round him, you will be surprised to find it is very moderate after all. In the case of a tall man, his lungs are longer vertically than those of the short man.

8043. I suppose in all men the ribs hang down like the handle of a pail, they are oblique in position like that?—They are oblique.

8044. And when he takes a long breath they are made more horizontal, but still not absolutely so?—I may tell you measuring chests is a fine art; there is nothing but practice that will enable a man to attain it, and there are many that one might say are handless, as they say in Scotland—not very handy—they never become good measurers at all. I have seen that over and over again.

8045. The personal error is important?—A great many measurers tighten the tape too much, compress the surface, which is not fair; a great many also want a forced minimum. That is not fair. The minimum the man goes about with is a true minimum. Under ordinary circumstances I could force down a minimum an inch, perhaps, but I could not make them more than their maximum expansion. I have reached these facts a long time ago. Now we have a series of new tables we are measuring on, and at the end of this month, will report on them. It is practically the maximum that is now the standard.

8046. I suppose when a man slouches—stoops his shoulders—that he lowers his ribs and lessens his chest capacity?—Well, when you measure a man's chest, you must make him keep down his shoulders. He is always inclined to pull up the muscles, and so lessen the actual measurement of the chest. We make them put down their shoulders, keep their arms to their sides, and stand quite easy and quiet, but have great difficulty in effecting that; they will always want to go to the maximum. They are proud to do that, and blow themselves up as hard as they can.

8047. When you deal with recruits, a great many of them stoop, and so lessen their chest capacity?—You have just to watch them, and see that the tape is properly adjusted. That is one great point. It must be over the angles of the scapula behind, and above the nipples in front, but not compressed too much.

8048. Does not the curving of the back lessen the capacity of the chest? It lowers the ribs and lessens the expansion?—It is part of a forced minimum.

8049. When you straighten a man's back you raise his ribs and his chest congests more?—When he throws back his shoulders, as he is very apt to do, that does not increase his chest, but rather takes away from it.

8050. If you straighten his back it diminishes his chest capacity?—Let him stand quite still and quiet, and not move his limbs or shoulders in any way whatever.

8051. My point is this, may not some of those systems that have been brought before us, of simply rendering a man more straight, explain how in a few lessons or days his chest capacity may be altered?—Exactly, he gets up to it.

8052. And in your recruits when you set them up; when you straighten their spines and get them into the habit of walking with a straighter spine, the chest capacity is by that alone increased?—Undoubtedly, there is a knack in expanding the chest like anything else. You see that very much with militia recruits. Green youngsters—slouching fellows—after a certain amount of training come back to enlist in the regular army, and expand the chest much more freely and nicely.

8053. So that the slouching recruit compared with the trained recruit is simply the same man, but taught to hold himself better?—Taught how to hold himself; but, no doubt, the chest does increase under good food and training, and physical drill and so on.

8054. Yes; but not within a week or two?—No, but in seven weeks you see a difference; you often see that after seven weeks' training in the militia, and much more after the three months when the corps are embodied. Lieut.-Col.
W. G. Don,
M.D., A.M.S.
11 June '02.

8055. *By Mr Fergusson.*—Twice in your statement you say 'physical training if combined with sufficient food will signally contribute to the physical vigour,' you lay considerable stress on sufficient food?—I do, sir. Of course that is one point connected with army training. For instance, in the militia, if you get a flabby fellow, perhaps a potboy or a barman—something of that sort—he rather loses flesh under his physical training to begin with; but, if his food is sufficient, he immediately begins to put it on again, but if you strain them and do not give them enough to eat during their training, I do not think that you will have the good result you otherwise would have; they should have as much to eat as they like.

8056. Looking at that as applied to children—which we have got to deal with—you say you would have to be very careful how you gave physical training to underfed children?—Most certainly.

8057. And also that you ought to take steps, as far as possible, to see that the underfed ones were better fed?—Better fed, certainly. Training is bad unless you give the muscular system sufficient food.

8058. May I ask you what is oral sepsis?—It is a term which has been lately applied; a friend of mine wrote an article on it. Anything which produces putrefaction in the mouth, such as half-masticated food sticking in the teeth, want of cleanliness, no doubt has a great effect upon the teeth, and causes caries.

8059. 'The best system of drill,' quoting from what you have said, 'I have seen for young people is that practised at the Royal Military School, Chelsea'; that is the Duke of York School?—Yes. Drill:
Duke of York's
School.

8060. What system is that?—I could not tell you what system it is.

8061. But it is extremely good?—It is part of the physical army drill adapted to boys.

8062. It is what they call the Model Course, is it?—It is what they call ordinary physical drill, as opposed to military drill.

8063. It is nothing special for the Duke of York School; it is out of the Drill Book, the Red Book?—I think there is something special.

8064. You do not exactly know?—It struck me at the Military Tournament; I had never seen certain things before.

8065. As far as you have seen, you think it extremely good?—Extremely good. These boys come largely before me; they are very nice boys; if you saw them put through the drill, you would understand what I mean.

8067. *By Mr Shaw Stewart.*—I would ask you to help us on the point of the feet. We have had some rather conflicting evidence as to whether the children's feet should be treated in schools under a system of extended physical training. Some witnesses were very strongly in favour of removing their boots and giving them either stocking feet or shoes for tip-toe exercises and other exercises, to improve the feet. Would you advocate that?—Well, I think that a child's feet should be very carefully attended to, because they will not complain; they will seldom tell you if a boot pinches them or is too short. I have found it from my own children; they have to be watched. 'Now that boot 'is too short for you,' I say. 'Oh, I do not think so,' but it is, all the same. The feet grow rapidly, and the deformities that we see causes a very considerable amount of rejection, as you will see from the army statistics which I gave you—105 out of 3908. These would be nearly all contractions and bunions, flat feet, and so on; they will squeeze their feet into boots a size too small. The consequence is, that when they grow up and come to recruiting age, you see very serious malformations—overlapping or hammer toes, and all that sort of thing. Feet and
shoes.

8067. *By Mr Shaw Stewart.*—I would ask you to help us on the point of the feet. We have had some rather conflicting evidence as to whether the children's feet should be treated in schools under a system of extended physical training. Some witnesses were very strongly in favour of removing their boots and giving them either stocking feet or shoes for tip-toe exercises and other exercises, to improve the feet. Would you advocate that?—Well, I think that a child's feet should be very carefully attended to, because they will not complain; they will seldom tell you if a boot pinches them or is too short. The consequence is, that when they grow up and come to recruiting age, you see very serious malformations—overlapping or hammer toes, and all that sort of thing.

8068. I would put it to you in this way; supposing a school fund which is able to supply its pupils with

Lieut.-Col.
W. G. Don,
M.D., A.M.S.

11 June '02.

shoes to put on when they came to school, and to keep on all day till they left, enabling the children to go through their physical exercises in these shoes at stated periods in the day, do you think that would have a good effect on their feet in after life?—I think it would, most distinctly. I may state that I have got one small boy—I am a grandfather otherwise—about nine years old, who takes shoes to his school on drill days, and the sergeant makes him put them on, and drills him in these particular shoes—soft shoes, you know.

8069. Does he only put them on for the drill, or does he keep them on all day?—For the drill; he calls them his drill shoes.

8070. *By Sir Thomas Coats.*—You say, 'I am often asked whether I think the general physique of the Army has deteriorated within my recollection; and answer I do not think so, but I am absolutely certain the moral tone and intelligence of the men have materially increased.' I would like to ask you in your long experience regarding the class of recruits coming from the larger towns, have they got worse; I mean to say is the physical development of lads offering themselves as recruits worse? Of course, as you say they come before you after they have been selected?—That is it; I do not see all the various weeds; I see a good many weeds too. We have this difficulty with our sergeants, although we train them as well as we can, not to bring the halt, the maimed, the blind, and the lame. If we are too strict and too hard on the recruiters, and do not give them considerable latitude, they might miss good men, who otherwise would pass when they came before the examining officer; but still recruits undergo a very considerable selection before I see them. When I entered the service in 1858, I was sent over to Dublin, and the first thing told me was, 'You had better learn recruiting.' I look back to the old gentleman—I suppose he was my own present age—who examined recruits; it was a perfect farce—there were no measurements; no vision tests; no stethoscoping. I cannot help thinking the Army is now a very much better selected body than it ever has been. The approving officer is very strict upstairs; we may pass downstairs seventy in a day; but when we ask, 'How many did you swear in yesterday?' we are told fifty—twenty held over for enquiries; among them some are absolute frauds, and that sort of thing.

8071. My question was rather in your experience whether you could tell us whether the class of men offering were better or worse than they were during the time of your experience—twenty or thirty years ago?—I think the class of men offering are better than when I was young. I remember a lot of rascals in our regiment; I do not think they exist now. The last regiment I was with was the 6th Foot, in India, twenty-six or twenty-seven years ago; half of them were teetotallers; that was absolutely out of the question in my younger days—there was no such thing—and the number of courts-martial have decreased immensely.

8072. But for physical development do you think there has been any improvement? or has there been a decrease in the down line?—I do not think so; I think that the stringency of the medical and other examinations have made up for anything that might happen of that kind.

8073. I think you hardly understand what I want to be at; it is not those who are taken into the Army that I refer to; I mean those who offer; is that selection smaller than it was to get suitable men?—You mean do we reject more or fewer?

8074. No, what I mean is this; are the men who offer themselves as recruits better or worse than they were thirty years ago?—I think on the whole they are younger.

8075. They are not perceptibly worse set up; they are not worse?—No, they are younger than they were; there is no doubt about that; we do not catch the same proportion of men over twenty years that we used to get. The fact is, that they are settled in life now about twenty. I always like to catch a soldier young; get a young fellow and he makes a better soldier in the end.

8076. *By Mr Alston.*—I wanted to get the same opinion as Sir Thomas Glen Coats has asked for. I might turn it in this way. Your evidence says that you find no deterioration in the physique of the Army; has your experience led you to say that there has been no deterioration in the race generally?—I do not think so; I really do not think so.

8077. Even in urban young men?—Even in urban, I do not think so. I think they are better fed, and altogether the population is on a somewhat higher plane than it was forty or fifty years ago.

8078. That leads me to call attention to the second paragraph upon the second page. You say, such 'extremes of relative development I do not think can be wholly ascribed to or determined by variation in food, environment, or physical training in childhood.' The use of the word 'environment' there is in reference to a particular variation of development; but we had a witness before us the other day who spoke very strongly of the evil effects of environment, and particularly, he said, in London, in the crowded parts of London, the densely-populated parts of London with very high buildings, he found the physique was distinctly inferior as compared with the other parts; do you find the same?—Well, I could hardly discriminate between one part of London and another. It might be done if you found out the man's birthplace, but it does not follow that what he gives as his birthplace is where he has been reared.

8079. That is to say the facts that come before you do not lead you to put your finger upon the evils of environment with reference to city life?—I use that word environment with reference to public schools like the Duke of York School.

8080. But the other you found to be a just test of judgment?—Yes.

8081. Another point; at the top of the last page you say, speaking of the general physique of the Army not being deteriorated, 'But I am absolutely certain the moral tone and intelligence of the men have materially increased.' Why is that so?—Through education, I should think—less drunkenness and fewer petty offences.

8082. Has this moral tone and intelligence of the men been proved before they come into your hands, or is it a result of military training?—Both, I should say. They are better educated men, and then they are very carefully selected; it is wonderful the way in which a man's antecedents is now followed out. We hardly ever get a man to present himself for enlistment that is well known to the police as a blackguard; he avoids the recruiting sergeant quite as much as the policeman.

8083. The selection is closer now?—Oh, very much closer.

8084. But apart from that do you find a distinct improvement in the moral tone and intelligence in consequence of drill and discipline in the Army?—I think so.

8085. Would you say the same thing would take place in boys if the same discipline, the same control, the same methods, were adopted in the schools?—Most distinctly.

8086. The other point is in the last paragraph, in which you say you were 'very much struck with the splendid physique of the reservists, and especially of the last batch of Imperial Yeomen'?—Yes.

8087. Do you happen to know where they came from?—Oh, they came from everywhere. You see, the first yeomen sent out to South Africa were examined by civilian practitioners. A great many were passed that should not have been passed—that would not have been passed by a military medical officer. The last batch were put upon us in the month of January. We had 1200 of them at St George's Barracks, and of course getting superior pay; they were a superior class of men altogether; they came from every part of the three kingdoms.

8088. You find the same splendid physique among the reservists—old soldiers?—That shows what can be done with army training.

Col. 8089. I would ask you this. Were the Imperial
Don. Yeomen volunteers for the first time desiring to go to
A.M.S. the front?—Many of them volunteers for the first time.

8090. Do you find many men in the volunteer rifle
e 02. regiments (infantry) going to the front?—We found
many good men among them, but they were very
carefully selected regimentally.

8091. Would you draw any distinction between them

and the yeomen?—They were not quite so big as the
yeomen, some of whom were too big for their horses.

8092. Would that arise from the yeomen being from
the country?—A great many of them were country
gentlemen.

8093. That is from the country and accustomed to
country life?—Roughriders, gentlemen, farmers, and all
sorts and conditions of men. A wonderful collection.

The witness withdrew.

Adjourned.

SIXTEENTH DAY

Friday, 13th June 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT :

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSON.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr CLEMENT DUKES, M.D., B.S., examined.

Mr C. Dukes,
M.D., B.S.
13 June '02.

8094. *By Professor Ogston.*—We would like, in the
first place, Dr Dukes, to have noted down your quali-
fications, as, of course, they give value to your evidence.
You are M.D. of London?—B.S. London, and F.R.C.P.
London.

8095. You have had considerable experience of
medical practice, and the subject that we are dealing
with also?—I have been physician to Rugby School
going on for thirty years now.

8096 Also in general practice?—Yes.

8097. So that you can judge from your practice
among private children of the middle and better classes
as well as boys?—Yes, in all classes.

8098. And you have, of course, thought a good deal
upon this subject?—Yes, very greatly.

8099. Then would you be so kind as read over your
evidence? You need not adhere to it rigidly unless
you choose, if you wish to amplify it. Have you any
knowledge of the standards of height, weight, chest
girth, spirometry, and biceps girth of children at various
ages from six to eighteen years?—The most trustworthy
tables I know are those worked out by Dr Charles
Roberts. I am in process of collecting these details of
1000 public school boys, but have not yet recorded an
adequate number to be of any value. Mr Cecil
Hawkins, an assistant master at Haileybury College,
has worked more at this question than any other
human being, and could furnish statistics of value.

I append Dr Charles Roberts' tables, as I am unable,
in the short time at my disposal, to work out others.

TABLE showing the average and mean height and
weight, and the annual rate of increase, of 7850
boys and men, between the ages of ten and thirty,
of the artisan class—town population :—

Tables:
artisan class.

Age last birthday.	Height, without shoes.				Weight, including clothes of 9 lbs.			
	Average.	Growth.	Mean.	Growth.	Average.	Growth.	Mean.	Growth.
10	Ins.	Ins.	Ins.	Ins.	lbs.	lbs.	lbs.	lbs.
11	50·52	—	50·50	—	66·31	—	66·0	—
12	51·52	1·00	51·50	1·00	69·46	3·15	70·0	4·0

25-30	69'06	—	69'00	—	155'2	0'42	154'0	2'0

8100. Would you tell us from what sources have you derived those tables; have they ever been published?—They have been published. I forget the book that they are published in.

8101. Suppose you turn to the next page, which deals with the proportion of physically and mentally defective children from such causes as nerve deafness (incurable), diseased ears, blindness (myopia, hypermetropia, astigmatism), tubercular glands, tubercular joint or other diseases, rupture, diseased teeth, deformities, general weakness, etc.?—These defective children do not come within my cognisance. I am unable, therefore, even to express an opinion of any value.

8102. Are country children physically or mentally superior to urban children?—I do not know of any statistics bearing on these facts, though personally I have no doubt on the matter. I am in process of collecting these facts relating to 1000 boys, recording their place of birth, and of education, whether both have been in town or country, and the result as to their physique and their mental position on coming to school, gauged by measurements, and the 'form' in which they have entered the school. Dr Charles Roberts has shown that, between the ages of ten and twenty, children living in the country exceed those residing in towns by an inch in height, and, in many cases, by 7 lbs. in weight. Bearing on this question, I have had a valuable experience. I am Brigade-Surgeon Lieut.-Colonel the South Midland Volunteer Infantry Brigade, which comprises about 5000 men. These men form five battalions, and each battalion consists of about 1000 men of ten or twelve companies each. The men are enrolled at from eighteen to nineteen years of age from the various towns and country districts of the counties of Leicester, Worcester, and Warwick. Every year I accompany the Brigadier-General on his inspection of the battalions, and I am astounded at the variety of physique in the different companies. Some companies consist of well-grown, well-nourished, healthy-looking men, while in others they are puny, stunted, ill-nourished, sallow, and unhealthy-looking. In every case, and that year after year, I found that the former were enrolled from country districts, and the latter from large towns, such as Birmingham and Coventry, while the men of those companies that were neither well-grown nor stunted were enrolled from small towns.

8103. Are country children or urban children improving or degenerating?—I have no knowledge beyond the above experience.

8104. Does the work or exercise of country children dispense with the need of systematised exercise for

them?—No exercise can dispense with the need of games in the upbringing of the young in securing physique, agility, good fellowship, and brightness of disposition. No nation has excelled our English system of school games, which foster manliness and exterminate effeminacy.

8105. With reference to England, I suppose?—I was referring only to England, because I have no intimate knowledge of any other country.

8106. Does improved physical development entail improvement in brain power and in acuteness of the faculties?—Without a doubt the development of mind and character, as a rule, is largely dependent upon efficiency of body; neglect of part entails derangement of the whole. Not only the physique, therefore, but the mental calibre of the next generation depends upon the physical education provided for the children of the present.

8107. Do limits as to this exist, particularly at any age?—The only instances I know of are where boys of deficient stamina play too hard and work too hard at the same time, but these are unusual circumstances.

8108. Does improved physical development imply improved moral?—Strength of muscles, beyond all question, tends to produce such vigour of body that it almost ensures force of character and vigour of mind during the process of education. It is the loafer at our schools and in our streets who loses control over his instincts, and corrupts others.

8109. Does improved physical development promote morality?—Everything that tends to vigour of body ensures vigour of mind and strength of character. As a special case of this principle I would cite cycling as a mode of physical exercise which, from its nature, has outweighed the value of sermons and admonitions in the promotion of temperance in drink in the rising generation.

8110. Is a physical census of children desirable or necessary; in what ought it to consist?—The surest knowledge of children in this respect, and their best protection against injury, is most certainly obtained by a periodical record of their height and weight. This record reveals, more than anything else can, faulty systems of work or play, insufficient sleep, and the advent of incipient disease. Weight-losing, or failure of growth, betrays an unpardonable injury of some kind to the constitution of the child.

8111. Is inspection of the health of school children by a medical man necessary at present?—Yes, under the present régime, and in every grade of schools; though it should not only comprise the inspection of the pupils, but the inspection of the school buildings, the arrangements of work, play, sleep, and food, so that overcrowding, over-working, under-feeding, and imperfect sanitary arrangements would be impossible. But I desire to point out, on the other hand, that the inspection of the health of school children would be wholly unnecessary did they have their due during school life. What I mean is that they must have sufficient cubic space in the schoolroom, and not 80 to 120 cubic feet; that their work must be arranged not only according to their capacity, but the hours of work must be apportioned also according to their ages; that their hours of sleep must be allotted according to age, and that the needful exercise must be in the form of recreation, such as games, and not merely physical drill and gymnastics. A record of their height and weight is a greater safeguard against wrong being done than any medical inspection that could be devised.

8112. Will it become necessary if physical training be increased and rendered more systematic?—On the contrary, were physical education judiciously carried out, medical inspection would be less necessary, by virtue of the improved general health that would result. I would suggest the substitution of the term physical education for that of physical training, for it is as important in the welfare of the young as mental education.

8113. Is special clothing required for girls undergoing physical training?—Certainly in all gymnastic

Country and urban children.

exercises, and also in games entailing much perspiration, though not in such exercise as physical drill.
8114. Can you distinguish the value of the following forms of physical training, namely: Ordinary exercise, ordinary work, walking and running, games, exercises of the trunk and limbs, musical drill, gymnastics, military drill, self-defence, boxing, shooting, swimming. What is their absolute and relative value to children aged from six to twelve, from twelve to fourteen, from fourteen to eighteen?—

(a) Absolute Value :

Ordinary exercise	-	.	.	} These are suitable for all ages and both sexes.
Walking and running	-	.	.	
Games	-	.	.	
Exercises of the trunk and limbs	-	.	.	
Musical drill	-	.	.	
Gymnastics	-	.	.	} This is unsuitable for children from the ages of six to twelve.
Ordinary work	.	.	.	
Military drill	-	.	.	
Swimming	-	.	.	} These are suitable for the ages of ten to eighteen, and swimming should be taught to every child.
Self-defence	-	.	.	
Boxing	-	.	.	} These are suitable from the ages of fourteen to eighteen.
Shooting	-	.	.	

(b) Relative Value :

Games	} These exceed in value all other physical exercises at all ages.
Exercises of the trunk and limbs	-	.	.	.	
Gymnastics	-	.	.	.	} All of these are of untold value in the delicate, the deformed, and those suffering from deficient nutrition.
Military drill	-	.	.	.	
					} These children need systematic training even more than the healthy and robust, if they are to have a chance of developing into strong and healthy manhood.

8115. Do all of those exercises prevent in healthy children eye disease (short-sightedness, astigmatism), joint diseases, spine diseases, tuberculosis?—Their tendency is entirely in that direction.

8116. Do the same exercises produce in weaklings and those predisposed, or do they favour such things as rupture, heart disease, joint and spine disease, tuberculosis, fractures, dislocation, or other injuries, brain and sinus disease in ear cases?—The chief aim in the education of weaklings should be the development of the body at the only stage when it is plastic and capable of response. The vigour generated by appropriate exercise tends to prevent disease of the vital organs, such as the lungs, heart, and brain; renders the system proof against tuberculosis, by increasing the tone of the whole system, and by the growth of muscles which ensues in the limbs renders the limbs less prone to joint disease and fractures, and by increasing the contracting power of the abdominal muscles, makes rupture less likely.

8117. Are exercises required by the present race of children?—Beyond all question exercise is essential for growth and development, if the best is to be obtained for the child. But it must be borne in mind that, in the performance of exercise, energy is expended, and finally exhausted, and that this end arrives sooner in those whose tissues are immature, as they are deficient in 'staying' power by virtue of this fact. The defect in all exercise of the young (except where they are left to themselves), whether mental or physical, is that it usually fails in being insufficiently short and frequent. An hour's drill for a child is cruel, whereas four quarters of an hour at various times are of untold value in their growth and development.

8118. It occurs to me in reading this that there is an ambiguity, as it will be printed in the phrase, 'it usually fails in being short and frequent.' Would

you approve of altering that into such words as that it usually fails, inasmuch as it is too short and too frequent, or that it is not sufficiently short, and not sufficiently frequent?—Not sufficiently short. The tendency is to give the drill or the exercise all at one time, an hour consecutively, I mean.

8119. Are games required by the present race of School games, children?—School games are still more required, as they afford recreation as well as exercise, which engenders a brightness and alacrity of disposition, and begets a manliness in boys, and expunges effeminacy from girls as nothing else can.

8120. Are gymnastics required by the present race of children?—Gymnastics are essential for the rectification of physical defects in certain children, and they are good for all children where they do not take the place of games. They savour too much of a 'set' lesson to be a real recreation, and are usually performed in a gymnasium, which is too often ill-ventilated. As an adjunct to the playground they are of great value.

8121. Is military drill advantageous to the present race of children?—Next to games, I regard military drill as the most valuable exercise. It affords good sound exercise, is a good developer, is practised out of doors, is a good discipline, commands obedience, and teaches children to act together, without destroying individualism. And after school life is over the pleasures of military drill will induce children to join that excellent institution, the Boys' Brigade, which is doing so much in our towns to keep the young from loitering at street corners.

8122. To what extent is first aid and ambulance instruction desirable, if at all, in children, and to what extent should it, if desirable, be adapted to their ages, intelligence, and circumstances (e.g., six to fourteen years, and fourteen to eighteen years)?—Unsuitable for children; invaluable for young men and women towards the end of school-life or after the school age.

8123. Is instruction in self-defence—boxing, shooting—advantageous or otherwise?—Of great advantage from sixteen to eighteen, when under suitable control.

8124. Is instruction in swimming beneficial, and to what extent?—I would have every boy and girl taught swimming, but would postpone it until the age of ten, as young children, as a rule, are rather timid of the water.

8125. What is the best system of physical education?—Games are out and out the best physical education for children of all ages; military drill the next; and gymnastics follow, especially when available for wet days.

8126. What are the respective merits of physical training as practised (1) out of doors, and (2) within doors?—As children spend so much of their time in ill-ventilated schoolrooms in their mental education, all physical education should take place out of doors, except in wet weather, when means of exercise indoors are preferable.

8127. Are schoolrooms adequate?—The schoolroom can be largely adapted for gymnastics, physical drill, and military drill with very little trouble and expense.

8128. Are the playgrounds adequate?—The provision of playgrounds is as essential as schoolrooms for completeness of equipment in education. The great desideratum is a playground adjoining every school, where children, as they rush out of school, can find an immediate place for play, instead of resorting to the streets. A larger playground, in some central position, common to several schools, would be a boon, and would diminish expense.

8129. Are special playing-fields necessary?—School playing-fields are necessary in every school, not only for the purpose of physical education, but so that the honour and fairness, which are usually incidental to school games, qualities so much to be desired in the battle of life, may be promoted. Yet in a large proportion of schools the playground is conspicuous by its absence.

8130. You retain the word 'playground' there?—I think the term 'playground' and 'playing-field' is immaterial.

Mr C. Dukes,
M.D., B.S.
13 June '02.
Gymnasia.

8131. What is desirable in a proper gymnasium? Are any precautions needful in gymnasia?—Small gymnastic arrangements could be readily provided in the playground, such as one sees in villages in this country, and on the Continent. Large gymnasia could be arranged, common to several schools, to be utilised by the various schools on certain days, and at stated hours. Here instruction could be given by a competent and judicious instructor, and injury prevented by seeing that children do not undertake exercises beyond their capacity. Padded floors, or mattresses, may also be requisite.

Swimming-
bath :
desiderata.

8132. The desiderata of a proper swimming bath?—The desiderata for a swimming bath for children are :—(a) That the depth of water should be graduated by a sloping bottom. (b) That the water should be warmed so as not to be below 65° F., or above 70° F. (c) That the incoming warm water should find entrance at the bottom of the shallow end of the bath where the youngsters enter the water. (d) That the bath should be open at a certain time of day for beginners alone. (e) That a responsible person should be in charge of the bath to prevent bully-ragging, and in case of misadventure.

Precautions.

8133. Are any precautions specially needful in a swimming bath?—(a) The hot water should not enter the bath at the surface of the water where, owing to its being specifically lighter, it floats like oil, and heats the building instead of the water. (b) Too many children should not be allowed in the water at the same time. (c) No child should be permitted to be in the water for more than ten minutes. (d) The bath should be closed for at least an hour after meals.

Girls :
physical
training.

8134. In what should the physical training of girls consist?—The physical education of girls should be as thoroughly arranged as that for boys; in fact, it is of greater importance for girls than for boys owing to their more rapid growth, and their less stable nervous system. The necessity of being physically strong should be instilled into the minds of girls from their earliest years, and that it can only be obtained during their years of growth. This physical education not only involves muscular development, but is certain, at the same time, to produce a vigorous nervous tissue, and brain capacity; and, above all, that strength of character which is so fine a trait in women. For strength tends to develop courage and self-reliance; while bodily weakness is apt to produce timidity, with all its inherent pitfalls. Up to the age of puberty the same exercise should be common to both sexes; while after that age the games of girls should gradually merge into exercise of a quieter character. Up to this age, too, I think much good would be gained, and much expense saved, by educating boys and girls together. It should be remembered in organising the games of elder girls that there is a difference physically between girls and boys; and that exercise and games should, in every instance, be adapted and regulated accordingly. Their clothing should be appropriate to their exercise.

Girls : games.

8135. What exercises and games are best adapted for girls?—Walking, running, skipping, swinging, jumping, dancing, gymnastics, physical drill (such as the Swedish system), military drill, riding, swimming, skating, cycling, rowing, football (up to twelve years), cricket, racquets, fives, tennis, ping-pong, la crosse, golf, hockey, ringoal, croquet, baseball, battledoor and shuttlecock, gardening, natural history excursions, music.

Games.

8136. Are any particular games (e.g., football) injurious to boys or to girls?—I know of none. It is said that football is a dangerous game. Played amongst children this is not so. At the home of football I have fewer accidents from this game than from cricket. Where, however, it is played by men it is sometimes dangerous; though where the number of players is concerned, as well as the number of games, the percentage of accidents is comparatively trifling. It is also said that football is answerable for a large proportion of the cases of perityphlitis (appendicitis). This, again, is untrue. In thirty-one years I have had

nineteen cases of this disease; and I have had only one death.

Mr C. Dukes,
M.D., B.S.
13 June '02.
Proportion
time.

8137. What is a just proportion of time to be devoted to physical training in relation to study?—A just proportion, and not an exorbitant demand, of time devoted to physical education would be a maximum of two hours a day, and not always all at one time; and a minimum of one hour a day.

8138. Is physical training most advantageous if carried out daily, or frequently, in connection with school work?—It is most advantageous when carried out daily. Work is far better done when provision is made for daily exercise.

Daily
exercis

8139. Should military drill be carried out in periodic classes, or daily?—Military drill should be performed every other day, and so arranged as not to interfere with games.

Militar

8140. Does the instruction of children in physical training require an improved dietary?—There can be no question that children can exist, when doing no mental or physical work, on a bare subsistence diet. But the same experience is true in the case of children, as has been proved over and over again in the periods of famine in India, that a bare subsistence diet becomes a starvation diet when mental or bodily work is added. It should never be forgotten, especially in the case of children who have to grow as well as live, that *ex nihilo nihil fit*.

Dieta

8141. If physical education is introduced into schools, will any special provision require to be made in respect to diet?—This must depend entirely upon the position of the parents of the children concerned, whether they are able to adequately feed them or only afford them a bare subsistence diet.

Food :
positio
parents

8142. If an improved dietary be required, can any suggestions be made as to how to carry it into effect?—I have insufficient experience on this question to make a suggestion; but I would like to be permitted to say, with all the force I can command, that any supplementary food supplied by public authority should be in the form of such a food as porridge and raw milk, and not in that of soups, still less in those fashionable concentrated meat juices, which are stimulants rather than foods, and which, although they have their uses, are as injurious to the child as dram drinking. There are few children's foods which exceed in nutritive value those of porridge and uncooked milk.

Dietary
sugges

8143. What are the results of experience regarding physical training, athletics, etc., in secondary schools and universities?—(a) My experience of physical education and athletics—in the first class preparatory schools, where boys are educated from nine to thirteen years of age, and in public schools where the range is from thirteen to nineteen years—is that they are of the greatest value. The only fault I have to find with them is that they are too often most-inefficiently organised, whereas they should be as thoroughly organised as the mental education. The physical education of the young tends to training in perception and judgment, as well as in adroitness and courage. Even yet the influence of physical education on mental development and moral growth is not sufficiently recognised even in these schools; and the law is not yet practically regarded, that mental and bodily culture must be concurrent if the highest development is to be attained. I regard no question in the training of the young of more general importance than the mode of occupying 'out-of-school' hours. If children are not as fully and wisely occupied in that time as during the hours of work, moral discipline must be absent. If the young do not take regular and vigorous exercise, no sound health can result. Unless every care is bestowed to make the freedom from work a time of cheerful recreation and constant bodily occupation, every hour becomes a time of weariness and idle lounging: no guarantee for conduct exists, and the character and tone of the pupils must deteriorate. (b) I have no experience of the effect of physical education and athletics at the Universities. What is termed athleticism certainly does not, and cannot, exist in our

Physica
educati
athletic
results
experie

Dukes, B.S. public schools at the present time. There is no opportunity for it.

ne '02. Let us analyse what is the custom in these schools.—In the spring term occasionally football is played; but the main exercises are running and hockey and boating, where boating is able to take place, which occupy an hour to an hour and a quarter three times, and sometimes four times, a week. Time is also spent at workshops. In the summer term cricket is played for about two hours three, and occasionally four, times a week. Some boys are also able to go on 'ends' in the evening, bowling and batting pitches. Also considerable time is devoted to swimming. In the winter term football is played at most four, and usually, three, days a week, for an hour or an hour and a quarter. In addition to those *pieces de resistance*, there are opportunities afforded for a certain proportion of the boys to join in cycling, fives, racquets, hockey, rifle corps drill, rifle shooting, swimming, and the gymnasium. The faults I have to find with the system are the monotony of the games, when there might be a much greater variety to supply every bent if efficiently organised. Some boys can no more play at cricket than they can write a poem. And that facilities are not afforded for some form of physical education on every day of the week.

games. 8145. Is it ever found to be adverse to the intellectual development or progress of the scholars?—Beyond all doubt athleticism is occasionally adverse to the intellectual development and progress of the scholars, as in the case of the head of the eleven, or the fifteen, where all thought is bestowed upon these positions; but this is so rare as to be unworthy of consideration when it is weighed against the enormous amount of good school games have affected in our English school education. The physical education, as exemplified in school games, even in the thirty-one years over which my experience extends, has completely altered the tone and character of English schoolboys. These games have diminished bullying, and a 'fight' is all but unknown, because boys are legitimately occupied in out-of-school hours at exercise by which they can let off the steam. Further, school games furnish a healthy topic of conversation, which is such an estimable help in the formation of character.

al ion : e lly sed. 8146. The last question is, is there any fear of it becoming so?—What I want to see is a master told off to organise every variety of game for every taste of every boy, so that none may be unoccupied in out-of-school hours; but that all may have recreation in which they can take a keen interest, follow their own bent under guidance, and become experts. The sum of the whole matter is that the organisation of physical education should be as carefully arranged as that of mental education at school. The physique of the next generation depends mainly upon the physical education provided for the children of the present. Moreover, if children are to be happy in mind and healthy in body at school, they must play as well as work.

8147. One or two explanatory questions. I presume from the tone of your *précis* that you have not the position of regulating or organising the physical education of Rugby School?—Not the slightest; I have no voice in the matter in any way, except personal influence casually thrown out.

8148. Then what is done at Rugby in the way of physical education; is it what you mention after the words, 'Let us analyse what is the custom of these schools.' Do the following three paragraphs comprehend fairly what is done in the Rugby School?—And in all English public schools.

8149. I gather also you do not quite approve of it; you do not think that it is sufficiently organised to be anything like perfect?—I do not think enough good is got out of the games as might be.

8150. Turning to the first page, do you think that Mr Cecil Hawkins' observations would be of great value to this Commission?—I think they would; he certainly knows more about it than anybody else.

8151. And do you know the points to which he has chiefly directed attention?—He has taken all the

measurements that you ask for, though I cannot tell you how many others, for a great many years.

8152. Height, weight chest girth, muscular development, and head measurement?—Yes, I believe everything.

8153. Has he been all the time at Haileybury?—I think so; a great many years, I know.

8154. In the next page, under heading 'ordinary work,' I suppose we understand that the question and the answer there refer to ordinary occupations, as of country children, which you consider to be unsuitable for children of the ages of six and twelve, such as assisting their parents in country work, farm work and so forth?—I think there may be some out-of-door occupations in country districts that would not hurt the children—going errands and doing little things about the farm out of doors. I think that is rather good for them than otherwise.

8155. But you do not consider it capable of replacing a properly-organised physical education?—I do not.

8156. And in regard to games, the whole of your evidence bears out that you attach a very great value to games in contra-distinction to physical exercises, physical drill and military drill?—Yes.

8157. You think that games, properly organised, fulfil most of the needs of scholars?—Yes, certainly. You see, drill is a set lesson; there is no recreation. Well, I will not say there is no recreation resulting, because there is a good deal of pleasure obtained, but nothing like the freedom that is got out of games.

8158. I suppose, however, that dealing with schools in very poor urban districts, where games cannot be organised in this way, you would recognise that there is a field for physical education that might be filled up by proper drill and exercises which could never be reached by games?—Quite so; the greatest field for it.

8159. Could you indicate to us what the smaller gymnastic arrangements are that exist in the villages in this country and on the Continent, and which you think advantageous?—You see the giant stride, the parallel-bars, the see-saw, swings and trapezes, put up in fields in country districts; while on the Continent a really good out-door gymnasium is provided for elementary schools.

8160. And these are what you refer to when you say small gymnastics?—Yes, these are what I referred to.

8161. You say that the incoming warm water should enter at the shallow end; is there not a risk that if that were adopted as a principle for the replacing of the water, that the children who could not swim might be washed into the deeper end?—The heated water flows in very, very slowly, so that is impossible.

8162. But where a current existed, as in a rapidly-flowing river, you would approve of reversing that so as to avoid that peril?—Oh, certainly; but where the arrangements are made for heating the bath from the two plans, one with hot water pipes under the water—steam pipes, I suppose—and the other where the water passes through the boiler and out into the bath again, the circulation is exceedingly slow.

8163. I infer, also, that you would approve of there being inserted amongst desiderata for a swimming bath means of properly renewing, and frequently renewing, the water. You have not mentioned it, but I presume you would approve it?—Yes, certainly; the tendency is to leave the water in too long, because of the expense of heating and the expense of buying the water.

8164. Then you say, 'Up to this age, too (that is, 'puberty'), I think much good would be occasioned, 'and much expense saved, by educating a boy and 'girl together.' Does that statement refer to physical education or to general education?—Both.

8165. Regarding the question of a Saturday holiday being a necessity for children, what is your opinion; that it is, or that it is not?—For the teachers, I think it is a very great boon; for the children, I think they

would be much better if they had their morning's work, if they get some time every day for recreation; but where they do not get applied time every day for games, I think it is the very greatest boon, and is their great safety.

8166. Would you, in the case of girls, approve of their being instructed by women rather than by men in their physical education?—I think that is a question that is immaterial.

8167. *By Mr Alston.*—Your experience has been entirely with the English public schools, such as Rugby; you seem to have conceived a school in which all these things could be done?—You mean that I have taken my example from the highest schools instead of the lowest.

8168. Or rather from a first-class English public school. As we are going to deal largely with Board Schools—having all types of children—could you suggest any way by which all those very manifest advantages which you have sketched out could be applied without enormous expense?—I am unable to.

8169. I think, while we quite agree with the suggestions that you have made, the difficulty is that they would be applicable only to some very first-class schools, or, at any rate, to those under well-to-do School Boards?—Yes.

8170. Do you refer to the normal child?—Yes.

Normal and
abnormal.

8171. Of course, those that are not normal would require to be dealt with differently?—Yes; too often the abnormal child is considered abnormal, and no trouble is taken to make that abnormal child normal, and that is why I think if the height and weight were taken of all children, care and trouble would be taken to make these abnormal, delicate, unhealthy children, into normally good citizens, which I think the majority of them are capable of.

8172. The same remark would apply to the other section?—Yes.

Gymnastics.

8173. Then you refer to gymnastics; that is applied gymnastics with apparatus?—Yes.

8174. Would you have that regularly and always under proper supervision?—No, not unless you had all the apparatus incidental to a large gymnasium. Where I referred to villages where they have these smaller gymnasia out in the fields—the trapeze, the swing, parallel bars, and so on—I do not think it is necessary at all. You see they have got their field.

8175. Would you let the children, boy or girl, do anything with apparatus?—Yes.

8176. You think there would be no harm?—I do not think so; I see them playing about in those fields as it is.

Games.

8177. In advocating games as the most advantageous thing for the improvement of the young, it may not always mean regular school games under supervision or under direction?—No, I do not think so, except to organise them; except for a few boys, a large proportion—a very large proportion—will not start on their games themselves.

8178. Then the organising would be the introduction of games suited to the various classes of boys?—Yes.

8179. Then you would allow them to play themselves afterwards?—Oh; assuredly. It simply wants a master or some one to see that they do play.

8180. And the more play the better for every boy and girl?—Undoubtedly. The mental education is organised, and a boy has to give an account of what he is doing in school hours; but not the same trouble is taken to see what he is doing during out of school hours.

Athletics and
gymnastics.

8181. Then I think you refer to athletics; what do you mean by athletics as distinguished from gymnastics?—Gymnastics I took, and what I understand by that is exercise with gymnastic apparatus.

8182. Yes?—Athletics and physical drill may be both carried out without any gymnastic apparatus.

Physical drill
and athletics.

8183. How would you distinguish between physical drill and athletics?—Physical drill is generally a standing exercise with all manners of movements of arms and

legs, and stooping and bowing, every position under the sun—physical drill.

8184. Then would you take precautionary measures to prevent excess of athleticism in the schools?—I cannot recognise its existence; I have lived where it is supposed to be overdone, but I have never seen it.

8185. Over-running?—Oh, there you enter into another question.

8186. Over-cycling in cases?—Yes, I should think that might be possible, but I rather think running and exercise of that character should be organised exactly the same as a lesson is, that it should not take place too long or too frequently, and that exercise, as I have said here, in my evidence, should be according to the age of the boy. For instance, when I went to Rugby, the boys of thirteen, when they entered the school, had to go the same runs as boys of nineteen, the same distances, the same pace. I have seen the big fellows with a comforter round the neck of the little fellows dragging them along. I have seen the little fellow lying on the grass vomiting, with being overdone. Well, it took me about twenty-five years to get that altered, so that every boy should run according to his capacity. When a boy enters now, he is only allowed to run three miles, and to take an hour to do it. Well, I was laughed at when I asked for that. It was said, 'the boy can walk it.' 'Yes, I know the boy can walk it, but he cannot run it, and until a boy has really learned to run he cannot run the three miles in less than an hour, because he will run for 100 yards, and he will walk for 200. During the time he is walking the 200 yards, he will lounge along at about one mile an hour, so that it takes him really his hour to do his three miles' run.' Then boys at fifteen have got their five miles' run, and the boy who has been captain of the three miles' run has to certify that the boy who goes for the five miles' run is capable of doing it. Then we have another seven miles' run, and we have lastly another one which is thirteen miles, and only five or six of the very best boys enter for that.

8187. That seems to show that athletics of that kind should be under medical supervision?—I do not think so; ours are not under medical supervision.

8188. But you yourself brought your medical knowledge to bear upon the excessive use of it?—I only asked gentlemen to use their common sense and not insist upon boys of thirteen, who had never run before, being made to run the same number of miles as a boy of nineteen, because of its evil consequences.

8189. Then all these athletics being carefully conducted, you quite approve of their full application, and the champion should come out at the top?—Certainly.

8190. *By Sir Henry Craik.*—You have had large experience in public schools?—Yes.

8191. You have visited, I suppose, to a certain extent, the ordinary State-aided schools?—No; I have seen what used to be called the ordinary National school which exists in our villages; and the voluntary schools, and some of the Board Schools, I know something about them, and I know the masters, and, being interested in the subject, I have asked a great many questions.

8192. You have, at all events, a considerable general knowledge?—I have common knowledge.

8193. You speak about the cubic space that should be required in these schools not being limited to 120 cubic feet; it ought to be larger?—Yes.

8194. What would you put as the limit for the individual child?—Well, if I were to put what I like, I should ask for 400 feet; but that I could not get.

8195. Have you compared the finer Board Schools with some of our high-class public schools?—Yes, and the Board Schools would be superior.

8196. I quite agree with you; I expected you to answer so. What is the comparison with what you estimate would be the expense of providing playgrounds such as you contemplate in your evidence speaking of these expensive Board Schools? The playgrounds would bear a very small proportion?—Very, very; it has simply never been thought of.

Mr C. Dukes,
M.D., B.S.

13 June '02.

Over e
preven
organi

Accommi-
tion: lit

Playgrou
expense.

8197. It would add very little to the expense?—
Very.

8198. And comparing the two sets of schools, your experience points to this, that the higher-class school has been able to turn out more healthy boys from inferior class-rooms because they had large playgrounds, whereas your superior class-rooms in the expensive Board Schools have not done so because they have had no playground?—Quite so; there can be no doubt about that question.

8199. There is no doubt the lower school at Eton would not be passed by any of His Majesty's Inspectors?—I am sure of it.

8200. But the playgrounds in Eton are considerably superior to what we can afford?—Yes.

8201. If we are to improve the position of scholars in these lower schools, we ought to spend a little more upon playgrounds, and perhaps be a little more economical on buildings?—Yes, I would spend a little more on playgrounds without being a little more economical on buildings.

8202. The increase in the playgrounds would not be so large an increase compared with the great expense that is incurred?—Very small, I am sure.

8203. *By the Hon. Thomas Cochrane.*—In some schools it is practically impossible to get playgrounds such as a Board School that we inspected over Westminster to-day, and in those schools where you cannot get playgrounds you would still anticipate benefit from organised physical training?—Oh, great; but even then I think that if the thing were thought of when the schools were built, the playground in nine times out of ten could be managed; and I think, where you speak of a school like that, you might probably get a playground at the very top of the school of a flat roof. I do not think there is great difficulty; if the difficulty is only faced it melts away.

8204. First and foremost, you place, then, outdoor exercises, and certainly some form of physical training.

8205. *By the Chairman.*—You say that you have no experience whatever of defective children. That is rather a large statement. Do you really mean it absolutely as it stands?—No, probably not; not exactly.

8206. Would you mind explaining it a little, or telling us, in some sort of way, what experience you have had of children who have not been quite up to the mark? You must have known a great many who were not?—Oh, one sees every type, the chief type that is where they are not quite up to the mark—deficient in physique and in stamina.

8207. You will state to the Commission that you have frequently come across defective children?—The defective children that I come across really are those who are defective in tone, wanting in vigour rather than in being physically incapacitated.

8208. But what about eyesight—defective eyesight? If you ask me a year hence; I am getting out that fact too; it is a very small proportion amongst the class of which I have experience.

8209. And do you think, on that account, that that is a good sign, a sign of health not only in the children but in their parents?—I do not think it is material to health.

8210. Or have you no opinion on that point?—It is a defect which has little to do with health.

8211. You would not classify defective eyesight as either good, bad, or indifferent?—No, I think where the eyesight goes wrong in children, and where you get it in the poorer class, is where they are taught earlier than our children are.

8212. Then as to food, have you any special knowledge? You mentioned porridge, and so on. Are you acquainted with porridge *yourself*; have you ever cooked it?—No, never.

8213. Do you know how long it takes to cook?—It is said to take some hours.

8214. I may put it to you; I may say that it does take a considerable time to get anything like good porridge, therefore is it practicable, your recommending that.—I think so, quite.

8215. That there is time to cook the porridge?—

They told me, when I tried to get porridge for Rugby, that it could not be done, because it took such a long time to cook, but they have porridge every morning, because it is put in soak the night before, and then it takes fifteen or twenty minutes to cook in the morning, so they do get it.

8216. Do they like it?—All I wanted to impress was that soup should not be regarded as a real food for children.

8217. Were you talking of children at a high-class school, or children in the poor localities, who have had to walk some distance to get to their school?—That is what I was thinking of.

8218. You really suggest soup is not a good thing for children who have perhaps walked two and a half miles, and have to walk back the same distance in the evening?—No, I do not mean that; I think it is a good food, but I do not think it is nearly such good food as porridge and milk, bread and milk, or bread and butter and milk; nothing like it.

8219. In the middle of the day?—No; all soups and beef teas are far more a stimulant than they are a food.

8220. You mentioned something about Loretto just now; have you any knowledge of Loretto?—I do not know Loretto; I only know Dr Almond by correspondence, but I do know that he is one of the greatest schoolmasters in the country, and I know that he organised his games in such a way that, whereas he has only got 120 boys, he has the whole of those boys playing at football in one afternoon, and if you go to any other public school you will not find half of the school playing, not half.

8221. Is that so at Rugby?—Yes.

8222. Take football, ordinary Rugby football. What would you say is the average amount of football per week played by boys?—At Rugby?

Football :
amount at
Rugby.

8223. Yes, the average?—They play three afternoons a week for about one hour, or one hour and a quarter, or an hour and ten minutes.

8224. That would be often enough for a good Rugby game?—Yes; that is all they can play.

8225. Not on other days?—No.

8226. Rugby has a great deal less than Eton has?—They have no half-holiday three times a week.

8227. Do you know that at Eton they play between twelve and two every day at football?—I do not know that.

8228. That is only in the autumn; there is no football in the spring.—That is too much; the boys get exhausted playing it every day.

8229. It has got to be done?—Well, a large proportion of the boys do get exhausted, at all events.

8230. Do you not think that in games—this is a question that has been put to other witnesses before you came here—there is a tendency that those who are stronger get most of the chestnuts, and the others who are weaker go to the wall?—There is no question about it.

8231. In advocating games as physical exercises, do you not think that you are rather advocating physical training for the few, as against possibly the many?—Not when it is properly organised. It is a master's duty to see that his boys play, and that every boy plays, as much as it is to see that every boy works. Unless that is done, simply the weak go to the wall, and the few monopolise the whole of the playing fields.

Games :
strong and
weak.

8232. I should have thought—I have not had the pleasure of playing Rugby football for a considerable number of years—but I should have thought that in that game especially the stronger got all the opportunities of the game and the small boys did not play?—That is why I say the boys should be made to play.

8233. You cannot make little boys play the Rugby game if there are big boys there?—I am always advocating that the little boys shall have games for themselves. That is just what Dr Almond of Loretto does; he has on his playing fields 120 boys; there are four different lots of football going on on a half-holiday.

8234. And how are they graded—according to age.

Mr C. Dukes,
M.D., B.S.
13 June '02.

Mr C. Dulces, M.D., B.S., according to the standard of the school, or how?—According to size.

13 June '02. 8235. According to size in the school, not according to class or not according to age?—No.

Grading of boys for games.

8236. Absolutely according to size?—I will not say absolutely.
8237. This is at Loretto, do you say, or is it at Rugby too?—Yes; well, it is at most schools; they grade them, not according to their position in the school, but according to their size.

8238. You say it is so at Rugby now?—Yes.

8239. How many boys are there there?—575.

8240. Are they in one school or are they in different houses, or both?—They are in different houses—nine boarding-houses.

8241. And a schoolhouse is one of them?—That is one of them; yes.

8242. I should rather like some information about that; how do you grade them in that way, according to size out of all these different houses?—They play according to the houses.

8243. Quite so?—And the first thirty will play in one set, and then the smaller boys remaining in the house will play with the smaller boys in another house, what are called remnants.

8244. In no grades does the whole house play together?—I think not; I think they used to, but I think that is abolished now, because it was found that the little fellows did get so knocked about when playing with the bigger ones.

8245. I should like to ask you, because we may have to recommend something about it, as to cricket; what happens there?—They have their elevens and their twenty-twos.

8246. That is for the school?—That is for the school.

8247. But as regards each house, I suppose each house plays more or less by itself as a unit or as two units?—Yes, they do sometimes, but they are so continually playing with other houses—all below the eleven and twenty-two of a certain standing will play with the same kind of standing of another house; but they do play as houses too, and the way that is managed is that those who are not in the eleven and twenty-two will have their names put down for a certain afternoon, and some of them will play, and another afternoon others will play, and so on.

8248. So far as you are aware, you would recommend cricket and football for ordinary country school children?—Yes, very much.

8249. As part of their physical education?—Yes.

8250. If it could be done?—Yes, certainly; in country districts there should be no difficulty about it.

8251. That may be; it is not always easy to get a playground even in a country district?—No.

8252. But you would advocate playground as much in the country districts as you would in the towns?—Certainly.

8253. *By Mr Fergusson.*—You say, 'It is the loafer' at the school and in our streets who loses control over 'his instincts and corrupts others.' In a school where boys live and are always under control, you can deal with the loafer; but with Board School children you see the difficulty?—Yes.

8254. Unless you make some form of physical training compulsory in some way, the loafer will always escape?—Yes.

8255. And because a child is inclined to be a loafer he will not voluntarily submit to any training out of school hours?—That is where the organisation of the teacher should come in, and of course the teacher thinks that he has done his school work when his school duties have ended, but it is not so.

8256. Fourteen is the limit of the compulsory age—there have been questions raised whether it was not desirable to continue physical training after the age of fourteen?—Yes.

8257. What is your opinion about that; do you think that a great part of the early training is lost if it stops at fourteen?—Yes, I do, but I think if games

were properly organised for children when they were young, they would continue them in adolescent age, and in early manhood too.

8258. If they were given the taste for it in their youth?—If they were given the taste for it, I think it would keep them out of public-houses more than anything else.

8259. You said in answer to Sir Henry Craik that 400 cubic feet was what you would like to get if you could?—Yes?

8260. But what would you be satisfied with; you are not satisfied with 80 or 120; what do you think might be reasonably given?—I think 200 might be furnished quite easily. I can give you the testimony of one of the best teachers I know in a Board School where there were 120 cubic feet. He said that if he went out of his school for any purpose after the children had been in there for half an hour or three-quarters of an hour, and had to come back again, he simply could not enter the room, the stench was too great.

8261. I am afraid he does not open his windows?—That is part of the reason, no doubt.

8262. As to your recreation for children, we were told by one witness—no less an authority than Sandow—that under his system you had to concentrate your attention and brain upon the muscle you were exercising; well, that means, of course, brain work?—Yes.

8263. In the exercises you would have for children, do you want to have brain work, or do you want to give them something that relieves their brain work for the time?—That is it.

8264. You do not want to give them anything that is a strain on their brain!—It would simply undo the good that was got in young children when they were growing, I am sure.

8265. Then you do not agree with the view that no physical exercises are any use unless they employ some amount of brain work, that the mere doing this sort of thing, unless you are thinking of it, and setting your mind to it, is of no use?—Oh, I do not think so.

8266. As a medical man you do not think so. Then you say, 'Games are out and out the best physical education for children of all ages'; then you put military drill and then gymnastics, but you do not in that include free exercises; gymnastics we understand to be gymnastics with apparatus?—Quite so.

8267. But what about free exercises?—That is what I term physical drill, and what is usually termed physical drill.

8268. You speak of military drill?—Yes, military drill.

8270. You do not include that in your answer you have games, military drill, by which I suppose you mean purely formations, marching in fours, and all that sort of thing?—Yes.

8271. But where do your free exercises come in in that; I want to know in what position you put them; are they better than military drill?—I think they come next to military drill.

8272. Next in front or next after?—Next after.

8273. But the military drill includes extension motions of all kinds, does it not?—That is what I understand by it.

8275. These free exercises are included in the term military drill?—In the term military drill.

8276. I was interested in what you said about the porridge and milk; on the question of time, I do not know that porridge does not take as long to cook as the soup, but it would be less trouble to make. You will not get many children who would eat porridge and milk in the middle of the day?—They would always eat milk and bread and butter, and it is far better for them than soup.

8277. That you are certain about?—Oh, yes.

8278. When you say soup, do you include soup which is made with meat and vegetables, such as broth, pea-soup, lentil soup?—If you mix it with lentils or peas, that is very good.

8279. Potato soup and rice soup?—Yes, that is very good.

Country school children: cricket and football recommended.

Loafers.

Physical training after fourteen: should be continued.

Mr C. Dulces, M.D., B.S.
13 June '02

Accommodation.

Exercise for children: brain work undesirable.

Forms of physical training in order.

Food.

8280. Not clear soup?—Ordinary soup made from meat has no effect at all; a child will starve on it.

8281. Take broth or pea-soup—how does that compare with porridge and milk?—I should say that is very nearly as good as porridge and milk.

8282. Porridge and milk might be given as a variety?—Yes.

8283. And bread and milk?—Bread and milk, yes.

8284. It would be less trouble than soup; it would not take half the preparation?—Yes, and bread and butter and milk too.

8285. Then, as to the games in English public schools; you attribute the diminution of bullying and fighting to the good effect of the physical education of the last thirty years?—I do think so.

8286. Then I suppose it follows from that, if the same sort of training is applied to Board School children, some of the hooliganism might be reduced?—Yes, I am sure it would be.

8287. You think that might be expected to follow?—Yes.

8288. That is what corresponds to the fighting and bullying that used to go on in the public schools?—Yes.

8289. *By Professor Ogston.*—I am anxious to get the points of your evidence as accurate and clear as possible. Dealing with the question of soups, am I

correct in assuming that you believe that when meat is cooked into soup by boiling it is only the stimulating salts that are extracted, and that therefore pure soup is of little value?—I think so.

8290. The albumens and proteids and the nourishing parts are not extracted in ordinary soup?—They are extracted, and they act as stimulants far more than they do as nourishing factors, I think.

8291. Well, in such diets as porridge and milk, and milk and bread and butter, there is a large proportion of the nourishing constituents, and a smaller proportion of stimulating salts?—That is my belief; yes.

8292. And that the nearer a soup approaches by a mixture to porridge the more valuable it becomes?—Undoubtedly. I think a soup can be made as good as porridge and milk if it is made with lentils and peas, and so on.

8293. Precisely. Another different point is, I think you stated to Sir Henry Craik, that a certain number of the boys in your public schools would turn out for an examination more competent with corresponding lads from Board Schools. I suppose you would like us to understand that if this were more closely looked into, that the rest of the boys that you get, being picked boys, to some extent, would have some influence?—Oh, it would make a great difference.

8294. You would not attribute it entirely to that?—Oh, no.

The witness withdrew.

Col. The Hon. JOHN SCOTT NAPIER, C.M.G., examined.

8295. *By the Chairman.*—Would you mind reading from your notes, please?—The question is:—

1. Describe the system, the syllabus, and apparatus?—The system is one of progressive training, so applied as to run no risk of injury to the weakest. In its early stages it principally consists of free gymnastics and elementary work on the horizontal bar, parallel bars, vaulting-horse, and bridge ladder. Rope climbing is also taught. The syllabus and work on the apparatus will be found fully described in Appendix 1 and 2 of the new Infantry Training (provisional) just issued.

2. For what age is the system intended?—The training is applied to recruits on joining, no matter what their age is, and is intended to be kept up during the whole of their first period of service—that is, seven years—it being voluntary for men over thirty years of age.

3. What tests are made, and when?—The instructors, both at depôts and at headquarters of units, classify the recruits from time to time, according to their strength and capabilities. The inspector of gymnasia, assistant inspector of gymnasia, and the superintendents of gymnasia in districts visit these squads from time to time. The standard of efficiency is tested at the end of the first month, at the end of the second month, and at the end of the third month, and the relative tests are enumerated on page 293 of the Infantry Training for 1902. Should the recruit not come up to the standard required, he can be put back for a further course, or he may be discharged the service as unlikely to become an efficient soldier.

4. Are reports available for the use of the Commission?—I would suggest that these reports be called for from the War Office.

5. Describe the average physical progress made?—I found that recruit measurements taken at depôts and at headquarters of regiments were most unreliable and misleading. I would like to explain to the Commissioners that recruits often join at headquarters, and sometimes do not complete the course at the depôt, so, if you take them at half course, the measurements would be misleading; and then, again, if you take the measurements at headquarters, you would find them partially trained at the commencement, and then you would not have a fair test of what the increase was, because the men had already gone through a portion of the course at the depôts. I thought the depôts' books no use, so I did away with them. There are many difficulties to be contended with in a uniform system

of taking measurements. It requires an expert with experience to detect the various methods men have of expanding and inflating their chests. A man being measured in summer, after quick work with light dumbbells, will measure an inch and a half more round the chest, and nearly an inch more round the upper arm, than he would were he measured on a cold morning in winter when he first enters a gymnasium. Anybody who has ever worn a ring which is a tight fit in summer will find it will fall off in winter, but the shrinkage does not imply the loss of power. I, however, give below some average increases which may be expected after the first five months' recruit course: Increase, 2½ inches round the chest, 1½ inch round the upper arm, 1 inch round the forearm, and 1½ inch round the calf of the leg. From long experience I have found that a fair average. When the training is applied to a healthy boy who has been well nourished before joining, far better results are often obtained. For instance, I have often known three inches put on to a recruit's chest in the first six months of his service. That cannot be altogether put down to physical training, it no doubt has a good deal to do with a better and more liberal diet—putting on flesh. But physical progress cannot be properly described by measurements alone. The whole frame of the man is straightened and tightened up. What was fat is turned into sinew and muscle. His organs of breathing and digestion are improved. He is taught to move freely, and to apply what strength he has. The general improvement on his appearance and carriage is most marked, and conduces not only to self-respect, but to his efficiency as a soldier. (*See table p. 330 for example of average increase in twenty-two recruits, Northampton Regiment, after 110 attendances.*) They do not quite come up to average, because 110 attendances do not represent five months' training.

6. What are the defects usually shown in recruits, physical and moral?—In dealing with this question we must consider the various circumstances which induces men to accept military service. There are, no doubt, some few recruits who adopt the army as their profession under the influence of patriotism, prompted by the ambition to distinguish themselves in a calling which holds out many inducements to a roving and adventurous disposition. There are others who look forward to sharing in the plums of the service, and perhaps even look forward to the possibility of retiring on the pension of an officer—say £200 a year—before

Average				—	6	2	1	—	7	1		

they reach the age of 45. I had several examples of that in my own regiment. Opinions will vary as to the proportion of recruits who may be classed under the above heads. After some thirty-five years' experience of the service, I should say that 15 per cent. was a liberal estimate. There are other classes who enter the service because they find themselves unfitted for the steady plodding work required to earn a living in civil life. A fair proportion of these men may no doubt prove useful as soldiers, but I affirm that at least 80 per cent. of our line recruits enlist merely because they are unable, either through physical debility or for want of character, to procure their bread and butter elsewhere. In any case the sickness and crime prevalent in our ranks is conclusive proof that a large majority of our recruits are drawn from the lower grades of our population. Bad blood, irregular and indifferent feeding, foul air, degrading surroundings, all have their part in poisoning the sources from which our army is principally recruited. Under these circumstances military life and military training become an inestimable boon to these poor lads; it offers an asylum, and better, a home, to many an outcast. A certain amount of cleanliness is enforced; regular hours maintained; healthy food provided; physical exercise in the open-air practised; discipline enforced; comparatively luxurious accommodation provided; manly instincts and rivalry encouraged. Who can doubt, under these circumstances, that the army stands in the place of a vast national philanthropic institution, conferring an immense benefit on the people, and fulfilling many obligations which would otherwise have to be met by the local ratepayer. The recruits' physical and moral defects are those with which we, who have any experience of the lower grades of our juvenile population in large manufacturing towns, are all familiar. No better life than military life could be devised to meet these defects. On the other hand, it is a most serious and fatal mistake to lean on this material for the protection and development of our empire.

7. What proportion is due to feeding?—You cannot train a man physically on an empty stomach. The more wholesome food he can digest, the greater the physical development will be. For children and growing lads porridge and milk is the best bone and flesh-making food, and I would strongly recommend that this diet be insisted on in all establishments under State-aid or control. What may be called manufactured or concocted or preserved foods are responsible for much of the degeneracy of our present generation.

8. What proportion is due to want of physical training?—The want of healthy, open-air physical exercise has much to account for. I am a great believer in open-air work, especially for children and growing lads from the age of four to twelve. Physical training, however, between these ages, should be almost entirely restricted to free gymnastics, without apparatus or weights.

9. How remedied?—Public cook-houses, under District or County Councils, should be established, where wholesome cooked food could be had at approximately

cost price, any profits to be applied to the benefit of the poor.

8296. You mean District Councils in England or Scotland?—Well, I have answered it generally both in Scotland and England, and Ireland too. I think in our large manufacturing districts, if cheap dinners could be provided—

8297. Excuse me for a moment, but do you mean not actually District Councils, but collections of people in certain districts, do this, or do you mean Public Health Authorities?—I mean public cook-houses.

8298. Public Health Authorities should have these public cook-houses?—Cook-houses which would be started by Government aid, but which would be self-supporting, and distribute wholesome food to any of the poor who come forward with money to buy it under the system of soup kitchens, where tickets are now issued gratuitously. I think it has often been done, has it not, in different ways?

8299. I only quarrel with the words 'District Councils' because it has a specific meaning. If you put public cook-houses in districts that would be better.—Yes, I see. Well, I should make it part and parcel of the Local Government business to see there were cook-houses.

A far stricter official inspection of food stuffs. Bad bread, bad butter, and bad food-stuffs are sold to the public without any official supervision at all; that is my experience. Public grounds and open spaces, properly adapted to physical exercise. I have known many a mining village where they had not got a bit of ground to play a game of football in. Compulsory physical training in all schools, whether State-aided or voluntary. I do not think you can separate State-aided from voluntary schools, because, if you compel State-aided children to do one thing, their parents will resent exception being made in favour of voluntary schools. You have got to make it compulsory for all. The abolition of the public-house in its present form, and substitution of people's clubs under control of County Councils. The prohibition of smoking for all youths up to the age of eighteen. I speak under correction, but I believe that is carried out in Germany. They do not allow, at least not in Government schools, and they certainly do not allow their recruit boys to smoke. Public douche baths, where all State-aided children are thoroughly washed at least once a week. Of course people laugh at that, but it would be of immense advantage if we had some system for securing the cleanliness of children attending Government schools, anyone who has been into the married quarters, or into low quarters where the children of the poor live, knows that they are very seldom washed, and the foul clothes that are on them are no doubt contagious to other children. I could provide plans for these public kitchens, clubs, and baths, if the matter receives serious consideration.

10. What suggestions have you to make as to physical training for those of ages from ten to fourteen, and fourteen to eighteen years?—From ten to fourteen the system now in vogue at the Duke of

York's School and Hibernian Schools should, in my opinion, be compulsorily applied to all State-aided and voluntary schools throughout the United Kingdom, as it would be invidious to draw a distinction between classes. The exercise laid down in Part 1 Military Training, 1902, Sections 43 to 54 inclusive, would meet the requirements of children from ten to fourteen, while those from fourteen to eighteen might, with advantage, receive instruction in exercises laid down in Appendix 2 of Military Training.

11. Describe the average measurements taken of height, weight, chest, arms, and the standard required?—The official standards are all laid down in Appendix 2 of the recruiting regulations, but these are modified from time to time, and exceptions are made when recruiting is bad. I may tell the Commissioners that I have often represented this to the War Office, and they have always explained it away on the fact that they cannot get recruits. They are quite aware that the material they get is bad, but they cannot get any better. I called them 'special specials' on one occasion, and got hauled over the coals for using the expression. They allow a special under one standard, and then they take him special under another, so he is a 'special special.' He is too short and too weak, and too narrow and too light, and he is too everything except the right thing. A note on measurements taken appears under Answer to Question 5. I may add that in my opinion the standards fixed are by no means satisfactory, as they do not represent the physical development required to secure a useful soldier. The standard of age is notoriously disregarded. I have added a remark here that no character is verified. I have seen in the House of Commons that they give out that characters are recorded. It is not the case; there is no character required at all in the line. They take any character—thieves and criminals of every description.

12. What improvement in general health of recruits, and when shown?—I have no statistics in my office as to health, but it goes without saying, that good feeding and regular exercise improves anybody's health.

13. Are gymnastic training and physical exercises preferable to military drill, shooting, etc., for benefiting youth of country, both physically and morally? Give reasons?—I do not understand the comparison implied in this question. Physical training is necessary to enable a man to carry arms and stand the strain of military operations. Drill is essentially a part of a soldier's training. Skill at arms is necessary to the efficiency of the soldier, and has no moral effect one way or the other, unless it is to give the soldier confidence in the presence of the enemy. It may well be argued that both physical training and drill are beneficial, for they tend to self-respect and discipline. I have no detailed information regarding the systems of physical training in schools other than our military schools. In these, free gymnastics are practised under the supervision of the masters, who attend a short course of training at Aldershot. In my opinion, this course is insufficient. At the Duke of York's School and at the Royal Hibernian School there are certified gymnastic instructors, and the results are excellent.

Physical Training in Schools.—1. Describe systems in force within your knowledge and observation; and suggestions as to improvements and alterations?—I would suggest that the system in vogue in these two institutions be extended as far as possible to all Board Schools, and that a staff of instructors for the purpose be trained at Aldershot or Edinburgh. I suggested at the War Office three years ago that we should start an establishment at Aldershot for instructing civilian or army instructors that were to be employed by civilian schools, but they did not take any notice of it. The War Office will not do it at their expense. They cannot do anything towards training civilian instructors at civil schools, they have not got the staff for it.

2. Should there be a uniform system for all?—Yes.

3. Should it be compulsory; if so, within what limits of age and time, and on what conditions?—Yes, as

long as the pupil is obliged to attend school under the present law; half an hour daily should be set aside for the purpose, and where the pupils are numerous, classes should be taken separately. I do not think it is absolutely necessary that it should be daily. I think three times a week would be sufficient.

Training of Teachers for Schools.—1. Should men and women be in the same class?—No, men and women should be trained separately—that is, in separate squads. But, perhaps, I do not understand the question. They should be trained in separate squads. It is not necessary that they should be trained at separate times. For instance, the same instructor could take two squads, one of women and one of men, and be giving the same instructions to the two classes, but they should be separated, not to be in the same class.

2. What is the system at present?—I have never heard that the female teachers in military schools receive any training. I have already stated that military schoolmasters go through a short modified course at Aldershot Gymnasium, which is not sufficient to make them expert.

3. How treated, and by whom?—See above.

A five months' course would represent 140 attendances, at least. Recruits do, or are supposed to do, five months—three at the depôt and two with their headquarters, or the whole five with their headquarters.

The above table was taken haphazard out of our books, and may be accepted as a fair average for the 110 attendances.

I did not look out for a particular squad; I just told the clerk to take out the first he came across.

8300. What do you do with boys or drummers?—We put them through the same course as recruits. Boys or drummers.

8301. When do they go through their gymnastic course; not till they are seventeen or eighteen?—Oh, no; we put them through at once; the little boys fall in and go through just the same course.

8302. As a boy?—As a boy, but they do the same work as ordinary recruits, who often are no older than sixteen years.

8303. Therefore that rather gives one to understand that boys can be worked to the same degree as men are?—That is because our physical training is calculated to meet the very weakest description of men, and there are a number of the recruits who are only sixteen years of age; it is not worth while drawing a distinction. The work required of the recruit at sixteen is of such a mild character that it can be applied to any boy. Physical training in army.

8304. The boys, as a rule, I suppose, would be ten, eleven, or twelve?—I do not think we can take them in under fourteen, but I could not answer that offhand.

8305. About twelve?—About twelve very likely. They could tell you that at the Duke of York's School, 80 or 90 per cent. of whom join the ranks; all go, no matter what their age, through the same course.

8306. And they are none the worse for it?—No; they could not be. What we lay down are mild exercises, too mild in my opinion. You can hardly call them muscular exercises, they are more for setting up, for straightening the body.

8307. After a recruit has had more food and experience of a better life generally, he is able for something a little bit higher?—Yes.

8308. That is where you can take him to something higher?—Yes; we put him into what is called the established gymnasium, which has got apparatus, and we work him over the horse and all that sort of thing; but I find the boys are better than the men as a rule, because you see the men have begun to get wrong, whereas the boys start fresh and we keep them straight. Progressive course.

8309. Had you anything special in your mind when you stated at the end of number 6 that 'it is a most serious and fatal mistake to lean on this material for the protection and development of our empire'?—Yes, I had.

8310. Was it anything to do with us as regards

Conscription
advocated.

physical training that you would rather have a superior class, a better fed class?—I want a superior class in the army. I have always been strongly in favour of conscription, and I have written for years on the subject. I do not believe in our trusting to what at a shilling a day must necessarily mean waste and stray, I think if we had had conscription in force, instead of sending out bad characters—instead of sending out weedy, ill-conducted, unhealthy boys, we should have the pick of a very large number of healthy recruits of a better class, and that the Volunteers that we send out would be very much more useful, of course, if trained. Although conscription would not apply to foreign service, you would have a great mass of the population trained to arms, and from that mass you would find a great number willing to accept conditions of service either from patriotic motives or for higher pay; but a five-shilling man is little better than a shilling man if he is not trained.

Recruits
physically
unfit:
discharged.

8311. *By Mr Fergusson.*—Do you find any number of these recruits that have to be discharged because they cannot undergo the moderate training you give them?—For physical debility?

8312. Yes?—Well, a great number ought to be discharged. They are not always discharged; but I have been one of the promoters of a scheme, or rather of orders being issued, enabling officers in command at depôts to discharge men who are physically unfit, by holding a Board on them after the first three months' training, if they do not come up to a certain physical standard. They have now the power of getting rid of them which they used not to have, and a great number are so discharged.

System at
Duke of
York's School.

8313. In answer to the 10th question as to the training of boys from ten to fourteen, and fourteen to eighteen, you recommend that for ten to fourteen the system now in vogue at the Duke of York's School; what course is it; is that the army course?—You see that the Duke of York's School is a Government school, under Government control and discipline, and it is governed by a military man, and the whole institution is under military supervision, and the system is enforced and superintended by a skilled instructor trained by us.

8314. But is it a special course; is it laid down in any book?—No; the course is one that we have adopted for our recruits, really following my recommendation to the Board; you will see they do recruits' exercises.

8315. That is what you call the Model Course?—That, I am sorry to say, I do not know. I do not know anything about schools; I have not made it a study at all—civil schools; but I believe what is called the Model Course is one that has been adopted by the School Board, and the School Board was advised, and assisted, and directed by an old army instructor—Chesterton. He is an old quartermaster-sergeant in my department.

Chesterton's
system.

8316. Do you know Chesterton's system?—Yes, I do.

8317. Is that good?—Very good; I think it is rather too complicated; but he is an excellent man; he has more experience of children than I have.

8318. What Chesterton says of the Model Course is that it is not sufficiently progressive for children; you have not knowledge to tell us?—No, I could not tell you. My suggestion that the military recruit course should be applied would meet that—that it is sufficiently progressive.

8319. His view was that there is nothing in the Model Course which is not in Chesterton; but Chesterton has got some other things which make his course suitable for children?—He is a thoroughly trustworthy fellow. I know Chesterton very well; he was my quartermaster-sergeant, and he is a thoroughly sound fellow.

Physical
training and
smoking.

8320. *By Mr Shaw Stewart.*—You say that you would prohibit smoking for all youths up to the age of eighteen?—Yes.

8321. Do you consider that it very seriously interferes with physical training?—Yes, I do; I am certain of it. All smoking interferes with physical training at

any age, but with youths especially, smoking the dirty stumps of cigarettes and cigars that they pick up in the streets, injures their lungs and their digestion. They make themselves sick, and their appetite is spoiled for food; they cannot face their food. Recruits in the ranks, smoking two or three cigarettes in the morning on the march on an empty stomach, will come in utterly unfit to eat a wholesome breakfast; that is my experience.

8322. And if it is bad for the recruits in the Army, it must be still worse for younger boys in the street?—It is very bad for the recruits in the Army, and I do not think it ought to be allowed in the Army, only they are so afraid—they quite admit that—of putting on any restriction whatever for fear of losing recruits; if it were known that recruits were not allowed to smoke in the Army it would certainly have a bad effect on recruiting.

8323. And you think that smoking has such a bad effect on successful physical training that this Commission ought to take notice of it?—I do indeed; I think it is one of the greatest evils that exist, especially cigarette smoking, because they all inhale, whereas with the pipe it is less injurious; but the inhaling of cigarette smoke—vile mixed tobaccos, filled with drugs—is very injurious both to the lungs and to the digestion.

8324. One word with regard to the training that you recommend; at Aldershot or Edinburgh—a staff of instructors for the purpose that should be trained at Aldershot or Edinburgh—do you think that, instead of training Scottish teachers only at Edinburgh, it would answer the purpose equally as well if the Aldershot system were taught at the training schools, so that future teachers could go through it there?—At what training schools?

8325. There are training schools at Edinburgh, Glasgow and Aberdeen?—I do not know anything about these schools. I know that General Chapman tried to introduce a system of his own which had no authority, and our superintendents are not obliged—it would not be fair to ask them to take civilians, because civilians are not under military discipline, and therefore we should have no authority.

8326. My point is this, given certain instructors thoroughly trained on the Aldershot system, would they not be able to impart the Aldershot system of instruction at the training colleges, so as to enable the teachers to go through that course instead of coming to Edinburgh only?—Certainly, if the War Office could be induced to give us sufficient staff to undertake the work; but the staff is already too small for the military work in hand.

8327. The staff at Aldershot?—Our own staff is too small at present to cope with more than military work, and therefore we should not be able to do so unless you got the War Office to allow us a larger staff to train your civilian teachers. If they did that, I should have no objection to undertake the work, as far as I am concerned; but we could not do it on the present staff without seriously interfering with our regular work. They are very hard worked our instructors; they sometimes work six or eight hours a day, and it is very engrossing work; it requires a man's constant attention, and if he drops it at any time the instruction is of no use at all; you have got to keep your man on the work the whole time.

8328. My question referred more to the efficiency of the work. The work would be equally efficiently given at the training colleges by a skilled instructor as it could be given at Edinburgh?—Yes; the further you get from the fountain the less pure the water, you know; and you gradually get an old chap who has done his work very well at Aldershot, who goes up amongst these people, and gets lazy and inefficient; he requires constant supervision; we find that at our outlying stations. I have found a fellow, with a stomach on him that he could not possibly bring up to the bar if you gave him £100. He might have been a beautiful gymnast five years ago. So what I suggested

was to build a school under the Home Office at Aldershot for the training of efficient instructors and school teachers, and to increase our staff sufficiently to enable me to send instructors to schools. Of course expense comes in. The War Office would not build. We could not supervise the work unless it were close to our headquarters. That is why I say Aldershot, simply because we could supervise the work if it were close to our headquarters.

8329. One more question with regard to Edinburgh, if there was an instruction school at Edinburgh?—Yes; we have a superintendent in Scotland, whose headquarters are at Glasgow, but I think it might with advantage be at Edinburgh.

8330. Is his staff quite insufficient to undertake further teaching of civilian teachers?—Insufficient to undertake civilian teachers. They only give us as much as we can prove is absolutely indispensable. For instance, they will not pay an assistant instructor unless we can certify that he has a certain number of pupils; if he has not got these pupils he goes back to his regiment on his ordinary pay, and then when we get more recruits he is called on again; so they only bring up the staff to exactly what is required; we are short-handed already in our regular work.

8331. *By the Hon. Thomas Cochrane.*—On that point I would like to ask you whether it would be sufficient to train the Board School children if their ordinary teachers had a good system of instruction and were then supervised by some skilled and properly-trained person?—Yes, I think that, it would be sufficient for children attending Board Schools, and there is a distinct advantage in the children's own instructors doing it, although I do not say that they would do it quite as well as professionals. However, I admit that there are a great many of these schoolmasters that you never could make instructors out of. It is an advantage in working children that the person drilling them should be able to show in himself the benefit of the work. If you get a fellow with sloping shoulders drooping forward, with bandy legs and turning in his toes, he may talk till he is black in the face to a lot of children about what they are going to gain by it; they will not believe him. They say: 'If we are only coming to what you are, the less we do of this 'the better,' whereas, if they have got a smart chap who is well set-up, and they get a smart word of command, they see something in it. A civilian may learn all the thing up in theory, but the action is really taken from the tone and from the manner of the instructor, and you get better results. However, I have known very good civilian instructors. It all depends on whether it is in the man or not. Of course our men are picked. You could not find instructors by taking them out of the ranks haphazard. It is the rarest thing possible to get a good drill in an infantry regiment; there are not more than two or three that are worth a snuff. We get the pick of the army because we can pick them and discard them. We get one hundred and twenty non-commissioned officers every six months, and after the first month's work, if I do not like them I send them back to their corps.

8332. It is a very difficult thing to get really competent instructors?—Yes. Well, I go back to my former suggestion, whether civilians or our own people, we should train them at the fountain-head under our supervision, and send them out with certificates, and then have them periodically inspected by a Departmental officer. I could not do it. I would be very glad to oblige in starting the thing, and to assist in any way I could, but I could not possibly undertake—nor could the Department undertake—to supervise the training of the whole civilian juvenile population of the country as well as that of the army.

8333. Could you give some little explanation of this table; I do not quite understand it?—Yes, certainly I can explain it.

8334. I see the age when they joined; the average age was a month short of twenty years, and on completion it was twenty years and six months. That appears

to have been a course of seven months?—I see what you mean, and yet we only say 110 attendances. That is because they have broken the course, and therefore, although they have only put in 110 attendances, they have gone. As to their recorded ages, you can arrive at nothing, for calling a lad of sixteen to eighteen, on joining, upsets averages. Of course, it is an average; a great number of them may have been much younger, but then they declare themselves eighteen when they are only sixteen or seventeen; you cannot go on the declared age.

8336. I see they do not grow during the course of these seven months?—Not in height.

8337. That is rather unusual if they were recruits?—Yes, but you will see in the early part of my Report that I do not lay any stress on these measurements. If you want a very accurate table of measurement, I would undertake to prepare one under my own supervision, but I find, as a rule, the ordinary records are so unreliable that I have discontinued the practice at depôts and modified gymnasia.

8338. I think it would be very interesting?—I would begin a squad, and get the military authorities to leave it under my own supervision, and keep them steadily at it for six months.

8339. *By the Chairman.*—If you could do it within the next six months without any inconvenience to you?—Not to me, if the service will only leave them with me; but during this war it has been absolutely impossible to carry on any system. They take the men away before they have been through the recruits' course—blank firing.

8340. *By Sir Henry Craik.*—Could you, from the gymnasium at Aldershot or at Maryhill, supply instructors, provided the expenses were met?—We could only supply those who were discharged. We could not send away men at Aldershot who are required for military purposes.

8341. No; but surely there must be a large number of men who have gone through Aldershot who would be ready to take such employment?—If they were allowed to buy their discharges, or if the authorities allowed you to take them; but then they would be taken off the strength of the regiment, and the regiment would have to do without them until others were trained.

8342. But as a means of offering a new inducement to joining the army, would it not be a very valuable thing that there should be an opportunity of gaining such employment?—I said that to my class of non-commissioned officers the other day; I said, 'There is a wonderful market opening up to you fellows, because very soon this system will be compulsory all through the civil schools, and you will certainly get employment after leaving the service, I have no doubt'; but if you took them away whilst they are in the service, the drain would be so severe that we should not be able to keep pace with it. Our establishment now is only regulated to find the service with a sufficient number of instructors for military training.

8343. Is it not one great inducement that you are anxious to hold out to men joining the service that there should be opportunities of employment open to them?—Yes.

8344. If, as in Scotland, there were opportunities of having classes for training teachers under such instructors?—A great inducement.

8345. That is now the case in Scotland?—A great inducement.

I should like to add the following remarks:—It appears from the general drift of the questions set me that there is an idea that it may be possible to utilise the present Army Gymnastic Department to instruct civilian school teachers and to supervise their work. I must at once say *no* to this. In the first instance, many of our non-commissioned officers, although excellent drill and gymnastic instructors (when employed in recruit training and under the hand of discipline) are not fitted, either by nature or by training, to deal with small children and the civil element they would be

brought in contact with. Some, no doubt, are, but they are required for their military duties, and cannot be spared except in exceptional instances. The practice of allowing men who are engaged and paid for one work to accept other paid jobs out of time is open to many abuses, and should be carefully guarded. I like my non-commissioned officers to add to their scanty pay when it can be done without injury to their service work; but the work, which is very exacting, leaves little time or energy. In short, although I consider it would be very unfair to lay down a hard and fast rule that our instructors should never be allowed to take outside work, the conditions are such as to make it quite impossible for them to supervise the physical training in State-aided schools.

Suggestions. To meet this want my suggestions may be summed

The witness withdrew.

Adjourned.

SEVENTEENTH DAY.

Tuesday, 17th June 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr R. B. PEARSON, *Secretary.*

Major W. ELLIOT, examined.

8346. *By the Chairman.*—Would you describe your self?—Late Honorary Secretary of the Lads' Drill Association.

8347. I will ask you to read out your notes, please?—The aim of our country should be that every boy in the elementary schools should undergo a sound and systematic course of physical training; this training should be continued after leaving school, combined with more advanced military drill, rifle shooting, etc. In order that the physical training at elementary schools should be systematic and productive of the greatest good, it is necessary that the course should be carefully compiled by experts. Many forms of so-called physical exercises, though making a pretty display, when carried out do little towards the development of the body, the true objective of physical training. This course should embody the rudiments of military drill; this is essential to ensure that the different exercises are carried out with precision and smartness, without which the best results cannot be obtained. Moreover, military drill inculcates the habit of obedience and discipline, so necessary in the education of children. Such a course—the 'Model Course of Physical Training'—has been published by the Board of Education, based on the system of physical training in use in the army, which has proved of such inestimable value in developing our recruits. This course should be compulsory in all schools. This is important, as the teachers would then know what they were expected to teach, and the school inspectors what they had to inspect. Moreover, there would be no danger of the more showy but less effective forms of physical exercises being substituted. There would be no objection to any addition being

up as follows:—Home Office to be placed in communication with the War Office. A school or college of physical training to be erected under my planning and supervision on the north side of the army athletic ground at Aldershot, within 200 yards of my headquarters and our principal school of military training. Estimated cost (outside), £10,000.

The staff at this college to be selected and salaries fixed by the inspector of gymnasia. All Government school teachers who wish to qualify might be trained here, and if found efficient would receive a certificate. These civilians could be supplemented by selected and specially trained non-commissioned officers who had completed their first term of service, and had done good work on the gymnastic staff.

made to the course either in the direction of more advanced physical training or military exercises. But however excellent the course may be, the full benefits will not accrue to the children unless the teachers are fully qualified to carry it out. In many schools the services of a retired N.C.O. are obtained to give instruction in physical training. Though this may be necessary in certain cases, I personally am opposed to the system, and think it far preferable that the actual instruction should be carried out by the school teacher. As I have noted before, one of the great benefits derived from a proper system of physical training combined with military drill is the inculcation of habits of obedience and discipline in the children, and the person to inculcate such habits should be the school teacher; the good effect would be noticeable in the other branches of instruction he carries out. Moreover, if the teacher himself carried out the instruction, he would take a personal interest in the question, and he would more fully recognise the importance of the physical development of his pupils—an important point. There would, however, be no objection to employing a retired N.C.O. to supervise the instruction in the various schools of a district. In order that the teachers should themselves be taught to impart proper instruction in this subject, all studying at the different training colleges should go through a course of physical training, and the possession of a certificate of fitness to instruct in this subject should be compulsory for all Board teachers. Classes at the different regimental depôts might be formed for those who are at present teachers. The sergeant instructor of gymnasia could carry out the instruction

under the supervision of the district inspector of gymnasia. With regard to the future training in more advanced military drill and rifle shooting of lads who have left the elementary schools, it must be remembered that there is no compulsion for boys of this age to attend, and consequently any instruction given at this period of a boy's life must be attractive. Unquestionably drill does attract boys. This has been demonstrated in the different brigades of boys, where drill is used as a means to an end, *i.e.*, to collect and keep together boys in order to give them some form of religious instruction. But in order to ensure continuous and regular attendance, the instructor must be keen and enthusiastic, and here we have the real crux of the whole matter. If the teachers in the elementary schools would take up physical training in elementary and military drill in continuation schools with keenness and enthusiasm, there is not the least doubt that the movement would be successful. On their attitude depends the success or failure of the scheme. The chief obstacle to the formation of cadet corps in connection with elementary and continuation schools is the proviso by the War Office that for any body of boys to be recognised officially as cadets uniform is compulsory. The consequent expense practically debar any such corps being formed in connection with these schools. If the War Office would forego this, and would recognise any body of boys, not less than forty in number, of twelve years of age and upwards, as a cadet corps, whether in uniform or not, there would be no reason why such corps should not be established in connection with the majority of these schools. A badge might be worn, if considered desirable. Such corps having been formed, the teachers would receive commissions as cadet officers, and would be eligible to attend a course of instruction at the military schools. I would suggest that the course for cadet officers belonging to elementary schools should be modified, and embrace a certain amount of physical training as well as military drill. I am convinced that if this were allowed, and the teachers received commissions, and had the power of forming cadet corps in connection with their elementary schools—the boys after leaving these schools remaining members—the teachers would throw themselves into the movement with enthusiasm. They would realise the benefit, from an educational and moral point of view, of retaining touch with the boys after they had left the elementary schools, enabling them to carry out other and more advanced mental instruction, and they would also thoroughly appreciate, from a patriotic point of view, the fact that they were training the lads to take their part in the defence of their country should occasion for their services arise. The boys themselves would be keen on joining such corps; the official recognition by the War Office would make them feel that they were the 'real thing,' not playing at soldiers. Of course I am taking it for granted that military drill shall in future be a grant-earning subject in continuation schools.

8348. May I take it that you have had in the past any difficulty with the War Office regarding some of these questions?—You mean particularly with regard to abolishing the uniform?

8349. Well, that is one point; yes?—I would not exactly say that we have had any difficulty. We did ask that they should recognise in the schools bodies of boys as cadet corps without insisting on uniform, and they gave us a somewhat evasive answer. They have recognised such bodies to a certain extent—that is to say, they have instructed the general officer to carry out a certain amount of inspection, but they have not recognised them as a cadet corps, which is, to my mind, the main point.

8350. And when was this answer given, to put it on the notes?—It was in January, I think.

8351. Of this year?—Yes, this year; they sent a circular letter round from the Adjutant-General's office; I think it was in January.

8352. You have seen teachers drilling classes, I presume?—Yes.

8353. And you have seen very often that they have

very little knowledge of drill or the means of imparting it?—Certainly.

8354. Do you think that the object is gained of helping the physical training of children by giving them drill to a very badly given word of command?—Certainly not; I think it is worse than useless; unless the drill is taught properly and the physical exercises are taught properly it is waste of time; it is worse than none at all.

8355. Still thinking that, you strongly advocate that the teacher should be the person to give the drill?—I strongly advocate that as long as the teachers are properly taught

8356. And inspected?—And inspected.

8357. You recommend that classes at regimental depôts should be formed for those who are at present teachers. Do you not think there would be some difficulty with the civilian element and the military element?—I do not think so at all; I think that could be very easily arranged. I would not suggest that the classes of teachers should be taught at the same time as the recruits, but I think it may be very easily arranged for classes of school teachers alone on Saturdays, or say at some time when the gymnasium is not being used by the military.

8358. Of course the gymnastic non-commissioned officers and so on, I suppose, would receive something extra for that?—They ought certainly to receive something extra for that.

8359. Therefore it would be a matter of expense?—That would fall on the local authorities or the Board of Education; it would hardly be a fair charge to make on the military.

8360. *By the Hon. Thomas Cochrane.*—What regulation do you refer to when you say, 'Proviso by the War Office that, for any body of boys to be recognised officially as cadets, uniform is compulsory'?—It is laid down in the Volunteer Regulations dealing with cadets, that for a cadet corps to be formed you have to apply through the officer commanding the regimental district, stating the uniform that you are to wear. Two years ago it was absolutely necessary that the cadet corps and cadet battalions should wear the uniform of the battalion to which they are linked, but the War Office have modified that, and boys can now wear a suit of khaki serge or grey serge, which is very much cheaper, but still they must have some sort of uniform.

8361. They will not be satisfied with a cap and a belt?—No; so far they have not altered those regulations. In regard to what I said about the War Office, I cannot quite say that we actually asked the War Office to sanction this particular scheme that I suggest. We did ask them to recognise in the secondary schools bodies of boys without uniform as cadet corps. They never actually said, 'No, we will not recognise them,' but they said, 'We will allow drill carried out in those schools to be inspected.' But that, of course, is a different thing.

8362. That means to say they do not supply you with arms?—No; and they give none of the advantages of the cadet corps. My point about these corps, these bodies of boys, being considered as cadet corps and recognised as such in the elementary schools, is not so much really the getting of arms or ammunition; the main point is to get the teachers to become officers, because to my mind the whole question of the physical and further military training rests with the teachers; unless you get them on your side, well, it will be taught in a perfunctory manner, or it will not be taught at all. If these bodies at elementary schools and continuation schools were recognised as cadet corps, the teachers could get commissions, and I am sure that it would create enthusiasm.

8363. *By Sir Henry Craik.*—Just one question about this 'model course.' That 'model course,' as you are aware, begins with military drill and goes on to physical exercise?—Yes, I know that.

8364. Objections have been raised to that sequence?—Yes.

8365. Do you think they are well founded?—Do

Model course :
military drill
and physical
exercise :
proper order.

Major
W. Elliot.
17 June '02.

you mean from the general point of view or referring more especially to this 'model course'?

8366. No; I mean the beginning with a certain form of military drill and then going on to the physical exercise?—I think that is absolutely essential. I think that to get the full value out of physical exercise you must ground the boy in squad drill; you must teach him first of all to obey you before you begin to teach him physical training.

8367. It is not in order to give any military character to the instruction, but because it is the proper sequence in the education of the individual?—It is the proper sequence, and it will be useful afterwards; but, putting apart the military point of view entirely, to my mind, you cannot properly, physically, train anybody unless they are first taught to answer the word of command, and you cannot teach them to answer the word of command unless they have a certain amount of squad drill.

8368. Then one more question in regard to those cadet corps: What is the age required for entry into cadet corps?—For a cadet corps it is twelve.

8369. But, as a rule, they are rather older?—The cadet battalions. There are two forms of cadets; there is the cadet corps which is attached to a Volunteer regiment, and there is the cadet battalion which is an independent organisation; the cadet corps take boys from twelve upwards; cadet battalions from fourteen upwards.

8370. When they cease to give any attendance at the day schools?—From fourteen. My object in putting cadet corps especially rather than cadet battalions was for this question of age, because it seems to me so advisable, if you could begin, you could have your nucleus of a cadet battalion in your elementary schools of boys of twelve, which would then be carried on in the continuation schools with the older boys, so it would form a link, as it were, between the continuation and the elementary schools, which, I think, is a very valuable thing, not from a military point of view, but from the educational point of view.

8371. When those boys cease to attend school and go into a cadet battalion, there is no reason why the teachers should not be officers?—Not the least.

8372. But, as a rule, do they become officers?—It has never been tried. This scheme, really, has never been tried anywhere in England. It is in force in Victoria and in other Colonies.

8373. But, in your cadet corps, do you not rather aim at rather a different class for officers than the ordinary teachers?—At present there are no working-class cadet corps. There are working-class cadet battalions, but they are independent of schools. The cadet corps—the better class of cadet corps—are in our bigger schools, but I see no reason why the cadet system should not be carried out in the elementary schools, with the school teachers as officers. Of course you must bear in mind that a cadet officer is only an officer of cadets; he is not allowed to take command of any other body of men.

8374. But he holds the King's commission?—He holds the King's commission, and I think he ought to; if he is teaching the children military drill, he is the man to hold the King's commission.

8375. *By Sir Thomas Coats.*—Do you recommend that cadet corps should be formed at all the elementary schools with the boys from twelve years old and upwards?—I do, certainly.

8376. And that the teachers should have commissions?—Yes.

8377. Do you not think there would be a very great objection to that among many people, the idea that it was making them much more soldiers than anything hitherto attempted?—I do not think it would. I think people are far more frightened of the bugbear of militarism than there is any reason for; they do not feel this with the Volunteers; no one objects to Volunteers.

8378. That is voluntary?—That is voluntary; so this would be voluntary; I do not anticipate that it would be compulsory. I certainly have never said so in my evidence, and the advisability of starting it com-

pulsorily would be extremely doubtful, but I think, if it were allowed, a very large number would carry it out voluntarily.

8379. Then who would have the option, the School Board or the head-masters of schools?—If there was a feeling in any elementary school, if the schoolmaster was keen, and he suggested to the local bodies to start such a thing, if they were keen, they would agree together.

8380. Do you make any suggestion about the physical training in those schools where they do not adopt the cadet corps system?—Oh, the physical training in those schools would, of course, be based on the 'model course,' or whatever official course is issued by the Board of Education, quite irrespective of the cadet corps.

8381. Then, do you think both could go on in the same school; supposing they had a cadet corps numbering perhaps one-third of the boys in a particular Board School, do you think the cadet corps could go on, on parallel lines, to the physical education of the other boys?—Oh, perfectly, because part of the cadet corps' training would be the physical training; and, as an instance, though not in an elementary school, in St. Paul's School, Hammermith, they go on side by side. It is absolutely compulsory for all boys to have physical and military training, and they have a cadet corps at the same time, and the result of bringing in compulsory physical training in the school was to increase the number of the cadet corps. I do not see any difficulty in the two going on side by side, they are so closely connected.

8382. Then regarding the physical training of girls, you do not see any difficulty in carrying that on at the same time?—I see none.

8383. And would you require to have the girls taught by their own teachers—that is, by the lady teachers?—Yes, from all points of view, girls or boys, I certainly think the teachers ought to be the people to carry out the instruction. The moral and intellectual good that is instilled into children by a proper course of physical training being carried out on military lines, teaching them to obey, if the teacher taught them, would react in other branches of their education.

8384. I am interested in hearing your opinion that you would put military drill before physical training, because the other evidence we have had, I think, rather puts it the other way?—You are referring to a question Sir Henry Craik asked.

8385. Yes, that you would regard military drill before physical training, in order that they should learn how to obey the word of command?—Yes, when I say I put it before, I do not mean that I put it as a more important—

8386. No, no?—If you went into two schools, one of which was trained purely on physical training, and one was trained on physical training on the basis of military drill, you could tell in a moment which school had had military drill, because of the smartness and the precision that the one lot carry out the physical training, and the rather free and easy sort of style that the others do it—that is my point.

8387. In the infant classes, could you carry that out too; they give them physical training of a kind?—They give them physical training; there is no reason why infants should not learn to fall in and stand up to attention. That of itself is a physical training and a mental training too, of a very valuable sort. It is the most difficult thing in the world to get a boy to stand still now.

8388. *By Mr Shaw Stewart.*—I suppose the military drill which precedes the physical exercise is a very simple form of squad drill?—Absolutely a simple form; it is to enable the children to move from one quarter of the room to another, stop there when they are told, stand up to attention, keep still; really it is sufficient to make them properly obey a word of command.

8389. One question on the cadets' uniform; I would like to know what kind of uniform should satisfy the War Office, would it be simply belts and caps; do you think that will satisfy the War Office?—Absolutely, I

think that a cap of itself would be the minimum. Of course you would find in many schools that they would not be content with that, they would add a little more, that would be left to the school. The minimum, I think, if we had a uniform cap or a badge of some sort just to show that they belonged to a cadet corps.

8390. *By Mr Fergusson.*—When you were answering Mr Shaw Stewart's questions just now, I understood you to say that you wished little drill before physical exercise; for instance, for infants you said you wanted very elementary drill?—Yes, very.

8391. You dignify it by the name of 'military drill,' which perhaps made us think you were advocating something more complicated?—That is the pity, that people have the idea that military drill is a complicated thing, but I do not quite know how one can explain it otherwise than calling it military drill.

8392. Every system of physical exercise has these simple movements as part of the physical exercise?—As part of the physical exercise.

8393. It need not be called by any different name, it is included under physical exercise?—I do not mind what you call it, so long as you embody in it the essential squad drill.

8394. Quite so. Then, as to this 'model course,' what exactly is the 'model course'?—The 'model course' is a course that was drawn up by a Committee appointed by the Board of Education—the Superintendent of Army Gymnasia had a great deal to do with it—and it is a similar course to what they found has been so efficacious in the Army for our recruits, modified, of course, for the use of children of younger years.

8395. But really the only difference is change of words; there is very little modification, is there?—They have cut out certain exercises that are not suitable for children.

8396. We have been told that that course is extremely good, but it is not sufficiently progressive when you have to start children at five years of age and carry them on to fourteen—that there is something wanting in it; there is nothing in it that should not be in it; but there is something wanting, and that a system such as Chesterton's, being more progressive, is better. What do you say to that?—I hardly like really to give an opinion on that, because, of course, I am not an expert in the actual physical training. I could not say if I were asked of two exercises which was the superior of the two, or if they wanted an intermediate exercise; I am not a specialist in that particular line.

8397. As to these cadet corps—of course, I take it that you have been looking at the whole thing from the point of view which is at the end of your printed evidence—'training the lads to take their part in the defence of 'their country,' and make them and the teachers 'feel 'that they are "the real thing," not playing at soldiers. Please put that all aside, I put the view to you, that

we have nothing to do with making soldiers?—Quite so; yes.

8398. Suppose that all one wants to do is to make boys physically fit and healthy. Now, how do the cadet corps apply to that?—Well, they apply, to my mind, very strongly to that. The difficulty you have—at least, so it always seems to me—of dealing with the boys of the United Kingdom is this, you teach them up to the age of thirteen, when they leave school, then you drop them; there is nothing further done for them. You have got your continuation schools, where you try to get them to come to, but you have got no organization that joins on the boy when he is at school to the time when he is a man; and I think myself (it has been proved in Victoria, in Australia), that if you had an organization that started with the boy at school—an organization that, certainly putting aside, as you say, the military value entirely, is a military organization which improves him physically, and certainly morally, if you get an organization of that sort started in your elementary schools, then the boys would still remain on when they had left school, and until a boy was sixteen or seventeen, the same teacher that had taught him in the elementary school would also have his eye on him, and be in touch with him, provided, of course, he did not leave the place.

8399. But might it not be better to keep clear of any military element? Why give the teachers commissions and so on?—For this reason, because I think the experience of anyone who has had anything to do with boys is that it is no use trying to get a boy and put him down with the teacher to learn more advanced arithmetic and so on. If you say, 'Come out into 'the field and do some drill,' which is always popular, then you will hold him, as they have found in the different brigades of boys, who use drill merely as a means to keep them together.

8400. Then I may take it that you advocate this form of drill that you have told us of to make it attractive and popular with the boys, and not for the purpose of trying to make them soldiers?—Oh, no. You must not quite understand that. I say that there are two advantages, to my mind, in the scheme that I advocate; one is that it will enable the teacher to keep touch with the boy in after life, between the years of thirteen and seventeen, thereby enabling him to possibly carry on further instruction from the mental point of view, and certainly will keep him from loafing about the streets, and improve his physique at the same time. It will not make him into a soldier, but it will train him so that he will be of use if the country wants him, and I certainly think something of that sort ought to be done, as I look upon it as a very important part of the education of the individual. These are the two points. I could not, as evidence, say that my only object was to keep touch with the boy.

8401. Put it the other way, your only object is not to make him a soldier?—Certainly not.

The witness withdrew.

The Right Hon. The EARL OF MEATH, examined.

8403. *By the Chairman.*—You are President and Chairman of the Lads' Drill Association?—I am. I have also had a good deal of experience as regards the physical condition of people in London and other large towns. I was the first Chairman of the Parks' Committee of the London County Council, consequently that brought me into very close connection with the masses of the population in the Metropolis, especially in the poorer parts of the Metropolis, and I have also been connected with a great number of movements in relation to the physical and moral welfare of the masses of population in London, and that made me think, in the first instance, of the absolute necessity that exists for some steps to be taken to improve their physique. I was the founder and am the President and Chairman of the Metropolitan Public Gardens Association, which was established as a result of the conviction that came across my mind that open spaces and gymnasia were absolutely necessary, so that for many, many years I

have taken the very deepest interest in this question. The Royal Commission on Physical Training (Scotland) having been good enough to invite me to give evidence on the subject of Physical Training from the point of view of the Lads' Drill Association, of which I am the President, I think it right to state that I possess no special personal knowledge of the physical training of the people of Scotland. I am deeply impressed, however, with the low physical standard of the population of the poorer portions of almost all the large cities and towns of the United Kingdom. I am convinced that any nation, the people of which as a mass do not enjoy a fair measure of physical health and strength, cannot be successful in competition with other countries, either in peace or war. A lowered physical vitality means, as a rule, a weakened brain and a weakened will, and I am firmly of opinion that the habit of inordinate indulgence in intoxicating liquors is due in many cases to a feeling of depression

occasioned by physical exhaustion. Thus a vicious circle is created. The exhaustion tends to drunkenness, and the drunkenness to still greater depression, a weakened digestion, and a lowered vitality. The sad effects resulting from a low vitality are mostly to be seen in large populous centres, and are due to many causes—heredity, bad food, impure air, long hours of work, unhealthy excitement, irregular hours, immoral and vicious habits and want of self-control, lack of sufficient rest and sleep, mental anxiety, want of sufficient exercise, as well as to excessive indulgence in strong drinks, and to want of healthy recreation and amusement. I do not imagine that the Royal Commission can be in any doubt as to the palpable fact that the population of our large towns are inferior in physique to those inhabiting the country. A personal visit to the worst portions of London, Manchester, Liverpool, Birmingham, Leeds, Sheffield, Glasgow, or Dublin would soon satisfy any person who may be sceptical as to the truth of this proposition. I may say also I am the owner of property in the poorest parts of Dublin, consequently I have been brought into the very closest relationship with the most poverty-stricken portions of those districts, and have been so impressed with the necessity for physical exercise that I have established three open-air gymnasia on my own property with caretakers, and they are the greatest possible success; they are always crowded with children. I doubt not that the recruiting offices for the army could supply valuable information upon this subject, although it would be misleading to take the average height and weight of recruits enlisted in cities without previous enquiry, as almost all country lads go up to the large towns to enlist in the army. It has been stated publicly, and has never been contradicted, that out of 11,000 men who volunteered from Manchester to serve in the army in the year 1899 (which partly covers the time of the war in South Africa), only 3000 were accepted as physically fit, and of these only 1000 were found good enough for the regulars, the remaining 2000 being relegated to the militia. I know of no reason to doubt this statement, but if it be only partly true, there must be something very materially wrong in the condition of city life. The General Inspector of Recruiting, in his report for the year 1901, states the percentage of rejections all over the Kingdom of those who offered themselves for service in the army, on grounds of physical development, was 29·04. That more than a fourth of the young men who desired to enter the army in 1901 should be physically unfit is a very serious matter. The sad thing is that our population is rapidly becoming town-bred, and this remark applies to Scotland. At the last census the urban districts of England and Wales contained a population of rather more than 25,000,000, or 77 per cent. of the total population. The rural districts contained only 7½ millions of population, or 23 per cent. of the total. In Scotland the census showed a very similar state of things. There 3,367,280, or 75·3 per cent. of the population, lived in urban districts, whilst only 1,304,720, or 24·7, resided in the rural districts. These figures mean that the population of Great Britain is largely town-bred, and that for one man who lives in the country three reside in the town. Here is ample food for reflection. It must also be remembered that the transformation of a country-into a town-bred people is taking place at an astonishingly rapid pace. Within the recollection of most middle-aged men, the population of town and country bred was only two to one, instead of three to one as it is now, and at the commencement of the last century Great Britain might have been considered a country-bred nation. Notwithstanding the efforts which are being made by the Garden City Association and other bodies to encourage a movement from the cities back to the country, it appears very doubtful whether more can be hoped for than a partial arrest of the rapid growth of these populous centres. The experiences of modern life seem to compel the accumulation of large masses of human beings within confined areas. If this be the

case, it should be the urgent and constant pre-occupation of those whose duty it is to care for the welfare of these populations to see that all that thought, knowledge, science and money can effect be done, in order to save these men and women, and especially the children, from the physical deterioration which is sure to set in if steps be not taken to counteract it. Sanitary houses, good, abundant and well-cooked food, pure air and water, open spaces, open-air and covered gymnasia, well-trained instructors, and compulsory physical exercises in all schools, together with facilities for poor lads on leaving school to join cadet corps and battalions without expense to themselves or their parents;—all these things should tend to improve the physique and morale of the youth of our towns, and, although I lay greater stress on the provision of these necessities for the lads and lasses of our towns, they are needed sadly, I think, in a lesser degree, by those of our country districts. Many of the above requirements are beyond the scope of the terms of reference of the Royal Commission, but the provision of adequate playgrounds and of caretakers attached to schools, of covered gymnasia attended by competent teachers, the establishment of a system of physical exercises and drill which shall be compulsory upon every healthy scholar, such as the 'model course' lately recommended by the English Department of Education as suitable for both boys and girls in elementary schools, and the encouragement of cadet corps and battalions by making drill and physical exercises part of the curriculum of every continuation school, are all within the scope of the terms of reference, and would, in my opinion, greatly 'conduce to the welfare of the pupils, 'develop the faculties of those who have left the day 'schools, and thus contribute towards the source of 'national strength'? In order, however, that full benefit may be obtained for any outlay which is made on the purchase and maintenance of school playgrounds and gymnasia, it is absolutely necessary that a trained and competent teacher of organized games and of gymnastics should be constantly in charge of the children when in the ground, so as to train them how to make the most of the advantages provided for them, and also to prevent all accidents, loafing and bullying. Owing to the want of such trained caretakers many of the school playgrounds of London, which have been purchased at heavy cost to the ratepayers, are practically useless, and in many cases the gymnastic apparatus which had been provided has actually been removed in order to prevent accidents.

Now, in this connection, I may say that some years ago the Metropolitan Public Gardens Association, of which I was the founder, was so impressed with the absolute want of physical education in our schools, and the absence of all means of training, that the Association offered £300 to the London School Board to provide a gymnasium, because at that time so negligent were the governing authorities in this country in regard to physical education, that the School Board of London of that day wanted to teach the children physical exercises, and the members of the School Board had to pay out of their own pockets for doing so, as the auditor refused to pass the account of the money they had expended on physical education, and so impressed was the Metropolitan Public Gardens Association by what we thought this iniquitous conduct, that we said somebody ought to come forward and do something, and we offered £300, in order to assist them towards building some kind of shed where physical exercise could be taught. The School Board of London thanked us, but they said: 'Would you permit the £300 to be 'spent in bringing over physical exercise teachers from 'Norway and Sweden, where these exercises have for 'many years been established.' We at once thought that idea would be a very much better plan, and we said: 'Certainly, by all means; all we want is that 'physical exercise should be taught in our schools, and 'that it should not be possible for the country to make 'public-spirited men like you pay out of their own 'pockets for the physical education of the children. So we paid for these teachers, and that was the origin

of the physical exercise department of the London School Board. Afterwards the School Board of London of those days established gymnastic apparatus in many of their playgrounds. As you are aware, my lord, Saturday is the only half-holiday the children have, and after a very short time it was found that owing to the want of any caretaker being on the ground accidents occasionally happened. And the reason why the caretaker was not on the ground is this, that the Saturday is the only day the schools are empty, and they have to be cleaned out, and the caretaker has to clean out the schools on the Saturday afternoon. Consequently he cannot be in the playground. The whole benefit, therefore, that ought to have been obtained by the purchase of apparatus has in some instances been lost, because there is no caretaker to superintend the children, and the school playground has had to be closed against the children on a Saturday. That seems to me to be the most extraordinary action. Thousands, possibly even millions, of pounds have been spent in purchasing playgrounds, and the only day in the week in which the children can use them they are practically useless. So our Association again came forward, and said: 'We will pay an instructor to teach gymnastics in a certain number of schools; we have not got the funds to do more than that,' and we did; for two years we paid a gymnastic instructor, and it was a great success. He formed classes in these school playgrounds, and he taught drill and physical exercises to the children. We held competitions, and gave prizes. We did it with the object of setting a certain example to the public. But the thing should be done, not by a private Association, but out of public funds. Nobody followed our example. For two years we carried on the work, and then we were obliged to stop. We argued, 'our Association has been formed for the purpose of providing open spaces. It is perfectly true that in our original objects we said that we would do all we could to advance physical instruction, but our principal object is open spaces. We have given this example for two years, nobody has followed it; we cannot go on doing it any more, and the thing must be dropped.'

An interesting movement for the better physical training of the young in elementary schools has lately been started in Macclesfield under the name of the Macclesfield Patriotic Association. This society, which is supported by voluntary contributions, has under training some 2500 children, of whom about 800 are girls, the boys, in addition to drill, being instructed in the use of the rifle. It has formed a cadet corps in the borough, and has affiliated with it the three Boys' Brigades already existing, giving them help in the shape of the services of a drill instructor and monetary aid. It appears to me that the Education Authorities should be empowered by law to assist by grants any such associations as in their opinion conduce towards the physical training of the young, and should be authorized to support pecuniarily such cadet corps and cadet battalions as may attain a certain standard of efficiency in drill and shooting to be determined by the Department under the control of the Secretary of State for War. As the Royal Commission has invited me to give evidence 'more particularly from the point of view of the Lads' Drill Association,' I may state that the object of the organization is to press on the Government, the Education Authorities, and the public generally the urgent need of training our lads, so that when they attain the age of nineteen they may be physically fit to enter the struggle of life, and may be capable of taking their proper place as alert champions of their country's interest, either in peace or in war. We believe that the qualities which are developed by a mixed system of physical exercises and of military drill are those which are as much needed to make a nation successful in its contests of peace as in those of war; the power to obey as well as to command; alertness of mind; a quick observation; concentration of thought; the co-ordination of mind and body leading to rapid action of the muscles at the direction of the will; the subordination of selfish to corporate interests,

leading to noble thoughts and deeds; all these qualities appear to us to be developed by such a system, and we believe that the disorder and rowdiness to be met with amongst the young of both sexes in many large cities, and which lead to crime, are due in a large measure to the absence in our system of training of any outlets for the natural spirits of youth, and from a desire to use the muscles with which nature has provided them; and we are also of opinion that if the hours of study in most schools were broken up and interspersed with physical exercises, that discipline would not only be much easier maintained, but that owing to the blood being made to circulate properly through the brain as well as through other parts of the body, the scholars would return to their studies refreshed, and much more capable of assimilating the knowledge presented to them through the bracing of their intellectual faculties. The Lads' Drill Association advocates the training of every lad in physical and military exercises up to the age of eighteen, not only for the above reasons, but because they believe that the responsibilities of the Empire are now so vast that unless some such system is adopted it will sooner or later be found necessary to require that every man shall be trained to arms for a certain period of his life. If lads were taught during the educative periods of their lives such knowledge as would enable them in after years to become, in case of need, efficient defenders of their country, such compulsory adult training, except perhaps for very short periods, would become unnecessary, and we believe that such universal training of British youth in physical and military exercises would diminish the risk of wars, for many, if not most, British wars have arisen owing to the belief on the part of the enemy that the British nation had no military power at its back. The universal training of British youth in physical and military exercises would in the words of your terms of reference certainly 'contribute towards the sources of national strength,' and in a few years' time it would seem as natural for schools to train the body as to teach reading, writing and arithmetic. In order that such an organisation should be properly

carried out—

1. One system of physical and military drill should be made compulsory in all State-aided schools over the United Kingdom.
2. Centres should be established and supported by Government, where teachers could be properly instructed by experts in physical and military drill.
3. No school teacher should be permitted to give instruction in physical and military drill who had not passed an examination before an examining body appointed for the whole Kingdom. In Germany no teacher is allowed to teach physical exercise until he has spent six months at a training college; it used to be twelve months, but they have reduced it to six.
4. Educational authorities should be empowered by law to support financially schools where physical and military drill are taught by certificated physical instructors. They might also be empowered to give grants to associations which in their opinion were instrumental in the improvement of the national physique.
5. Municipal and County Authorities should be authorized by Parliament to support financially cadet corps and battalions which had obtained during the previous year certificates of efficiency issued under the instructions of the Secretary of State for War.
6. A small Parliamentary grant should be given to each corps for every efficient cadet between the ages of fourteen and nineteen.

If any number of lads are ever to find their way into cadet corps and battalions, it is imperative that some pecuniary assistance should be provided. These organizations cannot be carried on without money, and just in the localities where they are most needed it is impossible to raise the necessary funds. Such organizations, if made national and properly supported, would

Earl of Meath. lay hold of lads on leaving the elementary schools at thirteen or fourteen years of age, and would carry them over the most critical period of life until they became old enough at seventeen or eighteen years of age to join the volunteers and earn an efficiency grant. The lads would from their earliest years be taught the lessons of loyalty, patriotism, obedience, punctuality, unselfishness, cleanliness, orderliness and self-respect. They would gradually learn the responsibilities of life, and would be fitted for the high and important duties which are inseparable from the position of a citizen of Great Britain and a subject of the Empire.

Hooliganism : boxing. Now, my lord, it has been found that if you want to get hold of the roughest and the worst class of hooligan, there is only one way to get hold of him, and that is by making him expend his physical powers in heavy work, physical work, and the most successful workers amongst the roughest population in the East End of London have found that there is nothing better than starting boxing classes, and I know clergymen who have been most successful in that way. Lads who would not sit down to a table or listen to a lecture, or read, or do anything of that sort, will come into a gymnasium to learn boxing, and in a very short time you will find these lads perfectly different, and absolutely amenable to discipline. They are accustomed on the streets to bully those who are weaker than themselves; they cannot do that when they come in; they find there are certain laws, certain regulations, certain rules that they are bound to follow in the ring, and they get thoroughly well pommelled by others who are just as strong as themselves, and their energies are given vent to, and they learn the meaning of order, obedience, discipline and fairplay. One of the saddest things amongst the lowest population of our large towns is the want of fairplay. I think in former years there was a greater feeling 'do not hit a man when he is down,' and I am afraid nowadays it is not the case always. On a well-known recent occasion, when a volunteer who had just returned from serving his country in South Africa was killed, there were five wretched fellows who set upon one, and I have known several instances of that. In the gymnasium, in the boxing ring, fairplay is taught. And these lads, mind you, are not bad. There is splendid material in them. There are certain things they have to be taught, and it is quite possible to make splendid men of them. All your religious organizations are perfectly useless upon that sort of lad. When you have obtained a hold over this class of lad, and only then, can you approach him with any hope of success; then you may bring to his notice your religious organization, your technical and other instruction, your reading, your writing, and your arithmetic, and what you like, but the first thing is to get rid of his energy in a useful manner. A great deal of this hooliganism and riot and rowdiness is simply and solely because our lads have no means of working off their energies. This is why all my life I have striven to try and keep open our municipal lungs, and to increase playgrounds and gymnasia. But playgrounds and gymnasia are useless, my lord, unless you have caretakers, unless you have teachers. You must have teachers, and that is the great difficulty. I have tried for years to get voluntary teachers. It is impossible to do it; you cannot do it; they must be paid. Occasionally you get settlements where you can get men, devoted men to do an enormous amount of good, but, after all, that is only a drop in the ocean. What is wanted is some kind of State system, not necessarily under the Imperial Government, but under the County Councils or the Educational Authorities, or some central authority of that sort, or the Borough Councils; something which will be under regulation and rule, and shall have some fixed funds at its back. I feel certain, my lord, that you are at the head of a Commission which is dealing with one of the most important subjects that could possibly be brought to the knowledge of statesmen.

8404. *By Mr Alston.*—I think that in the general run of your printed evidence, and in the Report of the Lads' Drill Association, you are strongly in favour of military training?—Mixed with physical.

Drill plus physical exercises.

8405. The tendency of the evidence of the Association seems to be that the boys should be so trained that they may be able to serve as soldiers in the defence of their country?—That is only one branch; I am not in favour simply of drill, I am in favour of drill *plus* physical exercise.

8406. But you would not say physical training *minus* drill?—No, no; the two combined; I think one is not enough; you must have both combined.

8407. You refer to 'the need of training of our lads, 'so that, when they attain the age of nineteen, they 'may be physically fit to enter the struggle of life, and 'may be capable of taking their proper place as alert 'champions of their country's interest, either in peace 'or of war'; that of course goes beyond mere physical training?—Certainly, the two combined.

8408. And very far beyond military drill?—Oh, certainly, the two combined.

8409. I think you are the Honorary President of the Dublin Battalion of the Boys' Brigade?—I am.

8410. You do not think that the Boys' Brigade quite fulfils the conditions that you desire to obtain in the Lads' Drill Association?—Not quite fully, unless they go in, as many of them do, for physical exercise; a great many of them do.

8411. But there military drill is only, of course, for another object, and not to make the lad a soldier?—Not wholly, but they prepare themselves. They may have another object in view, but they prepare themselves for the defence of their country.

8412. In the constitution, military drill is sanctioned for securing discipline?—For another object.

8413. Simply as the means to attain that object?—Yes, but in doing it they make themselves capable of defending their country.

8414. In a certain sense?—Yes.

8415. But then, of course, there is no further military training for them, the ages being from twelve to seventeen?—No.

8416. But you would advance further, and carry the boy forward in purely military training?—If he chose; not compulsorily after he has left the elementary or the continuation school.

8417. Not compulsorily?—Oh, no.

8418. But you want to give him the opportunity?—To give him the opportunity.

8419. And again you refer to the Macclesfield Patriotic Association, and say it 'has under training 'some 2500 children, of whom 800 are girls, the boys, 'in addition to drill, being instructed in the use of the 'rifle.' What kind of rifle is that?—I have never seen it, but, as far as I understand, it is the rifle that the Government hand out now to all cadet corps.

8420. It is capable of being discharged, then?—Oh, certainly; yes.

8421. Because you go on to say, 'It has formed 'a cadet corps in the burgh, and has affiliated with 'it the three Boys' Brigades already existing?—Well, I may as well say at once that I think a dummy rifle is a mistake.

8422. But what companies are these; the three in Macclesfield?—I believe Boys' Brigades and Church Lads.

8423. And doubtless some others, because I have noticed in the Report of 1901 that the Boys' Brigade has only one Macclesfield company. It is connected with the Wesleyan Church?—I only know this from what I have seen in print. Mr Horsfall is at the head of that movement.

8424. That company could not be associated with the Patriotic Association that uses rifles that could be discharged?—Why not, sir?

8425. The Boys' Brigade would not sanction a rifle that could be discharged?—No, but they would not prevent them using it if it were supplied by the Association.

8426. Oh, yes?—No; I think they teach them to shoot, not the brigade itself; but they could not prevent them if they do it at home. The Association, as far as I understand, provide proper rifles. To the best of my belief all that the members of the Boys'

Boys' Brigade.

No compulsory elementary school.

Macclesfield Boys' Brigade weapon.

Meath. Brigade, who also belong to the Macclesfield Association, do, is to go and shoot with the other rifles, although they have the dummy rifles as well.

8427. I do not think the company, as a company, would be allowed to be affiliated with the Association?—I will not enter into that. I only understood so. I may be wrong.

8428. I wanted to get at that point?—If you want to know my own feeling in the matter, it is that every lad should be taught to shoot, and, as I have already stated, because I want to avoid conscription. My own positive conviction is that we must within twenty years come to conscription, or some kind of compulsory service, unless we train our lads. That is my firm conviction.

8429. Have you formed any opinion as to what would be the effect on the Boys' Brigade if such an association as yours absorbed the whole field?—I do not think it would be necessary to absorb the whole field. On the contrary, I should not wish it. I am perfectly satisfied with what is being carried out by the Boys' Brigade and the Church Lads' Brigade as far as they go; but the point is this, that the Boys' Brigade and the Church Lads' Brigades being established for a very excellent religious purpose, these brigades can never hope to obtain the rough lads from the great mass of the population. These lads, unfortunately, reject all attempt at being influenced by any religious association, and, unfortunately, the majority of lads are excessively shy—very wrongly, of course—of connecting themselves with a Christian Association, or anything which is of a definite religious character. Consequently, although I am a great supporter of the Lads' Brigade and of the Church Lads' Brigade, for its special objects—those religious objects—still, at the same time, looking at it from a national point of view, I say that if we are to improve the physique of the whole mass of the lads of our country, and also to make each lad capable of defending his country, if need be, we must have a much larger, broader, and more national organization. But we need not interfere with the Boys' Brigade or the Church Lads' Brigade. Those lads already drill *minus* the shooting, which can be obtained, as I understand, and is obtained, in Macclesfield by another side issue. There is nothing to prevent me or anyone else from offering prizes, if we so choose, to any lads belonging to the Lads' Brigade, or the Church Lads' Brigade, who elect to go and shoot at the neighbouring butts.

8430. As an individual boy?—As an individual boy.

8431. You are speaking of very rough lads; what ages are these rough lads?—Oh, of all ages; they begin as soon as they can bully the younger ones; they begin at ten and go on to nineteen.

8432. The Boys' Brigade would be willing and agree to get into their companies rough lads of the same kind, because they believe the drill and discipline would effect a reformation?—Yes; but unfortunately the rough lads will not come to them; these lads that I am talking of will not come to them; that is the difficulty.

8433. Between the ages of twelve and seventeen?—No; the better-behaved lads, those who have already a desire for something better, a tendency towards religious organizations, those are the lads who join those bodies; but the proof of my contention that they only attract the better disposed lads, is shown by the fact that the members of these religious organizations are so few in number compared to the mass of the youth of the country.

8434. *By Mr Fergusson.*—Just continuing that point, you say that it is the better-behaved lads who join, but how do you suggest that one can get hold of the ill-behaved ones unless under some compulsory system?—Oh, I feel quite certain, sir; of course it is difficult to give you a proof, but I feel perfectly certain from my knowledge of the poorer classes, and the lads in London, that you could get any number of lads if only the money were forthcoming; there is the difficulty. These cadet corps and battalions cost money. There

has to be a uniform, and, however cheap you make the uniform, it is impossible to do it without a certain amount of expense, and just in the places where you want these corps and battalions you cannot get the money; in the East End of London, and the north and the south, you cannot get the money; it is a most difficult thing. I think you will probably have evidence before you that several cadet corps and battalions have already broken up for want of money—already well-established ones—and it is the money which is the crux of the whole question. The lads are quite willing to come in; there is nothing more attractive to a lad than drill, especially if it is a real drill; and more particularly if it is connected with shooting.

8435. Then, without going the length of a cadet corps, do you think you could get lads to take up gymnastics and physical exercises without making them compulsory; mind you, I am speaking of the hooligan class?—Yes, I think you could, sir, because I know clergymen who do get hold of them in different parts of London.

8436. Then you would not be in favour of making physical training compulsory?—I would in schools.

8437. Not after the age of fourteen—fourteen to eighteen?—In continuation schools; I would in continuation schools.

8438. You would?—Yes, I would make it compulsory in continuation schools.

8439. You would make it a compulsory subject in continuation schools?—Yes, I would; yes.

8440. You give the percentage of 29·04 who are rejected on the ground of insufficient physical development; these figures really make it look better than the fact is, because the worst cases do not come up for inspection. The recruiting-sergeant rejects them at once; so these figures do not represent the worst of it?—No; and then there is another view of it. A lad who is physically incapable, and is aware of it, will not offer himself as a soldier.

8441. *By Mr Shaw Stewart.*—In answer to Mr Fergusson just now, you said you would make physical training a compulsory subject in continuation schools, but I would like to know whether you would be in favour of making attendance in continuation schools compulsory?—Yes, sir, I should. I believe it is compulsory in Germany, and I do not see why it should not be in this country.

8442. You think it is the only way to get the rougher boys to attend?—To do it thoroughly and effectively; yes.

8443. No doubt you are aware that there is such a thing as an anti-military spirit in the country?—Certainly.

8444. I daresay you have come across it?—Yes.

8445. And therefore you know it cannot be neglected; we, as a Commission, are bound to consider it?—Certainly.

8446. Do you think that military drill can be made to be very useful in civil measures, apart from military?—Certainly, sir, certainly.

8447. Do you think it would be useful, for instance, for the management of a crowd at a fire?—Certainly. I suppose you are aware that Sir Joseph Whitworth said that a man who had passed for military drill was worth one shilling and sixpence a week in his factories more than the men who had not.

8448. I was not aware of that; that is valuable evidence?—It is a well-known saying of his; I should not like to quote his actual words from memory, but they will be found in a Report issued by the Lads' Drill Association. Anyhow, it is a saying that is well known; one shilling and sixpence a week is, in his opinion, the extra money value of a drilled man.

8449. I take it that the chief objection to militarism is that it unsettles the boys for industrial life; is that your experience of the chief ground of opposition to it?—I think the chief ground is ignorance. No, I should say, on the contrary, it settled them more for civil life.

8450. Yes; but I suppose there is an idea among tradesmen, we will say, in large cities, that if their

sons were given regular military training, as boys, it might unsettle them for trades to which they wished to apprentice them afterwards?—I think it would be a very great mistake for them to think so. I have no doubt there are all sorts of erroneous views of that kind.

German education and training.

8451. I wanted to get your experience as to the chief groundwork for the objection existing in people's minds?—As I say, sir, I think those objections are entirely owing to ignorance, and I think I can give you a very good proof. Now, why is it, sir, we are all so dreadfully afraid of Germany? We point to Germany as being a military nation, and we say that we in England have a great advantage over Germany, because, whereas a German has to be two years or three years in military service, we are able to be in commercial and civil life during those years, and we get an advantage over them; and yet, at the same time, we are mortally afraid of the German, and we find the German cutting us out in the avocations of peace, and we are complaining all the time that he does so. Now, I think that there can be very little doubt whatever that it is owing to two things. First of all, I think the German has a very much better education than ourselves, but I do not think that is all. The other is, that he goes through the course of training in military drill and in physical exercises, which enable him to compete in a very much better way with other nations after those two or three years, especially with a nation like ours, which does not go through that course. It gives him qualities which help him afterwards to advance himself in the avocations of peace in a way that our *laissez aller* system or lack of system does not.

Loafers:
unemployed.

8452. So that you think that the military training that the young German gets makes him more efficient for industrial work?—Yes, certainly; and, not only that, but it gets rid of the loafing class, which we have in England, and which you do not see in any country where there is military training. One of the saddest things, coming back to my own country—I live a good deal abroad—is to see in our large towns that we have loafers hanging about public-houses, doing absolutely nothing, and who will not do anything. In connection with that, perhaps I might say that, on one occasion when a Mansion House Fund was established for the unemployed, the Lord Mayor sent me £5000 to expend on the unemployed, in connection with my Garden Association, and I was bound by the terms of the gift only to use it for the unemployed. Well, now, what was the result of that? I naturally accepted the money. I knew the money would be thrown away. We had, sir, to do the whole of the work over again, and it cost us twice as much as it would originally, because we had to employ men who could not do the work properly, and did not wish to do any work. We kept very accurate lists, and we found that only 3 per cent. of those men that were employed were capable and willing to work. Now, remember those two words, please, 'capable' and 'willing.' There was a larger percentage, if you took only capable; but of the capable and willing there were only 3 per cent. Now, that percentage, I found, was very much the same in another instance. On one occasion I was walking through Kensington Gardens, and I came across a specimen of humanity I had never seen in any other country in the world but this. He was a young man, about eighteen. He had no underclothing on at all; he only had outer garments, and those were in such holes that you could see his skin through almost every part of them; and there were two policemen—park-keepers—and I heard them following, and talking as to whether they should arrest him. They said, 'That man is indecent,' and so he was, absolutely indecent; and they were in doubt as to whether they should arrest him. His hair was one mass of vermin, and standing up like a Zulu's. I will show you the sort of way that man walked, with his hands in his pocket; he was eighteen or nineteen years of age, and he was walking in this sort of way, at that pace (*indicating*). There was absolutely nothing the matter with the man. 'Well,' I said to myself, 'ought I to

Illustration.

'go and speak to that fellow, or ought I not?' I did not want to at all. I was thinking of it as he passed me. 'Well, now, I will go round the Serpentine. I do not want to meet the brute, but if I meet him on the other side it is an evident sign I ought to speak to the fellow.' I did meet him. I said to him, 'My man, what has brought you to this?'—I must tell you he was smoking, so he could afford a pipe and tobacco, and he was whistling a tune; he was as jolly as a lark. He said, 'Misfortune.' I said, 'What kind of misfortune—drink?' 'No, no—misfortune.' I could get nothing more out of him, so being president of the Church Army, I said, 'My man, if it is really misfortune, I can provide you with a bed and with food and with work; but mind, you will have to work; do you want it?' He said 'Yes.' I said, 'Do not say it in that sort of voice; but, if you do not want it, say so; do you want it?' He said, 'Yes.' I said, 'Follow me.' I walked at my ordinary pace. I found he was miles behind. I sat down on a bench, and when he came up, I said, 'Can you not walk any faster than that?' 'No, I am too weak.' I said, 'All right, I will walk slower.' I went on at a slower pace, and again he was lagging behind. I sat down on another bench. When he came up, I said, 'I do not want to take you to this place, which is a good way off; I have a great deal of business on my hands; if you have nothing to do, I have; do you want to come with me?' He said, 'No, I do not think I do.' I said, 'All right; good morning.' He went about his way, and I went straight off to the Church Army. I saw Mr Carlile, and I said, 'Mr Carlile, many people doubt as to the real percentage of the genuinely distressed amongst the unemployed.' 'Now, I want you to do something for me.' He said, 'What is it?' I said, 'I want you to send out two of your most trusted inspectors for two whole days; let them have note-books, and let them go to any place where there are most of these sort of men; and let them put down exactly what the men say and offer them, as I did that man, bed, food, and work.' He did so, and a curious thing was, that out of between seventy and eighty men invited, only nine men came to the Home, and only three of these remained, proving that six men had come in the hope that they would after all not have to work. Only three men remained, showing a percentage not very much above 3 per cent. in this case also.

8453. I am sure that is very interesting evidence. I would like to ask you one question about your Dublin open-air gymnasium. I should like to know something as to the system which is pursued with regard to the pupils who come to the open-air gymnasium. Are they selected in any way?—Not in the smallest degree. You are aware, I have no doubt, that the same thing exists in the London County Council parks in the open-air gymnasia; they are on the same principle. It is a good deal owing to my originally having started it in Dublin that I got them to do the same thing in the London parks. Those in Dublin are my own private ones. When a certain suitable space falls vacant, instead of rebuilding the houses, I throw the houses down and plant the outskirts of the ground, and divide it into two portions usually with a railing, one side for girls and the other side for boys. We have swings and giant strides and horizontal and parallel bars, a cat gallows for jumping and a pole for climbing, and skittles; and on the girls' side we have, in addition, skipping ropes attached to a central pole. A central pole is put in the ground like that (*showing*), and there will be half a dozen skipping ropes attached to a ring, so it only needs two girls, one skipping and the other swinging the rope; it does not require three girls to skip, and they can skip round that. And then, for the children, sandpits, with clean sand put into a pit of concrete, and the children think themselves at the seaside, and make tunnels and forts, and seats are placed round for the mothers. Then nobody is allowed into the girls' part except the mothers; women and mothers and children, boys up to ten years of age.

Earl of Meath.
17 June '02.

Open-air
gymnasium.

Meath. 8454. You have laid some stress on the importance of systematic instruction in physical exercise?—Yes.

8455. What I should like to know is, how far you find you can impart the system of instruction in your open-air gymnasia?—The principal object of appointing a caretaker, who should also be a trained instructor, is to prevent any accidents, and to show the children how to use the apparatus. The actual instruction was carried out, as I told you, for two years in London here by our Metropolitan Public Gardens Association, where we had an instructor who went round and held classes, say, from eight to nine o'clock, in one ground, and from ten to eleven in another, and twelve to one in another, and so on. That is the way it was done; for an hour he held classes.

8456. Is that gymnasium open for certain hours in the day?—During the whole day, except during the luncheon hour of the caretaker, and also, I may say, for certain school hours for school children.

8457. My questions are directed with the object of getting information as to what use can be made of a more or less public gymnasium for children on Saturdays, for instance?—I would ask some of you, if you have not already done it, to visit some of the gymnasia and playgrounds kept up by the County Council. There is a very good gymnasium on the site of the Horsemonger Lane Jail in the south of London; it is worth visiting.

8458. *By the Hon. Thomas Cochrane.*—I think your statement is extraordinarily full and so informing, but I should like to know exactly the kind of recommendations you make. I gather from reading your statement that from the beginning in the elementary schools you would have physical education taught!—From the very beginning.

8459. Under the teachers with qualified supervision?—Yes.

8460. And that you think more playgrounds should be supplied?—More playgrounds, yes.

8461. And that qualified caretakers should be appointed to teach organised games and gymnastics?—To teach organised games and gymnastics. Now, for instance, in London, if I had only voluntary teachers, I could have any amount of single-wicket games of cricket played, but I have not got them. I daresay some of you have seen the splendid games of cricket that are played on board liners going out to Australia or America. They always play cricket; the stumps are put into a sort of stand, and then it is so arranged that when the ball touches it the stumps all fall back. These marine cricket stumps, and soft hemp balls, would be admirably suited for use in city playgrounds. The difficulty is in the asphalt pavement, that you cannot stick the stumps in. There are soft balls made and used on board ship; they are made of hemp. Fives courts are also admirably fitted for giving violent exercises in a small space of ground, but unfortunately here comes in the question of supervision. In Baker's Row, in the east of London, a gentleman, at his own cost, erected a charming playground, and built two Eton fives courts. Well, it sounded a splendid idea; I was delighted at the time, but I believe they have never been used except for immoral purposes. The other day the Rector of Whitechapel was staying with me, and he told me that they were very seriously thinking of getting up an agitation to close this and some other playgrounds; not that he was not in favour of the fives courts, but, he said, in these shelters and fives courts and places, oh! horrible things go on, and that is simply and solely because there is no caretaker—because there is no proper care-taking, and because you cannot get the authorities to see to it. These grounds used to be under the charge of different Vestries. They are now under the Borough Councils, but I doubt whether there is very much improvement.

8462. In addition to providing further facilities, those that exist should be better looked after?—That is it. The first thing is to get those that exist thoroughly utilised.

8463. And do you suggest the authority in whose care they should be placed?—I do not see how you

could interfere with the authority, the Borough Councils and the different Municipal Councils of other towns; you can hardly interfere with them, can you? *Earl of Meath.* 17 June '02.

8464. Their attention should be drawn to the matter, you think, to the necessity?—Yes.

8465. And trust to them taking steps?—I do not see what other steps could be taken.

8465A. After the children have passed the elementary school age, you suggest for their further physical training, evening continuation classes at which physical training should be a compulsory subject?—Yes. *Continuation Classes: physical training and Cadet corps.*

8466. And the formation of cadet corps?—Yes.

8467. Do you find any difficulty in the formation of cadet corps from the War Office regulations regarding the wearing of uniform?—Yes, certainly; I think it is a great mistake. I do not see what the necessity for having a uniform is. I think a badge would be quite sufficient. All you want to know is when you see a line of lads drawn up in front of you in company with other lads, which lads belong to your company and which do not. All that could be done very simply by a conspicuous badge of some kind. That is all that special constables wear. I remember being out in 1868 as a special constable, we only had a handkerchief round our arms. That was quite enough, we knew if we were in a row that it was our duty not to break the head of anyone who had a handkerchief upon his arm. That is all that is necessary. Of course there is this you must remember, that if you want to induce the lads to join, the uniform is a great attraction, but as far as the actual drill and physique is concerned, uniforms are unnecessary, and, moreover, are hampering. That is one of the things that our Lads' Drill Association has got out of the Government; that they do now permit a Norfolk jacket without a tight collar. *Uniform.*

8468. Then to deal with those whom neither evening continuation classes nor cadet corps would attract, you favour some system of compulsory attendance?—I should certainly, as far as continuation schools are concerned. *Compulsory attendance.*

8469. How could you enforce that?—The same way as the elementary schools. I should get information as to how it is done in Germany. We know that the German waiter after his day's work has to go and finish his course at continuation schools, if he has not already gone through it.

8470. What can be done elsewhere can be done in this country?—Can be done at home.

8471. *By Sir Thomas Coats.*—I suppose you would advocate the same physical training for boys and girls in the elementary schools, up to say fourteen?—Yes; that is so. Of course you could not have exactly the same unless you have already arranged a regular course like the 'model course,' which has been drawn up with a view to its being carried out both by boys and girls, and that is what I should like to see adopted in all elementary schools. *Boys and girls.*

8472. Then after they had left the elementary schools, would you advocate continuation classes being made compulsory for girls also?—I should; it is in Norway and Sweden, and I certainly should like to see it here. I believe it is just as much needed.

8473. Then you would confine physical training, I suppose, in the continuation classes?—I would. Perhaps you would allow me to remark, as I daresay you are aware, that there are classes of physical instruction in connection with many of the Polytechnics. There are some also established for the use of factory girls, and other young women up to twenty-five and twenty-six years of age, and as I am known to be interested in this, and also as I am Chairman of an Association called the British College of Physical Education, I am invited sometimes to give prizes, and I can assure you it is a most extraordinary thing to see the effect of physical exercises on these factory girls. Factory girls that you see going about in the streets, loud, ungraceful, physically ugly to our eyes, after a certain time, say six months of physical exercise, when you see them in their neat costume, upon my honour, I think you would be puzzled to know what class of *Physical training for girls: advantages.*

Earl of Meath.
17 June '02. girls they were; I think you would think many of them were ladies, so different they are, so graceful. I do not suppose their minds are altered in any material degree, though even of this I am somewhat doubtful, but they have the appearance of modesty and refinement, simply and solely from going through training in physical exercise and coming into contact with tidy teachers.

Playgrounds:
educational
authority. 8474. *By Sir Henry Craik.*—You spoke in answer to Mr Cochrane of the necessity for keeping up this gymnasias or playground?—Yes.

8475. And you saw no means of doing it except through the ordinary Local Authority—the Borough Councils?—Yes.

8476. But if this is a necessary part of education, would you not be prepared to lay it upon the educational authority?—Certainly, if the educational authority would do it.

8477. But do you not think, if it is an essential part of education, that it ought to be considered just as important as providing ordinary education?—Certainly, that would be in connection with schools.

8478. Yes?—But what I am speaking of is not the playgrounds in connection with schools; I am talking of the playgrounds which are kept up by the Borough Councils and by the London County Council.

8479. But these must have an educational character, evidently, and be under charge, if they are to be of any use?—I quite agree.

8480. And therefore perform a very considerable function in education?—Certainly.

8481. *By the Chairman.*—To ensure that any Borough Council, or the London County Council—I am not saying School Board, because there is not the same necessity, especially in London—to ensure that any Borough Council or the London County

Council doing its duty, you would require, would you not, to have public opinion very differently formed?—*Earl of Meath.*
17 Jun 2. Yes.

8482. So as to lay it down at the time of an election what was wanted to be done?—Certainly.

8483. Without that you could hardly expect it?—The difficulty would be that the Borough Council would not like to give up its power as regards its playgrounds, if you mean that.

8484. No, I mean a Borough Council had something put into it by the electorate, what it is to do?—Yes.

8485. Possibly, if the electorate was not very keen about it, the County Council would shunt it?—We want to educate public opinion, and keep on urging. We find we have public opinion in favour of it.

8486. You said you had no knowledge of anything of this kind in Scotland. Is that really the case? I happen to know some Scotch connection?—I am not aware that I know of anything particularly in Scotland.

8487. So that we must take London to set against?—I possess a certain knowledge of the requirements of Manchester, Liverpool and Birmingham, as well as of London, in this particular in connection with my Garden Association. I have had to visit these towns with that view, and I have gone through them, and Manchester was one of the first that started a public gymnasium. There was a Mr Armytage, one of the great manufacturers there, who established a private gymnasium and playground for his own employees. That was one of the first open-air playgrounds fitted with gymnastic apparatus which was established in England, and seeing his playground gave me the idea that I would make my own playgrounds in Dublin.

The witness withdrew.

Rev.
A. L. Lilley.

The Rev. A. L. LILLEY, examined.

Rev.
A. L. Lilley.

8488. *By the Chairman.*—You appear before this Commission as in the capacity of one much interested in the present and future of boys and girls at school?—Yes.

8489. And may I say after school age?—Yes, especially after school age.

Boys' and
girls' clubs. 8490. Will you kindly read your notes?—I shall confine myself to the opportunities of physical training offered by boys' and girls' clubs, so far as I have had personal knowledge of them in London. During ten years' experience as a parochial clergyman in London, I have myself been engaged in the direction of such clubs, and have learned something of many others—all worked on very much the same lines, and with very much the same objects.

Object. Object.—The principal object of these clubs is to continue the work of the elementary schools after boys and girls have reached the school age limit, so far as that work has to do with the formation of character. Especially in the case of boys' clubs, the membership is usually confined to old pupils at the parochial day-schools, with, perhaps, former choir-boys at the parish church who had not attended the day-schools of the parish. The limits of age for membership vary, some clubs not receiving boys till they are sixteen or seventeen, others receiving them immediately after leaving school. But, even in the case of those clubs which fix the higher standard of age, there is usually a junior branch. In this way the boys' clubs form a connecting link between the parochial schools and the various young men's clubs and societies, which are now so common a feature in the life of town parishes.

Physical
training in
boys' clubs. Physical training in boys' clubs.—There is a considerable variety in the physical training which these clubs offer. In nearly all of them gymnastics prevail. All kinds of drill, the use of Indian clubs, the parallel bars, and horizontal bar and boxing are the usual features of a gymnastic class. Then there is always a cricket club in the summer, and a football club in the winter, and a swimming club. In many places

swimming is popular all the year round. In others it is confined to the summer months. Arrangements for the swimming clubs are made with the committee of the local public baths.

Physical training in girls' clubs.—This is confined almost entirely to physical drill and figure dancing. Musical drill is very much used, and Indian clubs are also a favourite help to physical exercises. Here and there swimming is encouraged. My knowledge of girls' clubs is much less than that of boys'.

Use made of these clubs.—Wherever clubs are started they are successful in attracting large numbers of boys, and, I think, I might add girls also. Girls' clubs are not so numerous. Of course, not all the members take advantage of all the different forms of training provided. Indeed, as a rule, the cricket, football, swimming, etc., clubs are societies within a society. But there is very seldom a member of the boys' club who does not belong to one or other of these sectional clubs. Indeed, almost the sole attraction to membership is the opportunity for physical training (which the boy calls amusement) which it offers.

Advantages of club system.—Those who have had some acquaintance with these clubs know how much healthier and more developed is the boy who belongs to one of them than the average boy of the same class. Naturally, advantages of physical health and vigour translate themselves into moral advantages. One finds more energy and initiation, a greater mental quickness, a wider interest, and more self-control among them than is usual. No doubt it is partly because it is exactly the lazy and apathetic boys do not care to join a club after their day's work, and only those who are naturally more energetic will do so. But it is also true that a great and steady transformation in general character is a noticeable result of club work. Self-discipline and a certain elementary but quite trustworthy sense of honour are gains of the club-boy character.

Suggestions.—I think the club system is sufficiently well-established to be accepted as a kind of basis on which to build up a publicly-recognised system of physical training continued from that given in elementary schools. What is needed is that some recognised centre of local life, such as a church or a school, should be encouraged to provide in every district a club for those leaving school—with physical training as its most distinctive feature. It is hardly to be expected that the school teachers, wearied with their day's work, and living (at least in London) at long distances from the school, should undertake such a work as this. As a rule, the churches are found to be anxious to provide workers, plant, buildings, and money. In addition they are, as a rule, establishing in these clubs merely an extension of the teaching and training which they have already given in their schools and given to the same children who afterwards join the clubs. It is true that they cannot deal with the whole mass of children above school age who ought to be provided for. Some kind of inducement ought to be offered by the Board of Education to additional local effort of a voluntary kind. Some recognition of boys' and girls' clubs, as performing a public educational function, would give a very great fillip to a work which is now often a severe tax upon the energies of the parish clergyman; I mean really upon the energies of the local committee. It would enable him, or it, to get the necessary funds more easily; it would lay special stress upon the physical training side of club work; and generally it would accentuate, on the one hand, the interest of the local public, and on the other the sense of public responsibility on the part of the club management. Perhaps occasional, perhaps regular, inspection by an officer of the Board would be the most potent means to this end. There is a section of the boy population of large towns which—of course I mean especially in large towns: I do not know whether outside London it is exactly of the same character—completely escape the widest net that voluntary effort can cast. It remains a problem—exceedingly difficult of solution—how to deal with it. It is a section which is becoming more and more dangerous, because of its frank and defiant indiscipline. It is the recruiting ground of criminality. Certainly here some means of compulsion more effective than those which already exist ought to be provided for this class—boys who are openly defiant of all parental control, or whose parents are themselves criminal, or indifferent to their parental responsibility. Compulsory physical training might save this class where nothing else can.

8491. Your experience in London is, I suppose, purely confined to your own church school?—Yes; purely to parochial work, to parochial clubs.

8492. The clubs really all come, do they not, from the church school?—Well, they are church schools; they are closely connected with the Church; they are called National Schools by the Department.

8493. The two names are synonymous practically?—They are synonymous.

8494. I think the most interesting problem is that in the last paragraph of your evidence. You were to get hold of that boy that nobody else gets hold of. You advise compulsion; what do you mean by compulsion?—Well, I think all boys who are not at work after they leave school, who are not in some kind of work which might be classed as being occupied for four or five hours a day or more—a boy who is not so occupied ought to be compelled to attend some further course of training.

8495. By whom?—By the school officers.

8496. That is by the Department practically?—Practically by the Department.

8497. In order to cover all classes of schools?—Yes, by the educational authority; probably under the new Bill.

8498. Do you think from your knowledge as a clergyman of a parish that there would be much difficulty in enforcing that?—I think there would be a great deal of difficulty probably, but I think it can be done.

8499. But may I ask you: in your own parish, for instance, what executive authority is there at present existing by which such compulsion could be enforced?—The only authority is the school attendance officer of the London School Board.

8500. Let me understand you; has the school attendance officer of the London School Board any authority over your National School children?—Yes.

8501. He has no authority over them after they have left school?—After fourteen years of age, after the school limit is reached, he has no authority over any child. All I wish to do is to extend that authority for at least two years without extending the school age limit to the extent of compelling every boy to attend school until he is sixteen years of age. I would compel those who have not got regular work during those two years to attend classes during that time—evening classes if possible.

8502. That would include not only the boys that have been brought up by the School Board, but would include your own boys?—Yes, certainly, of course.

8503. After school age?—Yes.

8504. How would you propose that the expense to be incurred thereby should be met for the whole boy and possibly girl population?—You mean of providing teaching, teaching capacity.

8505. There would be bound to be expense of some kind; how would you propose that that should be met?—The teaching capacity, I mean the training capacity, the clubs or evening continuation classes which exist at the present would give ample opportunity, I should think, for all boys.

8506. But would the clubs existing at present be large enough to accommodate all the hooligans who would be compulsorily ordered to attend them—surely not?—Possibly not, but I should say that certainly the evening continuation classes at the schools, which is what I desire more than the actual club. The actual club is distinctly of a voluntary nature. It would possibly be impossible to get the present club membership to coalesce readily with the compelled membership. The present club membership would not at all fit in, I should think, with the others, but there are always the schools in every district. I know clergymen would be willing to offer their National Schools. The Board, of course, would be equally willing to offer their schools, both of us anxious to get the children into these evening continuation classes if possible, and I think most of us anxious to make the principal work physical as a basis for everything else. The only hope we have about a boy, the roughest class of boy, is to train him physically and to get him under a certain discipline which would be connected with physical training.

8507. Would you apply that in a modified way to girls too?—There is a class of girls, a very small class.

8508. Oh, no, but I meant to the girls at large in a modified way?—I think it is equally important in a modified way.

8509. Probably under medical supervision?—Yes.

8510. I mean, you would not be against it?—Certainly not.

8511. And you do not think it would do them any harm?—I think it is of importance for a certain class of girl in London.

8512. Provided such girl has no regular employment?—I think there ought to be no compulsion.

8513. Suppose she is a maid-of-all-work, how would she be able to attend continuation schools and do physical training?—I should not propose that compulsion should be employed or recommended in such cases.

8514. Therefore you would advocate compulsion coupled with very large powers of exemption?—Yes, with exemption for all who are engaged in any kind of work that you could call regular, regular wage-producing work, or in the preparation for such work. Of course that would cover a boy who is perhaps up till sixteen or seventeen years of age engaged in some further kind of preparation for his life-work and yet is the son of a working man: there are such.

Rev.
A. L. Lilley.
17 June '02.

Rev.
A. L. Lilley.
17 June '02.

8515. In connection with this special inquiry, you have no knowledge of Scotland?—No, none.

8516. *By Mr Fergusson.*—Your experience is not confined to Paddington, I suppose?—No; my experience was principally gained in Chelsea, in Holy Trinity, Sloane Street, when there was a very poor district in that particular parish.

8517. And in other districts of London?—I know most parts of London, and the nature of club work in most parts of London.

Physical training in church schools: depends on the management.

8518. Now, let me ask you two questions which are not touched on in what you have read. In the elementary schools, in the church schools, is there any regular system of physical training at present in existence?—Not universally; physical training will vary with the different schools.

8519. But does that mean that it varies with the different clergymen?—Practically, I should think with the management certainly.

8520. If you are in favour of physical training, you see to it in your schools; if you are not, there is no physical training; is that so? It depends on the clergyman?—It depends entirely on the management.

Compulsion desirable in elementary schools.

8521. Do you think physical training in the elementary schools should be made universal and compulsory?—Yes; I think it should be made universal and compulsory, certainly.

8522. You are judging that from the facts which have come under your notice?—Principally, and also from its moral value. I think it is the only sure basis.

Weak and under-fed children: how dealt with.

8523. In these poor districts you meet with a lot of children who are physically weak and who are underfed; how do you deal with those in your church schools?—Well, we have no way of dealing with them as a parish; they are dealt with by a central organisation, the Children's Dinners Association, and the teachers of a certain district hand the names of the children whom they recommend for such feeding, such dinners, to the local secretary, and they are there fed. We send about a dozen half a mile or so.

8524. Then that is done by the schoolmaster?—That is done by the schoolmaster.

8525. Who has instructions?—Yes.

8526. Do you try to get at the reason why they are underfed, and deal with the parents in any way?—Well, you see we deal with the parents very largely through our district relief committee, which is a local committee presided over by myself, and consisting of representatives of such bodies as the Charity Organization Society. A representative from their local committee sits upon the committee, and a number of local tradesmen who know the needs of the people of the parish and their circumstances well, and through that society we are in touch with all those who are in need, and whose families are like to be underfed on account of their needy circumstances. It is in that way that we know, and not through the school.

8527. Does that system deal efficiently with your underfed children?—Yes, I think so. I think that really very seldom we have to send children to the Children's Dinners Association, as perhaps not more than two or three families go in the course of the winter. Of course, none at all in the summer, because they are relieved through our own private relief committee.

Continuation Classes.

8528. Now, as to the continuation classes, let me understand exactly what you propose—that continuation classes should be compulsory, with large exemptions in individual cases?—That is practically my proposal. I have my eye principally on those who cannot be made by any other means, so far as I can see, than compulsion; who cannot be trained by any other means except compulsion. That is to say, if you cannot have compulsion, you leave out a large class that you want to get at.

Physical training should be made an attractive subject.

8529. Would you make physical training one of the subjects—or the only one?—It is the one that I should desire compulsion most for, but I should not make it the only one, nor desire that it should be the only one.

8530. Suppose I, as a boy, say, 'I do not want to

'take physical training; I want to take mathematics,' would you allow me to take mathematics and serve my time that way?—That is already provided for—the evening continuation schools.

8531. No, but if it was compulsory. I might take up any other subject, and I would not be compelled to take physical training as well?—I would certainly advocate that, that a boy whose tastes were intellectual, and who showed a desire to take up other work to prepare himself for intellectual pursuits, I should certainly advocate his being released from the necessity of passing any kind of physical training.

8532. You would make physical training one of the subjects and an attractive subject?—Yes.

8533. And your opinion is founded upon your experience, that a large number of boys would go in for that?—Practically all. My experience from clubs certainly is that all would take advantage of the physical training side.

8534. One exception you would make is girls; you would not make any compulsion for girls for any classes whatever?—I should like to, but I think it would be impossible and inadvisable.

Girls: compulsion inadvisable.

8535. To make it compulsory?—Yes.

8536. You consider that for the roughest element 'the hooligan,' the great hope is giving them physical training?—Certainly, because they are boys who naturally love adventure; they have splendid qualities nearly all of them; some of them of course turn into mere savages, become cruel, but as a rule they are boys who have a certain spice of the love of adventure in them and they like physical exercise of all kinds, and that would be a very great discipline, the regular physical training, in the case of such boys. One sees from Boys' Brigades, the work of Boys' Brigades, how much can be done. Of course I have not referred to that particular work here, though it is a very common branch of our work, because I knew that would be a special department.

Hooligans: physical training advocated.

8537. You think the managers of the Church School would welcome any system of that sort and give every assistance to it in their power?—Yes; my experience is that they would very generally, especially all the younger clergy of the Church of England; I am sure there is a very general desire to enlarge and develop the possibilities of these clubs.

8538. And of physical training?—And especially of the physical; that, I think, is the element most dwelt upon.

8539. *By Mr Alston.*—We have ascertained from your answer to the Chairman that these clubs are entirely under the control of the Church authority?—Yes.

8540. And that you thoroughly approve of the advantages of these clubs, but that you think that they do not go far enough?—Yes, I do think so.

8541. Is the training thoroughly efficient in these clubs of yours?—It varies very, very much indeed. Occasionally, where we have a good instructor, sympathetic and skilful himself, the training is most excellent, quite excellent.

8542. Who are these instructors?—Of course they vary very much indeed, but as a rule we get trained instructors.

8543. From the outside, not from your schools?—Oh, from the outside. We often pay instructors. In my present parish we have not got one, that is only because I have a very excellent member of my own parish who is an excellent gymnast and takes all that work upon himself, and has done for years.

8544. That would be exceptional, however?—That is exceptional.

8545. Then, unless you get your efficient instructor, your physical training in the clubs may not be of the very highest quality?—Certainly not.

8546. Is that a difficulty that you find?—One of the things that I most desire is that the clubs may be recognised by the Educational authority in order that we may have efficient teaching.

8547. But you think that the Education Department should enforce physical training in the continua-

tion classes?—I do think it would be a very great advantage; yes.

8548. But probably they may not continue your clubs?—Well, you see, they do so in the case of girls' clubs already.

8549. Do they?—Well, I mean they do not, of course, provide gymnastic teachers for those clubs, but they provide for the girls' clubs; the Evening Continuation Schools Committee does provide teaching in any department which the girls like to take up, which is recognised in the Evening Continuation Schools Code. My proposal, then, is that the Code should cover gymnastics or physical training as it covers branches of intellectual and manual training, such as cookery.

8550. And the Education Department would recognise clubs?—They recognise clubs already very largely.

8551. In England?—Here in London; yes.

8552. You made the remark, in answer to Mr Fergusson, that the intellectual aspiring boy might be allowed to take his intellectual course in the continuation class and be free of the physical training?—If he desired. I thought it very improbable that he would desire that.

8553. But you laid some stress in one part of your evidence here that the physical training is necessary, even for the intellectual boy, that all his powers should be increased?—I think so very much, and the point I understood Mr Fergusson to raise was whether there was a very decided objection on the part of a full-grown boy to taking part in physical training, as there might possibly be, whether we should use force. I thought that a boy who was engaged in intellectual cultivation had probably some clear idea what he was going to do in life, and was just one of these boys that would elect for himself; would not need force.

8554. You would let him off?—I would let him off.

8555. Suppose a number of boys, not at all intellectual, took that attitude, desirous to escape the physical training, not to be troubled with it, you would hardly make the rule of letting off general?—I should regret it very much, but I do not know that I should still compel in these cases.

8556. Your evidence before us has pointed to the difficulty of getting boys to attend continuation classes and physical training, that is to say, there was not sufficient attraction to bring the boy in, hence considerable stress was laid upon the necessity of making that compulsory?—Yes.

8557. Would you think that that was justified?—I think that for a certain class of boy it is absolutely essential; it is essential to make this compulsory.

8558. Whatever he thinks, you want the rough boy to be brought under discipline and kept under discipline?—I want the rough boy to be brought under discipline, because I know he would not have any intellectual interest; the boy who has any intellectual interest, I would not compel him.

8559. We agree with you as to the necessity of physical training for boys, but we think it equally advantageous for girls; you do not think the same restriction should be placed on girls as boys?—Equally advantageous and equally necessary, I think it is almost impossible. The conditions of girl life, their connection with the home, make it next to impossible to enforce it in the same way, to make it compulsory in the same way.

8560. Then there is this one other point—you refer to the brigades, the Church Lads' Brigade, which is entirely connected with your own Church. Do the officers there help you in these matters at all, in connection with the physical training in clubs, for instance. You ought to have very capable young

men in the Church Lads' Brigade. Are they not available in your clubs?—Oh, always; they are amongst our best workers.

8561. Is it not possible to dispense with the outside instructor, and depend upon the men within your Church?—Well, yes, I think it may be often; but it is an excellent thing, if you want to develop the very highest quality and the highest interest in gymnastics, to have a very first-rate teacher.

8562. Still, an expert from the outside might supervise the drill and the instruction of the voluntary worker within?—Yes.

8563. I mean, could not this organisation, which belongs entirely to your own Church, be made available in a great deal of the effort you are putting forth for the physical training of your boys?—I do think so. May I just say, with regard to the gymnastic training, it very often happens that a club is very large, and the gymnastics are not the particular form which the boys generally like most.

8564. Then let me ask about the word 'gymnastics'; Applied does that mean applied gymnastics, with apparatus?—Applied gymnastics: caretaker.

8565. Then do you exercise proper supervision, either medically or otherwise—that is, the care taken of the boys when they are performing on fixed apparatus?—Yes. You mean, for instance, with regard to heart disease.

8566. Oh, yes, and accident from the misuse of any of the apparatus?—Oh, yes, one is always careful about that, very naturally; I mean, testing the apparatus.

8567. Because a witness has told us, that when the caretaker was unable to attend the gymnasium, that was the day—namely, the Saturday holiday—when the accidents took place. It is clear, therefore, that there is always a necessity for guarding against accident with fixed apparatus, the use of which may be hurtful?—We are always careful to have a person in authority all the time the club is open, and there is very seldom an accident.

8568. Then, practically, it comes to this, that, while your clubs are admirable institutions, they cannot cover the whole ground which you desire to see covered?—Oh, certainly not.

8569. *By Sir Henry Craik.*—About the point Mr Fergusson and Mr Alston asked, would you, suppose a boy wishes to turn his attention chiefly to physical training, relieve him of the necessity of having intellectual education?—After fourteen? Intellectually disposed boys and physical training.

8570. Yes?—Yes.

8571. Not even earlier?—No.

8572. Do you not think the two things are complements one to another?—Yes.

8573. There are some lads of fourteen to eighteen who might take up certain intellectual lines which would not be peculiarly healthy, and which might have specially to be counteracted by some physical training?—I think it is hardly probable in the class with which we are acquainted, and with which we are dealing. I do not think so; I do not think there is any danger.

8574. You have no fear of allowing them to give it up altogether?—I should regret extremely that any boy should. I think, on the other hand, that if you find a boy prefers never to do so who is engaged in preparation for his life-work, it would be dangerous; it would be wrong, I think, to interfere, and say, 'You must take up this particular thing; this is indispensable to your continuation school work.' I should not advocate it.

8575. If the nation is to depend in any way upon our Volunteer forces or the physical strength of our citizens, is not that relieving a certain class from their obligation in order to pursue their own objects?—Even so; I am prepared to face that risk.

The witness withdrew.

Rev.
A. L. Lill y.
17 June '02.

Mrs Bryant

17 June '02.

Mrs BRYANT, examined.

Mrs B

17 Jun '02.

8576. *By the Chairman.*—What is your position in the North London Collegiate School for Girls?—Head-mistress.

8577. How long have you been so?—Since 1895.

8578. That is one of the schools founded by Miss Frances Mary Buss?—Yes.

8579. Is it the only one she founded?—She founded two schools, this school and the Camden School for Girls, which is also in the neighbourhood, and is a cheaper school, and I may say that the same system of physical training is carried on in the second school as in this school. It was carried on under Miss Buss' own supervision until she died in 1894.

This school was founded in 1850 by Miss Frances Mary Buss. Suitable buildings were provided by endowment in 1879, and the general scheme of physical training, in all the main features as described, was established in 1882. The number of pupils varies from 440 to 500. Number at present, 443.

Ages of pupils distributed as follows:—

Years of Age.	Number.
8	2
9	8
10	8
11	14
12	40
13	45
14	64
15	73
16	85
17	62
18	35
19	6
20	1

Accommoda-
tion.

The school buildings include a large gymnasium, well-equipped with suitable apparatus. There is only a small playground, with three fives courts, and a field is also rented for hockey, tennis, and other out-door games. The gymnasium is used daily for games, including corporate games of skill, such as the new game called net-ball, or basket-ball.

Physical
training
described.

Physical Training by Gymnastic Exercises fall under three heads:—

- (1) Two half-hour lessons per week as part of the regular school course. Exemption allowed if pressed for by parents on reasonable grounds shown. Also those who are physically unfit are exempted by school requirement. Total number exempted at present, 26; 6 per cent. Necessary, and not quite easy, to secure suitable conditions as to dress, etc. Effects of physical training in showing and gradually correcting defective nervous balance and control in nervously unsteady girls. Training to habits of attention and self-command. Reaction on intelligence. Simple apparatus, such as hoops, dumb-bells, wands, clubs, used, as well as free exercises. Uses of these. German methods.
- (2) Special courses of physical training for those who show any tendencies to any metrical or inadequate development, generally for an hour twice a week in the afternoons. No extra fee. Number thus treated at present, 24 per cent. Many cases of curvature certainly prevented. Instances of after-trouble in cases when parent fails to consent to treatment, as occasionally occurs. Satisfactory improvement in physique and bearing noticeable. Use of spinal desks.
- (3) Voluntary class one afternoon a week open to girls not excluded under (1) or included under (2), actually the class of school athletes. Gymnastic fixed apparatus, ladders, ropes, swinging-rings, parallel and horizontal bars used. Small fee paid. Permission from head-mistress to join is required, and is not granted to girls whose medical record is not sufficiently satisfactory. Pupils under fourteen generally ex-

cluded. The number in this class at present is 40, or 9 per cent. Trained teachers (certificate of British College of Physical Education) employed throughout. Staff of four, one being also a form mistress, who acts, moreover, as superintendent of the games in school.

Medical inspection is pre-supposed in this scheme. The medical inspector is always a woman; at present Miss Julia Cock, M.D., who wrote a valuable memorandum on the subject, with statistics up to date for the Report of the Royal Commission in 1895. Every pupil seen about once a year, and girls requiring care about once in six months. Four or five visits of three hours each are paid during the term. Work could not be done in this time without the aid of a very efficient secretary. This system of inspection in operation since 1882.

Objects and Results of Inspection are:—

(a) To prevent violent exercise being encouraged or allowed in cases when on account of defect or weakness (sometimes only temporary) of heart or lungs it is inadvisable. See exemptions under (1) above, and refusals under (3), which latter are made on reference to pupils' record in Medical Inspector's book. Five per cent. of such cases occur in the last 1330 observations.

(b) To discover cases which require special physical training under (2). Serious cases are reported to parents as requiring more thorough treatment under constant medical advice. (The work of the school for physical development by no means takes the place of individual care for health at home.) These are very few, but out of the last 1330 observations made, special exercises were prescribed for 30 per cent.

The defect, very common in a town population, of flat or flattish feet, may be noticed under this head; 35 per cent. noted in these 1330 cases. Much improvement effected by suitable foot exercise.

(c) To discover any special physical infirmity to which the attention of parents and teachers should be drawn, especially those such as defect of eyesight or anæmia, which affect or are affected by school work. Examples: 107 cases of eye defect (some very slight, some serious) occur in the 1330 cases—*i.e.*, 35 per cent.

(d) A record of anthropometric observations on each pupil is kept, as in specimen page of Record Book appended. Important measurements, height, weight, chest girth, waist girth, head dimensions. Table of averages is appended.

Games such as hockey and tennis organised by clubs governed by committees formed of pupils elected by the club and teachers, one at least of whom is selected by the head-mistress as vice-president, and responsible to her for public order and safety. The other officers are the captain, a pupil, and the treasurer, a teacher, both elected.

For ordinary games in school each form has a games club and captain of its own. There is one head captain of all these games clubs, who must be in the Sixth Form. Athletic sports are held once a year.

A swimming club is formed for the summer months, with organisation as above.

Matches are played with other schools, but these are restricted to the seniors, and not allowed to become too frequent, lest there should be too much excitement, too much distraction, or too much fatigue.

8580. You say that the physical training by gymnastic exercises falls under three heads?—Yes, in the first place there is a certain amount of physical training which is part of the regular school course and takes its place in the morning school together with the other studies as one may say; there are two half hour lessons a week, and all girls attend that unless they are exempted for some particular reason. The reason is generally one which we allege, because we think the girl unfit for

Object
result.Games
organised

Gymna

violent exercise, on account of weakness of the heart, or weakness of the lungs, or other reasons, which we make it our business to discover. That is a very important part of the whole system. All girls under medical inspection, so that we may be sure we are not doing any harm.

8581. You do have it under medical inspection?—Every girl is inspected. I thought you probably would like to know about the number that are exempted. A certain number are exempted also by some special wish of their parents. One tries to prevent that as far as possible by persuasion, when there is not a medical reason; but as a matter of fact about 6 per cent. are exempted on the whole, and some 5 per cent. of those would be by our decree; a very small number, but still some.

8582. Then you go on to No. 2?—No. 2 is the most important class of all. The medical inspection enables us to find out not only the girls who ought not to have any violent exercise, but also those who ought to have some special exercise, because of tendencies to lateral curvature or other defects, *i.e.*, asymmetrical or inadequate development. These come back in the afternoon, generally twice a week, sometimes once a week, and have special gymnastic exercises, which are prescribed by the medical inspector for the purpose. In the third place, there is the volunteer class of girls, who choose to come. They pay an extra fee, and have a more advanced course, with the usual gymnastic apparatus, climbing of ropes and ladders, parallel bars and horizontal bars, and so on.

8583. That is also under medical control?—Not exactly in the same way.

8584. But it is under medical control?—Yes, it is under medical control in this way. The medical inspector does not take any responsibility as to saying what those girls are to do; but when a girl applies to be admitted into that class, I do not admit her unless I find that her record in the medical book is satisfactory. I take the responsibility, because I hold that it is better for me to make a mistake than for her to make a mistake. So the girls whose medical records are not sufficiently good are excluded from that class, and also the very young girls. We think that the evidence goes to show that it is not advantageous for quite young children to have gymnastic exercise with apparatus, so that we do not let them in under fourteen years of age as a rule.

8585. And your medical inspector, you say, is always a woman?—She is always a woman, yes; she sees the girls when they come into the school: she comes about five times in the course of a term, and all the girls are brought up to her one by one, and each case recorded. I have brought down the record book.

8586. Would you mind handing it round?—I have also brought, for convenience, copies of a page, which may be kept. All the girls are seen soon after they enter, and the inspection is conducted in two stages. She sees them, in the first instance, makes a general observation, tests their eyes, and takes the measurements, and so on, and then we send a note home to the parents to ask if they will allow the child to be inspected fully. We do not do that without getting permission from home. This has avoided many difficulties which might otherwise have arisen.

8587. Is there much trouble in getting that permission, as a rule?—No; it has never given us much trouble, but it required, in the beginning, a good deal of persuasion and talk sometimes, and even now that occasionally happens. Only to-day I had a letter from a mother, who said she did not object if she might be present; but that is very rare. Then, of course, she ascertains carefully whether there is anything wrong with the girl's growth, and we deal with defects accordingly by the afternoon exercises.

8588. Then you go on to state the object and results of the inspection, and also I see that special cases are considered, and so on; and that flat feet comes under that head, and eyesight. I suppose eyesight gives you a lot of trouble?—Yes; I should like to say a word about both these points; they are

especially interesting in a town population. The prevalence of flat feet is entirely due to town life, and the difference is very striking when children come up from the country; the country children have better feet.

8589. The fact that they are living in the towns rather produces or encourages this defect?—Yes, and it can be corrected by certain exercise, tip-toe exercise, and so on, which country children get naturally.

8590. This book that has been handed round is the record of the anthropometric observations?—Yes, and the medical observations.

8591. Has that record obtained over a certain number of years; how long has it been going on?—Since 1882—twenty years.

8592. It is very unusual?—Oh, it is very unusual.

8593. Was that Miss Buss' doing?—Miss Buss initiated it herself; it was entirely her own idea in the first instance, and she put the school gymnastics under medical inspection on the opening of the school gymnasium. Her ideal has gradually come to be recognised, but very, very gradually, and only very partially now. I do not suppose that there is any other girls' school in which they do it so thoroughly, or try to do it so thoroughly.

May I say just something about eyesight? The number of cases which we find of slight defect—defect more or less—is very large, as will be seen from the percentage. Of course, that does not mean a large number of serious cases—the number of serious cases is very small—but there are serious cases that are never suspected at all by the parents. We frequently discover them. I see that Miss Cock in 1895 estimated that there were no less than 5 per cent. of uncorrected cases which we were able to remedy by drawing the attention of the parents to the fact, and getting them to take proper means. Another part of the system, of course, is to give the teachers sufficient information, so that they may look after the children, and see that the glasses are used, because that is very necessary. I should perhaps say that we do not attempt to deal fully with the cases of eye defect—defective eyesight. What we do is to draw the parents' attention to the fact that there is defective eyesight, and then get them to take the children to an oculist to be thoroughly examined.

8594. Then you go on to say that various games are organised by the clubs, and so forth, under special officers, all of whom are girls, of course, naturally?—All girls, yes.

8595. And various rules are laid down as to suspension, and so forth, and there is a swimming club; where do you get swimming?—We have a new swimming bath at St Pancras now, but that is open for the first time this year. Hitherto we have used baths at Hampstead and Hornsey, which two districts send a very large number of our girls; but now we have a splendid bath quite near.

8596. That is the new baths that were opened the other day?—Yes; so we shall be able to do a good deal more with swimming than has been hitherto possible. I thought, perhaps, you would like to see our programme of last year's sports. These take place in a field now; we used to have them in the gymnasium. I thought that you might like to note both sides of the training—the games on the one hand, and the semi-medical treatment on the other.

8597. *By Mr Alston.*—In these three sections the percentage in the first is 6, in the second 24, and in the third 9; that is 39 per cent. of your total number so treated; first of all, those physically unfit, then the tendency to inadequate development, and those in the gymnastic class?—Yes; this class is additional and voluntary.

8598. Does that account for a very small number still untouched?—All the pupils join the regular morning classes, except the 6 per cent.

8599. Then this volunteer gymnastic class has only 40 in it, or 9 per cent., of course there is other training besides for the remainder of the girls?—Oh, yes; the other training is the two half hours a week in morning school, which every one has.

Mrs Bryant
17 June '02.

Measurements: anthropometric observations.

Eyesight.

Games.

Swimming.

Physical training for all except those physically unfit.

Mrs Bryant 8600. This is rather an advanced class?—It is comparatively an advanced class.

17 June '02. 8601. In that way your whole school roll of 443 is engaged?—Yes, they all have something.

8602. They all have something except those physically unfit?—Except those physically unfit.

8603. This medical supervision is constant; you say every girl is examined properly, and the data put down with reference to this schedule?—Yes.

Eyesight. 8604. Have you found, as so many expert witnesses have found, that the eyesight in a school, whether boys or girls, is one of the subjects generally overlooked except in your own case?—Yes.

8605. And it is rather a surprise to those who have taken notice of it, what defects in eyesight there are in both boys and girls?—Yes. I have a little additional experience of that in connection with the London County Council scholars. All the scholars are examined now by order of the Technical Education Board; but in the first instance it was quite a surprise to find how many of those scholars had something the matter with them. One very clever girl, I remember, came up to us. She had only one eye; nobody ever knew she had only one eye.

8606. That is quite in keeping with the evidence we have had?—That was one case, and there are many other cases where children suffer from headaches, and no one suspects the cause to be the eyesight.

8607. Have you made this observation that a good deal of the suffering of those young children, in consequence of bad eyesight undiscovered, arises from their close attention to their books and lessons?—I do not think I could say that is so. That has been said; our experience does not bear upon it. Our experience rather is that there are many congenital cases which have been neglected, and that in consequence work and happiness suffer.

8608. We have heard of the case in which the child could not read because it was so short-sighted, but it was not known to anybody; have you met with cases of that kind?—Yes.

8609. Then, of course, under your system of very careful medical supervision, you discover the ailment at once, and you take steps to remedy?—Yes; I remember two sisters who came in who were very backward, very dull to all appearance. We discovered at once that they had most imperfect vision, and had probably been accustomed to do their lessons without ever seeing them clearly. They were so accustomed to do this that it did not seem to them at all curious that they could not see what was going on. We had difficulty in persuading the parents of these children to provide them with the proper treatment, and even then they had to be constantly watched to see that they wore the glasses. Another case occurs to me of a very fine healthy girl, but who has defective sight. I have never been able to persuade her parents to deal with it; they do not like to see her with glasses. She never can play her music properly, because she cannot see it.

8610. Have you discovered any defect arising from the position of your class as they sit in relation to the window?—When the school was built—the school was built under Miss Buss' own immediate supervision—that was all very carefully gone into. The buildings, which were opened in 1879, have a north light, and the light falls on the right-hand side.

8611. The strain is not aggravated by sitting against the light?—No.

Games. 8612. You advocate games, of course, of all kinds in your school?—Yes, if the girls are able for them.

8613. Of course always provided they are able both for the physical training and the games?—Yes.

8614. But would you advocate the use of hearty games for girls?—Oh, certainly.

Organisation. 8615. Do you supervise the games in any way?—Well, I know what is going on, and then there is the mistress who supervises each particular set of games—the vice-president of the club. Our system is that the vice-president of the hockey club or the swimming club is nominated by me, which gives me a certain con-

Mrs B trol over the club. There are some rules which the committee draw up, and there are some rules which are my rules.

8616. As regards the public games of the school?—Yes, the public games.

8617. Is there no playing at random with freedom as children will play?—Well, there is not very much room for that. We have a very small playground, by which we are seriously handicapped, and the girls make the most of their playground and their fives courts, and they make a good deal of the gymnasium; but the games are nearly all organised games. They used to play a good deal more as they pleased in the gymnasium in the dinner hour, but the games were not so good as now. The captain of the games club organises the games.

8618. With your difficulty of a small playground, nevertheless you cultivate games of all kinds?—Yes.

8619. You believe they are a necessity for the intellectual training which goes on in the other part of the building?—Yes, one of the mistresses practically looks after the games.

8620. Is there any game specially that you would advocate for the girls?—Well, hockey is the game from which I think they get most enjoyment—hockey in winter.

8621. Is it the one that produces the best results in the child herself; for instance, skipping has been spoken of most highly before us?—That is part of the gymnastic course. It is hardly a game. I think I ought perhaps to say, in relation to skipping, that a case once came to my knowledge where a serious mistake had been made in encouraging the girls to skip too much. It is dangerous if it is overdone. It may be injurious just like jumping too much; but that illustrates another point that I am glad just to speak of, namely, the danger of the competitive principle.

8622. Yes, I am glad you mentioned that.—In this case which I mentioned, the head-mistress—it was in a private school—in order to encourage physical activity on the part of the girls, offered a prize for the girl who did the most skips during the term, and the girl who won the prize found out some years afterwards, when she was married, that she had done herself harm: she had skipped too much. That illustrates the danger of the competitive principle. I think it a little dangerous, because girls are apt to do more than they ought to do?—We have, of course, the competitive principle in the athletic sports; but that is the only place it comes in.

8623. But again it is under supervision?—Certainly. When the girls' names are entered for sports, the list of entries is brought to me, and I compare them with the medical record of each girl in the book. If there is anything against her, I send for her, and cancel her entries in whole or part. I let her do, perhaps, something easy—a potato race or sack race, or something which does not mean much violent exercise. I take her almost ruthlessly out of running or jumping.

8624. *By Sir Henry Craik.*—Yours is the first school from which we have had evidence which is a higher-class school; it is for higher-class pupils?—Yes.

8625. They pay considerable fees?—The fee is 17 guineas under thirteen, 18 guineas over sixteen, and 20 guineas for those who enter over sixteen. The object of the last, of course, is to discourage late entry. As this is a higher fee than that of the girls' public day-schools, or any of the schools in the neighbourhood, I think you may take it that either the girls attending the schools are decidedly well-to-do, or else their parents are making very special efforts for them.

8626. Have you had any experience in comparing that class of girls with those in attendance at the State-aided schools?—Well, only the opportunity arising from the fact that we have a certain number who come up to us with scholarships—scholarships from the Board Schools, and the London County Council scholarships.

8627. They gain these scholarships by competition?—By competition.

Mrs Bryant
17 June '02.

8628. And perhaps after considerable hard work?—
From the elementary schools, yes.

8629. How do these girls compare with girls whose
circumstances are easier, and who have not had that
hard intellectual work?—Oh, I think I have seen a
good many cases where they come up rather fagged.

8630. Rather over-strained?—A little over-strained,
and I think—I could not say I have quite the
evidence for this, but I daresay I could look it up, and
make it more definite—a larger proportion of defects of
one kind or another.

8631. Have you ever watched the effect of the
physical training on these girls?—Oh, yes, they im-
prove wonderfully; they improve altogether; they
certainly improve physically.

8632. Then you get, of course, intellectually picked
girls out of the State-aided schools?—Yes.

8633. Those who are really best worth working for ;
but, at the same time, you find in their case that the
physical side has been rather neglected?—Yes; on the
whole, that was the object of getting the London
County Council to introduce some physical testing,
and I think more will probably develop in this way
later. They have accumulated some very interesting
evidence on the subject—about the eye-sight especially.

8634. How long have you been in charge of the
school?—Since 1895; but I should say I have been there
since 1875. I was there as mathematical mistress.

8635. Would you tell me what your experience is
as to the raising or falling-off of the physique of the
pupils during that time?—My impression is that
decidedly there is an improvement.

8636. That more attention is given by that class of
pupil to physical exercise?—Oh, much more; much
more interest in physical exercise; that is quite un-
doubted. I remember the days when we used to find
it difficult to make the girls play, and very difficult to
get them to take an interest in gymnastic exercises.
When I was a young mistress there, I used to go in and
do the gymnastic exercises with the girls, in order to
give them a lead.

8637. But that is not necessary now?—No.

8638. During the same time you have seen almost
the complete development of the competitive system
for the girls, their going in for degrees, and so on?—Yes.

8639. Do you think that has had any effect upon
their health?—No, not if it is watched.

8640. But it probably did call for all the greater
attention to their physical training being carried on at
the same time?—Yes, I should say so. We have always
watched over work very carefully in the North London
Collegiate School. We have a system of home time-
tables, by which each girl reports the number of hours
she takes over her work, so that we may check it in the
school. Especially in the sixth form, which I had to
do with before I was head-mistress, there would be two
or three girls very eager about their work, and I
had very carefully to watch them. I think there was
a little more difficulty then than there is now; but
still, there is always a necessity that girls should be
watched, lest they work too many hours. Also, in
regard to examinations, we make it a principle that
every girl shall promise, when she goes in for an exam-
ination, that she will not work at her books during the
examination, and I think that is a healthy rule. They
come to recognise that moderation in work is, on the
whole, best for the work, and I think they carry this
principle into life afterwards.

8641. Then you think, to sum up, that, "although
this development of the competitive system and of the
system of examinations might have been a great danger,
you have met it partly by careful supervision and regu-
lation of pupils' work, and partly also by the increased
development of physical exercise?—Yes, and I would
include in that careful revision of their work, the cul-
tivation of a common-sense view of it in themselves.

8642. I have only one other question to ask, what
effect have you found that this physical training has
upon the intelligence and the brain-work of the pupils?
—Oh, yes, that is a very interesting point. There is
no question, I think, about the improvement that is

effected. A girl who lacks balance begins to improve by
being interested in physical exercise, and thus gains
steadiness and self-control. Her physical training
helps her, and her intellectual training helps her;
but I have been very much struck with the steadying
effect of the physical training I have seen from time to
time. That is quite as striking, I think, as the im-
provement in symmetry and development.

8643. Then generally your verdict is, that although
you have no personal experience of the State-aided
schools, the effect of this upon best-selected pupils out
of those schools who have come under your charge has
been very excellent.—Yes.

8644. And that, instead of impeding, it has increased
their intelligence?—Certainly, I should say so. As
regards measurements of height and weight, etc., I
want to be allowed to supply you with statistics.*
I have not been able to get them ready in the time.
I have some here, but the numbers on which they are
based are not sufficient.

8645. *By the Chairman.*—We would be very glad to
have them if you can send them on?—I do not want to
leave you what I have to-day, because I am not sure that
they are accurate; but so far as they go, an interesting
fact appears. I have here the average heights for
different ages of the girls now in school, and also these
averages for each age as recorded in the medical book.
The former is a little better than the latter throughout,
but especially in the higher ages. That might turn
out to be an interesting piece of evidence.

8646. That the former one is better?—Those who are
in school now.

8647. They have improved, you mean?—They are
better, taking them on an average in school, than they
are taking them as they enter.

8648. So that there has been a general development?
—I think that is what it seems to show. Also the
average is higher than the ordinary average, which I
think is 62·6 at eighteen years of age, and I get 63·8.

8649. *By Sir Henry Craik.*—Yours is a day school
entirely, you have no boarders?—Oh, there are boarders;
there are four boarding-houses; that is how I spoke of
the girls who come up from the country.

8650. *By Sir Thomas Coats.*—In section No. 1 of the
physical training you say you give two half hours per
week to the children, that is for the general training,
not the special training; do you consider that two
half hours per week quite sufficient?—Yes, I think
so, in a general way. It is very thorough work.
Would you like me to describe what they do? It is
really gymnastic work. They use the simpler apparatus
as well as the free exercises, and they have gymnastic
dress. The dress is one of the difficulties. It
was only about three and a half years ago that we were
able to introduce the dress. The ordinary dress had
always been a difficulty, and considering that it varied
in fashion from time to time, one never could get the
better of it; but it was not till the interest in physical
training was strong enough, and it was popular enough,
that we were able to prescribe a dress. It is not, of
course, possible to change the dress in school, for lack
of time. They come to school with the gymnasium
dress, but with a skirt over it. This is perhaps a
detail to tell you, but it is an important detail, because
it is just what makes the dress possible.

8651. You would not advocate more time being given
if you could spare it from the other work; you would
not advocate more than two half hours per week?—If
we could spare it, yes—three.

8652. You think it might be of advantage if you
could spare it?—Our school hours are short.

8653. What time do you stop?—1.30. There are
always extra subjects in the afternoon, and all these
extra gymnastics in the afternoon.

8654. I meant to ask you about the dress the day
girls come in in the afternoon; do they dress specially
for the afternoon work, or do they dress specially the
whole day long?—They can wear the dress the whole
day long, or they wear it with an extra skirt. It is

* See Vol. I Appendix V.

Mrs Bryant
17 June '02.

just a simple blouse bodice, short skirt, made of blue serge; having an extra skirt turns it into an ordinary dress; it is so devised that it varies very little from the ordinary dress, and yet is distinctly a uniform.

8656. Is the dress so distinctive from an ordinary girl's dress as to be remarked?—Going through the street?

8657. Yes?—Well, in the winter time they would have jackets. It is not very noticeable even in the summer time, and I do not think they mind very much.

8658. My reason for asking was with regard to the poorer children in Board Schools, whether such a dress would be applicable to them; do you think it would?—There is the difficulty in expense. All these things mean some expense. I do think that is a difficulty.

8659. They could not substitute that dress for their ordinary dress?—Perfectly well. The little ones, of course, do not really want anything else; they could substitute it for their ordinary dress; that is to say, have that school dress which would answer the purpose.

Hygiene and domestic economy.

8660. With regard to domestic economy, of course it has a bearing on this question—perhaps not a direct one—do you teach domestic economy?—Yes, we have a course of hygiene and domestic economy once a year, in the spring term.

8661. But probably the girls in your school would not require to do their own cooking afterwards?—Well, the domestic economy and hygiene I spoke of is theoretical. There is a cookery class which they take in the afternoon, but it is not part of the regular school course; their parents do not want that for them; they are pleased to teach them for the most part at home.

German system.

8662. *By Mr Ferguson.*—In the physical training do you work on any book; what system do you work on?—I could describe it best by saying that it is German gymnastics for the most part. I am thinking of the two rival systems—the Swedish and the German.

8663. The German, you call it; is there a book?—I do not know; the apparatus work is the sort of work that is taught in the German gymnasia, and all our teachers have been trained on the German gymnastic system rather than on the Swedish system. On the other hand, the semi-medical work is very much of the nature of the Swedish system. There are four teachers altogether, and they are all trained teachers having their certificates.

8664. Have you any strong opinion in favour of one system or another; do you object to the Swedish?—Well, I think the German system is better on the whole than the Swedish. That is my own opinion; of course it is just rather contrary to the prevalent educational opinion, I know.

8665. Is there much drill in your system?—A certain amount of that in evolutions; yes, they have that, and, at the same time, free exercises, and exercises in

the use of dumb-bells and clubs and hoops; there are quarter-staves too; that is rather more advanced.

8666. It is only of late years that you have been able to introduce a special dress, but if you got on for so many years without the special dress, I may take it that, although a special dress is a good thing if you can get it, it is not necessary?—It makes an immense difference; the work is quite different; it is so very much improved.

8667. It looks better?—Not only that: I mean it is better because the ordinary dress—especially for these big girls, of whom I am thinking—is very unsuitable. The skirt is too long and the sleeves are probably too tight; there are all kinds of difficulties of that kind, and the ordinary dress is seldom suitable; it may be sometimes, by accident.

8668. You see, of course, what an enormous difficulty it would be in Board Schools?—I quite see.

8669. As to medical inspection, your girls are only seen, as a rule, once a year?—Once a year.

Medic inspection.

8670. I suppose on entering they are inspected?—Yes; and then they come round again in rotation.

8671. Unless there is anything special, once a year?—Yes; and the delicate ones about once in six months, and, of course, some oftener.

8672. If there is anything the teacher wishes to call attention to?—Yes; or according to the doctor's previous notes.

8673. You think that is sufficient once a year, with extra inspection for special purposes?—I think so; that answers very well.

8674. *By Mr Shaw Stewart.*—Why do you prefer the German system to the Swedish?—Well, I think the Swedish system in its completeness pays too much attention—dwells too much—upon training of the individual muscles, if I may so put it, as compared with the training of the body as a whole to do certain things. I am afraid I am putting it very crudely.

German and Swedish systems differ.

8675. I think I understand—the Swedish system is too particular, perhaps?—Too particularizing.

8676. And the German is more general?—Yes, and I believe that you get better results by fixing the attention upon the act to be performed rather than upon the training of particular muscles.

8677. I quite understand the distinction as you have explained it?—I am too ignorant to speak with any authority, but that seems to be the difference, as far as I understand it.

8678. *By Mr Alston.*—Can you refer us to a book on the German system?—No; but I daresay I could, probably by consulting my teachers, refer you to some book. The system which we use more or less is what is now being taught by Fraülein Wilke at the Polytechnic Gymnasium at Chelsea.

8679. Nothing to do with Sandow's method?—No; I do not quite know what Sandow's method is. The college for physical training best known is that of Madame Bergman-Osterberg on the Swedish system.

The witness withdrew.

Mr JOHN MASTERSON, examined.

Mr J. Masterson.

8680. *By the Chairman.*—You represent the School Board of Perth?—Yes.

8681. Do I understand what you say is what the School Board wish said, or is it your own opinion, or both?—It is the policy of the Board. What I have stated in my notes is exactly the policy of the Board.

8682. I should just like before we start to get your previous career—your military career—to be noted down. Would you just say what you were?—Yes, my lord. I left the Royal Scots Greys as Quartermaster-Sergeant, and since then I have just retired from military life. As you know, my lord, I have been instructor to the Yeomanry, to the Fife Light Horse, Sergeant-Major of the Fife Light Horse, after twenty-two years' service. I was instructor in the Yeomanry for three years after I left the Army, so that combined I have had forty-four years' service altogether.

8683. Which you have just completed, you may say?—Yes, I have just completed forty-four years' service.

8684. How long have you been a member of the School Board of Perth?—Nearly nine years.

8685. Uninterruptedly?—Uninterruptedly.

8686. Now, if you have got a copy of your notes, you might read them to the Commission?—I have been commissioned by the School Board of Perth (Burgh) to give evidence before this Commission. I have been a member of that School Board for nearly nine years. I claim to be an expert on the subject of physical training, having given instruction in it for forty years. I have recently been employed by the military authorities to test recruits for the South African Constabulary and Scottish Horse. I have also trained candidates for the Indian Civil and Military Services. I have always taken a great

J. B. Masterson.

Perth School Board.

interest in the subject of physical training. I may say I am one of the pioneers of physical training in the country, because I started it from the formation of the gymnasia in Aldershot in 1860, when the gymnasium was first started in the Army. The gymnasium was transferred from Woolwich, where it only existed, to Aldershot, and my colonel took a great interest in it, and sent a number of non-commissioned officers round the country giving exhibitions of physical training, and so induced a healthy feeling in that way. In 1875 we first introduced it into the schools in Britain, and ever since 1860 my regiment has taken a leading part in the introduction and carrying out of physical training. Twenty years ago I gave an impetus to such training in Perth by establishing the Perth Gymnasium and School of Arms. Previously to that there was little attention given to physical training in the schools. On the gymnasium and school of arms being opened, large numbers of adult ladies and gentlemen, as well as large numbers of young ladies and gentlemen from the two secondary schools in Perth (Perth Academy and Sharp's Institution), attended it. So successful were the classes that the School Board were approached with the object of getting drill introduced into their schools generally. At first the Board was not responsive, as at that time drill was not compulsory under the Code; nor is it yet, but unless we have physical training we get no grant on the highest scale. Physical training is not compulsory in the elementary schools. Gradually the advantages of drill came to be recognised, and facilities were given for teachers attending the gymnasium to qualify for teaching their classes. If you will allow me, I will show you the certificates we granted, and the Board accepted that certificate as qualifying for teaching. This is twelve years ago. Over twenty lady teachers attended a two-session course, and after an examination by the president of the gymnasium (Colonel J. Campbell), obtained certificates which the School Board accepted as showing competency to teach. On the gymnasium being closed, about nine years ago, the School Board took over its equipment and engaged their present instructor. Physical drill is now taught throughout in the elementary schools, and military drill is taught to the senior divisions in all these schools. The instructor engaged by the Board is a professional drill instructor and sergeant of Volunteers. He is also instructor of swimming. He teaches in all the elementary schools (there are seven in all) except one, where the janitor drills the children, he being an ex-soldier. The average attendance last year at these seven schools was 3681. In the infant departments of the various schools the drill is done by the teachers themselves, and is taken every day for a short period. From Standard I. upwards the drill is under charge of the special instructor, who visits the schools in rotation, and in this way every child (unless physically unfit) comes under his instruction for one half-hour per week. The salary of the instructor is £100 per annum. No grant is specially payable in respect of physical drill in day schools. In these it only receives encouragement negatively, in respect that if it is not provided for by the curriculum, the average attendance grant will not be on the highest scale. In the largest of the elementary schools (where the average attendance is 1031) there is a first-class gymnasium, with the usual offices attached. It is not only used by the children attending the day school to which it is attached, but by the children attending other day schools where like facilities do not exist. It is also used by the young men attending a large evening continuation school. There were forty-six young men received instruction in the evening school last session; besides, the girls got physical exercises once a week. We hope to receive 2s. 6d. per pupil per hour per week for a session of twenty weeks in respect of this evening school instruction. Perth Academy (secondary school) has also a gymnasium, which, though small, is very efficiently furnished. The instructor is the gymnastic instructor of the Depôt Black Watch. Attendance at the gymnastic classes is optional, an extra fee of 5s.

per session being charged for them. The classes, which are well taught, are very successful, being attended by thirty-four boys and sixteen girls out of an enrolment of about 300 pupils in the upper school. Besides the gymnastic classes, physical drill is taught. It is taken by about 300 pupils. In the preparatory department it takes the form of the usual infantile exercises taught by the head-mistress, who is a qualified teacher of such, and her assistants. All pupils of Junior I. and II. and Senior I., II., and III., who are physically fit, get physical drill in the gymnasium under the gymnastic instructor—the boys marching and formations, the girls calisthenics. In Sharp's Institution—the other secondary school in Perth—there is a very complete gymnasium. The janitor—an ex-soldier—is the instructor. All boys over twelve are taught military drill—*i.e.*, forming fours, formations, and marching. The drill in this school is as successfully and beneficially taught as in the schools under the management of the School Board. It is an endowed school. Swimming as a part of physical training is also taught to all children who wish instruction therein in the Corporation Swimming Baths, under an arrangement between the School Board and the Town Council. For this we pay the Town Council so much for 1000 tickets, and we make the granting of the tickets a premium for the attendance and good conduct of the scholars, both boys and girls. Systematic physical training thus appears to be available for the whole children in Perth who are physically fit, and the provision made by the Board is very generally taken advantage of. I have some programmes, if it is permissible, to show what we actually do in Perth. These are all for schools under the School Board (*showing*). Each elementary school holds an annual public exhibition of physical drill and calisthenics, and at these exhibitions every class in the school is represented, and the results of successful teaching are made apparent in the presence of the School Board and of crowded assemblies of parents and guardians, who seem to take a lively interest in seeing the children go through the various exercises. In the Perth Academy an annual competition of those attending the gymnasium is held, on the result of which prizes are awarded. There are also annual sports for past and present pupils, arranged by a committee of the pupils and teachers, under the patronage of the School Board and of leading noblemen and citizens of the county and city. I had the honour of reviving them in 1885; it had lapsed a long time, and they have gone on ever since, and that is the first programme of the reviving of the Academy sports (*showing*). The success of the instruction is seen in the improved discipline of the pupils and in the orderly manner in which they enter and leave their class-rooms, in an improved physique of the children, and in the interest it elicits among the parents, as seen at the annual exhibitions and sports before referred to. The interest which the boys themselves take in this form of instruction is evidenced by the large number of them who join the Boys' Brigade, and the considerable number of those who subsequently join the volunteers. Quite a number who passed as boys through my hands for physical training volunteered for the front on the outbreak of the South African War.

Suggestions:—

1. That military drill, as distinguished from ordinary gymnastic and calisthenic drill, be made compulsory for boys over twelve in the elementary schools, and should be taught by a soldier or ex-soldier qualified to do so, and should include such drill as is taught in Boys' Brigades, with a view to boys joining the Volunteers when they leave school.

2. That less gymnasium and more purely military drill be taught in the continuation school. That is actually a request from the managers of the school that we should do.

3. That encouragement be given to the senior boys in Perth Academy and other secondary schools to form cadet corps, the Government providing uniforms, arms,

and equipment; the officers to be commissioned by the School Board or Governors after ballot by the boys; the service to be three years, as in the volunteers; opportunities for rifle practice to be given; Morris tube, or the new tube that has just been introduced, for the first two, and range practice for third year; ammunition and Morris tubes to be provided by Government; such cadet corps to be placed under the authority of the officer commanding the district. They might, for drill purposes, be attached to the volunteer battalion, but should have their own military instructor. Rifles for the third year's shooting might be lent by the Military or Volunteer Authorities, and every cadet should be taught riding. As a certain section of the public are averse to anything military, care must be taken to show that military drill in school does not mean the manufacturing of soldiers, but the teaching of citizenship, the development of the physical powers, and the sharpening of the intellect. As regards the Government, they should make allowances for outlays incurred in pursuit of such exercises, and make grants for proficiency in them. They should also see that none but well-recommended N.C. officers are employed as drill instructors to obviate the complaint that such instructors mingle oaths and bad language with their instruction. That is one of the complaints that we have. And there is a further suggestion, if you would allow me to make it, and that is on behalf of our soldiers' and reservists' children. As you know, we have a number of them in Perth, and I would suggest, if possible, that there should be a military school in Scotland the same as in England and Ireland, and the orphans of soldiers should be allowed to go there after ten years of age.

8687. You mean a school somewhat equivalent to the Duke of York's or the Hibernian?—Something equivalent to the Duke of York's or the Hibernian.

8688. There is none in Scotland?—No; and it would be a great relief to a number of widows who have a number of boys thrown on their hands.

8689. *By Mr Alston.*—You say in the first main paragraph that teachers attending the gymnasium qualified for teaching their classes. 'Over twenty lady teachers attended a two-session course.' How long did they attend per day in that course?—They had two hours per week for twenty-six weeks. My course was six months. They spent two sessions of twenty-six weeks each, two hours each week. These were lady teachers for the Board Schools.

8690. And they got that certificate?—And they got that certificate, after examination by Colonel Campbell, who had each lady out to drill her squad, the same as she would drill her class at school.

8691. So that they were perfectly competent to take their classes in the schools?—Yes, sir.

8692. Had you the same thing for male teachers?—We had no male teachers, sir.

8693. Have you ever found the difficulty or heard the objection that the civilian school teacher is unable to give the proper military command, and therefore does not get the prompt obedience from the boys?—No, inasmuch as many of them are members of the Volunteers. We find a large number of the male teachers are Volunteers, and thereby get the necessary military attainment.

8694. Then in the third paragraph below, you say, speaking of the child, 'unless physically unfit.' Is there any medical supervision over these children?—Nothing further, sir, than that the headmaster sees that each child is physically fit. So far as he can see. If the child says he or she is not able, then the schoolmaster enquires. We have no medical officer in connection with the Board, to whom the child is sent, but if any objection is made by the parent to the child going through physical exercises, he would not be put through.

8695. You think the schoolmaster is capable of judging at a glance whether a boy or a girl is physically fit for training?—Well, we have so much confidence in the headmaster that he will not put the child to physical training.

8696. It is not a case of confidence in the master, it is a case of his medical knowledge?—Unless the complaint is made we have no medical examination.

8697. In these continuation classes, where forty-six young men received the instruction in evening school, you get or you hope to get that 2s. 6d. per pupil per hour per week, for your session of twenty weeks, and they could take another subject?—They are in connection with the continuation classes, and it is the only school, and the only course for which the Government has given us a grant. We have applied for a grant, because we have built a place specially for them, for the evening continuation school. We have built a workshop, laundry, cookery and gymnasium, and in this gymnasium the young men are trained, and we hope to get a grant of 2s. 6d. for each of them per hour per week.

8698. That is not military training or physical exercise?—Well, the instructor is a sergeant of the Volunteers, and also an officer of the Boys' Brigade, so he is thoroughly well up in military drill, and he gives the men marching drill and formations of fours, which is really the only thing they teach in the Boys' Brigade.

8699. You are pretty strong in the Boys' Brigade in Perth, there are fifteen companies, I see, in the battalion?—Well, we have a couple of lapsed companies, sir.

8700. Fifteen companies?—Fifteen companies there are, but we have two lapsed companies, sir, we may say. We have now thirteen companies that we can put on parade.

8701. Is that at the end of May this year?—On the 19th April, sir; we had our inspection on the 19th of April.

8702. You speak of display at the annual public exhibition of physical drill and calisthenics, and so on, I would like to ask is that drill a showy drill to interest the public, or is it thoroughly well grounded? We have noticed that a good deal of the drill that is shown in public displays to please the parents and the public is of a very showy character, and a skilled observer on the spot could point it out at once, and say, 'that is of no use physically for the children'?—No, sir, we have simply an exhibition of each class. Each class goes through a certain portion of this calisthenic drill. The infants go through under their head-mistress to music, we have had the boys go through it to music. In the Academy I have the honour of judging the competitions, and of course they do not get the prizes except I see they do it properly.

8703. You have found that it is not fancy or showy drill merely, but thoroughly-grounded drill?—Thoroughly grounded.

8704. Are any of the teachers allowed to introduce fancy movements?—No, sir, except in Indian clubs, in which I think there is a tendency more for ornamental than useful work. It is getting the fashion among Indian club players now to introduce a lot of fancy movements which are not in accordance with what General Hammersley used to teach us long, long ago.

8705. They serve no purpose?—It might strengthen the wrists, but it does not strengthen the other parts.

8706. You do not approve of them?—I do not approve of them. Of course I would prefer the club drill to be done after military fashion.

8707. Would you approve of the Aldershot system throughout?—Oh, yes; there is no system better than the Aldershot system, because it is all based on M'Laren, the Oxford man, whose book was the first introduced into the army in 1860. M'Laren was formerly the teacher of gymnastics at Oxford, and his book became the text-book for the Aldershot gymnasium when it was established.

8708. And if there was one uniform system to be adopted in Board Schools, would you approve of the Aldershot system?—I would, sir.

8709. And for girls, I suppose, something else?—I think would approve altogether of the Oxford system, because it is more of the nature of development than the ordinary so-called gymnastics, which have a tendency to make an abnormal development; and then, if a child does not follow them out, when he grows up the muscles

Teachers:

courses.

No medical
examination.

that he contracted in his youth disappear when he should have them as a man.

8710. Then, a little lower down, you speak of 'the interest which the boys themselves take in this form of instruction'—meaning the military form of instruction—is evidenced by the large number of them who join 'the Boys' Brigade.' Is it the case that the boys are passionately in love with drill?—I think more than one-fifth of our brigade are schoolboys.

8711. They must be between twelve and seventeen, and, of course, a large portion will still be schoolboys. Are they so keen about drill, there would be no difficulty?—There would be no difficulty.

8712. Would there be any difficulty in continuation classes after the school age?—That is where we lose them; we lose them after they have left the Boys' Brigade. If they attend classes they pay more attention to their classes for their trade purposes, unless they join the Volunteers. A great number of them do join the Volunteers.

8713. Would you approve of some inducement being given to them after school age to take drill?—I think so—something attractive to the boys between the school age and the age at which they may be admitted to the Volunteers.

8714. Do you say a great many of them join the Volunteers?—Yes, sir.

8715. From the Boys' Brigade?—From the Boys' Brigade, a great many.

8716. Do they go into the band?—No, into the ranks; the adjutant would rather have them.

8717. How does he get over the difficulty of the recruit drills they have to go through when they join?—They manage to do it. There are no less than four boys of the company I had the honour to belong to who have been at the front; they joined the Volunteers, and then volunteered to go to the front.

8718. Both officers and boys have gone to the front?—Yes.

8719. You knew that was a difficulty in the way of members of the Brigade Boys going to the Volunteers—the absurd burden the recruit drills demanded of them?—They get over a portion of that. When the adjutant finds a Boys' Brigade boy join the Volunteers, he sees he is perfectly drilled, and he gets a certain allowance for it.

8720. Is he allowed to do that?—I think so; I could not say for a fact, but the Boys' Brigade boys are always very acceptable to the adjutant of Volunteers.

8721. In your suggestions you are entirely military?—Yes.

8722. Our difficulty is just with this same military question. What is your opinion of the attitude of the public or the parents of the boys towards this military side of the matter?—Well, I have been held up to public opprobrium for making the lads soldiers. I hold very strongly that every boy, when he becomes a certain age, should be trained to the use of arms, and be able to fulfil his duties as a citizen, and I think the best way to do that is by the system that we are adopting at the present time, drafting them from the school into the Boys' Brigade; but every boy has naturally a liking for military drill, and following the music, and that especially where boys are for four years in the Boys' Brigade, where they get this training along with the physical training. Physical training is a secondary consideration in the Boys' Brigade, and they go into the Volunteers with a very good foundation.

8723. But you have met with that objection, have you not, on the part of the public and parents?—I have, sir, and especially in congregations that ought to be different.

8724. That ought to know better?—I mean we have two or three companies that are not in connection with a congregation. Our No. I. and No. III. in Perth are not connected with a congregation; they are in connection with what they call the Perth Working Boys' and Girls' Institute—they do not belong to any certain congregation, although their parents belong to various—and I find that we have a better

chance with those two companies than we have with some of them that belong to congregations. Some of the congregations object to a soldier having anything to do with the drilling, and others will not have anything unless there is a soldier drilling the boys.

8725. Is that a very strong feeling in Perth?—Well, it is so strong that we had to eliminate all the professional instructors.

8726. Then we look at the matter from the side of the public school. Could we get all the advantage of that military training to a large extent, and without using the words 'military training'?—I think so; if it were introduced at the schools, and made a compulsory subject, we could get all that. The parents would then have no option.

8727. But a little further down you say, 'As a certain section of the public are averse to anything military, care must be taken to show that military drill in schools does not mean the manufacture of soldiers'; and yet all your suggestions twenty lines above are entirely devoted to the manufacture of soldiers, even to the extent of improved rifle practice?—Well, we find the difficulty in the North with trade unionists.

8728. Indeed?—Trade unionists have peculiar notions, and one of these peculiar notions is that children are being manufactured into soldiers as against the interests of tradesmen, and one man in Dundee only a short time ago went so far as to say that in his youth he had been a volunteer, and that the instructor mingled with his instruction more oaths than instruction. That was a perfect libel upon the instructor. You see the feeling, and this was a petition that they sent to the Town Council.

8729. But that was taking rather a high tone on the part of the trade unionist if he objected on account of the moral character of the instructor?—Yes, of course it was; but he was probably voicing the opinion of a great many people, because there were others at the same meeting who gave expression to similar views.

8730. Then could you advise this Commission towards a large amount of improved physical training in the school during school age without harping too much on the military side of it?—Yes; I would suggest that the military training should be done by a soldier apart from the physical and calisthenic point of view. Let the instructor that the Board employs drill the children in calisthenics, such as bar-bells, dumb-bells, and marching and maypole dancing, and all those sort of things that develop physically; but let the instructor of the boys over twelve—or make it ten if you wish, because we find the boys of ten are very anxious to join the Boys' Brigade, and we cannot admit them, we cannot allow them—let these boys be taught by an army man. If he is not available in the town as a soldier, let him be an ex-soldier. One of the best schools in the town—one of our very best drilled schools—is done by the janitor, who is an old soldier, and our paid instructor does not come near that school at all—that is in the Craigie School. Sharp's is another of the secondary schools in which the janitor is an old soldier, and always gives the boys marching and formation of fours.

8731. Of course we have found that a perfectly trained male teacher is quite capable of giving all that sort of military drill in the school?—Quite so; the difficulty is to get them.

8732. A good many have been trained during recent years?—We find most of the men have been trained in Aberdeen under Colonel Cruden, who grants certificates, and I think it is a *sine qua non* of Aberdeen University or in the Normal School that the teacher must take a course of military drill or gymnastics.

8733. He is supposed to be competent, and we have had evidence that he is perfectly competent if he has gone away with a certificate from a proper school of instruction, in which case your old soldier does not require to be seen or heard?—Quite so.

8734. After school age, would you advocate, in continuation classes, compulsory military drill?—Well, you can hardly, because the boys are of that age that you can

Mr

dardly compel them ; you can invite them and make the drill attractive, and if there is a grant given for it, then, of course, they can do it ; but they must take two subjects in the continuation school, and if they take the subject that they are mostly in need of, such as writing or building construction or machine construction, or whatever scientific subject they want, let them take the military training as a second subject. A great many of the pupils attending the continuation classes simply go principally for one subject. The women now, for instance, go for millinery. Well, they go principally for millinery, but they must take two subjects ; well, they just put in anything else, and do not attend.

8735. Then as to the boys, what do the boys do ?—The boys are the same.

8736. What subject will they take ?—In the purely continuation school they commence just where they left off at the Fifth Standard, and if any of them want any technical education, their time is much taken up with that, and it is perhaps those who only want one subject that will go to the gymnasium. In the continuation school in Perth we have over 1000 entries, and you see there is only forty-six of them gone through the course there. Very likely these lads are only taking one subject that they wish to work up in, but in order to take advantage of the evening continuation school they must take two subjects, and they just take gymnastics as the other.

8737. That is, gymnastics distinguished from drill ?—Oh, different from drill ; and that is what I say, if we had less of the purely gymnastic element and more of the physical element, that is the building up, because really training a man to be an acrobat I do not think is a physical training.

8738. Boys want the gymnastics ?—Boys want the gymnastics.

Physical
training plus
drill.

8739. Whereas you want the physical training and the military drill as the other subject ?—Yes.

8740. Then how would you attain that ?—Suppose the boy says : 'No, I will go in for gymnastics and 'arithmetic.' I would make, perhaps, the time allotted to gymnastic exercises longer, and if they wished gymnastic exercises given them, we could give them the rest of the time military drill.

8741. Could the Boys' Brigade companies lift any of the grant under these conditions ?—I do not know.

8742. Not as they at present stand ?—Not as they at present stand.

Gymnastics
and physical
exercises
compared.

8743. *By Mr Shaw Stewart.*—You have had a great deal of experience in physical training. I want to get this from you. You have given us one reason why you prefer physical exercises to gymnastics, and that is that gymnastic work tends to develop certain muscles which are afterwards, perhaps, neglected, and physical training develops all the muscles, and so forth ; is there not another reason why physical exercises are better than gymnasium work, that physical exercises can be applied to the more weakly boys and girls ?—Oh, yes, sir.

8744. Gymnasium work attracts the best-developed and those least in need of physical training ; is not that it ?—Yes ; well, of course, in the gymnasium, that is more for physical training than pure gymnastics. I am speaking of boys who without control would so work upon a machine that they would abnormally develop themselves. Well, those boys when they leave school might go to an occupation that they would not have the chance of continuing that, and the muscle that they have abnormally developed would disappear altogether, to the detriment of those that should have been properly developed, whereas, if they had taken a milder course, the body would have been built up in the average rational manner, and it would always remain so.

8745. Would you say that physical exercises are of more value than gymnastics, that is to say, physical exercises without fixed apparatus are of more value to improve weakly boys and girls ?—Yes. What I mean by that is this, sir, that marching with a dumb-bell ; most of the exercises in an ordinary school are done what we call in the army at the halt, while in the army practice the man marches and works the bell as well, or works what-

ever instrument he is working with ; either with the club or with the bell, or with the dumb-bell, marches with it. By that means he builds up his body ; he is brought to an erect position, whereas if he was only at the halt he would be always at the lounge at some of the exercises, and not exercising the whole of the body at the one time. That is distinct from pure exercise on the horse or the parallels or the like of that. That is more for building up muscle, it is not for making the children grow up and bringing them up in a gradual physical state. But the exercises on the fixed apparatus as we call them are more for getting up muscle, as they say in the common expression.

8746. Therefore exercises with free movements are more generally valuable than exercises with apparatus ?—That is what I think, sir.

8747. I see that in the gymnasium that you speak of in connection with the largest elementary school, only thirty-four boys and sixteen girls, out of an enrolment of 300 pupils, attended the classes ?—That was in the Academy, sir.

8748. That was in the Perth Academy ?—Yes, sir. That may arise from the fact that they have to pay a fee for gymnastic instruction, and, of course, it is only the parents who wish their children to get that exercise that pay the fees.

Swim
ing

8749. One other question about the swimming classes ; how many children attend the swimming classes ? You say here that all who wish instruction attend ?—Yes ; well, we issued 15,000 tickets last year to the teachers, and there were 3000 returned, so we issued actually 12,000 tickets last year, and the system adopted is every child who wishes can get a ticket, but he must earn it by attendance at school or by attention to his lessons.

8750. It is looked upon as a kind of privilege ?—Yes, sir ; the boys and girls alike get the instruction, and, as I say, the same instructor who has the physical training gets £100 a year for physical training, and gets £25 for the session for swimming, and the superintendent of the Corporation Baths gets a little—£5 as a present for looking after the towels and that. And then we have, at the conclusion of the session, all the schools represented in competitions, for which the members of the School Board give prizes.

8751. And there is no difficulty in inducing the children to attend ?—Oh, not the least ; the difficulty is in making the selection.

8752. But it would be a good thing not to make a selection if you could ; it would be a good thing that every lad should attend, would it not, the swimming classes ?—What I mean by making a selection is that every child wishes tickets, but then some child might come to the school just for nothing else and stay away oftener than desirable, but the masters make it a condition, a reward for good work, that they get the ticket. There is no child precluded, but he must earn his ticket.

8753. *By Mr Fergusson.*—As a member of the School Board, did I understand you to say that you did not think the medical inspection of the children was necessary ?—Oh, no, I did not say it was not necessary, sir ; I said it was not carried out. If the headmaster thought any child was unfit for physical training, or if the parent objected to it on account of its illness, then, of course, he would not have it.

Medic
inspe
n.

8754. But it was suggested that you might go a step further and have a medical inspection of every child in a school once a year, so that the doctor might see there were no defects which the schoolmaster had not noticed ?—I think that would be a very good thing, sir.

8755. You think that would be a good thing ?—We have actually one of the medical officers of the city to whom we send any case.

8756. We were told by a previous witness that forty-five per cent. of the children at that particular school suffered from flat feet and twenty-nine per cent. from defects of eyesight ; now you know these are things that an ordinary teacher does not, as a rule, notice ?—No, sir.

8757. Except in the infant standard you have a special instructor for your physical training?—Yes, sir, for six of the schools.

8758. Do you do that because your school teachers are not competent to take the classes in physical training?—Oh, no, sir. When we appointed that instructor twenty-one of our lady teachers had earned those certificates that I have just handed to his lordship. A number of the male teachers who come to us; we give a man a preference if he has the certificate, but then the teaching of physical training in the elementary school is not on the curriculum. It is not a compulsory subject, and you take the teacher away from his class, from doing something else, if he has to give his class perhaps half an hour's training every day, whereas by having this paid instructor who goes round every school, the teacher is free for school work.

8759. Quite so; but it is done in school hours?—Yes.

8760. Well, the schoolmaster must be doing something?—Yes, but he has every period occupied. The curriculum of the Code is getting so heavy now that the teachers do not know what to do, there are so many subjects introduced.

8761. No; under the new Code, as it is now, there is great latitude?—They are making the Code harder every year, sir.

8762. Have you not found in your experience that children are under better control with their own teachers than they are with strangers?—Well, we have not found that, sir; we find that this man we have had has had the children under perfect control.

8763. You are quite satisfied with the system as you have carried it out in Perth?—As we carry it out.

8764. I notice you say there are crowded rooms of parents come to see these exhibitions, at the same time you have told us that there is a very widespread antipathy to making soldiers of your boys?—Well, that is really the fact; at all the exhibitions, every school we exhibited this year, we have had to take the City Hall for no less than three of the schools. We used to give exhibitions in each school, but we found the crowd of the mothers and friends coming to see the children was so great that we had to take the City Hall.

8765. But still you are aware of a large body of opinion which is distinctly against military training?—Well, I would not say a very large body; I say a body of extremists, men who will neither go for their families nor their country, and who find fault with everything that pertains to a soldier, who would like to see everything brought to his door, all made comfortable for him, but would not like to do anything for it. And we find that, especially in Dundee, in the Trades' Unions, the members of them have a very strong antipathy to soldiers, and I have found it in the Boys' Brigade, as I think I previously said that some congregations object to soldiers training the boys, though they were obliged to form a brigade; at first they were obliged, they had no help for it, they had to have that soldiering experience.

8766. Are you satisfied with the continuation classes as they are at present?—Yes, sir, but I would advocate very strongly that the gymnastic instruction of the continuation classes should be made more of a military character than it is. With the young men attending them you can hardly make it compulsory, but you might make it in a sense compulsory if the grant were only given for purely military exercises. Of course it says so in the Code, that grants will be given in the continuation schools for physical drill.

8767. But apart from that you are quite satisfied with the way the continuation classes are worked at present?—So far as we are concerned in Perth we are, sir.

8768. Do you know Chesterton's system of physical training, his book?—No, sir.

8769. *By Sir Thomas Coats.*—I gather from what you have said that you advocate the army teaching of military drill. You say here, I think, that boys over twelve in the elementary schools should be taught by a

soldier, and you would give him more military drill than you would of gymnastics or calisthenics; you would stop the physical drill at twelve?—Oh, no, sir.

8770. Then how could you obtain time for both?—Well, in this way, we might give them half an hour; they have only half an hour a week; I would give them half an hour a week physical drill, and half an hour a week military drill—alternate it.

8771. In that way you would get very little physical drill; would it not be absolutely worthless giving them half an hour every alternate week?—Yes, sir, but we could not get more time.

8772. As a member of the School Board, do you think it is impossible to get more time than half an hour a week?—Well, I do think so, on account of the number of subjects we have now. They have introduced this year a new subject, hand and eye drawing, brush work; it takes up a lot of time.

8773. In the continuation schools you would give less gymnastics and more purely military drill. These continuation schools, of course, are carried on in the evening; would it not be very difficult to give military drill, that is much marching or what you call military drill, in the evening?—But you know the tendency of the young men at the present day, he must go in for athletics of some sort, and if you try to force him into going with the marching, forming fours and that, some of them may belong to the Volunteers already, and may have enough of it, and they may be at the continuation school for one subject such as builders, building construction or mechanics, or something like that, and they go to the continuation class for that purpose alone, but they cannot take that at the continuation class without they take two subjects, so they fill in the other subject by going to the gymnasium and having gymnastics.

8774. My question rather referred to the difficulty of getting what you might call military drill at the evening classes, military drill as against physical drill. Would it not be much easier to give them physical drill; you could do it in much less space?—Well, if the physical drill could be adapted that you could combine the two. It is, to a certain extent, because the instructor if he carries on his class in a military spirit or in the military method—still, of course, every movement being done after a certain amount of marching and proper formation and that, it might be introduced that way.

8775. But from your experience in regard to the requisite training of the children, do you not think it would be more advisable to go in for a great deal of physical drill until the boy was able to join the volunteers. You see the great difficulty we have in the volunteers is to get any physical drill; we have no time for it. And the men come badly set-up for want of physical drill, and we are never able to supply that deficiency. The consequence is that when they are called upon to go to South Africa, or any place like that, a great many are thrown out for want of proper chest measurement or some other deficiency?—Well, if the boys, as I say, were getting the physical drill in the schools the same as we give the boys in the Boys' Brigade—the Boys' Brigade get the same physical exercise as the army, precisely the same, because our drill is all the same as the army, and we have Major Smith, who keeps us up in Scotland in the Boys' Brigade to the last published Regulation Book. Well, if these boys in the school over twelve were getting the physical exercises that are given in the Volunteers, and which is only given with the rifle, then when they come out and get the rifle in their hands they have the preliminaries all learned, and they have simply to use the rifle instead of using their hands. That is what I mean by giving them military drill and then formation of fours, the ordinary marching about the school. The instructor can put them into two ranks, and form fours just the same as he would forming one rank and making even numbers fall out and odd numbers fall out. Another way, use the form for physical drill with their arms doing the same as in the Boys' Brigade.

Mr
J. Masterson.
17 June '02.

When they joined the Boys' Brigade they would get the small rifles, and then they would grow up, and when they got into the volunteers the boys would be perfectly drilled.

8776. In the Boys' Brigade is the greater portion of the time not given to drill and physical training—given to military drill?—Yes, sir, it is.

8777. Much more than to physical exercise?—Yes.

8778. Then they are not getting a great deal of that setting-up that one would desire?—Well, of course, all our meetings of the Boys' Brigade are always opened and closed with prayer and hymn, and then they have always all the essays and Bible classes. No boy is admitted to a company unless he is a member of a Bible class and of Sunday school, and in that way we get a religious training; but it is a difficult thing to get the boys to go to a meeting for purely religious instruction with caps and belts and arms and that.

8779. I am quite aware of that; but apart from the religious instruction, the time devoted to drill and physical exercise; there is a much greater time given to drill, is there not, than to physical exercise?—Yes, sir, because they appreciate it more, they like it more.

Boys' Brigade:
development.

8780. But it does not develop them. My point is this; do you not think that it would be advisable both in school and in evening classes and in the higher class of school to develop them physically to the greatest advantage, so that when they joined the army or joined the volunteers they would be well set-up and have good physical development? Another point is this, do you find that the boys get tired of drill after a certain time and they are not so keen about joining the Volunteers?—I cannot say that, sir, because I have no experience of that; but I know that a boy, after he puts in four years in the Boys' Brigade, is a pattern boy—most of them are—and well set-up. It depends upon what he follows afterwards—what occupation he follows afterwards—how he develops. I need not tell you a boy of sixteen is not at all developed, and if you turn him out nice and straight and well-behaved, it much depends on the occupation he follows afterwards how that development will stand him. For instance, he might be in a sedentary occupation that will keep him bent over the desk all day, and he soon loses all the erectness that he had in his carriage before that.

8781. Do you think that more boys join the Volunteers from the Boys' Brigade than would have joined had there been no Boys' Brigade?—I do, sir.

8782. You think it is an inducement for them to go on and join the Volunteer corps?—I think so, because a number of our boys who joined the Boys' Brigade and became Volunteers afterwards became our officers in the Boys' Brigade, so it shows they keep up the connection throughout from the time they join the Boys' Brigade through the Volunteers, and then from the Volunteers they become our officers.

8783. *By the Chairman.*—In your suggestions paragraph, you mention the Government providing uniform, arms, and equipment; what do you mean by Government? Do you mean the War Office, or do you mean the Education Department?—Both combined. The Education Department could move the War Office. I am speaking here of cadet corps, the forming of cadet corps in the secondary schools, where the boys are of a better class and bigger boys; we can get them of a better age, because they attend school longer than they do in the Board Schools as a rule. If you give them 'rifles' I should have put in there instead of 'guns.' The rector of our Perth Academy is very anxious that a cadet corps should be formed. I tried some years ago to get a cadet corps, but the then rector was against it, but the present rector is very much in favour of it and wants it. You could not get that stamp of boy

Cadet corps.

to be satisfied with the dummy rifle, the same as we have in the Boys' Brigade. You must give them some interest in it, and if you were to give them a couple of hours with the new tube, that would provide the interest. We have formed rifle clubs in Perth now, and we only want twenty-five yards of space to carry on the same shooting and the same sight as we would at a regular range. If you gave them that, then when they got a couple of years' training you have them out to the range and let them shoot. You will have these young fellows, every one of them, join the Volunteers.

8784. And what happens to them afterwards?—I say you will have a number of these young fellows join the Volunteers.

8785. And what happens to them after that?—I do not know what they do after that; I could not say.

8786. Everybody cannot be a Volunteer; there would be nobody left to do the work of the place, would there. Are you not putting that a little too far forward?—No, I do not think so. I think if we had our Volunteer army a few hundred thousand stronger than it is, it would be all the better for the country. Then we could, departing a little now from the subject, form a better reserve of Volunteers, giving a man ten or twelve years' service in the Volunteers, put him into the reserve, and let the younger ones keep on in the volunteer force.

8787. I suppose I may take it you have no information about any school outside the borough?—No, my lord. As you are aware, we have Saturday classes which are organised and supported by the County Council. All the county teachers come in there on a Saturday, and in these Saturday classes military drill is one of the things that the grant is used for; but they are so anxious to learn everything else that they do not care for that, and Dr Thomson is very anxious that that should be insisted on, that they would be able to carry to their schools the proper training they can get in the Academy.

8788. Do I take it from you that the teachers from the county come into Perth on Saturdays, and do not avail themselves of the opportunities for learning physical drill?—No, they are more anxious to learn any other subject, my lord.

8789. Therefore the result of that would be that they would go away home not having any power of teaching their pupils military drill?—That is the very thing the rector wants to overcome.

8790. Would you correct that by compulsory physical exercise examinations?—Yes, my lord, when there is a grant given for it they ought to take it.

8791. Is there anything else that you would like to recommend to the Commission on their remit; anything that strikes you further?—I suggest that if these cadet corps were allowed to be formed, a number of them should be made to learn to ride.

8792. That all means money?—Oh, it does not mean very much. We are getting the yeomanry drilled in Perth now by a private gentleman paying for it. A great number of young fellows, over forty of them, who are only too anxious, and the riding is getting a very necessary portion of drill. Most young men now growing up, the moment they leave school, do not know where they are going to; in some places they must learn, *i.e.*, some situations where riding is necessary.

8793. But that expense would be otherwise than from school or educational authorities, would it not?—Well, it might be made up from school funds; in forming a cadet corps there might be a capitation grant; that could be done, that is if the War Office or the Volunteer authorities would grant it—I suppose it would come under the Volunteer Act rather than under the Military Act; there might be a capitation grant given to cover the expenses of that.

Adjourned.

EIGHTEENTH DAY.

Wednesday, 18th June 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.
 Sir THOMAS GLEN COATS, Bart.
 Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.
 Mr J. C. ALSTON.
 Mr J. B. FERGUSON.

Mr R. B. PEARSON, *Secretary.*

Mr JAMES CLARK, M.A., examined.

Mr J. Clark,
 M.A.
 18 June '02

8794. *By the Chairman.*—You are Mr James Clark, M.A. of Aberdeen, and B.A., Oxford, the Rector of Dumfries Academy?—Yes.

8795. And have been so for how long?—Since 1897.

8796. Is your experience limited to the Dumfries Academy, or where were you before?—In the matter of physical training it is limited to Dumfries

vanced gymnastic exercises with apparatus are optional. The course of training is slightly modified for girls. It includes free gymnastics, Indian club, and bar-bell exercises.

The following table will show the size of classes, average ages, hours of instruction, and the nature of the work done:—

Class.	Number of Pupils.		Average Age.	Hours of Instruction per Week.	Nature of Training
1st Preparatory	30		5-7	Half hour and four 10 minutes	Marching and arm exercises.
2nd "	21		8	Two half hours	Marching, forming fours, free-arm exercise.
3rd "	27		9	Three half hours	Same as 2nd.
4th "	23		10	Three half hours	Same as 2nd.
I. Upper School	Boys. 10	Girls. 9	11	Two half hours	Military drill as above. Dumb-bell exercise (without bells). Physical drill with wands. Leg exercises on the toes.
II. " "	13	12	12	Two half hours	Same as I., but with elementary gymnastics added (horse and rope).
III. " "	26	9	13	Two half hours	Squad drill, with gymnastics as in II.
IV. " "	33	38	14	One hour + half hour	Drill as in III. The whole Army physical training.
V. " "	39	29	15	Two half hours	Same as IV., but more advanced gymnastics.
VI. & VII. " "	15	No Class	16-17	Two half hours	Same as V.

Academy, but I was in Gordon's College, Aberdeen, before.

8797. Will you read over your notes, please?

Physical training is given at Dumfries Academy in the day school, the continuation classes, and Saturday classes for teachers under Article 91 (d) of the Code. The system followed is that of the Army Handbook of Physical Training.

Day School.—Dumfries Academy is one of the higher class schools of Scotland. In the present session there are in attendance 353 pupils (boys and girls,—101 of ages ranging from five to eleven, and 252 of ages ranging from eleven to seventeen. All the classes, from the lowest to the highest, receive regular instruction in military drill and physical exercises throughout the session. The lowest class is taught by the lady superintendent, the others by the drill instructor, who received his training in the gymnasium at Aldershot, and holds a first-class army certificate. Boys and girls over ten years of age are taught separately in a gymnasium fitted with a complete set of the best apparatus. It is the rule of the school that every pupil must attend the class drill, unless certified unfit for the lessons. The more ad-

An exhibition of the physical training of the school is given annually in the hall of the Academy, and a day is also set apart for athletic sports. The physical training is an important section of school work, which is now beginning to receive the position it ought to hold. Apart from the effect it has on the health of the pupils, it is a strong factor in promoting smartness, order and alertness in the school. Many of the pupils reach such a standard of efficiency in drill and gymnastics, that I should like to see them obtain a recognition of their attainments such as they receive for their mental work. The senior classes would, in my opinion, be made more attractive if the boys had the opportunity of rifle practice at stated times, either at a Morris tube range at school, or at the 'Volunteer' target, in charge of an officer. Where there are difficulties, as with us, in the way of forming a cadet corps, the development of the senior boy classes in the direction indicated would, I venture to think, in some measure at least, secure the benefits of a corps.

Gymnastics have been taught in the evenings for Continuation Classes. This session, however, military drill and the army physical training was given in a class conducted under the Continuation Code (Division IV.),

physical training at Dumfries Academy.

Mr J. Clark,
M.A.
18 June '02.

restricted to those who attended any other continuation class. Although the numbers who might have joined were thus limited, a class of 28 was formed, and 21 attended with very fair regularity. The class met one hour on each of two separate nights for a period of twenty-five weeks. It was composed of 15 clerks and 13 tradesmen of various ages. One was 15 years of age, four 16, four 17, two 18, four 19, nine 20, three 21, one 22. Five were volunteers. If this class were arranged so as to be in continuation of some physical exercises, and to include such Morris tube practice as I suggest for senior boys, it would, I believe, form an important element in the continuation training of lads who leave school at fourteen and fifteen.

Classes for the training of teachers in military drill and physical exercises under Article 91 (d) of the Code have been conducted for two sessions. In 1900-01, 34 male and 73 female teachers from the county of Dumfries and the stewartry of Kirkeudbright received instruction in separate classes for one hour each Saturday over a period of thirty weeks. In the current session 13 male and 30 female teachers were trained in separate classes for three-quarters of an hour each Saturday for the same period. The expenses of these classes are borne—three-quarters by the Education Department and one-quarter by the County Education Committees. The teachers are paid their travelling expenses by the County Committees on condition that they also attend a class either in drawing or nature study. A fee of 2s. 6d. is charged for the drill class, and 7s. 6d. for the others. The object of the classes was (1) to instruct teachers in the movements and exercises suitable for pupils in elementary schools; (2) to show them the standard of smartness and precision that should be aimed at both by instructor and pupil. This was carried out by putting the teachers through the drill in class, and by giving them frequent opportunity of individual handling of the classes. In my opinion, many of the teachers will be able from the instruction and practice they received to develop the physical training in their schools—the younger teachers to undertake the drill, the older to judge and direct effectively instruction given by the younger members of their staffs, or by external drill instructors. But this is a point that may be more thoroughly elucidated by Captain Armytage, K.R.R., who inspected the classes. If the teachers had better facilities for practice in their own schools, they would be able to give more effective training than is possible at present.

8798. *By Sir Thomas Coats.*—You seem to place a good deal of importance on shooting; why is it you do so?—Because I should like to see a cadet corps in connection with the school. I find it impossible to have such, and I thought an arrangement might be made by which the boys might have the opportunity of practising shooting.

8799. But as far as physical training is concerned, we are more immediately interested in physical training in continuation classes. What advantage as physical training is shooting?—Well, it is not so important as the other part of physical training, but it is a part of physical training in so far as shooting trains the hand and eye to a considerable extent.

8800. I have scarcely had time to look over this table, but in the time you devote to physical drill or drill, do you give the large portion of that time to marching and the turnings, forming fours, or is the greater part of the time given to actual physical drill, free exercises, in your school?—As far as possible, the instructor tries to give part of both in a lesson. He begins with marching, forming fours, and so on, ordinary squad drill, and gives free gymnastic exercises in the same lesson.

8801. You say he begins with marching?—He begins with that, and as far as possible alternates the military drill and the physical exercise.

8802. Do you know why he begins with the drill first?—I suppose it is to get them well set up before beginning the exercises that are intended to develop the muscles properly.

8803. Or to get them to act quickly, I suppose?—To produce alertness.

8804. On the word of command?—Yes.

8805. How long do you say physical training has been going on in your school?—Five years within my experience.

8806. But you have experience of five years?—There was not a gymnasium before I went to Dumfries, so drill was confined entirely to what could be done on the playground.

8807. Is a good deal of this work done in the gymnasium? Do you teach applied gymnastics, that is with parallel bars?—Yes; we have the full apparatus.

8808. Is there much time given to the work in the gymnasium, or is there more time devoted to free exercises?—The more advanced gymnastics are given only to the senior classes. Very elementary gymnastics are given in Class II, that is, to boys of the average age of twelve.

8809. Are the pupils very keen on this physical drill?—Yes, they are very keen on it.

8810. They like it?—Yes.

8811. And I suppose boys and girls have the same opportunities for drill?—Yes, with the exception of the oldest girls.

8812. With the exception of the oldest girls?—Yes.

8813. *By the Hon. Thomas Cochrane.*—What difficulties do you find in forming the cadet corps that you have mentioned?—In the first place, we have not sufficient numbers. I do not think it would be possible to bring the corps up to the strength of seventy-five, which, I believe, is the minimum strength of a cadet corps.

8814. Have you any difficulties about the uniform—the supply of the uniform?—That is the second difficulty, the expense of supplying uniform. I do not think the parents would be willing to contribute.

8815. If you really had an effective corps with uniform and belt and a cap, would that be sufficient to attract your boys?—I think the chief difficulty is in the way of numbers, because a large number of our pupils come from the country and go home by train at night, so they would not have an opportunity of joining the corps.

8816. Do you combine with any other schools to form a corps?—We are the only High School in the town.

8817. They would be rather a different class from the other boys?—Quite a different class.

8818. And you would like to have a Morris tube range, I gather; you think it would be more attractive?—I think it would.

8819. Could one be arranged in any way?—I think it would be quite an easy matter if arrangements could be made to provide arms and ammunition for the boys.

8820. If you could make an arrangement with the War Office?—Yes.

8821. Have you made any representation to them?—No; my idea is that it might be possible in a town of the size of Dumfries to form a rifle corps in plain clothes, and have the boys practise on Saturday, say, either at a Morris tube range at school or at the regular target.

8822. It would be a very excellent thing. In that way they could continue their physical training, and have the advantage of being taught how to handle a rifle between the ages of fifteen and seventeen; that is before the time they join the Volunteers.

8823. With regard to your classes for teachers, you have had no difficulty apparently in getting money?—No, none.

8824. You have understood how to interpret the Education Code?—Yes, quite; there has been no difficulty in that respect.

8825. Which allows you a certain proportion of the expense?—Yes.

8826. You have had no difficulty in getting the money you wanted?—No.

8827. There is no reason why others should not do the same?—Not so far as I see.

Mr J. Clark,

Uniform.

Morris tub
range.

Teachers'
classes:
money.

8828. *By Sir Henry Craik.*—Have you been a volunteer?—I was for two years.

8829. Then you had practice in shooting, I suppose?—Yes.

8830. And you believe that that would be a valuable part of education in the training of the eye and the hand and intelligence generally?—I think so, certainly.

8831. You carry on the instruction in your school through a drill instructor?—Yes.

8832. You do not use the ordinary teachers to do that?—No.

8833. But you contemplate that in the State-aided schools generally under the Code the instruction might be carried on by the teaching staff if they were properly prepared through courses such as you have?—Yes, I think the physical training could be carried on to a certain extent, but I should not say that it would be so effective.

8834. But for practical purposes, and in order to meet the difficulties, you think they could get sufficient skill to do the work themselves under proper supervision?—I see no reason why the younger teachers should not.

8835. But, at the same time, where you can do it as in your own case, in a school of better equipment like yours, you do it through a special drill instructor?—Entirely.

8836. Who taught the classes for teachers that you carried on?—The Academy drill instructor.

8837. The same man?—The same man.

8838. *By Mr Alston.*—In the table of your classes, under the note of the training, you use the words 'military drill.' I presume that refers to marching, forming fours, etc.?—Yes; we follow closely the squad drill of the infantry training.

8839. And you would apply the term 'military' to practice of that kind, marching and forming fours?—Yes, I used that term, because we have followed closely the drill of the Infantry Training Hand-book, which, of course, is military.

8840. You have a certain number of half hours allotted to the instruction per week; would it be possible to get in some physical training every day?—I should like to have it every day, but it is difficult to find time for it; there are so many subjects.

8841. Would it be possible in your present curriculum?—It might be possible with the junior classes, but not with the senior classes.

8842. And you would prefer that it should be possible?—I should prefer that it would be possible.

8843. Would it involve cutting off some other branch, then?—Yes.

8844. And laying stress upon physical drill as a necessity for boys and girls, would you be prepared to sacrifice some other branch of education?—I am afraid, with the high standard of examinations that we have now, it would scarcely be possible to sacrifice any other branch.

8845. But you say you would be glad to have some recognition for this branch?—Yes; my opinion is that it would raise the drill class in the eyes of the pupil if the class were inspected annually—say by a regular officer—and a certificate awarded to those of the pupils who have reached a certain standard of proficiency, a certificate which might be of some use afterwards if the pupil ever thought of joining the volunteers. What prevents a large number of our boys joining the Volunteers is that they have already gone through the recruit drill in school, and they find it irksome to put in forty drills a year as Volunteers. Now, my idea is, if some certificate of school attainments were given to boys which would exempt them from part, if not the whole, of the first year of recruit drill, that the Volunteers might benefit thereby.

8846. You mean to say that they would be perfectly able to go into the ranks of the Volunteer company by having the drill in the Academy that you give them?—Yes, quite.

8847. That is apart from the question of the cadet corps?—Yes.

8848. Which is, of course, a further stage of advance in military training?—Yes.

8849. Have you found the difficulty that the boys hesitate to go into the Volunteers on account of the recruit drill?—I have reason to believe so.

8850. Of course you have children here over the ordinary school age, a very large number; the average is fourteen and fifteen, yours is up to sixteen and seventeen—Yes.

8851. These higher ages would be the ages that should find a place in continuation classes?—Not exactly; our continuation classes are made up rather of older pupils.

8852. Older than these ages?—Yes. It is not the Academy-trained pupil who comes back to the continuation classes; it is the elementary school pupil who leaves at the age of fourteen; and although the continuation classes in Dumfries have not caught this pupil to the extent we should like—these pupils of the age of fourteen and fifteen—yet we hope to do so.

8853. How do you hope to catch them; by what attraction?—By the attraction of the subjects. The last year is the first year in which the Academy of Dumfries has had continuation classes under the Code, and the success that has attended these classes is very promising.

8854. What subject attracted them, then?—Well, we had drawing for engineers, and building construction for young builders and joiners, shorthand, type-writing, French and German, and Art classes.

8855. And did you give them military drill?—We had a military drill class there last year consisting of twenty-eight.

8856. A very fair number. And you see from the ages that I have given that the pupils were older than we wished to have them. I should like to have them coming in at the age of fourteen.

8857. Then I see from your evidence that you are perfectly satisfied that the teachers in the school are quite competent to instruct in what you call military drill?—Yes, except in the case of the older teachers who attended this year. There were some men of fifty or sixty. Of course one could not expect to—

8858. But both male and female teachers have shown their aptitude for instruction?—Yes, certainly.

8859. Have you met this difficulty which has come before us, inability of the civilian to give a proper word of command and get a proper response from the pupils?—That is the chief difficulty.

8860. You have found that?—I have found that.

8861. Is it found in both the male and female teachers?—In both; more particularly in female teachers.

8862. Then one other point; have you found any objection in Dumfries among the inhabitants to the use of military training?—When I went there five years ago I had considerable difficulty in getting the boys to take drill, and in getting parents to allow them.

8863. But the boys themselves would have jumped at it?—Both parents and boys were at first unwilling, but now there is a growing interest.

8864. Can you say why the boy in the first place was unwilling?—Because he had not been so much disciplined in drill previously.

8865. And why was the parent unwilling?—Because the parent thought it was too much play.

8866. Too much play?—Yes.

8867. Not a question of soldiering?—Not a question of soldiering. No. I know the military idea did not enter into their heads at all.

8868. Were they not able to see that it was a necessary part of training for their children?—Well, it required a couple of years to show some of them that; they see it now. I may say that there is a very great interest taken in the drill classes now.

8869. Then you have actually educated the Dumfries parents and boys?—The instructor has.

8870. *By Mr Fergusson.*—I see you say that you use the Army Handbook of Physical Training. Have you experience of any other system except the army system?—No.

Mr J. Clark.

18 June '02.

Continuation
Classes.

Military drill.

Teachers:
ordinary staff;
civilians
unable to give
word of
command.

Military
training:
former
objections.

Mr J. Clark,
M.A.
18 June '02.

Time.

8872. And you have no means of comparing that with any other system?—No, I have not.

8873. Are you quite satisfied with the Army Handbook as a system for young children?—Quite satisfied.

8874. I see from your time-table that for the first class you give seventy minutes a week; all the others seem to be one hour a week, in two half hours, except three half hours in one case?—Yes.

8875. Would you be afraid to extend that time for physical training?—No, I should prefer to extend it. It is the difficulty of getting it into the time-table, there are so many other subjects.

8876. But I mean by taking a little time off the other subjects and putting it on to physical training?—That would be possible.

8877. I will tell you why I ask. We have been given an instance of a school where the boys were given three hours a week of physical training, and we were told distinctly that not only this did not detract from the high standard of the book work, but increased it?—I should be rather afraid to make the experiment.

Cadet corps;
difficulties.

8878. As to the difficulties about the cadet corps, you say numbers are the first difficulty; you could not get seventy-five; could you get fifty?—I should say we could get between forty and fifty.

8879. Is there a rule which prevents fifty being constituted a cadet corps?—I understood that seventy or seventy-five was the minimum strength of a cadet corps attached to an academy.

8880. That is a War Office regulation?—Yes.

8881. Can you not have a cadet corps without intervention of the War Office?

8882. *By the Hon. Thomas Cochrane.*—You will not get the commissioned officers, and you will not get the rifles.—That is so; there would be the difficulty of supplying rifles.

Continuation
Classes.

8883. *By Mr Fergusson.*—As to the continuation classes, are you satisfied with the present system of continuation classes?—As far as regards physical training?

8884. Well, or generally?—Yes; I think there is a future for them.

8885. Do you think it handicaps the physical training that you have to take some other subject along with the physical training; physical training does not count by itself?—We should have had larger numbers in the drill class if it had not been for that restriction.

8886. Would you be averse to physical training being allowed to be taken by itself?—No.

Compulsion
advisable.

8887. Would you advocate any continuation classes being made compulsory for boys between fourteen and seventeen or eighteen either in physical training or in any other subject?—I think they will never be on a properly satisfactory footing until they are made compulsory for young boys between fourteen and fifteen. It is these that will not come to the class; they come after they have reached the age of seventeen or eighteen, when they begin to feel they require the instruction.

8888. But from fourteen to seventeen, do you see any practical objection to making them compulsory?—No, I see none.

Physical
training a
compulsory
subject.

8889. Would you like to see physical training made a prominent feature or made a compulsory subject for these lads?—I am afraid objections might be raised to making physical training compulsory. People might say that the military spirit was being fostered in the pupils. I think that should be avoided.

8890. But when I say physical training, I do not mean military subjects at all. I mean free exercises and gymnastics?—Well, if that were clearly understood, I do not think there would be any objection taken.

8891. Then as to boys and girls, do you have a special dress for the girls?—If we have a senior class.

We have had a senior class of girls with special dress, but there was no such class this year.

8891A. Is there any difficulty about that; the expense, for instance?—Yes. We had it only one year.

8892. Then as to the classes for teachers. I see you give one hour for thirty weeks; thirty hours is what you consider sufficient to make a teacher qualified to teach physical exercise?—I did not mean you to understand that.

8893. I think that is what you say, the one hour each Saturday for a period of thirty weeks?—Yes, but I do not think the Scotch Education Department recognise thirty hours' instruction as sufficient qualification for teaching.

8894. That appears to be all the instruction they can have?

8895. *Sir Henry Craik.*—They would need to go to two courses before they would get our certificate.

8896. *By Mr Fergusson.*—That is what I want to know?—I may say with regard to the present session's class of teachers, the School Board of Dumfries is now authorised by the Education Department to issue certificates of satisfactory progress and attendance, not certificates that they are qualified to teach.

8897. Then I see one of the conditions is that they have to take up another subject; they are not allowed to take up physical training by itself. 'The teachers are paid their travelling expenses by the County Committees on condition that they also attend a class 'either in drawing or nature study'?—That condition is laid down by the County Committee, not by the Department.

8898. Is that a hindrance to the teachers learning physical training?—No; I think it is to secure that the teachers will really do something for the travelling expenses that they get from the County Committee—that they will not simply come in and take one and a half hours of drawing.

8899. But is not learning physical training something?—

8900. *Sir Henry Craik.*—That is not a condition of the class; it is only a condition of their getting their railway fare for it.

8901. *Mr Fergusson.*—But that is a very serious condition; they are refused their expenses if they take up physical training only.

8902. *Sir Henry Craik.*—The railway expenses only.

8903. *Mr Fergusson.*—I do not know; we have already been told that that hindered some one, but I think it is quite a fair point to inquire into.

8904. *By the Chairman.*—I suppose some of these teachers come from considerable distances in the country before they strike the railway, do they not?—Yes, very long distances.

8905. Is your school the only school of the kind in the county?—The only High School.

8906. There is none in Annan, is there?—No. I think in the case of the older teachers it might be desirable to make some arrangement by which they might receive their drill elsewhere. It is a very great hardship for them to come. Some of them start at six or seven in the morning, and do not get home till six or seven o'clock at night every Saturday throughout the session.

8907. I do not know how you are to get over that; you cannot get any better plan; you all agree that it is very advantageous to get them all trained in a uniform way?—Yes, certainly.

8908. So that if a boy leaves one school and goes to another, he does not find a different system?—Yes.

The witness withdrew.

Mr A. ALEXANDER, examined.

Mr
A. Alexander
18 June '02.

8909. *By the Chairman.*—It is very good of you to come and help us. You are director of the Liverpool Gymnasium.—I was.

8910. You are honorary secretary of the National Physical Recreation Society?—I was.

8911. And author of *Modern Gymnastic Exercises, Healthful Exercises for Girls*, and so forth?—Yes. My present position is Principal of the Southport Physical Training College; that is my most important position.

8912. You propose to tell us something about Swedish gymnastics, German gymnastics, physical training in Switzerland, physical training in France, physical training in America, and some information about the advantages, first, of all military drill, and, secondly, on national physical training?—Yes, I should be very glad to try and do that.

8913. Then under the head of 'Swedish gymnastics,' you tell us that in Sweden it is under Government control?—That is so.

8914. Each town has its own gymnasium and teacher?—That is so.

8915. Periodical inspection is the rule. In Swedish drill no apparatus or music is used?—Yes.

8916. Pupils would rely on will-power for precision and benefit?—Yes.

8917. The system is prejudicial to mental study?—That is my view.

8918. The Swedes are inferior in strength and activity. What have you to tell us about their national, what is called 'Gymnastik Festen'?—Would you allow me to go over the previous points just a little, and if you would kindly just assist my memory, not being able to see, by giving me the various headings.

8919. Very well then, you want to speak first of all, 'It is under Government control'?—Yes.

8920. And each town has its own public gymnasium?—That is so.

8921. Periodical inspection?—That may be important. They have a Government inspector who goes round to each town periodically, not only in Sweden, but he covers also Norway—Norway, of course, belongs to Sweden—and he sees that the system which is carried out is in conformity with the Government rules; he also sees that the proper average attendance, not only of the school children but also of the civil population, has given its attendance at this particular gymnasium, and that the local official is responsible for the attendance; he then embodies this in the report, and just furnishes his own Government with it each year. I have seen those reports; I am not very proficient in the Swedish language, but it is pretty much what I say. They also have another branch. I do not know whether it would come under the examination of this Commission or not, but they do a great deal of what is called—it does not matter about the name—but what they mean is this, they take up cases of invalid children, suffering from deformities: they take great notice of these kind of cases in these various towns, and the local man gives a return of the number of cases treated in that way, such as spinal curvature, abnormal head, deficient chest developments, and so on. They take up these cases locally, and he gives a report to the chief inspector, who embodies it in his report. That is a little different to what most countries do. I do not think any other country does that.

8922. Then you say there is no apparatus or music used?—No, there is no apparatus or music used at all in the Swedish drill system.

8923. And they rely on will-power for precision and benefit?—Yes.

8924. Then you say the system is prejudicial to mental study; will you explain that a little?—Well, they entirely rely upon will-power. For instance, they say, 'We want the right hand to go above the head,' so; or this way, that is the way they generally use the hand to go above the head. The will, of course, tells the muscles to do that. Now, in the English system, or any other system that I have seen, they generally get some

other kind of cue to go up; they get a word of command, or a note of music, and why I consider the Swedish system is prejudicial to mental study is this: the students say, take the students of a large school in Sweden, at Stockholm, I have examined the children at the central school there. Now, the children would be kept in a state of nervous tension until the teacher would give the word of command. For instance, he would give the order, 'Head right,' which is this movement—turn the head to the right side (*illustrating*). Well, now he expects every child to go like lightning into that position, and if the child is a second, or half a second, behind, he gets 'called over the coals,' as it were, for it; so that the child is kept in a constant state of nervous tension to go from one position to another. They say, 'Heads right.' They all go like that. 'Front,' they go there. Then, 'Heads left'; they go left, and then he keeps them in this position for rather a longer time than we would consider good for the health, and that is only just an instance of what he does to all the muscles of the body. Their exercises are what we call localised. They commence at the foot, and they give all the exercises, just as I have shown for the head, for the feet. Then after they have finished with the feet they go to the legs.

8924A. Have you seen the Swedish drill at all; Nervous much of it?—I will just stand here to give an instance of what I mean. They go through the movements for the feet first of all, and then they do the leg movements, out here, and they keep it out a certain time until they count four; and then they do the waist movement in a similar way—turn to the right—and they keep in this position for some time, just about that period, and then through, and the great point is that the children are all on the *qui vive* to listen for the word of command of the teacher, and, if they are the slightest bit behind the others, as I say, they get reprimanded. Now they do waist movements; then go to the chest movements, and after they do the chest movements they go to the shoulders. The chest movements are very like ours. Then to the shoulder movements. This is a specimen of the shoulders (*illustrating*). They wait in that position for a long time. Set up shoulders; go back very quickly again, and then they ask you to reverse very quickly again, and they keep them in this. I hold that this constant nervous tension of the children being on the alert to catch the word of command of the teacher is prejudicial to their brain rest, at any rate I think they are always kept too much in this state. Very often their precision is wonderful; but I think it is gained at the expense of nervous tension. Then they go on to the head movements.

8925. You also go on to say that the Swedes are inferior in strength and activity?—Yes, that is so, because we have tested that on one occasion by bringing over to their 'Gymnastik Festen'—which we might compare to the Military Tournament here, only on a larger scale. They had it in the barracks and grounds of the Life Guards at Stockholm, where they also have a large number of fields. Then, for the purpose of economy, they only hold this every five years, and they do it primarily, in order to give a certain amount of emulation to all their various towns and villages over their two countries, Norway and Sweden; and they are conveyed carriage free up to this place. That is a certain section of the people—all competitors are conveyed, and they have their expenses paid free up to Stockholm. That is done, as I say, for the purpose of emulation, and so that they may return back to their homes having some knowledge of novelty in physical exercise. They also issue invitations to all the other nationalities of Europe and America, to the various gymnastic societies, and so on; and each sends a contingent over to this 'Gymnastik Festen.' It is quite a Government affair. The Government are responsible for all the arrangements, and for the awarding of the prizes. The prizes are rather handsome, and they attract a large number of

Mr
A. Alexander.
18 June '02.

competitors of various sorts. The last time I was there, there were about 2000 competitors, and many thousands of spectators. The King and Court were taking every interest in it, and all the military authorities.

8926. I think the Commission fully understand that. You say there are climatic and economic reasons for their system; I want you to explain that a little?—At this competition I could only bring about a dozen with me. On that occasion I was captain of the team, and the foreigners had only about a dozen events open to them. The rest were all closed—to the Norwegians, Swedes, Finns, and Russians; but in all the other competitions that were open to the foreigners, of which we were an example, we won the first prize in every case.

8927. *By the Hon Thomas Cochrane.*—Who were 'we'?—The English competitors.

8928. In Sweden?—Yes.
8929. *By the Chairman.*—When was this, please?—1895 or 1894; some time about then. I know they were not nearer than sixth. The ones that came after the English were the Norwegians or the Swiss people. There were one or two Americans in this, but we won every first prize—the English—and I think we substantiated our claim.

8930. What sort of competition was it?—Well, they have different names for them there to what we would term them here. Say the 100 yards flat race, they call it a short run; there were about 200 competitors in that.

8931. What else besides the 100 yards flat race?—The high jump, hurdles, putting the shot, etc.

8932. And the high jump, yes?—And in that particular item there were about 100 competitors, and each of the foreigners brought a spring-board under his arm and placed it under the high jump. They asked us where our spring-boards were, or our 'board spring,' as they termed it. We told them we never jumped with a spring-board in our country. We were rather disappointed. I had brought two very clever jumpers over with us; but we waited to see what they could do in jumping with their spring-boards—they only did 5 feet 6 inches. We asked them to clear away the spring-board, and our first man did 5 feet 10½ inches; our second man 5 feet 9½ inches, so that I consider we substantiated our position in those points that I have named, and the Swedes were not nearer than fourth or fifth.

8933. As to the climatic reasons?—In Sweden it is a very cold winter. They have a winter of about ten months. I should say nine and a half or ten months, and it is a well-known adage amongst people who go in for physical training that the man who makes himself warm with exercise is doing a great deal for ensuring himself a long life, so every time they get cold you will see them in the fields going through some regular movements with their body. Now, if they had any elaborate system of physical training, they could not possibly do that.

8934. You will see them in the fields or woods—you will see them in the woods going through these quick, vigorous movements, and in the streets; in fact, they are exercising from morning till night in that way. That is the climatic reason, and the economy of it is this, it is a poor country, and the system costs nothing. Their large gymnasia are simply large rooms fitted up with no apparatus at all like we have in this country, but with a few specimens of apparatus suitable for those medical gymnastics that they introduce occasionally. These are the two reasons, I think.

8935. *By Mr Alston.*—Being under Government, we understand the system is uniform throughout the two countries?—Not in Norway. The Norwegians broke loose from the system some few years ago. It was not quite suitable for their character, and the Swedes themselves complain of the monotony of it. As young children they do not know what monotony is, but as they grow up they gradually get tired of the system, and no one is in favour of it except the Government, who have it for the two last reasons mentioned, especially that of economy, and for the teachers, who find it very lucrative going abroad and obtaining posts;

but the Norwegians, who are a very independent race of people, broke loose some years ago: they insisted on having a system very much like the Danish. The Danish system consists of variety.

8936. Is it monotonous because the system is regular?—That is so.

8937. Is this Swedish drill the same thing as we have in the London School Board Schools among the girls?—It is a little better here; it is not quite so monotonous in the London Board Schools as it is over there. We have a greater variety of movements here than they have, and whenever they have any *fête* at the Albert Hall, or anything of that kind, I think they are obliged to promise the girls that they will allow them to do something else more varied still. If you have ever been at any one of these entertainments, you will notice that the Swedish drill takes up a very small part of the programme.

8938. *By Sir Thomas Coats.*—We were told by one witness that the Swedish drill had more effect in loosening and suppleing the joints than in forming muscles. What is your experience of that?—Yes, that is my experience quite. If you have a resistive power in the hand, it requires in proportion a greater muscular effort, and muscular effort means muscular tissue, and too much muscular tissue prevents looseness of the joints, and so on.

8939. Would not that make them very active—more active than muscular, perhaps?—No, I do not think so, because you have to have a certain amount of antagonism or resistive force if you are training up for anything; you must have something to grapple with. To better explain what I mean. They seem unable to get what we call in this country 'steam up' quickly. Our men would get in this position (*illustrating*), eager to run; getting the position of the body right for starting a run. They would pose in elaborate positions, which were quite unsuited, and they seemed to be unable to get up the power.

8940. *By Mr Fergusson.*—Is it compulsory this system?—In Sweden it is.

8941. Up to what age?—Well, they carry it right through up to adult age; they commence as young children at about six years of age with simple movements.

8942. Yes, but what is the compulsory limit—twenty, eighteen, or what?—I think it is about twenty-five.

8943. Then you said it was specially directed to deformities—curing deformities; is the system successful for that purpose?—Yes, I think it is very successful in many cases of deformity.

8944. Then I did not quite understand you how the nervous tension was greater in this than in any other system, because wherever you have a word of command and smartness, must you not have brain work?—Well, not in music, for instance. You get started off with your exercise, and you entirely rely upon the music to carry you back and forwards. You go to march time, say, for military or the musical drill. Either the military or the musical drill system is better for that reason, because you do everything to march time.

8945. Then what you wanted to advocate was the musical system in place of want of music?—Yes, I would prefer the medium system. My reason for advocating it is this, it requires so many movements to develop a certain muscle on that limb, or a certain number of movements to develop a chest to any extent. Now if they do these movements without music, just by the nervous tension of the body, they could not do the necessary number required, it would be so fatiguing; but if they utilised the music they would be able to do these movements without fatigue. If I give a parallel case of a regiment of soldiers marching a considerable distance with and without a band, or a number of persons getting up to dance with and without music, the effort in the one case is extremely difficult, hard work in fact; in the other case it is an enjoyment.

8946. *By the Hon Thomas Cochrane.*—I should just like to ask what has been the general result upon the

Swedes inferior in strength.

Climatic reasons for system.

Economic reason.

Monotonous system.

Mr Alexander. population of Sweden of this compulsory system—in physique?—It makes them very straight in the figure, which is a very nice thing to see, and it makes them healthy. These are the two things in its favour, straight and healthy physique; but, on the other hand, it makes them effeminate and stiff.

8947. And why do you consider this system prejudicial to mental study; what experience on that point have you had?—If you take a school where they are very hard worked mentally—

8948. Could you give concrete cases, not theoretical ones; but can you give any practical results of your experience?—Well, I will give you a parallel case in England. I will take a case in England in one of the Board Schools, say in Liverpool. They are pretty hard-worked there, like they are in all Board Schools, and the teacher has the option when he sees a sense of fatigue, of resting the pupils, to make them stand up and go through a few movements. They go through a few movements of what is known as popular English movements. The school teacher will perhaps play a few bars of music, and they will carry them through to this music for about three minutes only. That is rest. That is done with a view to resting the brain from studies that they have been going through, by giving them an entirely different kind of exercise. That rests the brain, but if the Swedish teacher—

8949. I think I can get to the point quicker; it is not physical exercise but the special exercise that you think fatiguing?—Yes.

8950. I gathered from this that you thought any physical exercise was prejudicial to mental study; that is not what you intended to convey?—No; that is only because of nervous tension of the Swedish system, there is no change from the mental state to the nervous tension, that was my contention.

8951. *By the Chairman.*—In Germany gymnastics are under the Government supervision; they have remarkably spacious gymnasia, and there is variety of apparatus and exercises. Resistive and antagonistic qualities are claimed, also ambidexterity; objections; abnormal development, non-athletic, too much compulsion?—Yes, that is so. The first two or three are well known. It is pretty much the same as in Sweden; I need not recapitulate, but they have very fine gymnasia—enormous gymnasia. The one in Berlin, I think, for instance, is about 250 feet long. The gymnasium of which I had charge at Liverpool—which was supposed to be the largest gymnasium in the world until this Berlin gymnasium was fitted—is about 100 feet long or 110, so the Berlin gymnasium is more than double the size of the largest of the English. But they use these gymnasia very largely for military purposes as well. They only have one end of the gymnasium fitted up with apparatus, and the rest of it is used for military evolutions, which form a large and conspicuous portion of their training. But in the school the school authorities have a gymnasium indoors—and they also have it outside, with similar apparatus. They have contrived a very wise provision of always sending the children out of doors when the weather permits, and there they go through the same amount of apparatus work. The system is compulsory, and, of course, they are very anxious to carry on this to an adult age, and so they make the exercises as varied as ever they can; they also make the apparatus as varied as ever they can, and by that means they entirely do away with the monotony which exists in the Swedish system.

8952. About the qualities claimed, the resistive and antagonistic qualities; also ambidexterity?—Well, the German authorities consider that physical training ought to enable the civilian or the schoolboy to commence at the earliest possible age with what we call resistive force; something to grapple with. He considers that when the boy grows up he will have to grapple with some kind of difficulties, either as emigrant, or in the army, or in some profession or other, and so from an early age he makes him go in for what we call resistive work. That is, he never allows him to go through exercises without

something in his hands; sometimes it is a wand, sometimes it is a dumb-bell, sometimes it is a piece of steel. Their system is mixed up with complex apparatus, such as climbing ropes, ladders, and so on. The German is a firm believer in that, and they also believe in the principle of antagonistic force from an early age; they make them practise wrestling with each other, and tugs-of-war; not like the English tug-of-war with a rope, but a long pole; and they also push against each other—they call that antagonistic work—in order to develop the effort of antagonism between one individual and the other. They carry that principle out to an adult age. Then, the point of ambidexterity that they claim, is rather one that we ought to concede, I think. They make everybody in Germany use the left hand as much as the right in their physical training, and by that means the German artisan, even when he is a small boy and goes into these toy factories, is said to get through a good deal more work than ordinary individuals, say from England, would do, who can only use their right hand. Even in the iron works in this country, Germans get a shilling or two shillings a week more, and one firm in Liverpool, I know, will give two shillings a week more, on the principle that they get through more work than a right-handed man. And so they claim that this ambidexterity is a principle very advantageous to them, and all their physical training is made up with those three principles in view. Everything is alternate. I will just show you what I mean (*illustrating*). English people will put up their hands so (*illustrating*), but this is how the Germans do—right up, left up; left out, right out; right forwards—left forwards. In fact, they make the left hand do everything that the right hand does, and I think it is a very good plan.

8953. The objections are, you say, abnormal development; they are not athletic, and there is too much compulsion in their exercises, and the result is they are too muscular a race of people?—The Germans do it too much. They put children on to apparatus, in my opinion, at too early an age, because you cannot use apparatus to resistive force unless you get muscles in proportion, so I think they are very ill-advised in placing their children on apparatus at too early an age, and they give them too much of it. The result is that if you examine a squad of Germans, as I have done many a time, examine all the various muscles, say, of the body, the principal development occurs at the shoulders and at the shoulder blades. They have enormous shoulders and very large biceps, but their legs are very deficient in development. They do not go in for athletics like we do in this country, therefore they have thin, spare legs, and they have very large hips, and for that reason they do not make good athletes. In the athletic competitions we have had with them—although the English were only a medium team, we could make sure of victory over the Germans for that reason. They are too abnormally strong, too heavy in their muscles. Muscles weigh very heavy, and they are too much developed in the upper quarters.

8954. *By Mr Fergusson.*—Might I ask a comparison between the German and the Swedish; taking the whole system; which do you think is the best?—I should think the German. German system preferable to Swedish.

8955. *By Sir Henry Craik.*—What do you mean, Mr Alexander, by too much compulsion in adult age?—With reference to the German? Well, they have a register in each of their towns, and they expect the civilians to put in an attendance at the gymnasium, I think, once a week up to thirty years of age, and the Germans having been at it since they were seven or eight years of age, and in spite of the variety which they give, and other means which they employ to make it as cheerful and as nice as possible for them, still can have too much of a good thing, and having been at it all their lifetime, and having to bear in mind they have conscription as well, so—as they say in Germany—I cannot give the German of it, but it means this—after thirty you cannot find a thin German, because they all run into flesh. They drink lager beer and seldom take

Profession :
medical
training.

exercise at all after thirty; they have had so much of it all their lifetime.

8956. *By the Hon. Thomas Cochrane.*—What is your profession?—A physical trainer—I think I am the only instance in this country of a man having been trained as gymnastic teacher from the age of twelve, and to nothing else. For the purpose of my health I was obliged to follow it from the age of twelve, and I have been thoroughly trained in every branch.

8957. You mentioned having inspected Sandow; did you inspect him from a medical point of view?—I made a physical examination of him; I am consulted by the leading physicians in this country on anything connected with physical training.

8958. Have you got any certificates?—No, none whatever.

8959. You are not a qualified medical practitioner?—No; I was going in for it, but stopped half-way, because my present profession is too lucrative. I thought a bird in the hand was better than the other.

8960. You are not qualified to speak as to the condition of the heart?—Oh, yes.

8961. Or any of the organs?—I have got medical certificates for physiology and hygiene and muscular movement. I have got all those certificates, but I am not a qualified surgeon or a qualified doctor.

8962. From what college did you obtain those certificates?—I was trained by the leading surgeons. I went as a private pupil to the leading surgeons at Dublin. I am pupil of Dr Wayland, who was the head of the Children's Infirmary in Dublin. I was a pupil of Professor Larkin, of the University College, Liverpool, Professor of Anatomy.

8963. And you hold diplomas?—I have their certificates, their letters.

8964. Only letters. You do not hold diplomas and certificates that appertain to the medical profession. You are not qualified to practise in any of these subjects. It is just as well to get down what it is?—No, I have no medical certificates qualifying me to practise—only experience. I have been used as an expert by the Aldershot authorities.

8965. You have been used as an expert in the training; you have been competent. There is a difference between that and being a qualified medical practitioner?—I am qualified to train a class in physiology and anatomy.

Swiss system.

8966. *By the Chairman.*—Physical training in Switzerland is under municipal control. There is a variety of exercise; skill and activity aimed at?—That is so. In Switzerland it is rather under the municipal than under the Imperial control. Each municipal body provides its own large gymnasium, and appoints its own teacher or teachers, and devises its own rules. They aim at variety; they aim at skill and activity, and they get that by providing a certain amount of variety—a great amount of variety—in their drills, and a fair amount of variety in their apparatus. They like skill perhaps better than anything; and it is rather interesting to see the school children; or in the continuation classes later on standing round a piece of apparatus working out a gymnastic problem. They go in very much for displaying skill in these matters. It is interesting to those who know anything about it; and then they are very fond of agility, very fond of vaulting over the horse, or high jumping, and all that sort of thing; but they are not up to the English in activity.

Vocal
accompani-
ment.

8967. You say they have a partiality for vocal accompaniment with their exercises?—Yes. They appear to be a very cheerful and merry race of people, and when I went over there the municipal authorities of Berne were good enough to get all the school children together to go through their various evolutions, and I never saw anything with which I was so much pleased in my life. All these children went through the various dumb-bell and other movements we have in this country, but to every movement they sang a chorus of Tyrolese airs, and they seemed to thoroughly enjoy this; they seemed to give such zest and energy to

their movements which you never see elsewhere. They had this cheerful music provided for them to carry them through their exercises. They showed me, in fact, in a striking way the difference between the Swedes and their system. The Swedish pupils could not have got through one quarter of their work without feeling thoroughly exhausted; but the Swiss, by the introduction of this cheerful and enlivening music, chiefly vocal, were able to get through a vast amount of work, and, of course, provided a better development. As a race of people they are much superior to the Swedes, and of much better figure than the Germans. Out of those three I should prefer the development of the Swiss.

8968. Then you say that the advantages claimed are mental rest from school studies?—Yes, that is so. I asked the teachers of the Central School at Berne why they introduced vocal music, and they informed me 'that the children are very tired over their studies, and we get them out here and put them through this drill; they sing to it, and forget all about their studies, therefore they are having a complete rest from what they have been previously doing—that is brain work.' That is what they claim for it, and I think they are right.

8969. Gymnastics, you say, are continued in adult age?—Yes; they seem to have such a cheerful existence as young people, and especially in that part regarding the skill and other interesting parts of their work, that they keep it up in adult age, and the various municipal bodies have got one society in which they confederate together, and every year they have a very large *fête*, similar to the Swedish *Gymnastik Festen*. They hold it either at Lucerne or Geneva, and they have 50,000, 60,000, or 100,000 at a time going through these evolutions, and they march to their rendezvous with their banners flying; they seem to make a great fuss about it, and to be thoroughly happy and to enjoy themselves. I think their system is very interesting, and it is a very wise system that can lead the children up to such a life in adult age afterwards; they seem to be thoroughly cheerful, and thoroughly satisfied with their kind of life.

8970. *By Mr Fergusson.*—I do not quite understand what sort of physical training there is in the school for the children; is it free exercises, or what?—They generally have something in their hands; their principal apparatus is a wand—a slight wand—about five feet long and about half an inch in diameter. That is their principal piece of apparatus. They go through movements—physical motions—slight free movements—only with this wand in their hand; most interesting motions; one there, or another one there, or they may come up here and do this business (*illustrating*).

8971. Rather a bar-bell business?—Only much lighter than the bar-bell—much cheaper; of course these only cost about a farthing each.

8972. When is the mental rest doing these exercises?—The benefit consists in the exercise, and the mental rest, in my opinion, consists in the music, vocal and otherwise, which takes them away, makes them forget all about their lessons and brain work.

8973. I put to an expert witness this question; he had been telling us if the physical exercise was to be of any use, you must concentrate the whole of your brain upon the particular muscle you wished to exercise. I said: 'Surely for children you are going out of the frying pan into the fire; that is a mental strain; it is no relief from their book work?' He said: 'Unless you use your mind for any physical exercise, it is no use whatever.' What do you say to that?—Well, I am afraid I must differ from him. If it were Sandow who was talking and wanted to develop abnormal muscle at any particular part, he would be quite right, but in the case of children, I think it would be ridiculous. The lion and tiger are strong, but do not use mental concentration.

8974. *By the Chairman.*—Then we go on to France. You say physical training in France is under Govern-

ment supervision, but based on English methods?—Yes, the French are very fond of altering their system. My experience runs back for over forty years. In that time they have had four changes, but they generally keep to what is known as the military system. They are very fond of marching and formations, and all the various military systems; but some ten years ago the Government instructed a commissioner to visit this country—a certain M. Sahe; he was sent over with letters of introduction to Dr Warre, Dr Lyttelton, and Mr Herbert Gladstone. These gentlemen sent him to me. I conducted him through the various educational centres of this country, and showed him our various kinds of work, and what he was most pleased with was the athletics of England. He returned back to France, and by a decree of the educational authorities over there, they devised a certain course of dumb-bells and bar-bells and other light gymnastic work, and they call it the Anglo-French system of gymnastics. They also go in very largely for the athletics of the English now, and you may say, speaking generally, they are striving very hard to emulate the English in every way, both in their exercises and in their games.

8975. *By Mr Shaw Stewart.*—Will you kindly repeat the name of the French gentleman?—M. Sahe.

8976. And what year was it that he came over?—I think it was about 1895 or 1896—about then.

8977. *By Mr Fergusson.*—Is the system a satisfactory one in your opinion?—Yes; I have frequent letters from this gentleman. He is most enthusiastic about it, and he says they are going on splendidly there, and we can see by the newspapers. Sometimes they beat us in a boat race now, and a game of cricket, and so on.

ican
n: great
y.

8978. *By the Chairman.*—Then physical training in America. Each State controls its own training?—Yes. About the year 1894 there was a gentleman went over to the Continent from the Washington authorities, and he brought a letter of introduction, first of all to myself. They knew that I was conversant with the European systems, and I gave him all the information I could. He went over Europe, after which he called upon me. Then he returned to Washington, and made his report, but each State differs in their opinion about this report of his. I suppose that one State is largely composed of Germans or one nationality more than another, because some favour the German system, some favour the Swedish system, and others favour some other system; but, speaking generally, the majority of the States are what we call eclectic—I think they call themselves—that is to say, they will not have any system; they prefer entire freedom, and so they have plenty of variety, and I think they are very wise in their choice, at any rate, in having plenty of variety. They ask for perfect freedom in the matter, and they have it—each State.

asia.

8979. You say, 'The town gymnasias are luxuriously fitted up'—Yes, they are most ridiculously fitted up with all sorts of polished woods and velvet coverings, and the apparatus is most gorgeous. It is almost unnecessary that sort of thing. I know that school children in this country would not respect it very much if they were let in there. I fancy the reason for doing it is to attract the civilians into the place, and to be a little better than anybody else in their fittings.

8980. Every township possesses its own gymnasium and teacher?—Yes, and then the teachers have a record, and the public schools send their children there. These teachers teach the civilians in the evening time.

ds kept.

8981. And records are kept of development, that is, the measurements?—Yes, they are very fond of that.

olsory
p fourteen.

8982. *By Mr Fergusson.*—Is it compulsory?—It is compulsory in every State in America.

8983. Up to what age?—Up to school age—leaving school.

8984. Fourteen?—Fourteen.

8985. And after that?—No, it is not compulsory after that, but they generally form themselves into

a cadet corps after that, and have some connection, but it is not compulsory.

Mr
A. Alexander.
18 June '02.

8986. *By Mr Shaw Stewart.*—As you say, there is a predilection for records?—Oh, that is so. Yes, it is very ridiculous that, but if you go into an American school or gymnasium, a child will tell you that he can lift a dumb-bell ninety-nine times above his head, and another one will tell you that last week he did it 101; and so they are fond of doing that sort of thing, and the same principle is carried on in adult age. I know one man who said he could lift a dumb-bell one thousand times above his head, and so on. Well, of course that is all very injurious to the proper physique of the child, and the proper and sensible physique of the man, and I should hope that nothing of the sort would ever occur in this country amongst children.

8987. Is that love for records encouraged or discouraged by the instructors?—It seems to be rather encouraged. I think he rather likes his college or his gymnasium to be the best in the State, and so on. They talk very loudly about that sort of thing, and it is a great pity. That principle applies not only to physical strength, but to activity and everything. These records are one of the worst things we can have amongst school children, or competitions. I do not believe in this excess of competitions. The teacher devotes all his time to a special few, and neglects the majority, for the purpose of abnormally developing a few to gain prizes. I think it is a bad principle.

Competitions.

8988. *By the Chairman.*—Then you go on to contrast military drill and physical training. You take military drill, as you say. It is useful for organization, and not suitable for physical development?—That is my opinion.

Military drill
and physical
training:
contrast.

8989. Swedish drill is very insufficient, but abnormal development should be avoided?—Yes.

8990. What is the happy medium between those two that you wish?—Well, the military drill, of course, is most useful in many ways. Of course, for forming-up in line, and conducting the pupils from one room to another, and so on, certain of their movements are useful, but when we consider that that physical drill of the military is only used for recruits who have passed a medical examination, I do not think any of us can say that it is a useful one for children also.

8991. But do you mean to say that the trained soldiers do no physical training?—Yes, the trained soldiers do, but they give the same training to the children, and I think that is not wise.

8992. Oh, to the military children?—Yes, all those children where the position of instructor is filled by a military man. For instance, I visited, say, a Board School at Liverpool some time ago. There was a military instructor there. He told the children to touch their toes, with stiff knees and stiff arms. Well, that is a very good exercise; but then our military friend did not use proper discretion over it; he got them in that position (*indicating*), while he gave a long lecture to them on the advantages of that position. When the children rose up again their faces were purple, and there were large veins at each side of the neck, showing the extremeness of the movement. Many of these children are underfed, and unable to go into any such position for such a length of time as that. They do not use proper discrimination over their movements, and the exercises as taught in the army are not suitable for young, delicate children, and there are, of course, a very large number of young delicate children in Board Schools, and they ought to have special exercises set for them that would meet their particular case.

Military
exercises
unsuitable for
children.

8993. What are the special exercises that you would recommend, because that is rather what we want to get at?—Of course I could give any amount, but what I would suggest is that they would have something like the Swiss system, like the light wand exercise. I can show them if you would care to see them; it would take up a little time. What they want is light wand exercise, and what they want is music adapted to it, to make them cheerful, just like the Swiss children's system—

Suggestions.

very largely cheerful, light exercises, because they are growing, and they cannot stand too much strain upon their young weak bodies, because they are not properly fed—half of them. It is like trying to get steam out of a locomotive without any coal in the furnace.

8994. And you say national physical training should aim at health, activity, endurance, and recreation?—Yes. I think a man, an Englishman who has these qualities, is the best kind of physical Englishman, and I think we ought to do our best in our elementary school system to try and develop that kind of man. Exercises of activity and endurance in the way I would suggest, that would be activity, anything in the way of running or games, or high jump, or light musical drill. And, of course, of endurance; I would have at the end of every playground a series of light climbing poles, in order to teach these children to climb. Very often the climbing children are active, and if they can go up a pole once or twice or three times it would all add to their endurance—their powers of endurance. And another thing is, it straightens the spine in children to have these spinal muscles developed by climbing. They are the principal muscles developed in climbing, the spinal muscles as well as the shoulders and arms, and so it would mean that they would have a straight back for the rest of their lifetime, and that is a very useful thing.

8995. You think a test of physical efficiency should be exacted from school children?—Yes, every child that goes from one Standard to another ought to have some little kind of proof, in the way of a jump a certain height, or climbing the rope or pole a certain height, or running a certain distance, and I think that every child ought to be taught to swim, that ought to be compulsory.

8996. Then you go on to say you will give some suggestions as to the organisation of physical training in schools, with the view to economy and effectiveness?—Yes.

8997. When you are on that subject would you give us your opinion of dress, both of boys and of girls?—Well, I do not think I can do better than instance two well-known training scholastic establishments or systems in this country. The first is the Cheltenham College. I am familiar with the work there. There are over 1000 girls there of, say, the middle class. They are taught by a couple of trained teachers; ladies who are well educated and who have been thoroughly taught in all the physiological and hygienic conditions which appertain to exercise in the human body. They are refined ladies also, so that they can be safely entrusted with the care of their pupils, and they are also competent to take on any special case of deformity under medical supervision; they are also very good swimmers, and they are very clever at games. They are a couple of perfect ladies. They are daughters of a military man, and they were specially trained for that work; in fact I trained them myself. I think it very essential in dress that it should be loose, graceful, comfortable, and that it should not be immodest. I think they should retain the modesty of the English maiden all throughout their dress, because some of the ladies I have seen exercising have all sorts of ridiculous costume, very much like the ladies of the ballet. I think that ought to be avoided. The ladies in this college have a sort of tunic reaching down to the knees; underneath they have knickerbockers. The tunic reaches a little below the knees. They wear long dark stockings and light shoes. The dress is made of blue serge, and it has got a little elaboration. I am not up to the ladies' costumes, but it has some elaboration of ornament about it. Well now, Miss Beale, the head-mistress of the college, told me some years ago that she had tried every system of physical training; but she said she had to stop the Swedish system and the military system, because they were both monotonous; they did not seem to interest the students enough, and now they have got what they call this varied system, the qualified teachers having complete liberty to do as they please, so long as their exercises are beneficial.

Their medical man sees to that, and supervises the whole thing. As long as these exercises are beneficial and healthful that is all he cares for, and the present class of work and the present teachers are the most successful Miss Beale has had for many years. She has now had them for several years, and is very well satisfied. Going to the other extreme—the elementary school system—you cannot do better, in fact it is the most perfect form of physical exercise we have in this country in my opinion—that of the very successful School Board of Leeds. The Leeds School Board, I think, is the most successful School Board, at any rate, that we have in this country. It gets more grants, and so on, from the proficiency of its children than any other. Well, the system they adopt there. Mr Cockburn, the chairman, some years ago complained very much about their physical training being in a very unfortunate state, and he was kind enough to ask my advice in the matter, and we proceeded to start a system which, I think, almost solely belongs to Leeds. They have attached to their Central Higher Grade School a large gymnasium, and an instructor, who has entire charge of the physical work. He is a gentleman, a well-educated man, and thoroughly conversant with all the physiological conditions of his work, and he has strong sympathies—a very important point with the children, and with all his pupils. He is also enthusiastic, it is a difficult thing to get, perhaps, but they have such a man there. Once a week all the male head teachers and assistant teachers are brought in, and on another evening in the week the female teachers are brought in, and they are thoroughly ground up in all the elementary work, not advanced work, but all the elementary work, which they afterwards impart and teach to their own pupils. And a special feature that they have there is, that each class teacher is thus competent to teach his own class in physical work. A class, I think, is composed of about twenty-five children. They find that a very wise plan, because each teacher necessarily knows the individuality of each of their class; they know when a child is weak or strong, or any peculiarity attached to the child, and they may take that child out of the ordinary drill and get some special exercise for it, if it happens to be weakly. The children, on the other hand, are not afraid of their class teacher, but they are rather afraid of a special teacher who comes before them, they have an affection for their class teacher, as a rule, and they go through their work very cheerfully and satisfactorily. And so that system teaches every year about 50,000 children in Leeds, a most satisfactory state of things, in my opinion; and the same system is attached to the swimming department. This gentleman has certain times for teaching the head-masters. He does not teach the ladies swimming, but he teaches them the swimming drill. He teaches the men and the women the swimming drill on land, so that when they go into the water to swim they will not receive the instructions of their teacher while they are half-choked with water; they know what they have to do when they do get into the water, and go straight at it, instead of shivering and waiting for instructions. That is a wise precaution, because it saves time. And so they teach several thousands of children every year in these Board Schools which have small baths attached to them. Then this system also is a good one, because they take up any promising boys belonging to the classes and give him a little extra drill. These boys then act as leaders in their various schools. And the same with the girls; they pick any promising girls out of the school and give them a little special instruction, and they act as leaders under their teachers; and so you have a very large and important School Board, with a large number of schools and many thousands of children. I think it only costs them about £300 a year for that large system of teaching by this gentleman. I think he has one assistant; I am not quite sure, because the system is spreading. And another great advantage about that particular system is, that they teach a very cheerful kind of drill, a medium kind of drill, something like

what I have pointed out as belonging to the Swiss people, and the children are so fond of it that they continue this drill in the continuation schools. Now, this teacher told me that unless he made this drill varied and cheerful he could not form classes in the continuation schools; 'but now,' he said, 'I have tried to make this drill attractive, varied, and cheerful, and the result is that I have splendid classes in the continuation schools,' and he added, 'they are exceedingly popular at Leeds.' He also has cadets which he passes into the volunteer force. I do not think that young children should be trained as cadets, or have any one system which some persons at the present day try to teach them, like one 'model course,' one system of this or one system of the other. I do not advocate any one system; I think any one thing, however good, one diet, for instance, however beneficial, or one walk, however interesting, or one book, however interesting, must pall upon the imagination or upon the system sooner or later. I think one anything is a mistake. I think life ought to be as varied and as cheerful as possible while we are on this earth of ours and not to be confined to one particular anything, and I think that the child should not be placed in the cadet corps until he is at least fourteen years of age. They are too delicate; their development is not in a sufficiently forward state to handle even dummy guns before fourteen. I think up to fourteen years of age they should receive as much careful development as they can, and, after fourteen they might try the cadet corps, which I think ought to be attached to the continuation classes, and then after that they might be attached to the local volunteers, and, finally, to the army. That is my suggestion about the economy and effectiveness of it.

8998. *By Mr Shaw Stewart.*—Your statement is very interesting. On the last point, about the varied system as against one set system, I quite understand that you recommend the varied system for children, but what do you recommend for the training of teachers? Should there not be one approved system for their training?—I do not think so; I think it is so easy to teach teachers. I have trained teachers of Training Colleges now for years. If I kept them three months, say, at the Swedish system, I would find them listless, apathetic, and having little interest in their work at all. Then I would give them another system, and I found the more variety I gave them, the more they liked it. They say that they cannot make the class interesting to their children unless they have variety, and they think that one system must sooner or later pall. And it is a very small matter to teach half a dozen drills to any teacher; you could teach them in a few weeks. Under a competent instructor, as at Leeds, they would learn half a dozen drills in, say, half a dozen months, and they all get more than that. All these drills are guaranteed to be the correct thing,

the correct kind of medicine to give, as it were, and then they go with these half dozen drills to the children, and they can ensure that those children will love their work and be benefited by it. But, if they go with one drill, not only will they themselves be heartily sick of the one drill, but the children will be worse than ever, because Mr Cockburn, the Chairman of the Leeds School Board, told me he had tried one drill, Swedish—I am not speaking offensively against Swedish drill, but I maintain any one drill, however good, in my opinion, is a mistake; it ought to be a varied physical training.

8999. But I suppose you would be in favour of teachers being grounded in certain elementary movements, approved movements, which are calculated to be of use in developing, for instance, ambidexterity for children?—As a part of their training I would, but not as the whole; I would not let it rest there; I think they ought to have more knowledge than that if they have anything to do with children.

9000. *By Mr Fergusson.*—But still, Mr Alexander, surely you must have some book or something of that sort to go on; some course of training for general use in Board Schools, or you would get into all sorts of difficulties, would you not? I do not say you should be confined to one form of drill; you may have a dozen forms in your course, but you must have something laid down for general school purposes when you are dealing with elementary schools?—That last remark of yours, of course, simplifies it, if they are not confined to one particular kind of drill, then, I think, there is no objection to it.

9001. You want a great variety in the exercises?—I think they ought to have plenty of variety, and I think each teacher ought to be allowed to have sufficient interest in his or her work, so that they can call upon their own ingenuity.

9002. Then let me ask you about the music; you wish music. We have been told by several witnesses that they cannot teach these exercises with music. They are quite in favour of music when the pupils have learned the exercises, but they desire to teach them without music?—But it will only take two or three practices to teach without music. I quite expected it would be understood that we always, for the first two or three lessons, teach it without music, say the first two lessons, but after that, if the teacher is competent, it ought to be conducted to music.

9003. And you are in favour of the teachers teaching their own classes physical work?—Yes, class teachers; it is the most economical, the most effective, and the most sympathetic for the children. My interests are entirely with the children. I think the children ought to be looked after in this matter.

9004. I may tell you that is not a patent of Leeds; it is practised in other places?—Yes.

The witness withdrew.

The Rev. C. T. WICKHAM, examined.

9005. *By the Chairman.*—You are the Headmaster of the Twyford School, Winchester?—I am.

9006. That is a school for boys of what sort of age?—Nine to fourteen.

9007. A preparatory school?—A preparatory school.

9008. A preparatory school for public schools?—For public schools.

9009. And have you been long headmaster of that school?—For nearly fifteen years.

9010. And you are interested in the subject of physical training, I understand?—Yes, of course I am, necessarily by my work.

9011. You wrote an article in Mr Sadler's book of special reports?—Yes; I wrote rather under protest; he asked me to do it, and so I did it. I have not written there as an expert in any sense.

9012. You will not mind helping the Commission?—Not the least in the world.

9013. Because your class of boys is a type of boy we have hardly reached, and, although principally in Scotland, it is one of those types that affect us as a Commission, which we have to deal with?—Quite so.

9014. May I ask whether your boys come from all parts of the country?—Yes, certainly; from Scotland and Ireland as well as from England.

9015. And you have some Scotch boys, and are in the habit of having Scotch boys in your school?—Yes, generally.

9016. So that puts you quite in the position to give us assistance?—Yes.

9016A. In the first answer on the summary of your evidence, what do you mean by the word 'possibilities'?—All possibilities—I mean opportunities, rather; I accepted the word in the sense of opportunities, and those five headings which I have put down there,

Rev. C. T.
Wickham.

18 June '02.

Physical
training:
opportunities.

broadly represent the opportunities. Those all exist, and I think they exist in most good preparatory schools.

9017. Perhaps you will continue your notes on that understanding?—Quite so; I have done so, really.

9018. Would you read from them?—

- '(a) Regular games, organised, trained, supervised.
- '(b) Drill and gymnastics.
- '(c) Athletics and runs.
- '(d) Handicrafts.
- '(e) Voice training.'

9019. Those are all the branches of physical training that obtain in your school?—Yes; but voice training to a very small extent and not universally, only, as a rule, in the case of boys who are musical.

Drill and
gymnastics.

9020. By drill do I understand you to mean physical drill, with sufficient military drill in it to bring boys to a certain place and take them away again, or do you mean a little more than that?—More than that; it includes the free gymnastics, marching of various kinds, as practised in the military gymnasia. We have a military instructor.

9021. But you differentiate between drill and gymnastics, drill being the free exercises and gymnastics the applied?—Gymnastics with apparatus; yes, I think so.

Benefits.
Games.

9022. Then you go on to say—Benefits of such training:—(a) 'Games give general alertness, accuracy, combination, intelligence of movement, "timing" often fail to develop chest and arms.' Boys acting in combination necessarily must more quickly seize opportunities. At cricket or football they must be ready to start at a moment's notice; they must be able to use hand and eye quickly. By 'intelligence of movement' I rather implied being on the lookout how to help their side, not to be mere machines doing a certain definite exercise, but to some extent each boy depending upon his own originality of thought. 'Timing,' of course, applies to such games as cricket, boating, fives, rackets—the hand and eye working quickly together. But I have found that after giving so much time to games as we do, and I do not know how we can help doing so, the development of chest and arms, especially arms, is sometimes defective. It is seen rather in the inability of a boy to pull himself up to his chest in the gymnasium without a good deal of special work at that sort of exercise. Now, a boy may play cricket and football all his life and be unable to do that. (b) Drill, implying marching of various kinds, quick, slow, double and fancy exercises, high stepping and so on, free gymnastics, with or without dumb-bells. Those give precision of movement. They certainly develop the muscles of the chest, back and stomach; the last being very necessary, perhaps at that age more necessary than any. I do not mean internal economy, but simply to give strength and uprightness of deportment, whereas the applied gymnastics on the apparatus strengthens the arms, enabling a boy to pull himself up and to support himself by his arms if he falls, teaches him to climb, teaches him to look for foothold. Then, (c) Athletics would be of greater use if kept up. Athletics in such schools as ours are trained and practised for, for a few weeks only before a given day on which athletic sports are held, and in consequence one of little practical value.

Drill.

Athletics.

9023. Probably in the spring?—Well, in my case it is in the autumn, before football begins; but it is generally in the spring or early in the summer term. It all has to be begun *de novo* every year. Even for boys who have practised one year, they have done nothing of the sort in the interval, and they are not in training, and I do not think athletics like this very much good; they are really rather looked upon as a stop-gap between certain games, football and cricket, filling up a difficult time in the year in the employment of the boys, rather than as an exercise in physical training. Another point that should be noticed, I think, is, that a boy may be able to run very well without any training at all; I have one in my school at this moment, rather an overgrown, lanky boy, who is a remarkable runner at

200 yards; but he is a miserable weedy boy in every other way. I suppose it is something in the set of the hips. Then paper chases I do not believe in a bit for little boys. They are much too trying for the heart and wind, and unless they were begun in the most methodical way—very short distances to begin with—I have always found them much too exhausting, except for just the very robust ones. Runs come practically under the same head. (d) 'Handicrafts (for physical training reduced to carpentry)'; that is to say, there is very little opportunity for a boy in preparatory schools to have any other kind of handicraft which is any good as eye training; he may do a little fret-work, but it does not help him. Of course, it develops the sense of measurement, accuracy of measurement, and strength of fore-arm and wrist in using the heavier tools effectively, and I think that it also teaches resourcefulness. That is a minor point which is of importance in after life. Then I go on to voice training, of which I can hardly speak. I am not sufficiently experienced in it to speak from anything of my own. They say that the training of the voice does develop the lungs, the chest and the throat, and it obviously must do so if properly applied; but it is not made use of in my own school, nor, I think, in the majority of such schools; that is to say, we have a certain amount of singing practice, and so on, but the boys are not taught to use their voices in a scientific way, and I think they very often do themselves more harm than good. If they were used, and they are in some schools, and that is why I have included them, they certainly would be a factor in physical development. Then you ask me how far these opportunities are taken advantage of? Well, they are very much more taken advantage of by some boys, boys who are naturally keen, than by others; some boys, of course, have a bent for games; others possibly like the gymnasium better, and will benefit more by the methodical instruction in a gymnasium. I have said under reasons for success or failure:—

- (a) 'Games are successful on the whole, except in the case of the quite unathletic. These often hate them, and are quite uncoachable. They can then only be attacked by drill and gymnastics; but cannot do without the moral effect of games.'

There are certain boys, perhaps one per cent., perhaps a little more, one or two per cent., who seem to take no interest in games whatever, and, of course, they lose all the advantages whether physical or otherwise. But I do not consider they can do without them.

9024. On account of the moral effect?—Yes; they must learn to work with others, but they get no good out of games that I can see at all. You may make them run, you may make them play football, you may make them do this, that, and the other, but they do not like it, and they do not develop under it.

9025. Then (b)?—Drill and gymnastics often fail of their object: (1) From the natural dislike for precision felt by most small boys; (2) because generally taken out of play hours; (3) from indifference arising from absence of stimulus and apparent absence of result. Such boys as I have been speaking of can be developed by drill and gymnastics, and under compulsory exercises they come on all right, but drill and gymnastics often fail. Little boys do not like precision of movement; they naturally rebel against it, just as they do against a lesson in grammar. It is just the same sort of objection, I think, so they do not work hard at it unless they have got a sergeant whom they like. If they have got a popular sergeant, or a sergeant who takes them the right way, he will get a great deal more out of them; but the ordinary martinet sergeant, the ordinary recruit sergeant does not get much out of them. He must know boys. This is a great difficulty, that gymnastics must necessarily at present be taken out of play hours, at least it seems to me necessary. The pressure on us of intellectual work demands so large a part of our day that you must take this physical exercise, physical training out of play hours. As I have said lower down, it does not tell either in examinations or in school contests. It is not what you might call a paying subject, and we could not, I do not think, sacrifice the

failu
game

Drill
gymn

In pla
reason

mental work, the intellectual work to it as things are at present. I admit that is a weakness, but I think it is a fact. Lastly, from indifference, arising from absence of stimulus and apparent absence of result. The absence of stimulus is covered by what I have said of its not telling in examinations or in school contests. Absence of result: a small boy is very unconscious of where he gets his strength from, unless he sees it tested in competition with others, and they are very apt to think that a boy is naturally a gymnast or an athlete; that is to say, they do not go into cause and effect; the majority of them do not care for drill or gymnastics, and so they do not work as hard as they might to improve themselves.

The necessity of a uniform system.—‘In order to secure the physical training of all, the drill and gymnastics should be organised with definite standards and exercises, with terminal half-yearly or yearly inspection. *N.B.*—It is not desirable to harden the muscles of boys under fourteen by severe exercises; but they should be taught to use them in all ordinary emergencies, and to gain for them the necessary firmness for this purpose. Under present conditions it is difficult to take the time from that given to mental work, and to take it from games would inevitably make it unpopular. It must therefore be given in very small doses daily. If it is to be universal and compulsory, it must be State-inspected, and I think State-aided. Can the State interfere in one department and not in all, *e.g.*, work, sanitary conditions, etc.? This is a dilemma.’ That is simply a pious opinion on the whole subject. I do not myself see how we are going to get any real practical result out of physical training in our schools unless some very strong pressure is brought on us from outside to methodise and arrange our work in that direction.

9026. At present I suppose it rests entirely with you?—Entirely. I might neglect it entirely if I liked. I do not suppose anybody would say anything to me about it. It must be taken in very small quantities, partly because we cannot give much time to it from the school work, and if we take it out of games we should make it unpopular and defeat our own object; not that one attaches, educationally speaking, great importance to whether the boys would like it or not, because I think they would get to like it; but at first it would be very unpopular, and that would defeat its own object. But I do not see how it is to be universal and compulsory unless it is a State matter. The State has always left us alone; at present in every way we have the advantage and many of the disadvantages of a purely private venture system. We ought first probably to be brought into line with the public schools on the subject, just as we ought in other ways. We are the preparatory departments, and it is largely a matter of secondary education; really it comes under a very much larger heading than I feel myself competent to deal with, but I think it must be organised if it is to be of any real good.

Improvement and development of present system.—‘If to remain voluntary, might not inspection be offered to a circle of schools in each district? The boys to wear some simple badge or equipment. Inspection to be followed by a written report, criticising freely, and commending where possible, the squads of individual schools. This would, I think, foster a school spirit, which at present is absent, since drill tells neither in examinations nor in inter-school contests.’ By inspection I mean a Government inspection might be offered to a circle of schools in each district. You might take the schools in my own county, Hampshire, or in a smaller district, schools within so many miles’ radius of a town, and I should like a district to be larger rather than smaller if it were done, so that competition might be greater; I was thinking when I wrote this down of the organization of the Church Lads’ Brigade, which I believe does work on a small red book of its own, and has just what I am thinking might be applied to such schools as ours. I think that possibly the public inspection, the public criticism and commendation where possible would

foster a school spirit in the matter of drill as apart from games, and perhaps supply the necessary stimulus to training of that character, the training which is at present absent.

9027. But you intend that competition to be with similar schools, or with all schools in the district?—I think it must be all schools.

9028. Of the same degree?—I was going to say of the same age, or within certain ages; that is all.

9029. Only a School Board School and a National School are very much on the same footing?—In respect of ages, and the Grammar Schools and Tradesmen’s Schools also; I do not see why we should not be in competition with them at all; in fact, it would do us good, it would stir us up.

The relation between mental study and physical training.—‘Physical training is not relaxation. The best mental work cannot be done if the body is tired. Great care therefore is needed in the adjustment of requirements to the powers of the boys.’ Here there are difficulties again, you see. Physical training is not relaxation. The attention required for any long period of drill certainly takes it out of the relaxation category.

9030. But turn it round and say a short period of drill; how would that have an effect?—I think it would do so if we could do twenty minutes or half an hour daily.

9031. As I say, turn this thing round. You say the best mental work cannot be done when the body is tired, and so the best physical work cannot be done when the brain is tired. Would you allow that or would you not?—I expect so.

9032. You have already said that you do not think that physical training is relaxation?—It is not.

9033. Not in your opinion?—No; that is for the sake of argument.

9034. We want to get your opinion?—Undoubtedly, I do not put it the other way to myself, but I should think it probably would be on all fours. That is, if you tire a boy out, and overwork him, I do not think he would come to his drill keen. I do not think you would get the best out of him except by a new pressure.

9035. The relative values of different kinds of physical exercises.—‘This can only be estimated very roughly. I should put them somewhat as follows:—Games, 50 per cent.; drill, 20 per cent.; gymnastics, 20 per cent.; athletics, 50 per cent.; handicrafts and voice-training, 5 per cent.; running, except under some such control as suggested above, is worthless if not harmful. Walking, as a factor in development, is worthless as at present practised at school.’ Athletics bring so many things into play, and also they induce the suppleness which would perhaps counteract any tendency to the stiffening of the muscles which drill and gymnastics certainly give if taken in excess. What I say in regard to walking refers to walking two and two, or going for long walks in the country.

9036. How do you walk your boys?—When they go for a walk, which is only occasionally, they just go as they like.

9037. They straggle about all over the road?—Oh, yes.

9038. When they go to church?—No; I am afraid they straggle about all over the road; they do not go two and two. I remember one did oneself. I do not think it makes church more popular.

9039. *By Sir Henry Craik.*—Your school, of course, is entirely for the better class scholars?—Yes.

9040. The children of well-to-do parents?—Yes.

9041. They come from homes where their health has been carefully attended to all through, and where probably, hereditarily, they have had some attention to athletics?—That is certainly true up to a certain point, but I am inclined to think that too much attention has been paid to their health at home, and that many of them are softened and unfitted for school life by the time they come to us.

9042. Have you had any experience of the ordinary child in the State-aided school?—In connection with

Higher-class
and State-
aided scholars:
comparison.

our own National School and Church Lads' Brigade which we run, yes.

9043. How have they compared?—I think they are harder; I think they are better developed than ours.

9044. Is that so in your experience?—I think it is so, yes; I have been running a gymnasium class with the Church Lads' Brigade this last winter in our school gymnasium, boys of about — they would not average a year older than my oldest boys, but the difference physically was a great deal more than that.

9045. These are country boys?—Yes, merely country boys. In six months of gymnastics they came on as much as my fellows did in two or three years.

9046. That is very startling; that must have been a well-to-do country district, I suppose, where all the children were well fed?—Yes, I think it is; I do not think there is very much poverty; it is a typical country village in the south of England.

9047. And in alertness of action and quickness?—Yes, very good.

9048. They compare rather favourably with your own boys?—Yes, I think they do. I know that the sergeant who took them was not at the time taking ours, but he has done so since, and he has made that criticism that they come on very much faster than our fellows. Now, I think that was partly because it was a real treat to those boys to come and work in a properly-appointed gymnasium; they never had that chance before, and our fellows had had everything provided for them from their cradles, and looked upon it rather as a bore.

9049. And have you taught them together in games?—Well, I have not tried that this year, but they have not had the same training in games. They can hit harder, and all that sort of thing; but they generally get beaten at cricket by boys younger than themselves.

9050. At cricket?—At cricket, yes.

9051. And at football?—At football I think they are rather better, but then they are a little older, and weight helps.

9052. The general upshot of your experience then, is that you would apply generally the views that you speak of in regard to your own boys to the ordinary scholars in our State-aided schools?—Yes, I think so.

Encourage-
ment of games
plus com-
pulsory
amount of
exercise.

9053. A certain amount of encouragement to games, and where games failed, a certain compulsory amount of exercise ought to be insisted upon?—Yes, undoubtedly, in my opinion. I have had two boys in my employment this year, one of whom was a member of the Church Lads' Brigade—had been so for this past year—and the other not, and the difference between them in movement, in smartness, was noticeable to everybody, and I do not think there is any other reason why it should have been so; they were equally healthy boys.

Military drill:
very advan-
tageous.

9054. With regard to the effect that the military drill has upon the two classes of boys, of course these boys whom you have to deal with are accustomed to the ordinary culture of refined life, but you think that military drill has even for them been a great advantage?—I think so; yes.

9055. Then, in the case of boys in our State-aided schools who have not had these advantages, they would be still more desirable?—Yes, I think so, in every way physically.

9056. In manners?—In manners, undoubtedly; an enormous advantage.

9057. And a sense of responsibility and regard for one another?—Yes, and readiness to act under direction.

Games and
drill.

9058. *By Sir Thomas Coats.*—I notice you say in the fourth paragraph: 'Games are successful on the whole, except in the case of the quite unathletic. These often hate them, and are quite uncoachable. They can then only be attacked by drill and gymnastics; but cannot do without the moral effect of games.' Is it those who do not take part in games that are relegated to military drill? Are those who are unfitted for games the boys who get most of the military drill, or do those who take part in the games get the same quantity of drill?—In my own school, and I think

in most schools of the same character, there is no difference made at all. I am sometimes tempted to give the quite unathletic more drill, but I have never done it.

9059. My reason for asking is, that I know that at Eton drill does not take the high position in school that games do?—No.

9060. You cannot get your house colours if you are ever so good a shot or ever so good at drill?—Quite so.

9061. I wondered whether that had the effect in driving those who are less good at games into the volunteers or into the cadet corps?—It did do so, but I do not know whether it does so much now. Of course we do not have a volunteer corps of boys of the age of which I am thinking, boys up to fourteen years of age. There is no such thing. I believe it would be a very good thing if time could be found for it, but I do not know where the time is to come from.

9062. You do not get the best, the most athletic men in the volunteers, either at, say, Eton or at Oxford?—No, but might they not be made more athletic or, at anyrate, more self-reliant in emergencies, which is, I take it, what is wanted, by more compulsory drill and gymnastics? The probability is that the unathletic boy will not care for his drill either, and then he goes through his school life without getting the benefits of either the games or the drill.

9063. My point was rather that you did not get hold of the best boys, say at Oxford in the volunteers?—No, I do not think you do.

9064. Is there no means by which you could make Volunteer drilling more popular, so as to get the best boys?—I think a good deal is being done in the public schools now by means of field days and other inducements to the boys to join the volunteer corps. There is no doubt that the volunteer corps are far more popular, and have a much greater number of members now, than they had twenty years ago. I think there is no doubt about that in the English public schools.

9065. *By Sir Henry Craik.*—It is compulsory at Eton, the fifth form now?—Is it?

9066. *By Mr Alston.*—You use the word 'super- Games at supervised,' as applied to games; do you mean the supervi- sion of the games?—I mean that boys are generally playing with masters, and that generally means trained athletes themselves are playing with the boys, and showing them how to play properly.

9067. We have had witnesses who advocated strongly that there should be no supervision in the games; that they should be organized and started, but that it was the enjoyment of the boy having the games in his own hand, doing what he liked?—What aged boy would that be?

9068. The boys in the Board Schools.—Our experience is that the boys—unless they mislead us—prefer us to play; that games go very much better when we play with them.

9069. They do not feel under restraint?—No, I think not; I think they prefer it. I do not mean to say entirely and always, but I am sure the games would not go well if we never played.

9070. And you get better results from the games in consequence of that supervision?—Oh, yes; undoubtedly.

9071. *By the Hon. Thomas Cochrane.*—I only wanted Physical to know whether the physical drill is made attractive to not attrac- the boys?—Yes, I think so, as far as any combined because t exact movement can be attractive to the small boys. in play h They do not like working in time—to the word of command, at anyrate at first. Of course they all do these exercises to the word of command, and I think they are made as attractive as possible. The exercises themselves are very often amusing, and they are encouraged to practise them themselves. When they go to bed they very often do some of these exercises on the floor on their own account.

9072. I rather gathered that they did not appear to take interest, and I wondered why; they are generally rather popular.—The reasons I have given are under '4 (b).'

Rev. C.
Wickham.

18 June '02.

9073. 'Generally taken out of play hours'; it is rather hard on them?—Yes, I think it is, and so is the amount of work required of them. We are working at high pressure, very high pressure.

9074. You could not take off any of the school hours, and let them have their physical exercise?—I would like to; I do not see how it is to be done at present; it is one of the greatest difficulties which is felt by preparatory schoolmasters at this moment.

9075. Do you think if they knocked off for ten minutes, and had physical exercises, that would interfere with, or would it improve, their work?—I sometimes do it in a long school, between two hours, and I think it brightens them up.

9076. I see you say 'Physical training is not relaxation'?—It is a change.

9077. You approve of a change from one kind of work to another?—In the same way that you will not do the same kind of mental work two hours running. With small boys you would divide your day more or less into periods of three-quarters of an hour, and the change from the one to the other is a great relief.

9078. I wanted to get your opinion on that?—Inasmuch as it is change, it is relaxation; I would modify that to that extent. But still it is hard work—taking the day through, it is tiring. That is what I mean really by saying it is not relaxation.

9079. *By Mr Fergusson*.—How much time do you devote in the course of the day to physical training of any sort?—Including games, and all these things?

9080. No, apart from games; physical exercise of any sort, or drill?—We do not devote a period of every day, by any means; two hours a week would be the outside, and very frequently less.

9081. That comes out of the play hours?—That means one of the afternoons, at least.

9082. How many hours of lessons do the boys have?—About thirty-two to thirty-three hours a week.

9083. Say six hours a day?—Five and a half hours, on an average.

9084. You would not like to reduce that to five, and take half an hour for physical exercise every day?—I

should very much, if I were sure I would get the same results in public examinations.

9085. But are you quite sure you will not? We have had witnesses who have told us from practical experience that they found it paid to do it, just because the physical exercise was good for the health of the boys, and brightened them up and made them alert, and was a relief to their brain; for that very reason they got better work. You cannot say it is so; you have never tried?—I have, to this extent—that at one time we were doing an average of over six hours a day, and we are certainly doing much better work with five and a half hours' work than we did with six, but I thought I had cut it down as low as I could do.

9086. As to physical training not being relaxation, are you speaking of drill or what sort of physical training?—I was speaking of training to the word of command.

9087. Free exercises; things of that sort?—Free exercises, yes; they are a change, and it may be relief, but in taking the day through, you would find that if you did much of them the boys would be more tired at the end of the day.

9088. I don't suggest much?—I mean they would be more tired after a period of drill than they would be after an equal period of games; that is my experience.

9089. Your physical training—your drill part of it—is all done by a drill sergeant?—Yes.

9090. You do not think it would be advantageous to do that yourself?—Probably very advantageous to myself.

9091. You said the boys did not care for the drill sergeant; they like you to play their games with them; do you not think they would like it better, and you would have a better hold of them, if you and your masters took the physical training?—Well, I cannot really say. As a rule, we do not get masters who are sufficiently trained gymnasts to be able to set the exercises properly. I certainly could not do it myself, even if I could do the free gymnastics.

9092. A great many of these drill sergeants have not much hold over the boys?—There is always some master present.

The witness withdrew.

Sir WILLIAM ARROL, M.P., examined.

9093. *By the Chairman*.—You are much interested in physical training?—Well, I must confess I am.

9094. I mean you are interested in the subject of our reference?—I have taken an interest in it for the last thirty years, more or less, more from a practical point of view than educationally.

9095. Quite so; it has to come in when you catch children young; you have to do what you can with them educationally?—Yes.

9096. You have read the reference, have you not?—No, I do not think I have.

9097. Well, the first part of it is to enquire into the opportunities of physical training now available. Are you a member of a School Board?—No, I am not a member of any School Board.

9098. I rather want to get at what your actual knowledge is on what goes on at the present time. Are you acquainted with the amount of physical training that is being given in the Board Schools, say, in the North?—No, I am not personally acquainted; I have never taken any part in any School Board or any educational matters at all connected with the education of children. My experience in physical training is more in the practical way of strengthening children, and for young men or young people going to work.

9099. That comes after. If you will allow me to ask, you have no information to give us as to what exists at the present time in the schools?—No.

9100. But you have ideas in your head as to what ought to be done to children in Scotland, both under the age of fourteen and between the age of fourteen and eighteen?—Yes.

9101. And both boys and girls?—I cannot say anything for the girls.

9102. You cannot?—No; more for boys.

9103. Will you tell us, to start with, what you think ought to be done, in a sensible-like manner, to children of school age—that is to say, under fourteen—in the way of physical exercise?—I will tell my reason first why I take an interest in that. At the commencement of the ten years' system in the army, I happened to be foreman at a public work in Glasgow. At that time there were a great many of these men came and sought employment as labourers. My experience in that—from that time till now, the present day, thirty-five years ago—is that a man who has been trained as a soldier, and drilled to discipline and obedience, is a far superior man to a man who has never been in the army, and I look upon it that children trained up in the same way are far superior; but not only that, it is healthier, more intelligent, and more important physically when you come to get them to do anything. For instance, message boys, if they have been in a Boys' Brigade they are far smarter, and you will train them up much quicker after that than if they had never been in it at all; it is quite a different thing altogether.

9104. The Boys' Brigade goes a little bit beyond what I am presently talking about. I want first of all to ask your opinion of the children under fourteen, and, secondly, over that age?—Well, I think whenever they are over fourteen they should be sent to work as soon as they can, because after that they get so obstreperous. Unless you are going to give them an education suited for a profession, I think they should be at a public

work. I am speaking for working-class children; I do not take in those who are better, or whose fathers can afford to keep them at school after fourteen; but I think when they come to fourteen, the sooner they are at work the better. You will not have to drill them at a school after that, and practically they learn nothing; they learn nonsense after that; they should be at work as soon as possible after fourteen.

Suggestions.
Loafers.

9105. But you are acquainted, are you not, with a large lounging class, in Scotland especially?—Yes.

9106. Who do not do work?—And I think the Government should take power to drill them up, and, if they did not find employment, make them soldiers or something of that kind; that would make them far more useful members of society. I think the educational authority should have power, if they are not working, to do something with them, or the Government should have power to do something with them to keep them in employment. During the last thirty-five years I have had great numbers of them—more particularly in connection with some of the large contracts that I have had through my hands—and I have seen the foreign element, that is, Germans and all nationalities, come over to our works in connection with their educational system. I hold—and during all my experience I have never seen anything to cause me to depart from it—that the German system is very different. There is a great outcry that there is a want of technical education. Now my experience is the opposite way. I think the superiority of the German education is due to the military system; that is drilled and instilled into them while they are young. They never forget it, and it is why the Germans have a superiority over our people in their perseverance and in their methodical system of going about what they have to do. It is not that they are any better men, in any shape or form, but they stick to the thing, and persevere straight through it until they gain the ends which they aim at. For instance, there are dozens of them coming over here, for the purpose of learning our language. They will get employment in some office or some public work till they manage that. Then they go abroad to some of our colonies, and generally they settle down there, and, as a rule, they succeed by their perseverance and the methodical way in which they go about their work. I hold that is instilled into them by the very communication of their military system, which gives them that advantage over our people here.

9107. You will not deny, I suppose, that Scotch people have been known to get on very well by perseverance?—Well, it is only by perseverance that they get on; that is my experience of them. Now, as to the product you are sending out from your Board Schools; I do not think we have value for the money that is spent.

Board School
education.

9108. That is in the Board School?—I do not say the Board Schools, but in our schools generally. The Board Schools, no doubt, are very well managed; we have very fine schools in Scotland. I do not suppose there are any better in the world than we have got in Glasgow, so far as I know; but, at the same time, I think they could be greatly improved. We attempt to teach the children far too much, instead of teaching them some things well that would be useful to them in after life. That is what I think is wanting.

Militarism.

9109. Are you acquainted at all with an outcry against militarism?—No, I am rather in favour of it.

9110. Are you acquainted with any outcry?—I have heard some talk about it, but I do not think there is anything in it; it is more a political thing than anything else; it is more politics, imagining our country is going to turn a military country and going for soldiering. I should like to see a few hundred thousand going in for soldiering; it would do them good; and I think if our Government enacted that it would do a very great deal of good to a class of men, who would have to enlist when they are young men, and pass their time through the army. Something should be provided for them to enable them to take up an employment, and not allow them to drift and drop

into a common class of labourer. I think the man who has been in the army is a superior man to a man who has never been in it, and they are worth a shilling or two shillings a week more as ordinary labourers for the intelligence and manner in which they go about their work.

9111. Have you had much experience of old soldiers, what they call old soldiers nowadays; that is men who have been three years or seven years in the army?—Men about thirty or thirty-five years of age, going up to that. I have always made it a rule that I never send away an old soldier when he applies to me for a job; I always give him a preference. I used to have a great number of them when I first took it up. I have had dozens of them, because I take them on in preference to any other class, and the reason for that was I required a great deal of unskilled labour. When I was foreman of the works I laid out my work in a particular way, and by spending perhaps a day with these men I could teach them to do what I wanted, and I could get these men to carry on the work practically as if I were there instructing them all the time, and as well as a tradesman. I had a great many piers to build, such as Brighton; all the piers nearly round the coast; and I found these men could carry out my work, and do it carefully. I spent some time with them teaching them to work, but afterwards they could work out the thing without troubling me, except now and again during the day.

9112. Were these soldiers at large or soldiers of English, Scotch, or Irish regiments?—They were soldiers who came to the gate and told me they wanted employment, without any other recommendation at all.

9113. And nothing to do with their previous rank?—No, nothing at all; I think they were all private soldiers. I have had a good number of sergeants and other officers, and those who have been up a little. They make capital timekeepers and all that class, and at the present moment we employ them still as timekeepers, and gatekeepers, and all that class of work.

9114. Have you ever heard anybody abuse soldiers in private life, saying that they were not suited to civilian labour?—No; I do not think there is anything of that. I always found they were very good. Of course, there are all kinds of them. There are some bad characters before they go to be soldiers, and they do not often forget it while they are there; but, on the whole, I have never had any trouble with them.

9115. We have had evidence before us that a soldier was so much looked after while in the army that he was lost, as it were, when he came to civilian life, and did not know how to set about anything?—I do not think it. I think if they get fairplay when they come to civilian life, and anybody takes an interest in them, they are better than any other class of the community that I know of; that is to say, if you take the same stamp of man of the same age loafing about as labourers, the soldier, I think, is the superior man.

9116. By Mr Fergusson.—You approve of the German military system of training?—Well, I do not know any details of the system. I just take it, the military system and discipline. I do not care who they are, whether they are children, boys or girls, it instils obedience into them.

9117. But it is carried on to the age of twenty-five?—I do not know what age it is carried on to.

9118. It is carried on to over twenty; but how do you reconcile that with advising that every boy should go to work whenever he is fourteen?—I do not see how their fathers and mothers can keep them very well after that.

9119. How can you give that military training when the boys have to go to work when they are fourteen?—I do not see why you should not give it before fourteen; marching.

9120. It is a very important time in a boy's life, fourteen to eighteen?—I think they should be learning their business that they are going to make their living by.

9121. If it is of so much importance, do you not think it would be advisable to carry on this training after

Sir
Arrol
18 Ju

Old sol
advant

Militar
trainin
boys up
fourteen

Afterfo
apprent
time.

the age of fourteen?—As long as they were at school. I would give them even more of it after fourteen.

9124. That is when they are apprentices, and you would carry on some training?—Apprentices; you cannot carry on a public work.

9125. I suppose they have some spare time in the evening?—In the evening.

9126. Could you not give a couple of hours a week?—Oh, yes.

9127. Would they not have time to do that?—Plenty.

9128. Would it be good for them?—Nothing better for boys between fourteen and eighteen to go into the school every night.

9129. Some employers insist on their apprentices taking up continuation classes?—Well, most employers advise all boys to go to the evening schools; they will learn more in the night school in a session or two sessions than in the day.

9130. One of the subjects taught in the night school might be physical drill?—They could take one hour or half an hour two nights a week.

9131. They have time to do that?—Plenty.

9132. Would you approve of anything of that sort being made compulsory?—I think it would do them good, you will not get them to do it by coaxing; you must make it somewhat compulsory.

9133. You think the apprentice boys could find time?—Oh, plenty of time. They all stop at five o'clock, there is plenty of time after that for a boy working in large public works.

9134. You think they would turn out better men and more useful tradesmen?—There is no doubt about that, if they are trained up with discipline and obedience to work together methodically in whatever they may have to do in after life. I think the educational system should not aim at giving them a great many subjects that are of no use to them, but should aim at training them up in the likelihood of the employment that they would find afterwards for their living.

9135. That is to say, fewer subjects and more thoroughly taught?—Give them plenty of mathematics and drawing of an educational kind in the lines that they are likely to follow in after life. It will be useful to them in almost any branch of their business. My experience of these young men who come through a great many of the training colleges. I have had a good many of them. Some of them from America, some from Germany, and some from our own schools—twenty-three or twenty-four years of age. And I find when they come to that age they know far too much, you cannot teach them any more. Even with all the work they have done as students, and after spending the time to twenty-six years of age, when they come into our place they are practically of little use, and not nearly so good as an ordinary boy coming in as he does and never having had any technical training at all, but beginning at the bottom and working up.

9136. Then you are no great believer in what is called technical education?—No doubt we should have a good technical school in each large town, but there are methods of technical education, and I think what should be aimed at is giving them what is necessary to assist them in after life. They never attempt to teach them to work. I remember a gentleman in Glasgow—he was a large employer of labour, and had a good many hundreds of engineers himself—thought to give his son a first-class education, and he sent him to America, and he spent four years in American colleges, he passed his time through these colleges, and went all through the various subjects; so many days to make him a blacksmith, so many days to make him a moulder, so many days to make him a pattern-maker, and when they were all tabulated up, it was found that they had taken six weeks to learn him the whole of a blacksmith's business from end to end. Dear me, he could not learn to hold the tongs in six weeks, that is a fact. Well, this young man when he came back after four years spent in America was twenty-three years of age. His father came to me to get him into a good shop where he would get all-round work the

last year of five years' apprenticeship. He had been four years in the schools. A friend of mine took him into the shop, a good practical engineering shop. I told my friend to take an interest in him. He was a smart young able fellow. There was no nonsense about him, and he was eager to learn, but after all he was very little better than any other lad coming in from fourteen to sixteen years of age, and starting his apprenticeship with the education got in one of our Board Schools, because he really could not work much in any way as a specialist. Now I had another one come from the college about two years ago, and he came to us when he was over twenty years of age. He had got the silver medal, and he came to get employment because, owing to a change in his father's circumstances, he could not support him, and he came to see if I could give him a job. He was a nice-looking lad, and I was very sorry for him. I said, 'I shall be very pleased to do what I can for him. If there is anything in the inside of our work that you can do—I do not care what it is—I will give you a job at it.' There was not a single thing that I could take him in and give him employment at the inside of our work. That was the position. He was a nice-looking young lad over twenty years of age. I advised him to go back and tell his friends what they ought to do for him, perhaps to get him for three years in an engineering work. I did not care where. They put him into one of the engineering shops nearest his home, and perhaps after serving three years he might be able to do something for himself. By that he could make a ladder to help him on afterwards. He came back about a fortnight after that, and told me that his friends had advised him to do what I said, and he wanted to see if I could do anything for him. I said I would be very glad to take him into my own work. I took him into my own work. He is working there yet, serving his three years. I told him at the same time that if he would push himself on I would not tie him down to any apprenticeship, but just pay him for anything that he could work at. I have had the young man working for me for nearly two years, and he is doing very well; but so many of them, when they come to that position, drop down and never get any further. That is my experience.

9137. *By Mr Alston.*—I have the same difficulty as Mr Fergusson in reconciling your statement about the good quality of the soldier, and the necessity of the boy going to the work he has to earn his bread at before he can be a soldier. Were these soldiers that you employed in preference mere labourers?—Mere labourers; they had never been at a trade.

9138. Then it would be a disadvantage if you made service compulsory that you would only turn out labourers, and when they came back to civil life they would not be able to do anything?—A soldier, if he has any push about him at all, if he has not sufficient education before he is a soldier, can make use of the time during which he is a soldier to enable him to earn his living afterwards. The Government makes a gross mistake. I have spoken to two or three about that; they do not find old soldiers employment in their own arsenals and dockyards, as they ought to do, for the great mass of these people. I think they are entitled, after they have served their country five or seven years, to find the arsenals and dockyards open for these men to come in; I think the Government are entitled to do that for the men who have served them.

9139. May not the majority remain just simply labourers?—No, they have so many machines of all kinds and descriptions. I could learn a good soldier to work a machine in the inside of three days, or, at the most, I may say a week, to enable him to earn from 25s. to 30s. a week.

9140. And what does the Trade Unions say to that?—I do not care a straw for the Trade Unions. If you have to work things to suit Trade Unions, then we must stop our business.

9141. Because the giving of a shilling or two shillings extra to the soldier labourer, if it had been in a Trade Union shop, they would probably have stopped the other men. The other men would probably stop if

*Sir Wm
Arrol, M.P.*
18 June '02.

Sir Wm.
Arrol, M.P.
18 June '02.

there were a Labourers' Union, for instance, in connection with your work?—There is no Labourers' Union in connection with our works, and as to unskilled labourers—organised Labourers' Unions generally—there is nothing in them, and an independent employer takes no notice of them.

9142. Might it not be an advantage to get these good soldier-like qualities that you admire so much by means of the Board Schools and in continuation classes, bringing out all the qualities that a soldier gets in the army?—If you expect to get them all brought out in a school, you will find your mistake.

Continuation
Classes.

9143. But in continuation classes could you not get a great deal of physical training, and military training, before the boy is committed entirely to work?—I think you should give them as much as you possibly can.

9144. Because I do not see how you are to turn that boy on to work at fourteen, and, at the same time, get these qualities that you desiderate?—That is the difficulty. Whenever a boy comes to be eleven or twelve years old, you cannot do much with him in the way of education, if he is a wild, obstreperous boy.

9145. The thing is to tempt him to stick at it a little after school age?—I think you should give them as much physical training as you can while they are at school. I do not care what age; give it them early.

9146. Give it at the continuation classes?—Yes; continue as long as they are at the school.

9147. *By the Hon. Thomas Cochrane.*—From your great experience of these lads in your works, would it do them any harm to make them come to continuation classes, say for an hour three nights a week, and learning physical training?—No; it would do them a great deal of good.

9148. It would not interfere with their work to make them go?—Not at all; they generally get into mischief at night, as they have too much time.

9149. You would rather see them at physical training than lounging at street corners?—Certainly.

Apprentices:
evening
classes.

9150. *By Sir Thomas Coats.*—You employ a good many apprentices in your own works!—Yes, we keep a great number of them.

9151. Do you make it a condition that they attend night classes or technical schools at night?—I advise all I come across to go to the technical school every night they possibly can get; I get them all to go. I get the foreman to take an interest, and see that they do go.

9152. Practically the whole of them go?—The whole of them go, as a rule, in the Glasgow schools.

9153. I suppose in these evening schools they are learning theoretically what they are working at practically during the day?—Well, they could do that in the technical schools; but mathematics and drawing are good for almost every kind of subject that they follow in after life. Suppose it is a joiner, or any kind of trade, you cannot give them too much of that in the night school, and there is no place better than the night school for getting boys to understand the real responsibility of their lives. Whenever they are learning to work through the day, it is a change of employment to go into school at night. If you try and put them into day schools they think they are entitled to play themselves all the day.

9154. Do they go every night?—They used to long ago; they used to go five nights a week, but now they only go three—three or four, I am not quite sure.

9155. Supposing they are going three nights a week, do you think if they had an opportunity of getting gymnastics and physical drill that they would go the other two nights?—Well, I think they would be quite willing to go one, anyway, even if they were getting one good night of physical training in a week—an hour one night, or give them half an hour two nights.

9156. You think they would like that; they would take to it?—Yes, I think they would, if there was a good man, a good sergeant, a man who has been in the army, to drill them up properly. I think the boys would like it, and it would do them a great deal of

good. It straightens them up, and makes them better for their work; there is nothing better either for boys or girls.

9157. *By Mr Shaw Stewart.*—You have given us evidence in favour of night schools—continuation schools—both for mental work and physical training. We have had a great deal of evidence in favour of compulsory attendance at continuation schools. Now I would like to ask you as a public man—do you think it would be possible to enforce compulsory attendance at continuation schools for all boys between fourteen and eighteen in Scotland?—Well, I do not know if you could make it compulsory, but I think if you were to make it a recommendation, I think you might get the co-operation of the employers of labour where the boys are employed, and they would insist on the boys going to school at night. I would hardly put it down as a hard-and-fast line, but it would be to the children's interest, as well as to the employers' interest, that these children should go to school at night. You might get the School Board or the employers to enforce attendance at the school at night.

9158. You think that a very strong recommendation from this Commission as to the benefits of attendance at continuation schools might stimulate employers of labour to encourage their boys to go to these schools?—I do not think any right-minded employers of labour would not be willing to co-operate and work along with them.

9159. That would only affect the respectable boys, who are at steady work?—Yes.

9160. We have to consider also the boys who are more or less learning to become loafers, who are loafers, in many cases?—Well, I would be inclined to put them under the police; if there were any means of enforcing it, I certainly would do it.

Loafer
attract
offered
compu

9161. Well, we have had a good deal of evidence to the effect that there is a number of boys who are not under any special control, who are not bad in themselves, and that, if they were got hold of and handled rightly, they could be made something of?—Yes, I think there could be a great deal made of them.

9162. And many witnesses say that the only way to make anything of them is to make them attend continuation schools by compulsion?—Yes, if there was any means of getting at them, I would be quite willing to apply compulsion; I think it would do them good, a great deal of good.

9163. Yes, it would do the boys good; but I am asking you, as a public man, as to whether you think the public mind would tolerate compulsion?—I am not very sure of that; they would turn round and say it was for militarism; it was for the purpose of training them as soldiers, or something of that kind. If you could mix the two together in some way that would be attractive to their parents as well as the children, I should think you might get a great many of them.

9164. Well, do you think that by providing some attraction, as displays of physical exercises and musical drill from time to time?—Drill is pleasing; you know there is no better exercise or better amusement than in being drilled.

9165. Take a town or city, do you think that if something were done in that direction by the Town Council, that would help to bring the boys out of the streets and get them into some discipline?—I do not think the Town Council could do much good. I think the School Board should have more power over that, and I think they might complain if these boys were running about wild; the compulsory officers could take note of them, and the magistrates should have some power over them. The School Board officer, in the event of a great crowd of idle boys running about certain districts, going about idle, neither working nor learning, should be able to bring them before the magistrates, and have them dealt with.

9166. What would the magistrates do?—Educate them; give them certain lessons at night, as well as drill. It is a difficult subject to take any of these things when you have no power over them.

Sir
Arrol
18 Ju
Conti
Classes
compu
inadvi

9167. It is a difficult subject, but we have to face it, and we would be very glad of any help you can give us in that direction?—The only thing is, you have got them in the school so long, if you can keep them up to thirteen, but you will have no control after that in the School Board.

9168. Do you not think it would be possible for

the Education Department to get control of the boys after they have left school for night work?—I would have no objections to get control over them for a couple of years; to get control over them when they go to work, to insist on them going to school.

9169. Two or three nights a week?—Yes, a couple of nights a week, perhaps.

The witness withdrew.

Adjourned.

Sir Wm. Arrol, M.P.
15 June '02.

NINETEENTH DAY.

Thursday, 19th June 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

Sir THOMAS GLEN COATS, Bart.

Mr M. H. SHAW STEWART, M.P.

Sir HENRY CRAIK, K.C.B.

Mr J. C. ALSTON.

Mr R. B. PEARSON, *Secretary.*

Major J. E. B. SEELY, D.S.O., M.P., examined.

Major J. E. B. Seely, D.S.O., M.P.
19 June '02.

9170. *By the Chairman.*—May I ask, have you taken practical interest in physical training in any school or schools, or is it only the general subject that you are interested in?—Well, I have taken a practical interest in physical training in various schools in the Isle of Wight, in fact it has been taken up somewhat keenly, especially in Ryde, where my predecessor, the Lord Chief-Justice of England, also takes a great interest in it, and has done all through, as, perhaps, you know.

9171. And has it obtained in the ordinary Board School there, or in the National Schools, or what sort of schools?—Well, to some extent in all; in the Board Schools and the National Schools, and also in other schools, girls' schools and boys' schools, for people who are better off.

9172. But what you wish rather to bring before us to-day, I gather from looking at your notes, is that which is in your mind for boys?—Yes.

9173. And probably for boys certainly in the higher part of their school time, and also later on?—That is so.

9174. Would you kindly read your notes, beginning at rifle shooting?—Rifle shooting as a part of physical training.

9175. You preface that, of course, by saying that it is physical training for boys of a certain age?—For boys.

9176. Say after twelve?—Say boys after fourteen.

9177. Then that would rather lead you to continuation schools, or some after course of training?—This is in connection with some after course of training. I would say that it seems to me that all this physical training is open to many objections, and I know that many of those objections have been brought before this Commission. For instance, the system, let us say, of Sandow, or of some other man, develops muscles of a particular part of the body at the expense of other muscles, or possibly develops muscles at the expense of other parts of the human frame, and I believe that many distinguished physicians are of that opinion. Rifle shooting as a part of physical training is open to none of those objections. It de-

velops, as I have said in my notes, sobriety, healthy habits of life, steadiness and coolness, and, what I have not stated in my notes, but I should imagine is of equal importance, it would develop a great interest in the boys themselves, whereas, I understand, that in many parts of the world where I have been the difficulty is that the children or boys get heartily sick of the physical training that they are being given. The foregoing refers to the value of rifle shooting from the moral and physical point of view. Then from the point of view of national strength—and here I would speak, I suppose, more or less as a representative of the National Service League, of which I am a member—

9178. Just follow on through your notes, and then we will ask you questions after?—From the point of view of national strength, I would say that my attention was first called to the necessity of training our boys, if we cannot train our men when they are grown up, to be able to use their weapon by an experience which I suppose has not fallen to the lot of most Englishmen. It fell to my lot to be in command in the field on active service of men who, with every other good military quality, did not know how to shoot at all, and did not pretend to be able to shoot. The reason for this was that men were urgently required at the moment, although this was a war against two small States, and they had to be sent out just as they were. Those men were irregular soldiers. A similar thing has occurred to my own knowledge with the militia, and I believe, though I cannot say for certain, with all branches of His Majesty's Forces. When men were urgently required, it was found that, whatever virtues they might have as natural soldiers, they had no knowledge whatever of rifle shooting, and if you would like to call the evidence of some officers commanding militia units whose names I could give you privately, I think you would get a very startling statement in reply. It would seem, therefore, that we are hopelessly behind every other nation, except possibly the Americans, though I understand that is not really the case. If it were part of your curriculum of physical training, if you recommend in your curriculum that people should be taught

As source of national strength.

to shoot, we should be saved the difficulties which the nation did meet with on certain occasions in this war. Rifle shooting is the only part of military training which can be carried out in peace with complete success. Courage, common sense, confidence in the leader, skill with the weapon, are the four most essential things for the soldier in war; of these four, only the last can be taught with certainty in time of peace. I would consequently desire to draw attention to the immense military strength of a nation of marksmen, and I have given as examples the English from the time of Crecy onwards for some hundreds of years, during which a system of compulsory shooting prevailed, up to the time, I believe, of the end of the reign of Elizabeth; the Swiss, of whom, no doubt, you have had evidence from other people; and the army of the late Orange Free State, perhaps the most striking example of all. Then, secondly, presuming it is found advisable to make rifle shooting a part of universal physical training in Scotland, comes the question of whether it is possible to do this; first, I have said that shooting with a reduced charge is practically as useful as shooting with a full charge, because the problems of rifle shooting in war, which would be the only ultimate object of teaching them to shoot, are two—(1) to get the back-sight, the fore-sight and the enemy in one line; and (2) to know the distance, and thus to correctly adjust the back-sight. The first can be taught quite as well at 50 yards as at 1000. That is aligning the sight with the object. The second will never be learned by shooting at fixed distances, or at any ordinary target, and in any case can be learned just as well without shooting at all. I mean to say the judging of distance can be learned quite as well without going to a range and letting off a rifle. As instancing that long ranges are not essential to accurate shooting at long range, I have noted that rifle competitions in the Orange Free State, before the late South African War, were conducted at short range, 100 and 200 yards; that is, their club shootings that were organised by their commandant, and yet their long range shooting during the war was most remarkably accurate, a fact which I think is not disputed. The range difficulty would therefore appear to be surmounted, because you can teach all that you wish to teach for the purpose of national strength on these reduced ranges. That is the theoretical part of the matter. Then, secondly, the practical application of these theories in my own constituency in the Isle of Wight. I very earnestly pressed all my constituents when I came home from South Africa to consider the value of rifle shooting, and as a consequence they responded in a somewhat remarkable manner, rifle clubs having been founded in every district where there is not a volunteer company, volunteer officers assisting in the movement. Four of these rifle clubs are now open, and a fifth is almost completed. Then I have given a description of an open-air rifle range for a reduced charge, running man, disappearing targets, etc. It is valuable, I think, to have your range in the open air, because shooting in an enclosed space somehow does not give the man or the boy the idea of the thing so well, and an open-air range is so much less expensive. These ranges that I have been instrumental in opening are from 25 yards up to 100 in length. Their cost varies. I have got the cost from the different people who have done the work for us. The cost in the case of the first one, which was the most expensive, was about £35; the second was £20, the third was £25, and the fourth, which is not yet completed in all details, is expected to be about £15; and the gentleman who has done most for me in this matter adds that he would be glad to undertake to make these ranges anywhere at £25, including a club shed in which to keep stores, rifles, and so forth.

9179. The ranges vary from 25 yards?—From 25 yards up to 100, and there are corresponding distances on the sighting of the rifle. You shoot with the same rifle that the man will use when he gets the opportunity of shooting at long range; the only difference is that you put into it any of the contrivances that enable you to shoot with a

reduced charge in a small cartridge. Of course, you could put a reduced charge in an ordinary cartridge, but that would involve the expense of the cartridge.

9180. *By Mr Shaw Stewart.*—Did you mention the length of the range?—Yes; the shortest range is 25 yards and the longest is 100 yards. You can also have at these short ranges what is so much more valuable than any stationary shooting, that is, disappearing targets and a running man, or whatever you may be pleased to have. I think I have given you the actual cost. Well, now comes the most important part of my evidence, or least unimportant, and that is as to whether my theories—of course, I do not know whether they have been put to this practical test before—are true, whether it is worth while to train our youths at short range, since, I presume, we cannot train them at long range in this thickly-populated country. The question is as to whether the short range would teach you to shoot at the long. I anticipated that possibly I might have an opportunity of bringing this matter before some authority; in fact, the Commander-in-Chief had said through another officer that he would be interested in knowing the result if the experiment could be conducted. I, therefore, gave only such notice to the people who had charge of my small range as would enable them to arrange to get the youths away from their business. I selected those whom I knew from my own knowledge had never fired with the rifle in their lives until they began firing with a reduced charge, and had never fired with anything but a reduced charge and at short range. I chose the spring, when I hoped there would be bad weather. I took them over to Portsmouth on an ordinary shooting day by the consent of the military authorities, and they fired at all the ranges that were available. It so happened that it was a very stormy day. There were very severe storms of hail during the greater part of the practice, just what I and the people who think with me had hoped for, because the question is, is the shooting of any value under service conditions? And the result was, I think, surprising, and here I have the registers of the shooting that they made. At 200 yards, which is the nearest military distance, the shooting was good for ordinary soldiers. Out of a possible 28 the scores were—18, 9, 20, and 17. At 400 yards, where you would think that the longer range would begin to tell, out of a possible 28 the scores were—26, 12, 18, and 18. Now comes the interesting part of the competition, which some people find it difficult to believe; fortunately I had plenty of witnesses; at 500 yards, lying down, and bearing in mind that the first shot of all these men at this range was the fifteenth shot that they had ever fired in their lives—

9181. No sighting shots?—With no instructions of any kind, and no sighting shots—no instructions of any kind previously—the scores of these lads were—21, 20, 22, and 24. It was, indeed, very remarkable. That shows conclusively how unnecessary it is, as we all used to say in South Africa, how totally unnecessary it is to have ranges of 2000 yards, with two miles kept clear behind the butts, in order to teach people to shoot. There was what we should call at sea half a gale of wind during the squalls; it was on our starboard quarter, from our right-hand rear, half a gale of wind during the squalls, and a very variable wind; at some times, at the very highest part of a squall, it was impossible to see the target, but as long as they could see the targets they went on shooting in the rain; it was quite the worst shooting day that I have ever been out in. I myself fired my usual course at the same time, and made very indifferent shooting, although I did my best. I may say that most of these lads at 500 yards made very much higher scores than I did myself. Although I am not a good shot, I have been a marksman ever since I belonged to any branch of the army.

9182. With this as your text, will you continue to give a little more direct evidence as to the value of this for boys over fourteen years of age all through the

Practical
of suggesti

Results.

Value for
over
fourteen

country; just a little to point the value of it?—I would say that it seems to me that if you can include in your training a thing which will undoubtedly interest the boys more than any other kind of physical training that you can give them—to which, I think, everyone would agree, because the element of competition comes in—and if that thing itself is one which must increase their desire to live healthy and clean lives, because if there is one thing more than another which depends upon health, sobriety, and clean living, it is rifle shooting, and if, at the same time, by giving that instruction which will be so good for them from the moral and physical points of view, you can add very greatly to your national strength in the event of a trouble arising which would require the calling on the civilian population to fly to arms, it seems to me it would be worth while doing. I think that the experiment that I have explained to you, and the scores actually made, will prove that it is possible to add to the national strength in this way, because if they can shoot at the short range, I think this proves that they can shoot at the long one; and as to the possibility of it, I think the figures I have given, with regard to the cost, will show that a rich country like ours can very well afford to pay for these little ranges, even if the patriotism of the people, if properly appealed to, would not do it. With regard to the fact that this Commission does not propose to take into account the purely military aspects of the case, I would say that what I and my colleagues of the National Service League are looking at in this matter is the possibility, the probability, almost the certainty, that in the event of our being engaged in war with any European Power we should be obliged to call upon a large part of the civilian population; for if we had to call upon our civilian population in a war against so small a number as 80,000 men, however gallant and apt soldiers, it follows of necessity, that if we are to engage any great power, even though you say you rely on the Navy, somehow or another you must again call on the civilian population. Therefore, what we earnestly desire is, that when the civilian population is called on, its education should have comprised not only learning, religion, and the care of the human frame, but something which may save the country from disaster by the fact that, at any rate, they have the elements of military skill, namely, the knowledge of their weapon. That is what I hope, and my colleagues on the National Service League hope, will be taken into consideration by this Royal Commission, so that part of the physical training may tend to the increase of national strength.

9183. There are one or two points I should like to ask you as to the practical part of the question. I understand you recommend Morris Tube Galleries?—No. I would not recommend Morris tubes, though, of course, they are good things in their way. Adaptors are better, and I understand that other inventions have been made since then.

9184. Are you aware that the Military Authorities are very reluctant to grant anything but a covered range for short distances?—No, my lord; certainly not in the Southern district, because all the Rifle Clubs that I have referred to in my evidence have been passed by the Local Military Authority, and have subsequently been affiliated to the National Rifle Association, and registered by the General Officer commanding the district.

9185. When I tell you that this very day I was informed that even for a Morris tube range permission by the Military Authorities, that is the War Office, was refused on account of such a range not being covered, would you be inclined to disagree with that?—No; if you told me so I should know it was true; but I should say that it must have been in a very dangerous situation.

9186. So far as I could see not at all dangerous?—Then I should say without hesitation—

9187. But such actually was the case?—It was a most ill-advised action on the part of the authorities.

9188. Do you happen to know, supposing any educational establishment wishes to adopt some means of rifle shooting, whether Morris tubes or otherwise, what

their plan of operations is, what the rule they have to consult is?—As I said in my evidence, this rifle shooting would be for the boys who have left the primary schools, and, therefore, I should imagine that the thing could best be done by the assistance of the Local Authorities, instead of by the Managers of the Board or Voluntary Schools; there would be a rifle range in the district, which would be run by the people of the district, and the boys should be induced to attend there on certain days, and ultimately to pass a shooting test in the same way, if you may take the concrete instance, as in the Isle of Wight. These ranges would be available for youths of that age at certain times; and the range would be put at their disposal by the people who have made the range. It seems to me you have only got to make the range at a cost of £25, and get the rifles, which, in the case of service rifles, would mean a cost of about £8 for two rifles—the means I adopted was to give the rifles to all those clubs myself—and the rest would follow of itself without difficulty.

9189. By Sir Henry Craik.—What is the age of the membership of the rifle clubs you speak of as being founded in your district?—The age of the members as they at present exist?

9190. Yes?—I am sorry to say, I only remembered that point as I came here. I have not got the rules which state the limit of age.

9191. But roughly?—Roughly speaking, the lads do not join before fifteen. I think that is the age; I am not certain.

9192. Beyond the school age?—Beyond the school age.

9193. About the age of adolescence?—Yes.

9194. Is there a subscription required?—Yes; that is required partly because, of course, it is run privately, and the thing must be made to pay; and, secondly, because there is a rule of the National Rifle Association requiring a subscription. All my rifle clubs are affiliated to the National Rifle Association by a small subscription.

9195. It has never been contemplated to include such instruction amongst continuation classes as a piece of the educational system?—Well, it has been contemplated by me. I do not know whether it has by others, and in point of fact it comes to the same thing in one district—in the district of St Helen's—because the number of members at present is 160, although it is quite a small place, and of those, 109 have already passed a severe shooting test. Of those 160, a considerable number are older men, but I fancy that almost every lad in St Helen's has now passed the shooting test, so that the thing has been done voluntarily by the exertions of the local people in this place, St Helen's, which I suggest might universally be done in Scotland.

9196. By an educational authority?—Yes.

9197. You speak in one place of the importance of knowing the distance, and thus acquiring dexterity in shooting?—Yes, correcting the back sight; that is a thing so few people realise in shooting.

9198. That might be carried on without shooting at all?—Certainly, the judging of distance.

9199. I do not know if you have studied the subjects in our Code; have you ever paid attention to the subject of nature knowledge, to which we have paid a good deal of attention of late?—I am afraid I have not read the books on it.

9200. One of the things that we very carefully urge in regard to the nature knowledge is the direct experimental knowledge of the standards of measure and weight, distance, and so on, and we specially urge that the pupils should, as far as possible, be taken into the open air to judge as to distance, to judge as to measurement of, say, a pole in the playground, or as to the position of the sun, so as to take the time of day, and so on. That is a new subject which has very much occupied our attention of late?—I would say it was most valuable, sir.

9201. Do you think that shooting might be a subject of instruction that would very well fall in with this general description of nature knowledge?—Certainly I would say so, sir.

19 June '02.

9202. It would develop many of those faculties which we seek to develop by this subject, which is now recognised in the Code?—That and some other faculties.

9203. That would lead to the conclusion that the subject that you are so anxious to get introduced is really an educational subject?—Perfectly.

9204. And might very well be considered as such?—Perfectly.

9205. Can you say whether for dexterity in that matter, and for the measurement of distances, the training of the eye, it is important to begin at an early age, or can you do it equally well if you begin boys after their school age?—I should say you could begin equally well after the school age; but I think it most important that this dexterity in the aligning of the sight and judging distance should be acquired while a boy is still growing. I think there is an enormous advantage in teaching a man to align the sights before he comes to the age of an average recruit. I believe all musketry instructors are of the same opinion.

9206. What was the age of the lads whom you took out to this experimental shooting at Portsmouth?—They would average to be about eighteen.

9207. Then they were well past school age?—Yes. Of course you see the thing that we are aiming at has not been done at all, so we are taking them at a later age; people who can afford to pay 2s. 6d. a year.

9208. Have you ever had any experience of taking school children out into a camp in the summer?—I have been to some camps of Boys' Brigades.

9209. Where there was shooting practice?—No, the experience I have had in that way is one Board School in Ryde, where the headmaster happened to be an enthusiast on the subject of shooting, and to whom I have undertaken to supply ammunition for practice with Morris tubes for the boys, and it is part of his ordinary curriculum. But I understand that it has caused some opposition, and I think also it may cause inconvenience to the neighbours, and I therefore would not recommend it as the method to be adopted; I would much sooner have an open-air range.

9210. But a good deal might be done in this way at a summer camp without shooting at all, by simply sighting the rifle?—Then you will bore them?

9211. Has that been the experience of those who have tried the boys?—I should think so, as compared to the actual letting off of the weapon; still much can be done.

9212. I think there were some experiments of this sort taken from London schools, and I think they were very much interested?—Oh, they would be; but I think they would be more interested if you could arrange to have the ammunition.

9213. *By Sir Thomas Coats.*—Regarding the advisability of starting rifle clubs, I suppose you know that one of the great inducements to a great many men to join the Volunteers, not only those who have passed through the Boys' Brigade or some similar training, but those who have joined for the first time, is that they would be allowed to shoot?—Yes.

9214. They join for the purpose of shooting?—Yes.

9215. Do you not think it possible that if they get the shooting without the trouble of drilling that they would go for the rifle clubs, and neglect the necessary amount of drill to make them useful men afterwards?—That, of course, had to be taken into consideration in the campaign I carried on in my constituency, and that is why I have put in my evidence that, in every place where there was not a volunteer company, one of these ranges has been opened, and added 'volunteer officers assisting in the 'movement.' It was thought by some of the volunteer officers—it so happens that my brother commands the volunteer battalion there—that that must be the effect, although I myself do not agree at all, and think that the more you familiarise people with shooting, the more anxious they will be to take up volunteering. I only founded these clubs in places where there was not a volunteer company, and I founded them largely with the assistance of volunteer officers. Of course it is

Volunteering:
shooting an
inducement
to join.

Rifle clubs:
effect on
volunteering.

too soon yet to tell what the effect will be, but, as far as it has gone, I think everybody is agreed that it tends to produce a spirit which realises the importance of knowing how to defend oneself in war, and, consequently, will be a help to volunteer recruiting. I believe that is the opinion of Lord Roberts. It is very strongly my own opinion, and, as far as it has gone in the Isle of Wight, such has been the fact.

9216. Do you not think there is a possible danger of teaching men, or young men, to shoot without getting any training in drill? There is this difficulty. It is well known that in the late war in South Africa there were many instances in which one body of our own troops were firing against the other. Well, of course, they wanted drill badly, or else they would not have been doing that, and had they been very good shots things would have been very fatal?—It is an entirely novel suggestion as to the value of inaccurate shooting.

9217. My point is this, that I think they should drill the men first and get the shooting afterwards?—Well, I may say at once that I am, I suppose, the only member of Parliament who frankly says that he is very much in favour of universal military training. I have said so in the most public manner, and I say so here, although, as you are aware, every member of Parliament is informed that by so saying he jeopardises his chance of retaining his seat. But I consider the matter so important and urgent that I have abandoned the question as to whether that will be the effect or not, and I have frankly said in my constituency and elsewhere that I consider it is necessary to our national safety; and if that view obtained, and if we were organised somewhat on the Swiss model or the Swedish model, the objection that you, sir, raise would not obtain at all.

9218. Oh, no; certainly it would disappear?—But I think half a loaf is better than no bread, and, therefore, if we can train the boys to shoot, we shall have done, as I say in my evidence, about one-fourth of what you possibly can teach people in time of peace; and if you are going to teach them as lads, there will be plenty of time afterwards to get them as volunteers. I know that there may be a thought that it is rather unwise to teach people the use of the weapon if you are not going to get them under any kind of discipline. As to that question about the parties firing at each other in South Africa, I have seen it happen frequently, and I myself have been subjected to a very severe fire from our own side in error, but I must add, not at all always from irregular troops; quite the other way, shrapnel and pom-pom, and even lyddite, has been fired at me and my men on numerous occasions.

9219. Not by regular troops?—By regular troops. I do not think that the reason you suggest was quite the reason of it; I think it is the natural inherent difficulty of distinguishing friend from foe when both are dressed so nearly alike.

9220. Regarding these scores, I am not surprised at the scores made, because, within my knowledge, recruits, after aiming drill and a little Morris tube practice, have done as well as you say here. But the difficulty comes in about the longer ranges. This practice was done, as you say, with a rear left or right wind?—A very violent wind; you had to aim off the target at 500 yards.

9221. At long ranges you have not only wind, but you have light to contend with, and that takes a lot of practice at long ranges?—Well, my experience is, that at long range you never can see your enemy nowadays.

9222. At 1000 yards or 800 yards; I have had some experience of rifle-shooting?—Yes. This Commission, I suppose, will dissolve too soon for me to have an experiment at the very long range, but I can have the same surprise experiment at 2000 yards, if the Commission would like.

9223. Do you not think judging distance a very important matter?—The most important.

9224. Could not that be done very easily without shooting at all if you had the range-finder; take the

distant

boys out in the country, and practise it regularly?—I think it would be most interesting, and if the element of competition came in, it would interest them still more.

9225. Of course with the range-finder you could tell whether they were right or not?—I think it would teach them much more of judging distance than shooting at the ordinary range.

9226. Which range-finder do you advocate for that purpose, not for ship purposes?—I should think that the range-finder as used by the Royal Artillery would be the best. I fancy it is fairly cheap; I do not know what it costs.

9227. Is it in one instrument?—No, the two with the long string with two men. I should think that would be a good thing for that occasion, because the boys would see exactly how it is done. It would educate the mind too—I mean it is a liberal education in a proposition of Euclid.

9228. There is one by Professor Pepper?—Is that the one with the other method.

9229. No, the long piece with the string?—That, I would suggest, would be the best; the boys would be most interested in it.

9230. I agree with you that the best shots are often men who are thoroughly sober and live a good life. There are exceptions to that, I suppose, you know?—Yes, I believe so; in fact I have known them.

9231. There are exceptions to every rule?—Yes.

9232. Regarding these disappearing targets, do you advocate the use of them before or after they have had a good deal of practice at the fixed?—I think it better to have a good deal of practice at fixed targets first to avoid any chance of accident, so that they might get entirely accustomed to the handling of the rifle; but from the point of view of the thing in war, we might give up shooting at fixed targets altogether. The ideal man in war, I should say, is the man who can shoot rabbits.

9233. Running men, pretty much like game shooting, in which hand and eye work together?—That is the valuable thing in war.

9234. It is a very different thing from firing at a fixed object?—I should say the firing, as conducted at present at fixed objects, is not at all good training, as it seems so me, for the purpose of warfare.

9235. It is one of the worst trainings they get for hand and eye to work together?—Quite one of the worst; unlimited time to arrange oneself and field-glasses and telescopes.

9236. *By Mr Shaw Stewart.*—On the point of the importance that you lay on the fact that boys should learn to shoot, do you, as a soldier, believe that shooting cannot be thoroughly learned as you think it should be learned by men over eighteen years of age unless they have had some practice in it as boys under eighteen?—I would not say it cannot be learned, but I would say it can be learned very much more easily.

9237. As thoroughly as you think it should be?—Well, I could not say that, because it depends upon how much time be given, but it can be learned much more thoroughly in the same time if you begin young—immeasurably more so; but I would say not before fourteen or fifteen, because before that age the boy will hardly understand the use of the rifle.

9238. Another question on another point. There is a difficulty in devising a scheme of universal attendance

without compulsion at continuation schools for mental and physical training, and that is the difficulty of holding out sufficient attraction to get the young men to come in. Do you think that rifle practice would be sufficient attraction to get in boys and young men from fourteen to eighteen to the continuation schools?—I do think so, sir, most emphatically. Firstly, if some kind of prize, however small, were given to bring in the element of competition; and, secondly, what is still more important, if it were in some way or other in your Code, or otherwise by proclamation of some kind, made plain to the boys that in learning to shoot, and shoot accurately, they were adding enormously to our strength as a nation, and making themselves more efficient citizens.

9239. That is, appealing rather to their feeling of patriotism?—Yes.

9240. I am thinking more of the young man's feeling of what interests him?—I should appeal to both, and I think you would get them.

9241. You think you would appeal sufficiently to his feelings of taking an interest in a sport?—Yes, more than any other kind of physical training, I should say. Certainly, it is more real.

9242. Would that apply to rifle practice at night?—To a less degree, very much, but it is a great deal better than not at all.

9243. Because you will easily understand that one difficulty that faces us is devising some method of attracting youths into some form of physical training after they have left school?—Perfectly; yes.

9244. And before they go perhaps to regular work?—Perfectly.

9245. You think, on the whole, rifle shooting is one of the attractions that might be held out to them?—Perfectly, with success.

9246. *By Mr Alston.*—You have said nothing in this evidence of yours about physical training during school age. Your evidence entirely applies to the teaching of rifle shooting; but would it not be of advantage that all these boys, during their school career, should have a thorough course of physical training?—Yes; I am very glad you have asked me to explain that. I may explain that I do not in the least under-rate the value of physical training from the point of view of national safety, but I speak purely of the rifle shooting, because that is the subject on which I have special knowledge, and I presumed that you would have many witnesses on other points.

9247. Because it has the appearance as if you did not care about anything but rifle shooting?—Well, if it can be made plain that, greatly as I value the physical training, and greatly as I deplore the low physique of a great proportion of our population, as evidenced by the continuing lowering of the standard of admission to the regular army, I refer to this and to this only because I understood you would have full evidence from other people on the former subject.

9248. We have had full evidence on that point?—I yield to no one that I consider physical training should be universal, and to its value to the nation in peace and war.

9249. But you would add to that. 'After you have done with them in the school, hand them over to me'?—Hand them over to someone, not to me personally; I am afraid I could not claim them.

The witness withdrew.

General E. F. CHAPMAN, C.B., examined.

9250. *By Sir Henry Craik.*—You held for several years the position of officer commanding the forces in Scotland?—Yes, five years.

9251. And during that time you gave a good deal of attention to physical exercise and drill as interesting the general population, and in its educational aspects?—Yes, I took a strong interest.

9252. You were in contact with several of the Educational Authorities, I think, on the subject in Scotland?—Yes, with you particularly.

9253. But also with some of the school managers?—I was in correspondence with all the managers of the School Board, and saw a great many at Glasgow, Edinburgh, Dundee, and Aberdeen.

Physical
training :
true aims.

Girls.

Overstrain :
care necessary.

9255. Which dealt in *Blackwood's Magazine* with the subject of this movement?—Yes. "It is difficult to over-estimate the importance, not only to Scotland but to the Empire at large, of the work assigned to this Royal Commission; but, if we are to obtain the fullest value from its deliberations, it must be supported by an adequate and enlightened public opinion, in formulating such a scheme for Scotland as may serve as the basis or model for a system suited to the needs of the nation at large. That the value of physical training is already generally recognised in Scotland, and that in this respect it is in advance of other parts of the kingdom, no doubt accounts for the fact of the appointment of this Commission; but it is of such vital importance that the true aim and principles of such training should not be lost sight of, that we do not hesitate to emphasise certain points that must be taken into consideration in dealing with the subject, and especially to invite their attention to an article which appeared in 'Maga' for March, 1899, on 'Physical Education in Schools,' setting forth very clearly 'the means by which such training may be 'made to conduce to the welfare of the pupils.' The writer of that article says, 'The mere exercise of boys 'in elementary drill and gymnastics, without the 'careful consideration of the physical condition and 'the special requirements of individuals, does not 'constitute physical education; nor yet, on the other 'hand, does an elaborate system of intricate drill and 'gymnastics, which has for its object the production of 'professional athletes or trained soldiers. Physical 'education is as extensive and varied in its character 'as the school life of the boy.' And its true aim is 'the training of boys under a system which concerns 'itself with the air they breathe, the food they eat, 'the lives they live, in order that they may begin the 'work of life with a large reserve fund of health and 'stamina.' In view of the truths here briefly set forth, it is a matter for congratulation that a medical expert has been included among the members of the Royal Commission, and we cannot doubt but that opportunity will be taken to obtain the advice and help of the Fellows of the Royal College of Physicians (Edin.), and of the Royal College of Surgeons (Edin.), for the members of those two important bodies should be able to suggest the character of the medical examination which pupils, both male and female, should be required to undergo, as well as the manner in which the system of training should be adapted to the needs and capabilities of the weaker and less developed, for on the principles of physiology, psychology, and of the hygiene of the human body any sound physical training must always depend. And here it may be well to point out how important it is that due consideration should be given to that side of the question which affects girls. Although they are not expressly mentioned, we cannot suppose that it is not intended to include them in the benefits of any scheme that may be adopted. The marked improvement in health and physical development which has taken place among girls of the upper classes is generally, and no doubt rightly, attributed to the fashion of playing outdoor games, and learning drill, gymnastics, or fencing. No one who has any knowledge of the girls or young women of the working classes but will admit the urgent need for improving their health and bodily development, or can doubt that such improvement would ultimately conduce to an increase of the national strength. Swedish drill has, of course, long formed an integral part of the elementary education of girls; and where military drill and gymnastics have been introduced into the schools for boys, girls have commonly been allowed to share them. But there is undoubtedly a danger that their special needs and weaknesses may be overlooked, and if they are to take part in exactly the same forms of physical training as boys, great care and watchfulness will be needed to avoid the danger of overstrain and consequent injury,

which can only be safely guarded against by the teachers knowing not only the movement and system of the training, but also the principles of physiology and anatomy on which they are based. This brings us to the very important point of the training of the teachers. Whether the physical training be given by the regular teaching staff of the school or by outside instructors, it is absolutely necessary that it should only be given by persons thoroughly trained for the purpose. In America this training is very generally provided for, notably by the Boston Normal School of Gymnastics, which was established in 1889 with the object of supplying the best opportunities for men and women who desire to prepare themselves to conduct gymnasia, or to direct physical training, according to the most approved methods. The curriculum is so arranged that instruction in the theory and the practice of gymnastics go hand in hand, and includes such subjects as biology, chemistry, anatomy, psychology, and pedagogy. The course extends over two years, and at the conclusion students who have fully satisfied all the requirements, and have given evidence that they are likely to maintain or carry forward successfully their professional work, receive diplomas. These diplomas, however, are given only to thoroughly-trained students. Although we have no college in this country which gives quite such a wide and scientific course of training as the Boston Normal School of Gymnastics, the needs of would-be teachers of physical exercises have not been altogether overlooked. Very excellent work has been done by the Aberdeen Physical Training College, instituted in 1889 for the special purpose of training teachers both in the theory and practice of physical culture. During the first seven years of its existence over a thousand teachers passed through its classes, and its certificates are recognised by the Scottish Education Department. There are many other institutions, both in England and Scotland, which are capable of doing the same work; but there is not one in which the instruction given has the same scientific basis as the American college. The system adopted at Aldershot for the training of military instructors has been very carefully worked out on scientific principles, and might very well be taken as a model for that to be carried out in other places. On whatever plan the training of instructors may, however, be arranged, the successful working of the system must largely depend on the character of the examination and inspection to which the pupils may be subjected. The Education Code provides for the cost of examination in all subjects taught in the schools, and qualified inspectors, either of gymnastics or military drill, might easily be found among officers of the army or of the volunteers, who could be specially selected for this duty by the colonel commanding the regimental district. Perhaps the most interesting and important part of the work confided to the Royal Commission is that which deals with the question of continuing and developing the opportunities for physical training for those who have left the day-schools. The power of the State to make education, whether mental or physical, compulsory, ceases at the age of fourteen; but it is just at this age and on to eighteen that the necessity and advantage of physical training are most apparent, and it may be that the labours of the Commission may lead to some form of physical and even military training being made compulsory for all boys between fourteen and eighteen years of age, on some such system perhaps as that which has been sketched by a recent writer in the *Times*. He quotes the words of Lord Balfour's letter to School Boards in Scotland as to the value of military drill:—'Not only does it tend to improve 'manual dexterity and to render more alert the faculties of observation, but it is also pre-eminently useful 'in developing those habits of comradeship, of responsibility, and of individual resource, which are of 'supreme importance, not only to the nation as a 'whole, but to the individual pupil'; and he enforces them from his own experience as an employer of labour both in this country and on the Continent, having formed the deliberate opinion that military training, in the countries where it is practised, has not only a high

physical and moral, but an appreciable and calculable financial value, which varies in direct proportion to the thoroughness and strictness with which it is enforced. But there is no doubt that a great deal may be done voluntarily to improve the opportunities for physical training available for boys who have left school, and to encourage them to take advantage of these opportunities. The Secretary of State for Scotland possesses a very favourable position for directing an inquiry into these subjects, and of securing the co-operation of the various bodies, other than educational ones, which have already exhibited an unusual interest in the practical working out of the problem set before the Royal Commission. The municipal authorities in most cities and towns throughout Scotland have long been supporters of the movement for improving the physique of the population; at Aberdeen, Dundee, and other places they have supported the quasi-public gymnasia, where school-teachers and others obtain certificates of qualification in the teaching of physical drill, and the County Councils, notably in Fife, have not been backward in giving similar encouragement. The athletic clubs throughout Scotland have done, and are doing, much to improve the physique of the Scottish youth; and, lastly, the Scottish volunteer authorities have introduced a system by which all would-be volunteer recruits must pass certain tests in physical fitness. All these different bodies have been working with the same end in view—namely, the physical development and training of the youth of the nation; and if the Royal Commission is able to inquire into the various schemes now in operation, and to suggest some method by which they may be co-ordinated and combined for the common good, the practical solution of the problem will not be far distant. The vital importance to the nation at large of improving the physique of the population of such cities as Glasgow and Dundee cannot escape the notice of a statesman like Lord Balfour; but the question no doubt arises as to what is the proper authority to undertake the work, which, as regards youths between fourteen and eighteen, must be looked upon as a continuation of that done in the day schools; and no doubt the recommendations of the Commission will deal with the question as to whether it should be undertaken by the Education Department, or by county or municipal authorities, in the same way as technical education is now. But, in the absence of any compulsory system of training, the unification of system and increase of opportunities will fail to induce those who especially need this training to undergo it. This can only be arrived at by putting a premium on physical qualification in all selections for posts under Government or under municipal authorities, and by requiring a certain number of attendances either at evening classes for physical drill or at outdoor training. The enormous success of the Boys' Brigade, especially in Scotland, is a convincing proof that both parents and boys themselves recognise the real moral as well as physical value of military drill and training. Though this association aims at producing God-fearing citizens rather than soldiers, its organization is closely modelled on military lines, and it is really in close touch with the volunteers through its officers, many of whom hold commissions in the volunteer force. These facts seem to point to the possibility of some similar organization, which should include all boys between fourteen and eighteen, and which should be closely allied to the local volunteer battalions, so as to share with them the use of their training grounds or drill halls. These latter are a necessity in any scheme of general physical training, and the expense of providing them is one of the obstacles in the way of the introduction of such a system; but if an arrangement could be made for the use of the existing halls by boys at an hour when not required by the volunteers, the expense would be greatly reduced. This association with the volunteers would have the further advantage of familiarizing the boys with the idea of joining our 'citizen army,' and it might be reasonably expected that a large proportion of them would do so on reaching a suitable age. In this way the physical training of

our population at school, during youth and in manhood, might be made to correspond to the threefold division of primary, secondary, and higher education, and military training take its place beside elementary and technical training as a recognized part of the national system of education. We have endeavoured to indicate as far as possible the points to which it seems to us the Royal Commission on Physical Training in Scottish schools will need to direct its attention, and to suggest the lines along which its inquiries may be most fruitfully prosecuted. It remains only to appeal to the patriotism of Scotsmen generally to ensure that the work of the Royal Commission may be of the utmost value to the nation. The honourable pre-eminence in education for which Scotland has so long been noted, and the phenomenal success of her sons in all walks of life all over the world, has a very direct connection with the physical health and strength of her population; and it must be a matter of national concern that effective measures should be taken in time to prevent the weakening of this health and strength through the conditions of modern life and civilization. As already shown, there is a wide recognition of these truths, and many efforts have been made to encourage and develop physical training; but what is needed now is that all who have the cause at heart should come forward and put their knowledge and experience at the disposal of the Royal Commission. We would specially appeal to those Lord Provosts and Provosts, and other members of municipalities and county councils, who have done so much in the past, to take advantage of the present opportunity to secure a real and thorough consideration of the whole subject as it affects the youth of the nation. The reference to the Commission directs its inquiry not only to the State-aided schools, but to other educational institutions, among which the magnificent endowed schools of the Merchant Company of Edinburgh, of the Heriot-Watt Trustees, and of other bodies are, of course, included; and with such resources at their command, we cannot but hope that the labours of the Royal Commission will result in the establishment of such a system of physical training throughout Scotland as will give a lead to public opinion, and serve as a model for systems to be adopted throughout the Empire."

9256. Might I just ask, then, some questions as to some of the points that are raised in this statement, which seem to be of special importance? You say: 'The mere exercise of boys in elementary drill and gymnastics without the careful consideration of physical conditions and the special requirements of individuals does not constitute physical education; nor yet, on the other hand, does an elaborate system of intricate drill and gymnastics, which has for its object the production of professional athletes or trained soldiers.' You think that is so—that for the real educational benefit to the individual you must not look to the purely professional aspect or military aspect of it?—Certainly not.

9257. And that to secure ourselves against any dangers you must have careful medical supervision?—Certainly. Medical supervision.

9258. Have you seen, in the course of your inquiries, any dangers arising from the want of medical supervision?—Well, I have noticed in the schools the training of girls in athletic exercises, notably at Sciennes School. Sometime ago I went with Mr Murray and pointed out to him that he was employing an instructor who really did not know his work; that the instructor was giving to young girls exercises that were only designed for young men, and that in that manner he was endangering the health of the pupils, and also the success of the system.

9259. Was it a system of his own devising, or was it any system that is generally in vogue?—No, it was of the instructor's devising.

9260. And based upon insufficient physiological knowledge?—He employed an instructor without knowing that the instructor was not qualified. In the same way, in a Board School—I forget the name of the Board School, I went to two or three of the Board

General
Chapman, C.B.
19 June '02.

General
Chapman, C.B.
19 June '02.

Schools in Edinburgh—they were all of them failing in the same way, because the instructors had not been taught the latest Aldershot system.

9261. You visited, I think, in my company, the Training College in Edinburgh?—Yes.

9262. And we saw several exhibitions of physical drill in the Waverley Market and in the Music Hall in Edinburgh?—Yes.

Aldershot
system:
exhibition
seen and
commended.

9263. Would you give the Commission your impression as to those?—Well, most of those exercises were on the Aldershot system entirely, and the only instructors that are qualified have been trained at Aldershot, and I thought that the exercises were very good indeed at the time, and they compared very favourably with what we saw the other day at the Albert Hall.

9264. In the Music Hall the school that was shown was the Merchant Company's School for Girls?—Yes, the Merchant Company's School.

Swedish
system for
girls.

9265. That was not purely the Aldershot system?—No; that was the Swedish system.

9266. How do you compare that with the Aldershot?—That is a very superior system—very superior for girls.

9267. To the Aldershot system?—It is the best system that can possibly be introduced for girls.

9268. But you do not think it is suitable for boys?—No.

9269. And, on the other hand, you do not think the Aldershot system is quite suitable for girls?—I would make a modification in it. I think there ought to be a modification made, with medical advice.

Uniform
system:
reasons.

9270. Then that brings us to the question, how far would you insist upon a uniform system, or how far would you allow diversity?—I would advocate a uniform system throughout, and any alteration of the system will be more or less a change in the exercises given to the pupils.

9271. Can you give us any reasons upon which you base your opinion as to the benefit of a uniform system rather than a system modified from time to time according to the notions of different masters?—The Aldershot system is a system that admits of a great deal of elasticity. For instance, during the last seven years it has undergone great changes, and year by year, as a particular exercise is found to be of greater value than another, more attention is paid to it.

9272. But it is based upon certain general principles?—It is based upon general principles which have been worked out and thoroughly tried.

9273. Can you describe what you think the general principles ought to be upon which any system is based?—I think that is too technical a question for me to answer. You will find it explained in any book on physical drill.

9274. It is a broad question for the Commission. Should it be a system which develops muscle, or rather which produces agility and lightness without undue fatigue?—Certainly the last; we do not want muscle at all.

9275. Have you studied Mr Sandow's system?—Yes.

9276. And are you in favour of that or not?—Not at all.

9277. Then perhaps you would tell us what you think are its defects?—Well, there again, it is difficult to state what I think are its defects.

Sandow's v.
Aldershot
system.

9278. But could you tell us how it compares with the Aldershot system which you favour?—No; I do not think I can, because it has not been tried in the same way. The Aldershot system has been tried with a large class of recruits, and we have for several years proved that we are satisfied with it, and we consider the development of the recruits, and their growth and health in carrying it out, and that is proved by the medical opinion to be thoroughly good. The system of Sandow has merely been experimented upon, and it produces a great deal of muscle, as you say, but the great question is whether it develops all the faculties of the body that are required to make a healthy man. I do not think so.

9279. The system you wish is one that should not

develop too exclusively in one direction, but should train the body all round?—Certainly.

9280. Passing on, you say that you are very anxious that due consideration should be given to the side of the question which affects girls. Are there any points that you would like to call the attention of the Commission to in that respect?—Well, I think girls should undertake only a portion of the exercises that are given to boys.

9281. Would you carry it on in the case of girls with musical accompaniment?—I think I would for girls.

9282. You think it relieves the strain upon them?—Yes.

9283. Would you have it conducted by male or by female teachers in the case of girls?—Male teachers are very good for all schools, but in many cases I would sooner have the lady teacher.

9284. And in your experience of the schools, did you think the best results were obtained by the lady teacher?—Those that we saw were excellent. The Merchant Company's Schools were excellent, but they are rather a class above what we are talking about.

9285. Oh, no; the Commission includes all classes; it is not confined.—I do not think I would limit the teachers; they must be men or women as may be thought fit.

9286. That brings us to the next point in the paper which you submit to us—the training of teachers, and you are anxious to urge certain views with regard to that?—Well, my view is one that I have always held and have put forward very strongly to the War Office, and I put it forward to the Lads' Drill Association, of which I am a member, that there should be a gymnastic school for civilian teachers arranged close to our Aldershot school for military teachers, and that the same system should be worked, with such modifications as may be desirable in either case.

9287. But do you prefer a separate school to which the teachers should go for this physical training rather than a system by which the physical training should be introduced into the existing Training Colleges for teachers?—No, I do not want them all to go to the one school, but I want the school to issue the plan of teaching, and to have any instructors that require it sent to the school for training.

9288. But why should they not have adequate provision made for them in their existing Training Colleges?—I do not see any difficulty at all, but you do not understand exactly what I mean by a school. A school like the Boston Normal School in America is practically a college, and has courses of instruction for one or two years, and people go out more or less qualified as instructors, and take the lead anywhere they may choose. All I want is that there should be a school.

9289. Then you contemplate that the instruction in this part of education should be in the hands of special teachers trained in this school rather than in the hands of the ordinary teachers receiving special instruction in this subject?—Oh, no; the ordinary teachers may receive instruction according to any rules the school may lay down.

9290. Yes, but would you rather have the teaching in the hands of the ordinary teacher, provided they were sufficiently trained in this way, or would you prefer that it should be in the hands of special instructors, quite apart from the ordinary body of teachers?—I think the ordinary body of teachers must go through a certain training, and be made fit to impart the knowledge in physical drill that they require to do.

9291. I think you have hardly answered the question, which is one of much interest for the Commission, whether you should prefer that it should be in the hands of the ordinary teacher having had a certain instruction, or in the hands of a special class of physical instructors distinct from the ordinary teachers?—Oh, I think the course can be mastered by the ordinary teachers.

9292. And you think it would be more desirable

General
Chapman, C.B.

19 June '02.

than to leave it in the hands of the ordinary teachers? —They should be made to go through the course.

9293. It should be a part of their ordinary training that they should get some instruction in physical exercise?—Yes. Do you remember the volunteer company that we saw at the Training College in Edinburgh; well, the men in that volunteer company have gone out as teachers qualified to carry on the physical training.

9294. Then, so far as you saw the work in the Training College, you think they were receiving adequate preparation for their work in physical exercise? —They were doing very well, indeed; but I sent for the captain of the company, and pointed out to him some things in which he was defective, and recommended him to go to Aldershot to get a refreshing course.

9295. But they were upon right lines?—They were on the right lines.

9296. And that system was satisfactory, only you think that it required additional inspection and supervision?—That is all.

9297. And advice?—And a refreshing of knowledge.

9298. By coming to a central physical school?—To a central physical school.

9299. And you prefer that there should be one for Scotland rather than that they should go to Aldershot? —No, I do not think I do. I think, for instance, in Scotland we managed very well by getting the instructor at Glasgow thoroughly taught at Aldershot with a staff of men trained at Aldershot.

9300. But do you think you can get all the teachers in Scotland to go up to Aldershot?—No, I should say not; but there could be a school. The advantage of having it at Aldershot is that there is the headquarters of the army system. We cannot make another.

9301. Then passing from that, you speak of the importance of a system of supervision and of inspection, and you say that the successful working of the system must largely depend upon the character of the examination and inspection to which the pupils may be subjected. Now, could you give us any suggestions of a practical nature as to that?—Well, I have talked that over with you before. I think the allowance for an inspection is sufficient to cover the travelling expenses of volunteer officers or sergeants-major in cases of smaller schools, and I think it can be easily carried out in a regimental district under the orders of the colonel commanding, in communication with the Educational Authorities, and I do not think that there need be any great disturbance of the existing system, provided it is allowed.

9302. Then we come to a very important point in your evidence, which, you say, is the most interesting and important part of the work confided to the Royal Commission, that which deals with the question of continuing and developing the opportunities for physical training for those who have left the day schools. Well, what suggestions would you offer as to that?—I would like to draw your attention to what exists in Scotland. There is a great deal in Scotland that exists that is not in any other part of the British Islands. The athletic clubs in Scotland, the Edinburgh Harriers, the Athenæum Club at Glasgow, the club at Dundee and at Aberdeen, and at Leith and other places, they are all working in one direction—to improve the physical condition of the people. And these clubs are taken an interest in. The Lord Provost is president of the Edinburgh Harriers' Club; the Provost of Leith was president of the club at Leith; and the Lord Provost of Dundee was president of the Gymnastic Club of Dundee; and the Lord Provost of Aberdeen took a large part in the matter; and they were all endeavouring to aim at one thing; and it was taken up largely by the School Board in Aberdeen and Sir John Cuthbertson in Glasgow; they were all anxious to arrive at the same thing.

9303. And they were doing good work?—In addition to that, the Boys' Brigade existed at Glasgow and all over Scotland, and the Boys' Brigade, I found, had

its officers very largely taken from the volunteers, they all wished to go through physical courses in order that they might train the boys, and were doing their utmost; so that I think the Commissioners must not lose sight of what is already existing and what I said in the Article was that the different means should be co-ordinated to arrive at some system that will suit the whole country.

9304. Then what you say shows that there is a good deal of work being done for this class of lad?—A great deal.

9305. And that it is in the right direction so far as it goes, these various agencies of the gymnastic clubs and the Boys' Brigade, and so on; but do you think that it adequately fills the whole field, or that there is a large class which they fail to get hold of through these agencies? —I have always advocated public gymnasia in all towns of importance, and the Lord Provost of Edinburgh had a Committee at my instigation to consider the formation of a gymnasium in Edinburgh, and that Committee came to certain resolutions and conclusions, and it only wanted a certain amount of money to be carried out; and I think that the idea is in all cases to form the gymnasium, where they may have classes as they now have at Dundee and in Aberdeen.

9306. But was that gymnasium actually established in Edinburgh?—No, because the Lord Provost went out, another Lord Provost came in, and we had not the £10,000 we wanted. We are waiting for £10,000.

9307. So that you think the voluntary efforts have been very good so far as they have gone, but that they want to be more universal and have a wider range?—Yes.

9308. And supposing these opportunities were provided, would you require that the youth of that age should avail themselves of them?—I think in my article I have said something about it.

9309. 'But there is no doubt that a great deal may be done voluntarily to improve the opportunities for physical training available for boys who have left school, and to encourage them to take advantage of these opportunities.' But I wish clearly to understand for the information of the Commission, are you prepared to say that it ought to be made a matter of compulsion that they should use these opportunities if provided, or are you not prepared to go so far?—Well, I say it in this way: 'In the absence of any compulsory system of training, the unification of system and increase of opportunities will fail to induce those who especially need this training to undergo it.'

9310. For them would you require compulsion?—Certainly, I say the absence of that will make them fail to undergo it.

9311. And you think the legislature will be entitled to enforce it; that is the point I want to get your answer on?—I think that is a question in regard to which I am afraid I must read the other portion of my sentence: 'This can only be arrived at by putting a premium on physical qualification in all departments for posts under Government or under municipal authorities.'

9312. Then you would prefer rather that it should be by encouragement, and by the recognition of the physical training, rather than by any system of compulsion?—I think you will get it most easily in that way. But then I say at the end: 'And by requiring a certain number of attendances, either at evening classes for physical drill or at outdoor training.'

9313. Then summing up your position, as I take it, is this, that you think that these physical exercises, quite apart from their importance from a professional or military aspect, form an important part of the education of every individual?—Certainly.

9314. That they must be carried out by one system, which, without being uniform, must be based upon certain general principles. That is your view, I think? —Yes.

9315. That it must be under medical supervision, and that the medical supervision of the children in our schools must be increased: that you think also—you

Encourage-
ment
preferable to
compulsion.System based
on certain
principles.Medical
supervision.

Ordinary
teachers :
careful
inspection.

have said so, I think, in the evidence?—When they are undergoing this course.

9316. And you think that the subject is one of equal importance for girls and for boys, and that the ordinary teachers might be entrusted with this part of education, provided always that they receive adequate training according to some authoritative system. I think that is your view?—Yes, and careful inspection is introduced.

9317. And that there should be adequate inspection and supervision?—Yes.

9318. That with regard to the boys over school age, you are quite convinced that opportunities should be provided for it, and that they should be encouraged, if not compelled, to make use of these opportunities?—Certainly.

9319. But you hesitate to apply the word compulsion?—I only hesitate about compulsion because I feel that it is a difficult question to raise.

9320. *By the Chairman.*—I think it is not only a difficult question to raise, but it is a difficult question to settle; more difficult to settle than it is to raise?—What I feel is, that if I raise it now, or anybody were to raise it, it would lead to the whole question being put off.

9321. You are acquainted, are you not, with the Duke of York's School and with the Hibernian School?—Yes; I have not been to the Hibernian School.

9322. But you know of its existence?—Yes.

9323. Do you think it is a pity that there is not a similar institution in Scotland?—I think it would be a very good thing.

9324. As an object lesson as to what can be done by the system which I understand you to advocate in particular, namely, the Aldershot system?—Yes; I think it would be an excellent thing.

9325. May I ask, are you so wedded to the Aldershot system that you consider Colonel Cruden's system not sufficiently adequate for school purposes?—Colonel Cruden's is the Aldershot system.

9326. Not absolutely?—Well, I mean to say it is as near it as can be. He was trained at Aldershot; he began by going to Aldershot to acquire his knowledge, but this was some time ago.

9327. May I not say that you gave approval to the officer in charge of gymnasia in Scotland to inspect certain exhibitions of training in schools?—Yes.

9328. You may take it from me that that officer has stated to us, in his evidence before us, that in one place, if not in more, he considered Colonel Cruden's system extremely faulty?—That is because Colonel Cruden has not refreshed himself; has not had the refreshing at Aldershot that he might have had.

9329. Another point; the Aldershot system is, of course—I think I am right in saying, am I not?—only good, if it is really properly taught by those who know how to impart drill?—Yes.

9330. And that a poor or even a mediocre knowledge of drill almost reduces it to absurdity?—Yes.

9331. That there is no benefit to be obtained from it unless it is imparted by one who knows how to drill children?—Quite so.

9332. What I rather want to get at is whether you consider that teachers are, as a general rule, sufficiently trained to be able to impart drill to be of any use?—We have a lack of teachers; there are not enough.

9333. Teachers in Scotland; in schools, I mean?—Teachers in schools must be qualified.

9334. Yes, but what they call qualified; they may be qualified to know the exercise, and not qualified in the least to impart it?—That will not do at all; they must go through a course.

9335. Have you from your personal knowledge any opinion on that point, having seen teachers who have been through schools, and who are supposed to be qualified; I rather mean my question to apply to Scotland?—Of course there are cases of the kind; if you go round the schools you would see them; these teachers vary enormously.

9336. What I rather want to get at is, do teachers vary so much that we ought to cast them aside, and not rely upon them as being generally fitted to teach physi-

cal exercise or gymnastics or drill?—No, I think ton; I think that would discourage them altogether in work in which they are very much interested, the improvement physically of their pupils; and it is very important to get them to go through the requisite training, in order that they may impart instruction.

9337. Should you be in favour of teachers being inspected, not merely by the ordinary inspector but by an expert as well?—Certainly.

9338. In physical training of all kinds?—Yes, if you can arrange it.

9339. What is your opinion of inspectors' knowledge of what is good or what is bad in drill as existing; have you any opportunity of knowing as to that point?—A small number only are qualified at present.

9340. In order to strengthen existing inspectors, I understand you recommend that they should be aided by an assessor in the shape of an expert?—Yes; that no officer should be named as an inspector unless he has certain qualifications which are approved of by the Gymnastic Instructor.

9341. I am meaning His Majesty's Inspector of Schools?—The Inspector of Schools; I consider him quite unfit to make the inspection.

9342. Without assistance?—Without being tested himself.

9343. Or the assistance of an expert assessor?—Yes; it is impossible.

9344. *By Mr Alston.*—You of course know a good deal about the Boys' Brigade?—Oh, yes.

9345. I think you remarked a little while ago that they have done a good deal for physical training; did you mean simply in their military drill, or apart from their military drill?—Well, in their military drill they have begun physical training; they have not opportunities.

9346. That is what I wanted to bring out. They have no opportunities other than their military drill, unless one of the officers happens to be a gymnast, in which case he probably starts a gymnastic club?—Yes.

9347. But would that military training of the Boys' Brigade be sufficient as physical training for the upbringing of the youth in the school?—No.

9348. It would not?—No.

9349. As the Chairman has said, we have been puzzled to know how to secure uniformity in physical training in schools among the various methods that have been produced; could you help us in that direction?—I think the only way is to form training schools, from which all the different ideas and orders should go out to the teachers.

9350. That would certainly obtain uniformity throughout the country, but it begins by insisting upon one particular method of instruction at headquarters?—Yes.

9351. And I think you said that the Aldershot system, in your view, is the best?—Undoubtedly.

9352. You think that it contains all the elements for training the child?—Yes; I think it has everything.

9353. Every part of the body?—Yes; I only think that it ought to be modified according as children are more or less capable of undergoing it.

9354. Would you leave that in the hands of a medical inspector?—I would leave that in the hands of a medical man.

9355. And you think there would be sufficient variety in the Aldershot system to provide physical instruction in the schools, both for boys and for girls?—I think there is great elasticity in it. For instance, Colonel Napier the other day was saying that one particular exercise was found the value of two or three years ago, and that exercise has been developed; and another exercise which was found to be useless—for instance, in lunging, it was found to be very difficult to carry out a certain position—it was then given up.

9356. Who introduced that exercise?—Well, the system was introduced at Aldershot, but Colonels Fox and Napier, the superintendents, found year by

year certain improvements to introduce. They have acquired a great deal from the Swedish drill, and from other schools, and they find out things every year.

9357. And the authorities at Aldershot are not so hide-bound as to refuse to introduce all the improvements that are necessary?—Not in the least.

9358. And I suppose the drill is a form of drill that the medical profession would approve of as fulfilling the requirements?—The medical profession have been consulted in every step that is taken.

9359. We saw a form of drill to-day in which improvement in the chest, the heart, and the lungs was apparently brought to great perfection by breathing exercises; is there anything of that kind at Aldershot?—Partially.

9360. A boy under fifteen, thirty-nine inches round the chest, produced by this particular method?—Yes.

9361. Is that to be found from the Aldershot instruction?—No, I do not think you would find a boy of fifteen there. Breathing and supplying the body with air is a common practice in certain exercises; in bending and stretching and rising they are taught that.

9362. The medical gentleman in charge laid great stress upon this training; he said we might expect boys trained by this particular form of exercise would, in after years, be entirely free from all lung disease?—That is a very happy conclusion to have arrived at.

9363. Other things being equal, and the boys not exposed to dangers from the outside; but he said practically these boys should be free in after-life from all ailments of the chest. In the same way with the exercises which strengthen the muscles of the abdomen, these boys should be free from danger in that quarter, such as hernia, and other strains?—Yes.

9364. The Aldershot system would produce these results also?—I suppose it would produce them all, not so distinctly.

9365. I notice, General, you advocated gymnastics in the schools; you mean gymnastics with apparatus?—Yes.

9366. Would you distinguish between these and the physical training on the floor, extension motions and so on, either with or without dumb-bells?—Gymnastics with the apparatus must take time.

9367. Would you advocate the gymnastics for boys in school?—When it could be done; when there is a good gymnasium; but I do not see why boys should not go through physical exercises without having gymnasia.

9368. That is what I meant. Would you be content with physical exercises without gymnastics?—No, I would not be content with them.

9369. You would commence apparatus with the boys in the school?—Yes, an enormous number of schools never practise.

9370. And then would you add the military drill to that?—Yes.

9371. Would you say that military drill was a necessity, and that the boy would not get all the benefit he ought unless he had gone through the complete military drill?—I think so.

9372. With the rifle—the dummy rifle?—Then you are going further still.

9373. I am thinking of military drill involving the manual and firing exercises?—I do not think a boy needs to handle a rifle; at fourteen he is very nearly too small; I do not think it is the boy that needs to handle a rifle.

9374. No, but I am thinking of the boy that needs to handle the rifle for the purpose of putting the finish upon the exercises in his military drill?—Yes, just when he is leaving school.

9375. Fourteen?—Yes; at fourteen, I think he might.

TWENTIETH DAY.

Friday, 20th June 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr R. B. PEARSON, *Secretary.*

Mr GEORGE SHARPLES, examined.

*Mr
G. Sharples.*

20 June '02.

9376. *By the Chairman.*—You are the headmaster, Waterloo Road Board School, Manchester?—I am.

9377. You have been so for some time?—Thirteen years.

9378. You have your notes before you; will you please read from them?—I have set out on this note merely the various forms. I take it for granted that practically you have had evidence with regard to these, so I simply set them out. The point, it seems to me, that you want me to deal with is as to whether these

are carried out, or can be carried out, under present conditions. Now, then, on I.: As you are aware, we have set out in the various schools in England various forms of calisthenic drill, but, to my mind, they are not suitable for the conditions under which they have to be carried out in the majority of schools in the country. The difficulty is that almost invariably you find the schools crowded with furniture, every classroom, so that practically they are driven, in the majority of instances, to the open air. In many cases

that cannot be done, because they have not suitable playgrounds to carry out the exercises properly, and further, that there are not even public grounds to which the children could be taken for the purpose. It seems to me that what is wanted—shall I say a gradation of orderly physical exercises, that could be taken even with furniture in rooms, until such times as we can prevail upon—shall I say the new authorities in England and the present authorities in Scotland? I cannot speak for Scotland; I ignore Scotland in this matter; a dangerous thing to do, I know, but still I am bound to—to introduce some graded, perhaps I had better say, scale of exercises to be performed in the school. In Manchester I think we are going to get over that difficulty somewhat. We have had a physical instructor appointed; he is totally different, in my experience, to physical instructors in a way, in the sense that he spent the first few months in the city in visiting the schools, and seeing the conditions under which the physical exercises had to be carried on, and on that he has based his exercises, which can be graduated for the different schools, but each bearing the essentials. Again, with regard to the marching exercises, I think that these could be done in the schools if there was a proper supervision, if the teachers thoroughly understood what was the meaning of the marching exercises, and there was some one to encourage these things to be done under ordinary conditions. The breathing exercises, of course, can be done anywhere. My opinion is that you really do not need to go through a long exercise to do that; they could be done using the wall as a base or using the desk as a base. You see I have added games for infants in the first portion. Now those are for ordinary schools, and I think they attempt to carry them out. What we want, of course, is a room, at any rate one room if not a central hall, without furniture, where they could be taken for some of the more advanced exercises. Suitable playgrounds, of course, and I am hoping that in England with the new arrangements, if the municipal authority is formed as the basis, seeing that it is a body that controls the education of the children and yet has control practically of the city, that they will see to it that there are suitable open spaces and gravelled spaces. I do not know quite what you understand by gravelled spaces. Salford has solved that very effectively in their congested districts by taking an area and simply gravelled it, and putting a good stout pipe round—a gas-pipe $1\frac{1}{2}$ inches in diameter, or an ordinary pipe of that character, with posts, where two or three matches, say, could be played at once, and undoubtedly they are the most active places in the whole town every spare leisure moment. Now take the suggestions in connection with I.—the room for each school to be free of all furniture, the drafting of suitable exercises for different types of schools. That has not yet been done. There is an attempt being made in Manchester. We have a system in draft which will be in print in a short time and can be obtained, and I think you ought to have a copy. I think you will find in it suitable exercises, comprising calisthenic exercises, marching exercises, leaping and jumping, which I am sorry to see is not carried on in the schools as they ought to be. Leaping and jumping are the finest exercise for the training of the muscles of the leg that I know of. As an old football player, I can say they are capital practice for the hot cup tied between Lancashire and Yorkshire—you know what they are. We used to fit our men in that way. Leaping and skipping and jumping could be carried on with the ordinary jumps—hop, skip, and a jump, and the standing jump could be done anywhere. They do it in the street in my district, but still it ought to be carried on. The setting aside of one of His Majesty's Inspectors or Junior Inspectors, in each Chief Inspectors' division, to make a special study of physical training, so that he could advise on, not inspect, the physical training in the schools. May I point out that we have had issued in England, just lately, model exercises, and we find that these exercises are expected to be carried on in schools where practi-

cally there is only one adult teacher, and where there are many divisions? The ages vary from the very lowest to the very highest, in numbers, say, from forty to sixty in average attendance, and they find they cannot do them. If they complain, they are simply told by some inspectors that is the book, that is the model set down; they have got to do it. I do not think that is quite what we want. I think if you had one officer who would make this a special study, and call the teachers together in the various districts, either through the District Unions or through the Local Associations, in a few kindly words of counsel, thoroughly understanding his subject, he would be able, I think, to get the teachers to see that this is as vital a matter—to my mind even more vital—than the ordinary education work. We shall never get on until we do get that spirit in the schools. An instructor for every Local Authority's district—that, I think, is very important. That, perhaps, would almost do as well as an inspector for each district, if we had some inspectors who would make it a special point in their work. II. is physical training in the playground outside school; of course II. and III. are outside school.

9379. I take it from you that is what is done at present: military drill, with physical exercises, or organised games?—Not universally. They have an opportunity to do that; they are encouraged to do that; that is to say, in large towns, of course, they do, but I do not see how they can take military drill in the smaller schools. All the boys take military drill in Manchester. In Manchester all the boys in the schools have been taught military drill by two instructors. I say that in Manchester, up to this new appointment, military drill has been taken by the boys in the Board Schools throughout the city, not taken in the school, but in the playground. In my own place we have kept it up in the ordinary way. We have five companies now of boys who are drilled regularly. Then, as to organised games in Manchester and in many of the large towns in the country, they are now carried on with wonderful success, and I am bound to say that I think this is one of the very finest ways of training the boys physically. You have my paper where I have summarised all these. It is too long; it is no use going through it now; I would refer you to what I have written. Then skipping and running exercises we have done with the girls, and that is extremely important. Then the difficulties. I am speaking now for the schools in general. This could not be done unless, of course, we had a room, which in some of our great cities might be brought about, and good playgrounds. By physical training applied, I mean that you carry this on in a wider way—that is to say, by the formation of School Associations. You get competition in the games, football and cricket, between school and school, carried on under League principles. That brings physical training into the ordinary schools, you see, they must be trained for the games. To have success in a particular school, they have to have boys training up for two or three years, consequently you have coming up boys who are kept in the very best of condition. My opinion is, that if you could form in every town, or in every district where the villages could be gathered together, School Associations to govern football or cricket competitions, you would be doing more than one would think in getting children properly trained physically. The same would apply to cricket and swimming. Our experience in Manchester will show you that. We hold in Manchester the national champions—the school-boy championship in swimming, Great Britain and Ireland, open to all boys under fourteen. One of our schools—Abbot Street Board School, in the very poorest quarter of the city—has taken the first three places in the competition in 1900 and 1901, and I expect they will do it again this year. They have seven cups and shields; and when I tell you that out of that district the present amateur champion swimmer and the late amateur swimmer have come, it shows you what a great deal there is in training. The formation of a Schools' Athletic Asso-

ciation. These I look upon as being extremely valuable. I sent a copy—I have one here—of the Eighth Annual Athletic Sports, held at the Zoological Gardens, Belle Vue, from which you will see what we get—competitions in the various forms. Of course it is a big expense; but that means that in every school in Manchester and Salford for the last month, and up to our next sports, which are on the second Wednesday in July, boys and girls are being tried and trained for the various competitions for which it is possible for them to enter. The effect must be valuable, of course, upon the physical wellbeing of the children.

9380. *By Mr Alston.*—I see you desire to encourage the formation of companies of the Boys' Brigade. That is a very important organisation in Manchester, I think?—Yes; we have two sections there, the Boys' Brigade and the Church Lads' Brigade. We sent 500 up last week to the review by the Prince of Wales, and Manchester was the second place in England, I think, to take up the question of forming the boys into brigades.

9381. It is about nine years old, I think, the Church Lads' Brigade?—Yes; I have a great many of my boys in the Boys' Brigade.

9382. And you find a great advantage in the physical training of the boys?—There is no question about it; you could pick them out in the streets.

9383. You can?—Oh, yes.

9384. Greater smartness?—Very smart; they carry themselves as boys ought to carry themselves.

9385. Do you find they are more polite and respectful?—Yes, I should think they are. Of course in a well-organised school all the boys are to be taught that, but they are smarter and more prompt.

9386. Do you find that employers of labour, such as shopkeepers desiring boys, look after boys connected with these organisations in preference to others?—I have no experience of that. The demand is greater than I can supply at present from my place, and that question has never arisen with me; but I should imagine I should do the same.

9387. Are you connected with one or other of these associations?—Not as an official in any way whatever, but I have followed the movement as an outsider for many years; I have not time.

9388. Which is the second one?—The Church Lads' Brigade.

9389. How many companies have they in Manchester?—I could not say how many companies. They have 2000 boys, I think. Those should be formed in connection with the blocks of schools. You cannot do it in each school, of course, because the boys as they are preparing to leave in the upper divisions could form a Brigade in the upper forms of the school.

9390. Would you not have this difficulty, that the companies of the Boys' Brigade are attached to a religious association?—The Church Lads' Brigade.

9391. I am speaking of the Boys' Brigade always; each company must be attached to a Christian organisation, a church or mission?—A church or mission; yes.

9392. In that way you could not make use of the organisation in connection with schools?—No; but the boys themselves could be encouraged to join one of the Brigades in the district, if you could not join yourself.

9393. The boys in the schools you would encourage to join one or the other of those organisations?—Yes; they are drilled already in Manchester.

9394. Would it be for the sake of the drill you would do so?—For the sake of the boy; it reacts upon him immensely; a very strong moral force on the boy at a critical time of his career, from twelve to fifteen years of age—extremely important.

9395. You have that control over the boy in the school?—Yes.

9396. You think it is a distinct advantage to join a military force after school age?—Certainly. I advise my boys now to do that. May I say in connection with that, to show you—I am in a Jewish district, and the

Jewish people have formed a Jewish Lads' Brigade, and very successful it has been. Now, I have advised all my Jewish boys, I have massed them together when they were at drill, I have detached them from the other boys, and advised them to join it, and they are doing so; it makes the boys smarter.

9397. You would go further, perhaps, and encourage the military drill amongst boys after leaving school up to the age of eighteen?—Personally, I must not in any sense be understood to speak for my organisation, or for anybody else but myself personally. I should go quite up to that, that everybody ought to go through a form of military drill up to eighteen.

9398. Would you recommend that such drill or physical exercise after school age should be compulsory?—I would. It is not popular, but that is my opinion; you must have some form of drill.

9399. Could you get classes filled with boys without compulsion?—I do not think you could.

9400. You have formed that opinion from your knowledge of boys?—In cities; it might in country districts where there is not much to do.

9401. Is there not sufficient attraction in these exercises to bring the boys?—There would be to some boys, but not the boys as a whole.

9402. The mass?—You see they work all day. I am understanding you to mean a compulsory weekly drill, something of that kind.

9403. Say in continuation classes after school age?—Yes.

9404. Your object being that these boys should be well drilled after they have left school?—Yes.

9405. And you think that it would require to be compulsory, because the attraction would not be sufficient to bring the boys?—I do not think it would; it might or it might not.

9406. Then you speak of breathing exercises on the first page; have you had much experience of that form of physical training?—Yes.

9407. Do you consider it very efficacious?—I do; I consider it very valuable.

9408. That is for the strengthening of the chest, the lungs, the heart, the organs in the chest?—Yes.

9409. Have you found any evil effects from its practice?—Yes, where it has not been properly done. I have in one or two cases found that it is possible to overdo it, of course.

9410. Have you medical supervision, then?—At the schools? Medical supervision.

9411. Yes?—No; we have not. We have just had a medical officer appointed; I suppose we shall have now.

9412. Then in exercise such as that, would you not recommend that the medical man should advise what boys should practise in breathing exercises?—If the teachers were properly instructed, I do not think it would be necessary.

9413. You have found no bad effects from exercises such as these breathing exercises?—In breathing exercises only; I have found that physical training has been overdone as a whole, but not breathing exercises particularly.

9414. Is it from want of skill on the part of the master?—Exactly. I may illustrate it in a simple way. You know the exercise to throw the arm back like that [*showing*]—well, I find even our military instructors allow boys to throw the arm right back like that, right to the end; well, the child feels it right down his back at once, and I have known children very seriously damaged by it. Taking it the ordinary way, just making the force, and bring it forward two inches, where he does not feel it quite the same, I have found children, weak children of course, have been damaged.

9415. Was that under instruction by a skilled instructor?—Not exactly a skilled instructor; a man who had been accustomed to drill men and not children.

9416. Then he was foolish enough not to see the difference, and apply only suitable exercises to children?—The same in the squaring of the shoulder.

9417. That is why I asked about the medical supervision being necessary?—That is what I mean by

Mr
G. Sharples.
20 June '02.

medical supervision being necessary; that is, I mean somebody who thoroughly understands the physical training, and has studied it from a physiological side as well.

9418. Have you worked upon a uniform system of physical training?—At school.

9419. What system have you adopted?—The name or man? In Manchester I have taken a part of Chesterton's drill in my school; but you are speaking of Manchester as a whole, are you not?

Manchester:
not recognised
system.

9420. Yes?—Manchester has not any recognised system; they have simply military drill; they have taken the military exercises until the appointment of this instructor.

9421. Is that the Aldershot system?—Yes, the old military system.

9422. Is it up to date?—I do not think it is.

System:
uniform in
essentials;
their grada-
tion.

9423. Would you approve of a uniform system of drill in schools?—Not quite. I would approve of the essence being uniform, and after that there should be a gradation suitable to the schools at which it should be carried on.

9424. Would you approve of a uniform system large enough and wide enough to enable you to select portions of it according to the conditions of the classes and of the children?—As a rule I would.

9425. So that all teachers, male and female, would go to the same fountainhead for their instruction, but vary the practice as the class required?—I think for the children I would until the teachers thoroughly understand the exercise.

Games v.
physical
exercises.

9426. *By Sir Henry Craik.*—I would like to ask two questions arising out of this paper: Do you prefer games to physical exercises in schools?—Yes.

9427. You describe yourself as against a uniform system in this paper?—A uniform system of what?

9428. Of physical exercises?—I do not quite understand that I do.

9429. Yes; once or twice you say 'it is almost 'uniform, and the good becomes minimised'?—I am speaking about the exercises that are just taken to relieve the monotony.

9430. Quite so; you prefer games to physical exercises?—Yes, I do. I like both, of course, but of the two I should prefer games.

9431. In this paper you state distinctly that games are preferable?—Yes.

9432. Do you know that there are certain dangers in the games, undue competition, with the effect of pushing the weaker to the wall?—In a game?

Games:
dangers.

9433. Yes, that there are such dangers?—No, I do not think so.

9434. How would you answer this, on page 8 of your paper? 'From Leeds,' you say, 'there has been 'a genuine physical improvement in the health of 'several boys, one parent begging that her son, who 'had been left out of his school team, might be re-'placed.' Does not that show that weaker boys are apt to be pushed aside?—Only from the team, not from the games themselves; that is from the eleven; that must always happen in any school.

9435. Looking again to page 10—'an admiration 'among the scholars for their athletic champions, 'equal to their respect for the school scholarship 'winners.' Will not that be apt to produce a rivalry, and give the advantage to the specially athletic, who would push the others aside?—I do not think so.

9436. Then you think that medical supervision is not necessary in regard to games, where there are such?—We have never needed it.

9437. You never required medical supervision?—We never had a medical man on the staff.

9438. You do not think that the games, as described by you in the paper, might now and then lead to something of professionalism or undue excitement, which might not altogether be healthy for boys?—It might in a single case or two.

9439. Do you think it is very desirable that you should have, for instance, an annual festival at Sheffield for the boys, visited by thousands of people, parents and friends of the children? Again, I will read

further on, at page 13: 'The number of entries was 'very large, and the number of spectators exceeded '20,000.' On page 16, that in 1897 the final tie was played before one of the largest concourses of people ever gathered together, over 60,000, at the Crystal Palace?—Yes.

9440. Do you think that is altogether desirable for a boy?—I do not see what harm it can do.

9441. You do not see any harm?—I think the very object of the game is that it is not playing for—

9442. You would admit that amount of competition?—That is not competition in that case.

9443. Without medical supervision?—Yes, I think in our own schools.

9444. *By Sir Thomas Coats.*—In following up the questions Sir Henry Craik has put to you regarding these games, I would like further to ask, do all the children in your schools take part in games?—Not in football.

9445. No, but in the other games?—You mean games of cricket and football?

9446. Are there not many children who are unsuited for playing games either from want of physical strength or because their minds do not lie towards playing games; is there not a number of children of that kind in the school?—Yes, we have, and some of them are too young to take part in organised games.

9447. I do not talk of the too young, but those of suitable age to play games, who for some reason or other, either from want of physical strength or that they have not an aptitude for games, are rather left out?—They cannot join in them of course, every-body.

9448. They do not get the same attention in physical training that the others do, and they are the very children, I should say, who most require that physical training?—They get the physical training, then, in the physical exercise taken in school; we do take both.

9449. But then you say you place more dependence on games than physical exercise; therefore these boys who are able to enter the first eleven in the cricket or the football elevens get this additional training in the games that you have laid stress upon?—Yes; they are the team of the school, but they are not the only boys who play football. There are games in the various classes, of course, besides.

9450. But do those play?—They play class against class; but the team that is spoken of here as appearing before the people are the specially selected team; and in the case of the last question, teams representing the whole city were only eleven boys out of the whole of Manchester, for example, or the whole of Liverpool would be taken; but more boys than that play, of course.

9451. All the boys take part in games—that is, all those who are physically capable?—Physically capable, yes; above Standard III., say.

9452. Do you make it compulsory?—Oh, no, we do not make it compulsory, but still they do; and in the training for it, preparing the boys to stand the endurance, they all take the running exercise. I very often take them round, twice round, our yard; we are well off in that respect; then three times, then four times; and they have that duty for weeks to give them wind.

9453. *By the Chairman.*—I think Sir Thomas Coats rather meant whether it was compulsory on boys to play games?—It is not compulsory on them to Clay games.

9454. If a boy likes to shirk, and not to play, he is able to do so?—Well, we should not force him to play, but we should give him some sort of physical training.

9455. *By Sir Thomas Coats.*—I will just explain what I wish you to answer further: Do you consider that there are any children in the school who do not get an adequate amount of physical training because they are not inclined to take part in games, or otherwise are physically unfit to do so?—There would be if there were no physical exercises undoubtedly taken, in addition to the games.

G. Sh
20 Jun

Games no
compulsor
but physic
training a
given.

9456. Yes; but I rather gather from what you say here, you depend more for physical training on the games than upon the actual physical training?—I did not mean to say I would not take physical exercises in addition.

9457. I do not think you quite understand what I mean. What I want to get at is this: Has the fact that you place so much stress upon games—and games are so much played in your school—the effect of extra training a number of boys and leaving a number of boys who would perhaps shirk games to have less training, although these very boys may require it more from want of physical development?—That may be, but, of course, the work we do is additional, and voluntary; you must understand that.

9458. Just one other question. We have had evidence in regard to the playing of games. One witness said that he quite believed in physical drill, but he objected very much to the extent to which games were now carried. He said that among his boys—his apprentices, who worked with him—they would run away to football matches on every half-holiday, and that it had a bad effect on them; they got too fond of running after football matches and things of that sort?—Professional matches every week. Well, I have heard that; but speaking from my own experience in Manchester, I do not see—

9459. It is from the boys' point of view, you see, I want it?—Yes; I daresay boys may be so lacking in what is their duty, that they think it is better to run to see a game than stop and to do their work, but I should think it is dying down very much.

9460. It is not in the North?—Well, I am speaking of Manchester.

9461. I refer to Scotland?—Football matches used

to attract in mid-week about 10,000 people, and now I do not think they attract more than 2000 or 3000.

9462. *By Mr Shaw Stewart.*—Of course you have had a great experience of teachers. Do you think that if all the teachers were obliged to go through a course of physical training while they are at the Training Colleges that would have a very good effect on their physique and on their health in after-life?—I should think it would.

9463. *By the Chairman.*—Only one question as regards jumping: you recommend jumping for children in schools as an exercise?—Yes.

9464. Is this during the school time?—In part of the physical exercise.

9465. During the school time?—And in the playground it should be recommended, the old style of jumping.

9466. Now what I want to ask you is this: Have you time in your school curriculum to ensure that each child shall be separately trained to jump?—In the Manchester scheme it is provided for—a leaping in the process as they march.

9467. Who regulates the Manchester scheme?—The new instructor, Mr William Clarke, has devised a scheme where that is a part.

9468. The inspector?—No, the physical instructor to the schools; and a very fine exercise it is.

9469. This instructor has recommended it for all the schools in Manchester?—He has put it as part of his scheme for the children at the latter end of their training; that is, when they get into the upper standards; that is one of the main exercises.

9470. That is taken into the curriculum?—It is part of the ordinary hour we spend in physical exercises by the Code.

The witness withdrew.

The Rev. JOHN SMITH, B.D., examined.

9471. *By the Chairman.*—You are the Chairman of the Govan Parish School Board?—I am, my lord.

9472. And have been so for how long?—Well, two terms as chairman; but I have been eleven years on the Board.

9473. You have kindly sent us in some notes, and also a copy of the Govan Parish School time-table for military drill. May I ask who has arranged that time-table?—It was arranged by the drill instructors, with the help of the clerk of the School Board and the headmasters as well.

9474. And with the approval of the inspectors, I presume?—Well, yes, I think so; it must be.

9475.—Please begin reading your notes?—The population of the district under the jurisdiction of the Board, as per last Census, was 207,712. There are twenty-five public schools, with accommodation for 29,748, and there were on roll in the month of April 1902, 29,033, with an average attendance of 25,000. The number of scholars who were under instruction in physical drill during the month of April was 14,323. Physical exercises begin in the infant room, and are accompanied by music, a piano being provided for the purpose in each school. They are continued throughout the school in a graduated course, and are given to both boys and girls. The drill is conducted in the school playgrounds, but in wet weather the covered play-sheds and central halls of the schools are utilised. The following is the course of instruction usually followed:—

Infants.—Bells, expanders, free exercises.

Classes I. and II.—Dumb-bells, expanders, free exercises, turnings.

Classes III. } Boys: Squad drill, dumb-bells, free exercises.

IV. } Girls: Wand drill, free exercises, expanders, dumb-bells.

V. }
Class VI.—Boys: Dumb-bells, singlestick, free exercises, squad and company drill.

Girls: Dumb-bells, ring drill, free exercises, expanders.

Secondary School.—Boys: Dumb-bells, singlestick, Indian clubs, squad and company drill.
Girls: Dumb-bells, bar-bells, ring drill, free exercises.

In one school there is a gymnasium, which is utilised for the boys of Class V. and upwards. Exemption from attendance at these exercises is only granted to pupils who are certified (medical certificate) as physically unfit to take part in them. In most schools military drill, as distinguished from other physical exercises, is introduced at Class III. The Board have given special attention in their schools for many years to the subject of physical training, and, as showing the efficiency reached in this branch of school work, it may be permissible to quote from H.M. Inspector's remarks on the subject in the annual reports of the Scotch Education Department. In the report for 1890–91, H.M. Inspector, speaking of physical education in the district, including this parish, says—'Physical education, I am glad to say, has become a marked feature in the district, in increasingly full and systematic courses, based on good text-books, which are now numerous, practical, and cheap. In some schools the exercises are given with very great success, and many managers have well provided the requisite apparatus in dumb-bells, wands, ropes, and the like, rightly including text-books for the teachers' guidance in the various exercises, which, to be healthy and effective, must be physiologically correct.' In the report for 1891–92, H.M. Inspector writes—'In all schools they (singing and physical exercises) are now more or less utilised; in most very fully even in the rural districts; in many, especially in Govan, in a thorough and systematic manner, which is its own reward, proofs of the efficiency attained being given by public exhibitions largely attended by parents and friends, Hillhead School standing pre-eminently first in this direction. Indeed, physical education has gradually become an integral portion of the school work in this district in a systematic course. . . . In many schools the results achieved are surprisingly good and

 Instructors.
 Time.

'attractive, and their admirable renovating and training effects are yearly securing their extension and improvement.' In the report for 1897-98, H.M. Inspector states—'Drill in some form or other finds a place in the routine of every school in the district. In Hillhead Public School, and in several of the other large schools of the Govan Board, the teaching of this branch is carried out with a skill and thoroughness that are beyond all praise.' The Board employ three drill instructors, who are all ex-Non-Commissioned Officers of the Army. These teach in twenty-two schools; in the other three schools the instruction is given by the janitors, who are also ex-Army men. The time per week given by the instructors to the work varies from two and a half to six hours, according to the size and character of the school. See time-table below:—

are about 200 former pupils of this school in the Volunteers, and that between forty and fifty old scholars have taken part in the South African War. The Board have provided large and admirably-constructed swimming baths at six of their schools, each of these forming a centre for a group of schools. Three of the swimming baths are 75 feet long by 30 feet broad. Boys and girls attend these baths, and there are male and female instructors. The children attend in classes at fixed hours. During the year ended 28th June last 2167 children (1327 boys and 840 girls) attended the baths. The number of these who were able to swim at the beginning of the year was 271 boys and 26 girls. At the end of the year 681 boys and 135 girls could swim, showing that 410 boys and 109 girls had learned the art during the year. It may be mentioned that

- Stewartville Monday and Friday, 1.30—4.30.
- Hillhead Daily, at various hours

Apparatus.
 Cadet corps.

The apparatus provided by the Board consists of dumb-bells, bar-bells, Indian clubs, calisthenic wands, rings, musical bells, singlesticks, etc. Some of the schools have provided themselves with rifles, and in some others the pupils have provided themselves with chest expanders. In connection with the Hillhead School, a cadet corps has been formed, and attached to the 2nd Volunteer Battalion of the Highland Light Infantry. Pupils from twelve to sixteen years of age showing proficiency in school drill and physical exercises are eligible for enrolment, and the strength is at present seventy-seven. It may be mentioned that there

boys who received all their instruction in swimming in these baths have been successful in gaining medals and prizes in open competitions in the public baths of the city. An annual swimming competition is held under the Board's auspices, at which four presentation challenge cups, medals, books, and other prizes provided by private subscription, are competed for. The baths are open for children during the summer holidays, and are largely taken advantage of during that period. Last summer holidays there was a daily average attendance of 194 boys and 46 girls—the total admissions being

Rev.
J. Smith,
B.D.
20 June '02.

36,238. A charge of one halfpenny each is made for admission during the holidays.

9476. *By Sir Henry Craik.*—You say there are 25,000 children in average attendance at your schools?—That is so.

9477. In the next paragraph you say that 14,323 were getting physical exercise; what happens to the rest?—There are some of them at their classes during the time. The 14,323 is the number of scholars under the special instruction of the drill instructors; the other 10,000 or thereby receive physical drill from the teachers, so that all the scholars, except those physically unfit, get physical drill.

9478. Then they do not have any opportunity?—I think most of them have an opportunity in one way or another.

9479. Yes, but only 14,000 out of 25,000 get it?—Yes, that is so. The other 10,000 receive their physical drill from the teachers.

9480. Is not that rather a serious admission?—We ought to have certainly more.

9481. Turning to your time-table, I find that in certain schools a good deal more time is given to it than in others. I should like you to look at these. I put first the Bellahouston Academy; it has seven hours?—From nine to four.

9482. Bellahouston Academy is a fee-paying school, attended by a pretty good class?—That is so.

9483. Albert Road has about nearly six hours; that also is a good school, I think?—That also is a good school.

9484. Fairfield is a good class of school also?—No, it is not; it is a free school.

9485. A free school?—Essentially working class.

9486. But pretty well to do?—Well, mechanics and engineers and riveters.

9487. Hamilton Crescent school has six hours; is also a fee-paying school?—Also a fee-paying school.

9488. And attended by very well-to-do children?—Very well-to-do children, yes.

9489. Can you point out one of the very poorest schools in your list?—Stewartville.

9490. Any other?—Well, Whiteinch is very much mixed.

9491. What I am driving at in this is, is it not the case that the opportunities for physical drill are rather more abundant in the better-class schools than in the poorer?—I think that is so.

9492. And probably those 10,000 or 11,000 who are getting none of it, are chiefly in the poorer schools?—Well, a large number are. Of course it is owing to the time-table; there is a difficulty in the time-table in getting all the scholars.

9493. But why should that difficulty prevail rather in the poorer schools than in the well-to-do?—I suppose there is slightly more liberty in the other schools.

9494. Have you any medical supervision over the pupils in your schools?—Well, doctors, you know, set apart for districts. We have a doctor in the Partick district, and a doctor in the Govan district, and a doctor in the Pollokshields district.

9495. What are his duties?—More in the case of teachers than in the case of scholars.

9496. But has he any duties with regard to scholars?—None whatever.

9497. Do you not think that it would be a good thing that in connection with this physical training there should be some medical supervision or inspection of the scholars?—I think there ought to be.

9498. *By Mr Shaw Stewart.*—In your preliminary note, you speak of the physical training based on the text-books; could you give us an idea as to what text-books are used?—Well, we have instructor Walker, who is the janitor and instructor in Hillhead School, the author of two or three capital text books which are very much used in our schools. He is also the instructor of the cadet corps..

9499. And Chesterton's is that used?—I am not certain; Walker's, I know, are very much used. They are beautiful little books; I am sorry I have not a copy with me here.

9500. What I wanted rather to get at was whether the Board approved of any particular system, or if they allowed any school to take what text-book they preferred?—I think we allow freedom in that respect. Sergeant Batchelor, I expect, will perhaps have his own text-book.

9501. Do you not think it would be a good plan to have the best text-book decided upon and acted upon?—Oh, undoubtedly.

9502. Then with regard to the swimming, does this take place out of school hours?—It is taken sometimes out of school hours; sometimes during school hours. During school hours we always send a teacher with the scholars to the bath.

9503. And do all the children go through the swimming classes?—I think most of them do; a great many of them do; not all.

9504. And what would be the exemptions except medical exemptions?—I think nothing except the medical exemptions.

9505. Practically they all get it?—Yes.

9506. I know Kinning Park district very well, and of course we all know that there are no open spaces in it at all; I see that physical training there only takes place once a week, from 1.30 to 4; I suppose you would agree that if it were possible in such closely confined areas the more physical training the children get the better?—I am strongly of that opinion. I think we ought to give more in several of our schools than we do.

9507. Do you think that a certain amount of mental training should be dropped out in order to bring in more physical training?—Well, I do not think there should be much necessity for dropping the mental training. I think it is possible by an an adjustment of the time-table we might get more physical drill.

9508. *By Sir Thomas Coats.*—Would you not advocate that the whole of the children should get physical training? As Sir Henry Craik has pointed out, there are about 10,000 who apparently during this month have got no physical training?—Oh! I think if it is possible all should have physical training—physical drill. Of course, they all get it in the Infant Department; there is no one exempted there, because it is all done in the class-room. But I should prefer to have the drill, if at all possible, in the open air in good weather. We do that with boys in the IV., V., and VI.; they are all in the playground, squad drill; and Company drill, boys of the VI. and above; boys of the III., IV., and V. get squad drill.

9509. But I think this is the first witness we have had in regard to Scotland where all the children were not getting physical drill, except those who were physically unfit?—Yes. All the children attending school receive physical drill. The number 14,323 refers to those who are under drill instructors; the rest, 10,000 or thereby, receive physical drill from their teachers.

9510. Then you give the time that is devoted to each school for physical drill under the different instructors; can you tell me how much per week each individual child would have; that is, those who take it?—Well, I would rather have difficulty.

9511. It is in the time-tables of the different schools?—It ought to be, but I am not quite certain.

9512. Would it be more than half-an-hour per week, do you think?—At least half-an-hour per week.

9513. But not much more than that?—Some will get much more than that, I think.

9514. Do you not think one hour and a half could be given quite well without interfering with the other work?—Well, I think if it can be done it ought to be done. I feel the importance of it, and the growing importance of it.

9515. We have evidence that a good deal more is given in some schools, and the schoolmasters say it is done with very beneficial effects to the book learning?—I am sure our Board will heartily enter into any school scheme whereby the time for physical exercises will be increased.

Uniform system desirable.

Swimming.

More physical training desirable.

Physical training for all in open-air advocated.

Time.

Rev.
J. Smith,
B.D.

20 June '02.

Time.

9516. You say that a number of valuable prizes are given for swimming competitions; are these open to all the children in the Board Schools?—We have district competitions, and they are open to all the children. On the south side of the river the most of the competitors hail from the south side of the river.

9517. The better class of schools?—No; all schools under the Board. We have another competition on the north side, some of the Hillhead boys and the Hamilton Crescent boys come to the swimming to compete.

9518. *By Mr Alston.*—The time given, you say, is two and a half to six hours per week for physical training?—Yes.

9519. Do those children that are under physical training get that amount of time, from two and a half to six hours per week?—They do not get that, not each individual child.

9520. It sounds a little like that, and we were very much struck with the small time that is assigned for physical training in each school. It has been as low as twenty minutes in the week, I think, and seldom above an hour a week?—You see it depends on the weather; the number who are under control at the time; we cannot take all the school at one time.

9521. Could you say how much time per week each child could get?—Oh! I should say at least half an hour, so far as I know.

9522. And you think that is not sufficient?—I think we ought to have more if possible.

9523. How far would you go?—I should say double that if possible.

9524. I think your Board has been noted for attention to physical training in schools?—Yes.

9525. At least an hour a week you would advocate for each child?—I think an hour a week.

9526. While only 70 per cent.—the other 30 per cent. receive physical drill from their teachers—are under training just now, you think the 100 per cent. should be under training?—Yes, except those medically unfit.

9527. There is nothing sacrificed in the other parts of the curriculum in favour of physical training?—I do not think so.

9528. We have heard that the Hillhead school in these public displays has made a very good appearance, and that there has been a very large attendance of the public?—We have. Yes.

Military drill.

9529. Is the drill and the display given there what you would call a fancy demonstration?—Not at all; we have regular military drill. The last exhibition we had, we had the cadet corps present.

9530. I was going to ask first about the physical training, that is to say, the movements on the floor?—Well, they are not fancy.

9531. The instruction is so thoroughly good, whatever is exhibited to the public is a genuine display of physical exercise, as it should be, in the interests of the pupil, not in the interests of an admiring public?—That is so; it is useful.

9532. Have you ever thought that the use of music in accompanying these movements is detrimental?—I am not sure that it is; I would not say that it is.

9533. Have you heard it stated that music is a very great danger unless you have thoroughly grounded the child first in the exercises, and then applied music as a means of making the movements easy and graceful?—Of course the physical exercises in the infants' room are sometimes done without music.

9534. You have not found that it is a defect sometimes, that these public displays before parents are much more a musical exhibition in movement and time than an actual demonstration of what physical training should be in the interests of the schools?—Well, I do not think so. The public displays serve both purposes. They have those two objects in view.

9535. Then the other point about military drill as distinguished from the other physical exercises: you make that a speciality; what kind of military drill is that?—The squad drill, company drill, forming fours.

Toy rifles: of no advantage.

9536. But in some schools you speak of the use of

rifles?—They have rifles very much like the Boys' Brigade rifles.

9537. A dummy?—A toy.

9538. And by what classes of the children are these rifles used?—I do not think that rifles are in use at the present moment, but in one of the poorest schools in Stewartville the head-master has got permission to purchase rifles. We are not supplying them from the Board, but he is supplying them himself.

9539. Now, what is his object in wanting rifles?—He thinks, at least he does not think so, but the instructor, the janitor, who is an ex-army man, thinks the rifles would serve some purpose; I do not think myself that they serve very much purpose.

9540. Does he want to give them manual or firing exercises?—Oh, nothing of the sort; they are simply toy rifles.

9541. But you can get manual exercise beautifully with a toy rifle?—But not out of the Boys' Brigade rifle.

9542. Brigade Boys are often perfect at the manual and perfect at the firing too?—I have heard from several volunteer officers that they are very little use. Sergeant Batchelor is very strongly of opinion that they should not use any toy rifle.

9543. Then what do you want those rifles for? Is it instead of dumb-bells?—Yes, instead of dumb-bells or bar-bells.

9544. You do not see the advantage in their use?—No.

9545. Then as to the army men as instructors, have they been long out of the army as non-commissioned officers?—I think Batchelor is several years out. He used to be drill instructor at Dumbarton in connection with the Dumbarton School Board School, the Academy in Dumbarton. We got him from Dumbarton.

9546. And what is the source from which they get their drill; is it Aldershot?—I think Batchelor drilled thoroughly, and he studied the whole system of drill.

9547. Do they keep themselves up to date?—Batchelor does.

9548. We have had it put that it is a necessity to go back to Aldershot to refresh themselves?—Batchelor is a thoroughly up to date man, so far as I know.

9549. And the janitors are also very efficient instructors?—I think so.

9550. Both in physical training and military training?—In physical training and military training. Walker, if I remember rightly, was connected with the band in the regiment to which he was attached, and he set himself to study physical drill as well as military drill; and now he is the instructor in our cadet corps, and does it thoroughly.

9551. What is the uniform for the cadet corps; what does it cost?—It is khaki. Cadet corp uniform.

9552. And will cost?—About thirty-two shillings, all told.

9553. That expense is met by the parents, I suppose?—That expense is met by the parents.

9554. And there is no objection on the part of the parents?—Not the slightest objection; most enthusiastic.

9555. In connection with teaching boys military drill in any shape, is there any objection on the part of the public?—Not the slightest, so far as I know. I think our Board are almost unanimous. Military no object

9556. You have not taken up the attitude, then, of the Glasgow School Board?—Oh, far from it.

9557. You do not see eye to eye with them in this matter?—No.

9558. What about the fear of militarism?—I think it is perfectly absurd; I can see no danger whatever. Militarism

9559. There has never been any objection on that account?—Oh, not the slightest.

9560. *By Mr Shaw Stewart.*—Could you furnish the Commission with copies of Walker's text-book?—I shall be delighted to do that.

9561. Perhaps you will be good enough to send them to the Secretary?—With pleasure.

The witness withdrew.

Mr JOHN CASSELLS, examined.

Mr
J. Cassells.
20 June '02.

9563. *By the Chairman.*—You are Vice-chairman of the Govan Parish School Board?—Yes, my lord.

9564. You have been connected with the School Board for a long time?—Eleven years.

9565. And have taken a great interest in the physical education of boys and girls?—Yes, my lord, of boys and girls.

9566. Will you kindly run through your notes?—My views on the subject of physical training and military drill are based upon the experience gained from thirty-five years' service in the volunteer force, and on an experience of eleven years as a member of the Govan Parish School Board. During the years I have been a member of the School Board, I have devoted special attention to the physical training of the pupils and their instruction in military drill, and I am convinced that the regular and systematic training in physical exercises which the Board have provided in all their schools has been in the highest degree beneficial. Not only has it helped the physical development of the pupils, but its effect in the habits of discipline, respect and obedience it has assisted to form, has been distinctly salutary. Its influence can be seen in our schools in the greater smartness of the lads and girls, and in their improved bearing; indeed, the same effects are still visible long after they pass from school. I am in favour of more rather than less time and attention being given to the subject in our schools. I am of opinion that the physical exercises begun in the youngest classes, followed by and coupled with the military drill given to the older scholars, should lead up to a system of national training in the essential elements of preparation for national defence among our young men. Every man, in my opinion, should be taught how to take part more or less effectively in the country's defence, and I am of opinion that the foundation of the training required for this should be laid in school. The drill begun in the school should be carried on in cadet corps, in boys' brigades, or in continuation classes, until the lads are old enough to join the Volunteers, or to undergo whatever further military training might be prescribed. This can be done without conscription; indeed, something like this is necessary to obviate the need for conscription. I would impress upon the boys in school that some measure of fitness to defend the country should be demanded of every man; that the drill they were being taught had this as one of its objects; the patriotism of the boys would be thus appealed to, and the subject would be invested with a new interest for them, which might induce them to carry on the training begun at school until they had reached some degree of serviceable efficiency in it. All the time they would be deriving real physical and moral benefit. Their bodily strength would be developed, while at the same time they would be forming habits of steadiness, obedience and self-reliance. In short, physical training which embraces light gymnastics has only a personal or individual advantage, whereas combined with military training it has a national or imperial advantage which cannot be overestimated.

9567. *By Mr Shaw Stewart.*—You say that the drill taken in the school should be carried on afterwards in cadet corps, boys' brigades, or continuation classes. On the point of the continuation classes, are you prepared to suggest that attendance at these should be compulsory?—Well, in connection with the continuation classes, I am not so strong on these, because the classes are made up of youths, elderly boys, and girls who are engaged in business, and when they attend their evening classes perhaps three nights per week, the other three nights you cannot just lay down a law for them. But they do not remain long at the continuation schools; it is only very few who do, and it is only the very few that attend continuation schools.

9568. When I use the phrase 'continuation schools,' I mean not only schools for mental training, but for physical training too. I am supposing that a scheme

might be devised for giving physical training at continuation schools, and I would like your opinion, if that were so, as to how we could get the boys to come into them. There are two ways of doing it; one is by making it compulsory—making every boy between the age of fourteen and eighteen attend them; and the other way is to make them so attractive that the boys will come of their own accord?—I think that is the proper way to do it.

9569. Make them attractive?—Make them attractive.

9570. Then I gather from your paper that one of the attractions that you would hold out to them would be learning to shoot with the rifle?—Certainly, at that age. Rifle shooting.

9571. That might attract the more patriotic boys, but would it attract the lazy and the idle?—I think it would be well to press that class a little; if they cannot see their way to fulfil their duty, they ought to be pressed forward to it.

9572. There you leave the attractive view, and you at once enter on the compulsory system?—Well, my experience is this, that with all those that I have seen connected with the volunteer movement, they are not long until they take a great interest in it; to the great majority of those who have become volunteers the work becomes attractive of itself.

9573. Yes; I quite understand that with the better disposed boys; but you see we have to pay quite as much attention, if not perhaps more attention, to the least well-disposed boys after they have left school?—Yes; well I believe the influence of military drill and military influences on that very class is one of the best for raising them out of that sort of condition, if you like to go as low down as the hooligan.

9574. We must pay attention to them?—Well, there is nothing I know will lift that class of people up to a sense of duty and a sense of self-respect like military discipline and drill. I have long years ago come to that conclusion.

9575. Do you think that the elementary training for military purposes should be taken during school age, or should that come after they have left school?—I think it should commence with the school. Elementary military drill during school age: reasons.

9576. With the school?—If I can be allowed to give an opinion, I would give you my reason for it.

9577. Please?—We educate our boys and girls to come forward in course of time to take up the position of carrying on the affairs of our empire. We ought, at the same time, to teach them that there is a duty attached to them which will come in the ordinary course of events, and that is the protection and defence of those interests; and I think the teaching of one ought to go steadily on with the other from school days.

9578. You are aware, of course, that there is a certain strong feeling in the country against what you are advocating?—I am quite aware.

9579. And which we cannot ignore?—Yes.

9580. Have you any answer to make to the objection raised by those who object to fostering what they call the military spirit at school; have you any answer that you would suggest to us by which we could meet that objection?—Well, I have not one single doubt in my mind on that question. I consider it is the duty of every person who lives under British authority to respect that authority, and be prepared to support it. It is their duty as citizens. There is nobody likes war; everybody would like to avoid it if possible; even soldiers say nobody has a greater horror of war than they have; but it has got to be met, and we must be able to meet it, if our country is to hold its position in the world—the position which it has worked so hard to occupy; so we must all, every man, be prepared to defend it. I would say that I hope the day is far off when our country is to be governed by sentimentalists.

9581. *By Sir Henry Craik.*—You are, besides being a member of the School Board, an employer of labour, I think?—I was, but am retired from business.

9582. From your experience as an employer of labour,

Mr
J. Cassels.
20 June '2.
As employer

advocates
military
training.

do you think that this further training that you desire would be for the advantage of these young men, and also for the advantage of the work they have to do?—I have no doubt in my mind upon that point either. Militarism introduced into business has a most salutary effect. It teaches men how to be at their posts and to stand by their duties. Wherever you meet in any public work a man who has been a soldier you will find him as a rule attentive to his duties, possessed of self-respect, and at all times a man that knows how to carry out his orders.

9583. And as an employer of labour you were glad to have your employees in the volunteer force?—Distinctly.

9584. One other point: you are also a Director of the Athenæum in Glasgow?—Yes.

9585. That has a great combination of continuation classes?—Yes.

9586. For the really energetic and intelligent youth of Glasgow?—Yes.

9587. A department of these, and a very well developed department, is the gymnasium and physical exercises?—It was, but we gave up the gymnasium about a year ago.

9588. I am very sorry to hear it, because I went through it with great admiration?—So am I.

9589. And was it because it was not attractive?—It was a very heavy charge on the Athenæum.

9590. But there was a large number of pupils?—That is so.

9591. It was not from want of pupils, but from the expense?—Most of our volunteer regiments have got their gymnasia, and there are many opportunities now afforded for gymnastic exercises. When the Athenæum commenced it was about the only one in Glasgow.

9592. That shows that while there was a want of this for the better class you did provide it at the Athenæum, and you have dropped it only because there are other opportunities for them?—Other opportunities.

9593. But still, for the lower class, it would be very desirable indeed?—It would be very desirable.

9594. And might be well provided for at the public expense?—Yes, that is so. We have one gymnasium in connection with one of our schools—Bellahouston Academy.

9595. You say you devote special attention to the physical training of the pupils in your schools; but have you observed that it is rather further advanced in the well-to-do schools than in the poorer schools of the district?—Yes, that is so.

9596. Have you any remedy to propose for that?—We hope very soon to be able to introduce more advanced military instruction to the higher standards in the poorer schools; we are working in that direction just now.

9597. You have had your attention called to the lack of it there?—Yes.

9598. *By the Chairman.*—I think you said that you hoped to give more military drill; did you mean military drill, as different from physical exercise in the lower schools, when you said that to Sir Henry Craik?—The ordinary physical drill, my lord, simply.

9599. Just please answer the question. When you answered Sir Henry Craik just now, did you mean military drill as distinct from physical exercise?—Yes, my lord.

9600. You did not mean that more physical exercise would be given to these poorer children?—Not more than would be given to any other children.

9601. But although you admitted to Sir Henry that the children of these poorer schools had not as much physical training as those of the better-class schools?—Well, if we take Hillhead School, we have a cadet corps in connection with that; we have that in connection with no other of our schools, but we have the question of cadet corps before us, and of course we will promote these as far as we can without interfering with the mental study or culture of the children of these schools. We will guard against overdoing it.

9602. You have not yet quite answered my question?—Well, I will be very glad to answer it.

9603. The question I asked you is: You say you propose to give increased physical training to the poorer schools; I want to know, is that increased physical training to be physical exercise, or is it to be military drill?—Military drill, my lord.

9604. And not physical exercise?—Oh yes; the two go together.

9605. Not entirely. Of course I do not quite know how you define military drill?—Well, I shall define military drill as squad drill and company drill. That is about as far as we can carry it in a school.

9606. And further than you can carry it really inside very often under cover?—Well, we have facilities for carrying it on under cover; we have playing sheds in some of our schools. The ground area of some of our schools is an open space. In others there is a gallery round the schools, with a large hall in the centre.

9607. May I ask you whether it is the custom for the children in any of these poorer schools, in the middle of what I call their mental instruction, to be relieved now and again with a little physical exercise?—Oh yes, that is done in our schools regularly.

9608. And such physical exercise, is it what we call physical training, or is it military drill?—Well, you may call it physical training. It is more a cessation for a minute or so from their studies to give a little chest expansion, or something like that, to waken them up and start them afresh again.

9609. You still tell me that you do not propose or hope to do that in the poorer schools?—We intend, of course, so far as the military part of it is concerned with the senior boys, to carry squad and company drill as far as they can be carried, and when it is possible to raise a cadet corps in connection with the school; and as far as I can see in the meantime, it is only practicable to raise cadet corps in connection with schools of the higher class. We have not tried it in any of the poorer schools yet, but if we can see our way to do so, we shall do it with pleasure.

9610. And the reason would naturally fall to be that of expense?—Well, there would be a little expense connected with it.

9611. If I could put it to you that, if you were to increase your physical exercise as apart from military drill, could that not be largely done at very little expense at all?—It could be done at very little expense, because the uniforms are cheap and the dummy rifles cost very little money. Some of our schools have the dummy rifles already.

9612. *By Sir Thomas Coats.*—We have had some evidence regarding the physical training in the Infant Schools, but I do not know whether we quite understood the matter. The evidence is, that, with an average of 25,000 pupils, there are only about 14,000 who get physical drill. I wish to know, is that the case, or does that mean that there are only 14,000 who get regular military drill; but do they all get physical drill?—They all get physical drill from the infants upwards.

9613. In all the standards?—But the physical drill in the infants, which are our largest departments, is of the very simplest character.

9614. But I would like to ask, do you give physical drill in all the standards in all the Govan schools?—Every one of them.

9615. We were under a misapprehension in regard to that. Then I would ask you again, you have a great many apprentices in Govan in the different ship-building yards and other places. Well, do most of these apprentices attend evening classes, either ordinary continuation classes or technical classes?—Well, as far as my experience goes, I have come to the conclusion that there are not more than 25 per cent. of our youths go to evening schools or any other classes after they leave school. There is about three-fourths, not less than three-fourths, of them require something like military exercise or otherwise to employ themselves with in the evenings.

9616. But I was rather asking what proportion of Ap

the apprentices go to evening schools?—I could not answer how many.

9617. I think you said that one objection to having much physical drill in evening schools was that they were tired; those who had worked during the day were too tired to take much physical drill?—That might be.

9618. I think you said so?—Well, I hardly went quite that length.

9619. In point of time?—In point of time, and they might have other means of occupying themselves during other evenings of the week.

9620. Yes; but do you not think that, in connection with the classes, with the hours that they do attend evening classes, you might devote a portion of that time to physical drill?—I do not think it could be very well done on the same evenings as they attend their classes, because if they leave business at say six or seven o'clock, by the time they go home and have tea, and turn out to a class at eight o'clock, and in the school till about ten, there is very little time left for either military or physical training after that; but they have other three evenings of the week; they are three evenings in school, and three evenings free.

9621. May I ask, are you still in the Volunteers?—No, sir.

9622. The reason I ask was, you advocate shooting as a part of the exercise to be undertaken by boys. Do you know anything about this movement of Burghers of the Queen that was started in Glasgow?—Well, I have no sympathy with them.

9623. Why have you no sympathy with them?—Either have the whole thing or nothing.

9624. That is the point I want to bring out; do you believe that a large proportion of men join the Volun-

teers to be able to get shooting at the ranges?—The shooting comes in as a part of the work, and an interesting part of the work.

9625. Do you believe that if large facilities were given for rifle practice without joining the Volunteers, a great many men would join these rifle clubs, and neglect their duties to the country by joining a volunteer battalion?—If they want to serve their country, they must do it in proper order, but a large body of loose individuals—I do not mean regarding character you know—go out and shoot, when they want an hour of target practice, and go away, and be under no specific control, is of no value.

9626. No; well I quite agree with you there; but do you think that if facilities were given for indulging that practice you talk of, that many men would go out for an hour or two to shoot, and would never think of becoming a volunteer?—Would never think of becoming a volunteer. Well, I believe that many old volunteers would be very glad to have the opportunity to get back to the targets after they are out of the service for the sake of the shooting.

9627. That is not the point I would like to ask you; I have reason for asking it; do you think that if facilities were given for rifle practice, without the necessity of going through a certain amount of drill, a good many would take advantage of that, and would shirk their responsibilities in becoming drilled in the Volunteers?—I would simply say it is my opinion that they are of very little use to the country. They may go out to the targets for the pleasure of shooting, but that would not be much good. If they are to be of any use, they must put on the uniform and go through the regular routine.

The witness withdrew.

Mr CLAUDESLEY BRERETON, M.A. (Cantab.), examined.

9628. *By the Chairman.*—You are Licencié-ès-Lettres (Paris), M.A. Cantab., and Temporary Inspector to the Irish Board for Intermediate Education?—Yes. I have prepared the following notes.

PHYSICAL EDUCATION IN FRANCE.

The Beginnings of Physical Education.—The necessity of building up the nation after the war of 1870 induced the French statesmen of the day to pay increased attention to education of all kinds, including physical. Jules Simon, in his book on the reform of secondary education, declared that the scholastic contempt for health and hygiene had been a potent factor in the disasters that had befallen the nation. The reforms in physical education took the shape of gymnastics and military exercises, the chief aim in view being the preparation of the rising generation for their future share in the national defence. The hands of those who took this patriotic view of physical education were greatly strengthened by the growing danger of a fresh invasion towards 1876. Gymnastics with apparatus were everywhere rendered obligatory, and the movement in favour of military drill culminated in the creation of regular cadet corps in the schools, both primary and secondary. These cadet corps were known by the name of 'bataillons scolaires.' As these cadet corps, after a brilliant debut, fell into discredit, and later on into complete ridicule, it is probably worth while giving a fairly full view of the causes of their inception, and particularly of their failure, since there is often as much to be learnt from experiences which have failed as from those which have been successful. Besides, the subject has some interest for us in this country, as there is today a distinct movement in favour of establishing some form or another of military drill in all the schools.

The Cadet Corps.—The chief cause of the foundation of these corps was the desire to make the school a sort of nursery for the future defenders of the country. The idea was naturally most widely adopted in the large centres of population, and especially at Paris. The children were armed with wooden swords and muskets, and provided with special uniforms. There were fifes,

trumpets, and drums. Some of the children were appointed non-commissioned officers. The higher posts were filled by the sergeant instructors, aided by several 'officers de réserve,' who were only too glad to air their uniform. Regular parades and reviews were held in the Garden of the Tuileries and elsewhere. Those whom I consulted on the subject admitted that the object in view of accustoming the child from its earliest years to consider itself the natural defender of its country was an excellent one, but they, one and all, declared the movement in France had been a complete fiasco.

Causes of Failure.—A good many reasons were given. The cost to the town was altogether out of proportion to the results obtained, and the results themselves were unsatisfactory rather than satisfactory. The children, especially those who were made non-commissioned officers, affected the manners and language of the drill sergeants, who imported into the playground the phraseology of the barracks. The teachers began to take alarm at their children, who swore and expectorated after the most approved military fashion. Then, again, the children who had been made corporals and sergeants tyrannised over the others. The discipline was often very slack. One witness told me of a case in which he saw a real colonel surrounded by his youthful prisoners, who kept him a virtual prisoner by crowding round him, while those in his rear decorated his uniform with elaborate designs in chalk. But the teachers were not the only opponents of the movement; the regular officers were also hostile. Experience showed that the children who had left the school at thirteen or fourteen had mostly forgotten what they had learnt when they became soldiers at nineteen and twenty. This was not, however, an unmitigated loss, as it was generally admitted that the young people who had taken part in these exercises had, as a rule, a good deal more to unlearn than those who came to the barracks without any preliminary training. Started in 1873, the last of the bataillons scolaires were suppressed in 1890. The moral of the whole experiment was

Gymnastics.

summed up to me by one witness in the following words: 'It is just as necessary to give the body a general training as it is to give the mind. Specialisation must come later. To expect to make a soldier of a boy of ten is as sensible as to try and make a boy of the same age into a dentist.'

Gymnastics.—This does not imply that the French have given up all idea of utilising the school as a preparation for the regiment. On the contrary, the gymnastics, with or without apparatus, were until recently far too much of a military type. While the bataillons scolaires have fallen out altogether, the societies of gymnastics still exist, though their career has been rather a chequered one. Up to 1887 the number of the private societies, recruited mainly from the primary schools, increased. Their numbers then remained stationary for several years, and have since declined. The reasons for this falling off are several. Their most severe critics have been those who have made a study of physical education on scientific lines.

Objections.

Objections to the French Gymnastics.—It has been shown that the exercises with apparatus are often injurious to those who are weakly constituted. Besides, the whole aim of such a system is to form rather acrobats than well-developed and well-proportioned individuals. Instead of seeking to increase the respiratory powers, its chief object is the foundation of muscle. During the last year or two, however, a great effort has been made to introduce the Swedish exercises, or at least the principles underlying them. The opposition has been very bitter on the part of the military instructors brought up under the old régime. All sorts of reasons have been advanced, not forgetting the patriotic. But, as one critic has pointed out, the so-called French system is really German, having been adopted in France after passing by Spain. Still the theories of which M. Demeny of Paris, and M. Tissié of Bordeaux, are advocates, appear to be getting the upper hand to-day, so much so that at the military school of Joinville le Pont, at which the military instructors for the army are formed, M. Demeny has now a class of his own. As these instructors become later on professors of gymnastics in the lycées and primary schools, it is evident that the 'gymnastique raisonnée,' as it is called, is sure of success in the long run.

Gymnastics
in primary
schools.

Gymnastics in the Primary Schools.—An important Commission in 1887 was nominated to revise the programme of gymnastics. Their new programme, issued in 1890, was followed by an official manual on gymnastic exercises and school games. This, however, was merely a book in which the teacher could pick and choose, and no indication was given as to how the teacher should form for himself a scientific course of instruction for his pupils. This gap was filled in 1899 by the publication of a volume by M. de Demeny, entitled, 'L'exercice à l'école,' in which a number of graduated courses were suggested.

French v.
Swedish.

French v. Swedish.—Meanwhile the old battle between the so-called French methods and the Swedish had been gradually fought out in the schools. The chief argument of the opponents of the Swedish system was that the spirit of the training given on the Swedish system was not in sympathy with the temperament of the French child, who has the greatest difficulty to remain still or concentrate his attention for any length of time.

Swedish
victorious.

Victory of the Swedish.—The Swedish method triumphed nevertheless, and to-day, although the new exercises¹ have only been introduced into the Paris schools since last October, the children have made excellent progress, thanks to the twenty-five teachers that M. le Colonel Dérué, inspector of gymnastics to the city of Paris, has been able to gather round him and train. Part of his success no doubt is due to the fact that the professors, though appointed by the town, are selected by himself.

Girls' school.

Description of a Girls' School.—I saw several large

¹ The thoroughness and scientific nature of these exercises may be judged by the fact that before they were adopted in the schools they were submitted to the 'Faculty of Medicine,' who approved of them unanimously.

classes of girls, one amounting to ninety pupils, undergoing a course of Swedish drill at the command of a lady instructor. There was very little shirking, the precision was very fair, and the discipline unimpeachable. The directress of the school, who was present, told me she had already remarked a distinct improvement in the deportment of the girls. The exercises were interspersed with short marching exercises, concluding with a pas-de-quatre step. During these exercises the children sang various rounds and ballads. The younger ones also sang while playing at catch-ball—a game at which some of them were not very expert. The practice of singing was much criticised at the International Congress of 1900, but provided it is restricted to marching exercises it has certainly a good effect on the pupils. There are no pianos in the schools; the cost of supplying them seems to be too great. The exercises took place in the covered playground, and it was somewhat remarkable not to see a single window open. In fine weather they take place in the open playground.

Description of a Boys' School.—In the boys' schools, in addition to these exercises, the pupils are taught a certain amount of military drill, including *la boxe*, which is roughly an exercise of arms and legs without apparatus. In one school I visited the military instructor took up a position at the side of the open playground and blew his whistle. Instantly the boys, who had not been warned, came tumbling out of the class-rooms, and in one minute forty seconds the whole 800 children had taken up their position in the playground in regular lines, with the masters beside them. They then proceeded to perform with precision several simple military exercises, after which the instructor dismissed them, and kept back one class which he put through various military exercises, such as forming fours, &c. In this case the drill took place in the open playground, but although in the open air the smell of the latrines was unpleasantly obvious.

A Possible Danger.—In all these cases the exercises are more or less the same for all classes, and no initiative is left at all to the instructor. There seems therefore a possible danger that teachers and taught may find them in the long run monotonous, though at present I did not see any sign of this.

Time Given.—The instruction given by the official instructor only amounts to half an hour per week for each class, an amount that the inspector himself regards as woefully deficient.

The rôle of Teacher.—This is indeed supplemented by another half hour in which the exercises are repeated by the teacher of the class, but the time is sometimes split into two quarters, which renders it thereby insufficient. Moreover, the teacher, so I was told in more than one quarter, is not always equal to the task. Unfortunately the teaching given in many of the normal schools is not at present adapted to enabling the teachers to give the right sort of training in the primary schools, though teachers are encouraged to obtain at the school a gymnastic certificate, with a view to earning the prize given by the city of Paris to those who possess it. Still the Administration is anxious to see the instruction largely given by the teachers. M. Bayet, the Director of Primary Instruction, told me that in Switzerland the physical education is given by the ordinary teachers in the normal schools, or, in fact, as it is often given in our London schools, only instead of the teachers receiving additional pay, the hours he puts in in teaching gymnastics count the same as the hours devoted to teaching French or mathematics in the total number of hours he is supposed to work per week.

Gymnastics in Country Schools.—Gymnastics and military drill in country schools are largely regarded as an optional subject. In some sixty schools that I visited two years ago, in north-west France, I only came across a few instances in which they were taught. As one teacher pointed out to me, the children got, as a rule, enough exercise by trudging to school and playing among themselves. What is often wanted in the country, however, is not the cultivation of muscle, but

Boys' sc

Danger.

Teacher

Country
schools
gymna s.

the cultivation of adroitness and agility and handiness ; in fact, the problem in the country is exactly the reverse of that in the towns, where the children are nimble-fingered enough, but lack the physique of the rural lad. It is curious to note that in some programmes of school work the 'school walk' is ranked under the heading of gymnastics.

Kindergarten.—In the Kindergarten the gymnastics are naturally confined to singing, games, and simple manoeuvres. I visited one school in which the children sang and performed some of the simple movements ; they were rather listless, but it is only fair to state it was near the end of the afternoon.

Higher Primary Schools.—I was told there was not much to be learnt in the Paris higher primary schools for boys distinct from what is done in the elementary and secondary schools. The head of one of the two higher primary schools for girls informed me that the gymnastic programme of the school was taken out of the general programme, the selection being made by the teacher of gymnastics and herself. Very little use is made of apparatus. They had given up the employment of staves from lack of space. The exercises took place either out of doors or in the covered playground. An attempt has been made to get the teaching given by the ordinary teachers attached to the school, a plan the directress preferred in the abstract, but it had not been successful.

For those who have left the Primary Schools.—There are no official evening classes in France, though much has been done by private societies and teachers in creating *patronages* and *associations d'anciens élèves*. In many cases the school is used as the meeting place, and a certain amount of gymnastics and dancing goes on, but, as the associations are under no control, there is no unity of method in the gymnastics as practised in these establishments.

Normal Schools.—In the Normal Schools a considerable amount of time is given to gymnastics, but, as has been already stated, it is not always of the kind calculated to make the teacher an instructor in simple gymnastics for the school. Thus in comparatively few Normal Schools for women are Swedish exercises taught. Still the time given to the subject—three hours a week—permits both the men and women in the different Normal Schools to gain a certificate in the subject. At Auteuil I saw a certain amount of drilling out of doors, combined with military exercises of the foot and hand (*la boxe*). Several exercises on the horizontal bar were very well done. The professor told me that he every year 'created' fresh movements, in order to prevent monotony. The gymnasium had the advantage of having one side completely open to the air. Like all the others that I saw, the floor was covered with sawdust. According to the professor, the pupils learn all the more common military manoeuvres, and they dance also among themselves twice a-week. The gymnasium is also always open, so they can practise whenever they like. In addition, they teach gymnastics in the practising schools, so that when they leave they are efficient in every way. I was told that in all schools the use of the musket had been suppressed. I came across one school, however, in the country in which they are still retained. In the other schools the pupils now use staves in their place in the gymnastic portion of their drill.

Fire Brigade.—In one school in the country that I visited I saw the pupils of the first year had been formed into a fire brigade. I saw them at practice, and they certainly worked with a will. They had already received their baptism of fire at a conflagration in the neighbourhood. The practice might certainly be extended to other schools with advantage.

Secondary Education.—As for the gymnastics in the lycée, they have never been really obligatory, except for the boarders. The day boys take an interest more or less in them. Thus of some thousand day pupils at Collège Rollin, about 400 attend the gymnastic classes. A few years ago, so I was informed, the subject was so unpopular with the boys in some lycées that the winner of the prize for gymnastics did not dare to go up for his prize for fear of being jeered by his fellows. This

spirit cannot, however, extend to all the schools, as at the Collège Chaptal, which is in part a secondary school, there are supplementary classes for those who care to pay for them, and they are well attended. In these schools, as elsewhere, the instruction is given by *anciens sous-officiers*, who are often also employed in the primary schools. The exercises themselves are largely taken out of the big manual published by the Ministry. Nominally there is a general inspector, but as he never appears in the schools, each teacher makes up his own programme. The time given to the subject seems to vary. At the Collège Rollin the pupils have three half hours a week.

Classes seen.—I saw several classes at exercise in this school. The dumb-bells in use for boys of sixteen and seventeen seemed far too heavy, weighing something like 13 pounds ; the smaller boys had also dumb-bells weighing from 4½ to 9 pounds. The exercises consisted of various dumb-bell movements, varied with practice on the horizontal bar, which was a mere bar of iron uncased with wood, or else consisted of rope and ladder climbing. The professors had sixteen hours' work a week. At Chaptal, which is partly a higher primary and partly a secondary school, gymnastics are obligatory. The number of hours per week is two. Here each lesson consists of twenty minutes of Swedish exercises, followed by forty minutes of military exercises with dumb-bells or other apparatus. I was present at a supplementary class. One squad practised on the horizontal bar, the other took a turn at jumping off a spring-board, and then had a lesson in rope-climbing. In the latter the teacher rightly laid stress on the climbing being done hand over hand, in order to develop each arm evenly.

Competition between the Schools in Gymnastics.—Every year there is at Paris a general competition in gymnastics for the Secondary and Normal Schools, in which the schools compete against one another either by single champions or by groups. Each school goes through, among other things, a selection of the exercises it has practised during the year, and this helps to keep the teaching in the different establishments more or less together. It was at the general competition of last year that the Normal School of Auteuil, mentioned above, won the first prize.

Athletics.—There is, no doubt, a certain discipline attached to the practice of gymnastics, but as a means for developing the character and individuality of the pupil they are obviously insufficient. Hence the necessity of combining them, as far as possible, with the numerous games and sports, either individualistic or collective. This combination found recognition in France in the composition of the official manual on physical exercise already alluded to. It also formed one of the chief subjects set down for discussion at the International Congress of 1900. This belief in the need of out-door athletics was largely strengthened by the overwork in Secondary Schools that resulted from the alterations in the official programmes in 1885. The Baron de Coubertin, to mention only one of the numerous reformers, came to England, saw and was conquered by the system of education which obtains in our big public schools.

(1) Recreative side.—Some of these reformers, it is true, only saw in the English system an excellent means of recreation, supplying the requisite antidote to the over-pressure from which the French schools were suffering. Others, on the contrary, regarded the English games as a capital device for keeping their pupils out of mischief—the French boy, in the eyes of the majority of the teachers, is, to parody the words of Rousseau, born fundamentally wicked.

(2) Pastime.—Here, however, the creators of new schools on the English model, such as MM. Demolins and Duhamel, have seen that for filling up a boy's spare time carpentry and other forms of manual work are distinctly preferable.

(3) Discipline of Games.—There remains, then, the third conception of out-door games as a school for the will. The necessity for self-improvement in the case of anyone who desires to excel in games is in itself a

liberal education, while the games in concert, such as football and rowing, provide an admirable field for the cultivation of social and public spirit. So truly is the British Public School a miniature republic, a training ground for civic life on a larger scale, where the pupils learn alike to obey and to lead, that the celebrated French educator, the père Didon, after visiting Eton, said the boys who learn to command in the games there are learning to command the Indies.

Games in
France.

The first phase of the Athletic Movement in France.—The movement in favour of out-door games and athletics in France took, however, at first a distinctly individualistic turn. The Lendit, as the annual championship founded by M. Grousset was called, was practically confined to competitions between the best individuals in each branch of athletics. This led in not a few cases to physical over-training, and had the unfortunate effect of revealing to French parents and school authorities the bad side of out-door sports without bringing home to them the moral benefits derived therefrom.

Objections.

Obstacles to success.—In fact, the great obstacle to the development of athletics in France has been the opposition offered by parents and school authorities. Though much has been done for the education of these persons, much remains to be accomplished. Blind by education to the advantages of games, both parties alike dread them as a possible source of distraction to their boys. In the present fierce competition to enter the public service, every hour given to exercise is apt to be regarded as an hour lost to work.

(1) By parents.

(1) From Parents.—The fear, again, of accidents is a potent factor with the French mother, and in the majority of cases the French mother is the business head of the family, as far as the education of the children is concerned. The question is evidently bound up with the future education of French women.

(2) By
teachers.

(2) From Teachers.—As for the teachers, the fear of accidents is also an important cause of their hostility, though the actual reason itself is different. Until recently they were held pecuniarily responsible for any accident to life or limb of the scholars under their charge. No matter however morally innocent the teacher was, he was legally liable. The classic instance—so M. Rabier, the Director of Secondary Education told me—was that of a teacher who was condemned to pay for an injury which happened to one of his scholars in a fight with another, 300 yards from the school. Lately the law has been changed, and the State now assumes responsibility, reserving, however, to itself the right of making the teacher responsible if it thinks fit. Naturally, the average teacher still considers it is better to avoid accidents at any price, and therefore looks coldly on any form of exercise which may occasion them.

Progress.

Progress all the same.—None the less, the school athletic associations, which started in 1890, have managed to interest a certain number of secondary pupils in games, and a still larger number of associations have been founded by pupils from the primary schools. A good instance of the progress is the Union of French Athletic Societies, which embraces some 340 societies and contains some 16,000 active members.

Hindrances.

Further Drawbacks to School Sports.—The movement in the schools has, however, not only suffered from the opposition of parents and professors, it has also been undermined by those who ought to have served as its best friends.

Premature Recruiting by the Big Clubs.—The larger athletic clubs for adults, such as the Racing Club, the Stade Française, etc., in their desire to augment their members and prestige, have treated the school associations as a happy hunting-ground for providing members for their football and athletic teams. They have thereby greatly increased. The Racing Club has over 1000 members, but the effect on the school associations has been deplorable. The average boy of fifteen or sixteen cannot be expected to resist the blandishments which membership of a well-known club offers, more especially when he is expressly invited to join by the committee.

The School Association stunted.—The results have, however, been disastrous in the long run. Perpetually drained of their best blood, many of the school associations have either dwindled away or remained stationary. Lacking the prestige that numbers alone can give, they fail to attract into their ranks more than a tithe of the pupils of the school.

Evil Effect on Student Life.—The evil does not end here. The vast majority of French students not having belonged to their school association, naturally fall into the idle and inactive ways of the *quartier latin*. To profit from the physical, and, above all, the moral advantages of athleticism, one must be caught young.

Athletics in Primary Schools.—As regards the pupils and former pupils of the primary schools, the most striking feature has been the enormous number who play at association football every Sunday in the Bois or the Fortifications. According to a competent authority they number thousands.

Bicycling.—The bicycle may also be mentioned here, not so much for its influence on the education of character, but for the immense impetus it has given to the French people generally to take exercise and live more out of doors. This is especially true of the female sex.

Swimming.—The number of scholars who take up swimming is likewise growing. Some of the primary school teachers take their pupils to the baths, and this custom also obtains in many of the religious private schools.

Shooting.—As regards shooting there exist a few school ranges at Paris, from thirteen to sixteen yards long. There are also six or seven targets at the municipal gymnasium in the Rue d'Allemagne. The children in the neighbouring primary schools who are nominated by their teachers for meritorious work go there and shoot. The range is also open to adults. The weapon generally employed is the small French carbine. The associations of former pupils also practise at the *Stande militaire* at the Point du Jour near Auteuil, and use the Lebel rifle with a reduced charge. There is no long range in the immediate neighbourhood of Paris. There are a certain number of *tir scolaire* in the country; I met with one or two when inspecting the schools, but they did not appear very numerous. In the same year there was a *tir scolaire* at Rouen for the whole of Normandy, but only fifteen schools competed. In two schools I found the teachers allowed certain of the elder pupils to *faire un carton* (fire a set of rounds) once a week as a reward for good work.

Medical Inspection.—The French schools, both primary and secondary, are subject to medical inspection.

(1) Primary Schools.—In the towns, according to Dr Philipp, the school doctors go round the primary schools twice a month. They inspect the buildings and sanitary arrangements, and the teachers point out to them any of the pupils who seem to need attention. In some schools they also examine in detail the teeth, eyes and ears of the scholars. In case of any epidemic the teacher is required to call in the doctor. Those children whom the doctor considers unfit to attend school are either sent home or to the hospital. In the former case they are attached as out-patients to a free dispensary, of which there are three or four in each arrondissement of Paris. The pay of a school doctor at Paris is £32 a year, and he has five groups of schools to look after.

(2) In Secondary Boarding Schools.—In secondary boarding schools belonging to the State, the doctor generally pays a daily visit. A league founded by the Doctor Mathieu to look after the lycées has done a great deal of good; great improvements have been made in the quality and variety of the food supplied in the State boarding-schools owing to the efforts of the league.

Absence of Statistics.—I was unable to obtain statistics on physical education in France, and no one I consulted seemed to know whether any were procurable, but some might be probably obtained at the

physical laboratory of the Collège of France. The only school I am aware of where statistics are kept of the growth and weight of the pupils is the newly-founded Collège de Normandie, which is largely run on British lines.

A Book of Health.—A few doctors of Paris, however, have started a movement which may have, later on, far-reaching consequences. At the lying-in clinic of Doctor Budier the mothers are given a *livret de santé* of their children, and encouraged to bring them every three months to the clinique. At first they could not understand the good of bringing their children when they were well. But now they have realised that there is also a preventative side to medicine, and they are only too willing to bring their children, and listen to the doctor's advice on their bringing up. A similar *livret de santé* has been established at the school of Rambouillet, attended by the children of those soldiers who are too poor to bring them up. A similar system is about to be started at the establishment for recruits who have been rejected for some physical defect from the army. The difficulty against extending such a system lies in the material opposition of the parents, as a rule, to any detailed inquiry into the state of their own health.

For Combating Physical Degeneration in the Towns.—Two schemes for combating the general degeneration of urban populations are sufficiently important to be mentioned here. One is the system of planting out in the country the *enfants moralement abandonnés*, or pauper children, and the other is the *colonie scolaire*, or the sending into the country for a time ailing or sickly children in the towns.

Les Enfants Moralement Abandonnés.—In the former case, the town of Paris has rescued some 50,000 children from certain ruin and degradation, and settled them out in the country with foster-parents. The latter are carefully watched, while the education of the children is safeguarded by the teachers under whom they are placed being remunerated in such cases as when their pupils obtain the school certificate. To prevent any distinction between these and the other children of the village they are provided with the ordinary costume of the children of the peasants. I was assured by the Municipal Councillor who superintended the scheme about four years ago that 80 per cent. of these children remain in the country; 10 per cent. have the love of a city life too strong in their veins. They return to Paris, the city finds them situations, and they settle down. The remaining 10 per cent. are lost sight of, but this does not necessarily imply they have lapsed into a life of mendicancy or crime.

Colonies Scolaires.—The school colonies take two forms. In the one case the arrondissement hires or borrows a boarding-school in the country during the summer holidays to which it sends several hundred children. In the other case, it acquires a former château in the country, to which it despatches relays of children during the year. The ordinary duration of stay is three weeks. In the majority of cases the locality is an inland one. The children are selected by the head teachers; the very poor and ailing are taken by preference. Each child must be at least ten years old. In a school of 800, the head-mistress told me she was requested last year to select not less than eight or more than ten.

School Kitchen.—In connection with this, allusion may be made, perhaps, to the *cantine scolaire*, or school kitchen, by which free meals are provided in each arrondissement for the children of the indigent, while those who desire can share in the meal for about three halfpence a day. The cost is partially borne by the school fund which is raised to aid the children of the poor; but, as there is always a very large deficit, the great proportion of the cost falls on the city of Paris itself.

Thanks to Authorities.—In conclusion, I should like to say that, whatever merits this imperfect sketch of physical education in France possesses, they are largely due to those whom I consulted on the subject. Among

those to whom I am particularly indebted I should like to mention M. Rabier, the Director of Secondary Education; M. Bayet, the Director of Primary Instruction; M. le Colonel Dérué, Inspecteur de la Gymnastique dans les Écoles de la Ville de Paris; M. Flamand, Inspecteur Primaire; M. Demeny, Rapporteur de la Commission Supérieure de l'Éducation Physique au Ministère de l'Instruction Publique, and Secrétaire Général du Congrès International de l'Éducation Physique; M. le Docteur Philipp; and M. J. Manchon, Professor au Collège de Normandie, as well as the various heads of schools and teachers of gymnastics that I met.

9629. *By Sir Henry Craik.*—Will you tell us what your experience has been in England as well as abroad?—My experience is altogether of a general kind. I do not pretend to be a specialist in these matters whatever, but I have taken a very strong interest in education for the last five or six years, and in this side of education, physical education, naturally; if you take up a subject like education, you must consider the physical quite as much as the other sides of the question.

9630. I presume you went through an English school or an University?—I went through an English school and an English University, and then I did rather an unusual thing: I went to France at the age of thirty-two, and got the leave of the Vice-Chancellor of the University to enter a French school as a small boy. I wanted to get a French degree. I was in the Lycée for a year and a half, and I was also a member of the University, so I know the inside of French life perhaps better than a good many people, and I am able to look at things more from a French point of view in consequence.

9631. Have you done anything as a teacher?—Of gymnastics?

9632. No; in the schools?—Oh, yes; I had seven years' experience of secondary teaching in England in four or five schools.

9633. Public schools?—Public schools, yes.

9634. Would you tell us which public schools?—I first of all started to teach at the Perse School at Cambridge, then I was at the Heath Grammar School, Halifax, next at St. Edmund's School at Canterbury, which used to be called the Clergy Orphans' School; and last of all I was at Queen Elizabeth's College, Guernsey.

9635. Physical exercises were, I presume, a good deal attended to in all these schools?—Oh, yes; at Halifax we had a regular gymnasium, and at Canterbury the schoolroom was fitted up for gymnastics, and at Guernsey again there was a regular gymnasium.

9636. But the exercises were chiefly taken in the form of games I suppose in all these schools?—Oh, no; the Guernsey gymnastics were pretty serious; they used to go in for the Aldershot competition and come out about fifteen.

9637. They had a military instructor?—They had a military instructor, and at Halifax also they had a sergeant who taught the pupils.

9638. Going on in your evidence, you give a sketch of the French since 1870?—Yes.

9639. And their first attempt at physical instruction after the war was too strongly of a military character—playing at soldiers?—That is the exact phrase that my informants used.

9640. And they came themselves to be convinced of it?—Absolutely convinced of it. I talked to the head of Primary Instruction in France, I talked to private individuals, I talked to the Colonel Dérué, who is the head inspector of Gymnastics at Paris, and I talked to the military instructors themselves, and I could not find one single person to say that the thing was in any way a success. They all recognised that the idea of taking your soldier in the bud—catching him young—was admirable, but as regards the experiment it was an absolute fiasco.

9641. There were certain defects that were peculiar to their experiment?—I am very sorry to interrupt

Failure:
reasons.

you, but I wish it to be understood I am only relating what the experience of France has been.

9642. I just want to accentuate a point in your evidence; the failure was partly due to the fact that it was carried out through non-commissioned officers, whose general bearing and manners were far from beneficial to children?—Yes; that seemed to be pretty widely considered to be the fact.

9643. And you are not prepared to say that under due precautions and better organised it might not be more successful?—I do not see in England that factor should count at all, but I mean the difficulty in France was this: the ordinary sergeant rather belongs to the old régime, who swears and expectorates freely, and when he went into the school he behaved more or less as if he were in the barracks instead of being in the school, and, of course, that had a deplorable effect on the *tenue* of children.

Gymnastic
association:
no progress.

9644. Having failed in the first experiment they turned next to gymnastic associations?—Yes, and they still, of course, had gymnastics in the schools of the military type.

9645. And these gymnastic associations have also failed?—I am told, on competent authority, that they seem to be stationary as it were, more or less; they do not seem to be growing. Up to 1887 they grew, and then since then they have been practically stationary.

9646. And you state have since declined?—I took that from a monograph which was prepared for me by a friend who knows this question very well, and why assured me that they have declined.

9647. Then, following your evidence, you think that the failure was not perhaps due entirely to the gymnastics generally, but to the errors in this particular system of gymnastics; that it was too much directed to acrobaticism?—Quite so. You are talking now specially of the schools or of the clubs?

9648. The associations?—Probably having my head full of French when I wrote this, I sometimes used French words instead of English. What I meant by associations was rather the outside clubs—the *patronages* and *associations d'anciens élèves*, and the clubs which are started by the societies, for evening classes in France like the *Philomathique* and the *Polytechnique*.

Reasons:

(1) Defective
system.

9649. But what I want to get for the information of the Commission is in what respect do you think that this system was defective. I understand you to say, because it tended rather to develop muscle than to develop the respiratory powers?—Yes, that is the view which has been adopted by the specialists in France.

(2) Competi-
tion of outdoor
sports.

9650. I am coming to that, but that is your impression of the failure?—Yes, that is one cause and the other is the competition of outdoor sports. These two reasons have prevented the gymnastic movement in France from taking anything like the extension that it has in Germany, for instance.

Swedish
system.

9651. And in place of that you speak of other theories having come forward; now would you describe to us what these theories are—the ‘*gymnastique raisonnée*’?—Well, there you see the military gymnastics and the gymnastics of the *Gymnase* generally, are purely empirical. It is a thing which has grown up; like Topsy, it has grown up by itself; it is not based on the lines of physiology. Now M.M. Demeny and Tissier came along and they said, ‘We must find a ‘philosophic basis for this thing,’ and of course they looked abroad, and they finally went to Sweden, and studied the Swedish system, and there they got their idea of physical development, and not merely the making of muscle; they saw how much more important it was to practise things, like deep breathing to develop the thorax, the chest capacity of the child, than merely to turn out a muscular Hercules.

Physical
development.

9652. How do you distinguish between physical development and the formation of muscle?—Well, of course, both of them ultimately lead to the formation of muscle; only if you take the gymnastic teaching as it was, the military, it had no scientific basis about it, and therefore it did not develop the whole of the physique

of the individual, and on the other hand, of course, it did not in any way take into account the physique of people who want rather building up as well as development, and therefore that kind of gymnastics was often absolutely bad for children of imperfect and weakly constitution.

9653. Now you describe the fight between the French and the Swedish system?—Yes.

9654. Leading to the ultimate triumph of the Swedish system?—Yes.

9655. Now, would you for the information of the Commission give us the salient features of distinction between the two?—The salient features are these: that the Swedish movements are more or less to an extent rhythmical, and the military ones are more jerky movements; if you want to see what the Swedish is like I would refer you to the second volume of Mr Sadler's Reports. The pictures it contains of the Swedish exercises as practised in the London Board Schools give a very fair notion of the system which they have adopted in the French schools. They start with the simplest movements, and then they combine them in more complicated exercises and they practise them more or less as we do in England, employing numbers, just as we do.

9656. But the Swedish system has, on the whole, from your own observation, had a great effect on the schools?—It was only introduced last October into the Paris schools, and considering the short time it has been going on, I thought they really had done very well. I mean if you have only had children for about six or eight months, and they only get half an hour a week with the regular instructor and another half an hour a week with the teachers, which is not so valuable, you must not judge them too severely.

9657. Although to a certain extent it was satisfactory, you think it is open to certain dangers. The chief of these you mention is that there is not sufficient initiative left to the instructor?—That is quite true. I asked M. le Colonel Dérué, and he said the exercises were absolutely the same all over Paris, as well as being very largely the same for each class. Of course, the system has only just been introduced, but it seems to me it might be liable to become slightly monotonous in the long run.

9658. Of course, that is the tendency of the French system of education all round to a certain extent?—Yes.

9659. Then you found also another defect, that the teacher is not always up to his work?—That, of course, is very strongly marked at the present time, and it comes from two reasons. One is that either the teacher has not undergone a gymnastic training, or that the gymnastic training he has undergone has not fitted him to be a teacher of the Swedish system.

9660. And one of the evils in the training of the teachers has been that there has been too much of the gymnastic element?—Quite so.

9661. And too much of the competitive element?—Quite so; yes.

9662. Coming to the country schools generally, you tell us that it is purely optional?—Perhaps I ought to qualify that in order to put it absolutely correctly. According to the ministerial decree it is obligatory, but it is one of those things that makes the French programme rather intricate. If you did everything that you were told, you would have to work for thirty-four hours a-week, and thirty hours is the regular course; therefore something has to go by the board, and naturally in the country districts the subject sacrificed is gymnastics. I visited about sixty schools two years ago for the English Government, and I think I only saw military drill or drilling of any kind in about two schools—three, I think it was—and I talked to the teachers about it, and they said to me, ‘Well, the children have enough exercise in coming to the ‘school.’

9663. But you think from your observation that they do require more; that there was a certain agility which had to be developed?—Exactly; the physical problem in the country seems to me to be the reverse

of that in the towns. In the towns the children are lithe and handy enough, you want to build up and strengthen their physique. In the country the children are strong and healthy. The problem is therefore to render them more agile and handy.

9664. You were able to compare the town and the country children of France?—Yes.

9665. From your previous experience in England can you give us any comparisons between the children of France and of England as to their acquirements; I mean England and Scotland, of course, of our country?—I am very sorry to say I do not know anything about Scotland.

9666. Of this country we will say?—Well, the district of France that I went through for the Government happens to be one of the most alcoholic districts of France. It is one of the most frightful things to contemplate how the physique of the inhabitants of these districts has degenerated during the last thirty years. Well, to give you some idea, the number of recruits who are rejected because they do not come up to the standard of the army requirements are six times as many as they were thirty years ago, so that naturally you can see in that particular district that I went through, although the children looked pretty well, they were degenerating, were they not, in a sense?

9667. Then beyond the age of elementary education, and for those who have left school altogether, you think there is very little opportunity in France for physical training?—Well, it seems to me that it is not solidly organised at the present time, that it is left very much to the individual teacher, the military instructor. One little thing that struck me was this—I think it is characteristic in a good many cases—the boys use far too heavy heavy dumb-bells in the ordinary exercises.

9668. The fact is, that from your sketch of it in the secondary schools it appears that it is looked upon very strictly as a part of the training and instruction, not as a recreation, and that the feeling of the pupils themselves is rather adverse to it?—Yes. I think in many schools they do not take it very seriously.

9669. But of course that is a feature of the secondary schools of France altogether, that athleticism is not so much developed and games are not so much a part of the life of the school as in this country?—Yes.

9670. *By Mr Alston.*—Is there anything in the nature of the French apart from the great mistake they have made in forming these cadet corps that led to their complete failure; are they very trifling, stupid sort of children?—I think what you say is certainly an interesting point, because it really hinges so largely on the different conceptions of discipline and of bringing up children which prevail in the two countries.

9671. You know at present cadet corps are very much in favour here?—Yes, I know they are.

9672. And we cannot conceive their failure in this country in the way they have failed in France?—I am only here to tell you what has happened. I do not pretend to convey the moral to England at all; I only want to give you what experience I have had in order that it may help you with the experience you have got.

9673. Is the new exercise they have introduced called *la boxe* anything like what we mean by boxing?—No, it is lunging, with arm movements.

9674. Physical training on the ground?—Physical training on the ground, yes.

9675. There are no qualities desired such as are supposed to be attained by boxing here?—No; it is purely a mechanical exercise which is called *la boxe*.

9676. And the fear of the French mother, is not that her son is to be a soldier, but lest he be hurt?—That is quite true.

9677. There can be no objection on the ground of militarism in France?—No, quite so.

9678. *By Sir Henry Craik.*—You describe how the failure of those systems came about, and you describe the development of athleticism in the schools and the difficulties it had to meet?—Yes.

9679. It is evident that the French nation was convinced that there had been too much of a formal

and uniform system of drill, and that what was wanted in their ease was the development of games?—Quite so; yes.

9680. But these have been checked by certain things; first of all, parents were against them?—Yes.

9681. Teachers were against them because of the absurd responsibility that was laid upon teachers?—Quite so.

9682. And the boys themselves were not very much in favour of them?—No.

9683. Besides that they were injured by the boys being drawn off to these older clubs?—To these older clubs.

9684. As recruits for their competing teams?—Yes.

9685. So that the element of undue competition came in as an additional obstacle to this development of athletic interest?—I might have seemed to be travelling a little far afield. I put that in because it is so; young men of university standing not having been caught young in athletics, spend their leisure in the Quartier Latin instead of going into athletics. That is an important element in the question of improving the national physique.

9686. Summing up, one finds that the experience of France has rather tended to make them give up cadet corps?—Quite so. Experience of France.

9687. Because of their imitation of military organisation?—Yes.

9688. Also formal gymnastic exercises?—Yes.

9689. And to develop themselves on the side where they were most failing, that of games?—Yes.

9690. But on the other hand, of course, in France, at a later period of life, the boy does get a military training?—Oh, yes; quite so.

9691. Well, they may wish to avoid it in their schools, knowing that at a later period the boy will go through that training?—That is perfectly true.

9692. That, then, of course, would not apply quite to the case of our own country?—No; except this. I have got two passages here which I would like just to quote. Some people think even on ordinary grounds that the boy should not go in for military training. The first passage is from Col. Dérué. He says up to sixteen it would be suitable to leave on one side those exercises which are exclusively military. He then goes on to say that the *bataillons scolaires*, the cadet corps, had one original vice. Their members were all scholars, everything finished with the school, and the young men from thirteen to twenty, of course the military age, were deprived of all direction. What he meant really was that the pupils went to the school, they learned a certain amount of military drill and that sort of thing, but there was such a long interval between the military drill at the school and the time when the young man joined the regiment, that the effect of the teaching of the school was lost. The other passage was from M. Demeny's Report. He was the Secretary-General of the International Congress, and one of his sentences is: 'The military gymnastics has been the first application of athleticism, but one has committed for a long time the error of transporting into the school the proceedings of athletes and applying to children the exercises of adults.' His criticism refers exclusively to the primary school, but this of course has been the chief defect up to only a year ago in France. Cadet corps.

9693. You speak of the medical inspection, going on with your paper; is the medical inspection of schools and of the children in the schools in France, in your mind, on a good basis?—What I put down was what I was told by a specialist on the subject, and I am sorry to say I had not time, in the short time I was over there, to go into the matter sufficiently to say whether it was thoroughly efficient or not. I spoke, however, on the subject, to another friend of mine, an inspector of schools, and he seemed to be perfectly satisfied with it. Medical inspection.

9694. Summing up the effect of your observations in their bearing upon this country, we have to avoid certain errors that they have committed, but at the same time these errors were of a kind to which France French system: deductions.

20 June '02.

Development of games desired by French: hindrances.

Mr
C. Brereton,
M.A.
(Cantab.).
20 June '02.

was rather more exposed than our own country?—Oh, yes; I think that is quite true.

9695. And that the tendency to militarism or formality and undue restraint in regard to physical exercise is not a danger so great in the schools of this country as it is in France?—No; I have my own ideas about military drill in England; I think, however, the question of discipline will come up in somewhat the same way.

In England :
cadet corps
in secondary
schools.

9696. But do you think, from your own experience of schools in England, that that military discipline will be a useful adjunct of ordinary school life?—I think in secondary schools it would be always easy to create cadet corps, because you have always got a certain number of boarders, and they are a sort of *cadres* round which English sports have formed in schools, and they will be the centre round which military drill will form in the schools. But I have got a perfectly open mind on the subject of the primary schools.

9697. You doubt whether it will be?—I wish to learn more myself; I have no opinion.

Sound
physical
training
desired.

9698. But for the poorer children, who have not the same opportunities for games, a certain form of well-devised and scientifically based physical instruction of course is very important?—I should like to see that introduced everywhere.

9699. And probably would not lead to those errors which France has dropped into?—No, certainly not; let us have something like the Swedish as a basis, and then build on that.

French
military
service.

9700. *By Sir Thomas Coats.*—What proportion of the male population of France are taken into the army; not the whole, of course?—Under the law now, everybody has got to serve at least one year, and most of the people, of course, serve three years; even the priests have to serve in the army, that is to say in the ambulance. Everybody who is not physically defective, or who is not the seventh son in the family or the son of a widow—the *soutien de famille*, one of the sons of a widow, has a right to get off the military service—has to serve without any exception.

French and
German
military
service.

9701. That is quite different from Germany?—Yes! It was one of the most serious mistakes the French made, making military service compulsory for all as they did, instead of maintaining the voluntary system, such as the Germans have. Among the fifty or sixty young fellows, at the Lycée and the University I have known, who had done their military service in France, I only remember one who liked his time in the army. They generally loathe it. When you go to Germany, it is quite different; the young fellows generally look back with pleasure on their year's service with the regiment; or at least they do not mind it.

9702. In Germany they only can afford to take up so many men each year; they take up the number that they require, then the others are left?—Yes, that is quite true.

9703. In France it is quite different?—Yes; some people go and live in Hamburg, because Hamburg has a comparatively small contingent to provide, and, therefore, if you live in Hamburg, you have more chance of not having to serve.

Country
schools :
musket.

9704. I notice you say that in the country schools they have given up the use of the musket entirely for drilling?—Yes, they have given it up entirely.

9705. Why is that; why do they object to that?—I think they gave it up because they were so sick of these cadet corps; you see the whole thing went by the board.

9706. Do you think there is any danger at the present time in this country of any falling into the same mistake that they did in France; do you think that after the war, having found so many men deficient in physical strength and chest measurement, we might run in the same lines that they did, and that it will be evanescent, that it will blow over in a short time?—All my French friends, when I told them of this military drill in England, said, 'Oh, you are going through that stage, are you?'

Perfunctory
gymnastic
training.

9707. I notice that you say that in the more advanced schools they hate the gymnastic training, and that the winner of the prize for gymnastics did not

dare to go up for his prize for fear of being jeered at by his fellows?—This was told me by a friend of mine who writes on education in France, so I believe it is correct. I remember also when I was at the Lycée the gymnastics were of the most perfunctory order. You were taken into the gymnasium for a quarter of an hour; about three-fourths of the fellows stood round and talked, and two or three fellows jumped over the horse, or got on the bars and turned round.

9708. It is more because it is not thoroughly done, is that it?—That and also you see the French people had entirely to organise their physical education. They did not understand. They do better now; they are beginning to appreciate the pleasure of the happy athlete, if I may put it in that way; perhaps that will bring to your mind what I mean; the pleasure of the body. If you go to France you are astonished by the influence of the Middle Ages which is still over the people. Take the question of hygiene, for instance; only quite recently in some of the big schools the boarders had only foot baths once a month and one bath a term. That recalls to you Michelet, who said the Middle Ages were 1000 years without a bath.

9709. You say that swimming is increasing?—Yes, swimming it is; but I do not remember any of the Lycées going there deliberately; the boys go down there, but the largest private schools very often take their boys to the public baths and teach them swimming.

9710. You said in certain parts of France that the physical development of the children is going down very much?—Undoubtedly it is.

9711. Is it confined to those districts you talked of, the alcoholic districts?—I did a report for the Government about two years ago on the rural schools in north-west France, and there is just a page on the subject that perhaps will help to throw light on your question. I had to inquire about the rural schools. Now, I do not believe in investigating country education unless you study the rural problem itself. It is like writing a prescription for somebody you do not know. You must know the country, and so I attempted to give a description of the country itself and the wants of the country. I happen unfortunately to live in the country, so I know something about the English problem. You have it here; it is on Alcoholism. I will leave the book here for you if you like; that will give you a bird's eye view of the whole problem.

9712. There is just one other question: you say shooting is not taken much advantage of; that they have opportunities for real shooting, but that they are not keen on it?—They say that the thing is stationary, that it does not grow.

9713. Shooting in the French army—is it a pretty high standard?—I cannot tell you; I do not think I know about that; I could easily find out for you if you like.

9714. *By Mr Shaw Stewart.*—I see that the French reformers who came over to England were struck by the value of British games?—Yes.

French
reform
games

9715. They say that games played in concert, such as football and rowing, provide an admirable field for the cultivation of social and public spirit?—Yes.

9716. We have had a good deal of evidence tending to show the value of physical exercises over games for bringing forward the qualities of every boy and girl; but I suppose you agree with the dictum of these French reformers?—Oh! absolutely.

Game
physi-
exerci-

9717. And we ought not to neglect the value of games as well as of physical exercises?—Yes; physical exercise does not seem to me to develop sufficiently the character of the individual. It either develops it badly in the sense of making things too much of a competition, or else as all movements are done in concert or by word of command; the pupil's will is exercised in a passive, not in an active fashion; the free activity of the child is not brought into play.

9718. In your opinion the two should be combined: physical exercises should lead up to well-organised games?—I would have both; I was talking of secondary schools; I would certainly have a gymnasium, and I would have games; undoubtedly both.

Combli-

9719. We have to consider not only the physical training at schools, but we are also in our remit asked to advise as to what can be done with the boys after they leave school between fourteen and eighteen?—That is most important; I would be quite as strong on both of them; they are both a sort of corrective, one of the other.

9720. Have you any views at all on providing attractions for boys after they leave school, attractions in the direction of physical exercise or athletics or games?—I have only seen one or two experiments. There was an exceedingly successful one at Halifax while I was there. We started a gymnasium for fellows who work in the mills. Work in the mills is all manual dexterity and finger-work. Although we had 1200 boys, there was not a single boy in one class of 200 who was able to take hold of the bar and pull himself up like that (*indicating*). After three or four years we had boys going out as gymnastic instructors. There was an experiment which went on wholesale; what made it so popular was that the sons of the millowners took it up, and gave the requisite lead.

9721. What age would these lads be?—Well, I suppose they started about twelve years of age; I should say the majority ranged from about fourteen to eighteen; they were mainly boys who had left school or were half-timers.

9722. I have no doubt of the excellence of the training of such boys, but one difficulty that presents itself to us is the attractions we can hold out to get them in to practise these games?—Yes; of course there was the personal element that brought them in there; you have got to enlist the right people, that is what it comes to.

9723. *By the Chairman.*—Just one question, please, about the French army; is it the case that they are very good at marching, or is it not the case?—I should think they are good at marching.

9724. I mean exceptionally good; is that true, the idea that has been conveyed to me?—I should imagine the best regiments do sometimes forty or fifty miles a day. I am speaking of the *chasseurs à pieds* in the army of the East on the frontier. These are specially trained in a fast military step called *le pas gymnastique*.

9725. I understand it is not general in the French army?—The French army varies enormously. I am only telling you what my friends have told me. They say if you happen to have the bad luck to go into the Army of the East—Nancy, about there—it is a most serious training in every way; but if you happen to go to some place in the West, you may have a very easy time. The army, undoubtedly, varies greatly, and therefore, of course, you always try and exert what family influence you have to be put into the regiments in the West.

9726. My object, of course, in asking the question about the marching was to show that in spite of singular deficiencies in physical training, somehow or other a considerable portion, as I understood it, were rather wonderful in their marching, although it was not very elegant?—One thing is they are fairly light weights, and I am sure it makes a difference if you have not got so much to carry; do you not think so? But I am sure from what they have told me of the West, the military exercises there are much less severe than those on the Eastern frontier

Marching in
French
Army.

The witness withdrew.

Adjourned.

TWENTY-FIRST DAY.

Monday, 15th September 1902.

At the Museum of Science and Art, Edinburgh.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman*.

The Hon. THOMAS COCHRANE, M.P.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr GEORGE M'CRAE, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary*.

Mr H. H. ALMOND, LL.D., examined.

9727.—*By the Chairman.*—1. State your school and university training, your former experience, and the time in your present position.

Ans. I was at Glasgow University for five sessions from the age of thirteen, and went at seventeen to Balliol as a Snell Exhibitioner. At Oxford I had a double First Class at Moderations, and a double Second at Finals; I also rowed in the Balliol Eight. After some minor Masterships, I became Second Master of Merchiston in 1858, and bought Loretto, then a preparatory school of fourteen boys, in 1862. I have been headmaster of Loretto ever since.

9727.—2. (a) What is the class of your school and scholars?

(b) Give the numbers and ages of the pupils.

Ans. Our boys are all boarders, and are of the class

which may be roughly indicated by the terms being about £100 on the Classical side, and £110 on the Science and Modern sides. When we broke up in July there were 142 boys on the school roll. About sixty of these were Scotch, sixty English, and the rest colonial or foreign (by residence). Reckoning by their last birthday, 6 of these boys were nineteen years of age, 14 were eighteen, 29 were seventeen, 20 were sixteen, 27 were fifteen, 16 were fourteen, 10 were thirteen, 8 were twelve, 5 were eleven, and 3 were ten.

9727.—3. Give in detail all the existing opportunities of physical training under the following branches:—

(a) Regular games, e.g., football, cricket, hockey, etc.

(1) Are they organised and supervised by masters?

Mr H. H.
Almond,
LL.D.

15 Sept. '02.

High-r class
school.

Mr H. H.
Almond,
LL.D.

15 Sept. '02.

(2) What is the size of the playing field, and its distance from the school?

(b) Drill: how taught, and by whom? Gymnastics, free or applied? Is there a gymnasium attached to the school?

(c) Athletics, e.g., jumping, running, etc.

(d) School runs, paper chases, etc.

(e) Handicrafts.

(f) Voice training.

(g) Cadet corps, rifle shooting.

(h) Swimming.

(1) Is there a swimming bath attached to the school?

(i) Fire brigade corps.

(j) First aid and ambulance.

Ans. The organisation of the games is this:—

Existing opportunities.
Games:
organisation.

The two head boys, who are selected by myself, make out from printed lists cricket, hockey and football sides, according to the season. The sides are so arranged that there always are a few over the number necessary, in case of any boy being incapacitated. These sides are only provisional, as boys can be changed from one to another at any time, so that promotion is always open to all.

I look over the sides, chiefly in order to see that, in football especially, no boy is put to play with those much bigger or stronger than himself, and also that the instructions contained in the book of the medical officer (*vide* 22) are duly carried out. Then, in consultation with the head boys, I appoint captains of sides, boys often being taken from a higher side to captain a lower.

Every day, in our assembly after morning prayers, I (or my deputy) see the boys divided into sides for the game of the day, those who are unable to play, or wish for exemption, sitting apart.

The sides are then arranged by the head boy as well as possible with regard to numbers.

Football.

Football sides play about three times a week (not counting Saturdays), the big side only twice, for about fifty minutes each time; hockey sides, or punt about, or runs on the other days in winter. Boys who are unable to play, or who have leave off sides (the number required being sufficient without them), say what form of exercise they wish to take, and the fives courts, lawn tennis courts, etc., are arranged for.

In summer the big side plays games about twice a week, the other side three or four times. Boys on the lower sides, on their days off, have to take their turns of fielding when big side have nets, but otherwise they can go cycle rides, etc., etc., only stating beforehand to the acting head boy what they mean to do.

Generally one or two masters play on big side at football and cricket, and masters often undertake to coach or referee or umpire for a particular side.

Otherwise there is no playfield supervision by masters, the school officers being responsible.

Playing fields.

(a) There are two playing fields of about 10 acres each; one is about three-quarters and the other about a quarter mile from the schoolhouse, but the latter is close beside the preparatory house. There are also within the school grounds two small parks and two dry playing grounds, suitable for various games.

Drill.

(b) Drill is taught by a resident sergeant-major instructor. The sergeant-major instructor of the Musselburgh Volunteers also gives two 'big open-air drills' weekly, during the summer term, to the whole school, in two divisions. Gymnastics, fencing, and boxing are also taught by the resident instructor in the gymnasium attached to the school.

Athletics.

(c) These exercises were once very prominent at Loretto, but have ceased to be so. I have come to regard long races, even 440 yards, as a frequently injurious strain on growing boys, and I consider competitive 'athletics' (though I once thought otherwise) to be nearly as great an evil as competitive Scholarships.

But in fine weather, in spring, the whole school have afternoons for jumping, hundred yards, and hurdles, and prizes are given for the attainment of certain standards, e.g., five feet for the high jump.

But the main object of such athletics is to develop the naturally clumsy boy (not to produce 'records'), just as the main object of school work is to do the best for the dull boy, rather than to attain what are called 'successes.'

(d) The country is not adapted for paper-chases; School and they also, in my opinion, often cause dangerous chills, from the hounds standing still, at fault, when overheated. But runs are most valuable. There are always runs for every boy on days too wet for games, about three miles on full school days and four and a quarter others. On days not absolutely wet, but unsuitable for games from wind or sodden ground, the boys often go 'grinds' (especially on Saturdays when there is no match) from six to twelve miles or more, according to circumstances.

(e) There are two carpenter's shops. Every boy on the modern side and in the two science classes has a box of tools of his own, and carpentry is a regular part of his school work, examined upon, and marked for at the annual examinations.

I hope soon to have appliances for blacksmithy and other handicrafts.

I regard the teaching of these as most valuable at school, so that boys may be learning what may be practically useful, at the same time that they are receiving the advantages of an all-round education.

(f) Every boy, who possibly can, learns singing. Voice training. There is a resident organist and choirmaster, with a resident assistant.

The younger boys have daily practice, partly in voice exercises, and partly in vocal (chiefly sacred) music. Each part has also half an hour or more weekly practice; and there are three full practices.

Boys who do not sing have other prescribed occupation at these times; so that singing counts in lesson hours. About three-fourths of the school are in the choir, and most of the rest have been in it as trebles, or will be in it when their voices have passed through the breaking stage.

(g) The non-cricketers (about 16 in number) have rifle drill and shooting, partly with Morris-tube and partly at butts on the sea-shore twice a week. Only upper boys are allowed to be non-cricketers. The cricket XI. have similar practice once a week. We have hitherto had the use of rifles belonging to the Musselburgh Volunteers. But we have arranged to procure rifles for our own use, and to have more rifle practice, extending over more boys. My answer to question 16 enters further into this subject.

(h) There is no swimming bath attached to the school. There is sea bathing in summer, and most boys learn to swim. By a certain amount of proficiency a boy becomes a 'rafter'; and if he can swim round all the rafts, he becomes an 'outer rafter,' which is an object of ambition. Boys also frequently go up in the afternoons, when their side is off, or when they get exemptions, to the excellent swimming baths at Portobello.

(i) (j) I am sorry to say we have no organisation under these heads. I see the desirability of it; but our programme is so full that it is impossible to organise, and to fit in, everything desirable.

9727.—4. State specifically the time allotted to these or any of them *per diem* and per week.

Ans. Football, as a rule, goes on for three afternoons weekly from October to March, weather and ground permitting, for about an hour.

Big side plays twice a week, at the most, for fifty minutes.

I regret that the modern development of the game, in order to attract spectators and make 'gates,' has tended to make it too fast, and a great strain on growing boys, where it is played keenly. I have done my utmost to persuade the other schools to join us in making rules adapted to growing boys; and here I am strongly supported by our medical officer, and, I believe, by the medical officers of other schools.

There is also a good deal of drop-kicking, and often a kind of association football, during our morning intervals, within the school grounds.

Mr J.
Alm
LL
15 Sep

H. 2
nd,
D.
02. Hockey is played regularly before and after the football season, and for more days in the week and longer time than is possible with modern football. It is also sometimes played during the football season.

Cricket is usually played from 3-4.15 p.m. on three days a week; and from 2.15-4.15 on other two. The elevens also, especially the XI., have often 'fields 'out' for half an hour before early dinner. But all boys have at least one day a week off cricket, and special exemptions may be gained by those who field keenly.

Gymnastics and drill, etc.—All boys have half an hour daily in the gymnasium, or for outdoor drill. Then half hours occur at various times in the morning or evening.

No boy may be in the gymnasium, or indeed anywhere indoors, for any cause whatever, except doctor's orders, during the time set apart for outdoor exercise in the afternoons.

Swimming in the sea has to be fitted into the tides. Rifle drill and shooting are at the same hours as the games.

School runs are also at these hours. But on wet days, so long as a boy does his run, he is not obliged to be out of doors the rest of the time.

Athletics when they are 'the game of the day' are at the usual hours. But boys often practise jumping, etc., inside the grounds during morning intervals.

During frost, skating takes the place of games, and when snow is on the ground, tobogganing. We owe many thanks to Lord Wemyss and Lord Elphinstone for the facilities which they have granted us for these splendid exercises.

So far I have not included Saturdays.

On Saturdays indoor work ends about 12.30, and there is no more till about 7.30 p.m.

There are usually three or four cricket matches in summer, often hockey matches in spring and autumn, and three or four football matches in winter.

Boys in general are allowed to look on, provided they take abundant exercise afterwards. After looking on at football, they have a three-mile run.

But many boys go on expeditions for cycling, catapulting, ferreting, bird-nesting, entomology, photography, etc.

On Saturdays when there are no matches there are 'grinds' for the whole school, as described before. On two Saturdays in the year there are longer grinds, usually one from Selkirk to Peebles, one from Pomathorn to Innerleithen, one across Muirfoots, and one up Carnethy or Arthur's Seat. The longer grinds are a privilege, gained by marks. As they extend to about forty boys, all VI. form, school officers, and members of XI. and XV. are eligible. What counts most for the rest, is having done a twenty mile walk in the previous holidays.

I think that walking and hill climbing ought to be far more encouraged than they are.

9727.—5. Are any of these taken in ordinary school hours?

9727.—6. What, in your opinion, are the respective merits and relative values of the various forms of physical training?

9727.—7. How far are these opportunities taken advantage of?

Ans. When boys first come to us, a great many of them are much disinclined for any exercises which involve much exertion or discomfort, or the possibility of being hurt. They have been carefully trained at home to avoid such things. I think that fully a third would not take much advantage of the gymnasium, the swimming rafts, wet weather runs, long grinds, or Rugby football, if they could help it. But with us, unless medically exempted, they cannot help it. By degrees nearly all boys become enthusiastic for Rugby football, and like gymnastics and long grinds and swimming. But though with most of our upper boys a wet weather run becomes such a second nature, and the absence of wet weather exercise produces such dullness and discomfort, that I think most of them would take such runs, in the worst weather of which this

climate is capable, if left entirely to themselves, yet I cannot say what proportion of the others would be found hanging over a fire, and progressing towards a flabby condition of body and mind, if they were allowed to prefer immediate comfort to high-spirited health. Some, after a fair trial, are exempted from cricket, if they have other active occupation, and take their turn of cricket fagging.

I have answered the spirit rather than the letter of this question, as there is generally no option for boys in the matter of taking advantage of our physical system.

9727.—8. What, in your opinion, are the results of such physical training?

Ans. I give the first place to wet weather runs and the grinds above mentioned. It is evident, even to outsiders, that the conditions, physical, mental, and moral, of boys who have been thus engaged, is likely to be much better than if they have been sitting over fires, or roaming about and vitiating the air of school-rooms or reading-rooms. Such continued exercise, never violent, as it sometimes is in games, or intermittent, as in cricket, or sluggish and interrupted, as in golf, is eminently calculated to expand the lungs, oxygenate the blood, and impart vitality to throw off noxious germs, especially, I think, those of tubercle.

But more than this, those who have experienced the delicious after-glow resulting from such exercise, and contrasted it with the stagnant condition occasioned by an afternoon spent indoors, acquire a most valuable habit for life. Many a young man remains well and strong under the unfavourable circumstances of modern city life by having formed at school the determination that, in spite of all obstacles wherever he is, under all possible circumstances of rain and storm, he will have his exercise. He may be too old for football; he may not be able to spare the great number of hours requisite to get sufficient exercise out of golf; the roads or streets may make cycling impossible, but he can always walk. And above all, if boys are taught at school that keeping themselves in prime physical condition is a moral duty, and that therefore the time daily allotted to it is nothing less than sacred from the interference alike of laziness and of impositions, the divine laws which have to do with health and well-being, and which are now more and more clearly revealed by science, gradually acquire a sanctity in their minds of which our forefathers never dreamt, and physical laziness and self-indulgence assume the character of physical sins. Circumstances and temptation in after life may bring about lapses, in this or in other ways, but the recollection of how their daily exercise, no matter what the weather, or the other calls upon their time, was made a paramount duty at school, will come back upon them with a force always strong and often irresistible.

I have enlarged perhaps unduly on this point, because that exercise is in the first place a duty, and in the second place only an amusement, is the keynote of the present enquiry, as I conceive it.

Of all our games the most important is football. It obviously cultivates courage, dash, and alertness of movement. But its even more valuable points are not so obvious to those who are not behind the scenes. Quickness of decision between a multitude of conflicting alternatives is one of the most valuable qualities in life; and it is eminently fostered by football. The issue of a game may depend on whether a player kicks up, or dribbles, or punts, or drop kicks, or passes. A mistake may be fatal, and hesitation is even worse. Those who talk platitudes about 'muscle and brains' forget or are ignorant what complex brain processes take place in such cases, and how much a great player at football owes to his brains.

And again, football only comes second to rowing in teaching endurance and self-restraint. Endurance, as I have said above, is carried even too far by the game which the Unions have encouraged. When a boy gasps out at the end of a match, 'I didn't know a fellow 'could go through an hour of that and live,' he has had a training in one of the noblest of virtues, most necessary to a great or even a safe people; but it has not

been altogether good for him. The gain in self-restraint, however, has no drawback. The boy who is in training for a match gains experience of the happiness and high spirits which result from eating and drinking what is best for him, rather than what he likes; and I am convinced that the most hopeful line of assault against both drink and immorality is the theoretical teaching and practical enforcement of the unnamed but cardinal virtue, which consists in the observance of physical laws and the avoidance of physical sins.

Drill and
gymnastics.

I cannot place so high a value on drill and gymnastics as some do, though I believe that they should form part of the daily work of all schools. Drill is undoubtedly useful in giving a boy something of a soldier's training, teaching him to give prompt obedience to the word of command, and makes him hold his head up and avoid a slouching gait. And gymnastics do much in the way of developing the muscles, and of expanding the chest, though I think that the latter object would be equally achieved by the freer games, which are more conducive both to high-spirited health and to the development of individuality and initiative. In these remarks I have been looking at things from my own point of view as the headmaster of a school in the country. In town schools generally, games, such as football, etc., are not attainable every day, and often not at all. In such cases drill and gymnastics are of the first order of importance. Drill of an active nature should always, when weather makes it possible, be in shirt sleeves or gymnastic dress.

Boxing.

But boxing seems to me to be a better thing than either, and I am much inclined to give it the place once assigned to fencing and basket-stick exercises. Gymnastics and boxing both share with Rugby football the advantage of developing the muscles of the chest and arms; for which most games, including association football, do little or nothing.

Swedish
exercises.

I thoroughly believe in what I know of exercises like Ling's for schools which have not abundant opportunity for gymnastics and various athletic games.

Cricket and
hockey.

Cricket and hockey are both admirable games. They can be carried on later in life than football, and are available in all parts of the English world. They are both far superior as a social training to all selfish games, such as golf, and also as a physical training to all games which involve no running or quick movement.

Of the two, I think hockey is the more valuable. Cricket, especially now that, with improved grounds, innings have become so long, demands an expenditure of time which few can afford; and, personally, I confess that drawn matches or exhibitions of individual prowess, apart from the success of a side, have no interest for me whatever; and I think that the more games tend to become spectatorial, the less value they possess.

Handicrafts.

I think our eyes have been somewhat suddenly opened in this country to the great value of handicrafts. Such schools as Abbotsholme and Claysmore have done a great service in this direction. Abundance and variety of occupation are not only useful in many ways which need not be particularized, but promote a healthy and vigorous life in those who might otherwise become aimless and frivolous. They also help to teach the dignity of labour, and form a most desirable link between brain workers and manual workers everywhere.

Voice
training.

Voice Training.—I attach great importance to our work in vocal music. It is an excellent exercise for the lungs, and I think that the vigorous singing of robust music, such as the old Scottish and English Psalms and Hymn tunes, with a few of the best of modern tunes, Anglican Chants, choruses from Handel, Haydn, etc., and Anthems of the old English school, with again a few modern ones, does much to cultivate a really sound musical taste, and to make vulgarity and sensational extravagance distasteful. There is also something most invigorating to the spirits and the character in the singing of a great chorus; and I think that training boys to take a vigorous part in public worship is an important part of their education.

I have expressed my view as to rifle corps and cadet corps in answer to question 16.

Every boy, I think, should learn to swim.

Hand fives, in open courts, seem to me one of the most valuable of our games. It gives much exercise, not too violent, in a short time; it can be carried on late in life (witness Edward Thring); it does not demand much time, and it exercises the left hand and arm, as few of our games do. Bat fives and racquets are far inferior from the latter point of view.

I would like to see hand fives courts available for all our city clerks, and half an hour allowed for their use in the middle of the day. Its effects would soon be evident to those who care about our breed of men. But this, I fear, is an institution of Utopia.

9727.—9. What are the effects, moral, physical and intellectual?

Ans. 8 and 9. The results are that, from a sound physical system, many weak boys become strong; nearly all boys with tuberculous tendencies (all, I believe, if treated soon enough) get rid of them, and many, possibly a majority, become imbued with more or less distinct notions of what I may broadly call physical morality for the rest of their lives.

I believe also that the supply of pure blood to the brain, which is the necessary result of regular and judicious exercise, both increases its power for all good purposes, and does much to prevent the character being injured by weak sentimentalism, or by morbid and pessimistic views of life, which rarely exist in those whose bodily organs are in healthy and harmonious action.

Many games also, as I have already said in the case of football, promote the rapid exercise of the reasoning powers under complicated circumstances calling for immediate action.

9727.—10. Is a uniform system of physical training in schools desirable or necessary?

Ans. I certainly do not think that a uniform system of physical or any other training in schools is desirable. There is already, in my opinion, too great a tendency towards regulation and unification, and too little individuality.

Circumstances and surroundings differ. For instance a school of 400 ought to have an excellent rifle Eight, and a high standard of rifle shooting generally. It ought also to have a very good band, glee club, pack of beagles, and other organisations. But if a school of 140 attempts all these things, the same set of capable upper boys have too many calls on their time and energies. Again, I think it a misfortune for a large school not to be near a river. Eton would have twice as many spectators lounging about the cricket field were it not for the Thames: and rowing ranks with football as a training of the qualities of endurance, pluck, and determination. But a river would hopelessly divide a small school.

But to take a wider line, originality is a necessity of true progress. And uniformity crushes out originality, and makes everything tend more or less towards the ideal which China has reached, and at which Germany appears to aim.

The only uniformity which there ought to be is a determination on the part of whoever presides over a school loyally to follow nature and truth, wherever they seem to him to lead.

9727.—12. What is the relation between mental study and physical training?

Ans. This is a question on which it is easy and common to express unverifiable opinions, but there are no data on which to come to a decisive and balanced judgment. There are, however, a few points which seem to me indisputable.

(a) An abundant supply of pure blood must be as conducive to a vigorous and normal condition of the brain as to that of any other organ of the body.

(b) Numerous instances may at the same time be quoted of men who have been and are eminent not only in Literature, Science, and Politics, but in positions requiring the exercise of those qualities of nerve, will power, and initiative which would seem to be most

nearly allied to physical vigour, who yet have not had any physical training worthy of the name, and, in some cases, have not been capable of it.

(c) There can be no doubt that the vigorous employment of the mental faculties produces very similar results on the circulation of the blood, and consequently on the bodily health, to those of physical exercise.

(d) This latter cause would be more evident in its operation than it is, if the work of brain workers was always performed in as pure air as that which is usually inhaled during physical exercise.

(e) Physical exercise, when excessive, as that of the ambitious athlete, often exhausts the system, and actually deprives the brain of a full supply of blood, by the undue demands made by the limbs and muscles.

Unfortunately, anything like an inductive investigation to determine the actual resultant of all these causes is impossible. The subject is surrounded by a multitude of side issues and cross considerations.

I shall merely give, for what they are worth, some facts which have come under my own notice.

I have carefully summed up all the honours of what I may call a First Class which have been gained by Loretto boys during my Headmastership of forty years. I include, First Classes or Open Scholarships at Oxford or Cambridge; Gold Medals, First Class Prizes, Open Bursaries, high degree distinctions at Scotch Universities; and appointments in the Indian Civil Service. Considerably above two-thirds of the entire list have been members of our first Football XV., which ranks highest with us as an athletic honour, and is the most closely connected with physical training of all our games. I have not included those who have passed into Woolwich and Sandhurst, because a large number of these have left too young to be in our XV., though several of them have gained that position before they left us.

When I was at Oxford, rowing occupied the place which football does with us. In our Balliol Eight, I remember there being four first classmen at one time, and I may say for myself, that being at the time in boating training was an immense assistance to my clear-headedness and vigour in the Oxford Schools.

In a most instructive paper in Vol. VI. of Government Educational Reports, by Mr George Sharples, on Physical Education in the English Board Schools, there is abundant testimony to the effects of such physical training as is inseparable from good football. Many of the teachers of Primary Schools have organised matches between the schoolboys of the large towns, and they speak decisively as to the effect, not only on the complexion and physical health and development, but on the character, language, and *schoolwork* of those who play.

At the same time, I have a great dread of overdone athletics and 'record' making of any kind.

Not only are the physiological effects of excessive exercise, and even of abnormal muscular development, calculated apparently to impair the general health of mind and body, and to shorten life, but to engender a feverish condition of excitement and dislike of all steady work, as well as bad habits of various kinds which I need not particularise. It is the typical athlete, from the days of Euripides to the present, who brings discredit upon physical training.

9727.—13. What is a just proportion of time to be devoted to physical training in relation to study?

Ans. This again is a hard question to answer. Many side issues are involved. I believe, *e.g.*, that the hours of sleep should be regulated both by age and by the season of the year. Boys, roughly speaking, up to ten or eleven, should have ten hours at least in bed; and during the chief growing age (*i.e.*, up to seventeen or seventeen and a half), at least nine in winter, and perhaps half an hour less in summer. These hours have often, I believe, been encroached upon to permit of sufficient time out of doors, and also for the numerous subjects required by a modern school curriculum.

Again, football or hockey requires only one hour, while to get sufficient exercise out of cricket, quite two, and out of golf, even more, especially on crowded links.

But there ought to be a great deal of what I may call breathing time in the open air, besides what is spent in hard games.

Generally speaking, I would say that six hours spent in actual study or preparation, one in drawing or singing, ten in the bedroom, one and a half at meals; one in unoccupied time after meals, half an hour at prayers or school assemblies, half an hour in the gymnasium, leaving two and a half for games and fresh air, and one for entirely leisure time.

This estimate is, of course, subject to the variations indicated above, but I think it gives the minimum allowance consistent with due attention to robustness and vitality.

On Saturdays there is, of course, more open air, and I think that all schoolboys should learn to take a good walk on Sundays, if only to keep up the habit of walking as an exercise.

9727.—14. Is physical training most advantageous if carried out daily in connection with school work?

Ans. Certainly, I think the two should go together. Nothing can be a worse habit for life than taking no exercise one day, and too much another. Exercise should be, like meals and sleep, part of the daily business of life, till the desire for it becomes an irrepressible instinct.

9727.—15. What are the respective merits of outdoor and indoor training?

Ans. They seem to me to be like food and drink, both equally necessary to well-being. Indoor life is less injurious the more it is associated with absolutely pure air, and a temperature never artificially raised above 55° or 56°.

I regret to say that these conditions are often frequently violated, not only by the world in general, but by schoolmasters, chiefly because they work in overheated studies; and even by scientific professors, lecturing perhaps on the sciences which are supposed to do with health to students who are suffering from gross violations of the principles of ventilation and of heat economy. If science were applied to the well-being of man himself, as rigorously as it is to the improvement of his material surroundings, such anomalies would not occur.

9727.—16. Should some form of military drill or training form part of the ordinary curriculum of every school?

Ans. As I have said before, I think that drill should form part of the regular business of a school, and that as many boys as possible should be trained to be good rifle shots. I further believe in boys camping out when the time can be spared, either during term or holidays, under something like military discipline, and learning to do everything for themselves which has to do with tent life.

But I am much opposed to anything which shall further interfere either with the studies, or the games, or the manual work and other occupations, or the already brief leisure time of school life, and still more so, to notions of military smartness bringing about any obstruction to the free play of the lungs or the free movements of the limbs; in fact, boys have clothes enough already; and for rich and poor alike, I object to any special clothes for their 'playing at soldiers,' just as I have effectually objected to all distinctive athletic millinery not absolutely necessary for the purposes of games. General Sir Hector Macdonald reviewed the cadet corps of Wanganui School, New Zealand, in grey flannel shirts, bare necks, and short trousers. He said it was the best uniform he had seen, with some sort of loose jacket to put on when required by the weather. I particularly approved of this, because it is also the best wardrobe for a cyclist. But, generally speaking, I have apprehensions as to the results of encouraging the military spirit in schools. We wish to teach our boys to think for themselves, to appeal to reason rather than to custom and prejudice in all they do. And I fear that the military spirit has been, hitherto at least, productive of cast-iron regulations, and opposed to what is rational, individual, and unconventional. If I could have a school cadet corps, equipped and accoutred

15 Sept. '02.

without any interference from the War Office, and trained to exercise initiative and common sense, my present views might be modified, but I believe in development after the model of a rifle club (*vide Spectator*, August 23) rather than after that of a cadet corps.

9727.—17. What system of physical training is, in your opinion, the best?

Ans. I think that this question is answered in the course of others.

I have treated questions 18–21 as general only as far as I could.

9727.—18. As distinct from physical training, what physical education is given in your school?

Ans. I am not sure that I fully grasp the scope of this question, but I take it as referring to teaching boys the principles of their physical training.

At all events it is not alien to the present enquiry, if I say that, in all classes of schools, one of the most, if not the most, important subject of instruction is what I may call the science of life; the importance of pure air, and how it is to be secured; the laws of heat economy, and how they are to be observed; the physiology of exercise, and the evils both of excess and defect; the way in which common maladies, like colds and chills, can be avoided by its means; the reasons why any hard exercise should be taken in flannel, and not in any cotton fabrics; something of the chemistry of food, and of the secretions which help digestion, and the practical rules deducible from such knowledge. All these things are more important for boys (and girls) to know than the dates of the kings or the nature of adverbial clauses. If such an education as this were given in all schools, as a necessary and prominent part of education, we would no longer hear of children in the Highlands and other country parts being fed on tea and white bread and tinned meats: of the consequent want of freshness and rosiness and hardness of the present generation; nor would children be kept at school in towns during winter months with little more open-air exercise than what they get by climbing up and driving on a tram car.

I suppose, for my own part, that there is scarcely a day on which I do not speak to my boys on some point which has to do with the *rationale* of their physical training, or insist, from the standpoint of practical Christianity, on the duty of avoiding 'physical sins,' when known to be such. And further, I believe that laying such a foundation of physical morality presents the best chance of resistance to the formation of drinking habits in after life. Teach a boy why his stomach should have periods of repose, and, therefore, why he should not eat or 'grub' between meals, and he is less likely to be subject to a craving for 'something,' which afterwards will only be appeased by stimulants, and he will not only have formed the habit of controlling his appetites, but he will have learned why he should control them, and also have experienced the effect of such self-mastery on his bodily vigour. It would be easy to multiply illustrations, but I think I have said enough in support of the thesis, that theoretical education is the proper and essential supplement of physical training.

9727.—19. What are the results of your experience regarding physical training, games, etc.?

Ans. It is difficult to make any definite statement as to results of the nature indicated. The results of the training of any school are evident only to those who are largely acquainted with its output.

But I may mention one fact in this connection which has no exclusive reference to any one school.

Generally speaking, physical training is more organised, and the duty of daily exercise, both in the open air and in the gymnasium, is more rigidly enforced in the Scottish public schools than in most of the English ones. And the result of such training is more directly manifested (for schools which have no river) in Rugby football than in any other game or exercise.

Now, in a list which has lately appeared in an English journal, of what are called Rugby Blues, or men who have played for Oxford or Cambridge in their annual match, two Scotch schools take the first two places by

a large majority, though their united numbers do not equal those of a large English school.

There is no other possible cause to account for this except a better physical training.

Some other points of importance fairly come within the scope of this question.

(1) It is a common-place that 'games injure work.' I object to the antithesis. Games are only one of a number of means towards a physical training, which again implies and involves physical work. If the chief end were amusement, the present prominence given to games would be indefensible. Amusement, and its resulting high spirits, are certainly excellent things. But the energy, time, and money spent on this particular sort of amusement would be wickedly excessive, if cricket and football were in the same category as balls and picnics.

Runs in the rain are certainly not an amusement, though the recompense of the after-glow is soon discovered; football is rarely an amusement to a boy fresh from home. He would usually rather be in school than in a scrummage. But the resulting joyousness, akin to that of war, is usually a plant of quicker growth than the deep delight in great literature, which is slowly but surely imbibed by those who have become saturated, as it were, with Sophocles or Homer, by the arduous process of translation. And as the delight from active exercises comes sooner, and is more visibly displayed than mere intellectual pleasure, the idea of amusement has become connected with the former, and that recreation is one main purpose of the latter has been forgotten.

(2) It is said 'Does this not result in too much talk 'about games'? Archdeacon Wilson replied to this, 'What do French boys talk about'? I doubt whether, when boys are gathered in hall, or men in smoking room, much more edifying subjects are, or ever were, the staple of conversation. Any one who really gets to know boys becomes aware of the enormous variety of topics in which they take interest, and about which they will talk freely when alone or with one or two congenial friends. But such subjects of individual interest would not be suitable for general social talk and badinage in the school world or in any other.

(3) A result of the present position of the great games is that they really do give an education in observation and reasoning of no mean order.

In a discussion, to take one point as to when it is advisable to take first choice of innings at cricket, or the choice of ground and wind at football, the number of logical or fallacious processes, both inductive or deductive, which occur in such arguments, are as numerous and as educative as if the discussion concerned politics or casuistry. School politics, indeed, have often been proved to be a good training for those of the bigger world.

(4) The tendency of some of our great games to become spectatorial, which is deplored by every man of sense, and which really constitutes a national evil and danger, is not fostered by a sound system of physical training and education, but the very reverse. The man who, as a boy, has been taught the duty, and experienced the advantage and pleasure, of taking exercise for himself, of a kind suitable to his age and circumstances, is not likely to sit or stand during a Saturday afternoon, as spectator of a gladiatorial show, unless he can otherwise secure his own personal exercise. For my own part, I have not witnessed a cricket or football match for very many years. I require the time for my own exercise.

9727.—20. Are they at present sufficiently organised and supervised?

Ans. Generally speaking, not at all properly organized; nor are the principles on which such organization rests sufficiently recognised. At the same time, in all future organization care must be taken to avoid the evils of over unification and regulation, and to leave free scope for fresh departures and experiments, and for individual freedom and variety.

9727.—21. Are the teachers themselves duly qualified and instructed?

Physical education: theoretical education the proper and essential supplement to physical training.

Experience: results.

Mr H.
Almond
LL.D.

15 Sept.

Games: system of truly recreative education

Games may be properly organised with individual liberty

Ans. My experience as to this is very limited. So far as drill, etc., is concerned, I engage one sergeant-major instructor permanently, and another partially for 140 boys. The one is more proficient in gymnastics and boxing, and the other in rifle drill and shooting. I presume that other public schools have similarly efficient instructors. We have also had the same cricket tutor, certainly a competent one, for thirty-two years, with an assistant in summer, and they are ably aided by several of the staff. And at least three members of our staff are fully competent either to coach and referee or to play on football sides. The vulgar and ridiculous reproach that schoolmasters are chosen for their 'athletics' is founded on the truths that, in order to bring out the educative element in games, there must be some experienced and rational instruction, and that many reasons make it desirable that some masters should take part in the great games, and not be conspicuously inferior in them to the leaders of the boys.

For other schools I can speak of the splendid work done by the late lamented Mr. Burgess at Merchiston, by Mr. W. W. Anderson at Watson's College, and many at Fettes College, Edinburgh Academy, and other schools. But how far masters at Scotch elementary schools take an interest in the physical education of the children I cannot say. The number of closed windows in too many cases is an indirect evidence to me that things are not always quite as they should be, for open windows are an unfailing index of a man who cares for physical education. For the great work which is being done in many English primary schools I have already referred to Mr Sharples' paper.

9727.—22. Are the pupils examined by a medical man?

Ans. All our boys are examined by our school medical officer on first entry, and his report comes to me in the doctor's book. He there enters any intimation which appears to him desirable as to boys being exempted from particular games, runs, or other exercises. His word is final.

He also, or his partner, makes daily visits to the school, and sees every boy who is suffering from any ailment or accident, or who wishes for advice as to his exercise. These reports come to me in his book.

Such reports reappear in 'The Medical Ledger,' in which each boy has his own page, so that I can see the medical history of a boy at a glance.

9727.—23. What kind of medical examination is made, and how often?

9727.—24. Is a school register kept, showing the height, weight, chest girth, spirometry, biceps' girth, and general physical development of the pupils?

9727.—25. If so, how often are these measurements taken, and by whom?

Ans. 24 and 25. Measurements are made three times annually of weight, chest girth, height, girth of upper and of lower left arm. The reason for registering the left arm is because it is apt to be neglected, and it is as well to register the united effects of gymnastics, Rugby football, and fives.

Every new boy is also measured similarly on his arrival. New measurements are entered in a book, from which typical extracts are sent, the boys of each age at last birthday being on a separate page.

Spirometry does not appear in the register. It probably ought to be attended to, but I am unwilling to increase the time taken up in measuring, and chest girth answers nearly every purpose.

There is also a physical ledger, in which the measurements of each boy are re-entered on a separate page.

This is of the greatest possible service. I frequently inspect it, and whenever a boy's chest girth is standing still, especially at too low a point for his age and height, I have his lungs sounded by our medical officer. In many cases unsuspected delicacy has been thus detected and the right measures to set things right adopted in time. Our medical officer or myself could give details of one such case, which is certainly one of the first cases on record of the cure of incipient tubercular disease by the open-air treatment, in which, I

need scarcely say, all my experience makes me cordially believe.

9727.—27. What remedies or suggestions have you to propose regarding the last part of the terms of reference, viz.—How the existing opportunities for physical training may be increased by continuation classes and otherwise, so as to develop, in their practical application to the requirements of life, the faculties of those who have left the day schools, and thus to contribute towards the sources of national strength?

Ans. Before attempting to answer this question, I hope it may not be out of place to say a few words about the last clause.

The whole subject matter of this Commission seems to me of such overwhelmingly national importance, and the subordinate place which it has hitherto occupied so full of danger to the country, that I have rejoiced at its being brought into prominence by the appointment of the Commission.

My reason why it is of so much importance is because at least three causes are in operation, all tending to lessen the amount both of bodily exercise and of open-air life.

These are—1st, The gathering of the population into towns and the comparative desertion of the country; 2dly, The growing substitution of artificial means of locomotion for the use of the legs; 3rdly, The continually increasing extent to which manual labour is supplanted by mechanical appliances both by land and sea. The only escape from the deterioration of our race, which is the natural result of these causes, and which is already evident at least in our cities, is that the exercise of the limbs and breathing organs, which used to be necessitated by the daily work of large masses of the population, shall be taken by them in the way of recreation, or from a sense of the necessity of such for the exercise, health and enjoyment of life.

And I am persuaded that, if the general principles, which I have attempted to lay down, were once cordially recognised and brought prominently forward in Parliament, press, pulpit, and on platform, that an innumerable number of ways by which they could be carried into practice and made the source of untold blessings to our people would gradually open out.

And again, if such truths were inculcated and practised in all grades of schools, healthy habits of all kinds would become a second nature to the large mass of the pupils, and there would spring up the habit of regulating the actions of daily life by reason rather than by blind custom. In particular, I am persuaded that daily physical exercise usually engenders a craving for it, which will avail itself of all outlets and opportunities, and in strong-willed natures will make opportunities in spite of apparently overwhelming obstacles.

Such outlets and opportunities should be provided, in all large cities at least, in the shape of continuation classes for gymnastics and drill, in suitable, well-ventilated and never over-heated buildings. They would be abundantly taken advantage of if the spirit of the previous education was such as I have tried to sketch.

And no public money could possibly be better spent than in providing such facilities.

Regular attendance and proficiency at such classes should, I think, be allowed to reckon towards Volunteer and Militia drill, but I am too imperfectly acquainted with the subject to speak confidently here.

It is also incumbent upon us, so far as legislation and education can bring it about, to provide not only that every possible opportunity shall be given to young people of all classes towards forming the habit of regular exercise, but that its physiology and advantage should be impressed upon them, in connection with corresponding and independent truths about food, air, sleep and clothing, which have generally been almost totally neglected in schemes of education, and consequently about which grievous errors have been prevalent, and in many cases enforced by custom

Mr H. H. Almond, LL.D.

Subject matter of enquiry of national importance.

Deterioration of race : causes : remedies.

Continuation classes.

Suggestions : sound system of practical and theoretical education

Mr H. H.
Almond,
LL.D.

15 Sept. '02.

sometimes even by authority, in the daily life of the vast majority of our people.

And at the base of all such instruction and training I believe that the duty of conforming to known physical and physiological laws, and of avoiding physical sins, should form an integral part of all religious education which is given in schools, and be firmly rooted in the minds of the young on a religious basis. The sin of excess in drink would then, in their minds, rest on the same foundation as the sin of physical indolence, or of the compression of the breathing or other organs by tight clothing, or of indulgence in excessive or unwholesome food. And far more good would be effected by all these and other departures from truth and nature being seen to result from the neglect of the same general principles of theory and practice than by some of them being attacked, in an isolated and sensational manner, and others either ignored or treated as of no practical importance.

I see the question has been put whether there should be any compulsory powers with reference to such classes or attendances.

Continuation
classes: com-
pulsion
undesirable.

Putting aside the practical difficulties and great unpopularity of such compulsion, I believe it to be entirely unnecessary, for the reasons which I have given. And I observe that Mr J. L. Robertson, who has had far better opportunities for forming a judgment than I have had, says such classes would be extremely popular.

Compulsion would strike at the root of such popularity; it would rob the exercises of all spontaneity and joyousness; it would introduce an element of grumblers into such classes, who, even when in a contemptible minority, rub the bloom off all good things, and would be a step towards the spirit of unification, regulation and regimentation which prevails among some Continental nations, and which, I trust, may not make any further progress in this country than it has done already.

Uniform
system
madvisable.

9728. I think it would be rather interesting if you would elaborate a little more your statement that you don't think that a uniform system of physical or any other training in schools is desirable?—In saying that, I mean that I don't think it would be a good thing if the same cast-iron system was put in force all over Scotland. There should be individuality and independence in the different schools.

9728A. But you do approve of the same system obtaining in each school?—Certainly; within each school you must have the same training, but I don't think that there should be the same cast-iron system applied all over.

9729. Do you apply that to all schools of different classes in Scotland?—I think there must be differences in the systems for different classes of schools. I have had some communications with the headmaster of Fettes about that, and he is very strong indeed on our keeping our individuality. The schools should keep their own individualities, and one school should not be the exact counterpart of the other. We don't want it to be as in France, where the Minister of Education can say at any moment what every boy is doing.

9730. Would you apply that to Board Schools?—I don't know enough about them. It is twenty-five years since I was a member of a School Board, and I would not like to give an opinion about that. The more individuality there is about it the better I would like it.

Military drill
or training.
Soldiering
at school
undesirable.

9731. Then, in answer to the question as to whether some form of military drill or training should form some part of the ordinary curriculum of every school, you give your opinion that you rather deprecate any military work, as military work, on the part of school-boys?—I am inclined to advocate what tends towards military work, and helps for that, rather than soldiering at school. I think the drill that we are doing, of which I have given an account, very much helps, as I have been told by old boys. The drill, although it is not entirely military, is conducted by military instructors and on military principles, and I think it helps very greatly. I think there should be a great deal more

rifle-shooting, as it is the most important thing of all, and that we are doing.

9732. You say that you fear that the military spirit has been hitherto, at least, productive of cast-iron regulations, and opposed to what is rational, individual, and unconventional. You mean that to apply to boys as boys?—I think it applies generally; I rather speak of the general military spirit. What I have said has been based greatly on evidence taken from old boys from our school who have been in the volunteers and the line, and also evidence that I have got from the military colleges on many things.

9733. Is there any point you would like to supplement?—I think there is one point with reference to a matter which I have made my particular study—the matter of chest girth referred to in my evidence. I have kept these registers that I mention for a very long time. My attention was drawn to the matter very much by a letter, which created a great sensation, appearing in the *Times*, by a very eminent Public School medical man whom I won't mention, although I know his name. That letter appeared in 1898, and in it he said that of many hundreds of boys examined by him, I think 64 per cent. of those who entered the school for which he acted as medical officer were in bad condition. I replied to that letter that it was quite true that boys were not coming in as good condition as they ought to be if properly brought up, but things were very much better in my experience than they had been many years ago. I need not trouble you with my detailed evidence. In the matter of chest girth, I can give evidence from the time when our records began in 1874 down to the present time. There is fully one inch more in chest girth in the boys who come to us at all ages.

9734. Can you attribute that to anything?—I think it is partly due to the fact that preparatory schools have had much more outdoor exercise, and there may have been a great deal done in the other schools. For instance, in Edinburgh Academy there has been a great deal done. In this matter of chest girth I would say that there is a very great improvement in the condition of the boys who come to us compared with what it used to be. Of course we draw more from preparatory schools than we used to do, and they are better managed than they used to be from that point of view. I think that the improvement is very great, and I can give figures for it which I have analysed very carefully. There is another point on which I would like to say a word, and on which, I think, I can give some facts—that is the influence of games in promoting military spirit. I think that football in particular does a great deal to prepare men for military life. We had 47 old boys at the war in South Africa who had not got into the Army by the regular routes. Of these boys 31 had played in our school fifteen. Now a boy is not generally big enough for our fifteen unless he is over seventeen years of age, although there are sometimes boys of fifteen or sixteen. Of the remaining 16 boys who had not been members of our fifteen, there were only 4 who had been over seventeen when they left school, and two of those were very small boys, one very delicate, and the remaining one nicknamed 'The Ghost,' so that every one of those who volunteered for South Africa and had been eligible for our school fifteen had played in it. You might ask what proportion of our boys are not in our school fifteen. In our last returns we had 55 boys over seventeen, and it stands to reason only one-third of such boys can get into the fifteen. I have instanced football because I think it has so many qualities, not only physical, but such qualities as readiness of decision, and I think it fosters the desire for active service more than anything else that we do—I would say even more than drill or gymnastics.

9735. By the Hon. Thomas Cochrane.—I think you are an athlete yourself?—Never very much of one, but I was in the Balliol Eight. I attribute any success I had to my boating training, but I cannot call myself an athlete.

9736. You found what you say in favour of physical

training on your own experience?—Yes. I would not have the vigour that I have if I did not take regular exercise.

pt. '02.
advantages
ning.
9737. Among the advantages you mention in one of your answers is a gain in self-restraint?—Yes; matters of eating and drinking, and generally in having to do things which are temporarily unpleasant in order to gain a future end. I think there is a very great gain there. I experienced that when boat training, and I found a great advantage. Advantage is to be gained even in abstaining from tobacco and sweets, and things of that sort.

tion :
ng of
f life
ealth.
9738. You are hopeful that physical training might strengthen the population against the assaults of drink and immorality?—Yes, I think so. You should teach children, using the word in its broadest sense, the grounds on which this training is good for them, the grounds on which the not eating between meals is good for them, and many things of the same sort. We should teach them the theory of the thing as well as give them rules for practice. I think it would do an immense amount of good, and it would make them believe in it.

9739. From your experience you think it would strengthen them morally and physically?—Yes. Of course it has not that effect on everyone. You will find a number of failures under any system, but I think the general effect is, if you make a boy believe in the rightness of doing certain things, he is far more likely to cultivate good habits than if you don't make him believe in them. I think that Miss Louisa Twining, who is an old lady of over eighty, said a very forcible thing in a letter to the *Times* the other day. What she looks upon as a thing of the greatest importance is the teaching of the laws of life and health, which should be given in our schools. I believe that is the groundwork of it all.

9740. You give certain exercises that you think very advantageous, and among those you include boxing, fencing, and single-stick?—Yes, boxing most of all.

9741. You find it is a good training in keeping the temper?—Yes, I think it is. There is not very much danger now from temper, but it is a training in temper, and so is football, and so, I may say, is golf, but whether it always succeeds or not is a different matter. The difficulty about golf as a school game is that it is so difficult on a crowded links to get sufficient exercise, as there is so much standing about. I think it is an admirable thing for holidays, but I don't think it cultivates the moral qualities. It does not cultivate the social qualities, for instance. It is very selfish.

a
game.
9742. You say that you have not found that physical exercises have had any effect in interfering with scholarly success?—That is so. I think it is rather the contrary. Of course I cannot say so much about that as the headmaster of Fettes, because we have no entrance scholarships in our school, and it is very seldom that we get any of the better intellectual material. The headmaster of Fettes gets far more boys of ability than we have.

9743. Your own experience is that a certain amount of physical training is not detrimental?—It certainly is not detrimental. It was not so at college.

9744. You place some considerable importance upon the subject matter of this Commission?—Certainly.

9745. You give certain reasons why you think that the race is likely to deteriorate, or has deteriorated?—Yes, I think it has.

9746. You attribute that to the gathering of the population into towns, the growing substitution of artificial means of locomotion, and the increasing extent to which manual labour is supplanted by mechanical appliances, and you consider that the only escape from the deterioration of our race is that further opportunity should be taken by the population in the way of physical exercise and recreation?—Yes.

9747. Does it come within your knowledge to suggest any means of physical exercises for the general population outside your own school and outside the Board Schools?—It is very difficult to answer that generally, but if you have, what I most of all advocate, the principles on which exercise depends, and the

principles of life and health taught in all schools, then the subject will work itself out. The great change in popular feeling will find out ways by which progress will be made. When I was a member of the School Board, twenty-five years ago, I proposed that there should be drill for the children, I think two half-hours a week. The chairman at once said that we should now proceed to some practical business, which I think was the grant. I don't think that would be said by any chairman now. There has been a great change of opinion, and that is fortunate. I think, without being able to lay down at a moment's notice any general means by which the thing can be done, if there is the will there will be the way.

9748. You think that by letting the people know that more physical exercise is required such interest will be taken in the matter that some means will be found?—Yes, and by successive generations of children being taught it. It applies not only to exercise, but to food and everything else.

9749. At the end of your evidence you hope that it won't be necessary to make attendance at continuation schools compulsory?—I am opposed to such compulsion.

9750. If facilities of such classes were given, you think they would be availed of?—Yes, increasingly.

9751. By Sir Henry Craik.—The scholars in your school are drawn from a good social class, of course?—Yes.

9752. They have been accustomed to behave themselves as they ought to behave?—Yes, generally.

9753. That, of course, is an essential condition of satisfactorily carrying out games?—In general it is, but a great deal has been done in that report of Mr Sharples in carrying out games in particular schools.

9754. In connection with that report, was your attention drawn to the fact that the boys of whom he speaks were frequently taken to compete before crowds, I think on one occasion before a crowd as large as 20,000 people, at a football match?—Yes.

9755. Is that good for the boys?—It is dangerous, but not necessarily bad. Whether the spirit could have been got up without it, I don't know. Mr Sharples and a number of others say that they give us their evidence that they notice a very great improvement in those boys who did join in these big matches, not only in physique, as you would expect, and high spirits, but also in their language, which very much surprised me, and their general tone.

9756. Do you think that their language would be improved?—I would not have thought so, but perhaps it was on the same principle as the Spartan helots, that they were disgusted. That is the evidence given by Mr Sharples and a number of others.

9757. In the games in your school how do you deal with boys who are weak in health, and recommended by the medical officer not to take part in them?—They can do all sorts of things. A boy who cannot play football may play fives.

9758. In the schools we have to deal with there must be many children who in a game would be thrust aside by the stronger, and might get injured or be discouraged from taking part in the games at all?—That is so.

9759. To meet the case of such boys, is it not important that there should be some regular physical exercise entirely independent of games?—Yes, but I think I have said so. I say somewhere in my evidence that in schools in towns the same system would not apply. It is most important that there should be physical exercise. I think that boys who cannot do games should do more drill, and take long walks in the country. In towns these boys might have extra work in the gymnasium, although I think it is better that they should be in the open air. However, I don't think that that is as good as games.

9760. Don't you think that drill will probably be found a more essential thing in regard to the great mass of the children in our town schools than games?—Probably it is. I am not sufficiently acquainted with those schools to be able to say that I think that it is most important.

Board schools in towns: most important to have regular system of physical exercise independent of games.

work

9761. What I wish to bring out is this—you agree that in dealing with those large public schools the question of physical drill occupies a more prominent position than it would in a school like your own?—Yes, but in George Watson's, I have known them turn out eleven fifteens on a Saturday.

9762. Dealing with the question of uniformity, do you not think that when an immense number of children are taken, when teachers must move from one school to another to take part in the instruction of a new school as well as the old school, that it is well that there should be some system which they understand, and which can be followed?—That is the case.

9763. So you are not altogether opposed to uniformity?—No, there are circumstances where it is necessary; but what I object to is the forcing of uniformity on schools where it is not necessary, enforcing uniformity on them when they could take lines of their own.

9764. With regard to the question at the end of your evidence as to compulsion, are you opposed to all measures of compulsion in education?—No.

9765. You are not opposed to it in the case of boys from five to fourteen years of age as under the present education system?—That is a very big question. I have very grave doubts as to whether compulsion should have been carried further than the three R's, but I think there is some compulsion necessary, although I don't share the general opinions about compulsion in education.

9766. Don't you think it is a very important thing that a boy should be required during his earlier years to attend school, and not to be left on the street? Do you not agree with that?—I am very much afraid of compulsion destroying the feeling of liberty, but, generally speaking, it is desirable that boys between six and fourteen should be forced to attend school.

9767. And when they get to fourteen, would it be a very hard thing to ask boys between fourteen and eighteen to give two or three hours one or two nights a week to what is certainly by common agreement for their great advantage?—I think that in country districts it would be practically impossible to get that done.

9768. Are you acquainted by experience with the mass of town boys at that age?—No, but I think, as I have said, that if they are trained in the advantages of it, and have physical exercises at school, they would continue it without compulsion.

9769. Can you ever get boys to learn reading, writing, and arithmetic by teaching them that it is useful?—No, but you are dealing with boys of an earlier age. There are two classes, viz., between five and fourteen, and between fourteen and eighteen. In the class between five and fourteen I admit that there should be a certain amount of compulsion, but over that there should be less, and there should be more freedom.

9770. You are not sufficiently acquainted with that class of boys to say whether, if anything is to be done, compulsion is required?—No, but I would be very sorry to see it extended to all classes.

9771. Would you be surprised to know that employers have told us that they thought that the usefulness of these boys would be greatly increased, that their prospects of a happy life would be greatly added to, if they were required to attend evening classes?—I don't like the word 'required.' I think that so many of them would attend if they were properly educated before that it would not be necessary, and I adhere to what I have said at the end of my evidence.

9772. But if they did not attend?—Then that would be for future deliberation, but it would be very difficult to get a law to apply to both town and country, and to all classes. I think this might be done, that if the boys could pass certain examinations in drill and rifle shooting that might count for volunteer and militia work, and that would greatly aid such things in school, and make something to be gained by doing that.

9773. By Mr Alston.—Can you tell us the number of hours per week that your boys get for other work than study?—I would not like to do that without reckoning

up. I have given it already per day, and our days are very much the same except Saturday, which I have particularised.

9774. I find that in your evidence you state, 'Generally speaking, I would say that six hours spent in actual study or preparation, one in drawing or singing, ten in the bedroom, one and a half at meals, one in unoccupied time after meals, half an hour at prayers or school assemblies, half an hour in the gymnasium, leaving two and a half for games and fresh air, and one for entirely leisure time'—That is every day except Saturday and Sunday. On Saturdays, as I said, there is, of course, more open air. The boys are in the school on Saturdays up till 12.30.

9775. You arrange these exercises so that they shall produce the greatest amount of good?—Yes, so far as we can.

9776. You have given more attention to games than Drill to military drill or physical drill in the military instructor. form?—Yes, but I think we have done a good deal towards drill. As I have already said, drill is taught by a resident sergeant-major instructor. We are extending our rifle shooting very much.

9777. This drill is taught by a resident sergeant-major instructor. What are his qualifications?—I got him from Colchester. He is a very good gymnast, and knows well about military drill.

9778. Is he the same as the resident instructor in the gymnasium?—Yes. There is another, a sergeant-major instructor of the Musselburgh Volunteers who gives two big open-air drills weekly in the summer term. There were some reasons that I had for employing this man for the big drills.

9779. Has this instructor been long out of the army?—I cannot say how long.

9780. You cannot tell his qualifications? Suppose he were examined by competent men, what would be the verdict pronounced on him?—He came to us in 1899, and I had the very best testimonials about him then. We had had the same man from 1874 till 1899, and I thought he was evidently getting rather old and stiff, and rather behind the time, but he was an excellent man. I think this present one is a great deal more up to the times. In selecting him I did the best I could, writing to the best military men in Aldershot and other places so as to get the best man I could.

9781. In answer to the question as to how far the opportunities for physical training are taken advantage of, you refer to the disinclination generally of boys for exercise, and you use the expression that they have been carefully trained at home to avoid the possibility of being hurt?—I said that when boys first come to us a great many of them are much disinclined for much exercise which involves much exertion or discomfort or the possibility of being hurt. They have been carefully trained at home to avoid such things. That is quite true of a good many of them.

9782. In regard to Scottish boys?—It is worse with English boys than with Scotch boys. As I have about equal numbers of both Scotch and English, I can say that the Scotch boys are more hardly brought up than the English boys. I have enquired about that from other schoolmasters, and it seems to me proved that the further south you go the more softly are they brought up.

9783. We would expect that phrase to be used in reference to a French boy, but not in reference to a British boy?—It refers to a good many of them, but they are not so bad as the French boys.

9784. When once they enter these games and exercises, do they lay aside all fear of weather or hurt?—Most of them do.

9785. While you don't approve of a hard-and-fast system of physical training instruction, you refer to Ling's exercises. Is there anything special in them?—They are Swedish: they are formal exercises. I think there is this disadvantage, that they do not encourage the same qualities as games encourage.

9786. We have had the methods of physical instruction before us, and many have given evidence upon that point?—Yes, I have read it.

Mr. H. H.
Almond,
LL.D.

15 Sept. '02.

Drill

ion of boys at
first.

Uniform
system plus
scope for in-
dividuality

H. H. 9787. You notice the difficulty we have. We have
 pond, so many manuals of physical training that the question
 D. is, should one not be fixed upon as the best, say the
 Aldershot system?—I cannot say.

9788. You have not any objection to an ascertained
 pt. '02. best manual being introduced?—No, if there is plenty
 of scope left for individuality.

9789. In the matter of military drill in connection
 y drill: with the cadet corps, you object to the uniform?—Yes.
 ons to As a life member of the Lads' Drill Association I made
 uniform. a very strong representation to Lord Meath about the
 nature of the uniform. I object to its being so tight
 across the chest and being so cumbrous. The Associa-
 tion applied to the War Office and got leave to have a
 uniform which is just a simple jacket. That removes
 a good many of my objections, but I would rather be
 independent; I would rather go in for a rifle club
 than a cadet corps. I would not have any more clothes
 than we have got. I think it is a pity that military
 drill is so much associated with uniform. I think
 there should be no uniform.

9790. It is an advantage that they should have the
 full military drill, but you do not think that there
 should be special military clothing?—That is my
 opinion. You might have a uniform shirt as they
 have at Wanganui in New Zealand, where they have
 a grey flannel shirt, bare necks and short trousers.

9791. In the report of the Lads' Drill Association we
 had pictures of those boys drilling in flannel shirts?—
 Very probably I have seen it. I have had a communi-
 cation about it with the headmaster.

9792. In your evidence you refer in a complimentary
 class way to two Scotch schools which take a very high place,
 : and you add that there is no other possible cause to
 com- give for this except the better physical training. Is
 that the physical training got in the Board Schools or
 in the public schools?—In the public schools. I would
 rather not mention the names of those schools. I
 think our system in the Scotch schools, perhaps from
 the competition, is better than it is in England. I may
 mention Merchiston Castle school and Fettes school.
 I think it is much better there than in England. I have
 had most deploring letters from doctors of English
 schools stating that boys get far too many exemptions,
 that there is too little compulsory exercise and too many
 means of getting free from it.

9793. Does your remark apply to the public schools
 generally in Scotland or to a few special ones?—To a
 few that I know well.

9794. In Scotland generally less attention is paid to
 physical training and to organised school games than
 in England. Is that not the case?—I don't know.

9795. At one time it was, but perhaps things have
 altered for the better?—It is not the case with regard
 to the schools I know. I am speaking only with
 reference to those schools in the same line as English
 schools.

9796. That is residential schools?—Yes, and also the
 Edinburgh Academy and George Watson's.

9797. In the old days the Scotch public school was
 a day school?—Yes. Edinburgh Academy and George
 Watson's are both day schools, and there is a lot of
 physical work being done there with great advantage.

9798. That must be an improvement of recent years?
 —Yes, within the last six or seven years.

9799. You referred to the continuation classes, and
 tion said that you were quite convinced that they would
 e be abundantly taken advantage of if the spirit of the
 previous education was such as you had sketched. If
 it were not, what would happen?—I think that is the
 root of the whole business, that all the Board Schools
 ought not only to train their pupils in good healthy
 habits, but to teach them the *rationale* of such
 habits.

9800. And boys over fourteen would go to these
 continuation classes?—Yes.

9801. Not only for the interest of the teaching there,
 but from the instruction they had received?—Yes. I
 think one of your witnesses, a Scotch inspector, gave
 the same evidence.

9802. At the same time there has been a good

deal of evidence that nothing would tempt them to go
 to continuation classes?—As they are.

9803. That is why the question of compulsion has
 been put so strongly before you, from the feeling that
 it would be required if they are to come in?—It might
 have to come in if the other ways failed.

9804. *By Mr M Crae.*—You say in your evidence in
 answer to the question as to whether some form of
 military drill or training should form part of the
 ordinary curriculum of every school: 'I have appre-
 'hensions as to the results of encouraging the military
 'spirit in schools.' Will you explain a little more fully
 what you mean by that phrase?—I think I rather gave
 my reasons. As I said, we wish to teach our boys
 to think for themselves, to appeal to reason rather
 than to custom and prejudice in all they do, and I fear
 that the military spirit has been productive of cast-
 iron regulations. I think that encouraging the mili-
 tary spirit might have a tendency to do away with
 freedom and individuality in schools.

9805. You are aware that the whole tendency of
 modern drill is towards developing the individuality
 of the soldier?—I am very glad that that is so.

9806. Suppose that it is so, would that alter your
 view with regard to drill?—Yes, to a great extent if
 they got rid of the idea of tightness being necessary to
 smartness. If I could get the sailor idea of smartness
 instead of the soldier idea I would be satisfied.

9807. You object not to drill itself but rather to
 the red tape of the War Office?—Yes. We have big
 drills twice a week and drill every day, so that I
 cannot object to it.

9808. You recommend the formation of rifle clubs?
 —Yes.

9809. It is very important from the patriotic point
 of view, but it does not produce the same benefit in
 physical training as ordinary drill?—No, but it should
 be taken along with drill. There have been great
 difficulties about a range. Our only available range is
 on the sea coast, and we can only use it at high tide.
 It is often not available, but of late the invention of
 the Morris tube has greatly facilitated matters. Even
 although it does not do everything, it does a great
 deal. We are going to have one of our own. I think
 that shooting is most important.

9810. With regard to physical training in public
 schools, such as your own, is there anything you could
 propose whereby that might be encouraged or devel-
 oped, or do you think that you have enough at the
 present time?—We have enough, but in everything we
 must look for improvements.

9811. You can understand that a different system
 may be necessary with regard to Board Schools?—Yes.

9812. You have not the same opportunity there of
 conducting a school on individualistic lines?—No,
 but the same spirit might prevail. I think they have
 greatly improved. You could hardly find schools like
 what they were twenty years ago, when in going into a
 school I have been nearly knocked down by the
 atmosphere. The inspectors would prevent that now.

9813. *By Professor Ogston.*—You mentioned that
 you had endeavoured in regard to football to obtain
 a consensus to a series of rules, and that you were
 strongly supported by your medical officer and the
 medical officers of other schools in regard to that.

What were these rules that you advocated?—I must
 go into a technical point about that. The tendency of
 the unions lately has been to develop the game in the
 interest of the spectators and to get large gates. What
 they wish is very quick play. That play is too quick
 for growing boys, and I think that the rules which are
 the best for attracting crowds, and which, perhaps, may
 do for grown men, are not likely to be the same as
 would be best for growing boys. I think our present
 rules tend to make the game too fast for growing
 boys. I am strongly supported in that by my medical
 officer and by others, and I hope we will be able to do
 something. We are to have a meeting about it to see
 if something can be done to make the game less
 quick. It is not roughness that I refer to, as there is
 no roughness.

Mr H. H.
 Almond,
 LL.D.

rationale
of training.

Training in
all schools:
movement
growing.
Inspection
necessary.

9814. You also referred to continued exercise, 'never violent.' Do you object to violent exercise?—No, but it must not be every day. We have only a big side at football twice a week, which I think is enough. Violent exercise is a good thing, but not every day. I will quote the opinion of the late rector of the Edinburgh Academy, Mr Mackenzie, whom I respected very much. He told me that one great advantage that they had over us was that there was not hard exercise every day.

9815. You referred to your medical officer's examinations. Can you furnish us with a sample of the entries in the doctor's book?—Yes, I sent that in.

9816. No. These are not taken from the doctor's book?—I beg your pardon; I confused it with the physical register. I have no objections to send in samples of the entries, without the names, of course.

9817. You said as the result of your very large experience you would be sanguine that the teaching of the duty of conforming to known physical and physiological laws, and of avoiding physical sins, should form an integral part of all religious education which is given in schools, and be firmly rooted in the minds of the young on a religious basis. You further said that 'the sin of excess in drink would then, in their minds, rest on the same foundation as the sin of physical indolence or of the compression of the breathing or other organs by tight clothing or of indulgence in excessive or unwholesome food?'—I think it would do an immense deal towards that. It would not affect everybody, but it would affect a few and they would affect others.

9818. Do you think that such a system of religious education could supersede in schools a compulsory system of physical training?—No, I think it goes along with it. Training goes hand in hand with the explanation of the rationale of training. I never make a rule with regard to physical work without telling the boys the reason or physiology of it, and I deal with food in the same way. You should teach a boy why he should eat vegetables, because if you don't do that some boys would not eat them. You must try and persuade them. If you persuade one in three you are doing a vast deal of good.

9819. You think that that system would be applicable to schools generally, Board Schools and others?—I think there is the same reason in all boys. It would depend very much on the personality and influence of the teacher. One man might be able to do a great deal while another man would do nothing.

9820. By Mr Fergusson.—In answer to the Chairman you said that your measurements show that boys are improving in their measurements, and you attributed that to the greater attention paid to physical exercise in preparatory schools?—Yes.

9821. Do you think that that attention is sufficient over all the schools, including Board Schools, or do you think that any steps should be taken to ensure that increased attention be paid to physical training in all schools such as yours and preparatory schools?—I think that steps should be taken wherever they can be taken, but I think that the movement in that direction is growing. I don't think you can lay down any hard and fast rules.

9822. Do you suggest that any public authority, such as the Education Department, should take steps to satisfy themselves that sufficient attention is paid in the preparatory schools?—In any inspection of schools, I think that that should form a part of the inspection.

9823. There is no Government inspection of your school?—There is an inspection by the Education Department.

9824. Do you think that the Education Department should satisfy themselves that physical training is being sufficiently attended to in these schools?—If the feeling of the necessity is not working this way, independent of the Government, I think that it should, but I think that the feeling is growing. There are far more boys who come to us now brought up to sleep with their

windows open, and not to think that night air is a bad thing, and all such things, which is a help.

9825. You think that is going on sufficiently well?—Yes. The great thing is to persuade the people.

9826. You lay great stress on hand fives as an excellent game. That is a game which might be very easily introduced into the board and other schools?—Certainly, it is not expensive.

9827. With regard to a system, I take the words of another witness and ask you if these words convey what you mean, that 'a system should be drawn up which would guide the teacher in theory and not hamper him in practice.' Is that the sort of system you would like?—Yes, I think it is to a great extent, but I may say that if every teacher and every parent would read such a book as Dr Duker on schools, they would find everything there that can be said.

9828. I would just ask one question with regard to the matter of compulsion. You think that if physical training was made a very attractive part of continuation classes a large number of boys would avail themselves of these classes. I suppose you will admit that there will be a considerable class of idlers who won't go to these classes, and they are the very class we wish to get at, the class from whom the hooligans are recruited. How do you propose to deal with them?—That is a question I could scarcely answer, but I do feel this, that in any system of compulsion the greatest care must be taken not to subject people to it that don't need it.

9829. Could you give any help as to what is to be done with that class?—If you can reach them without applying compulsion to those who don't need it I would be very glad to hear it.

9830. Did you read an article in the *Nineteenth Century* by Sir Robert Anderson with regard to the putting down of the hooligan?—No, but I will read it.

9831. By Mr Shaw Stewart.—I would like to ask a question on the same point—about compulsion. In answering Sir Henry Craik on the subject I think you had in view boys who had formerly been properly educated?—Yes.

9832. We have also to consider how to deal with boys after they have left school who have perhaps not been properly educated?—If any system of compulsion could be found to apply to boys who have not been properly educated without being applied to all who did not require it, I would have very much less objection. I don't see how compulsion is to be applied to country boys. It would be a great grievance to apply it to those who don't need it, and I think it would be a great burden.

9833. I suppose the boys who have not had the same advantages as the boys have at Loretto stand quite as much in need of compulsion as the Loretto boys?—Yes, more so.

9834. In going over your evidence, it does not appear that you have spared compulsion?—Certainly not, within the limits of the same society. You cannot spare compulsion. I am talking of the world generally just now, and I say that if there was a law made that every youth between fourteen and eighteen, whatever his education and his class of society, must attend continuation classes, it would be a great piece of unnecessary tyranny.

9835. But has not the great success in your school arisen very greatly from such compulsion as this? All the boys have to play cricket—all the boys have to take part in outdoor exercise?—Yes.

9836. Unless medically exempted, the boys cannot help playing football?—Yes, that is true, but that is with the consent of their parents. Their parents send them to be under this system, and they know it. It is not compelling the whole people to go under that system.

9837. But the excellent results in your school have been brought about by judicious compulsion in the first instance?—Yes, within the same small community, but I don't see how it will apply to the whole people without great grievance.

9838. I put it to you if compulsion is not even

Mr H. H.
Almond

LL.D.

hooligans.

Compulsory
difficult
wide applica-
tion with-
out creating
burden.

Compulsory
necessary
one school;
results.

H. more required by the boy in the street than by the rather picked boy who comes under your charge?—
 D. Yes; and if you could separate the class of those who do require it from those who don't, then I would be with you.

9839. Those who don't require compulsion will come in without it?—No, they may not want to go on with continuation classes if they had all that at school.

9840. Do you think that half an hour of physical training on three nights a week would do a boy between fourteen and eighteen any harm?—If he was in an office it might interfere with his liberties, and besides, I don't see how it is to be carried out with boys in the country. They are not to be brought into town for it. I say that the practical difficulties are very great.

9841. You see the difficulty that faces us. We have to choose between attraction and compulsion if we want to recommend any physical training for boys after they have left school?—Possibly there might be compulsion for those who could not say that they had received previous physical training.

9842. You would go as far as that?—I might, but I don't see how it could apply to country or village boys. I would rather try attraction first, and only try compulsion if necessary.

9843. I have one other question on another point. Your school has been famous for physical training. I think it would add to the value of your evidence if you would hand in a list of successes in mental regions which your school has attained. Would you have any objection to hand in a list of first-class and gold medals won at your school?—No, but you must remember that we don't get the same ability as other schools get, because we have no open scholarships.

9844. I quite understand that. But anyone reading your evidence would say, 'This is excellent evidence for 'physical training,' but what have been the results in 'mental training.' I thought it might add to the value of your evidence if you would hand in a list of mental successes that you refer to in the question as to the relations between mental study and physical training?—I have no objection. The tangible results cannot be

very large, and they might give a false idea, because it must be remembered that we do not have picked boys. I have no objection whatever to hand that in. It is not a very big list.

9845. You might also hand in the number of those who pass into the army?—That is more difficult to do. I had an army side of five boys at one time who all passed, but I determined that I would never have another, and I gave my reasons in an article in the *Fortnightly Review*. It is too long a question to go into now. I thought the system at Sandhurst was bad, and I could not conscientiously adopt it, and I consequently turned the boys over to tutors.

9846. Perhaps you will think over my suggestion?—Yes, I will.

I wish to draw attention to the enormous amount of harm done by cigarette smoking among boys. In connection with my observations about 'physical sins,' I ought to have mentioned it as a case in which a vast amount of good might be effected by schoolmasters if they were instructed to explain the evils and dangers of smoking before maturity is reached. I believe that far more than is generally supposed might be effected by persuasion if the duty and advantage of keeping themselves in prime physical condition were put in the very forefront of the moral and religious training of children, and enforced by constant object lessons. Personally, I would be in favour of far more drastic measures. I think that teachers and magistrates should be empowered to sentence any one under 16 indulging in smoking in public places, to a sound dose of the birch. Infinitely more future misery would be saved than immediate pain caused by such an infliction. But public feeling, except among the more highly educated classes, has become so morbid on the subject of what is far the least objectionable of all forms of punishment for boys, that I am afraid that my views about it are scarcely practical. Imprisonment, or fines with the alternative of imprisonment, seem to me out of the question. But if something is not done, the prevalence of juvenile smoking is a heavy handicap on the progress of physical education.

Mr H. H. Almond,
 LL.D.

15 Sept. '02.

Cigarette smoking among boys: dangers and suggested remedies.

The witness withdrew.

Mr GEORGE MACKAY, M.D., F.R.C.S., examined.

9847. By Professor Ogston—We will first of all put on record that you are a Doctor of Medicine, Fellow of the Royal College of Surgeons of Edinburgh, member of the Royal College of Surgeons of England, Ophthalmic Surgeon to the Royal Infirmary, Royal Blind Asylum, Deaf and Dumb Institution, Lecturer on Diseases of the Eye at Surgeons' Hall, Edinburgh?—Yes.

9848. You have prepared a *précis* of your intended evidence?—Yes.

In considering the ocular causes of physical disability in children, it appears essential in the first place to refer very briefly to the anatomical construction of the eye, and to the part played by its component parts in the act of vision.

We see objects by means of the light rays, which, coming from them, enter our eyes. By means of the natural lenses of the eye the light is focussed on the sensitive lining membrane ('retina') of each eye.

An image of an external object is thus obtained within the eye upon a surface which is really the terminal expansion of its optic nerve.

The nervous stimulus travels up each optic nerve to the brain, where the real sensation of sight is experienced.

Defective vision may be due to—

- A. Faulty illumination of the object.
- B. Loss of transparency in the lenses of the eyes.
- C. Some structural error in the lenses or in the dimensions of the eyes making focussing difficult or inaccurate.
- D. Want of nerve power to perceive what is focussed.

A. *Faulty illumination of the object.*—In this connection attention might be drawn to the importance of a sufficiency of light in school-rooms (avoiding excess), to the proper arrangement of scholars' seats, of blackboards and mural diagrams, etc., in relation to windows or sources of artificial illumination.

B. *Loss of transparency in the lenses of the eyes* is responsible for the majority of cases of actual blindness in children. This is generally the result of inflammation or ulceration of the front of the eye, and may arise from various causes, local or constitutional. It is a very melancholy fact that about 30 per cent. of the inmates of our asylums and schools for the blind have been deprived of their capacity for vision by one cause alone, namely, *want of proper cleansing of the eyes at the time of birth, and consequent infection from foul maternal passages.*

Attention has been drawn to this again and again by ophthalmic surgeons,¹ but the difficulty of safeguarding the State from this chronic disaster seems almost insuperable, and the evil still continues.

In some of the States of America legislative Acts have been passed requiring notification of every case of inflammation of the eyes in newborn children by the nurse or guardian, so that skilled medical aid may be at once invoked; but even this is usually too late to check the disease.

There is a simple means of *prevention*—the application a few minutes after birth of some drops of 2 per cent. solution of nitrate of silver within the eyelids.

¹ For an admirable and recent exposition of this subject, see 'Infantile Ophthalmia,' paper by E. T. Collins, F.R.C.S., in *The Practitioner* for April 1902, pp. 423-443.

Mr G. Mackay,
 M.D.,
 F.R.C.S.

Mr G.
Mackay,
M.D.,
F.R.C.S.

15 Sept. '02.

This is almost infallible, but to secure its application nothing short of compulsory notification of *expected* births and the securing of the attendance of a trained midwife at every confinement can guarantee the remedy.

[Attention might also be drawn to other forms of inflammation which interfere with school attendance and render some children permanently defective in vision, or only fit for blind asylum teaching (*e.g.*, strumous and tubercular and syphilitic keratitis, epidemic conjunctivitis and trachoma). In not a few instances the immoralities of parents are visited on their helpless offspring.]

C. *Structural errors in the lenses and dimensions of the eyes* interfering with the normal focussing mechanism are extremely common.

In children, at least, they are seldom if ever so extreme as to justify by their effects the term 'blindness,' but they may cause various degrees of defective vision, they may induce ocular strain and directly or indirectly may lead to physical and intellectual discomfort.

Some of them may become aggravated by want of early recognition, and they may seriously interfere with success in life.

Emmetropia.

1. '*Emmetropia*.'—An optically normal eye is one which is so happily proportioned that a *distant* object is focussed on the retina with no further effort than that of directing the axis of the eye towards the object.

Optically speaking, the eye is *at rest* in the act of distant vision.

To define a *near* object one of the lenses of the eye must be made more convex by the contraction of a very delicate muscle within the eyeball.

In reading or writing this muscular contraction must not only be maintained with the greatest exactitude, but must be supplemented by the harmonious action of the external muscles which keep the eyes converged simultaneously on the object and carry them to and fro across the printed or written page.

There is thus incessant muscular action in the eyes of a studying child superadded to the intellectual efforts of comprehension. It is thus easy to understand how even healthy eyes may become fatigued by prolonged use, and how they may be relieved by variety of occupation, and especially by the interpolation of intervals devoted to the absorption of knowledge by *hearing* rather than seeing, and by recreative physical exercises of muscles and nerves in other parts of the body. (For further remarks, see under '*Myopia*.) Provided then that good health is maintained, a normal pair of eyes should perform their functions satisfactorily until middle life (about the age of forty-five) is attained, when, owing to the gradual loss of elasticity in their texture, the lenses of the eyes find themselves incapable of voluntarily altering their convexity and of bringing near objects into focus. Reading or any other near work becomes increasingly difficult simply because the outlines cannot now be focussed by the unaided eye. This condition of '*old sight*' (*Presbyopia*) is easily remedied by the artificial assistance of suitable glasses.

Employers of labour have great prejudice against wearing of glasses.

I should not occupy time in referring to this matter, which does not directly affect children of school age, if it were not that a vast amount of prejudice exists among employers of labour against the wearing of glasses, and a vast amount of ignorance abounds as to what really constitutes good sight and bad sight.

I have over and over again spent hours in gratuitously testing and prescribing glasses for lithographic and music printers, compositors, paper rulers, painters, furniture polishers, brass finishers, tailors, and many others of both sexes who have worked for many years in shops and workshops, only to be told that they dared not wear spectacles at their employment as they would have their wages reduced or be dismissed.

I am quite prepared to admit that there are many occupations in which glasses might get broken or the face and eyes might be damaged thereby (though out of many thousands of eye injuries I have rarely seen this happen), and I have only to say that no one who needs glasses at the outset of such careers should engage in

them. (*N.B.*—It is indeed one of the arguments in favour of a physical census of school children that they might thereby receive due warning of the age at which they are likely to require glasses, and select their vocations accordingly.)

But I think it must be conceded that in most of the occupations which I have instanced no such difficulty need arise, and I consider that the present prejudice against glasses on the part of employers is utterly discreditably to our twentieth century enlightenment, and often a grave injustice.

Employers who object to the use of glasses by their workmen or workwomen, especially after accepting their services without them, are blind to their own interests, and ignorance recoils on their own heads; for those workers who have defective or failing sight often conceal their misfortune and work either less well or less fast, and the employer suffers unconsciously with them in purse or reputation.

2. '*Hypermetropia*.'—A large proportion of infants are born with eyes which may perhaps be most simply described as having *less than normal focal strength*.

Hypermetropia

In such a '*hypermetropic*' eye light from a distant object impinges on the retina before it has come to its proper focus. Since this would give a blurred and ill-defined image, the eye tends instinctively to exert its focussing muscle ('muscle of accommodation') *even for distant objects*, and must of course exert a still greater effort than a normal eye in defining near things.

In a considerable number of children Nature seems to correct this defect by subsequent growth, so that the eyes attain to the *normal* standard (*Emmetropia*), as defined above. But it persists sufficiently often to constitute the commonest optical fault met with in children, and in a large proportion of persons it is a permanent condition throughout life.

If the error be of high degree, or the child be of sensitive temperament or in poor health, with feeble muscular tone, symptoms of difficulty in vision or ocular distress may arise and attract attention before or during school life.

But owing to the elasticity of the texture of the human lenses in childhood and youth, many *hypermetropic* young persons grow up quite unconscious of the extra amount of focussing effort which they have always had to exert. They have a superabundance of focussing power, and they use it freely and instinctively. They believe themselves that they have normal eyes, and they may unintentionally mislead superficial inquirers by responding correctly to such tests as the counting of dots, or naming of letters in the '*Test Types*,' which are commonly used in so-called '*vision testing*.' This method of testing is of great value as a means of recording the acuteness of vision *at the moment of examination*, but unless supplemented by further optical measurements, it affords no reliable information as to the actual optical condition of the eye, or its probable future usefulness.

3. '*Myopia*.'—Comparatively few children are born with eyes which *exceed* the normal standard of focal strength, but during the years of school time and active growth a considerable number of eyes stretch and yield in such a way as to put the retina out of focus for distant objects while enabling the eye to focus nearer objects with less effort.

This lengthening of the axis of the eyeball has often been regarded as an illustration of natural evolution adapting the eye to the needs of modern civilisation, which requires the use of the eyes more for things near at hand than for things at a distance. Its intimate relation to school life has been brought out by the study of its comparative frequency in the senior as compared with the junior classes in schools and colleges all over the civilised world.

But *myopia* (near-sightedness) has many disadvantages both in school and after life. It is often progressive, and if unchecked may lead not merely to physical disability for many occupations, but may develop into actual disease in the membranes of the eye, and incurable impairment of vision.

It can undoubtedly be checked in many cases by the

Mr
Mac
M.
F.R.
15 Sep

use of appropriate glasses, by a judicious cessation or regulation of the time devoted to near work, by a rigorous correction of faulty attitudes at work, and the encouragement of physical exercise and recreations which do not require fixation of the eyes on near objects.

Unlike hypermetropia, it cannot be disguised by any voluntary muscular effort of focussing; it can be compensated for only by getting near enough to the object, or by the use of concave glasses.

4. *Astigmatism*.—In a normal eye the front window of the eye (cornea) has practically an equally curved surface in every meridian, but not infrequently the curvature of one meridian (say, the vertical) is more acute than normal, or that of another (say, the horizontal meridian) may be less acute than normal. The effect of such inequalities of curvature is to give rise to unequal focussing on the retina, and is a frequent cause of difficulty in vision, ocular strain, or headache.

It is usually congenital, or, if acquired, is often developed in early life.

It cannot be satisfactorily corrected by any voluntary effort, but can generally be compensated for by very accurately devised spectacles or eye-glasses.

That form of it which is associated with *myopia* may to some extent be checked by the means suggested in that section.

D. Nerve power and vision.—This constitutes the most important factor in the whole visual act, since however transparent the lenses of the eye, and however excellent the focal power, the actual perception of the object depends ultimately on the degree of integrity and vitality of the optic nerves and parts of the brain to which they pass. That much can be done for training the eye to observe accurately and quickly, and for co-ordinating hand and eye by physical training, is well recognised. It does not seem practicable to confer upon our town-bred children any system of physical training which will give them the keen sight of the hunter, or tracker, or stalker, but in country places perhaps more might be done on the lines suggested by General Baden Powell's little book on *Scouting*.

For recreative purposes I would insist that games or exercises which encourage the focussing of the eye on objects, at least 20 feet distant, should be encouraged, since this tends to secure relaxation of focal effort.

In connection with the selection of occupations, the presence or absence of colour sense should be determined during school life. If the sense for colour is congenitally absent, no amount of training can create it.

In a public lecture, which I delivered at the request of the Edinburgh Health Society in 1891, on 'Colour Blindness and Defective Sight in Relation to Public Duty,' I raised the question whether every child at school should not only undergo the mental examinations at present enforced for the purpose of ascertaining its intellectual progress, but also periodic inspections as to its physical health and development, in which the eyes and sight should receive careful attention. I further suggested that since the great mass of School Board pupils seek occupations in which strength of limb and sharpness of sight are of as great practical value as book knowledge, it would be an excellent plan if each boy and girl received on leaving school a certificate showing the state of their sensory faculties and general physical development. It appeared to me that among the advantages to be gained from such a system would be:—

(1) That more attention would be paid to physical education and the laws of health in schools, and that a great impetus would be given to the diffusion of that kind of knowledge among the people.

(2) That there would be less excuse for any laxity on the part of the authorities in our public departments or private establishments unwittingly admitting to employment those who are from the outset likely to be physical failures.

(3) That there would be a truer distinction between those defects which are real and those which are only apparent.

(4) That our citizens, knowing better their own constitutions, their weaknesses, and the disadvantages which they entail, might be moved to more prudence in marrying and giving in marriage, so that the gradual advance may be promoted towards those ideals of health and physical perfection which are admittedly desirable for the welfare of the race, and which are certainly unattainable by haphazard methods or slothful indifference to ascertainable facts.

Another decade of experience in ophthalmic work has not only served to confirm the opinions which I then expressed, but has involved another argument in support of them. The passing of the Workmen's Compensation Act has resulted in daily claims being now made for damages received in various employments. Referring only to those which are due to injuries of eyes and sight, my experience is that in determining how much of any given ocular defect is due to conditions existing prior to the date of injury, and how much to the accident for which compensation is claimed, is often a very difficult problem.

I suggest that a permanent record of the powers of vision in each case at the time of leaving school would be of the highest value to employers and employed in many such cases in arriving at an equitable settlement.

But I must most strongly urge that if a physical census of school children is thought to be worth having it must be done thoroughly and by the best scientific methods.

Of the folly and false economy of entrusting such examinations to unqualified persons, I could give many illustrations from the experience of the Board of Trade in its futile endeavours to control the eyesight of officers in the mercantile marine, and from the records which I possess of the experiences of officers and men in our navy and army, and in our railway companies.

There are exact scientific methods by which ophthalmic surgeons can determine the presence or absence of optical errors and measure their precise amount in children of any age. If a thing is worth doing it is worth doing well.

9849. I might emphasise in your evidence one or two points that we might have more especially before us now. The first point of practical importance is where you say that it is one of the arguments in favour of a physical census of school children that they might thereby receive due warning as to the age at which they are likely to require glasses, and select their vocation accordingly. The second important point is when you say that it does not seem practicable to force upon our town-bred children any system of physical training which will give them the keen sight of the hunter, or the tracker, or stalker, but in country places, perhaps, more might be done on the lines suggested by General Baden-Powell's little book on *Scouting*. The third important point is when you say that a system of periodic inspections as to physical health and development, in which the eyes and sight received careful attention, would have great advantages. You say that these advantages would be '(1) That more attention would be paid to physical education and the laws of health in schools, and that a great impetus would be given to the diffusion of that kind of knowledge among the people.

'(2) That there would be less excuse for any laxity on the part of the authorities in our public departments or private establishments unwittingly admitting to employment those who are from the outset likely to be physical failures.

'(3) That there would be a truer distinction between those defects which are real and those which are only apparent.

'(4) That our citizens, knowing better their own constitutions, their weaknesses, and the disadvantages which they entail, might be moved to more prudence in marrying and giving in marriage, so that the gradual advance may be promoted towards those ideals of health and physical perfection which are admittedly desirable for the welfare of the race, and which are certainly unattainable by haphazard methods, or sloth-

F.R.C.S.

15 Sept. '02.

'ful indifference to ascertainable facts.' Those words, I suppose, contain the full expression of your opinion? Do you wish to elaborate any of those points?—Not just now.

9850. Are there any other points you wish to draw attention to?—I should like to draw attention to the point about the Workmen's Compensation Act, which is, indeed, very important. Cases are constantly cropping up now in which workmen, after injury, make claims on account of some supposed defect of vision, and it is a matter of the utmost difficulty to determine what the real state of their vision was before the injury took place. If any such system as I suggest were introduced, which would enable one to have a record to appeal to as to what the state of their vision was when they left school, a great deal of assistance might be given in equitably adjusting these claims.

9851. Is it not possible for an oculist examining an injured workman to ascertain from his present condition what has been the state of refraction in his eyes in childhood?—Yes, but it is not always possible to certify the precise state of vision, whatever the state of refraction may be. The two stand quite apart, and that is the point I am specially anxious to prove.

9852. So it would only be in the case of injuries to the brain or head that you would be unable to say whether this was the result of the accident, or whether it existed before?—Not necessarily. It is, of course, quite possible that a workman may pretend that he does not see as he did before, or he may never have observed the defect in his vision until some accident deprives him of the sight he depended on, and then he puts in a claim for full loss of vision, whereas he never had full vision before.

9853. The bearing of this remark is as regards the Workmen's Compensation Act, and the use that a physical census of children might be in regard to it?—Yes.

9854. Are there any other subjects in regard to our remit?—Yes. In my *precis* I merely endeavoured, as I was approaching a highly technical subject, to prepare the Commission, and tried to explain the nature of visual defects, because it was obvious from the questions sent to me with the remit that it was scarcely justifiable to talk of as 'blindness' an error which was due to refraction, and might be corrected by glasses, and it was also because of that I laid some stress on the loss of transparency. There is one important question, and that is as regards the proportion of cases of abnormal vision in school children. A good deal has been done in that line of investigation both here and on the Continent, and there is no question that a very large proportion of school children have defects which are never appreciated at all, and which may never be attended to. Perhaps you are aware that Dr Arnold Lawson was asked to make an examination for the Education Department in London, and he examined 2014, and out of these he only found 698 who could be said to have normal vision, all the others having some defect or other. I think that his method of procedure was open to criticism, as it was not sufficiently searching as a life test, although it was sufficient for the moment. I have seen in constant daily practice among children of all classes an enormous number who have defective vision, but I would not venture to make any statement as regards the proportions in State-aided schools, nor would I advise anyone to do so on the reports that have been made, because no two examiners have followed the same method or tabulated the cases in the same way. One great advantage that might be done, if it appeared good to the Government to introduce some system of examining the children physically, would be gained if they could lay down a definite system, which, under proper supervision, was carried out for a series of years. I think that might lead the way towards the basis of a uniform method, which might be more broadly applied. There are many assertions published which are open to question, because the methods and standards are not the same. In some American cities examination is carried out under an ophthalmic surgeon, and I believe that an excellent report of the method employed, for instance,

Defective vision: proportion of cases of abnormal vision.

Physical census: definite system for series of years.

in the city of Minneapolis is given by Dr Allport, the doctor appointed in that city, in the *Educational Review* for 1897. Then there is another point which I might emphasize if I have not made it sufficiently clear, and that is that under present conditions of civilisation we must expect that a certain number of our boys and girls will necessarily tend to develop near-sightedness, and we should, therefore, take some means to try to prevent that. Now, we cannot prevent it if we do not do something before they complain. We should be on the watch for it and run those children in, just as we set a policeman to prevent robbery. It is to be guarded against by a careful regulation of work and encouragement to physical exercise as against bookwork. It is a very curious thing, and is often asserted, that the development of near-sightedness is intimately related with the progress of education. It is comparatively rare among savage people, and extremely common among much educated people, such as the Germans, and especially such people whose printing is not very legible, also the Germans. That has been said to be responsible for a great deal of the near-sightedness in Germany. Another factor has to be considered, and that is that once young persons develop near-sightedness, they are apt to lose interest in distant things; seeing them indistinctly, they find more pleasure in occupations that engage their sight near at hand. They employ themselves with near things, and by employing their eyes for near things they make their eyes more near-sighted. It is very desirable that opportunities for physical recreation should be rather enforced upon the children with that tendency, otherwise their recreation probably will be, when they go home, to read some book, some novel, or do needlework—anything but run about and exercise their eyes in distant vision. A very important problem arises upon the question of the selection of occupation. Perhaps this is too Utopian a suggestion to make; but if every child could be informed of its physical condition before leaving school, the ruining of many careers might be avoided. I could give many instances of persons I have seen who have embarked upon careers utterly unsuited for them by want of guidance in that matter. The point I want to emphasize is, that if that guidance is to be sound, it must be given on proper scientific methods. It is false economy for a State, if desiring scientific ends, to use unscientific means. They must employ properly qualified persons to conduct these examinations; if they do not, they may find that they are not getting the good results that they might get. There are means by which accurate results can be obtained, even in early childhood, giving the focus of the eye. These means must be employed by someone who is in the habit of devoting himself to the subject. The State, through employing inaccurate methods, are squandering money. I could put my finger on cases where the Treasury is wasting money right and left by not having a sound scientific and proper examination.

9855. I think that what you have said is sufficient as bearing on that point without giving illustrative cases. Is there any other point you wish to bring before the Commission?—No, I don't think there is anything more, unless I went into details.

9856. I may focus it by saying that you are distinctly of opinion that a good deal of the defective vision could be avoided by suitable physical training?—Yes, in cases of near-sightedness. Of course, hypermetropia, undersized eyes, is a congenital condition.

9857. You are of opinion that an examination by school teachers is utterly out of the question; it must be conducted by a medical expert?—Yes; to be of life value it should be. Of course for temporary value a layman can do it.

9858. Is it practicable to apply this to the whole of Scotland, to schools even in remote districts?—It would be possible. Of course, the further you go with it the more expense it entails, but it would be quite possible by appointing competent persons.

9859. You have no special suggestion to make in regard to the hands into which such an inspection should be entrusted or the mechanism by which it

Mr Mackay,
M.D.,
F.R.C.S.
15 Sept.

Near-sightedness: remedies: careful regulation of work and sufficient physical exercise.

Physical certificate advantageous.

Examination should be by medical expert.

might be carried out?—I have no preconceived scheme to suggest. I have already indicated the kind of policy I should be disposed to pursue in the matter, and that would be to deal with a small part in an easily accessible town, such as Glasgow, Edinburgh, or Aberdeen, and to watch it carefully, and not to have a great scheme for the whole country at once. Take a comparatively small part where advice is easily accessible, and judge by the results whether it would be worth while extending it on a large scale.

9860. *By Sir Henry Craik.*—Dealing with myopia, you say: 'Its intimate relation to school life has been brought out by the study of its comparative frequency in the senior as compared with the junior classes in schools and colleges all over the civilised world.' On what basis do you found that generalisation?—The fact that numerous papers have been published, very notably in Germany, where the subject has been of national importance, as there are so many cases of myopia there.

9861. Do you think that it is a consequence of the conditions of school life?—I am sure that it is largely influenced by that, but I don't think it is by that alone, as there are hereditary and personal factors to be considered.

9862. Do you think that the state of the school-rooms generally in Scotland are such as to account for this increase, keeping in view the time the children are there?—I am not sufficiently acquainted with the school-rooms to be able to make any statement on that matter. My experience with regard to the examination of children and students is outside their class-rooms, and I have little opportunity of seeing where they study, but we find this condition of myopia to be comparatively infrequent in young children, and it progresses with greater frequency during the later years of school life and during student life.

9863. You think it is occupation that produces it; it is not the conditions of light and so on?—Both have to do with it.

9864. The conditions of light in most of our schools are better than in most of the houses where they live?—That is possible, and therefore I don't express any opinion.

9865. You simply say that as a fact it does develop during the course of their school life?—Yes, and it may go on after they leave school. A great deal depends on occupation. The lighting is, of course, a very important factor. You may have a brilliantly-lighted school in which the children are badly placed.

9866. In approving plans, the Department looks very carefully to the direction from which the light comes?—I believe so.

9867. *By Mr Alston.*—That is what I want to ask you, whether an expert oculist could not lay down rules as to the lighting of schools and the position of the children?—Yes. I have given advice in one case where I saw the children trying to decipher the blackboard between two windows, and writing at badly placed ill-fitting benches.

9868. Have you had many cases of that kind?—That is just one instance in which I was able to draw attention to the point.

9869. Would you advocate that in the construction of schools expert opinion should be taken as to the position of the children in classrooms with regard to the light?—Yes, but I think it has been done to a very large extent. I think architects and the Education Department are very much alive to that now.

9870. You spoke of the Workmen's Compensation Act. You did not refer to the claims of children?—I was speaking of lads as well as adult workmen.

9871. That, of course, could only follow on a very large number of cases being scheduled?—Yes. If it was desirable to have a physical census of the population to be able to say what the national physical assets are, then I think that it would be useful to have an accurate record of vision. There are cases now of comparatively young men who, after some kind of injury, come and say that they have received such serious

damage that they want one to certify that they have suffered great loss, and it is often extremely difficult to make up one's mind what the value of the eye has been before the accident.

9872. The man might not have an intention to deceive?—Very often there is no such intention.

9873. It is from absolute ignorance?—Yes. If we had some record that might be looked up it might facilitate an equitable adjustment.

9874. *By Mr McCrae.*—Have you considered whether the amount of mental work exacted in our public schools is detrimental to the eyesight through too great a strain?—I have considered it only so far that undoubtedly, to return to myopia, the tendency to myopia is progressive in many cases. One cannot say that it is a matter of the arrangement of the seat or the light; it is very often hereditary. Only a week or two ago I had an illustration in my own consulting room of a lad who was tending to develop near-sightedness. He had himself begun to notice that he could not see things on the blackboard, and he was taken to see an oculist. The advice given to him was that while he might continue to study he should do no evening work at all, and that he should stop at 3 or 4 o'clock in the afternoon. The advice had been decidedly beneficial. In that way I think if one had in schools someone supervising the children with a tendency to myopia, there would be many a case in which, by an earlier recognition of the tendency and a control of the hours of work, good might be done.

9875. In any case, if there was an increase in the physical training given in the schools, then there would be a relief from the mental strain, which would be an advantage from your standpoint?—I had more the strain on the eyes in my mind, but, of course, I agree with you. In the actual amount of physical exercise undertaken some precaution should be secured for children who have a tendency to be near-sighted, not to engage them too much in exercise that would involve hanging their heads, as from a horizontal bar. That would be undesirable for them.

9876. *By the Chairman.*—There is just one question, and that is as to your suggestion about a certificate being given to children when they leave school, at, I presume, the age of fourteen. How, so far as their optical powers are concerned, would that affect their future life? Is it not rather early at that age to give a certificate that might affect them throughout the rest of their life?—It is a difficulty, and I appreciate it more especially in connection with those who tend to develop near-sightedness, but such certificates are frequently sought and given at that age, e.g. to naval cadets.

9877. Is the difficulty so great as to make it impracticable?—No, a majority of children commence life with eyes (hypermetropic) below the normal focal standard.

If they are going to develop normal eyes they will usually have done so by the age of fourteen.

If they have not done so they will probably need convex glasses for exact work long before middle life, and may be warned when leaving school to avoid occupation in which glasses cannot be easily employed.

Again, by the age of fourteen a large proportion of those who have a tendency to develop 'Myopia' will have begun to do so, and may receive warning and guidance towards the prevention of further development.

And further, apart from these refractive or optical errors there is a large group of cases in which the vision of one eye is not so keen as the other, from some congenital or irremediable condition at the back of the eye, or both eyes may be defective in nerve power though appearing healthy externally. All such congenital cases, and many which result from infantile disease, can be detected by the time of leaving school. Besides, if a physical census were established in State aided schools the physical examination could be extended to technical schools and continuation classes, and certificates could be revised and renewed. The earlier record, if properly made, would be of great value.

Mr G. Mackay,
M. D.,
F. R. C. S.

15 Sep

9878. *By the Chairman.*—You are Sheriff-Substitute of Forfarshire, and have been so for how long?—Five years.

9879. Your evidence is most interesting. Perhaps you might read it through?

After school age: town and country lads.

On the general question, I believe that a certain amount of physical training after school age is desirable as an aid to both physical and moral development. If the cities and large towns alone had to be considered, I should see no objection to making some such training for boys compulsory, but I should make it optional to any lad to enter a preparatory volunteer force (*i.e.*, to go through a course of regular military training), as an alternative to the regular compulsory course. But, without professing any special knowledge of the requirements of town boys, I believe that there is more need for something to be done in the country districts, where any general and compulsory system is hardly practicable. In the towns every boy has the choice of various outlets for his surplus activity; he is surrounded by different influences and examples, good and bad, and it is probable that his character, as developed by his earlier education and upbringing, will determine for him his pursuits and companions and habits. The country life, on the other hand—and especially the life of the farm bothy—offers few, if any, opportunities for healthy activity, and leaves the young lad wholly dependent on the influence of the two or three older men who are his necessary companions. These companions have already, not so much through any fault of their own as by long custom, probably become loafers. The young lad soon finds that the only recognised signs of manliness are to vary the monotony of idleness with occasional visits to the public house, competition against the virtue of the young women of the district, and perhaps a little poaching. These and such like adventures become the chief topics of conversation at meal times and in the evening, and the lad, until he can hold his own with an obscene jest or a discreditable experience, is made to feel his inferiority in the opinion of the others, and is subjected to an amount of banter and abuse which only the strongest can withstand. The inevitable result is that the average ploughman grows up, or rather under the present conditions is trained up, into habits of idleness and dissipation, which more or less colour and affect his whole future life and work. My jurisdiction as a county judge extends over a very large agricultural area—at least 500 or 600 square miles, I should say—carrying a population of over 100,000, of whom about one half must live out of the towns. Amongst this large rural population there is almost no serious crime. Dishonesty is very rare. But the farm servant (in five cases out of six the young unmarried farm servant) is a very frequent visitor in the court. He often appears as principal or witness in cases of breach of the peace, malicious mischief, or assault,—cases which may be generalised as drunken brawls. I do not probably see most of the cases of this kind which occur, as much of the drinking is in the burghs, and the resulting brawls are dealt with in the burgh courts. He also appears often in affiliation cases, in actions of damages for desertion of service, and less frequently as a defender to actions for the recovery of tailors' or other tradesmen's accounts. His appearance in court is seldom a credit to the educational system under which he has been produced. He is generally stupid and irrelevant, partly I think from ignorant suspicion. His manner and behaviour show no trace of respect or civility. He lolls upon the witness-box, spits upon the floor, and if he answers questions at all, does so unwillingly and rudely. He appears to me to have, as a rule, little sense of the duties of citizenship, and though on oath will often not speak the truth until it is forced from him, and then only because he cannot, or is afraid to, longer withhold it. The same want of discipline, and of the better-brought-up lad's sense of honour and respect, are very noticeable in the relations of the farm servant with his master. In some cases service is deserted to obtain a better place or better

Farm servants: sketch of their life and environment.

Want of discipline.

wages elsewhere. Oftener it is done in temper or sullen anger at a rebuke, or an order to do something unusual or irksome. In either case there is an apparent resentment of authority and assertion of independence which, if permitted, would make the position of master and servant impossible.

These features, which I have noticed as fairly general, do not make up a very pleasing personality. But I have always strongly felt—and every year's experience adds to my belief—that if the product is unsatisfactory, the fault lies in the method of production and not in the material. These farm-servants are, as I have said, almost wholly free from serious crime. They are physically strong, though clumsy, and do not desire to shirk exertion. Among themselves they appear to be good-natured and social. I have often seen them, when they have survived their days of service and become farmers or managers, or when they have left the farm to join the police force or private service, or to become railway servants, develop under the influence of new surroundings into as fine men as any country could desire to show. But in such cases the development is always slow; and I have seen men who, after years of successful and valued work in responsible positions, have never been able to wholly shake off the early idea that any kind of discipline is inconsistent with manliness, and to recognise that a deferential manner can be consistent with self-respect.

I think that some form of physical training on more or less military lines might—not all at once, but gradually—improve this state of matters. It ought to induce a more general amenability to discipline, and to produce a better bearing and better manners. To some extent it might also counteract the natural desire to loaf. But loafing is, in my view, not due so much to natural laziness as to environment, and until you can combine with such physical training as is possible in sparsely populated districts some healthy and innocent outlet for physical activity, the training will do little to remove the temptations which are inseparable from the present conditions of life. I am not aware that for the ordinary unmarried farm-servant there exists any inducement to innocent and healthy recreation. Apart from his work he has the bothy and nothing else. He may spend his time with his companions inside over the fire, or outside leaning against the wall, but for anything else he must go afield, and it is unlikely that he will find anything different until he gets to the nearest public-house. Combination for games may exist in exceptional cases, but for the most part there is no suitable accommodation, and the farm-servant is too migratory to combine to acquire accommodation. Besides, he has not been educated to regard physical exercise except as an exhibition by others for him to watch. I believe this could easily be changed. I have seen cases where some enterprising person has found no difficulty in getting up and maintaining a cricket club. There are other ways in which recreation can be found. Most of the railway companies now give annual prizes for the best-kept stations. The result has been that the majority of stationmasters have become enthusiastic gardeners, and among the smaller stations, when the porters are constantly being moved (promoted most of them), I have seen time and again that the porter, who has no interest in the result, quickly catches the enthusiasm and willingly gives his spare time to unpaid labour in his superior's garden. I always hope that such a man has found a life-long antidote to idleness and its temptations. It would be interesting to learn from some of the companies if they can estimate the effect of gardening on the temperance and conduct of their servants.

I would summarise my views in this way, premising that I do not include the less complex question of town life:—

1. I believe that some system of physical training would contribute to the sources of national strength.

Remedial military training healthy recreation

Suggestion for country lads.

- Lee. 2. That such a system, if combined with facilities for the physical exercise and recreation of the youth of the country, would greatly diminish the sources of national weakness, and that it would so diminish them in proportion to its attractiveness.
3. That to foster the inclination to physical recreation by providing facilities would be the easiest way to popularise physical training.
4. That a general system of physical training in the country districts, unless combined with the inducement to general and voluntary physical exercise, would not probably yield a result at all proportionate to its cost.

I am unable to suggest any practical scheme which would give effect to these views. I think that a good deal might be done in small ways, but that for the full solution of the problem—which one day may have to be faced—something more than a mere Education Act would be required. I should endeavour—by persuasion if possible, by legislation if necessary—to acquire gardens for all labourers' cottages and bothies. The local horticultural societies will offer inducements for their culture. I should try to get persons of position in the country districts to take the lead in the formation of clubs or combinations for outdoor sports, and in this way to accustom the popular mind to the belief that physical exercise may be the best form of rest from outdoor labour, and, therefore, that physical training may be a not unimportant department of education. But, after all, to ask a working lad in the country to attend regularly for any considerable period at classes at a distance would not probably be successful unless some tangible inducement could be offered. The inducement ought to be practical and personal, but at the same time commendable to the ratepayer as yielding direct as well as indirect returns on his expenditure. If it were found possible that service for ten, fifteen or twenty years in a Volunteer force should entitle the Volunteer at some stated age to the enjoyment of an old age pension, and if such service were allowed to begin from the age of fourteen years on condition that between the ages of fourteen and eighteen, only those years should count in which the Volunteer had satisfactorily attended such physical or other classes as might be required, I believe that with such an inducement the introduction of a national system of physical training would in Scotland be assured of popular acceptance.

9880. There is in your evidence a good deal of matter that is new to us, and what we have been anxious to get at. What is your special object in treating so largely on the habits of the farm labourers?—As a class they have very generally come before me, and I don't know that any other class in particular does come before me.

9881. It must have struck you as a difficulty as regards further employment of men of the ploughman class that their spare time after their work is done during a large portion of the year is somewhat limited?—Yes.

9882. The hours of rising are so early that they are almost bound to go early to bed?—But I don't think that they do go early to bed. I thought you meant the other part of the year when they rise practically with the sun and stop work with the darkness, so that their hours of daylight for recreation are very limited.

9883. You don't think in winter time they are so limited in their hours of recreation?—They are not limited at all in winter except by the light. The farm servant in winter rises later than he would do if he began work at the ordinary hours, because it is too dark for him to work, and for the same reason he stops earlier, the same want of light that deprives him of the power of working will also deprive him of the power of recreation outdoors.

9884. You say that as a general rule they don't get much rest. Do you know at what time they go to bed?—I don't think the ploughman goes to bed nearly as early as he used to do. Certainly in the county of Forfar

I would say that there is no ploughman who has not got a bicycle. Now that takes them far afield. Certainly the life of the ploughman is generally accepted to be not so healthy as it used to be, partly because he does not look after his sleep so well, and partly because his food is so very much altered for the worse.

9885. What is your reason for saying that in country districts in general your compulsory system is hardly applicable?—I mentioned 500 or 600 square miles, which is a very large district. If you subdivide that into three or four you would still leave very large distances for many of the people from the place where you proposed to give instruction. They might go to a place one night a week, but you could hardly introduce classes at so many different places so as to make it practicable to have regular courses daily, or even three or four times a week.

9886. So far as your experience goes, at what age, as a rule, does a boy become a ploughman?—I should think at fourteen or fifteen.

9887. Just after he has left school?—Yes.

9888. He goes with all the impressions of school life, good or bad, that he has formed?—Yes.

9889. He starts as a ploughman with the defects you have narrated?—Yes.

9890. Are these defects due to his school education?—I think not. I think he starts life probably as well taught in the school as he need be, but at fourteen he has no stamina to enable him to resist temptations when put into the bothy.

9891. He deteriorates from the bothy system?—He is forced down. I constantly see young men to whom drink must be pain coming into court. They have always got drunk in the company of older men.

9892. Then you say that physical training, more or less on military lines, might gradually improve this state of matters, but you are unable to suggest any practical scheme to give effect generally to these views?—Yes. What I think will be the great difficulty is that what seems to me to be wanted is something that will generally occupy the man. I think that physical training would do an enormous amount of good in the way of disciplining him and helping him to hold himself up, which I think is very important, and to remove the special temptations which bring him very much into the Criminal Court, and involve such a tremendous waste of his and public money.

9893. By physical training, you mean physical training after he has left school?—Yes.

9894. You are aware that he has had a certain amount of physical training for some years past while at school?—I suppose he has had that. I confess one does not see much result from it, but I suppose it is too early to look for a result.

9895. You would naturally expect from what is called adequate physical training that the result would be at all events an amelioration in his manners?—Yes, I should think so.

9896. But you don't find it?—I don't know that I see many people who have had physical training. The persons educated in towns certainly do have a certain amount, and I think there is a good result there, but I doubt whether persons educated in a small school away up near Braemar, say, get any physical training.

9897. I assume that they do have what is considered by the inspector to be adequate physical training, and I only ask your view as to the result within the last few years. You say that there has not been any?—I confess that I don't see any.

9898. Do you think, if some parochial or district arrangement of parts for physical training after school were arranged it would be a benefit?—Yes. I spoke to the Chief Constable of Forfarshire the day before yesterday. I asked him to read over a copy of my evidence, and give any suggestions he had to make. He said that the point I made about gardening struck him as being the most useful of the lot. He said he knew three parts of the county in which gardening had been introduced. One was at Haliburton, where Mr Menzies would not allow his gardeners to throw any thing away, everything being given to those who would

Mr B. P. 1. es.

15 Sept. '02.

Compulsion : difficulties.

Remedy : training and occupation.

Gardening.

Mr B. P. Lee.
15 Sept. '02.

take it. The result is that everybody is neat and tidy, and takes an interest in gardening, and no one goes to the public house. In the same way someone else has done the same in the district near Montrose; I think it is the gardener of Charleton. He has got up a Horticultural Society, which he has got every cottage in the village to join, and the same result is there. The Chief Constable is not troubled with drunkenness or mischief; everyone has got his occupation.

9899. That would be a summer occupation?—No, it is wonderful what they do. The Chief Constable told me that one of these ploughmen had taken a first prize for Chrysanthemums three years running, and that must have meant daily work in nursing them.

9900. *By Mr Shaw Stewart.*—I am afraid your evidence is rather negative on the whole?—It may be negative, but I should be enthusiastically in favour of anything being done. I think it is very necessary, but I think it is far more necessary to get something to occupy the people. I think if you once get that you would introduce physical training much more easily.

9901. You mean intelligent occupation. Have you ever considered the idea of evening classes in villages, combining physical training with mental training, at which village lads, not necessarily ploughmen, but all sorts of lads, might be attracted or compelled to attend? Have you ever considered that?—Yes. We have not got many villages.

9902. In Scotland?—In Forfarshire. Certainly there are many places which would be much more easy to get at with bicycles, but you would not get those fellows I talk of to go to these classes unless you compelled them. In Scotland there is no inclination to physical exercise, at least over a great part of it there is not, and I think it is very easily fostered. I think if you once got people to understand that there was pleasure and profit in physical exercise, you could then quite easily persuade them to go to classes for physical training. These farm servants are very keen on anything that they do take up.

9903. The difficulty is to find the best way of taking the first step?—Yes.

9904. *By Mr Fergusson.*—You are dealing rather with one class, the ploughmen in Forfarshire?—Yes, entirely.

9905. Of course I agree with you that they are a very difficult class. You spoke of cricket clubs as being easily got up for them, but are they of use for ploughmen, who are not free till about seven o'clock in the summer nights, and are not free till after dark in winter time. I am one of those 'enterprising persons' who have tried such things as reading rooms. The ploughmen will never enter them. I will try your plan of gardening and see how it works?—The difficulty is that you may start these places all over the country, but as yet you have not the necessary interest to draw the people. If you are prepared to make it compulsory for them to go, then you would have the outcry that these poor fellows after their ten hours' work were not fit. There is a difficulty either way.

9906. *By Professor Ogston.*—This valuable suggestion regarding possible service for ten, fifteen, or twenty years in a volunteer force entitling the man at some stated age to enjoy an old age pension would require some alteration in the volunteer regulations?—Yes, I did not offer that as a practical suggestion.

9907. You do not consider it impracticable?—I don't think that is within my sphere at all. I merely tried to state the kind of inducement that I thought would draw Scotchmen.

9908. You lay considerable weight upon some inducement of this nature as likely to be of great value in reaching that class you have so graphically described?—Yes, I am sure it would reach them.

9909. *By Mr McCrae.*—The great difficulty seems to be just after the boy has left school, so far as the ploughman class is concerned, and the class he is brought in contact with for the first time?—The ploughmen, from his very start, is a person who changes once a year, and even twice a year. They don't stay long in their places. They are almost

equally submitted to temptation during the four or five years. Mr B. P.

9910. Do you think, if a boy had a proper course of physical training at school, and he began to feel the benefit of it, that would help to keep him straight afterwards?—I think it would, if he had facilities for physical recreation afterwards.

9911. How many ploughmen do you think are volunteers?—Very few indeed, but in the neighbouring county of Aberdeen I think there are a great many more. I have often heard it suggested in Forfarshire that if there was a volunteer cycling corps got up, that would draw them, especially if they could see any way of getting a grant for their bicycles.

9912. Supposing there was a compulsory system of volunteering, which is rather paradoxical, but if it were compulsory that those lads, between fifteen and nineteen, should put in so many attendances at drill, do you think that would help you over the difficulty? Would it give them such an interest in drill, combined with shooting, perhaps, as to keep them away from the public houses?—The moment you bring in compulsion, you have everybody against you, and you are apt, I think, to destroy any enthusiasm that the person you compel might otherwise have.

9913. Do you think it would be possible to have gymnasia on a parish basis?—I think that every reading-room should be a reading and recreation room. I think it is a waste to have these reading-rooms all over the country as reading-rooms only. They would be more useful if there were means of doing something else in them.

9914. Would there be any possibility of having a cadet corps on a parish basis for the younger boys?—I should think so. Cadet co in parish

9915. I mean having regard to distances?—Things have changed a great deal. The bicycle is now so universal that I think there ought not to be any difficulty. If they wanted to go, there would not be the slightest difficulty in going.

9916. At what age?—From the time they left school and started work.

9917. *By Mr Alston.*—You have said that the age at which these farm hands begin their work is from fourteen to fifteen?—Yes, I think so.

9918. They are, in fact, boys from school?—Yes.

9919. What induces them to take to this particular line of life?—I think they are better paid.

9920. Even at that age?—Yes, they are very well paid.

9921. Have you any idea of the number of such hands in Forfarshire, roughly speaking?—No. I think that the Forfarshire County constituency is 12,000 voters, and I should think there must be a good deal more than that. They are mostly farm people.

9922. The difficulty would be that while there is a large number of youthful farm hands, they are very much scattered?—Yes. Young fi servants much scattered

9923. You could only get at them in small sections at a time?—Yes, but they are more or less concentrated. The valleys that go up in the most sparsely populated districts contain all the population within a small area.

9924. You require a certain number to make a volunteer company, and somewhat near residence to make it effective. Would that be a difficulty among farm hands?—I think that very likely it would be unless you shortened the hours of labour. If you improved the farm servant, I think there would be no difficulty in shortening the hours of labour.

9925. You have spoken of the free use of the bicycle. The introduction of a bicycle corps attached to a company might be of great interest?—Yes. Bicycle c

9926. It might get at these lads?—Yes. The bicycle, without a proper use for it, is rather a curse than a blessing.

9927. You advocated training on military lines. That would be for the sake of the discipline?—Yes. Military training disciplin

9928. The gross boorishness of these lads is said to be common to the whole Scottish population. Are they specially bad?—Yes, compared with the Aberdeenshire lads. In Aberdeenshire I think the general

Lee. system is for the farm servants to have their meals in the house of the farmer, and with his family.

02. 9929. Whereas in Forfarshire you have the bothy system?—Yes.

n. 9930. These young fellows live with the older men. You used the word 'loafer.' In what sense did you use it?—A person who spends his spare time in doing absolutely nothing, and by his spare time I mean his evenings, and his time out of work.

9931. The word is generally applied to a man who does no work at all. That is not the meaning you attach to it here?—No. At work time they would be very good workmen.

9932. They would be hard workers?—Yes. They have no disposition to shirk exertion at all.

g of 9933. You have advocated gardening, and given instances in which it has been of immense value to these men. Would it be possible to introduce not only gardening but some instruction in the scientific side of the work in which they are engaged—farming. Would they take any interest in their occupation?—That has been tried, but I don't think they do. Mr Bruce, a Bachelor of Science, is paid by the County Council to lecture all over the county. I have never heard that these lectures were popular, or that any farm servants attended them. You will get a few young farmers to attend.

9934. Have these farm servants any idea of being farmers ultimately?—Yes.

9935. But many of them go to other occupations?—Yes.

9936. They don't enter the farming occupation because they intend to advance to the higher grades of it?—The most of them enter it because it is the natural thing for them to do.

9937. It is well-paid labour?—Yes.

9938. There is no inducement to carry that out as the business of their life, and to advance to the more scientific knowledge of it?—A great many of them will take farms after a bit.

9939. The great difficulty would be that they are very scattered, that they change their places frequently from year to year, and that you cannot get a hold of these lads as a whole?—That is so.

9940. Is that why you speak of the less complex system of the towns?—I don't think I should have used that word.

n a 9941. In a town you have large masses easily handled?—Yes. It is less complex to this extent, if that you came to the conclusion that physical training was of such probable advantage that you were prepared to make it compulsory, there would not be the same hardship in making it compulsory in the towns; but there would be a hardship in the country where a boy might have to go fifteen miles.

9942. Do you think that there are insuperable difficulties in bringing these lads under military training or physical training after leaving school?—I hope not.

9943. But there are difficulties?—They seem to me difficult, but I hope they won't be insuperable.

ned 9944. Then you spoke about the food altering for the worse?—Yes, very much so. They still get their allowance of meal, but that is never used, I believe, in the bothy. It is always sold. If you enter a bothy (I have not done so myself, but I have made inquiries) you find it full of whisky and beer bottles, salmon and corned beef tins, tomato tins, and so on. Their sole food now is tinned meat and bread.

9945. On the whole this class of boy is a healthy boy as compared with the boys in town schools?—Yes, but the old farm servants will tell you that they are degenerating terribly through the changed food, and through giving up their porridge.

9946. You could give these boys, however, a large amount of physical training without any danger?—Yes.

f n e p. 9947. By Sir Henry Craik.—You don't, I think, raise any objections to the training which boys receive before they are fourteen. You think the work there is done fairly well?—Yes, excellently.

9948. Except that you think that there ought to be

more development physically?—I think it would do them good.

9949. It would do them good at a later stage of life. You say that you find that they develop into first-rate citizens?—Yes. I should like very much to read what the Chief Constable of Forfarshire says about training, as he has actually seen it in turning ploughmen into policemen.

9950. I might just pursue this. You think that they have to go through four years which are exceedingly dangerous, and which lead to a great waste. That is between fourteen and eighteen?—Yes. After fourteen: some systematic training.

9951. They have no guidance and no systematic training either mentally or physically during that time?—That is so.

9952. You have no doubt whatever of the advantage it would be to them and to the community generally that they should be brought under some such systematic course of training?—I have no doubt about it.

9953. You only dread the compulsion?—I should not dread it at all if I thought you could compel them.

9954. Do you think it would be unduly hard to compel them to a comparative short attendance in the evening when they are compelled up to fourteen to attend at school?—I don't think it would be hard, because I think if they would go voluntarily they could do it without any difficulty at all.

9955. Whether evening school attendance is to be compulsory or not, you think that a certain amount of physical training should be a necessary part of the curriculum of every evening school?—Yes. Is not physical training much more important to these persons than anything else? There is always danger if you educate the people too much, that they give up the farm-servant's life altogether, and go away into the towns to become badly-paid clerks, and after a year or two they come back less efficient workmen, having failed in the towns. Continuation classes: physical work should be part of curriculum.

9956. Just as we require physical training to be part of the curriculum of the day school, you think it more important that it should be part of the curriculum of the continuation classes?—Yes, in the country certainly.

9957. By the Hon. Thomas Cochrane.—You draw a very graphic picture of the whole life of the farm-servant. Is that drawn from your own observation?—Yes, entirely.

9958. You go into details as regards their general conversation in the bothies. Of course, that is second-hand?—In every affiliation case, for instance, one gets a sample of the kind of conversation that goes on every night, and then when the farm-servant of A fights with the farm-servant of B, you get the whole conversation. I have not got it by going round the bothies myself at night, although I think that that would be quite a proper thing to do.

9959. I see that you say that your general opinion is that, although he is rough in his manner, he possesses certain virtues. Dishonesty is rare?—Yes, very rare. Farm servant: good material wanting careful training at the receptive age fourteen to eighteen.

9960. He does not suffer from some of the smaller crimes?—That is so.

9961. In fact there is splendid material, and the best is not made of it?—That is so. It must be wonderfully good material, because one would think that with such a training a great many of them would lapse into crime and become absolutely useless, but as a rule they do not. Most of them survive it.

9962. There is a general false impression of what creates independence?—Yes.

9963. He mistakes roughness of manner for independence?—Yes.

9964. Probably that is the fault of not having any examples before him?—Yes, and never having been properly disciplined. Any training that a young boy gets, if it is not completed after the school age, really counts for very little when he grows up. The receptive time is between fourteen and eighteen, and that is when everyone is teaching him independence.

9965. When you say in your evidence 'deferential,' you don't mean subservient?—No.

Mr B. P. Lee.
15 Sept. '02.

Mr B. P. Lee. 9966. You mean a courteous manner?—Yes.

15 Sept. '02.

Farm servants easily trained to be policemen: testimony of chief constable of Forfar.

9967. You go on to say that after they have been trained as policemen they improve in many respects, and you were going to give us the experience of the Chief Constable in regard to the training of them as constables?—Yes. I happened to be in Forfar two days ago, and I showed my evidence to the Chief Constable, and asked for any suggestions that he could make. He agreed generally with me, and said that he would send me a few notes, which I got. He was himself a farm-servant. He entirely agrees that the bothy system is most fatal, and he also agrees that if you take farm servants away from the farm they are very easily trained by physical exercise, much more easily trained than I should have thought. Before he became Chief Constable of Forfarshire, he was Deputy Chief Constable in Aberdeen, where he says they have the most complete gymnasium of any place in Scotland. What he says about training is: 'I fully appreciate and endorse what you say in connection with the improvement that takes place in the habits and general bearing of the farm servant on becoming connected with railway or police service. I am speaking from experience when a member of Aberdeen City Police Force, and where there is probably the best equipped police gymnasium in Scotland. Aberdeen City Police is almost wholly recruited from the farm-servant class, and I have seen many recruits taken into the police service that, from their appearance, one would think it was impossible to make a decent-looking policeman from such raw material, but after a course or two at the gymnasium, it was simply marvellous the transformation that had taken place in the course of a few months. The raw, slouching, sullen-looking man had suddenly changed into a much smarter, better-shaped and much more amiable being. He was not only improved in general appearance, but his manner of address and whole bearing was so much changed and improved, that on going back to his home during his annual leave, his friends and acquaintances almost despaired of it being the same man. It is almost impossible to over-estimate the good that was done, both morally and physically, by the training in question.'

9968. He comes to the conclusion that this kind of

The witness withdrew.

Mr G. Smith.

15 Sept. '02.

9977. *By the Chairman.*—You are headmaster of Merchiston Castle School?—Yes.

9978. You have handed in a *précis* of your evidence?—Yes.

1. I was educated at Ayr Academy, Edinburgh University, and Oxford (Trinity College). On leaving the University I became a master for one term (September to December 1891) at Edinburgh Academy. From January 1892 to July 1898 I was an assistant master of Rugby School. Since September 1898 I have held my present position as headmaster of Merchiston Castle School.

2. Merchiston Castle is a public school (in the English acceptance of the term): it is mainly a boarding school, but a limited number of day-boys are admitted on condition that they are subject to the same discipline as boarders with regard to games and other school activities (*e.g.*, choir, Sunday service, and the like).

The school is divided into two departments, the Big School and the Preparatory. In the Big School there are about 110 boarders and 40 day-boys. The ages run from thirteen to nineteen. The work done is the usual work of such schools, training for entrance to the University and for scientific and commercial work. In the Preparatory there are about 30 boarders and 60 day-boys. The ages run from eight to thirteen.

3 (a). Rugby football is played in winter by all boys unless those who are certified by the school doctor as physically unfit to play. Cricket is also played by all

Games: organisation.

training improves the manners and appearance, and that is a valuable asset in ordinary life?—Yes.

9969. There are two points that you brought before the Commission—one is, that in order to get at these lads, you must either make continuation classes attractive, in order to get them voluntarily to take interest in the work, or you must compel them to attend?—Yes.

9970. Can you suggest any way in which you could make physical training attractive? I think you alluded to a bicycle corps?—I think that that would make volunteering attractive. Bicycles are more or less new to those people, and they get them cheaper now. They are certainly very much more numerous among the labouring classes than they used to be, and I think that if anything was to be done in the way of getting up a volunteer bicycle corps, it would probably be successful.

9971. Would they take an interest in rifle ranges?—Yes, and shooting competitions.

9972. And an interest in boxing?—That is rather a dangerous thing to teach them, I think.

9973. It was brought under our notice by Lord Meath very strongly, and he described what an excellent cure boxing was for hooliganism. You think that in those ways you might make it attractive and get them to come to the continuation classes?—I think so.

9974. As regards your remedy of gardens, would that be of any use to a lad between fourteen and eighteen in a bothy?—I think it would. The railway porters I spoke of are, I should think, men between seventeen and twenty.

9975. You think that the ordinary young farm labourer between fourteen and eighteen could be induced to work in a garden?—I have a strong feeling that to do nothing is not natural to anyone, and not desirable, and if there is anything to do, especially if it becomes the fashion to do it, the farm servant will do it rather than do nothing.

9976. You hope that local effort might be brought to bear upon this problem of occupation for the young men?—Yes. It would need to be done very carefully. It is just one of the ways in which one sees the want of discipline, the want of respect, that those fellows are apt to resent anything that is done to help them unless it is done very carefully.

Mr GEORGE SMITH, examined.

the boys in summer. Hockey is played during March to fill in the time between the close of the football season and the beginning of the cricket.

These games are organised and supervised partly by masters and partly by boys. There is a football committee and a cricket committee. Each of these consists of a master, the captain of football (or cricket), and another boy. The committee classifies boys in teams according to their size, skill, and strength. [In football it is of the utmost importance to take *size* and *strength* into consideration in classifying boys. To put a small or weak boy into a team, the average weight and strength of which is above his weight and strength, is either to make him run serious risk of bodily hurt or to teach him to funk.] The practice games of the juniors are supervised by masters or prefects, or both. The big side practice games are also taken part in by old boys; this is useful as helping to promote keenness and corporate spirit as well as skill in the game.

In cricket there are, in addition to masters and old boys, two professionals who bowl to and coach the teams.

Hockey is not yet completely organised with us, and is at present rather a stop-gap in a slack season. But it is a good game, requiring co-ordination of hand and foot in perhaps a more delicate degree than football does; and I hope that it will shortly be a regularly organised school game played by all the boys.

(b) The field is about 14 acres in extent, and is about 300 yards from the school.

Mr G.

15 Sep

(c) There is a school gymnasium. Every boy has two periods a week of gymnastics. The classes are taken by an instructor (Mr P. Stroud). There are from 15 to 20 boys in each class. Each period begins with a quarter of an hour or twenty minutes of dumb-bell or bar-bell drill. Thereafter there are exercises on the parallel or the horizontal bar, the sloping ladder, and the vaulting horse.

In addition to this the boarders in the Preparatory School have two hours per week in the evening of Swedish gymnastics (free movements).

The above-mentioned work in the gymnasium is compulsory, and part of school routine. In addition, the 'new boys' of the year are taken in extra gymnastics by the prefects for half an hour on two evenings in the week; the First Fifteen do twenty minutes' gymnastics after tea; and the senior boys learn boxing (forty minutes) on Friday evenings.

Every boy has a pair of light dumb-bells in his dormitory, and uses them for a few minutes every evening.

(d) Athletics.—School sports are held at the beginning of April. For these boys practise for three weeks previous. The sports include the usual events:—running (100 yards, quarter-mile, and mile), jumping (broad and high), putting weight, throwing cricket-ball, drop kicking and place kicking.

(e) Boys who are not playing football on any day go for a training-run (unless they are playing fives). The training-runs are, as a rule, short—from one mile to three and a half. These 'runs' are part walking and part running. Continuous running for the whole distance is discouraged, as tending to spoil a boy's action by producing a flat-footed jog-trot, and as liable to produce heart-strain in boys who are not yet come to full strength.

Once or twice a year there is a long run over the Pentlands (seven to nine miles). The boys go to Currie or Balerno by train and run and walk home.

Unless one goes some considerable distance from school there is hardly scope and room enough for *paper chases*. This is somewhat to be regretted; as a real paper-chase offers more stimulus of variety and competition than a training-run offers. But after all it is well that the element of competition should not enter argely into such runs.

(f) Handicrafts.—There is a small workshop at the school. The work done in it is limited in quantity and variety, and not all the boys take part in it. About twenty boys are engaged in making fishing-rods, golf-clubs, book-shelves, model yachts, and the like. The work is done under the superintendence of a master. It is done at odd times, not as part of the school routine.

With a larger workshop, which we hope soon to have, there would be further development of this side of training; but I think I should not make it compulsory.

In the Preparatory, the boarders are taught basket-making and woodwork two evenings every week.

(g) Voice training.—All the boys learn singing. One period a week is given to this. The music-master (resident) looks after this. He also tests the voice of every new boy, and puts him in the choir if his vocal powers fit him for it. In the singing lesson care is specially taken to train boys to breathe, articulate and produce their voice in the proper way. Boys who prove to be incapable of producing melodious sounds take extra gymnastics or drawing instead of singing.

(h) Cadet corps, etc.—The cadet corps is composed of all the boys in the Big School. The majority of the boys are in the ordinary infantry company. The smaller boys are classified as scouts, cyclists, or stretcher-bearers, and practise the drill associated with each of those branches. All wear uniform; the infantry wear doublet and kilt—a pre-eminently unpractical uniform in warfare, but excellent for occasional drill and parade; the rest wear Norfolk jackets and knickers and putties. The corps is attached to the Q.R.V.B.R.S., and boys above seventeen are sworn volunteers. The corps is commanded by a captain and a lieutenant (both masters), and has attached to it a sergeant-major and an ambulance instructor.

Boys above seventeen years of age are sworn volunteers in the Q.R.V.B.R.S. They pass their annual shooting-tests; but apart from this there is practically no practice in rifle-firing at a target. The difficulty of finding convenient times to use the ranges, and the large amount of time that is necessarily spent in going to and from the ranges, prevent us from developing this form of training more than we do.

(i) Swimming.—There is no swimming-bath at the school yet. We use the swimming-bath of the Edinburgh Hydropathic—a mile distant. Practically all the boys learn to swim; but there is no compulsion. Boys generally go (on bicycles) to the bath before breakfast, and on certain hours of the afternoon in summer.

(j) Fire Brigade.—Two squads, of eight each, are taught the use of the hydrant and hose, and the corridor pumps as attached to the school.

(k) Ambulances.—In addition to the training of stretcher-bearers, who are small boys (*vide* 3 (h) above), there is an ambulance class of sixteen of the bigger boys who get a course of ambulance lectures from Dr Dowden in the winter terms.

4. The following table shows the time devoted to each of those activities per day and per week:—

	Hours per day.	Days per week.	Hours per week.
All boys do	{ Football (or Hockey or Training Run), 1 Gymnastics, 2 Voice training, 1 Cadet Corps, 1		6
			12½
			1
			1
			<hr/> 9¼
Some boys do	{ Extra gymnastics (say) ½ Boxing, 1 Workshop, ½ Swimming, ½		1
			1
			3
			3
			<hr/> 8

5. Gymnastics and voice training are taken in ordinary school hours. The others (except swimming and workshop) although not put down in the school timetable, are an integral and compulsory portion of the school curriculum.

6. I think that the most important of these forms of physical training are the school games (football, hockey, cricket, fives, etc.), the gymnastics and the cadet corps.

(a) Games.—Football, cricket and the like have the great advantage of being *games* and not drill; *i.e.*, they are played spontaneously (the element of compulsion is not felt), and although they are organised and supervised, the details of play are of necessity left to the individual players' wit and skill. They thus make each boy act and think for himself (so far at least as the game is concerned), and not merely do what he is told to do. They are played in the open air, and are recreative as well as educative.

(b) Gymnastics are important because they provide a *systematic* means of developing the various muscles and organs of the body. Without gymnastics, training by games alone would be incomplete and defective in part: without games, training by gymnastics alone is in danger of being dull and monotonous. Gymnastics are generally worked in a walled and roofed gymnasium; but it is possible and advisable, in summer at least, to do much of the work in the open air.

(c) Cadet Corps.—The cadet corps is very valuable as a training of physical, intellectual and moral powers. Physically, it trains to erectness of bearing and good action in walking. Intellectually, it trains to concentration and continuity of attention. The necessity to be always alert for a sharp word of command, and to be prompt to carry it out at once, trains the will power in attention, and increases greatly the co-ordination of the receptive senses and the active powers. This necessity is felt most strongly in military drill. It *can* be inculcated also in combined gymnastic drill (free or with dumb-bells), but not so easily and inevitably: the tradition of smartness and promptness in *military* drill is very strong.

Morally, it teaches *esprit de corps*, the power of con-

Mr G. Smith.

Fire brigade.

Time allotted.

Important forms of training.

Mr G. Smith. 15 Sept. '02. corted action, and at least a rudimentary notion of the military duty of a citizen and of patriotic action. It is felt (often, I daresay, subconsciously) that cadet corps drill is not undertaken for fun or for purely individual purposes, but for a national purpose

Oppor-
tunities:
almost all
compulsory.

7. These opportunities of physical training are taken advantage of by all the boys. They are almost all compulsory. But compulsion does not produce distaste. Partly the spirit of competition, partly the fact that physical growth and development are easily measured and noted (as contrasted with mental growth), mainly perhaps the human nature in a boy, which leads him to put his limbs and lungs in vigorous motion, and the desire not to fall behind the tradition of the school, tend to make most boys keen on using all the opportunities they have.

Results:
physical,
mental and
moral
advantages.

8 and 9. Briefly, the results of such training are good. It is good for bodily health. Overstrain must of course be avoided. This can be done satisfactorily by a medical examination at the beginning of a course of training (and in the case of specific weakness by a repetition of such examination at such intervals as the doctor and the masters think necessary), and by careful observation on the part of masters, who can generally detect signs of overstrain in the appearance or the play or the work of a boy.

I have mentioned already (No. 6) the intellectual good results of games (*e.g.*, initiative), and of drill (*e.g.*, co-ordination and concentration). Physical exercise is of course indirectly useful to the intellect by the fact that it keeps the body in good health, and this reacts on the mind. There is, however, a distinct danger of physical training taking up too much of the thoughts of some boys, as there is of intellectual training taking up too much of the thoughts of some students. But the danger is less of an evil so long as the boy wants to *do* things himself, not to merely *look on* while other athletes do them. The *parasitic* interest in physical exercise is perilous and sometimes degrading; the *active* interest is healthy in tendency, although it may be overdone. When this active interest depends in great measure on the thought that physical fitness is a duty, there is little danger of loss of perspective; and intellectual training and development are in no danger of getting less than their fair share of attention also.

The moral results of games are mainly seen in the development of courage (especially in playing a losing game), of corporate spirit (the utter absence of this makes golf an inferior game for schools), and of the sportsmanlike (or chivalrous) spirit (*e.g.*, unquestioning obedience to the referee or the umpire, especially when he gives wrong decisions, and absolute observance of the rules of the game are recognised by all boys, theoretically at least, as binding duties, and are a sort of training in honour and in self-restraint).

In drill the subordination of the individual to the community (corps, or school, or nation); in gymnastics the implicit recognition of future excellence as a motive for present drudgery, are useful results.

One should only add that the boys are generally unconscious of these moral effects. If they were not, there would be serious risk of their becoming prig.

System;
certain
principles
essential; but
freedom desir-
able.

10. Some kind of system, with definite principles based on proved facts, should of course be followed; but I think that there is room for much diversity in detail in the adaptation of the system according to the nature and bodily powers of the scholars, the circumstances of the school, and even the predilections of the teacher. Thus some teachers like *musical* drill as a gymnastic exercise, because it helps to produce rhythmical movement and it gives pleasure; others object that the music gives *too much* help, and saves the pupil from exerting the will-power in attention, which is an important element in such an exercise, and they prefer a drill involving similar movements but allowing the pupil to attend to the time and rhythm for himself. In such a case, when there is obviously truth in both views, it is economical to let a master follow his own belief—he will teach all the better because of it.

11. I should think, however, that a skeleton system could be drawn up which should guide the teacher in theory and not hamper him in practice. Such a system would state the proportion of time which should be *generally* devoted to physical exercise, and what proportion of such time should *generally* be given to free movements, gymnastic drill (with dumb-bells or other apparatus), and military drill and games; but it should be clearly understood that these things are only generally (not universally) true, for the normal boy and the normal teacher, and that much latitude is permissible for exceptional classes of boys and for exceptional teachers. It would probably be advisable to agree upon some sort of manual of physical training, and to recommend it as a guide without tightening the requirements into a Code to be rigidly adhered to.

Games might almost be left to take care of themselves, provided that suitable ground and sufficient opportunity for playing them is afforded. But there should probably be an indispensable minimum of gymnastic and military drill demanded.

12 and 13. A just proportion of time and attention given to physical training reacts on and quickens the power of mental study. Again, there is no hard and fast rule. The adult has to discover for himself what is the just proportion for *him*, how much time he must give to physical exercise in order to keep his body and brain fit for his work. For most boys between fourteen and eighteen I should think that an average of 1½ or 2 hours daily of conscious and systematic physical exercise to 7 or 7½ of mental study is about right; but I make this statement with diffidence, and am ready to admit that it is subject to all manner of modifications.

A great deal depends on the kind of exercise. Thus a hard match at football (one hour only) would take it out of a boy more than twice as many hours devoted to workshop, singing and drill; just as a three hours' examination for the army or the civil service would take it out of a student more than six hours' work in his study. A great deal also depends on the kind of boy.

The just apportionment of time and attention to physical exercise is, however, of extreme importance. If too little time is given, the mind suffers from the sluggishness of the bodily functions. If too much, the boy may become too exhausted physically to exert his brain power, or he may transfer too much of his keenness and attention to such exercise. Again, a general rule is useful as a guide in theory, but the individual must be studied in practice. After all, pedagogic is full of general rules to which most boys are exceptions.

14. I have no doubt that physical training is most advantageous when it is carried out daily in connection with school work. One great point which is thus gained is that physical fitness up to the standard of the individual's natural powers is unconsciously inculcated as a duty parallel to the duty of intellectual equipment and of moral strength. I think that when this aspect of physical exercise becomes prominent in a boy's mind, it forms a considerable safeguard in later life against the danger of physical loafing and the danger of merely spectacular athleticism. Again, for almost all men (I am thinking mainly of professional men) it is important that they should have formed the habit of devoting a certain time daily to physical exercise, and this habit is best learnt at school.

15. The chief merit of *outdoor* training is that it ensures a good supply of fresh air to the lungs. This is an advantage that can hardly be over-estimated. During physical exercise more air is required to pass through the lungs than during physical quiescence. If pure fresh air is available, much is thereby done, primarily, to make and keep the lungs healthy, and, secondarily, to freshen, recreate, and strengthen all the functions of the body. Even a dozen full deep breaths, taken in the open air, with accompanying chest expansion movements, so as to open up and use all the corners of the lungs, have a very invigorating effect.

mith. The only merit of indoor training, as such, is that the pupil is protected from inclemency of weather. I am inclined to think that too much importance is attached to this merit. It is probably advisable to shelter from rain when possible during military or gymnastic drill; it is certainly necessary to prevent the bars, the ladder, and the vaulting horse from getting wet. But, so far as cold is concerned, it is very seldom that the weather is so cold that the physical movement and activity of drill will not keep a boy warm in the open air, and I should say that a roofed (but not walled) shed would be the best place for working such drill.

Besides this, out of doors is associated in a boy's mind with more pleasurable activity than indoors, and thus the exercise taken out of doors is more likely to be recreative and enlivening than indoor drill.

drill
rm
urri-
ool:
es. 16. I am convinced that some form of military drill should form part of the ordinary curriculum of every school. I have already mentioned (Pars. 6, 8, and 9) what I think are the chief advantages of this form of physical training. Physically, it tends to produce an upright carriage of body and good action in walking. Intellectually, it quickens co-ordination of the recipient senses and the active powers, and educates the attention in concentration and continuity—perhaps the most important and most difficult lesson for a boy to learn. Morally, it calls out and strengthens corporate spirit and teaches some sort of rudimentary patriotism.

I do not think that such military drill should be treated as 'technical training' for a soldier's life, but rather as an aspect of general culture. Its main aim should be to produce an efficient citizen, not a trained soldier. It has not been my experience that cadet corps' drill tends to make a boy in love with a soldier's life. The hard work of drill counterbalances the attraction of uniform and show, and the boy who has been a member of a cadet corps is more likely to decide wisely and on sufficient grounds whether a soldier's life is the best life for him. Thus, although the cadet corps at Merchiston is one of the most important of our school activities, the school is not by any means military in character. There is an army class, and one or two boys enter Woolwich or Sandhurst every year. There were about forty Merchistonians serving in the South African war. Not a few boys become volunteers after leaving school, and those who do so are generally very keen and efficient, as they enter on the work with their eyes open to its nature.

16A. There is, I should say, absolutely no basis in experience for the notion that compulsory cadet corps is a method for recruiting the regular army or a step towards conscription. It is a pity that some people (few, I think) think that it is. The avoidance of the name 'military drill' might tend to dissipate the delusion; but it would also tend to weaken the intellectual and moral effects of such drill. Ordinary gymnastic drill could probably be so systematised as to produce as good *physical* results as military drill. But strictness of discipline and promptness of obedience are so inevitably connected with military drill, and the feeling of corporate interest is so fostered by association with a citizen army that I should consider it a serious loss if such connection were cut by dropping the name of military drill.

17. I think that any system which includes the spontaneity and initiative of games, and the methodical training of gymnastic and military drill in fair proportions, is to be recommended. I fear that I am not familiar with the details of any one system. I feel certain that there is more peril in adhering rigorously to a system (however good) without consideration of local and individual peculiarities, than there is in laxity and lack of uniformity of method.

18. A class of senior boys is formed each year in ambulance work and theory. In addition to this, there are occasional health lectures given to all the school on the bodily powers and function, muscle, brain, lung, nerves, and the veins, and on the proper exercise of breathing, walking, running, bicycling. These lectures are not systematic, but occasional and

popular, and are given by old boys or by doctors who are specially interested in spreading this kind of knowledge. *Mr G. Smith*
15 Sept. 02.

19. I have already indicated (Pars. 8 and 9, 12 and 13) what are the results of my experience regarding physical training. The chief danger in it is not physical overstrain, but mental loss of perspective and exaggerated interest in merely physical development. It is perhaps worth noting, however, that interest in any good thing is liable to exaggeration, and yet enthusiasm is absolutely necessary as a motive power. Further, where physical exercise is treated as a conscious training for full and healthy life, and not as a mere means of display, the evils of exaggerated interest, even when it exists, are minimised.

So far as my own experience goes, I have found that physical training, methodically carried out as part of the discipline of school, does not as a rule tend to 'athleticism' in the bad sense of the word. I should be far from saying that that result is unknown; but, on the other hand, there are excellent results which far more frequently follow: improved bodily powers for certain, better knowledge of the conditions of health, promptitude and alertness in practical matters, courage in physical peril or emergency, and in general a completer and more vigorous life.

It is probable that mental study sometimes suffers from competition with physical training: on the other hand, it is certain that the analogy of keenness in games, in order to promote physical efficiency, produces not infrequently keenness in study in order to promote mental efficiency. And on the whole it is far better that a boy should leave school sound in wind and limb, keen and active in spirit, having learnt the lesson of attention to the work in hand, and ready to learn the other lessons of practical life, than that he should leave it book-learned and exhausted.

20 and 21. The physical training at Merchiston is, I think, sufficiently organised and supervised. The gymnastic instructor is duly qualified. The military drill is conducted by a sergeant-major of the Q.R.V.B., under the command of two masters, who are Captain and Lieutenant of the Cadet Corps, and who hold commissions in the Queen's. None of the other masters on the staff has, so far as I am aware, gone through any (teaching) course of instruction in gymnastic or physical training. Some of them, however, know the games (football, cricket, etc.) well, and are well qualified to act as coaches for the boys in these; and all are interested and keen on physical training, and consider it part of their duty to note, report, and, so far as possible, correct physical defects or weaknesses. The late Vice-Master (Mr J. R. Burgess) had made himself an acknowledged authority on physical training, and had, I believe, done a good deal to further it in the North of Scotland by giving advice and other help in the institution of gymnasiums and cadet corps. Several of the senior masters have also now attained considerable knowledge by experience, and the advice of the school doctor (Dr Burn Murdoch), who is also keenly interested in the physical education of the boys, is of great value.

It will thus be seen that while we depend for actual teaching in gymnastic drill on trained instructors, the system depends also for its success on the general interest taken in it by all the staff. I have not found any trace of a tendency among the teaching staff to think of physical training as a separate department, the claims of which clashed at times with the claims of study. It is considered by all as an integral portion of education-work.

By the way, I think that when physical training is taken up seriously, there is sometimes a danger of over-organising and over-supervising games (no such danger in drill or gymnastics), and of organising the fun and the spontaneity out of them. I have not, however, seen this happen anywhere in my experience.

22 and 23. All the new boys are examined by the school doctor, Dr Burn Murdoch. He examines specially their lungs, heart, throat, nose, and general physical development. (Sometimes the eyes, ears, and

teeth have also a special examination made of them.) Points of weakness are noted and instructions given to the gymnastic instructor to give special exercises to boys who need them for poor chest-development or tendency to curvature of the spine. The boy himself is also told what he can do by exercises with light dumb-bells or the like to further his own development. Sometimes the parents are informed of a weakness in nose or throat or the like which can be made good by a slight operation.

When a boy comes to school we receive a schedule from his parents, on which is stated (among other things):—

(a) Whether he has any ailment (*e.g.* rupture, heart disease) rendering 'school games' or any of them inadvisable.

(b) Whether there is any peculiarity in health (*e.g.* seeing or hearing defective) or constitution (*e.g.* family tendency to consumption, rheumatism), which should be mentioned.

(c) What other illnesses (*e.g.* pleurisy, congestion of the lungs) he has had.

These statements help to guide the school doctor in his examination. He then decides whether a boy is fit to take part in all the normal physical training of the school, and if he is not fit, how far it must be dropped or modified in his case.

In the case of a healthy boy the examination is not repeated; but in the case of weak boys it is repeated at such intervals as the doctor thinks necessary, or whenever any sign of exhaustion or overstrain seems to have been detected by any of the staff.

24, 25, 26. A school register is kept, showing the height, weight, girth of chest, biceps, forearm, and head. I am inclined to think that we might advantageously add measurement of lung-capacity by means of a spirometer, as chest girth *may*, owing to mere muscular development, be a fallacious index to this. But the error, where it exists, would generally be a trifling one, and not likely to cause any serious miscalculation.

These measurements are generally taken in October, December, March, and July by the gymnastic instructor.

27. The following suggestions occur to me, some as practicable and advisable, others as ideally desirable, methods of improving the physical training of the youth of Scotland:—

(1) In all schools, primary and secondary, a course of physical training of a sufficient number of hours a week should be compulsory for all the pupils (exceptions and modifications to be permitted only on the recommendation and advice of a doctor). The details of the course would vary in primary and secondary schools, and would be adapted to the nature and age of the pupils; but physical drill and military drill would form a part of each.

(2) School games, football and the like, should be encouraged in the primary schools especially by the provision of school playing fields, and by securing the co-operation of masters (or others) who know something of athletics in arranging the games, and seeing that *small* boys do not play in teams too big for them. The co-operation of masters, who are known by the boys to have other interests besides football, seems to me exceedingly valuable: their example will tend to prevent the exaggerated interest in games which I have already mentioned as a danger.

(3) In secondary schools cadet corps should be encouraged. I think that service in a cadet corps might be made compulsory on all pupils of such schools. In any case, a grant should be given to efficient cadet corps sufficiently large to cover their necessary expense. The increased civic and possibly military efficiency of the pupil would justify such a grant. I think, too, that the grant should be for educational, not specifically military purposes.

(4) A cadet corps should also be formed for the old pupils of a school (or a group of schools, or for a local division), boys between 14 and 18 years of age. I fear that compulsory service in these is not yet

a practicable measure, but it is ideally desirable. If, however, military drill is begun at the primary school, and if corporate spirit is fostered there by association in games, there will be some probability of boys joining these corps in large numbers. If, further, the cadet corps was made the centre of organisation of physical exercise for the youth of the group or district, with arrangements for gymnastics, swimming, athletics, and the like closely bound up with it, this would prove a considerable attraction; it would still further increase corporate spirit, and it would secure that physical exercise should be treated in some systematic way under the superintendence and advice of those in command of the corps. I think that the extension of the cadet corps system among boys who have left school is of the utmost importance. It would tend to produce three good results—better physique, more corporate spirit, and less loafing.

(5) Opportunities for physical training should be provided at all (or nearly all) continuation classes. The co-operation of doctors and old athletes as managers and lecturers and demonstrators should be welcomed, and employers of labour should be invited to encourage their young employees to join such classes.

9979. *By Sir Henry Craik.*—The boys in Merchiston Castle School are of the better class of society socially?—Yes.

9980. Have you had any experience of State-aided schools?—Not since I was a boy. I was at a Board School myself.

9981. A Scottish Board School?—Yes. I have had no experience since then.

9982. Looking to your recollections of that school, and comparing it with what you know of Merchiston Castle School, would you say what are the comparative merits of each system in regard to physical training?—I don't think that the system of the old Board School had any merits at all in the matter of physical training. Physical training was non-existent.

9983. Where was your school?—At Ayr.

9984. Not the Academy?—No, one of the ordinary State-aided schools. That was before I went to the Ayr Academy.

9985. There was no physical training?—No; of course we played games: all boys do that.

9986. But you played them, left to yourselves?—Yes, and somewhat discouraged by the masters, who looked upon football as being a rough game.

9987. They looked upon games as taking up time from your lessons?—I don't think so. I think it was mainly because it was counted to be rough.

9988. You don't know anything of such schools in towns?—No.

9989. If football were introduced largely into ordinary State-aided schools, especially in towns, there might be a danger of it becoming rough?—Yes. I think it exists among day schools here: they have a kind of league matches with one another.

9990. These matches must employ the picked boys rather than the great mass of the boys?—Yes, unless the thing is looked after by masters and fully organised.

9991. In your case at Merchiston Castle School, you carefully superintend the games?—Yes.

9992. But you consider the games are more prominent on the whole than any sort of regular drill?—Yes, the games are more prominent from the boys' point of view, but I think that regular drill from the school point of view is almost more important.

9993. Even in the case of Merchiston Castle?—Yes. Military By drill I mean gymnastics and military drill.

9994. You have more than most schools developed the military drill?—Yes, I fancy that ours is the only cadet corps in Edinburgh.

9995. Your cadet corps is affiliated to the Queen's? Cadet co—Yes.

9996. You think that the system of drill has great advantages, but you don't care for the affiliation?—That is so.

9997. In what way?—In order to get the grant, we have to swear-in as volunteers the boys who are of

volunteering age, and some of the conditions for getting the grant are not quite suitable for boys. I am thinking mainly of the present condition of one week's camping.

9998. Don't you do that?—We do. This year is the first time it has been compulsory, and we sent those of volunteering age into camp. It would be much better, however, if we had cadet corps camps rather than a volunteer camp.

9999. You mean separate from the ordinary camps?—Yes. I think there are disadvantages in sending a company of boys to a big Volunteer or Military camp; at least there are probably disadvantages, although I have not found them in experience.

10,000. As regards the general training which drill gives you, you are entirely in favour of it in your own school?—Yes, I think it is extremely important.

10,001. From your recollection of the Board School, you would be inclined to place it at higher importance in a Board School?—Yes.

10,002. You do that because games cannot be introduced so well into Board Schools?—That is so. I think the introduction and development of cadet corps are very important.

10,003. You don't find that the development of the cadet corps so far as it involves a certain amount of training upon military lines and regular discipline and systematic exercise is in any way productive of undue uniformity or deadening in its influence?—No.

10,004. You think that the moral as well as the physical effect is thoroughly good?—Yes.

10,005. By whom is that drill carried out? Are the officers of the corps the masters in the school?—Yes, the captain and lieutenant are masters in the school, but the ordinary drill is done by the sergeant-major of the Queen's.

10,006. What training have the officers gone through?—The present officers, I am afraid, have gone through no training, but they will have training before next term. They are new officers, and they will have had a month's training at Glencorse or some other barracks.

10,007. The sergeant is a regular trained man?—Yes.

10,008. On the Aldershot system?—I suppose so.

10,009. You have not found that the physical training and the thorough development of it has in any way injured the intellectual activity of your pupils?—I don't think so. I have seen one or two cases where a boy was so keen in getting through some examination that he was in danger of over-working himself by trying also to be an efficient member of the fifteen while cramming hard for an examination.

10,010. To prevent that requires, even in your school, great care?—Yes.

10,011. It would require greater care in the case of great masses of boys?—Yes, that is if you had any very strong competitive element.

10,012. You have a regular medical attendant and medical inspection at your school?—Yes.

10,013. Are the boys inspected when they enter and during their attendance at school?—They are always inspected when they enter. If they are in absolute normal health they are not inspected afterwards.

10,014. The medical officer does not look out for any physical defects?—He does when the boy first comes to school, but not every year.

10,015. He does not take regular notes of the physical progress of the boy?—Not except in cases that seem out of the ordinary, a case of a special weakness and that sort of thing.

10,016. Where any weakness was developed in the course of a boy's attendance, you would have opportunities of noticing them and would leave it to the doctor?—Yes, I think that is always noticed.

10,017. You find that to be a very important element in your school life?—Yes, because in a school like ours, where physical activities are compulsory, we have to safeguard them by having the doctor to certify that such compulsion would be good for the boys.

10,018. Looking back to your own recollections of

the Board School, where there was no such medical examination, do you remember any cases of boys weakly perhaps in physique who would have been the better of such inspection?—I cannot think of any individual cases.

10,019. Of course, as a boy you would not notice them?—That is so.

10,020. You do agree that it would be very important to have such medical inspections?—Yes, very.

10,021. Almost more important in Board Schools than in schools where the pupils have full attention at home?—Yes. Although the medical inspection at Merchiston only affects four or five boys each year, there is so much good done by that that I think there is bound to be even more if the new boys were examined at any school when they entered—there are so many little defects that have not been noticed.

10,022. At all events you think that such medical inspection would be even more necessary and essential in the schools attended by those large numbers than it is in your own school?—Yes, if it can be carried out.

10,023. By Professor Ogston.—Have you any formula by which your medical man examines the boy at his entrance into the school? Has the experience of your school led you to adopt any systematic set of questions or points which you direct your medical man to examine into?—Not exactly. We have answers to certain questions that we put.

10,024. Answers by the parent?—Yes.

10,025. These are almost useless, or are they only vague indications?—They are only vague indications, but I have them two or three weeks before the boy comes, and we generally communicate with the boy's family doctor, and he sends a report to Dr Burn-Murdoch.

10,026. My point was rather whether you found that from your experience it was an advantage to have a set formula to give your doctor, or whether you found it best to trust to the doctor himself as to the points to be examined?—We simply trust to the doctor himself. It was suggested by Dr Dukes of Rugby that there should be a regular form.

10,027. I have here your register kept by the drill sergeant. The last point was regarding the effect of physical training on mental capacity. Have you means of testing that in your school? For instance, what do your best boys go in for after leaving school?—There are four or five who go to Oxford or Cambridge or Edinburgh, mainly Edinburgh, to become doctors or lawyers or to try for civil service, and we have two or three who go into the army.

10,028. In university and civil service competitions, do you find that the boys who have taken advantage of the physical training are advantageously situated as regards their mental work?—I don't think, so far as I can see, that physical training as it exists at Merchiston has handicapped the boys who would get scholarships. I think that any boy who has failed to get a scholarship has failed, not because of physical training at all. I have never seen any reason to believe that it interfered, except in the one or two cases I have mentioned, where the excitement of competition in physical training handicapped the boy for mental work.

10,029. By Mr Alston.—In 16A of your *précis* you have touched upon a point that has come before the Commission more than once. You seem to have no fear of the term 'military drill'?—I know it is a term rather inclined to put people off, but I think it ought to be kept if we can keep it.

10,030. You would not agree to the term being dropped in favour of simply 'drill,' so that you could smuggle in your drill without emphasis?—I think the fact of its being military is important.

10,031. You lay great stress upon the fact that it is military drill?—Yes. I have frequently seen gymnastic drill taken by a non-military man, and no matter how smart he is, the difference between the standard of smartness demanded by him and that demanded by a drill sergeant, as in military drill, is very great.

10,032. That is to say, not smartness alone, but there is something in the whole bearing of the company

kept: no ob-
jections by
parents.

Mr G. Smith. under military drill, alert response to word of command, which is quite different in other methods of physical training.—

15 Sept. '02.

10,033. You would be sorry to lose such results?—Yes.

10,034. Have you heard any views from the general public, and the parents of boys, in connection with this military drill?—I am afraid I have not.

10,035. You have heard no objections taken?—No.

10,036. The cadet corps is the backbone of your military instruction at Merchiston?—Yes.

10,037. That is drilled once a week?—Yes.

10,038. It has a kilt, which you don't think very suitable for practical purposes?—That is so.

10,039. Is there anything in the boys being attracted by the uniform?—That is very difficult to tell. They are proud of the uniform—those who wear kilts are probably more proud of their uniform than the smaller boys with their knickers. You cannot tell if they are attracted or not, because they all have to go.

Cadet corps: good uniform might attract Board School children.

10,040. Have you any opinion with regard to the formation of a cadet corps in connection with a Board School how far this attraction of uniform, and a good uniform such as kilts, would go to attract the boys?—I think it is certain to attract them very much.

10,041. Of course this military drill may be given in the school apart from the cadet corps, but you don't advocate that. You wish the drill to be given as in a military company?—Yes.

Music: drill should be practised without.

10,042. You touched on the question of musical accompaniment, and you drew a distinction between when it might be used and when it should not be used in physical drill. Has it been pointed out to you that the use of musical accompaniment is a serious defect in physical drill, inasmuch as they forget to instruct the boys in the foundation of the drill, and the performance is just an accented movement in time with the music?—That is one of the weaknesses, but I don't know how much weight should be attached to it. We don't have musical drill except for the last week of the term, and that is in order to get up a show piece for the visitors.

10,043. Is there a danger then?—The drill has all been practised without the music, otherwise we would never use the music for the ordinary drill. I think it lacks crispness.

10,044. *By the Hon. Thomas Cochrane.*—It might be difficult to supply military drill in all Board Schools?—Yes, I wonder if a good deal might not be made of the enthusiasm of ordinary volunteers.

10,045. If military drill could not be supplied, you think that ordinary gymnastic drill could be so systematised as to bring about as good results?—Almost as good *physically*.

System of drill with certain latitude.

10,046. You are in favour of some kind of system of drill on definite principles?—Some kind of system of physical training.

10,047. Is there any particular system that you advocate?—I am afraid there is not. I don't know enough about it.

10,048. In paragraph 11 of your *précis* you give a very excellent description of a skeleton system to guide the teacher in theory and not hamper him in practice. You think there should be a general Code laid down giving the individual teacher a certain amount of latitude?—Yes.

Games: assistance of teachers desirable.

10,049. You think that games should be left to take care of themselves. Don't you think that some little assistance from teachers should be given in games?—Yes, I mean that they ought not to be systematised over the whole of Scotland.

10,050. You would not like certain games to be laid down as the only ones to be played?—No.

10,051. You would like to see these games adopted

in each school and assisted by the teachers?—Yes, it helps the boys in every way, both intellectually and physically.

Mr G. S.
15 Sept.

10,052. You think there should be a minimum of gymnastics and military drill in all schools?—Yes.

10,053. From that physical training you anticipate it would quicken the power of mental study?—Yes.

Training mental a moral advantage extended boys four to eight

10,054. It would be a safeguard in later life against the danger of loafing?—Yes.

10,055. You are a very strong believer in some form of physical training?—Yes.

10,056. You would like to see it extended to boys beyond the school age of fourteen?—Yes, the great difficulty is to get the boys between fourteen and eighteen.

10,057. Have you any suggestions to make?—I have made one suggestion in 27 (4), where I say that a cadet corps might be formed for the old pupils of a school, or a group of schools or a district. I am not certain that a district would not be better. If such a corps were made a kind of centre of athletic organisation, with a gymnasium attached to it and with football teams and so on, it could become a very strong piece of machinery for getting boys of that age to work at physical training.

Suggest cadet corp old pupils not compulsory, attractive

10,058. You would endeavour to attract the boys into your organisation?—Yes, provided one could not compel them.

10,059. You would compel them if you could?—Yes, if we are ready for that.

10,060. You think the difficulties of attracting boys so great that you would be willing to exercise pressure to induce them to take advantage of physical training?—Yes.

10,061. *By the Chairman.*—Can you give a contrast between the boys at Rugby school as to their needs for physical education, and the means which they take to receive such education, and the boys of your own school. You were at Rugby before Merchiston?—Yes.

Rugby & Merchiston contrast better at latter

10,062. It would be interesting if you could give us any contrast?—I don't think I could give any very definite contrast; it would be nothing but an impression. My general impression is that the boys at Merchiston are, as a rule, very much better developed than those at Rugby were.

10,063. Much better developed when they come to school?—No, on the contrary, we get more boys who are sent as weaklings.

10,064. Then your system at Merchiston is a better system of physical training than that which obtains at Rugby?—Yes.

10,065. Do you play Rugby football at Merchiston?—Yes.

10,066. Ordinary Rugby football?—Yes. I do not want to say anything that I am not quite certain about, but if I am not mistaken, at Rugby the games were compulsory, but there the systematic physical education ended. Now I have said, and I hold very strongly, that games by themselves are not sufficient; they are liable to leave points of weakness, and a boy will play at that game he likes best and leave undeveloped that portion of his body which requires most development. That is why I think that gymnastics and drill are very important.

Games be supplemented gymnastics and drill

10,067. And they don't obtain at Rugby?—They are not compulsory, I think, but I would not make that statement absolutely. I think the boys only went to gymnastics if they liked. There was a cadet corps at Rugby, but it was not compulsory. They were probably much better at rifle shooting than we are, but they got more chances of practising. I think it would improve our shooting if we could send boys up to Bisley.

The witness withdrew.

Mr RODERICK ROSS, examined.

Mr R. Ross.

15 Sept. '02.

10,068. *By the Chairman.*—You are Chief Constable of the City of Edinburgh?—Yes.

10,069. How long have you been so?—For two and a half years.

10,070. Before that, where were you?—At Bradford.

10,071. Were you acting in the same capacity there?—Yes.

10,072. How long were you there?—Three years.

10,073. And before that, where were you?—Ramsgate, in Kent.

10,074. Were you acting in the same capacity there also?—Yes.

10,075. You are a Scotchman?—Yes.

10,076. You have been a good deal in England?—The greater part of my service has been in England.

10,077. And it so happens that it has always been in a town?—Yes. I was two years in the constabulary.

10,078. You have been good enough to send in a very interesting *précis*, although it is rather a dismal one, I am afraid?—I will endeavour to brighten it for you as we go along.

I have the honour to submit the following information and statistics concerning crime amongst the juvenile population of this City; also a few comments as to the moral and physical condition of such youth. I regret to have to state that crime amongst juveniles in Edinburgh is steadily increasing, despite the most strenuous efforts of the police to prevent it. The tables will show that all classes of crime are committed by children of both sexes, their ages varying from twelve to eighteen years. It is the same in all large cities and towns—this alarming state of crime amongst the juvenile population. From my experience as Chief Constable of Bradford, and latterly of Edinburgh, I am convinced that juvenile depravity is regulated to a very great extent by the home influence on the child. Take, for instance, a boy with middle-class parents. He has the advantage of a good sound education at one of the many excellent schools in the city, and in the ordinary course of events he passes through the various grades of the school with more or less success, according to his abilities. Unfortunately, however, during the middle-class schoolboy's career there is an intermediate stage during the period from about twelve to fourteen years when he is keenly susceptible to any influence which may be brought to bear upon him either for good or evil. It is at this stage that the home influence for good should be brought to bear most strongly upon the lad. Parents should show a greater spirit of companionship to their children than they do, and should not leave their boys and girls to find their own amusement, no matter where or of what nature. In sadly too many cases which have come under my notice I have found that a boy has gone astray, not so much because of any uncontrollable desire within him to do evil, but simply because he has been left too much alone and has formed all sorts of fantastic ideas, which in company with other lads similarly constituted have culminated in the commission of some serious offence against the law. Too much attention, therefore, cannot be given to the question of home influence, especially in the middle-class families. Many of the cases where I have ordered the children to attend my office, for the purpose of being cautioned as to their conduct, have proved to me beyond a doubt that the parents are often to blame for the conduct of their children. One or other of the parents in the foregoing cases generally accompanies the child to the office, and whilst waiting there they discuss the case with each other, and more often than not take up a brief for their lad and invent all manner of excuses and defences, and at times deliberately lie in support of their case. What can be expected of a child with such parents? Amongst the lowest class of the city, of course, one finds the children most depraved, their parents or guardians in very many cases being criminals of the lowest possible standard. Street trading, in my opinion, is undoubtedly a curse to this class of children.

It has been proved again and again during my experience of police work that the street gamin is second to none in vice and wickedness of every conceivable kind; in fact, he reduces the commission of a crime to a fine art. If, however, he is taken from his evil surroundings and placed in an Industrial School or Reformatory, he, in the majority of cases, turns out a success in life. The late war bears out this in a very marked degree, as several instances are recorded of lads who from their training received at such institutions have proved themselves in every way worthy of respect and esteem, and in some cases winning the coveted V.C. Provided a lad is not allowed to return to his evil habits and haunts on leaving the Industrial School or Reformatory, the training, physical and mental, he has received is of the greatest possible benefit to him, and under proper management and guidance he invariably makes his way in life. Newspaper selling, hawking matches and flowers, etc., are the commonest forms of street trading by children. Street trading by children in a city like Edinburgh, with all its evil associations, is in a very great degree conducive to boys becoming thieves, loafers, and gamblers, etc. As for the girls—a very little time elapses before they fall into most degrading and vicious habits, and eventually become prostitutes. As may be easily imagined, the physique of the children of the lower orders is of a very inferior standard owing to their irregular and often unwholesome food and the bad sanitary conditions under which they live. The great difficulty to contend with in establishing some system of supervision by means of continuation classes and a course of drill, etc., would be that of making the children physically fit to stand even a medium course of military training. The life of the ordinary street arab is not one which makes him a good pupil upon which to inflict even the mildest disciplinary measures. Admirable as physical training is in all its forms, I cannot quite see how the youth of the slums of the city are to be reached, and with any lasting beneficial results, unless the legislation with regard to the education of children is completely revised both in the mental and physical branch. In comparison with the middle-class boy, the street gamin or boy of the lower class has by far and away the greater physical strain upon him during the day. The former is at school, and then at night for perhaps three or four hours is engaged with his studies, and exercise or physical training in any form have necessarily to be confined to perhaps one afternoon or evening a week. Whereas the latter, outside what little school-work he does, is at play or at large over the whole of the city all the remainder of the day and well on into the night. I quite admit the exercise of this latter class is not of any specific nature, such as drill, etc., but this is where I am afraid the difficulty will arise—that of reconciling them to a prescribed form of recreation. My experience of the youth of the age of both classes is, that they will go through any amount of exercise in the execution of their own plans and ideas, but ask them to do something which has a useful object, where only half as much exertion is needed, and you will find a very great reluctance on their part to comply.

Training in Industrial Schools of great value.

Street trading: common forms: conducive to crime.

Physique of such children very low: difficult to enforce disciplinary training.

10,079. In your opinion this state of matters is distinctly getting worse?—There is no doubt about it.

10,080. Do you believe that if there were any compulsory measures taken with children of those ages, that is, immediately after school life, it would be feasible, and, in the second place, be ever allowed or popular?—I see no reason why it should not become popular. Surely the parents should see that what is to the interest of the children is a good thing for them.

Compulsion: feasible and probably popular.

10,081. You don't see any reason why it should not become popular?—No.

10,082. You see no reason why it should not be feasible?—No.

10,083. Who is to do it? Who is to be in charge of this compulsory movement?—The School Boards and educational institutions, I think. At present, to my mind, there is not sufficient inducement to the children

Public parks: more inducements for children to play there.

Mr E. Ross.
15 Sept. '02.

to go in for physical exercise and play. For instance, in the parks in Edinburgh there are scarcely any appliances to induce the lads to go there—at least there are no appliances to any extent. To my mind the lads won't go there unless you induce them to go. I have a list of the parks here.

10,084. I don't mean so much the parks as covered-in gymnasia. Does such a thing exist in Edinburgh?—There are gymnasia attached to some of the schools—George Watson's school and the Heriot-Watt school—but I am not aware of any attached to the Board Schools, although there may be. I am referring specially to the public parks of the city. There is not sufficient inducement for the boys to go there.

10,085. You say that there is in this city a very large class that have very little to do; that they do what is not right, and that they would be very much the better of being got at by some means or other in order to give them something to do that would be useful and would keep them out of mischief. That is your opinion?—Yes. You usually find boys, especially of the lower order, who take a delight in doing what they are told not to do, and unless you give them some inducement they won't attend. You cannot get them to attend unless you make it compulsory.

10,086. You rather put that down to the fault of the parents?—Yes.

10,087. Particularly in the case of the middle class?—Yes; the boys of working people are allowed to roam about the streets at will when they come out of school, and they fall foul of the police in consequence.

10,088. You go on to say that in that manner they get out of hand, and their parents have no control over them?—That is so.

10,089. Of course you are aware that any alteration in this matter would be one entailing considerable expense?—I have no doubt of that. All improvements must necessarily incur expense. A halfpenny rate would make a great deal of difference, and I don't think that the working class of the community would grudge that to improve the children.

10,090. Can you bring yourself to say that you think that they would welcome something that would improve their children?—That is my opinion.

10,091. Is your opinion grounded on hearsay or only what you think is natural?—The parents, when they come before me, complain that the children have no place to go to play in. When they go to the parks there are no appliances for them to play with. In some of the parks no games are allowed. The consequence is, that a boy prefers to kick a tin can about the street.

10,092. Was that the same in Bradford?—It is the same pretty well all over. The boys here are no worse than elsewhere, according to my experience.

10,093. The state of affairs is no worse than it always has been?—It is certainly increasing. Probably the police are a little more vigilant, and that may be one reason for it. I don't think that boys are any worse than they were some years ago. In my opinion it arises through the police being increased in vigilance.

10,094. You think there is more vigilance?—Yes.

10,095. They are taken up more than they used to be?—Yes.

10,096. That rather goes against what I thought I had got from you, that they were deteriorating and getting worse?—Of course, from a statistical point of view, they are; but I am satisfied that the police are more vigilant than they used to be. There have been a number of complaints about street rowdyism, and the police have, therefore, been more vigilant. Of course boys will be boys. Unless the people in the locality complain against the children, the police won't interfere.

10,097. When you say boys will be boys, you say that they have been boys but not hooligans?—I would not say that they are hooligans.

10,098. You have no experience of hooliganism?—I have and some, but I look upon a hooligan as a footpad and a garrotter, etc.

10,099. You repudiate the notion of hooliganism in

Edinburgh?—Yes, most strongly. The boys are no worse here than in other cities, and I would be sorry to say that hooliganism exists in many cities in England and Scotland.

10,100. By Professor Ogston.—Although you are not very hopeful of reaching those boys of whom you have been telling us, you are a believer in physical education?—Yes.

10,101. You have used it extensively among your police?—Yes.

10,102. Would you tell me what you have done; have you introduced gymnasia?—We have not gone so far as that, but we have more drill than we used to have.

10,103. Have you tried to get a gymnasium for your police?—No, the expense is too great.

10,104. You consider that physical training is beneficial to your own constables, and would be beneficial to those boys if they could be got to take it up?—Yes. It would cure the majority of the evils complained of.

10,105. By Mr McCrae.—I think you admitted that this increase is not a real increase, but is rather the result of more careful statistics. I don't know that the question I ask you is applicable, namely, to give the reason why, seeing we have more education and better control, and control up to a greater age in our schools, there should be any increase?—I put it down to the extraordinary number of complaints we get, and the consequent increased vigilance on the part of the police. A boy playing football on the streets would not be interfered with by the police unless the residents in the immediate neighbourhood complained about it being a nuisance to them.

10,106. The word 'middle-class' here is used by you as indicating the better working-class?—Yes, 'working-class' would have been a more proper phrase to use.

10,107. You say that the great difficulty to contend with in establishing some system of supervision by means of continuation classes and a course of drill, etc., would be that of making the children physically fit to stand even a medium course of military training. I suppose if more physical training were given in our ordinary Board Schools, that objection would really disappear, because they would be gradually trained to bear a greater physical strain after school age?—Yes.

10,108. You think that the physical training which you recommend after they leave school should be entirely of a voluntary character?—I don't think that the country would stand compulsion in these matters.

10,109. Take, for instance, the continuation evening schools; you don't think that they might be made compulsory after, say, fourteen years of age, or that the physical training part of their curriculum should be made compulsory?—I certainly think that is the only way you will make it a success, but whether it would be popular or not is another thing.

10,110. Do you find in Edinburgh any large number of boys who have no occupation after they have left school?—Yes, there are a great number, especially of the lower order.

10,111. But leaving aside the slum children, and take the children of artisans?—There are a few, but not many.

10,112. It is an exception and does not obtain to any large extent?—That is so.

10,113. When a boy leaves school he has no difficulty in getting work?—He finds something to do.

10,114. Referring to Table No. 7, which you have given us, can you give any explanation why there should be an increase in 1898, a large increase in 1899, and a decrease in 1900, and again an increase in 1901?—There is no special reason for that.

10,115. There was one point that struck me in connection with Table 4, where you give the number of male and female apprehensions. In the total under breach of peace, the proportion as between male and female is not at all so bad as when you come to the next column, the total under drunkenness. Drunkenness among females seems to be abnormally large as compared with all the other tabulated crimes. Has it struck you at all that drunkenness among younger

Mr E.
15 Sept

Physical education police: more drill beneficial boys in streets.

Training more given Board Schools, after four capable of more.

Continuation classes: compulsion necessary probably popular.

Boys out after leaving school.

Deterioration in conduct: boys much the same, but police more vigilant.

Hooligans: none in Edinburgh.

10,115. females is increasing in Edinburgh?—There is no doubt it is increasing a little.

10,116. How do you account for that?—I suppose it is through the greater facilities for getting drunk. It is very difficult to account for it.

10,117. Would that not be obviated if there was some system of physical training for females after leaving school?—There can be no question that that would be equally good for girls as for boys.

10,118. It would have a moral advantage as well?—Naturally. It tends to make them behave themselves. Drill and all that kind of thing has that effect.

10,119. *By Mr Fergusson.*—I think one of your principal troubles in Edinburgh is that there is nowhere for boys over fourteen to go for any exercise?—There are a number of places, but the lads don't seem to take advantage of them.

10,120. Are there no gymnasia available?—No. There are the public parks, but there are no appliances for the boys there.

10,121. They are not made popular?—No.

10,122. Do you think that if there was a course of physical training made attractive, and more particularly gymnastics in connection with classes of that sort, they would be largely taken advantage of by boys over fourteen?—Yes, if there was some inducement in the way of competitions and prizes and so on.

10,123. Still there would be a considerable class who are loafers who would not take advantage of these facilities?—That is so.

10,124. Although you are not troubled with hooligans, still you have the ordinary street loafer?—Yes.

10,125. What can you do to deal with him?—It would require to be a very special inducement that you would need. Nothing short of compulsion would induce him.

10,126. Have you read an article in the *Nineteenth Century* by Sir Robert Anderson on the subject of hooligans?—No; I have not noticed it.

10,127. *By Mr Alston.*—You say that crime amongst juveniles in Edinburgh would steadily increase despite the most strenuous efforts of the police to prevent it. Have you not rather modified that statement during your examination?—I don't think that I have.

10,128. In reading that, we understood that it was exceedingly bad and was still increasing?—It is increasing, although we are giving it every attention. What I mean to convey is, that minor offences are increasing statistically, owing to increased vigilance on the part of the police. Crime, however, has increased in reality.

10,129. The same condition of things obtains in most towns in England?—Yes, according to statistics.

10,130. You indicated that perhaps the cause of it might be the more careful supervision of the police in taking up cases?—I don't think that the boys are any worse than they were before.

10,131. You think it is due to the action of the police?—Indirectly. It is the result of complaints being made.

10,132. The complaints would follow upon increased crime?—Yes.

10,133. Then crime is practically increasing?—Yes, if you put it that way.

10,134. Is there no institution or association in Edinburgh using any means to improve this state of things as regards the condition of the lower class juvenile population either in their food, clothing, housing, or manners?—Yes, there are several institutions who give clothing in the winter time. The Town Council are endeavouring to improve their houses, and they have done so to a certain extent.

10,135. These are causes of that state of things?—There is no doubt about that.

10,136. You would encourage games in the open parks. Would you have these free to all and without supervision?—I would have them free, but I would have supervision.

10,137. Would you have a caretaker on the spot?—Yes. There are five or six caretakers in the city already on these playgrounds, and there are some appliances for the amusement of the children.

10,138. You want these appliances in the public parks as well?—Yes.

10,139. And of sufficient number to provide for these children?—Yes. Take King's Park. In the Dumbiedykes district, which is near that park, there are more complaints to the police than in any other part of the town, and that even although it is so close to the park.

10,140. Which they might go into, but there is no attraction for them?—That is so.

10,141. How would that affect the lowest class who are engaged in street trading, which you say is the curse of that class?—I am afraid it would be very difficult to enforce that. It would require a compulsion to get at them.

10,142. It is really the artisan class that would be attracted there?—Yes.

10,143. Only compulsion would bring the street trading class?—That is so.

10,144. You cannot compel children to play?—No.

10,145. You said you were in Ramsgate. Can you compare Ramsgate with Edinburgh?—It is a smaller town, and in such smaller towns you don't have the slums that you have in the larger towns.

10,146. Then the condition of the children should be better in Bradford than in Edinburgh?—Yes.

10,147. Was crime increasing there also?—I cannot say that it was. When I said crime was increasing, I meant that it was increasing in the large cities and towns.

10,148. Particularly manufacturing cities, where there are a great number of working people living under bad conditions?—Yes.

10,149. *By Mr Shaw Stewart.*—You say in your paper that admirable as physical training is in all its forms, you cannot quite see how the youth of the slums of the city are to be reached, and that with any lasting beneficial results, unless the legislation with regard to the education of children is completely revised both in the mental and physical branches. Do you refer to any particular change, or do you mean continuation classes?—What I suggest is that the continuation classes should be made compulsory; otherwise you won't reach the children of the slums.

10,150. You are strongly in favour of continuation classes for mental and physical training with compulsory attendance?—Yes, but I question if it would be popular.

10,151. With the parents or with the children?—Both. I don't mind the children so much as the parents. I would not take the children so much into consideration as regards popularity.

10,152. To make the classes a success, we should hope that they would be made popular to the children or they would not be so useful to the children themselves?—That is so.

10,153. You say there is a difficulty of reconciling the children with the prescribed form of recreation. Don't you think they might be interested in emulation?—I have no doubt they would when they got there and became interested.

10,154. As regards the popularity of compulsory attendance at continuation classes with the parents, if, after a short time, say two or three years, they found that children became better behaved and more useful citizens and easier to look after at home on account of these classes, then the popularity would naturally follow?—Yes.

10,155. You would look forward to that result as being likely to happen?—Yes, I would indeed.

10,156. So far as the popularity idea goes, I may take it from you that you think that would follow?—Yes, I think so.

10,157. *By Sir Henry Craik.*—You speak of the very critical age between twelve and fourteen years. Is that the period you are looking to chiefly in your evidence?—To my mind that is the crucial period of a child's life.

10,158. I observe in Table No. 3 that a very large proportion of those juveniles cautioned for minor offences belong to the age between twelve and fourteen?—Yes.

Mr R. Ross.

15 Sept. '02.

Street trading class: compulsion necessary.

Continuation classes: compulsory attendance necessary; good results expected; therefore popular.

Children twelve to fourteen: crucial period.

Mr R. Ross.
15 Sept. '02.

10,159. Even in Table 5 they about equal those between fourteen and eighteen?—There are not so many.

10,160. Of course from twelve to fourteen you have every possible remedy that you wish, as school attendance is compulsory to fourteen years of age?—What I say is that that is the age at which parents should pay special attention to the children.

10,161. But all the legislature can do in the way of requiring school attendance and providing schools and even physical instruction in these schools up to fourteen is given?—Yes. I refer specially to the parents in that part of my evidence.

Continuation
classes:
voluntary
for artisans'
children:
compulsory
for slum
children.

10,162. I don't quite make out how in your view the children of this artisan class, called the middle class, differ in their conditions and in the remedies that you propose from the lower class children?—I don't want to propose a different remedy for the artisan class and for the lower class children. What I suggested was that the lower class would not voluntarily come to any kind of physical training or continuation classes.

10,163. Then you think that the artisan children would?—Yes, because the parents would impress upon them the advantage to be derived from attending these classes, whereas the riff-raff of the community, the parents of the slum child, would not take the trouble. As a rule they are drunk.

10,164. But the parent, from your account, does not take very much interest in his child; he rather goes the length of associating himself with the child in telling a lie?—I would not go so far as to say that he does not take an interest in his child, but he is anxious that his child should not be stigmatised by the police, and he does not scruple to tell a lie for that purpose.

10,165. You think, in the case of the lower class boy, the exercise he takes by himself in the street would unfit him for physical training?—I think he is physically unfit for training, having regard to his surroundings, food, etc. One can see what the little chap is like in going round the city. If you put him under physical training, then it would require to be under medical supervision.

10,166. By Mr McCrae.—Would that apply even when he was attending school?—Yes. There are many of these little chaps who go to school who are no good for physical training, as it would simply upset them.

10,167. By Sir Henry Craik.—If you required them to go in for some systematic and well-considered system of physical training, would that not take them off the street?—If you compel them to go, of course it would; but what I suggest is that they will not attend unless you have some extraordinary inducements to offer them.

10,168. By the Hon. Thomas Cochrane.—In looking through your tables, I see that you have taken the period from 1st July of one year to 31st July of another year?—Yes, two years and a month.

10,169. That seems to me to be an unusual period. Is that the time during which you have been Chief Constable?—Practically.

10,170. I see the great majority of the juveniles who come under your notice are boys?—The greater number are.

10,171. A much greater number?—Yes.

10,172. Is that owing to the greater depravity of the males?—Yes, and probably the police are not so hard upon the girls.

10,173. I see you are opposed to street trading for children?—Yes, unless it is properly regulated.

10,174. What would you have them do in their leisure time; there is a great deal of leisure for these boys of between twelve and fourteen years?—I would allow no boy of drunken parents to go out and sell papers or matches for his parents to drink. There are very few of those boys who go out to sell on the streets whose parents are thoroughly respectable, although there are some. I have called for reports, and the result is that the great majority of cases where the boys are engaged in street trading are cases of children of drunken parents.

10,175. Have you no local Act similar to what exists

in Liverpool, Manchester and Bradford?—It does exist now, but it has not yet been put into force.

10,176. Will that give you power to license children for street trading?—Yes, the same as in Liverpool, Manchester and Bradford.

10,177. These boys and girls between twelve and fourteen in the hours of leisure can only play in the streets or remain at home, probably in a bad atmosphere?—They can find other means of employment.

10,178. What can they do?—They can find employment in the same way as the artisan children do if they look for it; but they don't look for it, because they get money much more easily this way, and more of it.

10,179. You would like them to be employed in some regulated way?—Yes.

10,180. You have no objection to their working?—No.

10,181. There was a Departmental Committee on the employment of children?—I have not seen their report.

10,182. In discussing this question as to occupation, they say that in their opinion the support of public opinion would be far more readily given if it could be shown that there are within the reach of the great mass of children means of both work and play which are more worthy and beneficial to them. That is to say, if there was any other occupation for these children, the parents would not object to a restriction of the street trading?—No respectable parents would, but there are very few of these in this town.

10,183. If it was shown to the parents that it was very beneficial to their children to take them off the streets and give them a system of physical training, do you think they would have any objection to their children being compelled to attend continuation classes?—I don't think they take sufficient interest in their children.

10,184. But the better class would?—Unquestionably they would.

10,185. They would rather have their children go to a continuation class than roam about the streets?—Yes.

10,186. Those who object to it would be the class on whose objection you would not place much weight?—That is so.

10,187. On the whole, your opinion is that some compulsory attendance might be enforced without any unpopularity?—It is certainly necessary in the case of the street arabs. I would not say that it would be necessary in the case of the children of artisans, because they have an interest in their children; and if you can make them believe in physical training and the benefit that it would be to their children, then they would like their children to go there.

10,188. The artisan would send his child voluntarily, and the other person might be compelled to send his child?—That would be class legislation, and would be a bad thing.

10,189. You know that the children who go to reformatories and industrial schools in the majority of cases turn out successfully?—There is no doubt about that. I have known many, many cases. That is what I say, that if the boy of the slums had an opportunity to do well he would do well. At present no one knows what becomes of him. If that boy is taken from his evil surroundings and properly trained, and sent to some place away from his old associates, then he will do well. In very few cases have I known them to go wrong. Once he goes back to his old associates that he has had in school, then he invariably goes wrong again.

10,190. Is it the discipline in the reformatory schools and the physical training that does him good?—Undoubtedly, and those with whom he associates. A boy imitates his associates whether they be good or bad.

10,191. If you can apply the same system to the street arabs, then you would expect beneficial results?—Yes, I believe many of these lads would do well if they only had an opportunity.

10,192. And something more profitable to do than

Mr R.
15 Sep

Street
trading:
remedies
proposed.

Compuls
desirable
street an

Industria
schools
commend

10,192. loaf about the streets?—Yes. At present they have no ambition to do anything.

10,193. Have you any opportunity of bringing before the authorities of Edinburgh your remarks regarding the want of appliances for games in the parks?—I have not made any report on the subject. The matter has not been discussed.

10,194. But as Chief Constable you are strongly in favour of greater opportunities for games in the parks?—Yes.

10,195. You are in favour of having gymnastic apparatus in some quiet corners of the parks?—Yes; and I think that competitions might be held and prizes given, which would induce the lads to go there.

10,196. *By Mr Alston.*—You said the parents, and no one else, cared about these children?—Very few people do care about them.

10,197. Is it the case that the parents object to their children being taken away because it prevents their earning money?—Sometimes they do, but at other times they are glad to see them brought up in a reformatory. If the child is at such an age that he can earn money, then they don't want him to be sent to a reformatory. You will always find that if the child is of such a tender age that it cannot earn money, then they are glad to get rid of it.

10,198. The parent to that extent does not care about the child, but the time arrives when he wants it?—Yes.

10,199. Would you approve of emigration for the children from reformatories?—Yes, if you get work for them.

10,200. *By Mr Fergusson.*—If that is so, is it not rather doubtful whether any system of continuation classes or training will do any good when we always

keep them in the same place where their evil surroundings are?—At present they are continually in bad surroundings day and night, but if you take them to these continuation classes, they would for a few hours be in good surroundings, and it is reasonable to assume that that would have a good effect on them. At present they come across nothing else but cursing, swearing, and debauchery from morning till night.

10,201. *By Mr Shaw Stewart.*—In answer to Mr Cochrane you said that if the slum boy was compelled to attend, and the respectable artisan's boy was not, you would be introducing class legislation?—That is so.

10,202. Setting aside the slum boy altogether for the moment, do you think it would be a good thing for the son of the artisan to be obliged to attend continuation schools two or three times a week if it was looked upon as part of the school curriculum going on from fourteen to eighteen? You don't consider that it would be a hardship if he had to attend for an hour two or three times a week?—At present the boy has to study for two or three hours at home. You could not expect him to attend two or three hours a week at evening classes and do the same amount of study.

10,203. But I mean after he has departed from school, and is between fourteen and eighteen. Would it be a hardship to the artisan's boy to be obliged to attend continuation evening classes after school age?—I don't see why it should be a hardship if the boy left off work at six o'clock.

10,204. If compulsory attendance were the same for the artisan and the slum boys, there would be no question of class legislation?—No.

10,205. It would be a benefit both to the artisan boy and the street boy?—There is no doubt about that.

Mr K. Ross.
15 Sept. '02.

Continuation classes: compulsory attendance for artisan and slum boys beneficial.

The witness withdrew.

Adjourned.

TWENTY-SECOND DAY.

Tuesday, 16th September 1902.

At the Museum of Science and Art, Edinburgh.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr GEORGE M^cCRAE, M.P.

Professor OGSTON.

Mr B. B. PEARSON, *Secretary.*

Mr R. MILNE MURRAY, M.B., C.M., examined.

10,206. *By Professor Ogston.*—Will you give the Commission your qualifications?—I am M.A. of St Andrews University, M.B., C.M. of Edinburgh, Fellow of the Royal College of Physicians, Edinburgh, Physician to the Maternity Hospital, Edinburgh, and Assistant Gynæcologist to the Royal Infirmary, Edinburgh. I am also Lecturer on Midwifery and Diseases of Women in the Edinburgh School of Medicine.

10,207. For how many years have you had experience as a specialist?—Fifteen years.

10,208. Will you kindly read over the statement that you have prepared?—

I venture to ask the attention of the Commissioners to the following considerations:—

1. Any rational system of physical training must take into account the physiological differences between the two sexes.

2. These physiological differences may be said to be at a minimum up to the age of 11 or 12 years.

3. Up to this time the difference may be said to consist, mainly, in a greater degree of muscular and nervous energy on the part of boys as compared with girls. The power of endurance is thus always greater in the former than in the latter.

Mr Milne Murray, M.B., C.M.
16 Sept. '02.

Training: physiological differences between boys and girls up to ages eleven or twelve.

Mr Milne
Murray,
M.B., C.M.
16 Sept. '02.

Girls: must
be separately
trained.

Girls after
twelve.

Girls after
puberty:
great care
necessary.

4. Accordingly, most forms of systematised physical training suitable for boys may be adapted to girls under 11 or 12 years of age, if due allowance be made for the fact that the physical capacity of girls is less than that of boys.

5. It also follows that the physical training of the sexes must be carried out separately, in order that any undue emulation and consequent danger of overstrain on the part of girls may be avoided.

6. From the age of 12, when the functional activity of the sexual organs in girls becomes established, care will have to be exercised in the regulation and supervision of all organised physical training.

7. From the time of the establishment of the menstrual process, a girl, even in perfect health, passes each month through a time during which the bodily energy, as shown by the powers of endurance and resistance, is lowered.

8. During this period, varying from three to six days in each month, she is peculiarly liable to the risks of overstrain, the occurrence of which may not only injuriously affect her sexual organs, functionally and organically, but may seriously impair her general health.

9. There is no doubt that during this period a girl is, in most cases, unfit for an amount of physical and mental effort which at other times she is quite competent to accomplish, and the systematic attempt to do this will in many cases lead to disaster.

10. Moreover, it is the case that in many young girls the menstrual process is for two or three years after its onset very irregular as to occurrence and duration.

11. Accordingly, in organising any scheme of physical training for girls, it will be necessary, if grave danger to their health is to be avoided, to take into account this recurring disability, and in view of this to regulate their exercises so as to avoid any danger of undue strain, or, as will be necessary in some cases, to forbid them entirely at this time.

Aids to proper
supervision.

12. In order that proper supervision and regulation may be possible, I venture to think that two things are of primary importance, viz.—

1. An intelligent comprehension of the physiological processes referred to, and of their direct effects on the bodily functions, on the part of those who may be responsible for the physical training of girls.

2. An intelligent and frank co-operation between the parents and guardians of girls on the one hand, and the responsible heads of schools on the other.

13. By these means it should be possible to regulate and adjust the system of physical training in such a way as to make allowance for the temporary disability or idiosyncrasy of individual girls.

14. It is obvious that while certain of the less exacting exercises may be practised even during menstruation by healthy girls, there are others which are entirely unsuitable for all at this time. Among these I mention swimming, bicycle riding, and gymnastic exercises which put any special strain on the muscular and vascular apparatus of the pelvis, such as trapeze and horizontal bar exercises.

Faults:
indifference
and ignorance.

I have ventured to lay this statement before the Commissioners, because, as the result of considerable experience in the medical treatment of school-girls, I have been struck, on the one hand, with the indifference of many parents as well as the responsible heads of schools to the grave physiological bearings of the sexual functions in girls, and on the other, with the disastrous influence of this indifference on the permanent health of many school-girls.

Training:
separate for
the sexes.

10,209. You think that physical training of the sexes must be carried out separately?—Yes, on account of this essential difference between the two, that if a boy and girl are trained in the same exercises, the boy, in the great majority of cases, will succeed in doing the thing more quickly and better than the girl, and the girl is apt to overstrain herself, whereas, if the girls worked alone, this emulation is done away with.

Teachers:
desirable to
have women.

10,210. Would you give separate teachers to the

two classes?—I think so. I don't think that in these physical exercises a man, unless very specially trained, is able to properly conduct these classes: I think that it is almost essential to have an intelligent woman.

10,211. You can realise that there will be some difficulty in regard to that in many of the poorer and more remote schools?—Yes.

10,212. Still, in the face of that, you think that separate training, as far as possible, is extremely desirable?—Yes, most assuredly. It is largely a question of convenience in respect to the cases you refer to and in remote schools; but, in the great majority of schools, I take it that there is a female teacher as well as a male teacher who would be able to carry it out.

10,213. If it was found to be unavoidable to mix them in the smaller schools, you think that by judicious advice and co-operation with those who know better it might be practicable?—Yes, I think it might.

10,214. You suggest that care would have to be exercised in the regulation and supervision of all organised physical training. Can you give us any suggestions as to the lines on which that care ought to be exercised?—I was referring to the time after the girls have entered the age of puberty. From that time onwards I think it would be quite necessary for the teacher to know whether a particular girl under observation was fit on account of her condition to undergo any exercise at all. The girls will require, so far as I see, to be classified as to whether they are competent to undergo the exercises for the time being or not. That is the first point. In the second place, I think that those girls who are perfectly well so far as they can be at this particular time might quite safely be exercised in certain parts of physical training, avoiding such exercises as I have mentioned—the horizontal bar, jumping, or anything of that sort.

10,215. Can you give us any suggestions with regard to clothing? Is it necessary that there should be special clothing for girls who are being trained in physical exercises?—I think that they should be dressed in loose clothing, divested of their stays, for example, but I don't think it is necessary to have special clothing unless for those swinging exercises.

10,216. You think, therefore, that a certain amount of physical training suitable for girls, even at the age of puberty, could be carried out in the poorer schools without special clothing?—Yes.

10,217. The question of expense, there, is very material?—Yes.

10,218. In paragraph 11 you say that in organising any scheme of physical training for girls, if danger to their health is to be avoided, account must be taken of the recurring disability to which they are liable. What would you suggest? Can you suggest any practical way of dealing with that, any means in which those supervising them might adopt?—I should be inclined, as a general principle in connection with this point, to put all the girls aside while in this condition and to keep them aside for the time being. I am convinced that the danger of overstraining at this time is very great, and where girls have been submitted to a training of this sort, I have seen very serious accidents occurring over and over again. I have suggested how the thing should be done. There is a great difficulty in getting the parents of the girls to inform the teacher or in the teacher discovering what really should be done when this particular function is occurring. When a girl turns unwell, then you could keep her from the exercise, but she does not tell when she is unwell. A free communication between the girl and the teacher seems to me to be essential.

10,219. Do you think it would be of material assistance in managing that difficulty if proper medical inspection and supervision and the co-operation of a School Board medical man of sufficient ability were secured in connection with Board Schools?—I should think that that would help very materially.

10,220. Would you consider it essential?—I would not go the length of saying that it was absolutely essential, because if you could disseminate a certain amount of rational information among the parents,

either by printed communication or communication by some intelligent person, as regards the importance of the teacher knowing of this condition, then they would look on it as an essential part of their duty.

10,221. I suppose, however, the weight of any representation to them would largely rest on its being based on medical testimony?—Yes, you would require to employ medical men to make the communication to the parents, and, as it were, to start their education.

10,222. That would require to be done by a special medical officer. It could not be done by the medical officer of health?—I think he is quite competent to do so.

10,223. In your evidence you have specified the exercises that are dangerous. Can you offer any suggestions regarding the exercises that are specially suitable for girls, not necessarily at any particular period, but generally speaking: can you suggest what exercises should be introduced into schools for girls?—I don't profess to be an expert in gymnastic training, but I should say that exercises which tend to develop the respiratory organs are exceedingly desirable, such as dumb-bell exercises, not only in the erect position, but in various positions, and some forms of Swedish gymnastics. I think that these are more important for girls than violent exercises where the body is swung about, because they avoid the very risks that I deprecate.

10,224. Do you think that dumb-bells and Swedish exercise might be practised even when a girl was unwell?—Dumb-bells might be if the girl was perfectly well otherwise.

10,225. Could you give us the name of any diseases or disabilities that have occurred in your experience from physical exercise in girls?—Of course my experience has been more associated with the mischief produced by persistent over-study during this time, but at the same time I can speak to the effect of bicycling, which is a very favourite amusement among girls. I am perfectly certain that ill-health has been brought about through that, over and over again.

10,226. Would you name that?—Menorrhagia, resulting in profound anæmia and debility.

10,227. Any displacements?—Normal displacements aggravated, uterine displacements, and chronic ovaritis.

10,228. All these you have seen and treated?—Yes, as a result of overstraining on the bicycle. I am speaking of the bicycle alone just now.

10,229. Appendicitis?—No, I have never seen that.

10,230. By Mr Ferguson.—I don't understand you to say that mild exercise such as arm exercise ought to be entirely prohibited at this time?—No, not in girls who are otherwise quite well.

10,231. I am quite aware of the importance of what you have been telling us, but I thought it was so universally known and acted on that you would hardly find a school that professed to be in any way well conducted where these points were not carefully attended to?—That is quite the exception in my experience. Of recent years there are some secondary schools that have made that an essential part of their study, but a very large proportion of the schools in Edinburgh ignore that entirely.

10,232. By Sir Henry Craik.—Have you in your view secondary schools chiefly, or have you any experience of elementary schools?—I am speaking specially of girls over twelve or thereabouts, the great majority of whom are in secondary schools. In most elementary schools they leave before that time.

10,233. Now they go on longer?—Yes.

10,234. At such times would girls be disposed not to play games or take other exercise?—That depends on the peculiarity of the girls. Some girls will exercise at that time almost more vigorously than at other times.

10,235. Bicycling, of course, is not a school exercise; it is one that they do for themselves, and which they are apt to overdo. Physical training in a regularly systematised form is important as restraining them from doing so?—Yes.

10,236. You don't advocate the absence of any

systematic training, but you think it should be carefully regulated?—Yes. I should like to say that many girls at this time, feeling the sensation of unwellness, generally resort to physical exercise as a means of throwing it off.

10,237. Instead of dispensing with exercise to meet this danger, you think there ought to be a regulated and carefully conducted system?—Yes, that would be judicious.

10,238. You also said that you found many instances of intellectual overstraining?—I have had far more experience of that.

10,239. In order to relieve that strain it would be important to have a system of systematised physical training?—Yes, presuming that it is judiciously carried out. It would require to be done with very great skill.

10,240. You are in favour of this being given?—Yes, in the perfectly healthy.

10,241. By Sir Thomas Glen Coats.—On account of delicacy in those matters and the difficulty of a doctor obtaining the necessary information, would you advocate lady doctors to be appointed in such places in large towns?—If you could get the information better by lady doctors, then by all means appoint them, but my experience is that women are as frank to men as to women in matters of that sort. I have had considerable experience of women who have passed through the hands of lady doctors. I don't think you will get better information through women than through men.

10,242. Will they not speak more readily to women than to men?—That may be so. What you want here is communication between the parents and the teacher.

10,243. And also the pupil?—If the parent took the responsibility of seeing that her daughter was in this condition, it would not be necessary to have the pupil. The pupil herself would be very apt to be reticent in the matter. Of course have lady doctors by all means if necessary.

10,244. By the Hon. Thomas Cochrane.—Would this question arise very much in Board Schools at the ordinary school age?—In a great many cases the process begins much earlier than in a normal case. A great many girls begin at eleven, and they would require more attention than the others, because they are precocious and apt to go wrong. When you have girls from ten upwards you require to consider the question carefully.

10,245. The ordinary system of physical training would not do them much harm?—I would not go the length of saying that. I think that these young girls, especially girls beginning early, are peculiarly liable to be hurt—they are extremely fragile.

10,246. It would be rather difficult to ascertain their condition without the parents telling the teacher about them?—That is the whole point. I think you must get co-operation between the teacher and the parents.

10,247. It would be difficult to have a medical officer going round each parent?—I don't think that the medical officer need do that. I think his duty should rather be to instruct the parents as to what they should do.

10,248. And then they should confide to the female teacher at the school that their child would be probably unfit for the exercise. That would be the practical way?—Yes.

10,249. By the Chairman.—That is all very well, but you cannot deny the fact that for several years past physical training has been given to boy and girl alike in schools. I would like to know what you could say against that?—I cannot speak against that.

10,250. Can you tell us what effect that has had during these last few years?—I cannot answer that at all.

10,251. You don't know, and if you are not in a position to say whether it has had a bad effect, then you may almost take it that it has not been very bad. You see this is not a new matter. There has been a considerable amount of physical exercise given to girls as well as boys for several years past?—Yes.

10,252. Can you say that considerable damage has been done?—I have no reason to think that at all. I

Doctors: male and female.

Suggestion: co-operation between parent and teacher.

Physical exercises for boys and girls; no bad effects observed; but insufficient in quality to effect much good or harm.

Mr Milne
Murray,
M.B., C.M.
16 Sept. '02.

don't think that the time has sufficiently elapsed to enable us to judge of the result of physical drill in schools. The amount of physical drill is limited to a small number of exercises, no more than you would give in a systematised scheme of physical training such as they have in Germany or Austria.

10,253. What makes you think that? Have you seen it done in schools?—Yes, I have seen it in elementary schools.

10,254. Did what you see strike you as being far from sufficient?—It seemed to me excellent training so far as it went, but not sufficient to develop to any large extent the physical side of the constitution of a boy or girl.

10,255. Have you ever seen physical drill in any institution other than a Board School?—Yes, I have seen it in one or two private schools in London.

10,256. Carried out to a large extent?—Yes, much more elaborately.

10,257. Without any precautions?—I am speaking of girls' schools, where the precautions were highly developed indeed.

Girls' illness :
suggested
communica-
tion between
parent and
teacher each
month.

10,258. Are you able to tell us at all whether a girl when she is in this state of health is very prone to confess it, as it were?—Girls vary very much; some girls are quite frank, while other girls are exceedingly reticent.

10,259. A little girl of eleven or twelve may not know what it is?—Unfortunately they don't know at first, but they soon discover, because they may be very ill indeed.

10,260. It does not follow that the teacher is aware without being told?—No, she may not be able to tell in many cases.

10,261. That seems to me to be the practical difficulty of the whole thing, unless you have a medical examination, which is hardly feasible?—I should say that the parent is in a position to communicate that fact. If a mother knows or believes that this exercise at that time is a source of risk to her child, she may communicate it to the teacher by a note saying that the child is not fit for the exercise.

10,262. Should she write that each month?—Certainly. You might have a set of forms for that matter which the parents could have. A mere statement is quite sufficient. I think it should be done once a month; it would be no burden on a mother even although she had half-a-dozen children.

10,263. Do you imagine that that precaution is absolutely neglected at the present time, that the girls are not set apart on certain days and told not to do anything?—I think that that is quite an exception.

10,264. They all work alike?—Yes.

10,265. And that is wrong?—Yes.

10,266. A great many girls would, of course, be put aside?—Yes, that is the difficulty.

Physical
exercise most
important
before and
after fourteen
if carried out
with physio-
logical know-
ledge.

10,267. You join, of course, in saying that physical exercise is of utmost importance?—Yes, and it is

The witness withdrew.

Mr GEORGE MACKAY, examined.

10,277. *By the Chairman.*—You are teacher at Skerries School, Lerwick, Shetland?—Yes.

I am a certificated teacher, and my age is fifty-five years. I have been engaged in teaching continuously for thirty-five years. I have had charge of the Skerries School for the past eight years. Previous to coming to Skerries I taught in the Highlands of Scotland and in Orkney.

The Skerries School is a church school, and in addition to my duties as teacher, I act as lay missionary for the district. The isolated situation of the people renders this arrangement necessary, and it is an arrangement that has hitherto worked satisfactorily. But in all other respects the school is a fair sample of a country school in Shetland.

The *quoad sacra* parish of Whalsay, of which Skerries forms a part, contains about 1100 of a popula-

highly desirable in the schools which get the least of it just now.

10,268. It is desirable over the age of fourteen as well as under it?—Yes, always assuming that it is carried out with reasonable physiological knowledge.

10,269. Have you any information to give as to the deterioration or otherwise of young women at the present day. Are they more anæmic than they used to be?—No. In the upper classes they have improved very much, because those are the girls who later on make up for what they have wanted very much at school by golf and tennis and so on, whereas the girls of the working class are in a very different position. I think that this suggestion of developing physical training is most important, because when they enter shops their exercise is limited to a run on the bicycle when they can afford to buy one. We are running a considerable risk of deterioration of our race, and complicating the process of parturition in the working classes, by the fact that these girls get married in a totally unfit condition, whereas, on the other hand, education is being pressed and the skull and head are increasing in size. They are getting bigger heads and bigger brains, and there is greater difficulty in producing children.

10,270. That is your deliberate opinion?—Yes. There is a diminution in the total birth rate in this country. There are various things to account for it, one of them being that a great many working women become permanently damaged by the first, second or third labour, and are incapable of bearing more children.

10,271. That would be obviated by more care in the physical training of the young?—I hope so.

10,272. You only think so?—Yes, but it is the most rational view to take of the disabilities.

10,273. You would attach importance to proper nourishment when young?—Yes, you cannot exercise a child without nourishing it properly.

10,274. *By Mr Fergusson.*—The very dangerous positions that you speak of only arise in their worst form in the case of applied gymnastics with apparatus. If you confine yourself to the Swedish exercises for girls, you can keep them on during this time and there is not so much risk of any harm being done?—There is much less risk.

10,275. So that with the Swedish exercises the serious risk will be overcome?—It will be very much minimised.

10,276. *By Professor Ogston.*—Can you assure us that what you have stated as to the enlarged size of the head and the relative lessened size of the pelvis, and the consequent difficulties in parturition, are founded on data which make that absolutely certain?—No, it is rather a general impression that has been gathered. I don't think that there are any statistics to make it sufficiently accurate.

various forms are not uncommon, but they do not appear to shorten life. I have acted as registrar for the Skerries district for the past eight years, and the average age of the deaths I registered during that period was slightly over seventy years.

I would not go so far as to say that scientific physical training is given in all Shetland schools, but training of some sort is given in most of them. In Skerries about two hours a week are devoted to physical exercises, mainly dumb-bells and military drill. But Shetland boys row about a great deal in their small boats, and in this way get much physical exercise. At eighteen or nineteen years of age most of our young men join the Royal Naval Reserve, and undergo a month's training annually at Lerwick. In this district of Skerries we have about forty men, manning six large fishing boats, a large proportion of Naval Reserve men, and from a physical standpoint a finer body of men could not be met with anywhere.

I think physical training should be made compulsory, and some of the money at present lavishly spent on bursaries might be employed by County Councils in developing the physical resources of the young. An expert in physical training might superintend all the schools in a county, acting as officer, with the teachers as drill instructors under him. The playgrounds at all country schools should be enlarged. On no playground that I know of can games be played. Of course children romp about and play, however limited the space at their disposal; but cricket, hockey or shinty, football, and the old Highland game of 'War' cannot possibly be played on the limited area at present used as a playground. In this respect the present compares very unfavourably with the past, the old parish and church schools having fine spaces at their disposal as playgrounds.

I think a periodical examination of a school by a doctor would do good and strengthen the hands of the teacher. Apart from his professional skill, a doctor's visit would be an advantage, for the more educated people come in contact with a school the better. A country teacher works under disadvantages sometimes, as very few take much interest in his work.

The problem of the physical training and development of the rising generation is a complex one, and is interwoven with other problems that await solution. The depopulation of the rural districts has a bearing on it. The physically fit, the energetic, and the enterprising of both sexes leave us to push their way in the large cities or the colonies, and we are left with the second-rates mentally and physically. This is not quite so true of Shetland as it is of Orkney and the districts of Scotland which have come under my own observation. My experience as a teacher is that the level of intelligence and physical force is lower now in the North of Scotland than it was thirty years ago. I shall not, however, enlarge on this aspect of the question, as I shall have an opportunity of stating my views before the Commission.

Specimen of Scheme of Physical Training for County.

—1. Superintendent of Physical Education (appointed by the County Council), whose duties would consist of visiting the schools, giving specimen lessons, assisting teachers with his advice, and generally supervising the work. His salary to be provided partly by grant from the Government and partly by contributions from School Boards.

2. In parishes where a volunteer company exists, the drill instructor would on Saturdays instruct all the boys of the parish in military drill.

3. The medical officer of the parish would visit the school periodically and report on the health of the children. In cases where a poor physique was the result of unsanitary and unhealthy conditions of home life, the sanitary inspector's services to be called in and the case reported to the authorities.

4. Children to be classified according to age, and when a certain standard of proficiency in physical training is attained, be entitled to wear a sash, badge or cap, with further right to compete in the county athletic sports and games which would be established

for children. The superintendent to grant the necessary certificate entitling the holder to wear the ribbon or badge, or whatever else might be considered appropriate. Perhaps a coloured 'jersey' would be as good as anything.

5. At the outside, the total cost of setting on foot and carrying on this scheme should not be more than £300 per annum, and that is not a large sum for a county. It has the advantage of making use of the machinery already in existence, and there cannot be any solid objection to it on the score of its expense.

6. Physical training and military drill to be compulsory, except in cases where the medical officer exempts the boy on the ground of ill-health.

7. After the age of eighteen, physical training and military drill may be given or continued, but they shall not be made compulsory. At eighteen a boy can enter the Naval Reserve, or he may become a volunteer.

8. School Boards must provide suitable spaces for games, not necessarily at the school, but not too far away, if spaces available. Size of playground to be not less than 1½ acres.

10,278. What system of physical training is practised by you?—I have just dumb-bells. As I cannot teach them military drill myself, I get one of the naval reserve men to do it. System: based on Cruden.

10,279. Who taught you how to teach dumb-bell exercises?—I learned it out of a text-book.

10,280. What was the text-book?—If I recollect aright, I think it was Cruden's. I am sorry to say I have forgotten.

10,281. You got it out of some book, at any rate?—Yes.

10,282. Was that some time ago?—I have been at it ever since physical exercises were required by the Education Department.

10,283. You did not use physical exercise before?—No, but we played a great deal of games in my youth, which was equivalent.

10,284. When the inspector comes and visits you he sees the physical exercise so far as you teach it?—Yes, and the military drill.

10,285. Where is the military drill performed?—In the playground.

10,286. Is there room for it?—Yes. We are not confined in this school at Skerries. It is a church and a school, and there is attached to it a piece of land. It is not a School Board school. The proprietor has been very liberal, and granted us about two acres of ground.

10,287. Have you much acquaintance with Board Schools?—Yes, I know them well.

10,288. Can you tell us whether they do the same sort of physical drill?—Yes, they do just the same.

10,289. Not more elaborate?—No. The teachers who are my age or slightly under it have just learned it out of a book in order to satisfy the requirements of the Department, but they would be glad to welcome any practical instruction, and that is why I recommend a drill sergeant. Older teachers: recommend expert.

10,290. What happens in the case of the younger teachers?—I suppose they are trained. They have a better chance of being trained than we of the older school.

10,291. Do they go away to get trained?—When there is a volunteer company at hand then they become Volunteers, and that gives them a certain amount of training, but I don't know that there are any facilities for receiving instruction. We have just to take it out of the book the best way that we can.

10,292. Do the children like it?—Yes, immensely. Training very popular among the children.

10,293. It is popular?—Yes, it is the most popular lesson of the day.

10,294. Do you teach it to boys and girls alike?—Yes.

10,295. How long do you keep your boys and girls at school; do you keep the boys any longer at school than the girls?—No, they remain much about the same.

10,296. At what age is it that they leave?—About fourteen.

Mr G. Mackay. 10,297. Have you any children in your school over that age?—No, I don't have any. The boys all leave to go to the fishing boats and to earn money.

16 Sept. '02. Physical exercise after fourteen : boys get sufficient in their employment. Remarkable development among Shetland boys : due to healthy occupation.

10,298. *By Sir Thomas Glen Coats.*—I see from your evidence that the children after they leave school get employment on board these fishing boats, and when they are old enough they join the Naval Reserve. After they leave school, would you consider it necessary to continue physical exercise, or do they get enough in their employment?—They get enough, judging from the result. My boys who leave at fourteen get on to boats as rope coilers. They are not very big boys, but in a few years they develop into huge, strong men, so that that shows that the physical exercise agrees with them.

10,299. Are the children at school age strong?—Yes, fairly, but they don't appear to be remarkably strong in school. It is a curious thing that they develop into very strong men.

10,300. In many parts of the West Highlands the children appear sickly at school age, and they afterwards develop into strong men?—That is so. I have a case of a boy in Skerries who I thought was so weakly that we could do nothing to help him, but he joined a big fishing boat as rope coiler. I thought that he would not have lasted a week, but instead of that he turned out an enormously strong fellow, and a perfect transformation took place. I notice that our boys shoot into men sooner than any other boys that I have seen. All Shetland boys do that. They don't appear to be very strong as school boys, but they go to the fishing boats and become men in a very short time.

Girls : develop fairly fast but age quickly.

10,301. Do the girls develop in the same way?—Not quite so fast. They develop fairly fast, but they age sooner than other Scotch people. The conditions of life are harder on the women than on the men. The men are all fishermen, and the work in the crofts therefore falls on the women. In that way they get older sooner than the men.

10,302. Do you consider that children benefit by physical training when at school?—I think they do. It is a beginning. It is not so apparent in the school, but there is no doubt that it produces good results afterwards. Of course it is not apparent day by day.

10,303. Do they get sufficient nourishment as children?—Quite sufficient.

Level of intelligence and physique in North of Scotland lower now than formerly : due to emigration of the best.

10,304. *By Sir Henry Craik.*—I observe that although you find boys in your own experience growing into very strong men, you say that the level of intelligence and physique is lower than it was thirty years ago?—Yes, I think it is worse in the north of Scotland.

10,305. You are not speaking of Shetland there?—I don't know Shetland so well as I know the Highlands.

10,306. To what do you attribute that?—I think it is due to the continued exodus out of the country, the strong and energetic and plucky people leaving us, with the effect that only the second-rate population remain. That may have something to do with it, but I cannot tell. My experience is that it takes twice as much labour now to work a boy into a state of intelligence that will satisfy an inspector of schools than it did at one time. That possibly may be due to my getting older, but I have heard other teachers say the same thing. I heard Mr Muir, the Inspector of Schools, say the same thing. I attribute it partly to the continued decrease in the population, and the taking away of the smart people from us.

10,307. Education would lead to emigration?—Yes.

Remedy : development of the Lovat Scouts.

10,308. You cannot suggest any remedies?—Yes, I have a remedy, and that is to develop the Lovat Scouts idea. That would be the salvation of the north of Scotland, because it would arrest the exodus of the population. I know the Highland crofter very well. He could be trained to be a military man. The Naval Reserve is of immense benefit; there they earn from £6 to £10. The Highland crofter does not earn that, and consequently he has to go away. If the crofter in the Highlands was a scout or a soldier, so that military

training could be had, then he would not leave his home.

10,309. How would the soldiering help him to live?—The Naval Reserve man gets £6 and so much per week. Now, if he earned £10, that would be of immense benefit to the family; it would be just an income, and he would be an independent man, along with what he made from the land. That is the secret of the depopulation—there is nothing to do, the croft is not sufficiently large, and they leave.

10,310. *By the Hon. Thomas Cochrane.*—The Militia is open to the crofter, and he would get his £4 a year in addition to his other bounties, and that would come to very much the same?—It might; but the Militia has never been very popular. The scouts have been immensely popular, but why that should be I cannot tell. It may be the pony and the new idea of the war. If an addition were wanted for the scouts, I am sure that thousands could be had.

10,311. *By Sir Henry Craik.*—You advocate the maintenance of a mounted Militia in the Highlands?—Yes; it would be the outcome of the physical training.

10,312. *By Mr Shaw Stewart.*—In one part of your evidence you say that Shetland boys, besides getting their physical training in school, row about a great deal in their small boats and get a lot of exercise; and then you say that physical exercise should be made compulsory. Is that because there are some boys in Shetland who do not get enough physical exercise, or because you would like to see the same training all over the country?—I would like to see every boy trained. It makes an immense difference to a boy. It helps a teacher in the day school if an outsider comes and trains the boys. I receive great benefit from the Naval Reserve man. The boy gets the idea that someone else is drilling him other than his enemy—the schoolmaster—and he gets fond of it. It is a new thing, and is out of the ordinary routine of school work.

10,313. So far as Shetland is concerned, almost enough physical training is attained at the present time?—Yes, they get a lot of physical training.

10,314. Every boy gets his share?—Yes; the only difference with an additional instructor or superintendent would be that the training would be organised, and they would see that it was put right.

10,315. Would the furnishing of the playgrounds with masts and yards and ropes be of advantage for preparing boys for life at sea?—They have the preparation lying in the bay just at their doors.

10,316. It is not necessary to have any special teaching?—No, because every boy in Shetland knows every rope and spar at a very early age. He is a practised sailor from his youth, and can do marvellous things in a boat.

10,317. *By Mr Fergusson.*—You say in the first paragraph that you think physical training should be made compulsory. Up to what age should it be made compulsory?—Up to about eighteen, I should think.

10,318. How would you propose to continue it after the school age?—In Shetland the Naval Reserve age, I think, is eighteen, although I am not quite certain about that, and I think that they should take boys on at fourteen or fifteen.

10,319. You think they should take your boys as they come from school?—Yes.

10,320. Between fourteen and eighteen what sort of physical training would you suggest?—Military drill. They get plenty physical exercise on their boats.

10,321. You say that no games can be played in the playgrounds. Is that your experience in the north of Scotland?—Yes. We never can play a game of shinty or football.

10,322. Is that the newer schools that you are talking of?—Yes.

10,323. Do you think that quarter of an acre is insufficient?—Yes, you could not play shinty or football or any good game on it.

10,324. I understand you rather favour a special teacher for physical training instead of the schoolmaster teaching?—Yes.

Mr Mackay. 16 Sept.

Mount Militia be out of train

Train should univer

Comp on to eig an

Naval advoc

Play made

Teach exper desir

10,325. Is it not your experience that the schoolmaster has more control over his boys than a stranger?—That is so, but schoolmasters won't attach as much importance to physical training as special instructors would.

10,326. You advocate that on account of the teacher and not on account of the pupils. You think that the expert will be able to teach better than the ordinary teacher?—Yes.

10,327. If the schoolmaster was sufficiently instructed himself, you would still prefer the expert?—I don't see any very great difference. It would do very well in town schools, but it is a lonely life in a country school, and we would be glad to see other men coming and telling us the new things.

10,328. You say that children should be classified according to age. In doing that you might have to take the children out of their classes and break up the whole work of the school?—That is not what I mean. I mean that if a boy of nine was expected to reach a special development, there should be a standard, and the expert would be able to say what the boy could do, and he could give some award.

10,329. You don't mean classifying them according to age before putting them through their exercises?—No, that would be impracticable.

10,330. Have you ever found the want of medical inspection of your children? Would you like a doctor now and again to inspect them?—Yes, I think I would.

10,331. Are your children well fed?—Very well fed indeed.

10,332. How much time out of your school day would you like to devote to physical exercise and drill?—About half an hour a day. On wet days they would not be able to go to the playground in a country place.

10,333. If that is so, would you favour covered playgrounds, roofed over, but without sides?—Yes, but in country places the expense would stand in the way.

10,334. An iron roof without stone walls is not very expensive?—I think it would be very nice.

10,335. You are a good deal troubled by not being able to work outside?—When boys get a ball and kick it over land belonging to some other people, they make a row, and that has been a perfect nuisance. It is very difficult to keep the boys from wandering about if the playground is too small, and then the people on whose land they wander make things hot for you.

10,336. *By Professor Ogston.*—I suppose your school is one of the most remote of the whole of the Scottish schools?—Yes, it is remote in the sense that it is difficult to get there or away from it. It is only twelve miles from the nearest telegraphic station, but then twelve miles in a stormy firth make it very remote.

10,337. Is it as great a contrast with an Edinburgh school as there exists in Scotland?—Yes, in some respects it is.

10,338. Do you know of any school in Scotland that is more of a contrast, and more remote than your own school?—No, I could not imagine one.

10,339. Where about are the Skerries situated?—About twenty-four miles north-east of Lerwick.

10,340. How far are they from the nearest land?—The nearest land is seven miles distant, and the nearest telegraphic station is twelve miles away.

10,341. Are the Skerries a group?—Yes, an archipelago.

10,342. How many of the islands are inhabited?—Three.

10,343. Do those three furnish the pupils to your school?—Yes.

10,344. Are they so situated that the pupils can regularly attend?—Yes. The Congested Districts Board gave us a bridge to connect the two inhabited islands, and that has been an immense benefit. They can all attend, and they do attend very regularly.

10,345. How many acres are there in the Skerries?—I should say that the largest island is about two miles long and about half a mile broad. The other islands will be less.

10,346. Three or four square miles will be the area of what supplies your school?—Yes.

10,347. What amount of that is arable?—A very small proportion.

10,348. One half or a quarter, a tenth or a hundredth?—About a hundredth. Skerries simply means rocks. There is just a covering of soil on the rock. The arable part is of very little consequence so far as the people's living is concerned.

10,349. What will be the size of the biggest field?—About two acres.

10,350. So your playground is as large a piece of flat ground as the islands contain?—Yes.

10,351. Is the climate very bad in the Skerries?—It Climate. is very wet.

10,352. Will every second day be wet?—I think more. It is a strange thing when it is not wet, in winter especially.

10,353. So the difficulties of children attending and getting physical exercise are considerably enhanced in the Skerries?—Yes, in winter, but we have beautiful weather in summer.

10,354. Every second or third day is wet?—Yes, in winter.

10,355. But all over the year?—I don't think so.

10,356. You have not found the weather so bad as to totally prohibit your giving physical training?—No. We have no winter in the sense of frost and snow. Although it rains, it is not raining during the whole twenty-four hours.

10,357. You in the Skerries do not include the *quoad sacra* parish of Whalsay?—No, we are only a portion of it.

10,358. The other portion has its own school?—There are two schools.

10,359. Your school is the Skerries School?—Yes.

10,360. How often does the Inspector visit you?—Once a year.

10,361. What is the size of the school building?—It is used also as the church. We built it two or three years ago. Size of school buildings: accommodation.

10,362. Is it a building of one room?—Yes.

10,363. What is the size of it?—About 50 feet by 20 feet.

10,364. Is it fitted with benches?—Yes, it is beautifully fitted.

10,365. Fixed benches?—Yes.

10,366. Raised on steps?—No. The desks and seats are movable.

10,367. So you can lift the whole of them out and clear the place?—Yes.

10,368. Is it well lit and ventilated?—Yes, it is beautifully done. The Inspector said it was the best house in the islands.

10,369. What is the population in the Skerries?—Population. From 130 to 150.

10,370. All class and all ages?—Yes, a great deal depends on the lighthouse colony.

10,371. Then your statistics of the Skerries during the eight years you have acted as Registrar, and in which the average age at death was seventy years, are not founded on big figures?—No. There was a young man died just a day or two after I wrote my evidence.

10,372. In this average of age at death, which is slightly over seventy years, do you include infants?—We had only one infant who died in the eight years. That infant was born weak and not in normal condition of health.

10,373. In so small a population you could scarcely say whether the infant mortality was great or not?—It is not great, because the people are very healthy.

10,374. Are you the only teacher in the Skerries?—Yes.

10,375. You have no female assistant?—No, but my wife helps in the sewing.

10,376. Is that part of her duty or does she do it voluntarily?—If she did not do it then someone else would have to do it.

10,377. She is not remunerated for it?—No. We act more as general assistants for everything in the Skerries. The teaching is only one thing.

Mr G.
Mackay.
16 Sept. '02.

- Mr G. Mackay.*
16 Sept. '02.
Number of scholars.
Varying population.
Inter-marriage : still a healthy population.
Doctor.
Hours of light and darkness.
Training self taught.
Expert inspector : beneficial.
- 10,378. You act as missionary and doctor too?—
Yes.
- 10,379. What number of school children have you?—I think the average last year was twenty-five.
- 10,380. How many were males?—twelve or thirteen.
- 10,381. Did they attend regularly?—Yes, remarkably so.
- 10,382. Is the population of the Skerries a varying population?—During fishing season we have an influx of fishermen, who come in very large numbers, and we have a large population for about six weeks or so. In the spring-time all the able-bodied people leave us and go to the west of Shetland, and then we are a very poor community.
- 10,383. There must be a great deal of inter-marriage in the Skerries?—Yes.
- 10,384. Do you recognise any diseases among the children arising from consanguinity?—No, it is a singular thing that we don't have any.
- 10,385. You have no defective sight or blind eyes?—No. There are one or two cases of children born imbecile.
- 10,386. How many such cases do you know?—Just one, and then there was the one which I spoke of that died.
- 10,387. Have you much club-foot or hare-lip, or other signs of consanguinity?—No, these are the only two cases I know of.
- 10,388. Is there much consumption?—I never knew of a case.
- 10,389. There is no other form of disease that you can specify?—No.
- 10,390. On the whole they are a healthy population?—Yes. I know when a case is bad, and I then send for the doctor.
- 10,391. You have no doctor on the island?—No.
- 10,392. Where does the doctor come from?—Twelve miles away.
- 10,393. He can only visit you in great emergencies?—We send a big boat for him and he comes to us.
- 10,394. Can you always send and can he always come in a boat?—Not in winter.
- 10,395. Might there be weeks when he could not come?—Yes, and months.
- 10,396. What are the hours of darkness in Shetland?—We have to light the lamp at half-past two in the afternoon.
- 10,397. When do you extinguish the lamp in the morning?—About nine.
- 10,398. So you have daylight from about nine to two?—Yes. It is not actually dark at 2.30, but we have to go to the windows.
- 10,399. In the morning can you manage without artificial light?—Yes.
- 10,400. What holidays do you have in your school? Six weeks.
- 10,401. At what time of the year?—Just to suit the harvest.
- 10,402. The holidays are movable?—Yes.
- 10,403. Do you regulate them?—The people regulate them. I just ask the parents what time would suit, and we fix them in that way.
- 10,404. You state that you learned physical training from a book. Suppose you wished to improve yourself in physical training, how could you do it; could you go to Edinburgh and study it in your holidays?—Yes.
- 10,405. You would have to pay for it yourself?—Yes.
- 10,406. Would you get your passage or instruction paid?—I don't suppose I would.
- 10,407. So you are really dependent upon your own intelligence and the books?—Yes.
- 10,408. It is probably less perfect than if it had been taught you by a school inspector?—Yes, necessarily so.
- 10,409. You feel the defect of it yourself?—Yes. I don't have the confidence that I would have if I saw it actually done.
- 10,410. Do you think that if an inspector were appointed and came regularly round, you could learn sufficient to satisfy you that you were teaching physical training in a thorough and proper way?—Yes, I think so. Even if the inspector came for a short time he would see that the teachers knew about the training. Very few teachers past forty years of age know much about it, but they try to learn as much as they can from a book.
- 10,411. The inspector could convey to you the newer advances as they are introduced?—Yes.
- 10,412. Take one day and tell us what your physical teaching consisted of?—I had dumb-bells.
- 10,413. Made of metal?—No, wood. I got them made.
- 10,414. Did you get them gratuitously?—Yes.
- 10,415. Had you no funds?—No.
- 10,416. Could you not obtain funds?—I could obtain funds, but the cost was so small, and the man who made them was obliging enough to help us.
- 10,417. You don't have one of your dumb-bells here?—No.
- 10,418. When teaching the boys the last time, how did you proceed?—I forget the rules; but they took the dumb-bells and went through the various motions, and then after that I gave them a part of the military drill, and they liked it.
- 10,419. What is that?—Just forming a line and fours, and two deep, and learning how to march.
- 10,420. You don't teach them the handling of a rifle or bayonet?—No.
- 10,421. What about the girls?—They just go through the same exercise as the boys.
- 10,422. They also form fours and have the same physical and military drill?—Yes, the girls like it as well as the boys.
- 10,423. You never give them swimming lessons?—No.
- 10,424. Can all the boys in the Skerries swim?—I don't think so.
- 10,425. Only a few?—Yes.
- 10,426. A very few?—Yes.
- 10,427. Would there be any difficulty in teaching them swimming?—I don't think so.
- 10,428. Have you such a beach and such facilities as would make it safely taught at all suitable seasons?—Yes.
- 10,429. Is military drill beyond the mere forming fours and such elementary things possible with you?—After fourteen I should like to see them getting a chance of being taken into the Reserve, which at present won't take them until they are eighteen. If they went in at fourteen they would get the same instruction as their big brothers.
- 10,430. Your instructor has been teaching them military drill?—One of the fishermen.
- 10,431. What does he teach? Does he get beyond forming fours and marching?—No.
- 10,432. There is no company drill or skirmishing?—No, they do not go so far.
- 10,433. Have you games?—Yes.
- 10,434. What games do you have?—Football and other games with the ball, and then I taught them some games myself.
- 10,435. What do you mean by the war game?—The school divides itself into two sections, and each sits on its own territory with a king, queen and court. One territory wants to annex the other territory, and the whole object of the game is to defeat the wickedness of your opponents.
- 10,436. Is it done with stones or fists?—No; but they use their fists if the enemy use fists.
- 10,437. Do you encourage those games?—Yes, I like the game myself. I got my leg broken on a school playground. They don't fight in a bad way and hurt themselves, but one boy tumbles another boy over, and he is none the worse of it.
- 10,438. Are musical games possible in the Skerries?—Not very.
- 10,439. Would a medical inspection be possible in any way?—Yes; our medical officer comes once a year to vaccinate, and then he comes when he is called for in any serious case of illness. A medical examination of the school would be a very simple matter.

10,440. Can you carry out the separation of the sexes in your instruction in physical training?—No.

10,441. You don't think it desirable?—No.

10,442. And you don't think it possible?—No.

10,443. Your school is the type of many a Scottish school where the separation of the sexes for physical instruction would be neither desirable nor possible in your opinion?—That is so.

10,444. What is your school rate in the Skerries?—We have no school rate at all; we are a church school.

10,445. The church would have to provide you with the necessities for physical training?—Yes; but I expect they would leave us to ourselves.

10,446. What is your position with regard to the Education Department?—They recognise us as a church school.

10,447. Do they give you any money?—A grant.

10,448. Where does the other money come from?—We get money from the Education Department and the church, and then there is the Home Mission.

10,449. What are the proportions of the funds which you receive from these three sources?—More than one-half comes from the church.

10,450. And from the Board of Education?—The other half.

10,451. *By Sir Henry Craik.*—Is that really so, that your private subscriptions are more than our grant?—Yes, there is a salary attached to the lay missionary, but that is not entered on the schedule. I have counted what is given to whoever is there as lay missionary for reading the sermon, but I have not entered that as a contribution to the Education part. The Education Committee pays a part. The local contribution would be one-half, I think. They give £25 or £26, I forget which.

10,452. *By Mr Fergusson.*—The grant comes to about £1 a scholar?—Yes.

10,453. *By Mr M'Crae.*—You do not have a continuation evening school in the Skerries?—Yes, we have had one every winter.

10,454. Do you find that successful?—Yes, very.

10,455. Are the classes well attended?—Yes, very fairly.

10,456. By both sexes?—Yes.

10,457. After your boys leave school they go to work; there is no period during which they loaf about?—No. There is loafing in winter when there is nothing to do. Ever since I went there we have had continuation classes; we had them before we thought that the Department recognised them.

10,458. Do you teach physical training at those evening schools?—No. Owing to my lameness, I would not be a very successful teacher. We teach navigation and reading.

10,459. You say that physical training should be made compulsory. Of course it is compulsory up to fourteen, so far as a school system is concerned?—Yes.

10,460. What would you recommend ought to be done in your district and in Shetland and Orkney after the age of fourteen? Would you teach physical training in the continuation schools?—It would be a very expensive thing to teach, because you would require a separate teacher for every school. It would be a very good thing if they could be allowed to enter the Naval Reserve at an earlier age.

10,461. You recommended that they should be taught drill after the school age?—Yes.

The witness withdrew.

Mr GEORGE CRUDEN, M.A., examined.

10,480. *By the Chairman.*—You are an advocate in Aberdeen, and Honorary Fellow of the Educational Institute of Scotland, and lecturer on Physical Training in the University in Aberdeen?—Yes.

10,481. You appear here as representative of the Aberdeen University?—Yes.

10,482. Give in detail all the existing opportunities of physical training under the following branches:—

10,462. Are any of your lads attached to a Volunteer company?—No. There is only one company in Shetland, and that is at Lerwick.

10,463. *By Mr Alston.*—Judging from your statement, the Shetlanders seem to be an exceedingly healthy and physically fine set of men?—Those that I know are so.

10,464. Your reason for being so strong on physical drill as to go the length of making it compulsory is not to improve their physical quality, but is some other reason?—Speaking generally, the Shetlanders develop through the physical training they get on their boats, but that might be guided.

10,465. You want it to produce some other quality than fine physical powers?—Yes obedience to orders, and then it gives a man a certain value, that he is able to act in concert with his fellow-men and is dependent on them, and often it promotes good comradeship.

10,466. Physical training in the schools and military drill produce these qualities?—Yes, and self-reliance.

10,467. The men in the Skerries are all fishermen?—Yes.

10,468. Their practice at rowing will be of a very laborious kind. It is not scientific in any way?—No.

10,469. Their knowledge of seamanship is confined to the small boats?—Yes, but a good many of them go to the merchant marine and become captains.

10,470. Do they go to the whale fishing?—Not so many.

10,471. That used to be a very large thing?—The herring fishing has been a great success for some years past, and that has kept the people at home.

10,472. Their exercise in seamanship is somewhat limited?—Yes.

10,473. Could training be got in seamanship?—Yes.

10,474. They are not taught seamanship by the men in the Naval Reserve?—No. One of my boys, who is a captain in a ship, learned his navigation in the continuation school.

10,475. In the Naval Reserve they don't drill them in handling guns?—I don't know.

10,476. You say that they very largely go into the Naval Reserve, and that you would advocate the formation of Scouts?—Yes, in the Highlands. Of course I say the Shetlander is a seaman.

10,477. He would have no opportunity of mounted training unless you sent him to the mainland?—No, he is a seaman by nature.

10,478. As to the Naval Reserve and the Scouts to which the Shetlander might be sent, what about the feeling of the parents in regard to military service of that kind?—I think that they would be agreeable. The great objection that they had to military training was that the boys went away and associated with a loose kind of people, and thus their boys were lost to them. If parents were certain that their boy was in respectable company, then there would be no objection to military life in itself, but the reverse is the case. The Volunteer companies are very strong in every parish, and so would be the military life, but they would object to their boys going away and never being heard of again. Their objection arises through the bad name that the army has got; they have no objection to the army as a profession.

10,479. That is to say, the word military is not known in an evil sense in Shetland?—That is so.

Mr G. Cruden,
M.A.

(a) Regular games, e.g. football, cricket, hockey, etc.

(1) Are they organised and supervised by masters?

(2) What is the size of the playing field and its distance from the university?

(b) Drill: how taught, and by whom? Gymnastics, free or applied? Is there a gymnasium attached to the university?

(c) Athletics, e.g., jumping, running, etc.

Mr G. Cruden, M.A. 16 Sept. '02.	(d) Handicrafts. (e) Voice training. (f) Cadet corps, rifle shooting. (g) Swimming. Is there a swimming bath attached to the school? (h) Fire brigade corps. (i) First-aid and ambulance.
Aberdeen University : games organisation. Playing field.	Ans. (a). (1) Regular games are organised and supervised by the 'Field Committee' of the University of Aberdeen, which is constituted in terms of certain rules and regulations. (2) The size of the playing field is about eight acres, contiguous to King's College, and about a quarter of an hour's walk from Marischal College. N.B.—These two Colleges constitute the University of Aberdeen.
Volunteer Company.	(b) Military drill is taught to about 120 of the students enrolled in the University Company attached to the 1st Volunteer Battalion Gordon Highlanders, of which I am at present the commanding officer. The instruction in military drill is imparted by the officers of the Company, aided by the Instructors of the Volunteer Battalion to which they are attached. Besides the foregoing, the King's students, male and female (numbering from 60 to 70) receive instruction in physical drill during the summer session from the members of the staff of the Aberdeen Physical Training College. A certain number of students, varying from 15 to 25, have formed themselves into a Gymnastic Club, and attend the gymnasium attached to the Aberdeen Physical Training College for training in 'free' and 'applied' gymnastics. During the winter and summer session (1901-1902) about 20 of the female students formed a Gymnastic Club, and also received instruction in the gymnasium of the Aberdeen Physical Training College. There is no gymnasium attached to the University at present, but, in the reconstruction of the University buildings, provision has been made for a large gymnasium at Marischal College, with ample cloak room and lavatory accommodation, and with a suitable lecture room attached, to be used by the lecturer on Physical Training for his pupils. At present lectures to the King's students on Elementary Physiology and on the Laws of Health (that is, School Hygiene so far as concerns school buildings and scholars) are given in the King Street Public School, where the King's students have also the use of the school gymnasium for their physical training.
King's students : physical drill.	(c) The students have an athletic club where practice in jumping, running, etc., is engaged in, and in the summer session the students have annual sports; a few of the more proficient taking part in the annual Scotch Inter-University Sports.
Gymnastic clubs.	(d) No provision is made at the university for such training, with the exception of the male King's students, who have a short course of manual training.
Gymnasium to be provided.	(e) Voice training. There is a Choral Society consisting of about 40 members, and this society is conducted by Mr Sandford Terry, Lecturer on History in the university.
Health lectures.	(f) There is no cadet corps connected with the university, but the members of the University Rifle Company, attached to the 1st Volunteer Battalion Gordon Highlanders, go through the annual course of musketry prescribed for volunteers, and they have also the use of the regimental range for private practice.
Athletics.	(g) There is no swimming bath attached to the university, but a few of the students have formed a swimming club, and taken advantage of the Corporation Swimming Baths at the beach, which is distant about three-quarters of a mile from Marischal College.
Handicrafts.	(h) There is no Fire Brigade Corps connected with the university.
Voice training.	(i) About 140 of the students are members of the Aberdeen Royal Army Medical Corps, and receive a regular course of training in first-aid and ambulance work.
Cadet corps.	10,483. What time is allotted to these or any of them <i>per diem</i> and <i>per week</i> ? Are any of these taken in ordinary university time?—The members of the Gymnastic Club have the use of the gymnasium of
Swimming : no bath.	
Fire Brigade : none.	
Ambulance.	
Time allotted.	

the Aberdeen Physical Training College for six hours per week. The members of the volunteer corps attend the number of drills necessary under the volunteer regulations. The Choral Society meets for practice one hour per week during the winter session, while the other athletic clubs have no definite arrangements for practice, except that each member of the various clubs is supposed to train for matches held on Saturdays. The university regulations do not set apart any time for the practice of athletics, with the exception of the King's students, whose hours for physical training form part of their university work.

10,484. How far are the existing opportunities taken advantage of? Give numbers approximately under the various heads?—There are 119 members in the athletic club, which, under the articles of constitution of the association, ought to include every member of every affiliated club. This year being the first, and not a complete year of the association, several members of each separate club have not yet joined the association.

I am informed by the secretary of the University Athletic Association that, including the members of the R.M.S.C., who are not affiliated to the Athletic Association, during session 1901-1902 about 200 students took part in athletics. The number of matriculated students (including the summer session and lady students) for 1901-2 was 830. Of these the following is approximately the numbers belonging to the various clubs, viz.—Cricket, 20; shinty, 25; Rugby football, 50; association football, 25; tennis, 20; gymnastics, 20; swimming, 50; boating, 20; and golf, 40;—in all, 270. Besides these there are the members of the University Rifle Company and of the Royal Medical Staff Corps, most of whom are members of one or other of the above clubs.

10,485. What organisation exists for the promotion of physical training in any form in the university?—The following organisations exist for the promotion of physical training in the university:—

(1) The Field Committee and Athletic Association (for constitution of which see articles of constitution); and

(2) The special course of training established in 1899 for the benefit of the King's students.

10,486. What, in your opinion, are the defects of the system?—In my opinion the difficulties of the organisation of games arise from the following circumstances:—

(1) That no compulsion is brought to bear upon the students to join these clubs; and

(2) A large proportion of the students are neither physically fit to engage in these games, and, even assuming that they are fit, they have had little, if any, practice in many of them prior to their becoming students, and they therefore fail to be attracted by them.

10,487. What remedies or suggestions have you to propose? Should there be any form of compulsion?—These games afford what might be called 'recreative,' as opposed to 'educational,' exercises. Assuming that each student is sufficiently well developed physically and in a normal state of health before he matriculates, these games might with good results be made compulsory. Until that is found to be the case, the compulsory attendance of students at these games would probably result in greater injury to their health than if they were not to take part in them at all.

10,488. Do you think a medical examination of students from time to time necessary, with a view of development of physical training?—I am strongly of opinion that periodical medical examinations of students at stated intervals during their university career would be of immense advantage to the students themselves, and, if followed by a compulsory period of training in prescribed exercises, would not only make up to a great extent for the want of proper training in their younger days, but would also increase their health and strength, enabling them to study with far better results, and, when they leave the university, they would be better fitted for any profession they may adopt.

10,489. Generally, what suggestions or proposals have you to make regarding physical training in the

Scotch universities?—From a national point of view the physical training of the students attending the university must aim, not at producing a few expert athletes in one or more of the recognised sports of the day, but at developing the body of every student by rational methods of exercise to ensure *health*, so that when he leaves the university he shall have every function of his body fully developed and in the highest state of efficiency as well as his mind. Such a training would result not in the production of acrobats or record-beating athletes, but in health, and so the *mens sana in corpore sano* would be the nation's reward. To attain this object the system should be principally educational in its character, and not recreative as is the case at the present time.

10,490. Generally, state your school and university training, your former experience and your present position?—Up to the age of fourteen I had no special physical training, apart from engaging as a boy in games usually taken part in by pupils in country schools. For two (fourteen to sixteen) years I was a pupil in the Aberdeen Grammar School, but, not feeling strong, I took part in none of the usual school games of football, cricket, and such-like. At the age of sixteen I matriculated as an Arts student in the university of Aberdeen, but during my first session I took part in none of the games at the university. At the age of seventeen (1867) I became a private in the 1st Volunteer Battalion Gordon Highlanders, and a few months after joined the Aberdeen Gymnastic and Rowing Club. At that time we had no instructor, and were allowed to practise any exercises we might think fit. At the time of my joining the Gymnastic Club my height was 5 ft. 5½ inches, my weight was 7 st. 7 lb., and chest measurement 30 inches.

In 1885 my measurements were—height 5 ft. 8½ inches, weight 12 st. 3 lbs., chest 42·3 inches, lower arm 11·6 inches, upper arm 14·3 inches.

In 1868 I was appointed honorary secretary of the Gymnastic Club, and retained that appointment until 1890. In 1869 I gained the first prize for general excellence in gymnastics, and for about seven years, with the exception of the year in which I attended law classes at Edinburgh University, I retained that position. While in Edinburgh I became a member of the Edinburgh University Gymnastic Club and carried off the second prize. In 1885, after receiving a special course of training in fencing and gymnastics from a military instructor, I passed through a special course of instruction in the Military Gymnasium at Aldershot and was the first Volunteer Officer to secure a military certificate for gymnastics and fencing. On my return from Aldershot I re-modelled the course of instruction in the gymnasium, basing it on the military system, and at the same time employed my spare hours in the evenings in teaching boys and girls in several institutions, in which my firm acted as secretaries. After two years' experience I found that the military system failed to retain the attention of the children in these institutions, and that the young men attending the gymnasium seemed to lose interest in the work. In that year (1887) the National Physical Recreation Society was founded by Mr Alexander of Liverpool, and I entered a team from our Gymnastic Club for the annual competition for the shield presented by that Society, open to teams of eight from any affiliated club. In that year we reached the final round, but, in London, we were handsomely beaten by teams from Liverpool and Exeter Hall. In the following year (1888) we were again successful in reaching the final round, but in the final contest at Dundee—between Liverpool, Exeter Hall and Aberdeen—we again came in a bad third. In 1889 we again reached the final round, along with teams from the Liverpool and Birmingham Gymnasias, and at the final contest in Liverpool we were placed third, being 2½ points behind Liverpool and 7 points behind Birmingham, who were adjudged winners. In 1890 and in 1891 we again competed, but in the early rounds we were defeated by Dundee and Liverpool respectively.

In 1892 we once more reached the final round, and

in the contest at Dundee between Exeter Hall and Aberdeen, we succeeded in securing the championship of the United Kingdom.

Since then we have twice repeated our performance of 1892, and at present Aberdeen holds the championship of the United Kingdom. In all these years Aberdeen invariably secured the highest marks for musical drill. In addition to my duties as honorary secretary of the gymnastic club, I devoted my evenings to organising classes on the lines adopted by the National Physical Recreation Society for training children in various hospitals in Aberdeen, the teachers being members of our gymnastic club. The result of such training was eminently satisfactory, and there was a marked improvement in the physique of the boys and girls in these institutions.

10,491. Give details of your system of physical training, on what based and how carried out, etc.?—In the military system, which we at first adopted, the exercises laid down were confined to Swedish exercises, or, as they are called, 'free gymnastics,' with the addition of dumb-bell exercises without music, but I found that these exercises soon failed to retain the attention of the children. I therefore—aided by the advice and musical knowledge of Mr John Thomson, junr., who was at that time cashier to my firm—proceeded to devise a much larger variety of exercises than were then included in the military system, introducing—in addition to dumb-bells—hoop drill, bar-bell drill, and Indian clubs.

The system of physical training adopted by the Aberdeen Physical Training College is based on the Swedish system so far as most of the exercises are concerned, but in every case a musical accompaniment is provided. In coming to this conclusion I found from experience that the attention of the children was more easily maintained by the provision of a musical accompaniment, and, by providing dumb-bells, hoop, bar-bell and Indian club exercises, we were enabled to produce a variety of movements sufficient to retain and interest the children during their school life, lasting for about four to five years. As the time allowed in school did not exceed half-an-hour per week, it was necessary not only to provide a variety of movements sufficient for a course extending over five years, but also to exercise the children in their usual clothing, and as the physique of a class of say forty children was so very unequal, special care was taken to see that the apparatus (dumb-bells, etc.) used was such as would not be too heavy for the weakest child in the class. I found too, as the result of further experience, that, by introducing a musical accompaniment, the children were able to go through the various movements with less mental concentration than when the exercises were given without an accompaniment. The result of such a system of training seems to me to possess one very important advantage, viz., that while engaged in physical training the child does not require to draw so much upon its intellectual resources to perform the exercises set as when called on to do so without an accompaniment.

10,492. Describe your physical training college. How and when founded?—The success of this system was remarkable, and in 1889, on the instigation of several gentlemen connected with the city of Aberdeen, I proceeded to found the Aberdeen Physical Training College, the object of which was to 'promote an increased interest in the movement for improved physical training and to secure for the middle-aged and for the young a regulated and efficient system of training, and to aid by every practical means in placing a hitherto neglected but valuable branch of education in its proper position as one of the most important subjects in our national system of physical education.' To bring about this result I acquired a large building in Crown Street, Aberdeen, which is known as the Aberdeen Physical Training College, and which, in addition to supplying accommodation and instruction to the members of the Aberdeen Gymnastic Club, was intended to afford training to boys, girls, ladies, and gentlemen in the most modern phases of physical

development. To carry out this work I framed a syllabus of instruction, suitable both for colleges and for schools, and submitted it to all the educational institutions in the city. Within a short time the Aberdeen Physical Training College secured the support of the Aberdeen School Board, the Aberdeen Church of Scotland and Free Church of Scotland Training Colleges, and in addition our staff were employed in carrying out the training of the children in many of the other schools in the city. Juvenile classes for boys and girls under twelve years of age, classes for girls and for ladies, and special classes for gentlemen engaged in business were formed, and at once met with considerable success. The result of the college's system of physical education began to tell. The provision of suitable halls for physical training became part of the building programme of the School Board and other educational institutions in Aberdeen. In 1897 the Governors of Gordon's College, one of the principal educational institutions in the city, recognised the value of the training supplied by the Aberdeen Physical Training College, and erected in connection with their college a large and well-equipped hall. The Aberdeen Grammar School, which had employed our staff since 1881, built a large and commodious hall for the use of the boys attending that school, and in the reconstruction of the Girls' High School in 1897 similar accommodation was provided. In all these institutions the staff of the Aberdeen Physical Training College was employed to carry out the physical training of the pupils, and the fact that the staff of the college are still engaged in this work goes to prove that the instruction given has satisfied the authorities of these different institutions. In 1895, in consequence of the Scotch Education Department insisting on physical training being part of the school work, special holiday classes were formed in Aberdeen in connection with the college, and at the following centres, namely, Edinburgh, Banff, Fraserburgh, Turriff, Elgin, Ayr, Falkirk, etc. In 1899 I was appointed lecturer in elementary physiology and on the laws of health (school hygiene) to the King's students of Aberdeen University, and the practical training in physical exercises of these students was placed in the hands of the staff of our Physical Training College. In 1899 the physical training of the students attending the Glasgow Church of Scotland and United Free Church Training Colleges was also placed in the hands of our training college, and down to the present day over 3000 teachers have passed through a course of instruction in physical training, and these students are believed to be imparting the system they were taught in many of the elementary and secondary schools throughout Scotland, in England, and in many other countries.

10,493. Describe the syllabus, length of courses of instruction, number of pupils in particular classes, number of pupils attending per annum, etc.?—A syllabus of instruction for the various institutions was drawn up for the guidance of the members of the staff, but, while in the main the syllabus was expected to be followed, the teacher was allowed to modify the exercises given to suit the wants of various classes of pupils to be met with in different schools and colleges. For the students attending the training colleges the time allowed is one hour per week per session, or about forty-two hours in all during the college year. During the first half of the session the junior and senior students—male and female at different hours—are taught the various exercises in our text book, while in the latter part of the session the students are divided into sections, and the senior students in these sections are called out to drill the rest of their section in turn. Owing to the short time devoted to physical training, this college only aims at teaching the teachers how to do all the exercises in the text book and to instruct only in what might be termed a 'first lesson' to a class of children. In the special holiday classes for teachers the time is reduced to a fortnight, or twelve working days of at least four hours a day. During the first ten days of the course a scheme
