TERMS OF REFERENCE.

To enquire into the opportunities for physical training now available in the State-aided schools and other educational institutions of Scotland; and to suggest means by which such training may be made to conduce to the welfare of the pupils; and, further, how such opportunities may be increased by Continuation Classes and otherwise, so as to develop, in their practical application to the requirements of life, the faculties of those who have left the day schools, and thus to contribute towards the sources of national strength.

W A R R A N T.

EDWARD, R.

EDWARD THE SEVENTH, by the Grace of God, of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas, King, Defender of the Faith, to—

Our right trusty and right well-beloved Cousin William David, Earl of Mansfield (Chairman);

Our trusty and well-beloved Thomas Horatio Arthur Ernest Cochrane, Esquire, commonly called the Honourable Thomas Horatio Arthur Ernest Cochrane, Member of Parliament;

Our trusty and well-beloved Sir Thomas Glen-Coats, Baronet;

Our trusty and well-beloved Sir Henry Craik, Knight Commander of Our Most Honourable Order of the Bath, Doctor of Laws, Secretary of the Committee of Our Privy Council on Education in Scotland;

Our trusty and well-beloved Michael Hugh Shaw-Stewart, Esquire, Member of Parliament;

Our trusty and well-beloved James Carfrae Alston, Esquire, President of the Boys' Brigade;

Our trusty and well-beloved John Blackburn Fergusson, Esquire, Barrister-at-Law, Chairman of the School Board of Alloway;

Our trusty and well-beloved George M^cCrae, Esquire, Member of Parliament; and

Our trusty and well-beloved Alexander Ogston, Esquire, Doctor of Medicine, Master of Surgery, Professor of Surgery in Our University of Aberdeen. Greeting!

Whereas We have deemed it expedient that a Commission should forthwith issue to enquire into the opportunities for physical training now available in the State-aided schools and other educational institutions of Scotland; and to suggest means by which such training may be made to conduce to the welfare of the pupils; and, further, how such opportunities may be increased by Continuation Classes and otherwise, so as to develop, in their practical application to the requirements of life, the faculties of those who have left the day schools, and thus to contribute towards the sources of national strength.

Now know ye, that We, reposing great trust and confidence in your knowledge, discretion, and ability, have nominated, constituted, and appointed, and do by these presents nominate, constitute, and appoint you, the said William David, Earl of Mansfield, Thomas Horatio Arthur Ernest Cochrane, Sir Thomas Glen-Coats, Sir Henry Craik, Michael Hugh Shaw-Stewart, James Carfrae Alston, John Blackburn Fergusson, George M^cCrae, and Alexander Ogston to be Our Commissioners for the purposes of the said enquiry.

And for the better enabling you Our said Commissioners to make the said enquiry, We do by these presents authorize and empower you, or any three or more of you, to call before you, or any three or more of you, such persons as you may judge necessary, by whom you may be the better informed of the matters herein submitted for your consideration, and every matter connected therewith; and also to call for, have access to, and examine, all such books, documents, papers or records as you shall judge likely to afford you the fullest information on the subject of this Our Commission; and to enquire of and concerning the premises by all other lawful ways and means whatsoever.

And We do further by these presents authorize and empower you, or any three or more of you, to visit and personally inspect such places as you may deem expedient for the more effectual carrying out of the purposes aforesaid.

And Our further will and pleasure is that you, or any three or more of you, do, with as little delay as possible, report to Us under your hands and seals upon the matters referred to you as aforesaid, and that you may have power to certify to Us, from time to time, your several proceedings in respect of the matters aforesaid, if it may seem expedient to you so to do.

And We further will and command, and by these presents ordain, that this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any three or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

And for your assistance in the execution of these presents, We do hereby nominate and appoint Our trusty and well-beloved Robert Barclay Pearson, Esquire, Advocate, to be Secretary to this Our Commission.

Given at Our Court at *Saint James's*, the thirty-first day of *March*, one thousand nine hundred and two, in the second year of Our Reign.

By His Majesty's Command,

BALFOUR OF BURLEIGH.

ROYAL COMMISSION ON PHYSICAL TRAINING (SCOTLAND).

REPORT

I. INTRODUCTION.

MAY IT PLEASE YOUR MAJESTY,—

1. We have now completed the enquiry which was committed to us by Warrant of Your Majesty, bearing date 31st March 1902, and we beg leave to submit our Report detailing the result of this enquiry, and embodying the conclusions at which we have arrived.

The subject remitted to us by Your Majesty is best explained in the words of the reference contained in Your Majesty's Warrant :—

‘To enquire into the opportunities for physical training now available in the State-aided schools and other educational institutions of Scotland; and to suggest means by which such training may be made to conduce to the welfare of the pupils; and, further, how such opportunities may be increased by Continuation Classes and otherwise, so as to develop, in their practical application to the requirements of life, the faculties of those who have left the day schools, and thus to contribute towards the sources of national strength.’

2. We have held 28 sittings for the taking of evidence, and have examined 127 witnesses. In the course of conducting our enquiry in London, we judged it expedient to visit certain schools in the vicinity, with the view of making ourselves acquainted with different methods of training. For this purpose we paid visits of inspection to two London Board Schools, to the Duke of York's School at Chelsea, and to the London Orphan Asylum at Watford. We also saw in the Portsmouth Town Hall an exhibition of physical exercises given by the pupils of various schools. Later in the year we sat in Edinburgh and Glasgow; and visited the Clyde Industrial Training Ship ‘Empress,’ and the Mossbank Industrial School at Robroyston, near Glasgow. In addition, we paid visits of inspection—without sending notice beforehand—to six schools in Edinburgh, Glasgow, and Aberdeen respectively. We have inserted a list of the schools visited in the Appendix to our Report.

Appendix VII

3. We have had the advantage of taking evidence from the Assistant Secretary of the Scotch Education Department, Inspectors of schools, members of the medical profession, military officers of special experience, and certain persons qualified to give valuable expert assistance in the subject-matter of our enquiry. We have also had before us members or officials of all the principal School Boards, headmasters or assistant teachers of typical schools of all classes, representatives of the Training Colleges and of the Universities, members and officials of various voluntary agencies, the Chief Constables of Edinburgh, Perthshire, and Roxburghshire and Berwickshire, one of the Sheriff-Substitutes of Forfarshire, the Lord Provost of Glasgow, and other witnesses who had special experience of miscellaneous matters connected with our enquiry.

4. Beyond the sphere of influence covered by the compulsory clauses of the Education Acts, the remit to us embraces those scholars above the age of fourteen, for whose benefit Continuation Classes are maintained, and whose prospects in life, as well as their contribution by sound equipment to the general prosperity of the nation, must be powerfully affected by the educational influences—intellectual, moral, and physical—which may be brought to bear upon them during the critical period of life which intervenes between leaving the day school and the approach of manhood. We accordingly enquired how far the arrangements of the Continuation Classes might be considered to foster adequately this important branch of education: and our investigations necessarily led us also to enquire what additional inducements might be offered to such persons to avail themselves of the Continuation Classes, and how far it might be expedient, both in the interests of these

persons themselves, and of the community at large, to enforce attendance at these classes by legislative action.

5. We felt it to be our duty to take medical evidence with regard to the general physical condition of the youth of the country, to ascertain the data which were available for guidance, and whether any conclusions might safely be formed with regard to its tendency to advance or to decline. We enquired how far this was influenced by the means of training given in the various educational institutions of Scotland, and what evidence there was to show whether these opportunities were in themselves adequate, as compared with those available at other times or in other countries. There was some interesting evidence laid before us as regards the courses of training given in France, Germany, and Switzerland, and the systems in use in America and Sweden. It proved to be a necessary part of our enquiry that we should examine the bearing upon this part of training, of recent developments of national education, and the altered economic conditions involved in the rapid concentration of population in the large manufacturing towns. We sought the experience of those versed in the subject in order to judge how such training might conduce to the welfare of the pupils which the terms of our reference recognise as its primary aim, and what were the general principles that ought to guide us in deciding what arrangements were best adapted to that end, and what should be the lines of any system to be generally followed.

6. Having enquired into the requirements of physical training as a branch of national education, we next considered how far medical knowledge might be used as a guide and ally in this part of the work, and whether adequate use has hitherto been made of the assistance which medical science might afford. We examined and compared the views of experts with regard to the systems of physical training already practised in various schools, and with a view to recommending the general principles upon which such training should be based. We took evidence upon the capacity of the present body of school teachers in Scotland for undertaking such work; the training which was necessary; how such training might be given and qualifications tested; and what amount of expert assistance over and above the ordinary educational staff might with advantage be called in for training teachers, for giving instruction to scholars, or for supervising the system generally and maintaining its thorough efficiency. We made careful enquiry into the causes which were alleged to hinder that efficiency, and the reasons for the apathy regarding it which is occasionally found to prevail.

7. With respect to physical training in its bearing on those above school age, we thought it right to receive evidence from the representatives of various voluntary agencies, and to enquire how their efforts might be encouraged and directed, and how they might best be organised as effective allies in the work of national education.

8. Lastly, we thought it our duty, in obedience to the terms of the reference, to enquire fully into the conditions prevailing in institutions which stand outside the range of the usual educational operations of the State—principally the Higher Class Schools and the Universities. We obtained such evidence in regard to these as might enable us to judge how far they were giving adequate attention to this subject; in what respect they offered examples worthy of imitation and capable of adaptation in the State-aided schools; and how far any neglect of the subject was due to causes which admitted of remedy, or to the prevalence of mistaken views which might be altered by a more intelligent appreciation of the benefits of proper physical training, and its importance as an element of national welfare.

II. EXISTING OPPORTUNITIES OF PHYSICAL TRAINING AS REGARDS:—

(1) *The Elementary Schools.*

9. We have examined a large number of witnesses, both members of School Boards and school masters, representative of large towns and country districts, with regard to the existing state of matters in these schools. As was to be expected, we found that the opportunities varied in the different districts; but there was a consensus of opinion that the physical training throughout these schools generally was inadequate in quantity and quality.

10. Some kind of training is given in most schools, owing to the demand in the Code for an 'adequate' amount; but this term appears to be taken to mean 'adequate, considering the opportunities.' Most of the witnesses who appeared before us agreed that the subject was of the greatest importance, but its recognition as a prominent branch of a liberal education appears to be theoretical rather than practical. And this is clearly demonstrated

Miss Stevenson,
2286.

Mr Powell, 3047.

Mr Craigen, 3058.

Mr Davidson,

5978.

by the amount of time allotted to it in the school time-table. As a rule the pupils receive instruction in some branch of physical training for half an hour a week. In some instances more time is devoted; indeed, in one or two cases as much as three hours *per* week were set apart, without detriment to the ordinary work of the school, but these were very exceptional.

11. In many towns there appear to be considerable facilities which are not, however, properly taken advantage of. Many of the more modern schools have gymnasia attached, whilst the use of swimming-baths can often be obtained. There are also covered sheds in many playgrounds wherein the pupils can in all weathers receive instruction in physical exercises and drill. We are convinced that these are, as a rule, valuable adjuncts to the school buildings, and that they may often be used with advantage, especially in country districts, where the accommodation in the class-rooms is more restricted than in large town schools, which often have central halls.

12. One of the chief hindrances to the development of physical training in these schools appears to be the utter lack of system and the want of qualified teachers. Individual effort and enterprise have done much in certain schools, but we are convinced that a properly graded course of systematic instruction is indispensably necessary. We have elsewhere laid down the general principles on which, in our opinion, any such system should be based.

13. But our enquiry has led us to recognise the importance and benefit of physical drill for all children, whether town or country, and we desire to see it constitute an essential part of any system. One practical advantage, which we ourselves saw in some of the largest schools, is that by means of the drill the school can be cleared in an expeditious and orderly manner. One headmaster told us that in the case of an alarm of fire all fears of panic were allayed by the simple and practical method of marching out the children to the accompaniment of music.

14. Although we are fully alive to the difficulty of obtaining sufficient open spaces in towns for children's recreation immediately contiguous to the school, yet we do not think that this should present insuperable difficulties in the way of providing means for, and encouraging, games in connection with town schools, and we think that it is equally important to give such opportunity and encouragement in the country, where playing-fields can more readily be obtained. The development of games has made some progress in those schools where the teachers have personally attended to their organisation, and the results have been entirely beneficial, not only on account of the direct good arising from the healthy exercise, but also on account of the personal contact of the teachers with the children outside the class-rooms. And this might be extended were some means taken to arouse the sympathies of former pupils, whose assistance would be welcomed by the teachers.

(2) *Industrial Schools and Reformatories.*

15. We were informed that at eighteen out of twenty-three of these institutions for boys either free or applied gymnastics were taught; and at the remainder, some form of physical training. At the twelve schools for girls, instruction was given in physical drill, swimming, dancing and free gymnastics.

16. The Inspector of Reformatory and Industrial Schools, Mr Legge, besides giving us much valuable information, handed in the results of a physical census as regards his own schools, taken in 1901. Certain tables extracted from his report are printed in the Appendix. We were told that in such schools in England the physical training was much more fully developed than in Scotland, and this was attributed partly to the reason that the former schools possessed larger resources, inasmuch as they received greater support from the rates. The disciplinary results of the physical training were highly commended; in fact, one direct effect appears to be that lately the serious difficulties in the management of these schools have sensibly lightened. And it was maintained that, as regards the moral and mental improvement, it could be proved to demonstration that where the training was highly developed, the boys showed better educational results than in those schools where little attention is paid to this branch of education.

17. On a consideration of the evidence, we have come to the conclusion that, with very unpromising physical and moral conditions and previous training, an immense deal has in such institutions been done by a system properly applied and vigorously pursued on a scientific basis.

18. The experience of such institutions clearly shows that physical training is quite as important in fitting boys for civil life as it is for boys intended for the Army or Navy. And the case is not different with regard to the girls. We were informed that in consequence of systematic training on somewhat unpromising material, fully eighty *per*

cent. turn out well. One benefit, out of many, appears to be that the girls show not only greater amenability to discipline, but an increased alertness in movement and apprehension, with the practical result that they are enabled to obtain better situations in domestic service.

Mr Legge, 724.
Com. Deverell,
12,554.
Mr Macfarlane,
12,743.
Miss Hunter,
13,599.

19. The impression of the high efficiency of these institutions produced on our minds by the evidence of the witnesses representing the Reformatories and Industrial Schools, was increased by the visits of inspection which we paid to the Clyde Industrial Training Ship 'Empress,' and to the Boys' Industrial School at Mossbank. The last-named is under the management of the Juvenile Delinquency Board in Glasgow, under the special local Act of 1878.

20. Throughout these schools there is in operation a comprehensive system of physical training, including physical drill, gymnastics (free and applied), swimming, games, boat-pulling (remarkably well done by the boys on the 'Empress'), instruction in handicrafts and industries, etc. Ample accommodation, both indoors and in the open air, is provided for the purpose of thorough instruction in the various forms of training. In this connection we desire to notice the admirable gymnasium and swimming-bath at Mossbank, which was, in our opinion, the most suitably adapted for its purpose we have seen. The provision of this well-equipped gymnasium and swimming-bath, combined in one building, in which instruction is arranged for some four hundred boys, cost the moderate sum of £800.

Mr Macfarlane,
12,748.

21. Most of the boys who are received into these schools are waifs and strays, the result of being neglected at home; in the expression of one witness, 'they have been 'more sinned against than sinning.' As a rule, on entry, they appear to be very backward in education; and yet, owing to the admirable treatment, between ninety and ninety-five *per cent.* turn out good and useful citizens.

22. In conclusion, we desire to record our appreciation of the good work done in these schools, and to report that, in our opinion, the physical training carried out therein is, on the whole, adequate in amount and quality.

(3) *Training Colleges.*

23. A subject of the first importance in considering this question generally is that which relates to the opportunities for physical training available for the teachers of Scotland.

Mr Struthers,
8, § IV.

24. The Training Colleges have, we believe, for some time past given some instruction in drill to the male students. Up till 1901, drill, though often taken, was not a necessary part of their curriculum; not being included in the Education Department's scheme of examination for certificate, it was regarded more or less as an extra or voluntary subject, to be taken as the exigencies of other subjects allowed. In 1901 the Department undertook a reconstruction of the Training College curriculum, and in that curriculum physical exercises and drill have become necessary subjects, in which reasonable proficiency will, in ordinary cases, be expected as a condition of the issue of a certificate. Proposals for the instruction of students in these and other subjects have been submitted, we were informed, to the Department; but these syllabuses of work are to be regarded for the present as provisional only. An inspection of all the Colleges was last year made by Captain Armytage, Superintendent of Military Gymnasia in Scotland, on behalf of the Education Department, and we trust that similar inspection will be continued.

Dr Paterson,
11,393.
Mr Macnee,
11,656.
Canon
Mackintosh,
13,116.

25. We had the advantage of hearing evidence of representatives of three of the Training Colleges, two for both men and women, and the other for female students alone. In two of these Colleges some of the students are attached to local Volunteer battalions, and undergo all the regular work and training of the corps, including, in one case, attendance at the summer exercise camp. Drill and physical exercises are taught by qualified instructors to all the students, unless medically exempted. This instruction is given either in the college hall or playground; for none of these Colleges are so fortunate as to possess a gymnasium, a defect we much deplore. Nor do they possess playing-fields, so that, with only a limited use of the public parks, games are not sufficiently taken advantage of. The amount of time devoted to training varied from two half-hours to three hours a week, these lessons being given in ordinary college time.

26. We were glad to hear that some lectures were given on Physiology, Hygiene, and the Laws of Health; and we would here point out how important we consider it to be that those who are about to become members of the scholastic profession, and particularly those who are to teach physical exercises, should themselves be thoroughly instructed in such subjects, so as to give to the children under their charge such instruction therein as may usefully supplement their practical physical training.

27. The principal difficulty, as we found elsewhere, appears to be the inability to allot a sufficient amount of time to the subject. As a necessary result of emphasising the importance of the subject, we consider that a systematic course of training should become a more prominent feature in the curriculum of the Training Colleges, and that it should receive a more liberal allowance of time than it does at present. Students should receive direct encouragement to attach themselves to a Volunteer company; for we feel convinced that this is an important factor in Training College life, and that its extension would prove to be beneficial, in giving the students a good all-round training, with the resulting good health and vigour, as well as in adding to their power for good in their future careers.

28. With regard to the insufficient accommodation in playgrounds and gymnasias to which we have alluded, we think that with the present very liberal terms of grant to the Training Colleges from the Parliamentary Vote, it is not too much to expect that the committees managing these institutions should be enabled, with the assistance of local funds, to make such addition to their accommodation and equipment as may be called for in the interests of sound training.

(4) Higher Class Schools.

29. There has been presented to us a considerable body of evidence with regard to the existing state of matters at the Higher Class Schools. We have examined the headmasters of several typical day and residential schools. The former included the Higher Class Public Schools under the management of School Boards, Endowed Schools under special administration, as well as the voluntary Higher Class Schools.

30. Although on general grounds the proportion of physical to mental training should be the same for all children, it is evident that the methods of organisation must be different in the cases of day and boarding schools, for the reason that in the latter the whole time of every pupil during each day is controlled and regulated by the school authorities, whilst in the day schools no such control is possible, the pupils attending for instruction during some five or six hours *per diem*, and thereafter being free of all school discipline.

31. In many of the Higher Class Day Schools there are considerable facilities provided for physical exercise and instruction. Drill and gymnastics, free and applied, form a regular part of the school curriculum, and, as such, are taken in school hours. These are taught in well-equipped gymnasias, with which almost all of these schools appear to be provided.

32. The amount of time *per week* allotted to these subjects varies from one half-hour in some instances, to one hour and a half in others; but in nearly all we found that as the pupil advanced he received less instruction in consequence, as was testified to us, of the pressure of other subjects.

33. In several of these schools cadet corps have been established, and in this way military drill and training is given to the older boys. The headmasters of these schools and others have strongly advocated the desirability of having some form of military drill and training as part of the curriculum of every school, thus affording a kind of training most valuable for the older boys. We have been much impressed with the weight of this evidence.

34. We found that practically all the Higher Class Day Schools were furnished with such playground accommodation immediately contiguous to the building as to enable the pupils to enjoy their recreative intervals between the classes in the open air if the weather permitted; and in addition, most of them had the use of large playing-fields, although in a few instances these were situated at some little distance from the school itself. The possession of these fields leads to a large number of the pupils taking part in the ordinary school games. Whilst in most cases the boys themselves organise and regulate these, generally there was some supervision by members of the school staff.

35. We were glad to hear from several of the witnesses that the former pupils' clubs, formed in connection with the schools, were doing some valuable work in not only stimulating interest in the games among the present boys, but also fostering a healthy *esprit de corps*. We are disposed to give great weight to the evidence tendered by many competent witnesses as to the high value of the great school games, which, we are convinced, constitute most valuable adjuncts to school life. In one instance the games were compulsory, and excellent results were obtained.

36. We also took evidence as to the existing opportunities for physical exercises in one large and typical Higher Class Day School for girls, where we were glad to note that a course of systematic training in drill, gymnastics, and dancing, formed a regular part of the school work. We found that the greatest care was taken to guard against overstraining or similar dangers, which, in view of the special conditions of health to which girls are subject, render it essential that the classification of the pupils for such exercises should be matter of special consideration, and that the exercises should not be carried on according to the classifica-

tion applicable to the rest of school work. Two thoroughly qualified lady teachers, specially trained in the theoretical and practical work, have charge of the instruction. Whilst the drill and gymnastics, in accordance with Ling's Swedish system, were not compulsory, the lessons were taken advantage of by ninety *per cent.* of the pupils. Unfortunately, the school in question possesses no playground or field. In the absence of these, the place of games in the regular time-table was largely supplied by this systematic physical exercise; and we were told that this course was pursued with excellent results. We were informed that each class received weekly an hour's lesson in dancing, and the same in drill and gymnastics.

37. With regard to the Higher Class Day Schools generally, the evidence seems to show that in the case of many of these schools the subject of systematic physical training did not receive sufficient attention or recognition, and that the time devoted to it was inadequate. We are satisfied that this view is well founded, although we recognise that latterly there has been an advance in public opinion.

38. The chief difficulty urged against any extension of physical training in these schools was the lack of time, owing to the pressure of other subjects, demanded by the exigencies of competitive examinations. But there is, we think, no doubt that, even as regards mental conditions, better permanent results would ensue if all the pupils received adequate physical exercise. We are convinced that this is quite as necessary for proper intellectual equipment as for physical development.

39. As regards the further extension of games in these schools, our attention has been directed to the fact that many of the pupils come from a distance, and that, owing to the wide extent of area from which they are drawn, there are several difficulties which stand in the way of the proper organisation of games. Such organisation of games, together with some direction and supervision on the part of the staff, is not only most desirable, but also of high educational value.

40. This difficulty is no doubt increased by the distance at which some of the school playing-fields are situated. Nevertheless, much has been already accomplished, and there is no good reason why more may not yet be done, and why these Higher Class Day Schools, which have long been a special feature of Scottish education, should not set an example to Scotland in respect of the thoroughness of the physical as well as of the intellectual training which they offer to their pupils. If in these Schools the want of control over the leisure time of pupils militates against the games being largely taken advantage of, that is, in our opinion, a cogent reason for carefully guarding against the neglect of the systematic physical training which serves as the best substitute for games, and which ought in all cases to be taught with them. On the whole, whilst we are generally satisfied as to the efforts which are being made, we recommend that more time should be given to the subject. We consider that a necessary element in the liberal education of every citizen is a sound system of physical training, and that even where games are freely pursued, there ought to be in every Higher Class Day School a course of systematic physical training, including gymnastics, drill, swimming and the like. For this purpose we consider that proper arrangements and facilities should be provided, and also that instruction should be given in Hygiene and Physiology. It is most important that the pupils should not only have mastered the practical part of the training, but that they should understand something of the theory upon which it is based.

41. Not only is the theoretical education the proper and essential supplement to physical training, but we believe that if such instruction, in its relation for example to the Laws of Health, became a necessary and prominent feature in all schools, the general diffusion of such knowledge would gradually effect far-reaching improvements in the social, physical and moral conditions of the population.

42. With regard to the boarding or residential schools, we found that the opportunities and facilities are both varied and numerous. They are possessed of ample playing-fields and playgrounds, with the result that games are universally taken advantage of, due attention being paid to their organisation. Several of the witnesses here, too, have laid special stress on the high value of games, as being not only recreative, but truly educational.

43. We fully appreciate these advantages, which have been admirably stated to us, and we recognise that they are one of a number of means towards proper physical training which should receive adequate encouragement. At the same time, as the evidence shows, it is most desirable that games, even when conducted under the most favourable conditions, should be supplemented by a systematic course of training. Without such training there are certain dangers and defects which are inseparable from games. A boy is naturally inclined to play the games he likes best, and perhaps thereby leaves undeveloped that portion of his body which requires most attention. On the other hand, the systematic physical course provides for the proper all-round physical development of such a boy; and it meets the case of those who, from weak health, from physique or like cause, shrink from taking

part in the great school games. As a fact, this has so impressed the school authorities that they have already arranged, besides the opportunities for games, that there shall be provided courses of drill, gymnastics, rifle shooting, cadet corps, runs, swimming, boxing and fencing, and other means, not merely of supplying outlets for physical activity, but systematic physical development. Besides the benefit to health, obedience, self-respect and physical morality are promoted; and, briefly stated, there is abundant testimony to prove that a comprehensive and well-considered physical training is of material importance in the production of good results, physical, mental and moral.

44. On the whole, we are satisfied that the residential schools are alive to the importance of physical education, and that their authorities are conscious of their duty in this matter to the parents and pupils in providing proper facilities and ample opportunities. By our appreciation, we desire to encourage them in the valuable work they are performing, and to remind them that, endowed as they are with many peculiar advantages for the furtherance of this branch of education, they should make it their aim to be an object-lesson to the other educational institutions, and that in addition to games they ought to include in physical training a certain amount of systematic exercises and drill.

(5) Universities.

45. With respect to the Universities, we are strongly of opinion that the evidence discloses a lack of physical training which calls for some remedy, and which gives rise to serious regret.

46. In the first place, it is necessary to consider what opportunities are at present available in the four Universities. At Aberdeen, military drill is taught to about 120 of the students who are enrolled in a Volunteer company. There is also a Volunteer Royal Army Medical Corps, numbering 150 students. The King's students, male and female, numbering some sixty to seventy, receive instruction in physical drill during the summer session, whilst in addition there is a small gymnastic club who attend the gymnasium attached to the Aberdeen Physical Training College. At present there is no gymnasium at the University, but we were glad to be informed that in the reconstruction of the University buildings provision has been made for a large gymnasium. A lecturer appointed by the University authorities gives instruction to the King's students in Elementary Physiology and the Laws of Health, School Hygiene, etc. Whilst there is no swimming bath, there is a large playing-field contiguous to the University, and the interest shown by the students in games and athletics is represented by the fact that some 200 out of a total of over 800 take advantage of these opportunities.

47. With respect to St Andrews, we were informed that, with the use of a playing-field, a few students indulge in various games and athletics under the organisation of a recently formed athletic union; gymnastics are taught to a small class, and military drill to some ninety students who form the Volunteer company.

48. At Edinburgh, a prominent feature is the Volunteer corps. There is an efficient Volunteer company, the average number of students drawn from all the Faculties being 150 to 170; again, a battery of Volunteers belonging to the City Artillery contains about 75 students, also drawn from all the Faculties; and in addition there exists a special medical company belonging to the Royal Army Medical Corps, which always musters 100 men. In all, these embrace some 350 students. We are glad to know that such an interest is taken in the Volunteer movement, for therein lies a method of systematic training applicable to a large number of students. Under the organisation of an athletic club, which has a large playing-field, situated fully two miles off, and purchased partly by public subscriptions and partly by a grant from the University funds, about 350 students take part in various games. It has been pointed out to us that in considering the numbers of students who take advantage of the various opportunities for physical training, it is difficult to estimate the proportion borne to the total on the roll (between 2000 and 3000), for the reason that many students are members of both the Volunteer corps and the athletic club, and also that many who have been educated in the Edinburgh schools retain their connection with their old schools by belonging to the former pupils' clubs. There are no baths or gymnasium in connection with the University.

49. With regard to Glasgow University, we were much surprised to learn that barely ten *per cent.* out of the total number of students (1500 to 2000) take part in any physical exercises organised in connection with the University. There is a playing-field adjoining the buildings held by the athletic club. The only drill taught is in connection with the University Company of the Royal Army Medical Corps. One gratifying feature is that there is a well-equipped gymnasium, built and furnished by subscriptions, which is managed by a joint-committee of professors and students. But this admirable institution does not attract students, for only some thirty to forty attend it for instruction. Apart

from allowing the gymnasium to be built on University ground and giving the field rent free, the University authorities do not afford any assistance to the students in obtaining physical training.

Such is, briefly, the existing state of matters at the Universities.

50. One of the chief difficulties again alleged is the lack of time. It has been represented to us that not only have many of the students no time for physical exercise, but many are unable to get their meals properly or at reasonable hours. The difficulty of finding sufficient time appears to be due to the students being unwilling to sacrifice any period of the day to physical culture, and also to the fact that the authorities find themselves obliged to arrange the classes closely together, in order that the University course may be taken within the minimum of time, and that each session may be brought within the present limit of rather less than six months. It is increased by the over-pressure of study, owing to the students being constantly in preparation for some kind of examination, for which the keen competition at present existing is largely responsible. So long as the progress and capacity of students continue to be tested only by the narrow and unsatisfactory criterion of written examinations, we fear that this cause will continue to be a deterrent.

51. But there is also neglect on the part of the students themselves, due to ignorance as to the necessity for taking physical exercise, and to the feeling that it is only a waste of time. Under the force of circumstances, they appear to find it necessary to pay such exclusive attention to their book work, or rather to the somewhat restricted task of preparing for examination, that in the pursuit of what they conceive to be mental development, they neglect the rules of health, and the cultivation of that physical energy which is essential to real success in life.

52. No doubt this partly arises from the fact of many of the students having received no prior training, and this defect has been attributed, in a large measure, we think, rightly, to a lack of a proper appreciation of the subject in the schools, primary and secondary. If a boy's training at school has been one-sided and imperfect, it is not surprising that, never having been taught to regard physical exercise as necessary or desirable, he neglects it when left to his own devices at the University. Some witnesses of large experience strongly favoured the view that physical training in the Universities should be made obligatory. As materially assisting in the maintenance of health, it was asserted that it would promote intellectual progress; and whilst too many of the best students were inclined to neglect it, this was mainly due to the want of adequate facilities and proper organisation, and therefore it should not be left to the students themselves.

53. One witness put the whole case for compulsion very forcibly:—'I think many of them would be a great deal the better for having a certain amount of physical exercise forced upon them. They go through their examination well, perhaps as the result of the extra time they are devoting to their studies, on account of their giving no time at all to physical exercise; but the ultimate outcome of it is not satisfactory—the final discipline of the man and his fitness for his ultimate life-work has been impaired by it, and one can easily point, in any Scotch University, to lads who afterwards suffer from not having taken sufficient physical exercise. They may have taken very high places in the University, but they have left it worn out physically and mentally, and fit for nothing strenuous in the battle of life.'

54. With the grounds of that opinion we entirely agree; but we deem any obligatory course to be at present both impracticable and inexpedient. We rather desire to draw the attention of the University authorities to what we conceive to be one of the necessities of education, especially in view of the probable general development in the near future of physical training throughout all educational institutions.

55. In our opinion, proper opportunities and facilities should be granted by the Universities. Careful consideration should be given to the question of time, admitted on all hands to be the chief difficulty, whereby lectures might be so arranged as to enable students to make good use of facilities, and to allow meals to be taken at regular and reasonable hours. We suggest, as a means of obviating, at least to some extent, the great overcrowding of lectures, and consequent over-pressure of study, that the sessions might be lengthened.

56. We are convinced that great benefit would result from the proper organisation of physical training; and were gymnasia, swimming-baths, fives-courts, opportunities for games, and, indeed, a systematic course of training, directly encouraged by the authorities, we are confident that a gratifying improvement among the students would be effected. The expense in connection with games and gymnastics, which we were told acted as a deterrent, should be reduced as far as possible.

57. In the case of those students at the Universities who intend to join the teaching profession, we think that it should be a necessary and compulsory part of their training

that they should qualify in the teaching and practice of physical drill and gymnastics, by these being considered as necessary subjects of the qualifying examination. These qualifying classes should be open to all students, who might be trained together with those who are preparing for the scholastic profession.

58. We are compelled to report that the evidence laid before us brings out in the strongest light the grave fact that the physical education of the University students in Scotland is neglected; and we strongly recommend to the notice of the authorities the foregoing suggestions.

(6) *Feeble-minded and Cripples.*

59. We have had the advantage of hearing evidence from witnesses of special experience with regard to the education and training of the feeble-minded as well as the cripple and otherwise infirm children. It was gratifying to learn that so much is being done for the amelioration of these poor children. Miss Monteagle, 13,893.
Mr MacKeith, 13,967.

60. With regard to the feeble-minded, we found that the children were taught in the ordinary Board School class-rooms. The degree of feeble-mindedness is determined by the doctor, who examines the child on a report from the teacher that it is making little progress in school work. After this medical examination the child is put into one of the main divisions. Simple elementary instruction is given, together with a course of training, of physical exercises and manual occupations. These exercises are found to be most salutary, and to exert a wholesome influence over *all* feeble-minded children. Miss Monteagle, 13,926.

61. It is eminently advisable to have these mentally defective children in special classes, both for their own sakes and for the sake of the other children, for when they attend the ordinary schools they are very often neglected. Whilst in large centres special classes can be properly arranged, there is more difficulty with regard to country districts. In the latter the difficulty would probably best be met by the provision of special institutions, such as exists at Larbert. Miss Monteagle, 13,946.

62. The education of cripple and infirm children is in Glasgow carried on by philanthropic organisations with the co-operation of the School Board, and much good work is being done with the aid of special invalid schools. The physical exercises are controlled by medical examination of the children. The doctor visits the school each month, examines the children and determines what exercises are suitable, an eminently satisfactory arrangement. We desire to notice the good work carried out in connection with these children, for the treatment they receive has very practical results. The first is that, whereas they were formerly neglected, they now receive such education, under careful supervision, as is compatible with their condition; and secondly, by being trained to handicraft, with the aid of suitable physical exercises, they are enabled to do a sufficient amount of remunerative work to give them an independent livelihood, instead of forming a burden on the rates. In brief, the aim of those in charge of their education is to fit them to help themselves. It was pointed out to us that, whilst these special invalid schools were under the management of School Boards, these authorities had not the powers to go the whole length and take the entire charge of these children. It is the duty of the School Board to see to the teaching of each child; but owing to a number of children being physically unable to go to the ordinary school, there must be special provision made if they are to receive instruction. Mr MacKeith, 13,967.

63. We see no reason why, on the analogy of the Blind and Deaf Mute Children Act 1890, and following the course pursued in England, the School Boards in Scotland might not have powers to support or contribute to institutions for such children. There are obvious reasons why the exercise of such powers should be carefully watched, and no inducement should be offered to bring children who might receive instruction in the ordinary way, within the category of the feeble-minded. But it appears to us that the conditions set forth in the Scottish Code for the payment of grants to these children are well devised in order to guard against these dangers, and may be trusted to prevent abuse. Mr MacKeith, 14,033.

III. PROPOSED REMEDY AND MEANS OF ENCOURAGEMENT.

64. Convinced as we are of the inadequacy of the present physical instruction which is given in the State-aided schools as a whole, we have next to consider what remedy may be proposed.

65. A ready means of attracting attention to the subject, and encouraging the devotion of a larger proportion of the time available in the school curriculum to it, may be suggested in the offer of a special grant. But there are many objections to such a course. In the first place, unless the existing proportion between local effort and Imperial grant is to be interfered with—a result which involves financial rather than educational considera-

tions, and therefore lies somewhat beyond the term of our reference—any grant for physical instruction would have to be provided by diminishing some other item in the Imperial contribution to the expenses of the school. Besides this, the system of grants for special subjects has been deliberately abandoned on the strongest educational grounds, and it seems to us undesirable to re-introduce it. It has a tendency to divert the mind of the teacher from the real educational development of his school, and to sacrifice that to financial considerations. It tempts him to crowd the curriculum in order to attain the minimum amount of efficiency in a variety of subjects which may secure a grant in each, rather than to cultivate to the full the interest and intelligence of the children where these can be most easily aroused, and to frame a curriculum so balanced as to develop their faculties in just proportion.

66. The remedy, we believe, is to be found in an improvement in the curriculum of the schools. The idea must be abandoned by teachers and managers alike that the best curriculum is that which is most varied and comprehensive. We have repeatedly been informed by teachers who gave evidence, that the real objection to increasing the time allotted to physical instruction lay in the excessive demands of the Code. But none of them was able to show that the imperative demands of the Code were excessive or could be reduced, nor could they show anything in the Code which encouraged a multiplicity of subjects. It was asserted that, even although the Code did not make such demands, the idiosyncrasies of individual Inspectors operated in this way, and that teachers could not hope to obtain a good report if they did not show proficiency in a variety of subjects. We cannot, of course, pronounce what foundation there is for this assertion, but we would strongly urge that the instructions issued to the inspecting staff should be sufficiently clear and explicit to prevent any such danger, and that the Chief Inspectors should vigilantly exercise their authority to prevent such action, which is, we are convinced, entirely opposed to the spirit and intention of the present Code.

67. The difficulty arises very largely from the prevalence of long-continued habit and antiquated views on the part of school authorities, teachers, and parents. While we found on the part of all the witnesses a perfect readiness to admit the importance of physical training, we found hardly any who had accustomed themselves to think of it as deserving anything more than an infinitesimal portion of school time. The period allotted to it sometimes fell to a quarter or half an hour a week, and very few teachers considered it possible to allot as much as two hours a week to it, or, indeed, appeared ever to have contemplated the possibility of such a thing.

68. The habit of mind produced by former Codes, which regulated payments by the number of subjects taken up, has by no means disappeared. Teachers are accustomed to measure their own success by the catalogue of subjects which they can take up. They believe that this must be the basis of the judgment of others on their work. The same tendency is perhaps still more marked on the part of some School Boards, who find such a method of criticising the work of those in their service to be easy and obvious, if it is not very intelligent. We can only trust that such a tendency may be abandoned as sounder educational views come to prevail.

69. On the part of parents also, there is a habit of regarding the end and object of school from a mistaken point of view—arising here also, in our opinion, from faults in previous systems. Until the Education Act of 1901 was passed, the exemption from compulsory school attendance could be gained at ten years of age, provided that the fifth standard was then passed. It became an object, therefore, to attain this exemption at this early age—often with the very worst results on the pupil. But to do so as quickly as possible became the dominating aim of school life, and there was a strong temptation to regard the work which assisted this as the only important element in that life.

70. The Act of 1901 has absolutely abolished the method of exemption by passing a standard. The period of compulsory attendance is regulated by age, with such modifications as may be exercised at the discretion of the School Board. The harmful influence of pressing the pupils so as to pass a certain standard at the minimum age—which we believe not only to have been pernicious to the children themselves, but to have introduced an unsound conception of the aim of education—is thus removed. We trust that its removal may lead all concerned to take a juster and more enlarged view of educational effort. But we fear it has tended hitherto, and may continue to tend until the evil effects of habit have passed away, to interfere with the curriculum of schools, and to assign in that curriculum an exaggerated place to subjects that can be tested by annual examination.

71. We believe that the fundamental scheme of instruction laid down in the Code does not, if rightly understood, make any undue demand. In the time-tables of the Schools which we have seen, there is frequently a division of subjects which might very well be treated as parts of a whole. English, for instance, ought not to be treated, as it often is, as forming several subjects, a certain time being allotted to Grammar, Analysis,

Spelling, and Composition. The subject is essentially one, and it may be treated with greater variety, greater interest, and less demand on time if it be dealt with as a whole. The subject of Nature-Knowledge, again, instead of embracing a wide range of sciences, classified under different heads, should be narrowed down to the most simple methods, and should comprise as little as possible of miscellaneous information, requiring exercise of memory rather than thought and observation. Its aim is to train intelligence and observation, not to overload the memory. If the real aim of the Code were more fully grasped, teachers would find the demands on their time much less heavy, although doubtless the substitution of intelligent and adaptive teaching, in place of methods of routine, would lay a severe burden upon the energy, the attention, and the natural aptitudes demanded from the teacher.

72. We believe that were such methods to prevail, and were the wider aims of education more fully recognised, ample time would be found for sufficient physical exercises without trespassing on the proper intellectual training of the children. But unquestionably a new conception of education must be formed. It is too much the habit to judge of efficiency by the work of each day, and to test the development of the children by their advance from week to week, month to month, and even year to year. It is not observed that the Code makes no demand as to the amount of periodical advance. The normal school career of every child is nine years. This is ample for any ordinary elementary training, and there must be something essentially wrong with our educational system if it cannot, as a general rule, give a fair mental and physical training within that time to any average boy or girl. But we shall never succeed so long as the standard of advance is measured only by the month or the year. The real educational problem is, not how many subjects can be pressed into a curriculum, but how the nine available years can be best spent, so that no essential part of the equipment for life is entirely overlooked.

73. The contrast in this respect between some of the Industrial and Reformatory Schools which we have visited, and the ordinary schools, is very marked. There is no doubt that in many of these institutions the children rescued from unfortunate surroundings, and committed by order of the magistrate, enjoy advantages which are not open to the child of respectable parents. In these institutions there is no question of overcrowded curriculum. The whole day is judiciously mapped out, and so allocated as to produce the most wholesome tone and atmosphere, and enforce sound discipline. No one would attempt to carry on such institutions with the minimum of physical exercise allotted to the children in most day schools. To pass a certain standard at a certain age is not, and never has been, the aim of the pupils in those schools. The whole effort of the staff is necessarily directed to one aim, viz., to turn those neglected children, who often have already entered on a career of crime, into sound and respectable citizens, with mind and body so trained as to enable them to start life on favourable terms.

74. We have no wish to interfere with the Industrial and Reformatory Schools, and similar institutions, and we believe that no suggestions as to physical training are necessary in their case. But undoubtedly they offer advantages which are not open to many who recognise their parental responsibility. We have no wish to suggest anything that may impair the sense of that responsibility, which is a valuable national asset. But the question remains—do our Elementary Day Schools give as many of the advantages of these institutions as if properly organised they might embrace? Have these ordinary Elementary Schools not tended rather in the direction of a lópsided curriculum, which takes little, if any, account of some essential element in the training of a good citizen? Nine years of the life of each boy and girl must be spent in these schools. Are these schools so arranged that they shall take a large place in the life of the children during these nine years; shall be to them places attractive as well as instructive; shall disregard no one of the faculties essential to fit them for their work in after life; and shall eventually turn them out with an adequate intellectual, moral, and physical equipment?

75. We fear that the answer in the case of a great many of these schools must be in the negative. This is due to no fault on the part of the teaching staff. They are called upon to put the children through a certain course of training. They feel compelled to follow certain fixed habits, and to conform to certain deeply-grounded conceptions of school work. They have not been permitted sufficient freedom of method in the past, and they seem unwilling or unable now to assume it.

76. In many of the better class Elementary Schools this produces no very harmful results. The children are well looked after at home, and they can very well devote to strictly scholastic work the hours of their school attendance. But it is not the case with the poorest schools—or, indeed, with the majority of scholars. We were struck by the fact that, in the large towns, the schools in the poorest localities were those which had fewest advantages as regards physical training and recreation opportunities. It is above all for these schools that we think a very elastic curriculum is absolutely essential, and that, at least during the earlier part of the school life, the physical and recreative part of education

is as valuable as anything of the nature of book work or brain work, and should bear a proportion to the rest of school life quite different from that hitherto assigned to it. We believe that by this means the school would become a centre of attraction; that it would take a larger place in the life of the scholars; that it would leave a deeper impression and play a larger part in their moral and physical training; and that, even with this restriction of the time allotted to them, the purely intellectual results in the pupils at the end of their school time would not only not be impaired, but would be greatly enhanced.

77. For this purpose we recommend that while a minimum of at least two hours a week, properly distributed, should be required in the case of all school children, school authorities should be at liberty, when circumstances seem to render it expedient, to assign any proportion of time which they think fit up to one out of every two school openings, to physical exercises on an improved system, games carried on under proper supervision, or occupations, also under proper supervision, of a more or less recreative character. Where weather permits it, the physical exercise or games should be conducted out of doors. Where this is not possible, they should be carried on in a gymnasium or recreation hall.

78. Comparing the time allotted to such occupations in the Higher-Class Schools (as stated to us in evidence) with that given to them in the State-aided schools, we find that while the average in the latter schools ranges from three-quarters of an hour to one and a half hours a week, in the Higher Schools from one-third to one-half is the proportion of time given to them. It must further be remembered that in the case of the Higher-Class Schools this does not probably cover the time which the scholars spend in this way during their leisure and at their homes. If we compare the Elementary Schools, where many of the scholars have little opportunity outside school hours for healthy or improving recreation, the contrast is striking. It can hardly be maintained that the time now allotted to such occupations in the Elementary Schools bears any fair proportion to that which is given in the case of children whose parents choose for themselves, and are guided, presumably, by medical advice. If the absence of such wise allotment of time is injurious to the elementary scholars, the loser is the State as a whole, no less than the individual.

79. This disproportion is confirmed by a comparison of the premises of the Higher-Class Schools with those of the Elementary Schools. In the Elementary Schools as a whole, the class-rooms compare very favourably with the Higher-Class Schools. But it is quite different when we come to compare the playground accommodation. No Higher School could subsist for a year unless it provided ample playground accommodation for its pupils. Even in the case of Higher-Class Schools under School Boards, it is evident that in most cases no expense is spared in providing ample playgrounds for the pupils; and yet the same School Boards appear to think that they have done all that is required for the Elementary Schools if, along with large and admirably-equipped school-rooms, they provide a small paved yard in which the children can get an occasional breath of air, but where games are entirely out of the question. Higher-Class Schools frequently have the use of fields of some acres in extent, situated at some distance from the school. Not in a single instance did we find that such fields were provided, even for a combination of several Elementary Schools.

80. This contrast is very striking. Money has been spent lavishly in stone and lime, where the more formal school-work can be carried on, and school-rooms have been built which excel many Higher-Class Schools. But gymnasia and playgrounds, which would not have cost nearly so much, and are equally necessary for the welfare of the poorer scholars, have been much neglected.

81. We are quite alive to the necessity for keeping expenditure within due limits, and have no wish to advise measures which would involve serious increase on the public burdens. We are convinced that larger accommodation for physical and recreative training is required, but we see no reason why it should lead to lavish expenditure.

82. We think that at present many of the children are too long confined to the atmosphere and surroundings of the school-room. We are convinced that they would be benefited by being occupied for four or five mornings or afternoons in the week in physical exercises, games, or such light instruction as might be given in conversational form to large numbers at a time, and the evidence before us leads us to believe that this might be effected without any increase of home lessons. If a certain proportion of the children—say about one-third, or about 300 in a school of 1000 children—were moved in relays to a playground or gymnasium, this would be beneficial to them, and it would largely relieve the pressure on school accommodation in large towns. Both for teachers and children it would give a much-needed relaxation, by change of scene and work. In large towns the growth of population involves a ceaseless and costly addition to school places. We are convinced that it would be of immense benefit if, for a time, the additional school places took the form of playground or gymnasium accommodation. By this means their school

life would become infinitely more attractive to the children. The change of occupation would greatly relieve the drudgery of the teachers' work, and would give them that elasticity of mind which is essential to the best efficiency. The school would enter more largely into the child's life and would assist to make up for any defects in home training. There might be less book work done from day to day, but we are convinced that the result of such a system, after a course of years, would give better intellectual results, while the moral and physical aspects of education, which are now pushed aside, would be advanced by such a process. We find a certain confirmation of this in the fact which was brought under our notice in evidence, that in half-time schools good and improving results were obtained in the case of children who give a smaller proportion of time to school work, in the strict sense, by means of an improved staff, increased attention, and a system better adapted to the circumstances of these children.

83. We think that prospective increase in the school population should, at least to a large degree, be met not by added school accommodation, but by playgrounds and gymnasia or recreation halls. How far this can be carried out in particular instances must, of course, be matter for the consideration of the Education Department and of Local Authorities. But we are convinced that where it can be carried out, the result of working by such a relay system, leading to the interchange of children between the recreation and the class-room, would be at once economical and beneficial in its results. We urge that these results be judged with patience, and not by the narrow and deceptive test of examinations recurring at short intervals.

84. There is another consideration in favour of such a system, which we are not disposed to disregard. Formerly, the voluntary element in the work of our Elementary Schools—that is to say, the assistance that was freely given by those who had a personal interest in the work—was very large. It brought sympathy to the teachers, introduced a fresh element into school life, and made the school the centre of many beneficial agencies. We think there is no scheme more likely to revive that voluntary assistance than the institution of places of recreation, which would be the common meeting-ground of a group of schools.

85. So far as physical training consists in systematic physical drill, we think it should be an integral part of the school curriculum. But equally important for the development of a healthy body is a due encouragement of sports and games. The organised game is a characteristically British institution. Foreign countries envy us the splendid moral discipline of the cricket or football field, and the debt which we undoubtedly owe to foreigners as regards gymnastics, free and applied, we are now repaying with interest in teaching them our games. But the bulk of the school population of this country have never had the advantage of this institution. In Higher-Class Schools the position of games has reached a pitch which some people regard as dangerous; there is little fear that this will ever be the case in our Elementary Schools.

86. For the proper organisation of games we believe that voluntary assistance can and should be enlisted. In most districts will be found cricket, football, swimming, boating, athletic, cross-country clubs or associations. We believe that the moving spirits in these clubs could be called upon for co-operation. But we should like to see this done systematically. We should like to see every School Board associate with itself a games committee, formed of the moving spirits mentioned above, and teachers distinguished by a love of games. To that committee might well be referred all matters connected with games or athletics, and above all, the necessary arrangements for the profitable employment of holidays and half-holidays in healthy exercise. Clubs may be found ready enough to lend their grounds and apparatus for games properly organised and under skilled direction, when they might hesitate to admit a rough crowd for mere unregulated play. The difficulty and expense of finding playgrounds may thus in a measure be mitigated. There are very few grounds in the country which are occupied by their regular tenants in the forenoon of any day in the week. The games committees of adjacent districts will naturally confer, and so the whole country be gradually covered with a network of good comradeship. We are confident that were the Department to issue an official invitation to School Boards to appoint games committees as suggested, the response would be a ready one, and a humane interest aroused which could be productive of nothing but good.

IV. CONTINUATION CLASSES, AND LOAFERS.

87. In the case of scholars over fourteen years of age, the chief means of educational influence are those afforded in connection with Continuation Classes.

88. The first question which arises in regard to these classes is, whether in their arrangements adequate weight is given to physical training, and whether its importance for youths

of the age of those attending such classes is sufficiently recognised. The next question is, whether means might be taken to enforce attendance at such classes.

89. With regard to the first question it has been suggested that, as in the case of day schools, an adequate amount of physical training should be an essential and universal condition of grant to Continuation Classes. We are of opinion that by many who attend such classes, and who gain benefit by the advanced technical instruction which may be obtained in them, any such universal rule would be resented, and would seriously interfere with the usefulness of the classes. But we are nevertheless convinced that, short of such a universal rule, applicable to all scholars in Continuation Classes, it would be reasonable to require that all groups of Continuation Classes which are recognised by the Education Department should afford adequate opportunities for physical training for those who desired to avail themselves of such opportunities; and, further, that those pupils on whose account grant was claimed under Division I. of the Continuation Class Code (*i.e.*, on account of education which is complementary to elementary education), should be required either to take part in that physical training, or to produce a certificate of sufficient previous training of the same kind, adequate to their age and strength.

90. We believe that our proposals with regard to Continuation Classes will popularise them, and that an increasing number of well-disposed young persons above fourteen will take advantage of them, and incidentally profit by the physical training which we desire to see a prominent feature in connection with them. But there will always remain a certain number of those who are not well-disposed. They are without satisfactory home influences; they lead as children a shifty existence; they contract a love of loafing about the streets; and as they grow up they fight shy of regular work, and prefer the attractions of a street corner or the shelter of a railway arch to those of any Continuation Class.

91. In considering what can be done for such young persons, we are conscious that we are in some degree trenching on the great question of vagrancy, the problem of dealing with which is now as ever under discussion, and still far from solution. Our contribution to the discussion relates to loafers and vagrants who, though not children, are yet young, and with regard to whom an experiment may be tried with greater hope of success than in the case of adults.

92. The English Vagrancy Act, 1824, of which section 4 was amended and made in its entirety applicable to Scotland by the Prevention of Crimes Act, 1871, section 15, enacts that persons committing certain offences shall be deemed rogues and vagabonds, and may be imprisoned for three months with hard labour. Included in the definition of a rogue and vagabond is, 'every person wandering abroad and lodging in any barn or outhouse, or in any deserted or unoccupied building, or in the open air, or under a tent, or in any cart or waggon, not having any visible means of subsistence, and not giving a good account of himself or herself.'

In section 144 of the Glasgow Police Act, 1866, a vagrant is defined as follows:—
'Any person who within the city is found wandering abroad, or lodging in any barn or outhouse, or in any deserted or unoccupied building, or in the open air, or under a tent, or in any cart or waggon, shall be deemed a vagrant unless he proves, to the satisfaction of the magistrate, that he has a fixed place of residence, and some lawful means of gaining a livelihood within the city.'

The Burgh Police (Scotland) Act, 1892, section 408, makes 'every person conducting himself as a vagrant, having no fixed place of residence and no lawful means of getting his livelihood,' liable to fine or imprisonment. This Act applies to every existing burgh, except Edinburgh, Glasgow, Aberdeen, Dundee, and Greenock (which may, however, adopt it in whole or in part), and to every burgh created under the Act.

93. These definitions will cover most of those whose case we are now considering. The law provides ample means of punishment. The only alternative to punishment, beyond handing over to the Inspector of Poor those who are fit objects for parochial relief, is limited to the case of those below sixteen, who can, on conviction, be committed to a Reformatory. This course undoubtedly gives a chance to the young loafer who oversteps the narrow line separating vagrancy from what can more strictly be called crime. But the expense of maintaining for a long period all who might conceivably profit by committal to a Reformatory School must be a bar to the use of the Reformatory Acts except in grave cases. What is wanted is a means of dealing with the loafer who has not overstepped the line; a remedy, not a punishment; a scheme at once practicable and economical; and one which shall be available for young persons up to the age of eighteen, not merely sixteen.

94. Some assistance in solving the problem may be afforded by a consideration of what is done for children under fourteen who commit offences against the law, or who have to be rescued from criminal surroundings, or who prove themselves confirmed truants. These

may be committed to Industrial Schools. But Industrial Schools are of three kinds : First, the ordinary Industrial School, where children are detained for a series of years ; Second, the Truant Industrial School, where they are detained for a few weeks ; Third, the Day Industrial School, where they receive their food, elementary education, and industrial training in the school, but continue to sleep at home. Can nothing be devised for young persons between fourteen and eighteen, similar to the Truant School, or the Day Industrial School ? It is extremely doubtful whether the latter can possibly be as effective in the case of young persons as of children. The attendance of a child at the Day Industrial School implies that the school has the backing of some parental influence, however slight. It may be taken for granted that no street loafer or hooligan over fourteen is subject to any parental influence whatever. But what might be done is to give a Court power, where it thinks fit, to make in a particular case of proved vagrancy a Compulsory Attendance Order at a Continuation Class, with a penalty, in case of non-compliance with the Order, of committal to the special class of school described below, to an ordinary Reformatory School, or even, in the last resort, to prison.

95. We suggest that the experiment of establishing a Short Detention School, which should bear the same relation to the Reformatory that the Truant School does to the ordinary Industrial School, might well be tried. Under the existing law a child whose case does not appear to call for a long period of detention can be committed under an indeterminate sentence, nominally expiring at the age of fourteen, to a Truant School. After a few weeks he may be licensed out on condition of attending regularly an ordinary school. If he breaks that condition, he is called back to the Truant School, and he is detained there for rather a longer term before he can earn a fresh licence. In the report of Your Majesty's Inspector of Reformatory and Industrial Schools for 1900, it is stated that, of the 34,000 children who up to that date had crossed the threshold of a Truant School, more than half had done so once and no more ; while only about one in six had had to be admitted more than twice. In the same report it is stated that the Glasgow School Board is about to open a Truant School. It would be well if some Local Authority had power to establish a similar school for the older class of whom we have been speaking. An essential condition for the success of the enterprise would be that those dealt with should not be youths whose fit and proper place is the ordinary Reformatory School. There must be discrimination. The magistrate should only commit to the Short Detention School those whom he is quite certain he ought not to commit to the Reformatory School, and the committal should not count as a criminal conviction. The Short Detention School should be as brisk and lively, as strenuous in the activity of the schoolroom and the workshop, and of the drill yard or gymnasium, as the best organised Truant School ; and a licence, conditional on regular work and attendance at a Continuation Class, should be easily earned. There seems no reason why such an institution should not be as effective as a Truant School, and we suggest that the proposal is at least well worth a trial. An objection may be raised on the score of expense, but if the experiment succeeds it will furnish an answer to that objection, because success would bring a perceptible reduction in the number of young loafers or hooligans, and a corresponding saving to voluntary subscriptions, the rates, and the Imperial Exchequer.

V. EXISTING PHYSICAL CONDITIONS.

96. Of the various factors underlying the Reference in Your Majesty's Warrant, not the least important is an enquiry into the exact state of the children in the State-aided schools and other educational institutions of Scotland, who constitute the material to which physical training may be applied, in regard to their need of it, their fitness to benefit by it, and especially the numbers and classes amongst them who, from impaired health, or bodily or mental defects, call for exceptional precautions in its application to them. On this section of our enquiry the evidence placed before us was found to be deficient ; for though opinions were freely tendered, proved facts were few, owing to the great labour entailed and special skill called for where measurements and observations upon which statistics could be based had to be made. We therefore took steps to obtain some exact evidence in detail from examinations specially conducted, which, as will be seen lower down, has produced very valuable information.

97. The chief data which we found ready at our disposal regarding the physical condition of the inhabitants of the British Isles lay in the ' Final Report of the Anthropometric Committee of the British Association of 1882-1883 (F. Galton, Chairman), drawn up by C. Roberts and Sir Rawson W. Rawson,' which embraces both children and adults ; and the most important Tables from this Report have been reproduced in the Appendix VII. Appendix.

Appendix V.

98. We were also furnished with Tables regarding the measurements of girls attending the North London Collegiate School, from Mrs Bryant, its headmistress; and regarding English and Scottish children in Industrial and Reformatory Schools, from Mr James G. Legge, Inspector of these schools. Although fragmentary and only partially applicable to the ages chiefly dealt with in our enquiry, these data were of sufficient importance to warrant their being reproduced.

Appendix I.

Appendix III.

99. Of especial value was the statistical evidence, bearing specially on our enquiry, supplied by Dr Francis Warner, the most important Tables of which appear in the Appendix to our Report. They supply information regarding the measurements of American children of school ages, which were compiled by Dr Bowditch of Massachusetts from Boston schools, and also an extensive, accurate and valuable series of statistics concerning various matters dealing with the nutrition and the mental and physical condition of 100,000 boys and girls in English schools. They are worthy of a careful study, but it is sufficient here to say that among the most striking facts which they reveal are that 3 *per cent.* of the whole were delicate or badly nourished, and 7 *per cent.* were mentally dull. One of Dr Warner's Tables embraces 50,000 English, Irish and Jewish children, and shows a percentage of Low Nutrition varying between about 4 to 6, and of mental dulness varying between 6 and 14, Irish children being 50 to 100 *per cent.* (approximately) worse than English or Jewish children, who stand nearly equal. Dr Warner's Tables further show that of 50,000 London school children, 239 were cripples, or 0.47 *per cent.*

Appendix III.,
No. 6, §§ C. and D.
Appendix III.,
No. 7.Appendix III.,
No. 11.

Appendix IV.

100. Lieut.-Col. W. G. Don, A.M.S., supplied us with information, showing that out of about 12,000 recruits examined for the Army, over 31 *per cent.* had to be rejected for diseases or defects, and as these figures refer to young men not very much over school age, they were considered as sufficiently germane to our enquiry to be preserved among the statistics bearing upon it.

Appendix II.
Appendix VI.

101. We were able to obtain statistical evidence concerning the results of physical training in improving the condition of children from Mr Thomas Chesterton and Mr Rippon Seymour, and as it was the only evidence of this nature tendered to the Commission, their figures were considered suitable to be inserted in our Records. They are valuable testimony to the benefits of physical education, as tested by the standards of height, weight, and girth.

Appendix III.,
No. 8.

102. But throughout all the evidence which we obtained, there was little which could be directly referred to Scotland and the children in Scottish schools. Only in one Table, by Dr Warner, were children of that nationality dealt with: 1600 Scottish were compared with over 5000 Jewish, 4000 Irish, and 38,000 English school children. These children seem, however, to have been domiciled in England, and to have been attending English schools. The Table dealt with a limited section only of the physical condition of children, and we could not infer that they fairly represented the children in the schools of Scotland, with whom our enquiry was concerned.

103. It was felt that further information must be obtained, in order that a correct judgment might be formed as to the subjects in Scotland to whom physical training was to be applied; as only thus could we correctly judge of the effects it was likely to produce, of the need which exists for it, and of the precautions called for in the case of the feeble and defective. Such a step appeared also to be of importance as likely to afford a basis for observations regarding the future well-being of Scottish children, and the results which an improved system of physical training may possibly have upon them.

104. It was obviously desirable that such information should include reliable statistics regarding both urban and rural children, if they were capable of being quickly and readily obtained. This, however, proved not to be the case. There was little difficulty with the towns, but to have collected sufficient numbers, under identical conditions, of children attending country schools, was recognised to be, for the moment at least, impracticable, and that to attempt to do so would vitiate the statistical results. It was therefore decided to select Edinburgh as one base of observation, and a town in a totally different part of Scotland as another to be compared with it; and for the latter we selected Aberdeen. It was considered that, in this manner, a fair representation of the state of matters throughout Scotland generally would be obtained, especially if the experts entrusted with the investigation were instructed to discriminate, in each place, between schools attended respectively by the poorest and by the better classes, and between urban and suburban schools.

105. In order to limit the time demanded for an adequate investigation, it was decided to examine, in each of these towns, 100 girls and 100 boys in each of three groups of school ages—viz., equal numbers in each year between six and nine, nine and twelve, and twelve and fifteen—which would afford ready percentages of each sex in each group, would bear prompt comparison with standard tables, and would extend over 1200 Scottish school children. This number, though not very large, would, it was expected, in the hands of such thoroughly competent examiners as the Commission would appoint to conduct the in-

vestigation, afford data so accurate as to be unlikely to vary materially from those which a larger number would have afforded, accurate work by one or two exact observers being preferable to that of many observers over a larger field, as lessening the personal error to which observations of the nature desired are so liable. The points which we considered to be most weighty in the statistics to be collected were height, weight, nutrition, mental condition, clothing, disease, and deformity, along with such other data as could readily be gathered without unduly prolonging the task of the Examiners.

106. The investigations were entrusted to Professor Matthew Hay, Aberdeen, and Dr Leslie Mackenzie, Edinburgh, and their reports are given in the Appendix.

Appendix IX.

107. We desire to record our indebtedness to these gentlemen for the full analytical reports which they presented to us, and our satisfaction with the care and minuteness which they bestowed upon the examination of the children, and the various circumstances influencing their development. The co-operation that subsisted between them in carrying out our request resulted in a harmony between the schemes of observing and recording, as pursued in the two cities, which enables the one to be satisfactorily compared with the other, and renders the joint statistics of both available for our enquiries.

Medical
Examiners'
Reports.

108. The reports and tables bear intrinsic evidence of such care and exactness on the parts of Drs Hay and Mackenzie, and their mutual understanding as to methods and results has been so complete, as to convince us that any differences between them due to the 'personal equation' are not material. Whatever discrepancies exist between the Edinburgh and Aberdeen results are due, we feel convinced, to facts, not to inaccuracies.

109. The numbers of children examined, although not large, was sufficiently great to bear a sensible relation to those upon which our standard tables are based, and to permit of a just comparison with them; the grouping of the children into the three-yearly periods of 6-9, 9-12 and 12-15 ensures more accurate averages being reached in dealing with small numbers; while the selection of an equal number of each sex from each year of life guards against the importation of any great error into the estimation of averages.

Numbers
examined.

110. The general scheme of examination which was followed was, as has been already said, in the main that which was suggested by the Commission; but it is right to mention that the credit of working out the scheme on the lines presented in the reports is due to Drs Hay and Mackenzie, who supplied, further, a number of valuable points in addition to those demanded of them. They collected spontaneously a mass of additional information which will be valued by many, anthropologists and others. They also worked out many results in their tables and reports beyond those to which we have principally to refer. The materials gathered by them are such as can rarely be obtained, and deserve a close study, embracing, as they do, much beyond the more important features to which we direct attention.

Scheme of
examination.

111. So desirous were the Examiners of reaching all attainable accuracy, that several special original measuring instruments of superior delicacy and trustworthiness were devised by Professor Hay, and used by the Examiners in making their observations.

112. Although the data collected by the Examiners did not exactly realise the expectation of the Commissioners, that a distinction could be drawn between urban and suburban schools, whereby we would be provided with information regarding the condition of town and country children in Scotland, inasmuch as such a distinction between the schools was found impracticable in Aberdeen, yet to some degree they did so, as Edinburgh permitted a comparison nearly approaching to this in the cases of the Bruntsfield School attended by children of a better class, and the North Canongate School attended by children from a very poor district. Further, when these Aberdeen schools, with a better class of children than in the metropolis, are compared with the Edinburgh schools, which embrace a lower class of children, inferences regarding the comparative condition of the school children of Scotland as a whole may, with considerable accuracy, be drawn. It may be assumed, with little if any risk of error, that the Aberdeen schools fairly represent the School Board children in Scotland generally, and can be contrasted with the scholars in the larger towns, such as Edinburgh, Glasgow and Dundee.

Representative
nature of the
observations col-
lected.Edinburgh Report,
Table I.*Edinburgh, Table
I.

Aberdeen, Table I.

113. With these explanatory general remarks, we proceed to draw attention to the details of the information conveyed in the Examiners' reports, selecting, however, only the points bearing most strongly upon our remit, and referring to the reports themselves for the other subjects of interest in which they are so rich.

114. The idea suggested by the Examiners of obtaining information regarding the housing of the children has proved a fertile one. They ascertained the number of rooms inhabited by the family from which each child was drawn; and while all the school buildings, both in Edinburgh and Aberdeen, were ascertained to be at least fair in

Schools, housing,
health and nutri-
tion of children.

* N.B.—The Reports and Tables referred to in the margin will be found as follows:—

Edinburgh Report and Tables, Appendix IX., p. 76 *et seq.*

Aberdeen Report and Tables, Appendix IX., p. 101 *et seq.*

Tables I,
Aberdeen and
Edinburgh.*

respect of plan, ventilation, heating, etc., so that the manner in which each school influenced the condition of the children differed little, one from the other, it was otherwise with the houses where the children resided.

Aberdeen, Tables
XIII. and XIV.

115. The number of the rooms furnished a good indication of the social status of the children. In Aberdeen, 'the balance, in respect of health and development,' was found to be 'in favour of children drawn from three- and four- (and upwards) roomed houses,' and that city, most of whose school children were drawn from three-roomed houses, had the advantage over Edinburgh, whose children were drawn mostly from two-roomed houses. 31·3 *per cent.* of the Aberdeen children lived in three-roomed houses, while in Edinburgh, on the contrary, the predominant number, 35·32 *per cent.*, lived in two-roomed houses. Indeed, of all the Edinburgh children, 45 *per cent.* lived in very small, *i.e.*, one- or two-roomed houses.

Aberdeen, Table I.
Edinburgh,
Table I.

116. The ratio of health in both cities harmonises with these facts. Thus there are among all the children examined in Aberdeen, 0·5 *per cent.* in apparent poor health, while in Edinburgh there are 19·17 *per cent.*¹

Poor health.
Tables III.,
Aberdeen and
Edinburgh.
Bad nutrition.
Edinburgh and
Aberdeen, Tables
III.

117. The same tale is told by the statistics regarding the condition of nutrition of the children. Aberdeen shows 9 *per cent.* of its children badly nourished, while Edinburgh shows 29·83 *per cent.*²

Edinburgh and
Aberdeen, Tables
II.

118. And, similarly, mental dulness was noted in 8·8 *per cent.* of the Aberdeen children, compared with 12·33 *per cent.* in Edinburgh.³

Aberdeen, Table
III.
Edinburgh Report,
p. 77.

119. The same connection between housing and health is apparent in other ways, of which only the fact that in Aberdeen the 'thin' children are drawn in larger proportion from the poorer houses need be adverted to. The Examiners were so impressed by the intimate connection between housing and health, that Dr Mackenzie remarks that the inferiority in health is not due to defective schools, which are relatively more hygienic than the homes, and that the houses wherein the children live are reflected as to their quality by the height, weight, and nutrition of the children.

Edinburgh Report,
p. 87.

120. We cannot doubt that the quality of the houses where the children live corresponds, among other adverse factors, with the quality of the food they receive, and assent to the justice of Dr Mackenzie's comment on the difference between the Bruntsfield and North Canongate schools (the best and worst of those examined in Edinburgh), where he remarks that 'among the factors that produce' this great deterioration among the children in the North Canongate School, 'housing and food must be regarded as the chief. Race 'can scarcely count for much.' The verdict is equally true of the difference between Aberdeen and Edinburgh. Race fails to have any apparent bearing on the matter, judged by the cephalic index, one of the most abiding signs of race. Edinburgh, with an index almost uniformly just over 78, should show, were race the chief cause, a less striking contrast between its schools than Aberdeen, where there is more uniformity of conditions among the children of the different schools, though the co-existence of unfused races is greater, as shown by the cephalic index, varying between 81·4 and 78·5.

Edinburgh, Table
IV.

Aberdeen, Table X.

Height, weight
and girth.

Aberdeen, Tables
X.-XII.
Edinburgh, Tables
IV.-VB.

121. An affinity exists between conditions of nutrition and health of body and mind, on the one hand, and measurements of height, weight and girth on the other. We are supplied with data regarding the latter in Tables X., XI. and XII of Aberdeen, and in Tables IV., V., VA., and VB. of Edinburgh, and they present a general correspondence with the incidence of the former which we have just discussed. The Edinburgh children are, throughout, much below those of Aberdeen in height and weight, and that to a somewhat startling degree. Perhaps the matter may be most readily focussed by saying, that while the Edinburgh *adult* man is 1½ (1·56) ins. taller, and 12½ (12·7) lbs. heavier than the *adult* male Aberdonian (Report of the Anthropometric Committee, Table III.), the Edinburgh average school child is 1·35 ins. shorter, and 4·97 lbs. lighter than the Aberdeen school child. This shows a serious deficiency somewhere in Edinburgh. The Aberdeen child (and both sexes and all ages from six to fifteen are included in all these computations) is 0·07 ins. taller than the average British child, but weighs 0·63 lbs. less. The British child stands 0·86 ins. less, and scales 2·3 lbs. less than the American child. The Edinburgh child is the worst of all four, being 1·28 ins. shorter and 5·61 lbs. lighter than the British standard. The facts may be given, in slightly greater detail, in the following table:—

¹ It may be noted that Mrs Sidgwick gives the proportion of apparent poor health in English college girls as about 11 *per cent.* App. III., No. 2.

² Against 3·52 *per cent.* of English school children, as shown in Dr Warner's Tables (or 4·03 *per cent.* of children of English nationality only). App. III., No. 6, § C, and No. 7.

³ Dr Warner gives 7·39 *per cent.* for children in English schools, and 7·20 *per cent.* for children of English nationality. App. III., No. 6, § D, and No. 7.

* *N.B.*—The Reports and Tables referred to in the margin will be found as follows:—

Edinburgh Report and Tables, Appendix IX., p. 76 *et seq.*
Aberdeen Report and Tables, Appendix IX., p. 101 *et seq.*

*Comparative Table of the Height and Weight of British, American, Aberdeen
and Edinburgh School Children.*

			British Population. Roberts.	Boston School Children. Bowditch.	Aberdeen School Children. Hay.	Edinburgh School Children. Mackenzie.	London School Girls, English. Mrs Bryant.
Height,	boys	Ages. 6-9	ins. 45·67	ins. 46·15	ins. 46·0	ins. 44·52	...
	girls	6-9	44·64	45·89	45·4	44·51	...
	boys	9-12	51·68	52·10	51·2	50·20	...
	girls	9-12	50·96	51·72	50·9	49·93	53·66
	boys	12-15	57·07	58·34	57·3	55·26	...
	girls	12-15	57·74	58·74	57·4	55·65	60·61
Weight,	boys	6-9	lbs. 49·6	lbs. 49·68	lbs. 51·1	lbs. 46·60	...
	girls	6-9	47·1	48·25	47·9	45·62	...
	boys	9-12	66·6	66·32	64·0	59·53	...
	girls	9-12	61·8	63·95	60·9	57·76	...
	boys	12-15	83·7	89·12	84·5	74·02	...
	girls	12-15	86·7	90·95	83·3	78·36	...

122. No great amount of argument is required to bring home to everyone the significance of such facts as these. Height, weight, pallor, bad health, bad nutrition, want of alertness, and bad carriage, besides other conditions not noticed here but dealt with in the reports, distinguish Edinburgh adversely throughout as compared with Aberdeen, and even Aberdeen, which probably is fairly representative of Scotland generally, as compared with the standard of the British Islands, leaves something to be desired.

Edinburgh and
Aberdeen, Tables
III.*

123. There seems no possible way of impugning the validity of these data. Some differences in the manner of collecting the facts or of making the measurements no doubt exist among different observers and authorities. The Anthropometric Committee, for instance, weighed with shoes on, our Examiners without shoes. It is also well known that no two examiners, however skilful and conscientious, will ever obtain exactly the same results; but, after making all possible allowances for those and other sources of error, there clearly exists a stratum of degeneracy in Edinburgh not reached in Aberdeen; and if Edinburgh be taken as a type of Glasgow and such towns, and Aberdeen as a type of the healthier towns and country districts of Scotland, the true state of school children in Scotland will be found to have been gauged with a near approximation to the truth. The more Drs Hay's and Mackenzie's reports are studied, the more they are found to present a harmonious mass of diverse observations of the most varied nature, all pointing in the same direction.

124. The question of race, as bearing on the Examiners' reports, has been carefully considered by the Examiners themselves, and likewise by us. Statistics were collected regarding the colour of the hair and eyes, and measurements of the skull with calculation of the cranial indices were made in both cities. They revealed more complete amalgamation of races in Edinburgh, signs of purer unfused races being more prevalent in Aberdeen, where there were greater variations in the cranial indices, which are, as already mentioned, one of the most permanent and reliable race signs.

Race.
Aberdeen, Table
V.; Edinburgh,
Table VII.
Aberdeen, Tables
X., XI., XII.;
Edinburgh, Tables
IV., V., VA.

125. Our attention was directed to the subject of progressive deterioration of the town inhabitants of our islands by a section of the Report of the Anthropometric Committee (§§ 65, 66),¹ and by the evidence of Mr James G. Legge, and others. The figures and facts bearing upon it are few. We are not called upon to arrive at a decision as to whether or not there exists a progressive deterioration of the slum population of Great Britain or of the inhabitants of its large towns as a whole. It is enough that we find, by comparing the statistics of Aberdeen and Edinburgh, and quite as much by comparing those of the better with the poorer schools in Edinburgh itself, evidence that, whatever may be the case with the population as a whole, there exists in Scotland an undeniable degeneration of individuals of the classes where food and environment are defective, which calls for attention and amelioration in obvious ways, one of which is a well-regulated system of physical training.

Degeneracy.
Mr J. Cantlie,
5705-811.
Appendix I.

¹ Appendix VII., p. 71.

* *N.B.*—The Reports and Tables referred to in the margin will be found as follows:—

Edinburgh Report and Tables, Appendix IX., p. 76 *et seq.*
Aberdeen Report and Tables, Appendix IX., p. 101 *et seq.*

Edinburgh Report, p. 87.* 126. Dr Mackenzie's remarks on social selection are worthy of attention, and his observations on the feeding and clothing of school children in Edinburgh are of an importance which it would be hard to over-estimate. We believe that the same Examiner touches appositely the effects of the degeneration which is going on, when he says that children ill-nourished and over-stimulated are older in experience than years, extremely alert but not very continuous in attention, and are better adapted to the casual life of the street than to the persistent system of school discipline.

Edinburgh Report, p. 80. 127. A large part of our attention was directed towards ascertaining with certainty what diseases and deformities exist among children at school years, and the report of our Examiners in Edinburgh and Aberdeen were of service in providing us with definite information regarding this matter, in respect of those attending Scottish elementary schools.

Disease among school children. 128. In analysing these reports, attention naturally turns in the first place towards any signs that may indicate the degree of vigour of growth possessed by the Scottish child, and one point only among those that they contain can, we conceive, be used as a means of measuring this—viz., the date at which the teeth appear above the gums. The successive eruptions of the various teeth are the milestones, as it were, by which nature marks the progress of the individual's struggle towards the attainment of full growth. Contrary to what might have been anticipated, the children of Edinburgh are ahead of those of Aberdeen in this respect, exhibiting a percentage of only 7·45 of delayed dentition, as against 18·7 in the latter city. We do not obtain any explanation of the strange fact that the Edinburgh child, in the race towards maturity, is ahead of his taller and weightier brother in Aberdeen. Possibly it may be connected with the well-known tendency, witnessed both in plants and animals, of an individual living under conditions adverse to his survival in the struggle for existence, to hurry through the stages of a short and stunted life towards a precocious brief period of maturity.¹

Vigour of growth. 129. Next in order to engage the attention comes the power of the constitution to resist enfeebling diseases, as tested by the prevalence of tuberculosis and such similar ailments as fasten by preference on those who are naturally or artificially below the average of strength.

130. Selecting these ailments from the reports, we find the following percentages:—

	Percentage of children affected with—	Aberdeen.	Edinburgh.
Abdn., Table IX. Edin., Table XI. Abdn., Table VIII.	Diseased glands (mostly tubercular)	2·0	18·5
Edin., Table X. Abdn., Table IX.	Nose and throat disease	30·0	52·54
Edin., Table XI. Abdn., Table IX.	Lung disease	1·8	3·0
Edin., Table XI.	Heart disease ²	1·0	4·33

Glands. 131. Dr Mackenzie, on the subject of diseased glands, remarks that tubercular glands are common, and are most numerous in the poorest Edinburgh schools, and fewest in the best. It is only necessary to add that it is chiefly through the channel of these glands that tubercle enters the system.

Edinburgh Report, p. 95. 132. The great prevalence of nose and throat disease is of importance. About one-half of the cases of throat disease were naso-pharyngeal adenoids, which impede physical development, retard growth, produce mouth breathing and the dangers which it entails, and lead to deafness and ear disease.

Throat disease. Edinburgh, Table X.
Aberdeen, Table VIII.
Lung disease. 133. Although lung diseases furnish a comparatively small percentage, yet their total, as inferred from the results of the limited number of children examined, must be very considerable, and their very serious import is familiar to every one. Dr Mackenzie states that they alone prove the need of systematic medical inspection, as he found children suffering from phthisis undergoing serious physical exercises even in the best of the Edinburgh schools which he examined.

Heart disease. 134. Heart disease, whose grave consequences are well known, was found in a relatively small, but absolutely large, number of cases.

135. From the remarks of both Examiners we learn that both unsuspected phthisis and valvular heart disease form a sensible danger among school children both in Edinburgh and Aberdeen, and that probably more of each existed among the children examined than was discovered.

Edinburgh Report, p. 97. ¹ The large numbers of the children in both towns who present decayed teeth is remarkable, but the bearing of this upon Physical Education is an indirect one.

² Dr Warner gives the percentage of English school children affected with heart disease as being 0·001. App. III., p. 50.

* *N.B.*—The Reports and Tables referred to in the margin will be found as follows:—

Edinburgh Report and Tables, Appendix IX., p. 76 *et seq.*
Aberdeen Report and Tables, Appendix IX., p. 101 *et seq.*

136. We remark with satisfaction that diseases of bones and joints were found in both cities in smaller numbers than might have been looked for. They existed as below :—

	Edinburgh.	Aberdeen.
Bone disease	2·17 per cent.	3·0 per cent.
Joint disease	0·17 „	0·2 „

Bone and joint disease. Edinburgh, Tables VIII. and IX.* Aberdeen, Tables VI. and VII.

137. The next subject that calls for comment is the class of diseases which, while not so much menacing the life of the individual child, interfere seriously with his capacity for receiving mental, and likewise impair his power of acquiring physical, training. These are diseases of the eyes and ears. They were found to be present in the following percentages :—

	Dr Warner, English Schools.	Prof. Hay, Aberdeen Schools.	Dr Mackenzie, Edinburgh Schools.
Diseases of refraction of eyes interfering with vision	23·9	31·67
Diseases of eyes and eyelids	2·92	12·2	15·5
Diseases of ears causing defective hearing	14·0	42·04

138. Of these we need only remark that, from children whose eyesight is defective and not corrected by appropriate lenses, or whose hearing is impaired, good work, mental or physical, can hardly be expected. The number of children with defective hearing is surprisingly large.

139. The number of cases of catarrh of the eyes (conjunctivitis and blepharitis), about 5 per cent. in each city, is not without its lesson, as such diseases are capable of being spread by contagion.

140. Last among the classes of disease concerning which we are provided with data by the Examiners are those physical disabilities which, interfering little, if at all, with mental training, yet form a factor in the enquiry into physical training which we should not be justified in overlooking.

Diseases, etc., interfering with Physical Training alone.

Such are deformities—congenital and acquired—ruptures, rickets, and the like.

141. We learn that in Edinburgh there were 10 cases of acquired deformity, or 1·67 per cent. Edinburgh, Table XI.

142. In Aberdeen we are informed that there were 5 cases of hernia, 2 cryptorchides, 2 flat-feet, 4 curvatures of the lower limbs, 7 cases of rickets, and 1 badly united fracture; 21 in all, or 3·5 per cent. Aberdeen Report, p. 110. Aberdeen, Table IX.

143. Relatively these numbers are small; but if the same average be maintained, they will amount to 500 cases in Edinburgh and 875 in Aberdeen of children requiring ‘special-care’ in physical training. If to these be added the 4·33 per cent. of heart and 3 per cent. of lung cases in Edinburgh, and in Aberdeen the 1·0 per cent. of heart and 1·8 per cent. of lung diseases, and perhaps the bone and joint diseases as well, the total will work out above Dr Warner’s¹ estimate for England of 0·811 per cent. of special care children.

144. The prevalence of disease among the school children in the cities of Edinburgh and Aberdeen is scarcely fully realised when attention is fixed upon percentages alone. A re-statement on other lines may be helpful in bringing out fully the conditions which have to be dealt with. If the ratios observed by the Examiners be admitted, and it may be gathered from their reports that they did not overstate the case, there are in Edinburgh Board Schools 700 cases of unrecognised phthisis and 458 in Aberdeen, and 1300 cases of unrecognised heart disease of a dangerous nature in Edinburgh and 250 in Aberdeen. Of lesser ailments there are in the Edinburgh schools 15,000 children affected with disease of the throat and 7580 in Aberdeen, and 12,000 cases of ear disease in Edinburgh and 2250 in Aberdeen.² Edinburgh Report, p. 100. Aberdeen and Edinburgh Reports on the question of Medical Inspection.

145. Of ailing children in the Edinburgh schools there is, even if only half the number of those reported be computed, a total of 10,500, and in Aberdeen 5708, all of whom are in need of medical attention.

146. Perhaps the most striking evidence that was laid before us in support of the absolute necessity of a better medical supervision of school children is the statement contained in the Edinburgh Report, that out of the total of 299 male children examined in Edinburgh, 259 showed some defect, however remediable, of the ears or throat, and that out of the 298 female children examined, 294 showed the same condition of disease. Edinburgh Report p. 93.

¹ His scheme of examination, however, probably entails his figures being under the truth.

² The total school children of Edinburgh and Aberdeen are taken as being 30,000 and 25,000 respectively. (See Vol. II. Minutes of Evidence, Miss Stevenson, Q. 2287; Mr Craigen, Q. 3058.)

* N.B.—The Reports and Tables referred to in the margin will be found as follows :—

Edinburgh Report and Tables, Appendix IX., p. 76 et seq.
Aberdeen Report and Tables, Appendix IX., p. 101 et seq.

Bearings of the
Aberdeen and
Edinburgh Re-
ports on Physical
Education.

Edinburgh Report,
p. 79.

147. The state of Edinburgh as regards its school children is so much worse than Aberdeen that it is from the former chiefly that comprehensive deductions regarding the nature and limitations of physical training must be drawn. The present system of physical education is, in the face of the facts presented, quite unsatisfactory, as shown, for example, by Dr Mackenzie's note that 'excessive strain' coincides with the largest proportion of heart affections in the London Street School, where Sandow's system is taught, and by his very proper reflection that, 'when the selection is left practically to the wish of the pupil, or the parent, or the superficial inspection of the teacher, or the Code standard in which the pupil is studying, the danger of damage is not to be disregarded.'

148. We are impressed with the weight of the evidence here set forth in regard to the number of children in Scottish schools—in the aggregate a very considerable quantity—whose conditions of health warrant us in drawing particular attention to the precautions that it is necessary to take in perfecting a system of Physical Training. Foremost among such precautions we hold that provision should be made for regular Medical Inspection of the children in all Schools.

149. We consider that it is highly desirable that an investigation similar to that conducted in Edinburgh and Aberdeen should be undertaken at an early date among the school children of Glasgow, in order that, along with those of Edinburgh and Aberdeen, its results may lay the foundation of a statistical medical census of Scotland.

VI. MEDICAL INSPECTION.

150. The defects to which we have alluded in connection with the medical data now available point to a very serious defect in our school organisation to which we desire to call special attention. This consists in the absence of any general or adequate system of medical inspection. Such a system is urgently demanded mainly for remedial objects, but also in order to make available information of the highest value both for ascertaining the facts of national physique and the means that may be adopted for its improvement, or for retarding such degeneration as may be in progress.

151. It is impossible to get beyond mere guesswork except by a steady and continuous collection of facts, and the only feasible way of getting at such facts is by weighing and measuring and carefully estimating the conditions as to health or disease, and the development and growth or decay of school children. It is only at this age that a complete examination of the population can be obtained; and for the pupils themselves, as well as for the nation, as a whole, it is of vital importance, as is shown in Part V., page 21, of our Report, that this opportunity should not be lost.

152. But there are other objects to be gained by such medical inspection. No uniform rules appear to prevail as to the granting of medical certificates of illness; as to the detection of infectious diseases and the adoption of the most efficacious means for arresting the spread of such diseases as affected by school arrangements. It is only by skilled medical inspection that defects in the organs of sight and hearing, or in mental development, or such physical weakness or state of nutrition as may demand special treatment in connection with school work can be detected. We feel convinced that some of the prevailing defects in health and physique might be very materially mitigated, if not removed, by a little timely attention, and by the careful inculcation of some simple rules of health and of the proper means of conserving physical strength and of developing physical faculties, which are now too often completely neglected or ignored. These must be taught early, if they are to become matters of habitual practice.

153. We think that sanitary inspection of a thorough and careful kind beyond what exists at present is called for. This is urgently necessary in regard to a matter to which we think it right to call special attention, viz., the too frequent neglect of the proper ventilation of schoolrooms. It is often found that, even in large and well-constructed rooms, the atmosphere is allowed to get into a condition that must be detrimental to health, and this is much more marked where the schoolrooms are inadequate to the attendance, and where they are not provided with proper means of ventilation. The question of ventilation is a difficult one, and sometimes it is found that the most modern and carefully constructed systems are not satisfactory in operation, owing to the want of expert skill on the part of those in charge of them. But it is at least certain that, while ventilation of a fairly satisfactory kind may be provided for in any properly constructed school at a comparatively moderate expense, this must be combined with proper methods of heating. Where a schoolroom is not sufficiently heated, it is plain that on a cold day, windows, and indeed every aperture by which air is normally admitted, are kept almost hermetically closed, so that good ventilation is practically impossible.

154. Defects of this kind are, we understand, carefully observed by the Inspectors on their visits to schools, and form the subject of very frequent comment and criticism. Such criticisms produce a certain effect; but it must be remembered that these visits are only occasional, and that the matter is one which requires constant care and watchfulness. The fact is indisputable, however, that even in schools constructed at great expense, and with what are considered to be highly efficient systems of ventilation, the atmosphere in which teachers and scholars spend so many hours each day is not such as can be considered consistent with healthy conditions. This can only be remedied by the exercise of constant vigilance on the part of school managers, upon whom the primary responsibility rests. We are also of opinion that much will always depend on the watchfulness of the headmaster, and it may be reasonably expected that, as questions of school Hygiene come to be more generally regarded as forming an important part of a schoolmaster's training, such matters will be more and more studied, and the teacher will realise more fully than the average master or mistress of a country school does at present, that by neglecting the proper ventilation of a classroom, he is endangering his pupils' health, and that attention to such a matter is as essential a part of his functions as the imparting of knowledge or the enforcing of school discipline.

155. We also desire to call serious attention to the too frequent neglect to keep the latrines and offices of the schools in proper order, and to have them regularly cleaned. 'Too many teachers,' we are told, 'seem to regard extra-mural decency as beyond their province.'

156. We are informed that managers in the rural districts leave the matter, as a rule, in the hands of a local tradesman, who may have no qualification for measuring the proper standard of cleanliness and propriety. This is a matter in which very great improvement is urgently demanded, and its influence upon the general tone, as well as the health, of the pupils is obvious.

157. We think, therefore, that school authorities should have better means of obtaining adequate medical assistance in connection with their work.

158. We suggest that the medical officers of burghs and counties should, where their services can be obtained, act as referees and consulting officers to whom the School Boards within the area should be able to resort for advice in regard to special difficulties; and that, where this is not the case, special officers should be appointed for the purpose. They should receive reports from local medical officers, and, if necessary, call the attention of the school authorities to any striking features in these reports. Their remuneration might take the form of a retaining fee proportionate to area and population, perhaps not exceeding £100 a year; and in our opinion it ought to be borne by Imperial funds.

159. Next, it should be the duty of the district medical officers to visit and report upon all the schools in their district, being remunerated by a certain fee for each school proportioned to the number of scholars. They should certify as to the school being closed or re-opened on account of infectious illness: should decide on the questions that emerge in cases of infectious disease in particular children: should furnish the certificates required in the case of children withdrawn from school: and should prepare statistical reports upon the physical condition of the pupils of the schools. They should be in touch with the school authorities, and should be paid by these authorities, although we think that a certain grant in aid of such remuneration should be paid out of the Parliamentary Vote. They should also report on special points, as occasion may require, to the county medical officer.

160. Lastly, we think that great assistance might be given to the school authorities by the appointment, to serve under the Education Department, and as supplementary to the present inspecting staff, of a certain number of Sub-Inspectors, to make occasional visits to the schools for the purpose of examining their sanitary conditions, and the health and cleanliness of the scholars. The assistance of women might often be useful in this work, so far as it regards the girls and infants, and the effect of physical training in their case.

VII. FEEDING.

161. We consider that the question of the proper and sufficient feeding of children is one which has the closest possible connection with any scheme which may be adopted for their physical, and equally for their mental, work. It is evident that among the causes which tell against the physical welfare of the population, the lack of proper nourishment is one of the most serious. The subject demands special notice, not only as regards the existing state of affairs, but still more in view of any increase of physical training throughout the State-aided schools which may commend itself.

Mr Struthers, 123.
Mr Scougal, 1754.
Miss Stevenson,
2390.
Dr Wm. Bruce,
5401.
Prof. Hay, 6802.
Dr L. Mackenzie,
7167.

162. A large number of important witnesses, members of the medical profession, Inspectors of schools, representatives of School Boards, teachers, and others, were questioned on this subject. They were unanimously of opinion that it was most desirable that increased attention should be paid to the feeding of children attending the State-aided schools. We entirely endorse that opinion, but, before indicating the course which we recommend, we think it right to point out some of the difficulties surrounding the general question.

163. We are aware that School Boards, as a general rule, have no power at present to deal with this question. They have no power to spend money from the school fund upon food, clothing, or lodging. Even if they make themselves the agents for supplying these, they act as a voluntary body, and not strictly under their statutory powers. There are, however, certain exceptions. School Boards may pay for board and lodging for blind, or deaf and dumb, children. Under the Act of 1872 (35 & 36 Viet. c. 62) they may establish Certified Industrial Schools, but they have never done so. Under the Act of 1893 (56 & 57 Viet. c. 12) they may establish Day Industrial Schools, and we have seen such a school in Edinburgh doing admirable work. Under the latter Act they can also contribute to a Certified or Day Industrial School and to the maintenance of any inmate of such school.

164. But we have had here to consider a serious difficulty. The lack of power in the hands of School Boards might easily be supplied by the extension of such agencies as the Juvenile Delinquency Board in Glasgow, which acts under a special private statute, and whose good work we saw at the Mossbank Industrial School for boys. These institutions certainly give to boys or girls who come under their influence advantages as regards physical conditions which are not open to the children of independent and respectable though very poor parents. The contrast between the condition of such children as seen in the poorest day schools and the condition of the children of parents who have altogether failed in their duty as seen in the 'Empress' Training-Ship, at Mossbank, and in similar institutions where sufficient feeding and physical training is given, is both marked and painful.

165. The powers of School Boards might, no doubt, be increased in the direction of establishing a system of better feeding, but this raises serious questions. It is matter for grave consideration whether the valuable asset to the nation in the improved moral and physical state of a large number of future citizens counterbalances the evils of impaired parental responsibility, or whether voluntary agency may be trusted to do this work with more discrimination and consequently less danger than a statutory system.

Mr Legge, 761.

166. Another remedy has been proposed, namely, that some simple fare—adequate to health—should be provided, and that parents should be compelled, in the absence of evidence that their children do otherwise obtain necessary sustenance, to pay something in the nature of a fee for that food, with the alternative of applying to the Poor Law authority (as they formerly did in respect of school fees) when they could not pay. Such a system would, of course, require legislation.

167. We are aware of the danger of further encroaching upon the independence of parents, and of entering upon the wide question of how far the State should go in relieving them of their primary responsibility. But we are not on that account deterred from calling attention to the necessity for better feeding, which, in our opinion, has been fully demonstrated, nor from considering a practical remedy. We have no desire to give encouragement to any inclination of the parent to abandon any of his duties and responsibilities in regard to the feeding and clothing of his children; but it must be remembered that, with every desire to act up to their parental responsibility, and while quite ready to contribute in proportion to their power, there are often impediments in the way of the home provision of suitable food by the parents. The proper selection, cooking, and preparation may often be matter of serious difficulty to many parents. It would be in many cases an inestimable advantage could regular and sufficient meals—such as broth, porridge and milk, or bread and milk—be provided at a minimum cost. The preparation and cooking of these meals, where it is found necessary to provide them, ought to be regarded as one of the charges incident to school management.

168. In like manner we think that an obligation for the proper supervision of the feeding of those who come for instruction should be regarded as one of the duties of school authorities, and that teachers should be instructed to take note of all children apparently ill-fed. Unless children receive sufficient nourishment, they cannot be expected to profit by the mental or physical training provided for them.

Miss Stevenson,
2390.
Mr G. W.
Alexander, 2951.
Mr Craigen, 3194.

169. We were informed by some of the School Board representatives, notably from Edinburgh, Glasgow, and Aberdeen, that in these towns the Boards co-operated in this matter with philanthropic agencies, and caused enquiry to be made, so that practically most of the necessitous cases were relieved.

170. In another case, that of a country district, where the children of the ploughmen and

farm labourers were the poorest, a system of providing broth and bread at the school during the five winter months was carried out, with the approval of the parents. A small charge was made to cover the cost. We believe that similar attempts have been made elsewhere with much success, and we do not see why they should not generally prevail.

171. We also had the advantage of hearing the evidence of a member of the London School Board, who informed us that they recognised it as their duty to see that the children were fed, but not at the expense of the rates. For this purpose the Board appointed a special Under-Fed Children Sub-Committee, which was in touch with the various voluntary agencies, with the result that, as we were even assured by the same witness, there are now practically no cases of under-fed children attending the London Board Schools. But we are entirely of the opinion, frequently expressed by many of the witnesses, that any scheme for the provision of meals, either for necessitous cases or as a matter of convenience, should be voluntary or self-supporting, and not fall upon the rates.

172. Accommodation and means for enabling children to be properly fed should, we think, be provided either in each school or in a centre; but, except a limited sum to provide the necessary equipment, no part of the cost should be allowed to fall on the rates. There are few or no districts where concerts or other entertainments by the school children could not be successfully organised to raise funds to meet any deficiency.

173. In this connection we are fully sensible of and thoroughly appreciate the good work which has been accomplished by individual enterprise and voluntary effort; and we strongly recommend that there should be hearty co-operation between the voluntary agencies and School Boards.

174. If the steps we have indicated, as in our opinion at present advisable, fail to effect a substantial improvement, we consider that some compulsory powers, if necessary, should be obtained for the purpose of dealing with parents on the ground of neglect, whilst, if the cause be poverty, recourse should be had to the parochial agencies of poor relief.

VIII. A NATIONAL SYSTEM OF PHYSICAL TRAINING.

175. The introduction of a fully-organised system of physical training into the State-aided schools of Scotland involves a new set of conditions and new methods of dealing with them. Unlike mental training, physical training has not been formed into a well-arranged system by the results of centuries of experience. Springing up in recent years, it has elicited a series of systems and theories, each of which is as yet imperfect or insufficiently tested. At the point which we have now reached these have to be sifted and analysed, so that out of each may be selected that which has most approved itself; and the defects of each have to be avoided, if the youth of the country are to receive the fullest benefit of an improved physique, and if harmful results are not to ensue. It is admitted that physical training may, if unsuitable or badly taught, be injurious to the young, that some exercises are unfitted for both sexes at certain ages, and that special weaknesses or defects may be aggravated if exercises are improperly carried out; but, on the other hand, even weakly or ill-formed children may receive the greatest possible benefit from physical training carefully devised.

176. The various systems brought to our notice are as follows:—

(1) *The Swedish System*, admirable in theory, and nearly perfect in its adaptation of certain exercises to attain certain results, is stated to be defective, inasmuch as it is exhausting, and tends to 'staleness' if thoroughly carried out, and its lack of interest and variety renders it unsuitable as a system to be pursued throughout nine years of school life. But selected exercises from it should form part of a wider and more varied whole.

(2) *The German System* is said to be remarkable for the development of ambidexterity, which proves valuable in many trades after school life. Objections taken to it are its abnormal development of muscle and non-athletic tendency, and that it requires the use of heavy apparatus.

(3) *The Swiss System* has many good points. It aims at skill and activity. Children while at practice sing Tyrolese songs, and its advocates assert that it gives refreshing mental rest after school study. One witness, however, attributed the high rate of heart disease in Switzerland to the use, by the elder boys, of too heavy staves while undergoing the training.

(4) *In France* there have been frequent changes of system. After the war of 1870 French physical education took the form of gymnastics and military exercises. A full account of the French systems and their results will be found in the evidence of a witness who has made them a special study, and who has had practical experience both of Lycée and University life. A brief summary may be noted here:—gymnastics with apparatus

were everywhere rendered obligatory, and the movements in favour of military drill culminated in the creation of military cadet corps in the schools, both primary and secondary. But these cadet corps, known by the name of *bataillons scolaires*, after a brilliant beginning, fell into discredit, and the last of them was suppressed in 1890. The causes of failure seem to have been (a) the cost, which was out of all proportion to the results obtained; (b) many of the results were unsatisfactory—for instance, the children affected the manners and language of the drill-sergeants, and imported into the playground the phraseology of the barracks, until the deterioration in the manners of the children set the teachers against the system; (c) the regular officers also became hostile, for they found that the too early specialisation for the child was a bad preparation for the recruit. For a time, private gymnastic societies flourished, and were recruited mainly from the primary schools, but these aimed less at the increase of the respiratory powers than at the formation of muscle by exercises with apparatus. The system pursued by the private societies is gradually giving way to the *Gymnastique raisonnée*, which is now being adopted both at the school for military instructors at Joinville le Pont and by the primary schools. It is founded on the Swedish plan. British games and sports, it may be added, are finding an increased number of admirers in France.

(5) *In America* each State has its own system; many are of great variety and excellence. One witness, however, deposed to having observed in them an undue predilection for 'records.'

Mr A. Alexander,
8986-7.
General Chapman,
9275.
Col. Fox, 7904-5.

(6) *Sundow's system*, valuable as it is stated to be for adults, involves an amount of concentrated attention which does not recommend it for the use of children; but some of the movements, notably the breathing exercises, as we saw them practised at the London Orphan Asylum, produce very good chest development, and may well be incorporated in a model system.

177. *A system of military drill*, pure and simple, is, of course, unfitted for small children. Some kind of drill, however, must of necessity form the basis of any training applied to a number of persons, whether adult or young, in order to move them, or to exercise their limbs and bodies, in concert.

178. A number of *Manuals* of school exercises, used in different schools in England and Scotland, have been brought to our notice, and they contain much that is valuable.

179. The skilful selection of the best methods from all the above, so as to obtain a system capable of being modified to meet the needs of (a) the very young, (b) the boys and girls between nine and twelve, (c) the boys over twelve, (d) the girls over twelve, and (e) the weaklings, delicate, ailing, and deformed, demands the most careful and practical consideration.

180. To this end we recommend to the Education Department for Scotland the appointment of a Committee, which should include persons specially conversant with educational questions as well as others well acquainted with the various systems of physical training (including some who have studied what is most suitable in the case of girls), and medical experts, who shall, under the auspices of the Education Department, prepare a model course containing exercises adapted to the requirements of the differently situated schools, and the different ages, sexes, and conditions of health of the school children in Scotland.

181. In making this recommendation we have no desire to evade the duty of defining what we believe should be the groundwork of a National System, viz. :—

(1) Physical training should be regarded as of equal importance with mental training.

(2) During school life physical training is quite as important for girls as for boys.

(3) Systematic physical training is necessary both for country and town children.

182. The daily walk to school is exercise, but not exercise which develops the body as a whole, or counteracts the liability to stoop, to be round-shouldered, or to be slovenly in gait. Moreover, all children during school life must spend many hours with little change of position, the effects of which can only be corrected by systematic physical exercises.

183. It should aim at the healthy development of the body as well as of the mind, by the regular development of all the muscles, the quickening of intelligence and activity, and the formation of habits of prompt obedience, precision, smartness, and discipline. The exercises should not be for mere display or entertainment, but each should have its particular purpose and value to duly develop all parts of the body.

Dr Stewart, 245.

184. A certain amount of physical exercise once a day or oftener is preferable to an even greater amount at longer or irregular intervals.

Dr Kerr, 6113.
Mr A. Alexander
9002.

185. Music should be introduced, but it should be clearly understood that, except in the infant classes, no music is to be used until the scholars have fully mastered the exercise without it. There was some conflict of evidence on this point, but this, we think, is the sound rule to lay down. Waving the arms about in good time may look well enough, but without precision the real value of the exercise is lost. This is sure to be the result, unless each exercise be learned without music.

186. We deprecate the use of rifles or carbines for boys under fourteen. Many boys can use the latter without ill effects, but the advantages of exercising boys with such weapons do not outweigh the risk of injury to some boys. Besides the use of the usual light dumb-bells and clubs, sufficiently good results can be obtained with light staves or dummy guns.

187. Applied Gymnastics, *i.e.* gymnastics with fixed apparatus, may be considered as outside the necessary curriculum of physical training in elementary schools, but they need not be excluded from schools where the teacher desires to introduce them and where efficient supervision is assured. For older boys they form a good safety-valve for working off superfluous energy, and, if made popular, are attractive to many who might not otherwise be induced to take sufficient healthy exercise.

188. Games are very useful, and certainly ought to be encouraged, but they cannot be played by all children, and usually the weaker go to the wall; in other words, those most in need of systematic development are excluded. Games, in affording opportunities for violent exercise, are useful for the development of reserve strength, and form an admirable field for the cultivation of social and public spirit. We strongly favour their organisation and development at all schools; see *supra*, Part II. (1) § 14; and Part III. § 86.

189. It is unnecessary to enumerate the games that are suitable for boys, but it may be noted that, in addition to regular games, country runs, leaping, and dancing the Highland fling have been recommended to us; and for girls, skipping and hockey. For both boys and girls swimming¹ is strongly advocated.

190. The attention of parents and all who are responsible for the care of children is directed to evidence dealing with the following, *viz.* :—

- (1) Clothing which fits too tightly is obviously detrimental to chest expansion; and
- (2) Tobacco smoking before maturity is reached has a most prejudicial effect on physical development, and this evil and increasing practice cannot be too strongly denounced.

Mr Porter, 10,847. Mr Macnee, 11,683. Dr Kerr, 6059, 6080. Col. Napier, 8320 *et seq.* Dr Almond, 9846. Mr Noble Smith, 6488, 6495. Prof. Hay, 6709. Mr Sandow, 7362. Dr Milne Murray, 10,215. Mr J. Macpherson, 9628.

IX. TRAINING AND QUALIFICATIONS OF TEACHERS, AND INSPECTION.

191. We hold that if the physical training is to be satisfactory it should be given by one who is properly qualified for the work by having gone through some systematic course, and whose qualifications are guaranteed by the possession of a certificate granted under the authority of the Education Department, and upon clearly-defined conditions. For the purpose of applying the necessary tests in connection with the granting of a certificate, we think that it is essential to employ the services of a fully-qualified expert. It seems undesirable that the certificate or diploma of private institutions should be accepted as a sufficient test. However great the efficiency of some such institutions may be, there must always be a danger that they should be tempted by competing institutions to lower their standard; and this can only be provided against by requiring that the Department, through its appointed representatives, shall always be associated with the granting of a certificate, and shall have a controlling power in regard to the qualification for earning a grant from public money. The Code now requires that in all State-aided schools there shall be adequate physical exercise according to an approved system, and a higher scale of grant is conditional upon the arrangements for such instruction being satisfactory. But, in addition to this, we think that no physical instruction can be considered satisfactory, in a State-aided school, which is not carried on by someone possessing such a certificate. The question of Physiological and Hygienic knowledge is of great importance, but is already referred to in Part II. (3), § 26.

192. On the other hand, there is a general consensus of opinion that, wherever it is possible, this instruction should be carried on by members of the school staff. In large schools, where the work is varied and where the numbers permit of its subdivision, the physical instruction may no doubt be carried on by someone specially employed for the purpose. But even in such a school, we consider it to be very important that members of the ordinary staff be associated in the work, and have sufficient special qualification in this subject to be able, occasionally and as a variation from their usual work, to put any class which may be under their care through some of the simpler forms of drill.

¹ Dr Tuke, 1469 *et seq.* Mr Scougal, 1717. Mr Burrows, 2275-6. Mr J. Mackenzie, 4948. Dr Kerr, 6059. Mr Noble Smith, 6488. Prof. Hay, 6709. Dr Dukes, 8124. Dr Lowe, 11,324. Mr Peacock, 11,622 and 11,631. Mr Lyons, 13,332.

193. But in the greater number of schools, where the teacher is single-handed, or has only a small staff, it will be necessary that he himself be possessed of the necessary qualifications. At present the ordinary teachers do not, except in rare instances, hold a certificate such as we contemplate, and may not be in a position to obtain one. Due allowance must, of course, be made in such cases; and for this purpose temporary provisions analogous to those with regard to qualification for teaching Drawing, Nature-Knowledge and other special subjects under the Code might be adopted. Teachers under forty years of age should have every opportunity for acquiring the necessary qualification, and be expected to make proper use of these opportunities. Only in the case of older teachers, and those in whose cases special difficulties appear to exist, ought exemption from this condition to be granted. Eventually, we have no hesitation in recommending that the presence on the school staff of a sufficient number of persons qualified by a certificate of efficiency for giving physical training should be an essential condition of the payment of grants to a State-aided school.

194. There remains a question of some difficulty. Ought the possession of such a certificate of qualification to give efficient physical instruction to be required in the case of every teacher employed in a State-aided school? Such a requirement is no doubt desirable, and may well be aimed at as ultimately a universal essential. The single teacher of a small school must certainly possess such a certificate. It is evident, also, that the acquiring of such a certificate cannot be a matter of serious difficulty to young men and women of good health, of the type which it is most desirable to attract into the ranks of the teaching profession. We trust that, without any undue demand upon those desiring to enter the teaching profession, it may be possible to make this an essential qualification. We have had evidence that, in respect of physique, the standard of those who seek to be male teachers has shown a tendency to decline. This is matter of serious regret, and any condition which would require at least a normal standard of health and physique is one which cannot be deemed superfluous for those who are to bring the proper qualities of character and temperament to the work of the profession. Almost no other calling makes such demands on that elasticity and energy of spirit which can hardly co-exist with defective physical condition. It is no doubt true that many persons at present do good work as teachers who cannot profitably to themselves or their pupils undertake physical training. In some cases advancing years may prevent it, although the teacher is still fully efficient for his ordinary work. Means can no doubt be devised for meeting such cases. But we think that as a general principle, in the case of all those proposing to enter the profession, it should be a necessary requirement that they should go through a sufficient course of instruction on the subject, and should be able to impart the essential elements of that instruction to their pupils.

195. But we would strongly urge that School Boards and other Local Authorities should give ample opportunities to existing teachers to obtain such qualification by means of those classes for special training which are contemplated under the present Code (Article 91 (*d*)). We were surprised to find that in many cases no advantage had been taken of that Article, and that so many authorities seemed to be ignorant of its provisions. Still more imperatively do we think that it ought to be required that the provision of such instruction should be an essential part of the training of students for the profession, and that no Training College or committee for the superintendence of King's students attending the University should hereafter receive a grant, unless there is provided thorough, systematic, and regular training of this kind, under the most skilled teachers who can be procured, and tested by regular inspection conducted by experts.

196. The subject of inspection is one to which we attach great importance. We fully recognise that in the present inspectorial staff there are several who have given special attention to this matter, and who have added wide and varied experience in schools to the qualification acquired by having themselves gone through a systematic course of training. But it would be subject of serious regret if this part of inspection were regarded as a secondary matter, to be discharged perfunctorily and as a subsidiary duty, and with no other than a casual equipment. We are convinced that, on the contrary, it calls for great care, well-grounded knowledge, and a systematic study of the principles upon which sound physical training, adapted to the requirements of children of various ages and in various circumstances, should be based. The Education Department ought to take care that in the staff there should at all times be included a sufficient number of persons who have, in addition to other qualifications, given special attention to this subject, and it would be well that some high expert authority, possessing sufficiently wide and comprehensive views and a thorough grasp of the scientific principles involved, should be available for reference and guidance wherever required.

X. VOLUNTARY AGENCIES—CADET CORPS AND BOYS' BRIGADE.

197. We have already indicated the necessity for improved physical training in Elementary Schools, and the lines which it might follow. It is important not only for the scholars in these schools during their school course, but in view of a further development in the same direction at a later stage.

198. In these schools we have no desire to impose any requirement that will give an unduly military character to the physical training, yet we fully recognise certain advantages in some aspects of military training and discipline, and we see no reason why these should not be employed as a means of influencing the youth of the country. The principal outside agencies by which this might be carried out are Cadet Corps and the Boys' Brigade. These are, in our opinion, capable of playing an important part in promoting the continued training for boys up to the ages of seventeen or eighteen.

199. The advantages claimed for Cadet Corps have been pressed on our notice by those well qualified to speak for them. It has been urged that, quite apart from the military point of view, the formation of Cadet Corps is desirable on other grounds, and as a means of benefiting very materially the youth of the country. One of the blots in our educational system is that boys are frequently freed from all restraining influences on reaching the age of fourteen. It cannot be denied that the next few years, from fourteen up to eighteen or nineteen are the most critical in the lives of all as moulding their future character; and any organisation that would, as it were, connect these years with the school life, would have a far-reaching effect for good. It is claimed that the cadet system would supply such an organisation. This would lay hold of lads before leaving the Elementary Schools, and carry them over the critical period referred to. They would, at an impressionable age, be taught the lessons of loyalty, patriotism, obedience, punctuality, unselfishness, cleanliness, orderliness, and self-respect.

200. The development of such a system is advocated on the ground that to its absence are due in a large measure the disorder and rowdyism to be met with amongst the youth of both sexes in many large cities. No adequate means are now provided for affording an outlet for the natural spirits of the young and for the use of muscles with which nature has endowed them. Lads who had joined a Cadet Corps at their schools would probably continue to belong to it after having left school (which is the experience in Australia), and they would consequently remain in touch with their former teachers; for it has been strongly urged that the school teachers should become the officers, thus extending their sphere of usefulness and influence for good. Such an organisation would thus form a connecting link with the Volunteer service, into which the youths might pass from the Cadet Corps.

201. It has been suggested that a Cadet Corps might form the centre of organisation of physical drill and exercise for the youth of a district, with three good results, namely, improvement of physique, promotion of a corporate spirit, and discouragement of loafing. We fully appreciate the advantages of the system as proved by the experience of certain schools, the representatives of which have testified to the popularity of the corps and have advocated their extension.

202. The other outside agency is the Boys' Brigade, with 400 companies and 20,000 boys in Scotland alone. Its advantages are briefly stated to be that it is an agency ready to hand, working parallel to the State-aided school, but slightly in advance of it in respect of age. For nineteen years it has been training boys between the ages of 12 and 17 in the squad and company, and in many cases the battalion, drill of the Army, besides giving instruction in physical training and athletics to a large proportion of its members. The present rate of recruiting passes, at least, 8000 boys *per annum* into the ranks; and since the origin of the movement about 50,000 Scottish boys have benefited by its military training and discipline. It is, in fact, claimed that it has been providing the very means of attraction for which we are seeking, in order to induce boys over school age to continue under the influence of training and discipline.

203. While the Brigade is a religious movement, and under its constitution each company must be attached to a church or other Christian organisation, and cannot therefore be subject to all the conditions which apply to a State-aided school, its advocates assert that its hold on the country is not thereby weakened but rather strengthened. It has peculiar advantages in dealing with boys, and its officers hold a more intimate relation to them than is possible between the ordinary teacher and his pupils. Its training is not only military, but also moral and religious. It uses of set purpose, and has successfully used, military drill and discipline as the attraction whereby the boys are brought under the influence of religious teaching.

Mr Clark, 8798.
Dr Spenser,
12,364, § 8.
Mr Temple,
12,862.
Mr Cuthbertson,
12,967A.

204. We have come to the conclusion that so long as these organisations have a distinctly educational value, they should receive recognition as agencies in the national work of education. It would be well that institutions such as Cadet Corps and the Boys' Brigade should be dealt with as parts of educational machinery and encouraged from that point of view.

205. Cadet Corps must necessarily have some connection with the Army. Their organisation should be on Army lines, and developed under military experts. They should be affiliated to units of the regular Army, for by this means a sense of responsibility and citizenship may be developed, and a valuable addition made to the available forces of the country. But in order to ensure the development of their educational features, as a means of promoting the mental and moral capacity of each individual, we are of opinion that they should be under the supervision of the Education Department, and receive any assistance which the State may give them in the form of an educational grant through that Department.

Mr Scougal, 1717.
Major Elliot, 8347.
Earl of Meath,
8467.
Mr Clark, 8813.
Sir Ian Hamilton,
11,798.

206. The difficulties which appear to be most prominent in connection with the carrying on of Cadet Corps at present are those due to the War Office regulations. Needless expense seems to be created by the insistence on the wearing of uniform. This is, of course, a matter lying within the province of the Military Authorities, but we respectfully desire to suggest that, in our opinion, the wearing of uniform should not be made compulsory, and that all expenses should be cut down to the minimum. Probably, in the matter of uniform, a cap and belt, or even a badge, would be sufficient. We have also been told that the necessity of getting seventy-five boys to join before being permitted to form a company has proved a deterrent; and that encouragement would be given in many districts were a considerably smaller number accepted. Again, there seems to be a difficulty in getting officers, and we think that this might be obviated were the teachers encouraged to become leaders of the movement; for, with their cordial co-operation, we are convinced that the system would prove highly beneficial and successful. We are of opinion that such difficulties as we have named would disappear, were the regulations altered and adapted for the extension of the system to the Elementary Schools.

207. As the Cadet Corps must be closely connected with Army organisation, so the Boys' Brigade is closely connected with a church or other religious organisation. In neither connection do we see anything to prevent their being treated as educational agencies, and receiving encouragement as such from public funds. Several facts have been stated to us as discouraging to the Boys' Brigade. One was the difficulty companies now experienced of earning grants under the present Continuation Code. The Code requires that, as a rule, physical training should be paid for only when joined with some other subject. We appreciate the weight of the reasons which led the Department to lay down this condition, and we think that in many cases it might be fulfilled without serious difficulty. But we do commend for consideration special cases in which it may be found possible to dispense with the condition in order to encourage efforts which would fail without financial aid.

Mr Whitton, 2725.
Mr Craigen, 3058.
Mr Gillanders,
11,133.
Mr Cuthbertson,
13,010.

208. The Volunteer recruit drills are said to be irksome and even deterrent to boys who have already been sufficiently trained. We think it only necessary to draw the attention of the proper authorities to the fact that it is manifestly short-sighted to bar entrance to the Volunteer Corps by insisting on the full number of recruit drills from lads whose previous training has fitted them to take their place in the ranks of the Volunteers.

Rev. H. Williamson,
7727.
Mr Peacock,
11,622.
Mr Cuthbertson,
13,063.

209. Some witnesses thought that the Brigade's sphere of influence is restricted, and that by reason of its necessary connection with a Church organisation it does not get hold of the roughest among the neglected boys. Whilst we must admit that there may be real grounds for this opinion, we think that it may fairly be hoped that proper recognition of it as one of the agencies in national education, and the weight which this would add to their efforts, might extend the sphere of action of the Boys' Brigade, and enable it to reach many who are not now under its influence.

XI. SUMMARY OF RECOMMENDATIONS.

210. In conclusion we would summarise the recommendations which our enquiry leads us to make as follows:—

(1) *Elementary Schools*.—The improvement in regard to physical training will be brought about chiefly by a more intelligent conception of the proper aim of education, by recognition of the fact that the education cannot be based on sound principles which neglects the training and development of the bodily powers, and by judging results as they are shown over the whole of school life, and not by short portions of

that life. The school life should cover a larger part not only of the working time, but also of the recreation of its pupils. Larger provision of playgrounds and of exercise halls is necessary, and might with advantage take the place of a certain amount of class-room accommodation. Variety should be substituted for formal methods; and in connection with games, use should be made of all available voluntary help.

(2) *Higher Class Schools.*—In the case of boarding schools, a certain amount of systematic physical exercise should be held to be necessary, and should be given independently of games; and in the case of day schools, while the opportunities provided are, as a rule, considerable, care should be taken to see that the pupils avail themselves of these opportunities, and that games and physical exercises should be treated as an essential part of the school course. Such a course should include instruction in the elements of Hygiene and Physiology.

(3) *The Universities.*—The condition of physical training at the Universities is unsatisfactory, and without suggesting that compulsion should be resorted to, we think that the subject demands the earnest attention of the University authorities, that they should afford adequate opportunities and facilities for such exercises, and that such re-arrangement of courses as may be necessary should be adopted in order to avoid an over-pressure which cannot but be injurious to the students, and hurtful to the nation generally.

(4) *Feeble-minded and Cripples.*—In any efforts for benefiting children of this class, we are convinced that carefully-adjusted physical training must play a very large part. School Boards should co-operate as far as possible with voluntary efforts in this direction; and any further powers which are required to enable them to supplement such efforts should be given.

(5) *Continuation Classes.*—For lads over school age these classes might be popularised by a larger introduction of physical exercises; and if attendance at these classes be not made compulsory for lads between fourteen and eighteen, there should be at least power in the case of proved vagrants to issue Compulsory Attendance Orders for a Continuation School, with a penalty, for breach of such Order, of committal to a Reformatory.

(6) *Medical Inspection.*—School Boards should have the command of medical advice and assistance in the supervision of schools; a systematic record of physical and health statistics should be kept; and a small number of medical and sanitary experts should be added to the inspecting staff under the Education Department.

(7) *Feeding.*—It should be one of the duties of School Boards and school managers generally to enquire into cases of apparently insufficient feeding; that they should provide facilities for the provision of suitable food by voluntary agencies, without cost to public funds, and should co-operate with these agencies in the organisation of this work. Should this prove inadequate, we think that powers should be given to provide a meal, and to demand from the parents a payment to meet the cost price.

(8) *System.*—While we are unwilling to confine teachers unduly to a hard and fast system, we think that certain principles should be carefully observed, and fundamental uniformity of method, for convenience of organisation, maintained. We have recommended (Part VIII., § 180) the appointment of a skilled Committee to prepare, under the auspices of the Education Department, a model course for a National System of Physical Training for Scotland. We hold that a daily amount of school time should, so far as possible, be devoted to physical exercises; short periods of exercise at frequent intervals being preferable to periods of longer duration at greater intervals.

(9) *Teachers.*—Except in large schools, or schools where the services of a special instructor are employed, the physical instruction should be given by the ordinary teaching staff. But for this purpose a certain amount of systematic training is absolutely necessary. The qualifications for giving physical instruction should be attested by a certificate issued under the authority of the Education Department, and in future no teacher should be recognised for giving such instruction unless he or she possesses such a certificate. In due course the possession of such a certificate should be an indispensable condition of recognition as teacher in any State-aided school.

No Training College should be recognised for assistance from the Parliamentary grant unless such systematic training forms a necessary part of its curriculum, or unless other provision is made for its being given to the students of the College.

We think that any Institution for Physical Instruction which is supported by adequate local effort, which is approved as necessary to meet the requirements of public schools, and which is certified to be efficient, should be eligible for grants on the same conditions as the present Training Colleges.

(10) *Inspection.*—There should always be on the Inspecting Staff persons who have given special attention to this subject, and competent expert and scientific aid should be available for advice and guidance.

(11) *Auxiliary Agencies.*—We think that such organisations as Cadet Corps and the Boys' Brigade may be of great use in connection with this work. Both agencies should be encouraged, and any assistance given them be given by the Education Authority, out of the grant for education. We hold that as means of disciplining the disorderly elements in society, and also of strengthening the available resources of the country, the aims of both these organisations are of supreme importance. But we prefer to regard them chiefly as means of benefiting the individual pupil, and as such we think that they may best co-operate with educational authorities, and receive any assistance granted by the State, not as military, but as educational agencies.

We cannot conclude our Report to Your Majesty without expressing our hearty appreciation of the ability as well as attention and untiring labours of our Secretary, Mr R. B. Pearson, who has been of the greatest assistance to us in our prolonged enquiry.

ALL WHICH WE HUMBLY SUBMIT TO YOUR MAJESTY'S GRACIOUS CONSIDERATION.

APPENDIX.

APPENDIX I.

Tables, &c., extracted from the Forty-fourth Report for the Year 1900, by Mr James G. Legge, H.M. Inspector of Reformatory and Industrial Schools. [See VOL. II., MINUTES OF EVIDENCE, QUESTIONS 724-984.]

Physique.—An attempt has been made during the summer of 1901 to collect statistics showing the physique of children in the Home Office schools. The superintendents of industrial schools were asked to furnish the height, weight, and chest measurement of all boys, the height and weight of all girls, between the ages of eleven and twelve, and fourteen and fifteen. These ages were selected because they afforded special facilities for comparison with the statistics compiled some twenty years ago by the Anthropometric Committee, and published, with comments, in their report of 1883. Mr Charles Roberts was one of the two mainly concerned in the production of the report, and it will be found printed as an appendix to his invaluable *Manual of Anthropometry*. Sir Frederick Treves describes the 'Manual' and the 'Report' as providing 'the most precise data upon anthropometry, so far as the English race is concerned, which we possess.'

The schools responded readily to the invitation to furnish statistics, and the following tables show how, for boys and girls in industrial schools, the results obtained in 1901 compare with those published in 1883. The conditions of measurement have been the same. The height was taken without boots, the weight in clothes (but without boots—a heavy item in many schools), and the chest girth with the chest empty. The figures given in all the tables, both for reformatory and industrial schools, are averages.

COMPARATIVE TABLE OF BOYS AND GIRLS IN INDUSTRIAL SCHOOLS IN 1883. (Table XXI. in Committee's Report. †)

Age last birthday.	Height in inches.		Weight in pounds.		Chest girth.	
	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.
14	54·46	55·00	77·35	81·25	27·29	...
11	49·11*	51·48	63·19	60·96	24·17	...

* This figure is probably too low. It is raised by Mr Roberts in his paper of 1895 to 49·6. In Table XIII. of the Anthropometric Committee's report the average height at eleven of Industrial School boys is given as 50·02, but this figure probably related to a single school. It is also probable that Poor Law schools contributed to the Committee's figures.

COMPARATIVE TABLE OF BOYS AND GIRLS IN INDUSTRIAL SCHOOLS IN 1901.

Age last birthday.	Height in inches.		Weight in pounds.		Chest girth.	
	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.
14	55·50	56·74	80·63	88·43	28·08	...
11	50·82	51·40	64·63	65 0	26·02	...

NOTE.—The numbers of observations was much greater in 1901 than in 1883. In that year the numbers were, for all purposes, boys and girls of eleven, 158 and 63 respectively; boys and girls of fourteen, 102 and 33 respectively. In 1901

† See Appendix VII.

the numbers were, as regards height at eleven, 1312 boys, 481 girls; at fourteen, 2367 boys, 765 girls; as regards weight at eleven, 1296 boys, 384 girls; at fourteen, 2340 boys, 643 girls; and as regards chest girth at eleven, 1312 boys; at fourteen, 2366 boys.

App. I.

The children between eleven and twelve are comparatively new-comers in the schools; at that age the figures for 1901 show a marked improvement as regards boys, though girls are stationary. The great majority of the children come from the slums of towns; and a fair inference from the figures is that the slum population of the country has not deteriorated during the past twenty years, but has, if anything, improved. This accords with the view expressed by the Anthropometric Committee of 1883 that the general belief in a rapid degeneracy in the population of the northern manufacturing towns was not founded upon fact. The advantage of girls over boys in industrial schools in 1901 accords with the rule established by the Anthropometric Committee that 'from ten to fifteen girls grow more rapidly than boys, and at the ages 11½ to 14½ are actually taller, and from 12½ to 15½ actually heavier than boys.'

At the age fourteen to fifteen the figures for 1901 show an improvement over those for 1883, an improvement more pronounced in the case of girls than of boys; but there is still much lee-way to be made up. In a paper written for the Royal Commission of 1895 on Secondary Education, Mr Roberts prints the following table (based on the figures of 1883) to show the stature and weight of boys aged eleven to twelve years, of different classes of the population:—

Number of observations.	Class of School.	Stature in inches.	Weight in pounds.
150	Public Schools, . . .	55·0	78·7
686	Middle Class Schools, . .	53·6	68·0
181	Elementary Schools, . .	52·6	67·8
341	Factory Children, . . .	51·6	67·4
840	Royal Military Asylums, .	51·2	65·1
180	Industrial Schools, . . .	49·6	63·2

He goes on to say:—'As age advances the difference widens, and at fourteen years of age industrial school boys are nearly seven inches (6·85) shorter of stature, and 24¾ lbs. lighter in weight than boys of the 'professional classes of the same age.' Assuming, for the purposes of comparison, that the standard for the professional class has remained the same, the advantage at fourteen of the boy of the professional classes over the industrial school boy of 1901, is reduced from 6·85 inches and 24¾ lbs. to 5·79 inches and 21½ lbs. So much for the gap between the two extremes. Even if we take the least developed of the normal classes dealt with by the Anthropometric Committee, viz., the country labourer and the town artisan of 1883, we find that these have the advantage over the industrial school boy of 1901, of three inches in height and six lbs. in weight. This fact affords a fair answer to those critics of Industrial Schools who are nervously apprehensive of the industrial school boy being raised above the level of 'the honest labourer's child outside.' These critics may still sleep sound. One more quotation may be given from Mr Roberts' paper already cited. 'Still later the difference becomes less, as the less

App. I.

'favoured classes attain maturity at a more advanced age than the well-nurtured classes. Full growth in stature is attained in the professional classes about the twenty-first year, but in the poorer classes, not before the twenty-fifth or twenty-sixth year.' It may be possible in a year or two to show how this rule affects young men who have left the Home Office Schools.

Tables showing how Protestant compare with Roman Catholic children, and English with Scottish, will be interesting.

COMPARATIVE TABLES OF PROTESTANT AND ROMAN CATHOLIC CHILDREN IN INDUSTRIAL SCHOOLS.

	Protestant.	Roman Catholic.	Protestant.	Roman Catholic.	Protestant.	Roman Catholic.
14	55.47	55.67	81.09	78.08	28.11	27.94
11	50.92	50.42	67.28	61.77	26.03	25.99

GIRLS.

Age last birthday.	Height in inches.		Weight in pounds.	
	Protestant.	Roman Catholic.	Protestant.	Roman Catholic.
14	56.71	56.78	87.61	90.65
11	51.60	51.12	65.63	63.94

NOTE.—The numbers of observations were—Protestant, at age eleven, height, 1053 boys, 282 girls; weight, 1007 boys, 259 girls; chest girth, 1053 boys; at age fourteen, height, 2009 boys, 516 girls; weight, 1932 boys, 470 girls; chest girth, 2008 boys. Roman Catholic, at age eleven, height, 259 boys, 199 girls; weight, 259 boys, 125 girls; chest girth, 259 boys; at age fourteen, height, 358 boys, 249 girls; weight, 358 boys, 173 girls; chest girth, 358 boys.

These tables do not show that Protestant children have a marked advantage in physique over Roman Catholic; indeed, Roman Catholic girls have the advantage at the higher age. Nevertheless the much higher death-rate in Roman Catholic Schools points perhaps to constitutional weaknesses not revealed by figures giving physical dimensions.

COMPARATIVE TABLE OF ENGLISH AND SCOTTISH CHILDREN IN INDUSTRIAL SCHOOLS.

BOYS.

Age last birthday.	Height in inches.		Weight in pounds.		Chest girth in inches.	
	English.	Scottish.	English.	Scottish.	English.	Scottish.
14	55.43	55.67	80.35	81.37	27.99	23.31
11	50.93	50.46	64.40	65.36	26.01	25.07

GIRLS.

Age last birthday.	Height in inches.		Weight in pounds.	
	English.	Scottish.	English.	Scottish.
14	56.80	56.53	87.92	90.10
11	51.35	51.57	64.65	66.81

NOTE.—The number of observations at age eleven were—for England, height, 1007 boys, 370 girls; weight, 1007 boys,

309 girls; chest girth, 1007 boys; at age fourteen, height, 1688 boys, 679 girls; weight, 1687 boys, 494 girls; chest girth, 1687 boys. Scotland, at age eleven, height, 305 boys, 111 girls; weight, 289 boys, 75 girls; chest girth, 305 boys; at age fourteen, height, 679 boys, 185 girls; weight, 653 boys, 149 girls; chest girth, 679 boys.

The figures are remarkably even, though Scotland has a slight advantage.

We now come to a table of great importance, the object of which is to compare the physique on board the Industrial School Ships, in Farm and Country Schools, and in Town Schools.

COMPARATIVE TABLES OF BOYS IN SHIPS, COUNTRY AND TOWN SCHOOLS.

AGES FOURTEEN TO FIFTEEN.

Class of School.	Number of observations.	Height in inches.	Weight in pounds.	Chest girth in inches.
Ship, . . .	630	55.66	80.83	28.49
Country, . . .	670	55.85	81.93	28.35
Town, . . .	774	55.40	81.50	27.66

AGES ELEVEN TO TWELVE.

Class of School.	Number of observations.	Height in inches.	Weight in pounds.	Chest girth in inches.
Ship, . . .	100	51.61	66.19	26.34
Country, . . .	345	51.26	61.75	26.36
Town, . . .	604	50.55	63.73	25.84

Ships and country schools have not the advantage at the higher age which might be anticipated. That town schools hold their own as well as they do may fairly be ascribed to the fact that, expressly to counteract their drawbacks, they took the lead in developing physique on scientific principles. The advantage of ships at the earlier age is probably due to the exercise of a discrimination which secures that when young boys are sent on board they are fairly well-grown for their class.

An attempt has been made to compare the material furnished by different towns in the country. The following is a list of towns which are responsible for at least 10 boys aged eleven to twelve. The towns are ranged in accordance with the average height of their children.

Town.	Number of children.	Average height.
Bristol,	34	51.97
Leeds,	11	51.88
Gateshead,	11	51.56
Newcastle-on-Tyne,	41	51.05
Birmingham,	14	51.03
London,	289	50.98
Edinburgh,	53	50.92
Leicester,	11	50.84
Derby,	11	50.72
Salford,	10	50.70
Dundee,	10	50.58
Manchester,	45	50.14
Liverpool,	74	50.06
Glasgow,	92	50.02
Perth,	12	49.91
Sunderland,	14	49.88
North and South Shields,	14	49.55

Lastly, with regard to Industrial School boys, it may be stated that the dimensions of over 1000 boys between fourteen and fifteen have been scrutinised, with a view to ascertaining how many might reasonably be expected at fifteen years and three months to reach the Naval standard. The percentage comes to about fifteen.

We may now pass to consider the physique of boys and girls in Reformatory Schools. The superintendents of these schools were asked to furnish figures for the ages fourteen to fifteen, and seventeen

I. to eighteen. Replies from almost every school have been received.

COMPARATIVE TABLE SHOWING THE HEIGHT, WEIGHT, AND IN THE CASE OF BOYS, CHEST-GIRTH, OF INMATES OF REFORMATORY SCHOOLS, AGED FOURTEEN TO FIFTEEN, AND SEVENTEEN TO EIGHTEEN.

Age last birthday.	Height in inches.		Weight in pounds.		Chest girth in inches.	
	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.
	17	61.42	60.77	110.14	111.82	31.79
14	56.24	58.04	84.35	95.74	28.24	...

NOTE.—The numbers of observations at age fourteen were—height, 819 boys and 113 girls; weight, 819 boys and 99 girls; chest girth, 819 boys. At age seventeen, height, 570 boys and 149 girls; weight, 570 boys and 119 girls; chest girth, 570 boys.

On comparing the Reformatory boy of fourteen with the Industrial School boy of the same age, it is interesting to note that he has the advantage all round. So, too, and more markedly, has the Reformatory girl over her Industrial School sister. This may be partially accounted for by the suggestion that they are, as it were, a survival of the fittest in their class. But reference may be made to the discussion in the Report for 1897 of the social condition of the parents of children in the schools, which brought out clearly the superiority financially of the parents in Reformatory cases over the parents in Industrial School cases. Strange though it be, the former seem to be in the better social position.

There is no means of comparing the reformatory lad or girl of seventeen in 1901 with their fellows in 1883. But compared with the artisan class in Towns (*see* Tables XVI.—XIX. of the Report of the Anthropometric Committee)* the reformatory lad at seventeen is 3.28 inches shorter and 10.36 lbs. lighter than the average artisan of the same age. On the other hand, the reformatory girl of seventeen is but 1.45 inches shorter and 2.58 lbs. lighter than the average girl of the commercial class—a class second only in physical development to the most favoured of all. This result will not surprise one acquainted with girls' reformatory schools. The aspect of a battalion of reformatory girls drawn up for physical drill is a formidable one.

We may again compare the results afforded by Protestant and Roman Catholic, and English and Scottish Schools.

COMPARATIVE TABLES OF INMATES OF PROTESTANT AND ROMAN CATHOLIC REFORMATORY SCHOOLS.

BOYS.

Age last birthday.	Height in inches.		Weight in pounds.		Chest girth in inches.	
	Pro- testant.	Roman Catholic.	Pro- testant.	Roman Catholic.	Pro- testant.	Roman Catholic.
	17	61.59	60.89	110.32	109.60	32.07
14	56.33	55.93	83.95	85.73	28.32	27.99

* *See* Appendix VII.

GIRLS.

Age last birthday.	Height in inches.		Weight in pounds.	
	Pro- testant.	Roman Catholic.	Pro- testant.	Roman Catholic.
17	60.44	61.53	110.08	118.01
14	57.56	59.45	93.67	103.00

NOTE.—The numbers of observations were—Protestants, at age fourteen, height, 636 boys and 84 girls; weight, 636 boys and 77 girls; chest girth, 636 boys; at age seventeen, height, 424 boys and 103 girls; weight, 424 boys and 93 girls; chest girth, 424 boys. Roman Catholics, at age fourteen, height, 183 boys and 29 girls; weight, 183 boys and 22 girls; chest girth, 183 boys; at age seventeen, height, 146 boys and 46 girls; weight, 146 boys and 26 girls; chest girth, 146 boys.

These tables confirm, on the whole, the industrial school tables. Protestant boys have an advantage over Roman Catholic boys, but not so marked as the advantage of Roman Catholic girls over Protestant girls.

COMPARATIVE TABLES OF INMATES OF ENGLISH AND SCOTTISH REFORMATORY SCHOOLS.

BOYS.

Age last birthday.	Height in inches.		Weight in pounds.		Chest girth in inches.	
	English.	Scottish.	English.	Scottish.	English.	Scottish.
17	61.70	60.46	110.41	107.31	31.81	31.59
14	56.22	56.35	84.24	84.90	28.17	28.58

GIRLS.

Age last birthday.	Height in inches.		Weight in pounds.	
	English.	Scottish.	English.	Scottish.
17	60.70	61.58	111.83	111.00
14	58.11	57.69	95.65	96.86

NOTE.—The numbers of observations were—England, at age fourteen, height, 677 boys and 95 girls; weight, 677 boys and 92 girls; chest girth, 677 boys; at age seventeen, height, 520 boys and 136 girls; weight, 520 boys and 117 girls; chest girth, 520 boys. Scotland, at age fourteen, height, 142 boys and 18 girls; weight, 142 boys and 7 girls; chest girth, 142 boys; at age seventeen, height, 50 boys and 13 girls; weight, 50 boys and 2 girls; chest girth, 50 boys.

Here again the balance between the two countries is fairly even. As regards boys Scotland has the advantage at fourteen, England at seventeen. The smallness of the number of observations in the case of Scottish girls rather spoils the comparative value of the second table.

APPENDIX II.

Tables prepared by Mr Thomas Chesterton, Organising Teacher of Physical Education (London School Board).

[See VOL II., MINUTES OF EVIDENCE, QUESTIONS 3932-4152.]

TABLE I.—CHILDREN'S MEASUREMENTS before and after undergoing a course of physical training. Chesterton's system as an experiment.

Station.	Year	Number of boys.	Time under instruction.	Description of Training.	Average Age at commencement.	Average Measurements.					Remarks.	
						Height in.	Weight lbs.	Chest in.	Right forearm.	Right upper arm.		
Chatham,	1886	40	6 months.	Free movements and a little gymnastics.	11½ years.	ft. in.						
						At commencement	73½	26½	7½	8	8	
						At termination	79	27½	8	8	8	
						Average gain	5½	1	½	½	½	
						Should be at commencement	74½	27	7½	8	8	
						Below Maclaren's standard	1½	½	½	½	½	
						Should be at termination	77½	27½	8	8	8	
						Over Maclaren's standard at termination	1½	½	½	½	½	
							...					
Union School, Crondall.	1888	33	6 months.	All measurements taken in presence of Superintendent. Free movements.	12¼ years.	ft. in.						
						At commencement	...	26½	
						At termination	...	28½	
						Average gain	...	1½	
						Should be at commencement	...	27½	
						Below Roberts' standard	...	½	
						Should be at termination	...	27½	
						Over Roberts' standard at termination	...	½	
							...					

No weight or arm measurements taken.

Measurements taken by Superintendent.

Garrison school children, two lessons per week, 4.30-5.30 p.m. January to July.

Maclaren's standard for better class at twelve years.
Maclaren's standard after six months' gymnastics.

Poor Law school, 30 minutes *per diem*, three days in week, and one special lesson, of 45 minutes' duration weekly.

Roberts' standard. Industrial school boys.

Roberts' standard after six months' training.

TABLE II.—MEASUREMENTS OF BOARD SCHOOL BOYS.—May 1902.

The following were taken during the month of May 1902, and show averages only for the different ages. The children aged 8-9 years were assembled in single rank and sized—shortest on the right—tallest on the left, numbered in threes, and the number ones selected for measurement. The same plan was followed with the other ages. Height taken without boots, and chest deflated, skin measurement, with arms at the sides.

Name of School.	Measurement taken.	Boys' ages in years.						Remarks.
		8-9.	9-10.	10-11.	11-12.	12-13.	13-14.	
Lyndhurst Grove, Camberwell	Height	4' 1"	4' 2 $\frac{3}{8}$ "	4' 4 $\frac{1}{8}$ "	4' 5"	4' 7 $\frac{7}{8}$ "	4' 9 $\frac{6}{8}$ "	} Ordinary Elementary School. Physical training a great speciality. Good residential neighbourhood.
	Chest	24"	24 $\frac{1}{8}$ "	24 $\frac{3}{8}$ "	25"	26 $\frac{3}{8}$ "	27 $\frac{5}{8}$ "	
	Number measured	15	16	18	19	18	16	
Monnow Road, Bermondsey	Height	4' 0 $\frac{7}{8}$ "	4' 1 $\frac{6}{8}$ "	4' 4 $\frac{1}{8}$ "	4' 5 $\frac{1}{8}$ "	4' 7 $\frac{1}{8}$ "	4' 9"	} Higher Grade School. Fairly good residential neighbourhood. Artisan class. Tanneries.
	Chest	23 $\frac{1}{2}$ "	23 $\frac{3}{8}$ "	24 $\frac{1}{8}$ "	24 $\frac{3}{8}$ "	25 $\frac{1}{2}$ "	26 $\frac{3}{8}$ "	
	Number measured	22	22	20	21	23	27	
Hugon Road, Fulham	Height	3' 11 $\frac{1}{8}$ "	4' 1 $\frac{1}{8}$ "	4' 3 $\frac{3}{8}$ "	4' 4 $\frac{3}{8}$ "	4' 5 $\frac{8}{8}$ "	4' 7 $\frac{8}{8}$ "	} Ordinary Elementary School. Poor neighbourhood. Water side.
	Chest	23"	23 $\frac{1}{8}$ "	24 $\frac{1}{8}$ "	24 $\frac{3}{8}$ "	24 $\frac{3}{8}$ "	25 $\frac{2}{8}$ "	
	Number measured	56	53	46	56	39	38	
Eltringham Street, Wandsworth	Height	4' 0 $\frac{1}{8}$ "	4' 2 $\frac{3}{8}$ "	4' 4 $\frac{2}{8}$ "	4' 6 $\frac{2}{8}$ "	4' 8 $\frac{3}{8}$ "	4' 10 $\frac{4}{8}$ "	} Ordinary Elementary School. Physical training in all its branches a great speciality. Poor neighbourhood. Water side.
	Chest	24 $\frac{3}{8}$ "	24 $\frac{5}{8}$ "	25 $\frac{1}{8}$ "	25 $\frac{3}{8}$ "	25 $\frac{5}{8}$ "	26 $\frac{6}{8}$ "	
	Number measured	24	24	24	24	24	24	
Kennington Road, Lambeth	Height	3' 11 $\frac{6}{8}$ "	4' 1 $\frac{6}{8}$ "	4' 2 $\frac{2}{8}$ "	4' 4"	4' 5 $\frac{5}{8}$ "	4' 8 $\frac{3}{8}$ "	} Ordinary Elementary School. Fairly good residential neighbourhood. Artisan class.
	Chest	23"	23 $\frac{1}{8}$ "	23 $\frac{3}{8}$ "	25 $\frac{3}{8}$ "	25 $\frac{5}{8}$ "	26 $\frac{6}{8}$ "	
	Number measured	17	22	23	21	21	16	
Average height		4' 0 $\frac{1}{8}$ "	4' 1 $\frac{7}{8}$ "	4' 3 $\frac{5}{8}$ "	4' 5"	4' 6 $\frac{6}{8}$ "	4' 9 $\frac{6}{8}$ "	} These figures may be taken as a fair average for the whole of the London Board Schools.
	" chest	23 $\frac{1}{2}$ "	23 $\frac{3}{8}$ "	24 $\frac{1}{8}$ "	25 $\frac{1}{8}$ "	25 $\frac{1}{8}$ "	26 $\frac{3}{8}$ "	
	Number measured	131	137	131	144	130	121	
Dr Roberts—Ordinary school boys		3' 11 $\frac{5}{8}$ "	4' 1 $\frac{7}{8}$ "	4' 3 $\frac{8}{8}$ "	4' 5 $\frac{5}{8}$ "	4' 7 $\frac{1}{8}$ "	4' 8 $\frac{9}{8}$ "	

Roberts' measurements were taken twenty years ago in better class Voluntary Schools, at which time children in such schools were physically superior to those found in Board Schools.

TABLE III.—MEASUREMENTS of the first 40 Boys on the Roll

Second Measurements taken 1st January 1902.

Senior Boys.

Institution.	Average age of the 40 senior boys on admission.	Date when admitted.	Average when admitted.			Average time in residence.	Average gain, each boy, since admission.			Remarks.
			Height ins.	Weight lbs.	Chest ins.		Height ins.	Weight lbs.	Chest ins.	
Training ship <i>Shaftesbury</i> .	12 $\frac{2}{3}$	From 30.8.98	ft. ins. 4 5 $\frac{1}{2}$	lbs. ozs. 69 6 $\frac{1}{2}$	Ins. 27	2 years and $\frac{9}{16}$ months.	5 $\frac{1}{16}$	21 $\frac{117}{160}$	3 $\frac{29}{80}$	Roberts says Industrial School boys should be 4 ft. 4 $\frac{1}{2}$ ins. from 12-13 years of age. From 15-16 years, 4 ft. 8 $\frac{1}{2}$ ins. These boys are at the present time 1 $\frac{2}{3}$ ins. above Roberts' average for Industrial School boys of the same age.

TABLE IV.—MEASUREMENTS of the first 40 Boys who have been on Board less than 15 months.

First Measurements taken 1st January 1901. Second Measurements taken 1st January 1902.

Junior Boys.

Institution.	Average age on 1st January 1901.	Date when measured.	Average when first measured.			Time in residence.	Average gain, each boy, for the period of one year.			Remarks.
			Height ins.	Weight lbs.	Chest ins.		Height ins.	Weight lbs.	Chest ins.	
Training ship <i>Shaftesbury</i> .	13 $\frac{1}{3}$	1.1.01	ft. ins. 4 6 $\frac{5}{16}$	73 $\frac{29}{32}$	26 $\frac{25}{32}$	Less than 15 months.	1 $\frac{1}{4}$	6 $\frac{3}{16}$	1 $\frac{9}{16}$	Roberts says Industrial School boys should be 4 ft. 5 $\frac{1}{2}$ ins. from 13-14 years of age, average. These boys were 4 ft. 7 $\frac{1}{16}$ ins. in height, average, on 1st January last.

TABLE V.—RESULTS of an experiment made on the Training Ship *Shaftesbury* in 1900. Ten boys were chosen indiscriminately. The physical training consisted of free movements and dumb-bell exercises only. The course extended over a period of 100 days—January to April—and the boys had one hour's instruction daily for six days in the week.

<i>Shaftesbury</i> .	Age.	Measurements.									Remarks.	
		Height ins.	Weight lbs.	Chest ins.	Right fore-arm.	Right upper arm.	Right triceps.	Left fore-arm.	Left upper arm.	Left triceps.		
Aggregate gain	At commencement 14 $\frac{1}{4}$.	10 $\frac{1}{2}$	55 $\frac{3}{4}$	8	4 $\frac{1}{4}$	3 $\frac{29}{32}$	5 $\frac{1}{2}$	3 $\frac{36}{80}$	3 $\frac{7}{8}$	4 $\frac{9}{16}$	The whole of the measurements were taken in the presence of the Chairman of the Committee and the Captain Superintendent.	
Average gain		1 $\frac{1}{4}$	5 $\frac{3}{16}$	$\frac{3}{8}$	$\frac{20}{32}$	$\frac{29}{32}$	$\frac{1}{16}$	$\frac{36}{80}$	$\frac{7}{8}$	$\frac{9}{16}$		
Maclaren for the artisan class.	At commencement 14 $\frac{1}{4}$.	11 $\frac{1}{2}$	5 $\frac{1}{4}$	5	$\frac{3}{8}$	$\frac{1}{2}$	Average gain at the end of a course of physical training lasting 100 days.	
		Under.	Over Maclaren's standard.									

APPENDIX III.

Extracts taken from Various Books by Mr Francis Warner, M.D., App. III.
 F.R.C.P. [See VOL. II., MINUTES OF EVIDENCE, QUESTIONS 7184-7332.]

Extracts from "The Nervous System of the Child," by Dr Warner.

Extracts from "The Study of Children," by Dr Warner.

The following table, drawn up by Dr Clement Dukes, in Remedies of the Needless Injury to Children, expresses his experience as to the amount of sleep required by children:—

TABLE SHOWING AVERAGE HEIGHTS AND WEIGHTS OF BOSTON SCHOOL CHILDREN OF AMERICAN PARENTAGE. No. 3.

AS WORK AND SLEEP SHOULD BE ALLOTTED.

Age	Hours of Work per Week.	Hours of Sleep per Night.
Children between 5-6	6	13½
" " 6-7	9	13
" " 7-8	12	12½
" " 8-9	15	12
Pupils between 8-10	20	11½
" " 10-11	25	11
" " 11-12	30	10½
" " 12-14	35	10
" " 14-15	40	9½
" " 15-17	45	9
" " 17-19	50	8½

After Dr Bowditch. See Annual Report of the State Board of Health, Massachusetts, 1877. Height taken without shoes; weight in ordinary dress.

Age Last Birthday.	Boys.		Girls.	
	Inches.	Pounds.	Inches.	Pounds.
5 years	41.74	41.20	41.47	39.82
6 "	44.10	45.14	43.66	43.81
7 "	46.21	49.47	45.94	48.02
8 "	48.16	54.43	48.07	52.93
9 "	50.09	59.97	49.61	57.52
10 "	52.21	66.02	51.78	64.09
11 "	54.01	72.39	53.79	70.26
12 "	55.78	79.82	57.16	81.35
13 "	58.17	88.26	58.75	91.18
14 "	61.08	99.28	60.32	100.32
15 "	62.96	110.84	61.39	108.42
16 "	65.58	123.07	61.72	112.97
17 "	66.29	128.72	61.99	115.84
18 "	66.76	132.71	62.01	115.80

This includes time devoted to study and chapel on Sunday; some will think the hours of work rather long.

Table based on 50,000 children seen in day schools, mostly in or near London (1892-94); viz., 26,287 boys, 23,713 girls. Showing the co-relation or association of the main classes of defect observed in children.

The table is arranged in four columns, giving the percentages for children in the age-groups and at all ages. The percentages are taken on the number with the main class of defect.

Thus: Of all cases with development defect at all ages, 38.4 per cent. of the boys and 49.9 per cent. of the girls were mentally dull.

Of all the dull children at all ages, 57.6 per cent. of the boys and 52.6 per cent. of the girls also presented abnormal nerve-signs.

The following Cambridge and Oxford health statistics of women at college were collected by Mrs Henry Sidgwick:—

	At ages 3-8 years.		At ages 8-14 years.		At ages 14-18 years.	
	American.	English.	American.	English.	American.	English.
Per cent. in excellent or good health	76.74	71.45	73.33	67.09	...	61.97
Per cent. in fair health	1.84	16.98	2.98	22.78	...	27.14
Per cent. in poor or indifferent health	21.42	11.57	23.69	10.13	...	10.89
	100.00	100.00	100.00	100.00	...	100.00

AVERAGE AGE AT ENTERING COLLEGE LIFE.

	American, 18.35 years. English, 21.9 years.	
	American.	English.
Per cent. in excellent or good health	78.16	68.20
Per cent. in fair health	1.98	22.08
Per cent. in poor or indifferent health	19.86	9.72
	100.00	100.00

	7 Years and under.		Age 8-10.		Age 11 and over.		All Ages.		
	Boys	Girls	Boys	Girls	Boys	Girls	Boys	Girls	
A									All cases with developmental defect.
AB	31.7	23.5	43.3	41.4	40.5	44.0	38.4	36.2	Boys, 2308; girls, 1618. Per cent. with abnormal nerve-signs.
AC	22.7	35.9	16.0	22.1	7.5	15.0	16.2	26.3	Per cent. with low nutrition.
AD	36.6	40.8	41.2	46.6	37.1	51.1	38.4	44.9	Per cent. with mental dullness.
B									All cases with abnormal nerve-signs.

In sorting the cards for the purpose of compiling the Tables relating to the cases seen 1892-94, the defects included under E, F, and G were not considered. Thus a card with A and F marked was counted as A only; B, C, and E as B C only; and so on. Combinations of A, B, C, or D, with E, F or G, have not been tabulated.

Extracts from the Report on the Scientific Study of the Mental Conditions of Childhood.

App. III.

NOMENCLATURE OF SIGNS ADOPTED AS THE BASIS OF THIS INQUIRY.—WITH TABULATION OF CASES.

The columns indicate the numbers of children presenting each condition or defect respectively as seen in school, 1888-91 and 1892-94. The total numbers among the 100,000 children under report are also given. If a decimal point be inserted at the third numeral from the right hand it gives the percentage of the number of children with the condition or defect as taken upon the number of children seen.

No. 6.

Each defect is enumerated, whether alone or in combination with other defects.	Of 50,000 in Schools seen 1888-1891.		Of 50,000 in Schools seen 1892-1894.		Of total of 100,000 in Schools seen 1888-1894.
	Boys.	Girls.	Boys.	Girls.	
S. Number of children seen	26,857*	23,143	26,287	23,713	100,000
A. DEFECTS IN DEVELOPMENT.—The term includes any point of defect in the form, proportion, or size of the body and its parts, or the absence of any part	3,616	2,235	2,308	1,618	9,777
(a 1). CRANIUM Defective includes any defect in size, form, proportions, or ossification of the cranium. A given case may come under more than one of the classes below. As to a standard of normal size: In a well-developed child of good potentiality the head circumference at ninth month is 17½ inches, at twelve months 19 inches, at seven years 20 to 21 inches. This is a rather high standard of size	1,528	1,048	806	611	3,993
(a 2). CRANIUM Large.—A head of 22 inches circumference or over may be considered large in a school child; allowance must be made for age. Doubtless many of these cases are rachitic. Hydrocephalus is entered in its own class	257	46	107	13	423
(a 3). CRANIUM Small.—The point of size of head is recorded as apart from the size of the child for its age. The volume is estimated in relation to the normal for age. This is determined by inspection, by the open hand placed upon the head, and by the measuring tape. A head with circumference over 20 inches at any school age is not registered as small; usually the small heads are 18 to 19½ inches circumference. Small head is noted independent of stature	327	738	149	516	1,720
(a 4). CRANIUM Bossed.—There may be bosses, protuberances, or outgrowth at the sites of the ossific centres of the frontal bones, at the parietal centres, at the site of the fontanelle, and elsewhere. These are usually symmetrical, but not always	495	127	323	47	992
(a 5). Forehead Defective.—The forehead may be narrow, shallow in vertical measurement, or small in all dimensions; it may bulge forward and overhang. All defects of the forehead, except 'bosses' and 'frontal ridge' (a 4, a 6), are here included	183	78	53	23	337
(a 6). Interfrontal Ridge.—The vertical suture between the two halves of the frontal bone may be the site of a bony ridge, present in all degrees; if the forehead be also narrow it forms the scapho-cephalic type	89	27	121	19	256
(a 7). CRANIUM Asymmetrical.—Asymmetry may be as to the forehead or other part; one side of the cranium may be smaller than the other	84	16	27	2	129
(a 8). Dolichocephalic.—Head long in antero-posterior diameter	43	10	26	2	81
(a 9). Hydrocephalic.—This term is used as in medicine	5	2	2	1	10
(a 10). Other types of CRANIUM.—Square; oxycephalic, or elevated and conical; cranium larger in anterior than in posterior segment	50	6	11	2	69
(b 11). EXTERNAL EAR Defective in its parts, size, or form. Abnormality in size, proportioning, absence of parts, texture of skin are here recorded. The ear may be outstanding with great convexity posteriorly and concavity in front; the helix or portions thereof and the antehelix may be absent; the skin over the cartilage may be tight and adherent, coarse in texture with varicosities. The ears may be asymmetrical, and the lobes may be adherent to the face	1,047	268	364	103	1,782
(c 12). EYELIDS WITH EPICANTHIS.—The epicanthis is a fold of skin continuous with the lower fold of the upper eyelid (not a fold of mucous membrane) placed across the inner angle of the opening of the eyelids covering the caruncle; it may be asymmetrical	514	384	288	190	1,376
(d 13). PALATE Defective in Shape.—Defects in form are described as seen in the horizontal and in the vertical plane	796	525	496	310	2,127
(d 14). PALATE Narrow.—Without being otherwise altered, the palate may be contracted laterally in the space between the alveolar processes	450	291	276	163	1,180
(d 15). V-shaped PALATE.—Pointed more or less sharply at its anterior extremity, the alveolar processes being nearly straight lines, meeting at their extremities at an acute angle	235	171	179	110	695
(d 16). PALATE Arched or Vaulted, thus deviating from the normal in the vertical plane with a high roof	86	41	30	22	179
(d 17). PALATE Cleft.—A deformity which may affect the hard and the soft palate	14	8	12	13	47
(d 18). Other Defective Types of PALATE, such as the flat and the horse-shoe type	10	15	...	3	28
(e 19). NASAL BONES, wide, sunken, or indented. The bony bridge of the nose may be thus ill-shaped and depressed as in the undeveloped condition of babyhood	241	214	155	153	763
(f 20). GROWTH SMALL or stature short.—Children short and small in build for their age	209	209	271	328	1,017
(g 21). OTHER DEFECTS IN DEVELOPMENT less frequently observed	908	645	250	212	2,015

* The actual number seen was 26,884, but 27 have been deducted so as to make a total of 50,000 for convenience of working percentages.

Mr
A. Lobban.
1 May '02.

education of the school? Did you find that there were deficiencies in other departments?—Not at all. It is a strong school at every point.

1815. Strong at every point?—Yes.

1186. Well that seems to show that you can devote a good deal more than half an hour a week without injuring the general education?—Yes; but then it is very possibly not very much more than half an hour. Alloway, after all, is a fairly large school; and though it may be that they are getting much more than half an hour in the week, is it not possible that when you come to individual pupils they may not have very much more?

1187. Of course the time-table will show that, and we can ask the headmaster?—But the time-table is somewhat misleading.

School
premises:
fixed
furniture:
central hall.

1188. As to the difficulty of finding space in schools for this training, you referred to the fixed furniture and graded floors and the want of a hall, and so on, but does it come within your knowledge that this system of having fixed furniture and graded floors is becoming universal in your schools?—It is not so bad in the old schools, but in the new schools that is always done. I think it is, generally speaking.

1189. Perhaps you do not know whether or not the Department insists on this being done?—Oh, I think the Department gives them an entirely free hand in the matter. There is no condition laid down about desks.

1190. When you are building a new school?—No; provided the furniture is suitable—that is all.

1191. Then the same as to central halls—do they encourage central halls?—They give the Boards there, too, an entirely free hand.

1192. I am afraid not, Mr Lobban. I fought very hard for our central hall, and it was only because I stuck to my point for months and months that I carried it?—I beg your pardon. I was rather thinking from the other point of view, whether they put any difficulty in the way; whether they insist upon free halls.

1194. Is the town of Ayr in your present district?—Oh, yes; the whole county is.

1195. Is there much physical training given in the Ayr Burgh schools?—Well, not very much.

1196. And still they have every advantage. It is a military centre, with instructors at their hand, and everything else?—Yes. I think it would be a very important advantage if the local military instructors could somehow be brought into touch with the education system of the country.

Military
instructors
should be
brought into
touch with
education
system.

1197. Then you spoke about prizes for competition among the schools, but do you not think that that might lead to the children, or a squad of them, being trained for show—rather to the neglect of the others?—No doubt there is a little risk in that way. I quite admit that.

1198. While you think the healthy spirit of competition would be good?—Yes.

1199. But it would have to be carefully done?—Yes, quite so.

Games
supervised.
Playground
inadequate.

1200. Then on the question of games. I suppose one of the troubles about games is that there is no place even in the country for the children to play games?—No, except the playground itself.

1201. A good many playgrounds, I suppose, are not suitable?—Well, they could not play cricket, and they cannot even play football.

1202. The village green unfortunately does not exist, but do you not think that it is desirable, even if it is only elementary football in the school playground, to start children well, and tell them how to play the game. I do not mean to give it to them as a lesson, as a piece of their school work, and stand over them and interfere with them, but put them in the right way of playing the game?—Well, if it means that the supervision of the teacher is to extend to the playground I entirely agree, and I think that as long as they are in the playground or on the premises at all, they are quite as much, or ought to be quite as much,

under the supervision of the teacher as they are in the classroom.

1203. Then so far you would be in favour of games being taught?—Supervise them. Leave the children free to select their games, but let them play in the playground under the supervision of the teachers.

1204. I was more supposing they are out of the playground. Supposing they had a field handy to the school where they could play, do you not think that it would be well to teach them how the games ought to be played?—I do not think it would become general very readily that there should be a play field for them—for the Board Schools.

1205. That may be; but if there were one?—But if there were one.

1206. You would not be against giving games more consideration?—No, certainly not; but I see very little prospect of ever having a playing field in connection with the ordinary Board School.

1207. You spoke of some of your School Boards objecting to the military spirit. Do you find that it is the general use of the words of 'military drill' to cover all sorts of physical exercises that has among a good many people exercised an adverse influence. They begin to say you are just trying to make soldiers of the children, whereas all the time you are only trying to teach them to breathe and walk properly?—I do not think I ever heard any Board or member of a School Board express to myself any objection or opposition to physical training. I think it was more a matter of hearsay; in fact, I think it takes me away back to the days when I was in Paisley. I think I heard some members of the Board there express an opinion adverse to military training—I mean that it fostered the military spirit; but I do not think it is general now, and if it had been in the early days it has entirely disappeared. I think we may take that for granted almost.

Mr
A. Lobban.

disapp

1208. Then, as far as the feeding is concerned, of course I suppose we may take it that if you increase the physical exercise you may increase the appetite of the children?—That is so.

1209. Taking it as you said, that the majority of the children in your district are fairly well fed, I understood you to say you would favour any system which enabled the children readily to get a good meal in the middle of the day?—Most decidedly.

1210. And you think that the parents—of course, all the parents can do is to give the child 'a piece' to take to school, or very often a penny which you know goes in sweets—you think that the parents would favour a way of making it easier for the children to get a good meal in the middle of the day; and they would not grudge to pay for it?—I think the parents would be too pleased if any reasonable arrangement of the sort could be made.

1211. You think it would be a good thing for the children as well?—Well, I have no doubt about that whatever.

1212. *By Mr Shaw Stewart.*—Just one question on the point of a field for the children to play in. It was suggested by a former witness that, in populous places, possibly schools might group together and get a field among them on different days. If that were done, to would the teachers welcome that, do you think—would they be willing to go out and help the boys in their games?—I do not think that there would be any objection on the part of the teachers; but, in any case, if it were for the benefit of the children, I do not think that the opinions of the teachers would bulk very largely in the matter.

1213. No, except so far that a great deal falls on the teacher during the week. Of course, he might do it under compulsion, or he might do it because he enjoyed it and liked it?—I think that teachers would be quite willing to favour such a scheme as that, but, of course, it would have to be by Boards you know; it could not be individual schools. Such a thing ought to be done by the Board of the place.

1214. Quite. I was speaking of groups of Board schools?—Yes.

Mr
A. Lobban.
May '02.

1215. *By the Chairman.*—You stated that the time-table was very often rather misleading. Am I correct in saying that every time-table is revised and sanctioned by you before it is applicable?—That is so.

1216. Would you explain, then, what you meant by saying misleading?—Well, drill may appear two or three times in the time-table, but this drill may be confined to a section of the school, so that it would hardly do to reason that, because drill appears perhaps three half hours in the time-table, every child in the school is getting one and a half hour's drill; it may be only three sections of the school, each getting half an hour, so that if you just merely look at the time-table—that is what I meant by saying it might be misleading if you do not have that in your mind—that it might apply only to sections.

1217. But if it might be misleading, are there any means by which that could be rectified. Do you consider it satisfactory that it possibly should be misleading, or would you prefer to leave it more or less general in terms?—Oh, I think it might be left more or less general in terms.

1218. You would hardly perhaps devote sufficient time to every individual time-table to go into the details?—I daresay we ought to do it.

1219. But, I mean, you have hardly time?—It is not easy.

1220. At the same time you do actually inspect every time-table before it is passed?—Every time-table comes under our supervision.

1221. You said also that you were not an expert in any way. I suppose you have to conduct an examination in drill the same as you do in sewing?—Or see it is conducted.

1222. Well, but practically it is you, because you are the person who reports?—I report upon what I see.

1223. Then practically you examine?—But I do not put them through their lessons, as it were. I do not myself give the word of command.

1224. But I suppose, from the frequency of these inspections that you had, that you became insensibly a sort of expert. You know that the thing is done well or badly?—Well, at any rate we institute comparisons, and know when the thing is well done.

1225. What I rather want to get at is, do you think you know sufficiently well, or do you think that perhaps inspectors coming on in the future ought to be more instructed in the matter?—Well, I should be very glad if I knew more of it, realising the importance of it as I do.

1226. For that reason you would rather that in future the inspectors should have a certain knowledge of it?—Yes.

1227. I mean at some period. Of course you cannot do these things all at once—in the far future say?—Or else have a man specially told off to look after the drill of the whole country.

1228. That would cost money, though, would it not?—Well, one man. He does not require to go to every school; he might select.

1229. When you have those inspections, if you do not like examinations—inspections of drill—do these not occur at your surprise visits?—Yes, we may ask them to be drilled at our surprise visits, just to satisfy ourselves that the instruction is regular and systematic throughout the year.

1230. Then, with regard to the physical exercises, you thought that at least very likely dumb-bells would be advisable. Who would you propose to be the deciding authority as to the weight of dumb-bells for different sized children and children of different ages?—Well, the dumb-bells that are in general use in the schools are merely wooden affairs, you know. It gives them something to hold in their hands, but the weight does not come in as a question at all. I do not think that the schoolmaster should be the man to settle the weight.

1231. You agree with me that that would be rather a question of health and scientific knowledge?—Health and scientific knowledge decidedly.

1232. And a man of skill?—Decidedly.

1233. There is another subject that I do not think you have touched upon at all in particular, and that is the physical training of girls. Have you any views about that—I must rather take you back, I am afraid, because you have only expressed it generally; but I should like to ask you particularly, on the subject of girls, as to whether you think such training is not only necessary, but has, in your opinion, been of value?—What I said was meant to apply to both boys and girls, except in the case of the older boys, who might be taken away to the drill hall, or anything like that. I do not propose that for girls.

1234. You do not propose anything in the way of special training for girls; you think boys and girls, up to the age of fourteen, ought to be able to do the same, as far as you know?—As far as I am able to judge in the matter.

1235. In the inspections that you now conduct, pretty much the same is the case?—Pretty much the same. There is a form of drill for girls, I see, giving hoop drill.

1236. Yes, and what about skipping: do you ever see that?—Not in schools.

1237. Not in schools?—Not in schools. I have never seen skipping in schools, and I have not seen dancing in any of my schools, though I believe it is done in some places.

1238. You revise the time-table for drill, but you do not revise the squad drill, do you?—Would it be within your power to suggest certain changes in the drill performed?—Oh, yes.

1239. Has it ever occurred to you to suggest dancing?—Well, I have had occasion to point out that there seemed to be no point, no aim in drill in a certain school; it was altogether a feckless, fusionless affair; and what I have in my mind just now is just a sort of mere arm exercise, where it does not go beyond the arms, where the body is not thrown into it at all; and these are just the cases where the teacher has no concern, no compulsion or aim to work it up.

1240. Because they have not been trained?—Because they have not been trained.

1241. Not for want of will, but for want of experience?—From want of training, and want of knowing what to do; and that class of teachers bulks pretty largely in my district, and I hope that we shall be able to do something to remove that at any rate.

1242. It is very interesting to know exactly the state of affairs at the present time. Then as regards the good feeding—general good feeding in towns as well as in the country—I suppose you are aware of the unfortunate number of convictions through the agency of the Society for the Prevention of Cruelty to Children that occurred not only in Ayrshire, but also all over Scotland?—All over the country. Yes.

1243. And where in many cases the child is found to be poorly nourished, and yet such and such a child to be a school child?—Yes.

1244. You will admit that there are a great many?—Oh, there are cases; and it is a very serious social problem that must be solved in some way.

1245. You had that on your mind when you said to the Commission that the children were well fed in towns. You rather suggested that the children in towns were better fed than in the country?—No, I should think not. I should think it would be rather the other way—that there is a stratum in the towns, where the children do come poorly fed, and a very difficult class they are to deal with too. That is rather a wide subject. I do not think that the children who come from those homes are able for the effort, either physically or mentally, that the school demands from them. It is a very serious problem. I admit it fully.

1246. *By Professor Ogston.*—Would you kindly allow me to put one single question. Suppose that an accident happened during the games or physical drill of any kind in a school in the neighbourhood, would it be reported to you as inspector, and by you to the Board, or would you obtain knowledge of it in any way?—Not in any way, except purely accidentally.

1247. By chance that means?—Yes; quite so.

Mr
A. Lobban.
1 May '02.

Girls: physical training same as for boys.

Teachers: lack of proper training.

Feeding of children in towns generally worse than in country.

Inspectors: should be of higher quality in drill.

Mr
Alan Tuke,
M.B., C.M.

1 May '02.

Physical
training;
time to be
devoted per
diem.

the time in the ordinary schools that you thought ought to be devoted to this work was twenty minutes daily for the infants, and forty minutes for the older classes?—Up to forty minutes for the older classes. I would make forty minutes the limit.

1396. Are you aware of any school where it even approaches that amount?—No, none of them.

1397. Forty minutes of drill is a good deal?—It is not continuous drill.

1398. How would you break it up?—I would break it up: in the infant department, say twenty minutes—5, 5, 5, with a five minutes' interval broken up in between; that is actually fifteen minutes' drill.

1399. How would you break up the forty minutes?—Supposing they had five minutes.

1400. Five minutes' drill?—Five minutes' marching; that would include taking as it stands here, marching and marching on tip-toes.

1401. I am not speaking of what it would include; but would you just explain how the time would be broken up; you would give them five minutes?—Of marching and marching on tip-toe.

1402. How long interval?—Supposing you give them two minutes' interval after that, then five minutes of the free exercises, and then a short march at the finish; the twenty minutes would be left to the discretion.

1403. The forty minutes would cover an hour and a half a day of school time at that rate?—No; forty minutes, as they get up to the other classes; the whole thing forty minutes.

1404. Forty minutes, broken up as you describe, would mean an hour and a half?—I want the twenty minutes, from start to finish, to include the interval, and the forty minutes includes the intervals.

1405. *By Mr Fergusson.*—When you said that physical training was haphazard and a waste of time, were you speaking of your knowledge of Dunfermline only, or have you any knowledge of schools all over the country?—My statement was made simply as I have seen it carried out in my own town of Dunfermline, which I am referring to want of system.

1406. Though you said you admitted that an untrained person who went to look at this work might find it taking to the eye?—Yes.

1407. I suppose that means that you think an untrained eye is not capable of understanding the niceties of physical training?—I do not think an untrained eye is able to see whether those movements that the pupils are doing are actual beneficial movements or not; that a person who is going to inspect them must be an inspector of physical training, as he is of reading, writing, and arithmetic.

1408. I suppose you would say that though any of H.M. Inspectors who are not trained to physical exercise report that the training looks well, it does not follow that it is correct; they are not sufficiently expert in training to know?—They are not experts; that is the difficulty, they are not experts.

1409. In your answer as to instructors, were you dealing with the instructors who were to teach the children in schools, or the instructors who were to teach the schoolmasters?—I want an instructor to be over all the teachers and the pupils as well—an inspector, to see that the teachers, first of all, know their work thoroughly, and are carrying out their work thoroughly.

1410. That is, a man who goes to the school now and again?—Who would go to the school regularly once a fortnight—go round every class once a fortnight.

1411. And that man, you say, should be a specially trained man; you do not like an old soldier?—I do not.

1412. When you said that, I suppose you meant a man who had been a drill-sergeant; you want an Aldershot-trained man, such as you find in a military gymnasium?—The instruction there is, I believe, splendid; exactly.

1413. You gave us a scheme of work divided into classes?—Yes.

1414. May I ask you, how did you arrive at that scheme—did you make it for the purpose of to-day, or had you seen it in practice?—Well, that is one we

have been following out for some time in the gymnasium as we have it at present; of course it is somewhat difficult there to class your children exactly as you want, but undoubtedly the infants must be handled lightly and gently. It seemed to me that by dividing them into six, one could best divide up the children as to their physical strength.

1415. But you have evolved that out of your experience?—Yes.

1416. It interested me because, curiously enough, it is exactly—you could not have stated it more exactly—the system of training we have adopted in a school of which I have some knowledge?—Is that so. In this I have some great assistance from our gymnasium instructor, who is a man of great ability.

1417. You said nothing about gymnastic work—applied gymnastics—do you consider that is not desirable for children of fourteen?—Well, I have got a note here as regards that. I said in class C, dumb-bells to be made of wood, and, if possible, once a week gymnasium, to make a pleasant break and induce further attendance there. If once a week the senior class were to come to the gymnasium, and there take advantage of the apparatus, I think that would have a good effect to have the apparatus most carefully applied to them, and it might make them a little brighter and throw some interest in it, and in fact make them take to it.

1418. There was another point, because there seems to me a practical difficulty in carrying out what you suggest. You say the work should be done in the morning?—Yes.

1419. And never at the end of class time?—

1420. *By the Chairman.*—I think he said never when the children were tired?—I said never when the children were tired.

1421. *By Mr Fergusson.*—I suppose you mean by that about the end of lesson time?—My idea of doing it in the morning is, the children come into the school cold, and by giving them the advantage of physical training, it seems to me, you create a good healthy warmth in them. That would be in winter.

1422. That would be for the ordinary training done by the teacher?—Yes.

1423. But then the regular instructor comes once a week?—That would be an exception.

1424. You would not insist on doing his hour in the morning. You see the practical difficulty?—You could not take anything so good in the morning in the winter time; it would warm the children up and put their circulation in good condition, and in the summer time, if possible, in the open air, outside, in the playground.

1425. Of course to carry out all this grading of children, and not give them work which is past their strength, you would require some system of medical examination?—Yes, and I may also say in the grading; there is one point I want to bring out there. After grading the young children, if I found any with spinal curvature, I would take them all out and send them, if possible, to the gymnasium to be put under the expert, because it seems to me by doing that one might stop very often spinal curvature. The child might lose a certain amount of its school, but certainly it might have a straight back. You see what I mean—that a young child who really showed signs of weakness, and physical training would affect it, I would send those children to the instructor, who is a trained man.

1426. Do you not think that the ordinary schoolmaster and schoolmistress, men and women who are accustomed to children and know about children, seeing these children every day, may be safely trusted to see for themselves the weak ones and to pick out the weak ones?—Yes.

1427. And do you think it is necessary to have a doctor to come and examine all these children at short intervals?—No. I do not know that it is absolutely essential to have a doctor coming round examining them, but I think it would be a very good thing at the beginning of each term if some medical advice were given as to grading the children.

Mr
Alan Tuke,
M.B., C.M.

APPENDIX V.

Tables prepared by Mrs Bryant, Headmistress of North London Collegiate School for Girls. [See VOL. II.; MINUTES OF EVIDENCE, QUESTIONS 8576-8679.]

I.

AVERAGE MEASUREMENTS for the different ages of pupils in the North London Collegiate School for Girls, as taken on the first examination after entry, from May 1893 to May 1902.

Age.	Height.	Weight	Chest Girth.	Waist.	No. of Obs.
10	53·05	68·00	25·00	22·01	57
11	56·60	78·50	26·10	22·70	66
12	57·91	84·14	27·17	23·55	88
13	59·82	91·69	27·91	24·66	110
14	61·66	105·48	29·14	24·01	129
15	62·42	112·43	29·87	23·90	151
16	62·44	114·54	29·57	24·13	131
17	62·46	120·66	29·90	24·38	42
18	62·15	121·00	30·07	24·67	8

The rate of increase in these measurements does not correspond at all to the average rate of growth in the girls, since the measurements are taken in all cases soon after entry. To illustrate this distinction, the following table of average heights of girls in school now is given, and shows a higher rate of increase. The rates of growth of the girls as they pass up the school is clearly higher than this. The reason is, no doubt, that the children who enter early are, on the whole, more wealthy.

TABLE showing the heights at different ages of 394 girls from the North London Collegiate School for Girls, measured on the 11th and 12th June 1902.

Age.	No. of Cases.	Average Height in Inches.
8	2	45·75
9	5	52·25
10	5	53·55
11	13	55·19
12	33	58·13
13	42	60·65
14	57	61·71

16	74	62·99
17	60	62·75
18	32	63·09

II.

PERCENTAGES of cases requiring physical treatment or care of different kinds, among 1330 pupils entering the North London Collegiate School between May 1893 and May 1902.

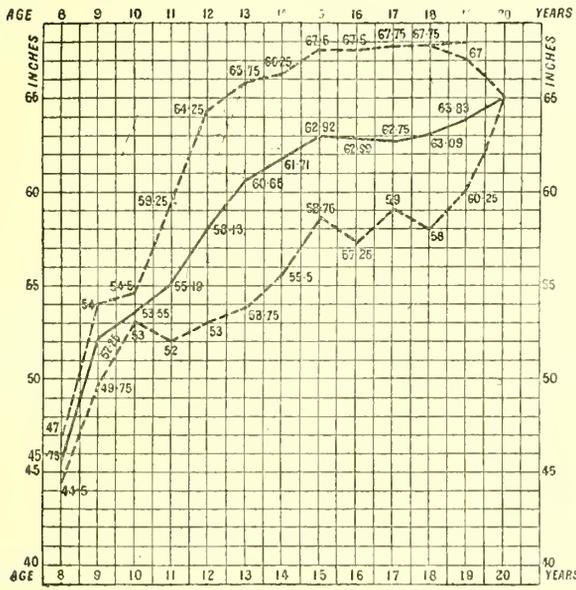

* Restricted in exercise on account of weakness of heart or lungs (often temporary).	4 per cent.
* Restricted for other reasons, e.g., anæmia or imperfect convalescence.	1 per cent.
Requiring special physical training for shorter or longer periods of time.	30 per cent.
Defects of eyesight of all kinds.	33 per cent.
Feet rather flat.	35 per cent.

* The number in school at any given time thus restricted is smaller than the above figures indicate, because of the improvement which is soon manifest, owing to the remedial exercises.

CHART and TABLE showing heights at different ages of 394 girls from the North London Collegiate School for Girls, measured on the 11th and 12th June 1902.

App. V.

Average heights at each age shewn in broad line.

TABLE VIII.—Showing the STATURE and WEIGHT of Adult Male Criminals and Lunatics, compared with that of the General Population.

Classes.	Height.				Weight.			
	Ages.				Ages.			
	20 to 25.	25 to 35.	35 to 45.	45 to 55.	20 to 25.	25 to 35.	35 to 45.	45 to 55.
	<i>Inches.</i>	<i>Inches.</i>	<i>Inches.</i>	<i>Inches.</i>	<i>Lbs.</i>	<i>Lbs.</i>	<i>Lbs.</i>	<i>Lbs.</i>
General :								
Average population - - - - -	67·5	67·9	67·9	67·9	146·2	156	162	163·8
Class 3: country labourers - - - - -	67·2	67·5	67·5	67·8	149·5	157·4	161·2	166·4
Class 4: town artisans - - - - -	66·5	66·6	66·9	66·6	139	147·3	154·1	148·6
Criminals - - - - -	65·2	65·6	65·7	65·8	136·9	140	141·4	143·4
Lunatics - - - - -	65·7				147·9			

40. When compared with the general population, lunatics show a deficiency of stature of 1·96 inches, and of weight 10·3 lbs.; and criminals of 2·06 inches, and 17·8 lbs., indicating a deficiency of physical as well as mental stamina in both these unfortunate classes of society. In respect to complexion, lunatics show an excess of 5 per cent. of light eyes with dark hair, and criminals of 10 per cent. of dark eyes with dark hair over the general population.

41. As an example of the relation of high mental to physical qualities, the stature of ninety-eight Fellows of the Royal Society is given. Their average stature is slightly above (0·38 inch) that of the professional classes of this country, to which the majority of them belong.

42. As an example of high physical qualities as developed by training, the measurements of eighty-nine professional and amateur athletes are given. Their average stature exceeds that of the general population from which they are drawn by 0·68 inch, while their average weight falls short of that standard by 14·5 lbs. The ratio of weight to stature is, in the athletes, 2·100 lbs., and in the general population 2·323 lbs., for each inch of stature. Thus a trained athlete whose stature is 5 feet 7 inches should weigh 10 stone, while an untrained man the same height should weigh 11 stones.

43. The statures of the Metropolitan Police and the London Fire Brigade are given as selected men of the

working classes. The former exceed the criminal class, with whom they have to deal, in stature by 4·5 inches and in weight by 45·3 lbs. The men of the Fire Brigade are selected for their activity and general fitness to meet sudden and trying demands on their physical and mental energies. The data referring to them may be accepted, therefore, as typical of the best physique which can be obtained for an English army, and of which our army should consist at its best.

CHILDREN AND ADULTS OF BOTH SEXES.

51. A large portion of the statistics collected by the Committee refer to children, and these, together with those referring to the adults already considered in the early part of this Report, have been arranged in Tables XV. to XXV. to show the influence of age, sex, nature, occupation, and sanitary surroundings on the physical development of the British population. The children are chiefly those of English parents, as few returns have been received from other parts of the kingdom. All classes of the community are represented, from the upper and professional classes whose children attend the Public Schools, like Eton, Marlborough, and Radley, to the poorest town population, whose children are found in the public elementary (or Board) schools, charitable institutions, and industrial schools. The adults also

I. include all classes from the Universities of Oxford and Cambridge, to town labourers and factory operatives.

52. In deciding upon the arrangement for practical purposes of returns so varied in their origin, and yet consisting in so large a proportion of information derived from special sources, the first consideration has been to establish a classification of the returns according to the *media* or influences which have been instrumental in differentiating one class from another. The Committee has adopted the subjoined scheme, prepared by Mr Roberts, and first brought before the association in a paper read in the Anthropological Section in 1878. It is based on the principle of collecting into a standard class as large a number of cases as possible which imply the most favourable conditions of existence in respect to fresh air, exercise, and wholesome and sufficient food—in one word, nurture—and specialising into classes which may be compared with this standard those which depart more or less from the most favourable condition. By this means, in respect to social condition, the influence of mental and manual work; in respect to nurture, the influence of food, clothing, etc., on development; in respect to occupation, the influence of physical conditions; and in respect to climate and sanitary

conditions, the influence of town and country life may be determined.

53. The classification has been constructed on the physiological and hygienic laws which are familiar to the students of sanitary science, and on a careful comparison of the measurements of different classes of the people, and especially of school children of the age of from eleven to twelve years. This age has been selected as particularly suited to the study of the *media* or conditions of life which influence the development of the human body, as it is subject to all the wide and more powerful agencies which surround and divide class from class, but is yet free from the disturbing elements of puberty and the numerous minor modifying influences, such as occupation, personal habits, etc., which in a measure shape the physique of older boys and adults. The data on which the classification has been based are given below. The most obvious facts which the figures disclose are the check which growth receives as we descend lower and lower in the social scale, and that a difference of five inches exists between the average statures of the best and the worst nurtured classes of children of corresponding ages, and of 3½ inches in adults.

TABLE XII.—CLASSIFICATION of the British Population according to *Media*—Occupation and other Conditions of Life.

Social Condition.*—Non-labouring Classes.		Labouring Classes.				Selected Classes.

Diagram showing the Stature, Weight, Chest girth and Strength of both Sexes at all Ages of the General Population of the United Kingdom.

Illustrating the Report of the Anthropometric Committee

Growth of Children of both Sexes.

56. Tables XVI. to XXII. show the growth of children of four of the five classes into which the returns have been divided. Class I. comprises the upper and professional classes and their children, and it may be accepted as representing the best physique of this country, and used as a standard with which to compare all other classes. According to the census of 1871 this class constitutes 4.46 per cent. of the population. Class II. consists of the commercial classes, such as clerks and shopkeepers and their children, whose occupations are carried on in towns, and for the most part indoors, and therefore under less favourable conditions to healthy development than the constituents of Class I. Class II. comprises 10.36 per cent., of the population. Class III. represents the labouring classes, such as agricultural labourers, fishermen, miners and others who follow outdoor healthy occupations, but whose nurture is inferior to the two former classes. This class comprises 47.46 per cent., or nearly half the population of the country. Class IV. represents the mass of our town population engaged as artisans. Their trades, being carried on indoors, and requiring less physical exercise than Class III., place them under less favourable conditions as to sanitary surroundings. This class forms 26.82 per cent., or about a fourth of the population. Class V., comprising persons living in towns and following sedentary occupations under the most unfavourable conditions as to nurture and sanitary surroundings, has been omitted from the tables, as sufficient data have not been received to fairly represent it. This class constitutes 10.90 per cent. of the population.

57. The average stature and weight of each of the four classes have been worked out from the number of observations for each class, but as the several classes constitute different proportions of the general population, the average representing the 'general population' has not been worked out from the total number of observations, but is the average of the other four averages, and it is therefore the average of the four classes rather than of all the individuals measured and weighed. The observations referring to adults are fairly representative of the general population as they were received from all parts of the country; but those referring to children were received from schools devoted to the education of special classes of society, and in numbers which did not correspond with their respective percentage proportion of the general population. By adopting the average of the averages of the four classes into which the school children have been distributed according to the occupation of their parents, the inequality of the percentage proportion has been eliminated. Tables and a diagram showing the *mean* stature, weight, chest girth, and strength of males, as deduced from all the observations collected by the committee, are given in the Report of 1881.

58. Tables (XIII., XIV.) have already been given (s. 53) which show the falling off in the average stature of children of the age eleven to twelve years, and of adults of the age twenty-five to thirty years, as the conditions under which they live are less and less favourable to healthy physical development. The children vary to the extent of 5 inches, and the adults to 3½ inches, and corresponding variations occur in the weights and other physical qualities.

59. Plate X. shows the growth in stature, weight, and strength of individuals of both sexes, and the girth of chest, head, arm, and leg of males as far as they have been recorded in the returns received by the committee. The tracings are made from the *averages* in the column representing the general population, similar tracings of the standard class (males) having been given in the Report for 1880.

The Period of Maturity in Man.

61. The Tables do not show distinctly at what period man attains his full stature, and much difference of opinion exists on the subject. Some French writers (Barnard, Allaire, etc.) maintain that growth in height goes on until the thirty-second or thirty-fifth year, and Dr Baxter arrives at the same conclusions from the statistics of the United States Army; while most English writers (Danson, Aitken, Roberts, etc.) regard the twenty-fifth as the year of mature growth, and Dr Beddoe places it as early as the twenty-third year, admitting, however, that a slight increase may take place after this age. The difference of opinion on the subject arises, no doubt, from the faulty method of relying on the measurements of many different individuals, instead of measuring the same individuals from year to year until growth ceases. The elimination of the weak and ill-developed by death, the difficulty of following the same class, and all the members of the class, through successive years, and the selection of special classes (*i.e.*, recruits whose ages are never certain), invalidate all conclusions as to the period of maturity drawn from statistics of measurements of many different persons; but, allowing for these sources of error, and judging by the run of the curves formed by the means and averages, it is probable that little actual growth takes place after the age of twenty-one, and that it entirely ceases by the twenty-fifth year. It is evident, moreover, from Table XVI., that the full stature is attained earlier in the well-fed and most favoured class (Class I.) than in the ill-fed and least favoured classes of the community (Class IV.).

62. It is difficult to understand, moreover, how any increase of stature can take place after the bones of the skeleton have become consolidated, and the epiphyses firmly united to the body of their respective bones; and the last of these unions in the long bones, on which the stature depends, occurs about the twenty-third year. In adopting the twenty-third year for men and the twentieth for women as the ages of the attainment of maturity, the committee was influenced by these considerations, and a desire to understate rather than overstate its case, and to embrace as large a number of observations as possible in its tables. In inquiries of this kind there is generally a slight amount of unconscious selection, very small persons being passed over, or having objections to being measured; and any deficiency of this kind will be balanced by the loss of growth which may occur after the age of twenty-three years. Females attain to maturity earlier than males, and the age of full growth has been fixed three years earlier for them.

Influence of Advancing Age.

63. The maintenance of the stature throughout life as shown by Table XVI. is a new and unexpected fact, but it is probably due to the survival of the taller and better developed members of the population, and the elimination by disease or death of the smaller and feebler ones. Quetelet has stated that man attains his maximum height at the age of thirty years, and maintains it up to fifty years, after which it begins to recede, and at ninety it has lost three inches. This may be, and probably is, true of individuals if measured from year to year, but it does not appear to be true of the population in the aggregate. The loss of stature resulting from the degeneration and loss of tissue, and the stooping position assumed by old people, is more than counterbalanced by the survival of a greater number of individuals who are above the average in height. The uniform increase in the weight and chest-girth throughout adult life also confirms this view.

VII. *Physical Improvement or Degeneracy of the Population.*

65. Few statistics are in existence which help to throw light on this subject. It is generally believed that the population in the manufacturing towns of the North of England is rapidly degenerating, but a comparison of the measurements of stature and weight given in the Report of the Factory Commissioners of 1833, and in the Report to the Local Government Board on "Changes in Hours and Ages of Employment of Children and Young Persons in Textile Factories," 1873, shows that this is not the case. On the contrary, an examination of Table XXIV., showing these measurements, indicates a slight but uniform increase in stature, and a very large increase in weight, at corresponding

ages. The increase in weight amounts to a whole year's gain, and a child of nine years of age in 1873 weighed as much as one of ten years in 1833, one of 10 as much as one of 11, and one of 11 as much as one of 12 years in the two periods respectively.

66. As an example of the condition of a class living under most favourable conditions, a table (XXV.) showing the measurements of the boys in the Friends' (Quakers') School at York, extending over a period of twenty-seven years, is given. Allowing for one or two obvious errors of observation, the general run of the figures is very uniform, the statures remaining stationary, while there is a slight improvement in the weight at the higher ages in the last nine years.

APPENDIX IX.

REPORT ON THE PHYSICAL EXAMINATION OF 1200
SCOTTISH SCHOOL CHILDREN.

BY

MATTHEW HAY, M.D., Professor of Forensic Medicine, University of Aberdeen,
Medical Officer of Health for Aberdeen;

and

W. LESLIE MACKENZIE, M.A., M.D., Medical Inspector for the Local Government Board of Scotland.

A.—Introduction.

TO THE ROYAL COMMISSION ON PHYSICAL TRAINING (SCOTLAND).

MY LORD AND GENTLEMEN,—

TIME OF EXAMINATION.

App. IX

We have the honour to report that, in accordance with the request of the Royal Commission on Physical Training (Scotland), we have examined 1200 Scottish school children—600 in Edinburgh, where the examination was under the direction of Dr Mackenzie, and 600 in Aberdeen, where the examination was directed by Professor Hay.

AGES OF CHILDREN.

The children were between the ages of six and fifteen years, and were chosen in equal numbers from both sexes, and, as nearly as practicable, in equal numbers from the several years of age. The children were taken entirely from the schools under the charge of the School Board.

APPROVED SCHEDULE.

The examination of each child was carried out in considerable detail, and according to the scheme laid down in a schedule, which had previously received the approval of the Commission.

ASSISTANCE IN CONDUCT OF EXAMINATION.

We desire to express our great indebtedness to the following gentlemen and ladies for their valuable assistance in carrying out the inquiry—in Edinburgh to Mr Edwin Matthew, M.A., M.B., M.R.C.P.Ed., Clinical Tutor, Royal Infirmary, Edinburgh, Assistant Physician, Leith Hospital, late Ettles Scholar, University, Edinburgh; to Mr J. D. Lithgow, M.B., C.M., Ear and Throat Department, Royal Infirmary, Edinburgh; to Mr E. M. Lithgow, M.B., Ch.B., Eye Department, Royal Infirmary; and to Mrs Edith Fowler, M.B., C.M., late Resident Physician, Leith Hospital; and in Aberdeen to Mr James Dawson, M.B., D.P.H., whose great services throughout the inquiry Professor Hay wishes to emphasise; Mr A. W. M. Sutherland, M.B.; Mr William F. Croll, M.B.; Mr William E. Taylor, M.B.; and Miss Anne Mercer Watson, L.R.C.P. In both towns the examiners included experts in eye diseases and ear and throat diseases.

Cordial acknowledgments are also due, in Edinburgh, to Mr A. J. Bain, and Mr Alex. McKinna, of the Local Government Board for Scotland, and in Aberdeen to Mr James Cumming, of the Public Health Department, for assistance in the arduous labour of summarising and tabulating the results.

We have also to express our appreciation of the facilities afforded by the School Boards of the two cities, and of the cordial co-operation and valuable help rendered by the headmasters and staffs of the schools selected.

In both cities we found it convenient to conduct the examination in the month of November, that is, about the middle of the term following the longest vacation of the year. The children may, therefore, have been discovered in somewhat better physical condition than the average for the school year.

In *Edinburgh* the examination was begun on 10th November, and finished on 28th November. The schools opened on 2nd September after the usual autumn vacation of six weeks.

In *Aberdeen* the examination took place in November, and continued from the 6th to the 30th. The schools opened in the third week of August after the usual autumn vacation of six weeks.

SCHOOLS VISITED.

In order to ensure that the children examined would represent fairly the different social grades of the population, schools were selected from the poorest and most crowded districts of each city, from the middle class districts, and from the better class districts. Information regarding the size of each school, date of construction, means of ventilation and heating, cubic space for each child, playground area for each child, and the number of children taken from each school, with the size of house in which they resided, is given in Table I. The size of the house, as determined by the number of rooms, is of use in affording a rough, but convenient and fairly reliable, index of the social condition of the child and of its general sanitary environment.

MODE OF SELECTING THE CHILDREN.

In order to obtain a representative selection of the school children in each of the cities, it was necessary, in the first place, to take schools that are themselves representative of the different social grades of the population, and, in the second place, to select the children by some chance method, as by ballot, keeping in view that the children should, as far as practicable, be equally spread over the several yearly ages from six to fifteen, and that there should be equal numbers of both sexes.

MODE OF EXAMINING THE CHILDREN AND OF
STATING THE RESULT.

All the children were examined in the schools at which they were attending, a suitable room or hall being utilised for the purpose.

The information sought for, as will be seen from the

App. IX.

schedule, is to some extent beyond the strict requirements of the inquiry so far as it deals merely with physical training; but it was thought advisable to include what might prove to be unessential rather than to omit some observations that might have been subsequently recognised to be important.

The information as to the mental capacity of the child, and as to its position in the class, and the regularity of attendance, was, of course, supplied by the teacher, who also obtained the desired information as to the age of the child and the size of the house. The remainder of the information was procured by the medical examiners. The eyes were examined in an improvised dark chamber by an expert, and the ears and nose and throat were also examined by an expert. The rest of the medical examination was conducted in the usual way, and with as little undressing as was consistent with a satisfactory inspection. The measurements were, in each city, undertaken for all the children by the same person or persons, so as to secure uniformity of mode. The apparatus used was, except in so far as specified under particular tables, of precisely the same kind for both cities. The whole procedure and method of examination was carefully discussed and arranged beforehand by Professor Hay and Dr Mackenzie, so as to ensure, as far as practicable, that the results in both towns would be strictly comparable.

The information obtained has, as far as possible, been summarised in the various tables accompanying the report. As the number of children examined at each year of age and for each sex is small, it has been thought advisable, in most of the tables, to group the children into three three-year-age groups, namely, a group composed of the children above six and under nine years, a second of the children above nine and under twelve, and a third group of the children above twelve and under fifteen—the sexes being separately distinguished. Such a grouping gives a safer basis for generalisation, and will, at the same time, enable the Commissioners to apprehend more quickly the main facts elicited by the inquiry. It will be convenient to bear in mind in reading the table that, as the number of each sex in each age-group for each of the two cities is either actually or approximately 100, the figures relating to each group under the various headings, and giving the number of children belonging to one or other division or grade, are, as near as may be, percentages of the number of children of each sex in each group. The total percentages for the whole children in each city are, as far as is possible, worked out at the bottom of each table.

In a few tables, where it has been thought desirable, the information is supplied for each year of age.

It is not possible to condense or focus the results of the inquiry without such group tables or summaries; but it has to be admitted that much of the value of the inquiry lies in a collation of the details for the individual children. But for the large addition to the tabular matter, it would have enhanced the permanent value of the report if a summary of the information for each child were given. Such detailed information would have made it possible for subsequent investigators to work out from the facts fresh problems for themselves, or to compare at all points the facts elicited in this inquiry with those obtained in future inquiries of a similar kind.

MENTAL CAPACITY, CLASS PLACE, AND REGULARITY OF ATTENDANCE.

The teacher was asked to give his opinion of the mental capacity of each child, the capacity being graded according as it was 'excellent,' 'good,' 'medium,' 'dull' or 'defective.'

The position of the child in its class, which was also obtained from the teacher, usually agrees with mental capacity, but not necessarily. In Edinburgh, owing to the teachers having stated the class position in general terms, it was found to differ so little from the opinion as to mental capacity that it has been thought unnecessary to tabulate the information. In Aberdeen

the teachers were good enough to supply for each child its average place in the class as well as the total number of pupils in the class, which has made it possible to arrange the children in four groups, according as they occupied a place in the top fourth, or one of the lower fourths of the class.

The standards for regularity of attendance were fixed after ascertaining the average percentage of absentees throughout the Board Schools in Edinburgh and Aberdeen. As the average is somewhat less in Aberdeen than in Edinburgh, and as the standard applied in the inquiry was the same for both towns, the proportion of irregular children has been correspondingly reduced in Aberdeen.

Very little reliable information was obtained as to the cause of irregular attendance, and, accordingly, a place has not been given to it in the table, though it stood in the schedule.

PERSONAL APPEARANCE.

This was noted by the medical examiners, and included complexion, health appearance, state of nutrition, brightness and alertness, carriage and general balance, and, lastly, cleanliness of body and clothing. Each was marked in one of three degrees—usually 'good,' 'medium,' and 'bad.'

There is naturally in this part of the examination a large subjective element in the observations of the examiner, and it is possible that this may account in some degree for the differences between the children of the two cities, for example, in respect of 'carriage and general balance.' But this was one of the items most likely to be viewed differently by different examiners, according as the standard was derived from the natural untrained child or from the physically trained child.

Only such uncleanliness was noted as was due to absence of proper habits and want of reasonable care.

TEETH.

The teeth of every child were examined in regard to cleanliness, regularity and shape, progress of development, amount of decay, and the attention given to brushing the teeth. Children in whom the development of the permanent teeth was delayed by more than a year from the average were entered as showing delayed development. The decaying teeth referred to in the table include all teeth showing signs of decay, whether slight or extensive, and the set—first or second—to which they belonged was noted. Teeth were only reckoned as lost when no part of them remained visible above the gum, otherwise they were counted amongst the decaying teeth. The lost teeth of the second or permanent set alone were recorded.

COLOUR OF HAIR AND EYES.

This was marked according to the schemes of colour in general use among anthropologists. It is not pretended that the observations on the colour of the hair and eyes have any value in connection with physical training, but they were easily taken, and possess some interest for the anthropologist, and they afford the material—perhaps not otherwise existing—for a comparison between the children of the two cities.

EYESIGHT.

The eyes were tested for distance vision by means of the usual Snellen's types (black on white) read at a distance of six metres. There was a slight difference in the scale numbers of the sets of types used in the two cities, which was not noticed until after the examinations had been completed, but it does not affect the value of the results. Both eyes were tested together.

'Emmetropia' implies normal refraction. 'Hypermetropia' corresponds to what is popularly known as 'long-sightedness.' Every degree of it was noted among the children examined, and as a slight degree of

App. IX.

IX. it is widely met with in young children, it is usually regarded in such cases and degree as virtually normal. The higher degrees correspond closely with the defective vision as tested by the Snellen's type, and call for correction by the use of suitable spectacles.

'Myopia' is usually known as 'short-sightedness, and nearly always requires, for school work, correction by spectacles.

'Astigmatism' is due to inequalities in the curvature of the lens and cornea of the eye, producing more or less blurring in vision, and almost always requires correction.

Errors in the refraction of eyes, when allowed to go uncorrected, interfere with the education of the child, and are also, in many cases, a source of headache and pain in the eyes. The percentage of children requiring correction for defective vision is given in the tables.

The colour-sense, though appearing in the schedule, was not tested. It was found to be impossible to make reliable tests with young children; and, even among the older children, it would have required a great expenditure of time to obtain satisfactory results. The omission is, however, of little consequence, as the colour-sense is not found to vary much in different parts of the world or under different conditions of life.

EARS AND HEARING.

The hearing power of each ear was separately tested, by means of a watch audible to a person of normal hearing in a still room at a distance of about nine feet.

Similar watches, which had been previously compared, were used in the two cities. This test is not altogether reliable in distinguishing the finer grades of defective hearing, especially in young children, but it is sufficiently useful for practical purposes. Where the hearing power of the two ears differed, the average has been used in making up the table. If the average distance at which the watch was heard was less than four feet, the hearing has been classed as 'distinctly defective'; if between four feet and eight feet, 'defective'; and if eight feet and upwards, 'normal.' It may be assumed that a large majority of the children marked as 'defective' would, nevertheless, have no great difficulty in following the work of the class. All those entered as 'distinctly defective' would have a decided difficulty. Defective hearing is usually due to disease of the ear or throat, or a combination of both. The causes of the defective hearing in the children examined have therefore been classified in reference to diseases of these parts.

The drum of each ear was examined with a speculum.

NOSE AND THROAT.

The nose and throat were examined as thoroughly as was possible without the aid of instruments, beyond a simple spatula. An attempt was made at first to use the nasal speculum and rhinoscopic mirror, but the children did not readily tolerate the use of these instruments, which were, therefore, abandoned. Consequently, some diseases may have escaped recognition, such as polypus and hypertrophy of turbinated bones.

The sense of smell was tested by a distilled solution of oil of peppermint of three different strengths—viz., 1 in 1000, 1 in 10,000, and 1 in 100,000. A control test of simple water was also used. The weakest of the peppermint solutions represented the limit of dilution detectable by a person with normal sense of smell. Children are classified in the table as defective in sense of smell if they failed to recognise one or all of the peppermint solutions. The number of failures were so few that it has been considered unnecessary to grade them.

MEASUREMENTS.

As the tables show, a large number of measurements were made of various parts of the body of each child, in addition to the usual measurements of height and

weight. The height sitting (from vertex to buttocks) was taken, as well as the height standing, in order to give a notion of the length of the trunk in proportion to the limbs. Various measurements of the length, width, and height of the head were made, for the purpose of obtaining some rough measure of the cranial capacity. The cephalic index was calculated from the average maximum length and width by the usual formula—viz., $\text{cephalic index} = \frac{\text{width} \times 100}{\text{length}}$.

The maximum length and width were ascertained by means of Gray's callipers, which are specially designed to secure unvarying pressure of the callipers on the head. The height of the head was measured by an apparatus devised by Professor Hay. In Edinburgh, Hepburn's callipers were also used for the same purpose, and gave approximately the same results. The circumference of the head and all other circumferences or girths were measured by a narrow steel or linen tape. In the head measurements the tape was drawn tightly, to diminish the error due to the hair; in other parts only sufficient pressure was used to ensure that the tape was in close contact all round. The width of the shoulders, pelvic crests, and hips was measured by a sliding callipers specially designed for the purpose by Professor Hay. These measurements are a test, along with the height, of the general skeletal development. The girth of the forearm and calf of leg was taken as a measure of muscular development; and in order to make allowance for differences in the thickness of the bones, the girth of the wrist and ankle was also measured. The muscular power was tested for the hand by a pressure apparatus constructed by Professor Hay, in which a rubber ball was attached by a tube to one arm of a specially designed manometer containing mercury. The child was asked to press the ball as firmly as it could by grasping it with the hand, and the degree of pressure exercised was read from a graduated arm of the manometer in terms of pounds of pressure per square inch. It should be remembered that the principle of the apparatus is different from that of the usual metal dynamometer, and the results are more accurate. The metal dynamometer is unsuitable for children. Each hand was separately tested, and the child was usually given two or more trials, the best of which was recorded. The apparatus worked satisfactorily.

All measurements were, as far as possible, made on the naked body; but where, as in the hip and pelvic measurements, it was impossible to insist on stripping in every case, an allowance was deducted for the thickness of clothing included in the measurements.

The tables giving the average measurements for each age and sex are supplemented by tables showing the number of children having measurements that deviate more than 5 per cent. above or below the average. The method as thus applied is, we believe, new, and gives interesting results.

DETAILED REPORTS.

This general outline indicates the scope of the investigation. The facts ascertained for each city are arranged and discussed in separate reports. These reports are, on the whole, parallel. The main facts are contained in two series of similar tables, and these are supplemented according to the special features emerging in each city. It is thus possible both to secure a certain unity of impression in the exposition of each sequence of facts, and to afford facilities for a detailed comparison of the one city with the other.—We are, my Lord and Gentlemen, your obedient Servants,

(Signed) MATTHEW HAY.
" W. LESLIE MACKENZIE

February, 1903.

B.—REPORT on the Physical Examination of 600 EDINBURGH School Children.

BY DR W. LESLIE MACKENZIE.

App. IX.

SCHOOLS VISITED.

SELECTION OF CHILDREN.

App. IX.

The schools selected in Edinburgh were the following:—

- (a) *South Bridge*, which lies in the east end of the city, and is attended by children from the east end, from the south, and to a less extent from the centre, the social grade being indicated by the predominance of two- and three-roomed houses.
- (b) *London Street*, which lies in the north of the city, and is attended by many classes of the community, including a considerable percentage of those from one- and two-roomed houses, but including also a majority from the classes indicated by the three- and four-roomed houses.
- (c) *North Canongate*, which lies in the east end, and is attended mainly by the children of the very poor classes, as indicated by the great predominance of one- and two-roomed houses.
- (d) *Bruntsfield*, which lies in the west of the city, and is a higher grade school, attended by the children of those living mainly in houses of three, four, five rooms and upwards.

From a careful study of the localities, and after consultation with Miss Flora Stevenson, Chairman of the Edinburgh School Board, with Mr Arnot, School Board Clerk, and with the headmasters, I concluded that these schools represent fairly the various leading classes of children attending the School Board schools of Edinburgh. The results as recorded in the tables show that this conclusion is justified. No children were taken from any secondary school.

From each of these schools 150 children were taken—300 to represent the poorer and 300 to represent the better housed classes. None of the schools corresponds to the Grammar School in Aberdeen. For boys of the classes represented there, it would have been necessary to resort to the Academy, or George Watson's College, or some of the other secondary schools of Edinburgh.

In detail the percentages selected were as under:—

- (a) *South Bridge*.—Daily average attendance during month of examination, 1112; number selected, 150, or 13·4 per cent.
- (b) *London Street*.—Daily average attendance, 1297; number selected, 150, or 11·5 per cent.
- (c) *North Canongate*.—Daily average attendance, 1303; number selected, 150, or 11·5 per cent.
- (d) *Bruntsfield*.—Daily average attendance, 1628; number selected, 150, or 9·2 per cent.

The total number of children in average daily attendance at Edinburgh Board Schools for the period concerned was 29,425, or, approximately, 30,000.

It is convenient to remember this in estimating from the 600 examined the prevalence of any of the diseases or defects recorded; the number multiplied by 50 will give the approximate prevalence, if the same rate of incidence be assumed to prevail.

- (a) *South Bridge*.—The names of all the children at each age from six to fourteen were brought together, numbers corresponding to these were placed in a hat, and out of this, 150 were taken blindly, equal numbers of male and female being taken at each age.

Of those selected, one or two were absent on the day appointed, and one objected to the examination, but these contingencies had been provided for by a ballot selection of some reserves.

- (b) *London Street*.—Here the odd numbers of the various registers were taken to the extent required. This is a usual method in the inspection of schools. The names on the registers are not in any specific order, the order being determined by the series of chances that bring the child to school on a particular day.

In *North Canongate* and *Bruntsfield* the same method was followed as at *London Street*.

From a careful scrutiny of all the children in the various schools at various times of the day, I am entirely satisfied that the selection was representative. In one or two instances regret was expressed by the teachers that their best children had not been taken, but everyone realised that the value of the observations depended largely on the pure chance nature of the selection, and there was no attempt to evade the methods indicated. In one or two instances, parents objected; but the places of their children were at once taken by the reserves. In several instances, special requests were sent by parents to have their children examined, particularly for ear defects. This was done, and advice given.

The examination aroused the keenest interest in the children themselves.

In two cases of a peculiarly pathetic nature, I informed the headmaster that the children were suffering from acute phthisis. He, in turn, informed the parents. I learned afterwards that the latter were profoundly grateful for the information conveyed, and at once took steps to place the children under medical treatment. In at least one other case of phthisis the parents were aware of the fact that the child was affected.

From some of the schools it would have been possible to select a much superior set of children and a much worse set.

The only point in the selection that might possibly give rise to wrong inferences was the impossibility of obtaining the full number of children of ages fourteen to fifteen. Only in one school were there sufficient children to make a ballot possible for the full number. Consequently, I had to make up the group of twelve to fifteen from a larger number of those at the lower of the three years of age. The only figures that can be seriously affected by this difference are the average weights, heights, and chest measurements at those

ages. To eliminate this source of error I have had the comparison between the schools made, first, with the fourteen to fifteen average included, and then with this average left out. The results are shown in the appropriate table. The difference is not great.

CONDITION OF SCHOOLS, VENTILATION, ETC.,
HOUSES, ETC.

(See TABLE I.)

1. *Ventilation and Heating.*—Three of the schools—South Bridge, London Street, and North Canongate—are ventilated by fires, stoves, windows, and the usual outlets and inlets. They are heated by open fires. In the infant department of North Canongate the fires are supplemented by mechanical ventilation and hot pipes. At Bruntfield there is a system of mechanical ventilation and steam heating.

The structures of the schools vary considerably, and, in consequence, the ventilation is more effective in some than in others. To speak generally, I found the ventilation fair in South Bridge, fair in North Canongate, very good in London Street and Bruntfield. In all cases the class-rooms were vacated practically every hour, and for at least one period of not less than an hour. At all the schools care was taken to flood the rooms with air. There was very little of the 'close' odours associated with schools. But I do not consider it sound practice to conduct drill in school-rooms that have been recently used for class work. In one school I saw a class of girls at drill. The windows were open, but the room had only recently been vacated by a class. The drill lasted for nearly an hour.

I saw no reason why it should not have been conducted in the open air. In another school I saw a class drilled in the Sandow exercises. The drill had been going on more or less continuously for an hour or more. This was in one of the 'naturally' ventilated schools. This form of drill, as well as the parallel-bar drill, which I also saw at this school, demands the most perfect ventilation to give the best results.

To judge by the sense of exhaustion after working for some five to six hours continuously in the school atmosphere, I should grade the ventilation of the schools thus: South Bridge and North Canongate, equal; London Street, very fresh; Bruntfield, very fresh, less draughts.

In all instances the air-conditions of the schools were, for the most of the day, superior to anything reasonably to be expected in the ordinary dwelling-house, and immeasurably superior to the average conditions found in the one- and two- and three-roomed houses. At these schools, therefore, the children are in a relatively more hygienic environment than at home.

2. *Cubic Space per Pupil.*—The table shows some variation in this. But cubic space must be considered in relation to ventilation. Thus South Bridge School shows greater cubic space *per* head than Bruntfield, but the large halls in the centre of the Bruntfield building, and the superior system of ventilation, certainly secure better aëration of all the spaces than South Bridge.

In North Canongate the cubic space is only 91 cubic feet per pupil, as against 153, 159, and 182 for the other schools. But although the cubic space is very small from the standpoint of theoretical physiology, the conclusions as to purity of air must be qualified by the fact that the rooms are never occupied except for short periods, are regularly flushed with air, and are constantly profiting by the movement of classes, and the incidental opening and closing of doors.

3. *Area of Playground.*—This is only an approximation, and is probably over the mark. Here allowance has to be made for the surroundings. In South Bridge the playground is hemmed in on all sides by buildings. At London Street it is open for almost the whole area. At North Canongate it is partly hemmed in and partly open, but has the disadvantage of being very near the railway, and is thus probably more polluted with smoke than the others. At Bruntfield it is almost entirely

open. In none of the playgrounds, however, is the light seriously obstructed, except in part of the North Canongate playground.

4. *Physical Training.*—In each of the four schools, physical training was organised according to a definite system. Each of the four schools has a gymnasium, provided with the usual appliances—including dumb-bells, bar-bells, Indian clubs, etc. Two of the four—namely, North Canongate and Bruntfield—have swimming ponds.

(a) *South Bridge.*—Every child from six to nine years of age receives a fixed lesson of thirty minutes weekly, and, in addition, five minutes daily. Every child from nine to fifteen years of age receives a fixed lesson of twenty minutes weekly, and five minutes daily to relieve the tedium of any exacting lesson. In addition, about 160 boys and 160 girls receive a course of twelve lessons of half an hour weekly, in gymnastics and calisthenics, from an instructor holding the Army Certificate.

It is unnecessary to detail the exercises, which are graded according to well-known systems of free exercises.

At this school I saw one class of girls at drill in free gymnastics. The chief criticism I should have made was that the exercises are apt to be continued too long, and that they were conducted in a class-room recently vacated by a class. Even with open windows it is difficult to secure adequate fresh air. From such drill there will be great advantages for discipline and carriage; but these will be counter-balanced by interference with nutrition.

(b) *North Canongate.*—The amount of drill and exercises was practically the same as at South Bridge. In addition, the swimming pond is much used, particularly by the boys. The water is kept at about 75° Fahrenheit. I saw one set of boys at exercise in the pond. In thinness of body they quite conformed to the other facts ascertained at this school, but they were mostly alert and eager. They were allowed to disport themselves freely for about half an hour in and out of the water, using the gymnasium as a 'drying' ground. They were under the supervision of a teacher. Four hundred children a week are washed in this pond. The exercise is popular. The effect on the older boys was obvious in the increased cleanliness. There is also a side trough for washing of feet and body before entry into the pond. The criticism I should have made here was that the children tend to take much more exercise than is physically justified by their generally underfed condition.

(c) *London Street.*—Besides the exercises mentioned above, special attention is given at this school to the 'Sandow' system, under direction of the chief lady assistant. I saw one mixed class go through the series, including the very severe exercises of rising from the prone position without using the hands, and lowering and raising of the body on toe tips and arms. Several of the girls were in good training, and went through the exercises well; but in at least one case, the strain on the spine was obviously excessive. I saw another class, partly of the same girls, go through a series of parallel-bar exercises, where the weight of the whole body on the arms comes constantly into play. The exercises were well done; but again the strain was excessive in some cases. Among both boys and girls the effect of the training was obvious in hard muscles and alertness of carriage, but it was in this school that the largest proportion of affected hearts was found. In some of the cases the indoor school exercises were supplemented by unrestricted football and cricket. The criticism I should have made of the whole system was that the exercises were apt to continue too long, that they were conducted indoors, and that they included exercises too violent in themselves and of little value either for nutrition or development. The same results as are aimed at by some of those violent exercises may be secured by less violent methods. Some of the results are not, in my opinion, desirable in any case. The violence tends to over-development of absolutely useless muscles and to over-strain of the heart, as demonstrated in the heart record.

								F.	99	99	99	297	27	115	82	34	39
								Both sexes		187	586	57	207	177	75	70	
								Percentages	9·73	35·32	30·20	12·80	11·95

The facts show that to secure benefit and to prevent injury, it is essential to select the cases for exercise and to select the exercises in each case. This is done at this school with considerable judgment by the teacher in charge, but more than apparent fitness ought to be considered. The indiscriminate practice of violent exercises of parallel-bar, or other acrobatic type, is certain to result in a considerable amount of physiological damage.

(d) *Bruntsfield*.—Besides the usual gymnastic and free gymnastic exercises, there is swimming. I saw a class of boys exercised under their instructor. They were taught how to fill the lungs, how to expand the chest, how to swim, dive, etc. The pond is a large one. From the chests inspected, there could be no doubt of the value of the exercises. A large proportion both of boys and girls practise in this pond. The temperature of the water was about 75° Fahrenheit. Exercises in diving were shown. It is here that swimming might result in injury. There is a tendency to encourage long diving—long both in distance and in time. This requires careful supervision. It should be absolutely forbidden except in specially examined cases. The danger in a case of heart or lung trouble would be enormous. Such exercise is open to the same criticism as the acrobatic exercises on bars and trapeze.

It was at this school that several phthisis cases were discovered. It is true that in only one or two were any exercises of a serious kind taken; but the number of cases in this—the best nourished of the four schools—is enough to show the absolute necessity of preliminary medical examination even of children apparently healthy and robust.

(e) *General Impression of the Exercises Seen*.—The general impression I formed of the exercises was that they contained a good deal too much of the more severe exercises, which are perhaps suitable enough for grown persons in training, but involve too great exertion for growing boys and girls. No doubt, under careful supervision, where the pupils are selected with strict regard to their health and physique, and not simply according to the grade of their class, the amount of harm (if any) that might result from one or two years of such exercises would be difficult to reckon; but when the selection is left practically to the wish of the pupil, or the parent, or the inspection of the teacher, or the Code standard in which the pupil is studying, the danger of damage is not to be disregarded.

5. *Rooms*.—In the allocation of rooms, 586 pupils have been considered. In the remainder of the 600 no correct returns were given.

The percentage of children living in *one-roomed* houses was, for the separate schools, as follows:—South Bridge, 4·7; London Street, 11·3; North Canongate, 20; and Bruntsfield, 2·1.

In *two-roomed* houses the percentages were—40·5, 30·6, 56·6, and 11·6 respectively.

In one-roomed and two-roomed houses, taken together, the percentages were—45·2, 42, 76·6, and 13·7 respectively.

In *three-roomed* houses the percentages were—36·4, 33·3, 21·3, and 29·7 respectively.

In *four-roomed* houses the percentages were—13·5, 10·6, 1·3, and 26·8.

In houses of five rooms and upwards the percentages were—4·7, 14, 0·6, 29·7.

From these figures it is evident that the children attending North Canongate are the worst housed. The percentage living in one-roomed houses is larger, the percentage living in two-roomed houses is larger, the percentage living in three-roomed houses is 21·3, as against 36·4, 33·3, and 29·7 for the others. The percentage living in four-roomed and five-roomed houses is only 1·3 and 0·6 respectively—a mere vanishing quantity.

If we classify schools according to the percentages of children living in houses of three rooms and upwards, we find that Bruntsfield is easily first with 86·2 per cent.; London Street second with 58 per cent.; South Bridge third with 54·7 per cent.; and Canon-

gate last with 23·3 per cent. The contrast between the first and last is very striking, and it was seen to be equally marked at the other end of the scale, Bruntsfield yielding as few for the one-roomed houses as Canongate does for the four- and five-roomed. In the subsequent tables, it will appear that the contrast between Canongate and Bruntsfield is reflected in the weights, heights, nutrition, and some other respects.

If we take the schools as a whole, we find that the percentage of children living in one room is 9·73; in two rooms, 35·32—or a total of 45. The remainder live in houses of three or more rooms.

MENTAL CAPACITY.

(See TABLE II.)

1. *Mental Capacity*.—In the Edinburgh schools it is not the custom to award precise merit places in class. The details ascertained in this regard, therefore, do not furnish any more exact information than the teacher's opinion of 'mental capacity.' The entries made were classified into good, medium and bad, which would correspond roughly to upper third, middle third and lower third. Of the goods, there were 51 per cent.; of mediums, 38 per cent.; and of bads, 10 per cent. If we compare this with the entries of teacher's opinion, we find that the 'excellents' and 'goods' together amount to 57 per cent., the 'mediums' to 30 per cent., and the 'bads' and 'defectives' to 12 per cent. These numbers correspond fairly with the goods, mediums and bads as estimated from 'position in class.' The inference from the comparison is that the children selected were on the whole representative, and this is known to be the case on other grounds.

For the different schools, the figures vary somewhat. Thus in South Bridge the 'goods in position' numbered 70 per cent.; in London Street, 44·6; in North Canongate, 28; in Bruntsfield, 61·6. The corresponding figures in terms of 'teacher's opinion' were—for South Bridge, 69; London Street, 50; North Canongate, 31; Bruntsfield, 65.

For 'mediums in position,' the figures are—South Bridge, 25 (teacher's opinion, 31); London Street, position 40 (teacher's opinion, 50); North Canongate, position 46 (teacher's opinion, 57); Bruntsfield, position 27 (teacher's opinion, 30).

The 'bads in position' were respectively 4·6, 14, 14·6, 7·5. 'Bads in teacher's opinion' were 8, 12, 22, 7.

The outstanding feature of these figures is that North Canongate reckons only 28 'goods in position,' as against 44, 61 and 70 for the other schools, and 14 bads, which, however, is the same as London Street. Of the 'bads in teacher's opinion,' North Canongate reckons 22, as against 8, 12 and 7 for each of the other schools. This deficiency of 'goods' and overplus of 'dulls' and 'defectives,' or 'bads,' corresponds with all the other facts ascertained about North Canongate.

In confirmation of these striking conclusions, it may be stated that during the process of the examination at North Canongate School it was noticed that the attention of the children was disturbed with extreme ease. Every little trifle was a distraction. The nervous restlessness was very marked. In South Bridge, on the other hand, while the readiness to fall into animated talk was very marked, restlessness, except as the result of surplus energy of muscle, was not particularly prominent. At London Street, the surplus muscular energy was strongly in evidence, but the capacity for sustained attention was good. At Bruntsfield the restlessness was not prominent, and the capacity for attention was high. One simple test brought out these features:—While the examination of a child was going on, the others were told to watch the process so that they could hear the numbers. This request operated fairly well at South Bridge, very well at London Street, very well at Bruntsfield, and hardly at all at Canongate. In the last, the curiosity of the children rose above every other consideration.

TABLE II.—MENTAL CAPACITY AND SCHOOL ATTENDANCE.

(Corresponds with Aberdeen, Table II.)

EDINBURGH.

Age-group.	Sex.	Number examined.	Teacher's opinion of Mental Capacity.					Regularity of Attendance.

								Under 8%.	Above 8% and under 16%.	Above 16%.
Above 6 and under 9	M.	100	16	34	31	18	1	71	19	10
	F.	99	16	39	31	12	1	72	22	5
Above 9 and under 12	M.	101	24	41	26	8	2	92	6	3
	F.	100	24	35	30	10	1	81	14	5
Above 12 and under 15	M.	100	18	51	25	6	...	78	11	11
	F.	100	7	39	39	15	...	72	16	12
Totals	M.	301	58	126	82	32	3	241	36	24
	F.	299	47	113	100	37	2	225	52	22
	Both sexes	600	105	239	182	69	5	466	88	46
Percentages			17.5	39.83	30.33	11.5	.83	77.67	14.67	7.66

The general inference I draw from these phenomena in the light of the figures is that the restlessness and shifting of attention so characteristic of the North Canongate children are based in their insufficiently nourished and over-stimulated nervous systems. They are older in experience than in years. They are extremely alert, but not very continuous in attention. They are better adapted to the casual life of the streets than to the persistent system of school discipline.

3. *Attendance.*—The feature of this part of the table is that the attendance is best for the nine to twelve group. This is capable of a general explanation. The younger children are more affected by conditions of weather, and the older children are more liable to be employed for home assistance. Those from nine to twelve are less liable on the whole to be affected by either of these well-known conditions.

In a fair number of cases I was informed that both before and after school hours boys were employed as messengers or paper boys. But I found nothing to show that this fact affected the attendance seriously.

In the individual schools, the attendance was as follows:—

	Good.	Medium.	Bad.
South Bridge . . .	118	24	8
London Street . . .	102	28	20
North Canongate . . .	120	21	9
Bruntsfield . . .	126	15	9

COMPLEXION, NUTRITION, ETC.

(See TABLE III.)

1. *Complexion.*—The inferences regarding personal appearance, cleanliness, etc., involve a high personal equation. In order that some uniformity of opinion might pervade the observations, I reserved this section of the schedule for myself. For much or for little, therefore, such error as there may be is fairly uniform. On a survey of the results, and a comparison of my recollections of the various schools, I have concluded that the standard varied a good deal without my being

aware of it at the time. The examination began at South Bridge School. The first school was naturally the occasion for the formation of a standard. Possibly I was rather more exacting in some respects than at the later schools. For example, I find that 69 cases of paleness are recorded, as against 68 for North Canongate, 62 for London Street, and 58 for Bruntsfield. These results do not quite correspond with the general impression formed of the schools. North Canongate would probably be found to yield a greater number of pale children than South Bridge if the examinations were conducted with the groups of children standing side by side and made available for immediate comparison. On the other hand, I find that in South Bridge 40 were recorded as ruddy in complexion. This is probably an over-estimate, for Bruntsfield shows only 42 ruddy and London Street shows only 35, while North Canongate shows 30. From a general impression, I should have said that the Bruntsfield children contained a considerably greater number of ruddy-faced children than South Bridge, and that London Street did not contain much less than South Bridge. On the whole, however, such uniformity as was possible in conditions that varied from hour to hour was secured, and the gross results are reliable enough for practical purposes.

The special points noted under complexion were the pallor, the inequality of diffusion of colour, the sharpness of the margins of pink and white, the paleness of the lips and inner surface of the eyelids.

A great many of those marked pale were not unhealthily pale. The 'pallor' of underfed, or feeble, or diseased children, differs, as it were, in texture from the 'paleness' of health. The figures cover both; but the figures under 'health appearance' form a constant check on the nature of the 'pallor' or 'paleness.'

2. *Health Appearance.*—The special points noted here were the presence of dark rings under the eyes, the sunken character of the eyes, the sallowness, the anæmia, and other indications of feeble circulation, or bad aëration of the blood. The ruddy complexions as

TABLE III.—PERSONAL APPEARANCE, CLEANLINESS.

App. IX.

a rule were found also to present a healthy appearance, but not always. In some delicate children the complexion had to be denominated ruddy.

3. *State of Nutrition.*—The facts of this column may be checked by the measurement of weights. (*See Measurement tables.*) The following summary brings out the relation:—

	Percentage of			Average weight in lbs.
	Stout.	Medium.	Thin.	
South Bridge . . .	23·3	52	24·6	59·7
London Street . . .	26	41	32·6	61·3
North Canongate . . .	10	51·3	38·6	56·5
Bruntsfield	31·2	45·2	23·3	63·8

The lowest percentage of 'stouts' occurs in North Canongate, where also the average weight is distinctly lowest. At Bruntsfield the percentage of 'stouts' was highest and the percentage of 'thins' lowest, while the average weight was distinctly highest. These correlations show that the judgment of stoutness, medium nutrition and thinness was on the whole sound. It is certain that the general impression from careful observation both of the children and of several hundreds of others not examined in detail entirely conforms to the inferences established by the figures. Nor that only. It is impossible to convey by means of figures the quality of the stoutness and thinness in each school. For example, there was the thinness due to under-feeding, which was the predominant form at North Canongate, and there was the thinness due to high training, both muscular and nervous, which was a common feature of the other schools. The one order of thinness was associated with unhealthiness of appearance, the other form usually was not. Thus, while in London Street the percentage of thin children (32) was slightly less than at North Canongate (38), the percentage of 'good' in health appearance at London Street (45) was nearly double those at North Canongate (24), and the percentage of 'stouts' (26) was more than double (10). This clearly shows that thinness does not necessarily mean bad healthy condition.

The same remarks apply to paleness of complexion.

The deficiency of 'stouts' is a better index of health conditions in the school than the presence of 'thins.'

In South Bridge and North Canongate the percentage of 'mediums' is a little over 50. In the other two schools it is in one case over 45 and in the other 41. The least extreme distribution is found at Bruntsfield, and the general impression of the nutrition, as well as the facts regarding the weight, confirm the conclusion that at this school the children all over are better nourished. At the same time I was impressed with the large percentage of active vigorous children at London Street. At this school the averages seem to have been composed largely of very good and rather bad. They were not the result of uniformly good nutrition. This is confirmed by the fact that the number of one-roomed houses associated with this school was large, and with the other fact that the percentage of 'thins' is as great as at North Canongate.

The correlation of the state of nutrition with the amount and kind of physical training is more complicated.

The amount of drill in school and play out of doors was, so far as I could judge, approximately the same for each school as a whole. I watched the various playgrounds during intervals and tried to form some conclusion from the number of idle or motionless children. But to find such a child was equally difficult in all the playgrounds. At South Bridge the classes were not one minute in the open-air before game groups were organised and actively at work. This was true of the other schools as well. Slowness of movement, quiescence, inactivity were conspicuously rare. Neither could I detect any registrable difference in the amount of noise. The playgrounds were all equally noisy. Within the schools, however, there were certain

distinguishable differences. These are detailed under the heading of 'physical training.'

4. *Brightness and Alertness.*—The percentages for brightness and alertness in the individual schools exhibit no obvious relation to the nutrition. The percentage of 'goods' is greatest and the percentage of 'bads' least in Bruntsfield, where the average weight is greatest. London Street, again, shows a high percentage of 'bad,' a high percentage of 'good,' and a low percentage of 'medium.'

	Per cent.	Per cent.	Per cent.
	good.	medium.	bad.
South Bridge	53·3	44·3	2
London Street	59	28	12·6
North Canongate	44	44	12
Bruntsfield	71	27	1·3

The estimation of brightness and alertness was somewhat difficult. I based my conclusion in each case on such circumstances as these—the readiness in answering questions, the readiness to grasp what was required of them, the quickness of motion in carrying out a request, the capacity to attend. In the last I found very great variations. One instance stands out prominently. A bright-looking girl of nine or ten, apparently appreciating everything that was done, could not be persuaded to attend seriously to anything asked of her. She seemed to be concerned with everyone's business but her own. On examining her carefully, I found that she was mentally defective. Her alertness was simply readiness to be distracted with whatever happened. In another case, however, where smartness was not at first apparent, where the face was pale, where no smile lit the countenance, the tensivity of attention was very great, every request was fulfilled without hurry, but perfectly and with intelligence.

Such cases as this last were all marked good. In another case where the readiness of attention was extreme and the alertness the same, I found that the pupil was the best in her section, and she turned out to be one of the cases of phthisis.

5. *Carriage and General Balance.*—These correspond roughly to the brightness and alertness. There were very few that one could justly call bad. The numbers recorded for each of the four schools show 86 good for South Bridge, 105 for London Street, 93 for North Canongate, and 120 for Bruntsfield.

6. *Cleanliness.*—Cleanliness of clothing and body is somewhat difficult to standardise. Of cases crawling with vermin—and there was an appreciable number of these—there could be no doubt. But of the clean skins showing many flea-bites it was more difficult to judge. Only 3·17 per cent. were marked bad for clothing, and only 8·5 per cent. for body. These, it is to be understood, were very bad. The general test of each school was not difficult to obtain:—In handling the children the examiner's hands were fouled in a much shorter time at some of the schools than at others. The largest percentage of unclean bodies and clothing was found at North Canongate. The percentage would probably have been greater than it was but for the measures taken at this school to secure cleanliness. The washing in the pond (*see under Table I.*) is optional, but a very large number of boys take advantage of the privilege and a smaller number of girls. The results were reflected in the children examined. The uncleanliness was not, as one might have expected, in proportion to the apparent poverty. The greatest proportion of unclean children was found among male children of six to nine. In the other schools there were extremely few unclean children of these ages. In a great many cases the weekly bath at home was found to be used systematically. In several cases a daily bath was common.

MEASUREMENTS.—GENERAL OBSERVATIONS.

(*See TABLES IV., V., VA, VB.*)

1. *Apparatus.*—(*a*) For the measurement of 'height sitting,' an accident made it impossible to use the specially-prepared stool or the scale attached to it. I

NOTE.—Shoes included in Anthropometric Committee's results; excluded in Edinburgh results

used instead an inch measure with adapted square piece, and followed strictly the directions laid down in Garson and Read's *Notes and Queries on Anthropology*, page 25.

(b) For the measurement of the skull from vertex to tragus, circumstances made it necessary to begin measuring with the callipers devised by Dr Hepburn of the Edinburgh University Anatomical Department. The callipers is known as the Hepburn-Waterston callipers, and my thanks are due to Dr Hepburn for its use. In using this instrument, Dr Edwin Matthew and myself followed the directions in Garson and Read's *Notes*, etc., page 23, applying the callipers in every case to the left side of the head. A few of the measurements were made by Dr Edwin Matthew; the great mass by myself. At the same time, I measured the heads with the 'double-vertical' instrument devised by Professor Hay. The difference in principle between the two instruments is this—with Professor Hay's, the measurement is made in the vertical plane of the tragus; with Dr Hepburn's instrument, the measurement is made from the tragus to the highest point of the skull when the head is set for taking the measurement of height standing or sitting (see Garson and Read's *Notes*, etc., page 23). There is usually no difficulty in determining the highest point, which as a rule coincides with the anatomical 'vertex,' and lies very frequently about half-an-inch to an inch and a half behind the plane of the tragus. The measurement was made only from one side. The average of the measurements with Professor Hay's instrument was taken, and I have placed the results of both instruments in columns side by side in Table IV. It has to be added that in South Bridge School only a few measurements were made with Hepburn's callipers, and they were not tabulated. Further, the last fifty children were not examined with the callipers. But in all, some 400 children were measured with both instruments. There is practically always a slight difference, the callipers giving the greater height. Except in a few cases, the same personal equation entered into both measurements.

In order that the instruments may be strictly compared, I give below the average of measurements recorded for the left side of the head with each instrument:—

Age.		Hay.	Hepburn.	Difference.
6-9	M.	12.21	12.42	0.21
	F.	11.73	11.89	0.16
9-12	M.	12.38	12.56	0.18
	F.	12.02	12.15	0.13
12-15	M.	12.60	12.65	0.05
	F.	12.24	12.28	0.04

2. *Division of Measurements.*—In all except about one hundred cases I took the following measurements personally:—Weight; height—standing and sitting; head—minimum width of forehead and height; trunk—width of shoulders, pelvis and hips. Dr Edwin Matthew took the others. The hand-grasping was equally divided.

3. *Comparison of Schools for Weight and Height.*—The differences between the schools are shown by the weights and heights. The contrast between North Canongate on the one hand and Bruntfield on the other is too striking not to be dealt with in some detail. From other facts in the other tables, the condition and constitution of the school population in each of these schools have been set forth. It has been found that in North Canongate, the percentage of children in one- and two-roomed houses is vastly greater than in Bruntfield. The cubic space per child is less. The percentage of stout children is less. In fact, taken generally, the children of North Canongate have been shown to occupy a worse position than those of Bruntfield in the following respects—nutrition, alertness, amount of ear disease, amount of throat disease, cleanliness of body and clothing, and some other minor matters. On the other hand, Bruntfield has shown a greater total of lung troubles, a fact not to be expected and not easy to explain.

In support of these general conclusions, we have the weights and heights.

For children of six to nine, the comparative weights are as follows:—Males, North Canongate, 43.35 lbs.; Bruntfield, 49.23; females, North Canongate, 40.45 lbs.; Bruntfield, 50.63. There is thus a difference in favour of Bruntfield of 5.88 lbs. for males, and 10.18 lbs. for females.

For children of nine to twelve, the figures are:—Males, North Canongate, 56.49 lbs.; Bruntfield, 62.59 lbs.; females, North Canongate, 55.91, Bruntfield, 58.99. There is thus a difference in favour of Bruntfield of 6.10 for males and 3.08 for females.

For children of twelve to fifteen, the figures are:—Males, North Canongate, 70.38 lbs., Bruntfield, 75.62; females, North Canongate, 72.63; Bruntfield, 85.01. There is thus a difference in favour of Bruntfield of 5.24 for males and 12.38 for females. But this is partly accounted for by the fact that a full complement of the fourteen to fifteen ages was to be found at Bruntfield alone. Compare average less these ages.

These differences are very great. But they correspond with the general impression of the superior nutrition of Bruntfield. Even if we allow a small difference for the difference in the weights of clothing—and the clothing of North Canongate children was markedly deficient—the margin against North Canongate is still very large. Among the factors that produce these differences, housing and food must be regarded as the chief. Race can scarcely count for much. My impression is that the races are more defined in the Canongate, more amalgamated in the Bruntfield, population. But the differences of weight cannot be assigned to race. Neither can they be assigned to differences in physical training. So far as I could judge, the amount of training is approximately equal in both schools. But it must not be forgotten that the existence of such a class as these children of the Canongate are drawn from presupposes a long process of social selection. Into that class the thriftless and the inefficient of every variety tend to drift. On the other hand, the population of Bruntfield School is supplied from a class selected by labour and occupation, which means greater physical efficiency. Consequently, the children of North Canongate are, to begin with, born from a class of distilled inefficiency. The hereditary factor must, therefore, count for something. But even if this is allowed for, the children were underfed and underclothed. The younger children particularly had little of the vigour and buoyancy associated with healthy childhood. As to clothing, flannel was rare among the underclothing. Obviously, the clothing in many cases had been made to fit sizes other than the wearers'.

These inferences, which are founded on direct observation, are confirmed by the Report of the Committee for Feeding and Clothing Destitute Children, 1901, where it is recorded that in North Canongate School 45 children received food and clothing, 137 food only. For the same year, at London Street School, 27 received food and clothing, 36 food only. At South Bridge, 12 received food and clothing, 34 food only. At Bruntfield, none received clothing, and only 2 received food.

Recent facts confirm this. Accordingly, I feel justified in concluding that a large minority, if not the majority, of North Canongate school children are habitually underfed and underclothed.

This fact must be taken into account in any estimate of the value and urgency of physical education. The primary necessity is adequate food; the next is adequate clothing. A large number of the 150 children examined at North Canongate had neither. Already I have noted that the amount of physical exercise at this school is approximately the same as at the other schools. But physical exercise unsupported by adequate food and adequate clothing must result in early physiological exhaustion and infirmity. The prematurity of the street gamin means this and little else.

In comparison of the other schools with each other,

App. IX.

the differences are less striking, but still considerable. Thus, to take the four schools in the following order—(1) South Bridge, (2) London Street, (3) North Canongate, (4) Bruntsfield—the figures for weight are these:—

Males.					
Age.	(1)	(2)	(3)	(4)	Average.
6 to 9.....	46·1	47·6	43·85	49·23	46·60
9 to 12.....	60·43	58·60	56·49	62·49	59·53
12 to 15.....	74·45	75·60	70·38	75·6	74·02

Females.					
Age.	(1)	(2)	(3)	(4)	Average.
6 to 9.....	45·49	45·92	40·45	50·63	45·62
9 to 12.....	56·86	59·27	55·91	58·99	57·76
12 to 15.....	74·87	80·91	72·63	85·01	78·36

In weight, North Canongate is lowest in every age-group, male and female.

The corresponding figures for height are these:—

Males.					
Age.	(1)	(2)	(3)	(4)	Average.
6 to 9.....	44·47	45·10	42·93	45·58	44·52
9 to 12.....	50·36	50·01	48·54	51·87	50·20
12 to 15.....	55·09	55·77	54·31	55·87	55·26

Females.					
Age.	(1)	(2)	(3)	(4)	Average.
6 to 9.....	44·06	44·83	42·98	46·8	44·51
9 to 12.....	49·42	49·91	49·11	51·28	49·93
12 to 15.....	54·93	55·61	54·71	57·36	55·65

In height, as in weight, North Canongate is lowest.

Comparison of Weights.—For males of ages six to nine, South Bridge and North Canongate are below the average of the four schools,—South Bridge being 0·5 lb. less, North Canongate 3·25 lbs. less. London Street and Bruntsfield are respectively 1 lb. and 2·63 lbs. above the average.

For females of six to nine, South Bridge and Canon-gate are, respectively, 0·13 lb. and 5·17 lbs. below the average. London Street and Bruntsfield are, respectively, 0·3 lb. and 5 lbs. above the average.

For males of nine to twelve, London Street and North Canongate are, respectively, 0·93 lb. and 2·04 lbs. below the average. South Bridge and Bruntsfield are, respectively, 0·90 lb. and 3·06 lbs. above the average.

For females of nine to twelve, South Bridge and North Canongate are, respectively, 0·9 lb. and 1·85 lb. below the average. London Street and Bruntsfield are, respectively, 1·51 lb. and 1·23 lb. above the average.

For males of twelve to fifteen, North Canongate is 3·74 lbs. below the average. The other three—South Bridge, London Street and Bruntsfield—are, respectively, 0·43 lb., 1·58 lb., and 1·58 lb. above the average.

For females of twelve to fifteen, South Bridge and North Canongate are, respectively, 3·49 lbs. and 5·73 lbs. below the average. London Street and Bruntsfield are, respectively, 2·55 lbs. and 6·65 lbs. above the average.

Thus for every age-group, male and female, North Canongate stands lowest in weight and Bruntsfield highest.

Comparison of Heights.—For males of six to nine, South Bridge and North Canongate are, respectively, 0·05 in. and 1·59 in. below the average. London Street and Bruntsfield are, respectively, 0·58 in. and 1·06 in. above the average.

For females of six to nine, South Bridge and North Canongate are, respectively, 0·45 in. and 1·53 in. below the average. London Street and Bruntsfield are, respectively, 0·32 in. and 1·67 in. above the average.

For males of nine to twelve, London Street and North Canongate are, respectively, 0·19 in. and 1·66 in. below the average. South Bridge and Bruntsfield are, respectively, 0·16 in. and 1·67 in. above the average.

For females of nine to twelve, South Bridge, London Street, and North Canongate are, respectively, 0·51 in., 0·02 in., and 0·82 in. below the average. Bruntsfield is 1·35 in. above the average.

For males of twelve to fifteen, South Bridge and North Canongate are, respectively, 0·17 in. and 0·95 in. below the average. London Street and Bruntsfield are, respectively, 0·51 in. and 0·61 in. above the average.

For females of twelve to fifteen, South Bridge and North Canongate are, respectively, 0·72 in. and 0·94 in. below the average. London Street and Bruntsfield are, respectively, 0·04 and 2·29 ins. above the average.

Thus in height, as in weight, North Canongate is uniformly lowest, Bruntsfield is uniformly highest.

On other grounds, North Canongate is shown to be the worst nourished and Bruntsfield the best. The detailed comparison of weights and heights gives to the general impression an absolute confirmation.

4. *Comparison of Averages at each Age with General Averages.*—In a special table (VB.) I have shown the average weights and heights (males and females) for each of the four schools, side by side with the averages of the Anthropometric Committee's Report of 1883 (see Stevenson and Murphy's *Hygiene*, Trèves on *Physical Education*, page 544).

In general, the averages both for weight and height are below the Anthropometric Committee's standards. Bruntsfield School comes best out of the comparison. It is to be noted, however, that in the Anthropometric Committee's tables 'weights' include the weight of shoes; in the Edinburgh and Aberdeen tables shoes are excluded. Even if an allowance of three-fourths of a pound at the lower ages to two pounds at the higher be made, the relations of weights recorded are not very greatly disturbed.

5. *Chests—Comparative Measurements.*—The schools are kept in the same order as above.

Males.					
	(1)	(2)	(3)	(4)	Average.
6 to 9.....	56·16	57·14	55·49	58·96	56·94
9 to 12.....	64·15	61·97	60·61	62·26	62·25
12 to 15.....	68·18	67·16	63·72	67·47	66·63

Females.					
	(1)	(2)	(3)	(4)	Average.
6 to 9.....	54·91	56·34	54·53	57·62	55·85
9 to 12.....	60·15	62·17	59·76	61·94	61·01
12 to 15.....	65·81	65·77	64·25	69·63	66·37

Here again North Canongate at all ages, males and females, is lowest. South Bridge is highest for males of nine to twelve and twelve to fifteen.

Among males of nine to twelve London Street stands low. The same is true for weight and height. (See tables.)

Bruntsfield is always above the average, but the preponderance is not so striking in chest measurements as in weight and height.

All the infants of six to nine, and the females of twelve to fifteen, are strikingly best in Bruntsfield.

6.—*Grasping Power—Comparative.*

Males.						
		(1)	(2)	(3)	(4)	Average.

App. IX.

In the muscular and nervous energy, as indicated by the mercury dynamometer, North Canongate, though as a rule low, is not very conspicuously lower than the other schools. The male children of six to nine are feebler; but those of nine to twelve are, with the right hand, better than the corresponding boys of South Bridge and London Street. In Bruntsfield, whose boys up to the nine to twelve ages lead, there is a distinct falling off in grasp at the ages twelve to fifteen.

Among females the North Canongate children of six to nine are the feeblest, but those from nine to twelve are strongest, and those from twelve to fifteen are almost equal to the best. In South Bridge and London Street there is a slight falling off at the ages of twelve to fifteen.

The dynamometer test is a fairly reliable test of musculo-nervous energy. Strong will plays an important part.

Where any doubt arose, the test was repeated. Where the muscle was feeble the second effort usually resulted in a lower reading than the first. Where the muscle was good the second reading frequently was higher than the first.

NOTE ON TABLES V. AND VA.

These tables exhibit the deviations exceeding five per cent. from the average weight, height, and some other measurements.

In Table VA. I have shown these deviations for each of the four schools. The figures bring out with great emphasis the differences between certain schools. Thus to take an example, in the weight columns, it is found that, while North Canongate shows that among males of ages six to nine, seven were above the average by a deviation of more than 5 per cent. and fifteen below, Bruntsfield shows thirteen above and only two below. Similarly with females—North Canongate shows only three above and nineteen below, while Bruntsfield shows thirteen above and only five below. It is thus clear that the average

weights at North Canongate were composed of a few good and a considerable number of bad, while at Bruntsfield they were composed of a few bad and a considerable number of good. The same is more or less true of the weights at the other ages. If the table is studied in detail, it will reveal with greater accuracy the relative conditions of the four schools in respect of weight, height, and the other measurements. For example, at South Bridge and London Street the number above and below were approximately equal, the number below being slightly in excess; at Bruntsfield the number *above* was considerably in excess; at North Canongate the number *below* was considerably in excess. So with heights, and circumference of chest, and less strikingly with grasping power.

TEETH.

(See TABLE VI.)

This table demands little comment. More than a fourth of the children were recorded as having unclean teeth. Only some 5 per cent. used a tooth-brush daily. Some seven per cent. showed delayed development of the teeth. The teeth of 67 per cent. were regular, and only 5½ per cent. showed irregularity. In 6 per cent. of cases the shape of the teeth was bad. In 571 cases out of 591 examined were found some decayed teeth of the first set. The average number of first set teeth so found decayed was 4·95. In 110 cases the second set showed decayed teeth, the average number of such teeth being 2·51. A considerable number showed defective teeth of both sets. The average number of the second set lost was 0·68.

COLOUR OF HAIR AND EYES.

(See TABLE VII.)

1. *Nutrition as shown by Hair.*—Apart from the question of colour, I was much impressed with the differences of nutrition as indicated by the hair. At

TABLE VII.—COLOUR OF HAIR AND EYES.

(Corresponds with Aberdeen, Table V.)

EDINBURGH.

* Includes 1 heterochromic case—right, blue; left, blue and brown.

App. IX.

North Canongate, where the nutrition generally was defective, it was the exception to find a luxurious crop of hair either on boy or girl. At South Bridge this was less rare. At each of the other schools—London Street and Bruntsfield—the hair of the girls was so strikingly different that it was the first thing to be noted. Not only was the hair more profuse and better grown, it was more glossy, less broken, better moistened. In the North Canongate the hair rarely gave any evidence of careful attention. It was ill-nourished, thin, dry, and often dirty. Not infrequently, it was overrun with vermin. This was not unknown as an occasional thing in the other schools, but in none of them was the nutrition of the hair so deficient. These facts apply mainly to the girls.

2. *Colour of Hair and Eyes.*—In the schools, as a whole, light blue eyes predominated. In the individual schools, there were considerable variations. In South Bridge, there were 58 light blue; in London Street 75; in North Canongate 71; and in Bruntsfield 51. Of light eyes other than blue, the numbers for the schools taken in the same order were 11, 25, 24, 34 out of the 150 examined at each school. Of dark eyes there were, in the same order, 48, 26, 40, 38. Of medium eyes, 33, 24, 14, 27.

If we add together for each school the number of children with medium and light 'other than blue,' we find that the numbers for the schools are, 44, 49, 38, 61. Here there is a decided predominance in Bruntsfield. In the children of this school, I found great difficulty in deciding under what colour to place the eyes. I was struck with the large number of indefinite colours. In the Canongate, on the other hand, and at London Street, I was struck with the definition of the colours. The blue eyes were unmistakably blue, the dark eyes unmistakably dark. In one case at North Canongate School, I encountered a 'heterochromic' child, one eye being blue, the other brown and blue.

What the significance of these variations may be I am not prepared to say. But I had the feeling that by the general build and the hair, the definition of race was, to some extent, indicated. At Bruntsfield, my feeling was that I was among the products of several amalgamated races. In North Canongate, on the other hand, I seemed to see very pronounced streaks of pure race. At all the schools there were some Jews, and at South Bridge there was a considerable number. The racial distinction was quite unmistakable.

The races encountered, so far as one could identify them from hair, eyes, build and other characters of feature and manner, were mainly these:—Highland Celt, Scandinavian or Danish, Irish Celt, Jew, Anglo-Saxon, Italian, German, and the mixed race that constitutes the Lowland Scots—including the pronounced East Lothian and Border types. In a few cases, it was possible to trace definitely the combination between the fair or red-haired Celt and dark-eyed types.

At London Street, I was much struck by the large number of the Danish or Scandinavian type—blue eye, fair hair, finely diffused complexion. I have encountered this type in Leith very frequently.

The general conclusion that seems justified is that in the North Canongate for some reason the races are more pronounced; in the Bruntsfield population, the races are more amalgamated.

EYES AND EYESIGHT.

(See TABLE VIII.)

1. In the consideration of this table it is important to remember that there is a cardinal distinction between 'normal' in 'acuteness of vision' with both eyes in use, and 'emmetropic,' which means optically normal. A child with a low degree of long sight (hypermetropia) may, by using its accommodation, that is by straining the eyes, read precisely the same print at the same distance as a child with eyes optically perfect. Both cases would be reckoned 'normal' under the heading 'acuteness of vision.' For the immediate purposes of school life they would be on an equal footing. But as

the child grows older the accommodation becomes less powerful, the defect in the refraction becomes more obvious, and in later life may actually be an obstacle to success in a particular trade or profession. Consequently, the need for spectacles (or correction) ought rather to be reckoned from the amount and kind of refraction-defect as revealed in each eye by the ophthalmoscope than by the mere result of reading at a given distance with both eyes. Further, a child with one good eye may read the normal type, while the other eye is practically functionless. Several cases of this sort were discovered in the course of the examination. One child, seven years old, could read the smallest type on the distance sheet as if her vision were normal; but the right eye was practically useless (being highly hypermetropic.) Frequently, when there is this variety of difference between the eyes, squint results. In the particular case there was no squint. The 'acuteness of vision' had to be recorded as normal, although it was normal only for one eye.

For these reasons the number of 'emmetropic' eyes does not correspond with the number having 'normal' vision reckoned by the 'acuteness of vision.' The percentage with vision requiring correction is, however, reckoned on the reading (or 'acuteness of vision') test alone. The term 'requiring correction' is understood to mean 'requiring correction for school purposes 'at the time.' The correction necessary to neutralise the optical defect has, however, also been calculated, and the differences in the resulting percentages are somewhat striking. The optical defect is the true test of defective vision. The percentages reckoned in this way are as follows:—

Ages 6 to 9 .	Males, 58	;	Females, 55·54.
" 9 to 12 .	Males, 55·44	;	Females, 55.
" 12 to 15 .	Males, 51	;	Females, 54.
Total . .	Males, <u>54·81</u>	;	Females, <u>54·51</u> .
	Both, 54·66.		

Reckoned on the basis of the reading test, the percentage requiring correction was, for both sexes, 31 per cent., a little less than a third of the whole. Reckoned on the basis of defects of refraction, the percentage was 54—that is, a little over a half of the whole. This means that 23 per cent., although their eyes were optically defective, could yet use them to obtain normal vision. It ought never to be necessary so to use, or rather abuse, the eyes.

The precise figures for each eye were ascertained, but it was not considered necessary to record both eyes in the tables. Where one eye was normal and one defective, the child was entered as suffering from the defect of the defective eye. In those marked 'emmetropic,' both eyes were optically normal.

It will be noticed that the number of hypermetropic or long-sighted children is very much greater than the number of myopic, or short-sighted. This explains how it is possible for the number of those that read 'normally' to be *greater* than the number with *optically* normal eyes.

2. *Astigmatism.*—Apart from the question of ability to read at the proper distance, astigmatism may cause such discomfort as to affect the health and acquisitive capacity of a child. Over 12 per cent. of the children showed some degree of hypermetropic astigmatism, and some 5 per cent. showed myopic astigmatism. There were a few mixed cases.

3. *Other Defects.*—Among the 'other diseases' was one extremely marked case of 'conical cornea' of both eyes—an incurable condition, and very difficult to correct even partially. The child was, for reading purposes, almost blind. His education was defective, but his intelligence was good.

The number of children whose vision had actually been corrected by spectacles was very small.

4. *Squint.*—There were twenty-six cases of squint. This was in almost all the cases due to long-sightedness (hypermetropia) of one eye. Boys showed a decidedly larger number of cases than girls, there being twenty

cases among boys, as against six among girls. In many instances the defect, or rather deformity, might have been prevented or improved by treatment at the right time. In several cases surgical treatment might still produce a distinct improvement.

The numbers of those that could read at the normal distance were, for the individual schools, as follows:—South Bridge, 93; London Steet, 72; North Canon-gate, 83; Bruntsfield, 87. The differences were not very marked. The numbers with defects of refraction were for the schools taken in the same order, 86, 79, 83, 80. It is thus clear that the defects of refraction are fairly well diffused in all the schools, none showing a great preponderance. This forms a striking contrast to the defects, such as enlarged tonsils or ear diseases, which depend so much on the environment. The ordinary refraction defects of the eye are always congenital, and may be made worse by environment. The general inference, more or less justified by this contrast, is that where the defect is hereditary it must be met by correction of the individual defect; but where it depends on nurture or housing, or other hygienic condition, or improper use, it must be met by preventive measures. In all cases the conditions of home and school should be such as not to aggravate either inherited or acquired defects.

5. *Diseases of Eyes.*—There was only one case of conjunctivitis. There were twenty-one cases of corneal ulcers or nebulae. These are sometimes an index of tubercular disposition. The greater number were found in girls.

6. *Diseases of Eyelids.*—The principal disease of the eyelids was blepharitis (chronic inflammation of eyelids), including styes. The cases were usually found associated with some defect of refraction. In all, there were thirty such cases. The number of other eyelid diseases was trifling.

For the individual schools the numbers of eyelid diseases were as follows:—South Bridge, 14; London Street, 19; North Canon-gate, 30; Bruntsfield, 16. Here, as in so many other connections, North Canon-gate school is worst.

EARS AND HEARING.

(See TABLE IX.)

1. *Number Examined.*—In this table the number examined is given as 597. The deficiency is due to the absence of three cases at the time fixed for examination of ears. This number, however, is too small to affect averages.

2. *Keenness of Hearing.*—From the conditions of the schools the watch-test of keenness of hearing was not particularly reliable. It was extremely difficult to find a room suitable at once for the watch test and for the speculum examination of the ears. The diffused noises of the school, the varying noises of the street, the periodic flooding of the playgrounds with noisy children, all contributed to reduce the value of the test. And with the younger children, there was another disturbing factor—suggestion. They answered 'yes' or 'no' largely according to their belief as to what was expected of them. With care and time, this might have been eliminated in every case; but even with the older children, it was extremely difficult to make certain that the sound supposed to be heard was not a suggested sound. In several instances I tested the hearing afterwards by speaking in a very low voice. In most cases this confirmed the results got by the watch, but the cases thus verified were too few to constitute a real check.

On the other hand the 'distinctly defective' children are probably all as defective as the watch-test indicates. By many of them the watch could be heard only on contact, or at a distance of a few inches or one foot. In all such cases a minute examination of each ear was made, and, except in one case—where the internal ear was affected—some definite defect of the

middle ear was discovered. The watch-test was thus of value less for testing the minute discrimination of distances than for the revelation of major defects. But it has to be remembered that children at school are accustomed to pick out sounds from a diffused matrix of irrelevant sounds, and this must be counted in favour of the watch-test results.

The percentage of 'distinctly defective' children was 6.70; of 'defective,' 35.34; of normal, 57.96.

Among males the percentage of 'defective' and 'distinctly defective' taken together was 38.5; among females, 45.63; both sexes, 42.04. The highest percentage—55—was found among females of nine to twelve; the lowest—34—among males of twelve to fifteen. The females of all three age-groups show a greater number of 'defectives' and 'slightly defectives.'

This result is confirmed by the figures in the 'disease' columns. If we take all the 'diseases,' including 'cerumen,' and including also the diseases of the throat, we find that, among females, the number was 294; among males, 259; excess for females, 35. If we deduct cerumen, the numbers become—for females, 221; for males, 189. If we confine ourselves to the specific ear diseases, the numbers become—for females, 115; for males, 100; excess for females, 15.

3. *Special Ear Diseases.*—(A) *Otitis Media and Perforation.*—This column probably does not include all the cases of perforation with inflammatory discharge; it should be read along with the column headed 'dry perforation' and 'chronic catarrh.' These three columns, along with the column 'Cicatrices,' fairly represent the amount of middle ear and tympanic disease.

(B) *Retracted Membrana Tympani.*—In many cases the retraction was very slight, in others it was very well marked, in every case of the 169, except 20, it was associated with enlarged tonsils, or with adenoids, or with both. Retraction of the membrane signifies closing of the Eustachian tube, which was not specifically ascertained in each case.

For the particular schools the facts are as follows:—

(a) *South Bridge.*—Cases of retracted membrane, 52; total enlarged tonsils or enlarged tonsils with adenoids, 115.

(b) *North Canon-gate.*—Retracted membrane, 53; enlarged tonsils or tonsils with adenoids, 80.

(c) *London Street.*—Retracted membrane, 36; enlarged tonsils or tonsils with adenoids, 65.

(d) *Bruntsfield.*—Retracted membrane, 28; enlarged tonsils, or tonsils with adenoids, 53.

The very large number of tonsils in South Bridge School is probably in part due to the fact that South Bridge was examined first. The standard applied was naturally more exacting. In respect to the diseases of the ears, South Bridge runs practically parallel with North Canon-gate, both having a higher total of ear diseases than either Loudon Street or Bruntsfield. Probably, on a careful comparison, case for case, the state of the throats would also be more nearly equal.

(C) *Cerumen.*—Cerumen (wax) was found in excess in 144 instances. Sometimes the quantity produced impaction of the tympanum, with distinct deafness. Very frequently the cerumen obscured the tympanum. Except in the impacted cases, cerumen cannot be designated a disease, but its presence in excess is evidence of inattention to the ears, or of injudicious moistening, or of general neglect of cleanliness. For the individual schools the cases were:—South Bridge, 47; London Street, 29; North Canon-gate, 46; Bruntsfield, 21.

(D) *Others.*—The diseases in this column were such as these:—Atresia, or narrowing of the external ear passage; eczema of the ears; inflammation of lobule; mastoid disease, etc.

(E) *General.*—Practically all the diseases found were due to preventable causes. The great majority were amenable to treatment. An exhaustive examination under hospital conditions would have involved syringing of many ears, and probably would have resulted in the discovery of more defects of a serious nature.

* Includes all cases of Ear Diseases. Throat : Includes only such cases of Throat Disease as co-existed with Defective Hearing.

NOSE AND THROAT.

(See TABLE X.)

1. *Enlarged Tonsils*.—The number of children suffering from enlarged tonsils alone—that is, uncombined with adenoids—was 147. Of these, 71 were found in South Bridge School, 27 in London Street, 22 in North Canongate, and 27 in Bruntsfield. The distribution between boys and girls was fairly equal, the girls showing a slight preponderance, which was maintained in all the schools except Bruntsfield. In South Bridge, 40 girls were affected, as against 31 boys; in London Street, 14 girls, as against 13 boys; in North Canongate, 13 girls, as against 9 boys; and in Bruntsfield, 10 girls, as against 17 boys.

2. *Enlarged Tonsils and Adenoids*.—Here, too, there is a slight preponderance among the girls, but only at the six to nine and nine to twelve age-groups. The numbers for the individual schools were—South Bridge, 20 girls, 20 boys; London Street, 10 girls, 9 boys; North Canongate, 19 girls, 17 boys; Bruntsfield, 10 girls, 6 boys.

3. *Adenoids alone*.—Here there is a slight preponderance among boys.

If enlarged tonsils and adenoids be taken together, it is found that the school showing most cases was South Bridge, 115; next North Canongate, 80; next London Street, 65; next Bruntsfield, 53. Probably South Bridge suffers to some extent in the comparison from the fact, noted elsewhere, that it stood first in the series; but as the same examiner dealt with all throats, and as care was taken that the standard should be kept as uniform as possible, the 'personal equation' cannot count for much. All enlargements, slight or great, were noted.

Tonsils and adenoids, singly or in combination, are of the first importance in relation to physical development. They are a decisive indication of the importance of discipline in breathing. No special note was taken of mouth-breathers, but, from a general impression, I concluded that the number was very large. From the standpoint of physical training, the mouth-breathers—that is practically all those affected with adenoids, and

most of those affected with enlarged tonsils—ought to be specially classified, and specially disciplined in correct habits of breathing. In many of the cases operation was indicated.

App. IX.

DISEASES.

(See TABLE XI.)

1. *Skin Diseases*.—The number of skin diseases found was trifling. The cases were eczema of the mouth, impetigo, psoriasis, and the like. There was one case of scabies and no case of ringworm. In one of the schools, however, there was a good deal of verminous irritation of the heads, and in some of these cases the post-cervical glands were affected. This, in part, accounts for the large number of glands recorded. In most instances the slight enlargement of the glands was in itself of no consequence; but it was thought right to record even trifling enlargement, since it must be assumed as among the possibilities that those irritated glands more readily become the seat of tubercular infection than normal glands do.

2. *Glands*.—The large number of glands has been partly accounted for above. The number of true tubercular glands was not great; but neck glands are always an indication of tissue susceptibility, and any gland may become tubercular. The incidence of glands varied with the schools. In South Bridge, 45 cases of enlarged glands were found; in London Street, 25; in North Canongate, 34; in Bruntsfield, 7. The small number of children found with affected glands at Bruntsfield was so striking that special attention was given to the examination, but the total number discovered did not exceed 7. This conforms to the facts recorded in the other tables, where the contrast between this school and the other schools, especially North Canongate, is sufficiently emphasised.

It is worthy of notice that the boys show a much larger number of glands than the girls. Boys show 66, as against girls, 45. Boys of nine to twelve show this preponderance most markedly. In North Canongate there were 24 gland-affected boys as against 10 girls,

* Excluding squint: in order downwards, 9-3; 7-3; 4-0; 20-6; total 26. (See Table VIII.)

and at Bruntsfield all the 7 cases were boys. In South Bridge and London Street the distribution was approximately the same in boys and girls.

From any point of view, the number of glands is very large. It is equivalent to 5550 cases among the 30,000 children of the Edinburgh schools.

3. *Bones—Joints.*—The amount of bone disease was trifling, and there was only one case of joint disease. The comparative absence of bone and joint disease is probably due in part to the fact that the hospital service of Edinburgh, being open to all classes, results in the elimination of bone and joint cases from the school population. In most cases the defects were due to rickets. In each of the three schools—South Bridge, North Canongate, and London Street—4 cases of rickets were found; in Brunt-field no case of bone or joint disease was found.

4. *Heart and Lung Diseases.*—In view of the primary importance of Heart Disease and Lung Disease in relation to Physical Training, I have detailed the cases of heart disease, phthisis, pneumonia, and bronchitis discovered among the 600 children selected. I have considered each case on its merits; I have estimated the seriousness of the disease according to the circumstances as verified at the time, and I have given an opinion from the standpoint of a Medical Inspector of Schools. I have to add that the principle followed in the examination of the chest and heart was that the child should have the benefit of any doubt; that the cases described were thoroughly verified so far as was possible from physical signs alone, and that, accordingly, the cases may be regarded as well-marked and serious. I am also of opinion, from general impressions of the children personally handled, that a leisurely examination under hospital conditions would have revealed an even larger number both of heart and of lung affections.

Of the heart cases, all should be under medical supervision; the majority should be strictly regulated in their exercises; a few should be forbidden the ordinary exercises, and placed under physical training applicable to heart cases; one or two should, for a time at least, be excluded from school.

Of the phthisis cases, all should be excluded from school if a cure is to be expected. Neither the atmosphere nor the excitement of the school can be regarded as other than harmful to any case of phthisis. In at least one of the cases the danger from the child's sputum was not a negligible quantity. In the other cases, the danger from infection was practically none, but might become considerable within a few weeks or months. One of the children affected was the most brilliant child of the 600.

Of the bronchitis cases, three were unfit to be at school; none of the four was fit for the ordinary exercises.

It is proper to add that in a few of the most marked cases the headmaster had secured that no exercises, or only light exercises, were exacted. In the majority of the cases there was no symptom likely to impress any one unfamiliar with the methods of medical examination.

5. *Cases of Heart Disease.*—CASE I.—Aged thirteen years and ten months, girl. *Functional murmur.* This girl was pale in complexion. The heart affection was merely a functional murmur. She occasionally 'kept house' for her mother. Attendance bad. In nutrition she was thin. She also suffered from a dry perforation of the left ear. Tonsils enlarged, adenoids present. This girl was not fit for school work at the time of examination.

CASE II.—Female, aged thirteen years and six months. *Irregular heart.* This girl suffered from irregularity of the heart. In nutrition stout. Mental capacity good. She weighed 91½ lbs., which was much above the average for girls at that school. Exercise—usual school drill and outdoor exercise.

CASE III.—Male, eight years and seven months. *Mitral stenosis.* This boy was dull in mental capacity; medium in attendance; irregularly pale in complexion; medium in healthiness of appearance. He suffered

from mitral stenosis. He was distinctly defective in hearing. His tonsils were enlarged. His ear-membranes were retracted. He weighed only 40·5 lbs. He was a competent enough child; but he was physiologically disqualified to benefit either by the ordinary school education or by any of the drills or exercises of the school.

CASE IV.—Female, aged six. *Congenital pulmonary stenosis.* Her mental capacity was good; her attendance good. She had two half-hours a week of musical drill. Skipping, balls, etc., were the recorded games. In nutrition, she was very thin. She was bright and alert. Her weight was 38·5 lbs. In other respects, she appeared healthy. Such a case requires medical supervision.

CASE V.—Female, aged six. *Mitral stenosis and mitral incompetence.* Irregular pulse. This girl was medium in mental capacity, pale, unhealthy in appearance, and thin. She weighed 42 lbs. She suffered from squint and hypermetropia. She underwent drill two half-hours weekly; drill in class daily—including hand-bell drill; skipping, racing, jingo-ring, etc. She was entirely unfit for such exercises, and probably her heart condition was aggravated by them. She ought to be under medical supervision.

CASE VI.—Female, aged twelve years and one month. *Mitral incompetence,* due to rheumatic fever. Suffered from rheumatism from time to time. She was ruddy in complexion, of medium healthiness in appearance, of medium nutrition, of medium mental capacity. Her weight was 71½ lbs. She suffered from myopic astigmatism in one eye and hypermetropia in the other. There was slight retraction of ear-membranes, but no marked deafness. Her physical exercises, as recorded were—military drill, two half-hours weekly; skipping-ropes; quarter of an hour daily, free gymnastics. This girl ought not to be permitted exercise except under medical supervision.

CASE VII.—Female, aged thirteen years and six months. *Impure first sound.* In this case, the attendance was bad; mental capacity medium; in most other respects medium or bad. Weight, 68½ lbs. There was chronic otorrhœa of both ears. She also suffered from adenoids and swelling of cervical glands. On the whole, she was unhealthy. Her physical exercises were as in Case VI. She ought to be under medical supervision, both for physical exercise and general health.

CASE VIII.—Male, seven years and six months. *Mitral disease; rickets.* Dull in mental capacity; pale, unhealthy in appearance, thin; bad in alertness and carriage. Weight, 48½ lbs. Exercise—close drill, hand-bell drill, two half-hours weekly; action songs; football, racing. This child ought to be under medical supervision. The physical exercise described would certainly aggravate his condition. At the time of examination, he was unfit for the exercises named.

CASE IX.—Male, aged eight years and four months. *Mitral stenosis; irregular pulse.* Medium in capacity. Ruddy, healthy in appearance, stout; bright and alert; good in carriage. Weight, 61¼ lbs. Hypermetropic. Exercises—same as other infants. This child ought to be under medical supervision. Indiscriminate exercise would aggravate his heart defects. His good muscular condition constitutes a temptation to over-exertion.

CASE X.—Male, aged ten years and three months. *Reduplicated second sound; chronic inflammation of middle ear.* This boy was good in mental capacity; perfect in attendance; pale, medium in health appearance, of medium stoutness. Weight, 55¼ lbs. He had chronic inflammation of left middle ear. The exercises recorded were—dumb-bell exercise and boys' games. As 'reduplicated second sound' may indicate failing heart muscle, this boy should be under medical supervision.

CASE XI.—Male, aged ten years and five months. *Impure first sound.* This boy was ruddy in complexion, healthy in appearance, and stout. Weight, 69 lbs. His case was one for observation and supervision. Usual exercises.

CASE XII.—Male, aged twelve years and eleven

months. *Old pericarditis*. This boy was recorded as excellent in mental capacity. His attendance was 'bad'—on account of bad health. He was ruddy in complexion, moderately healthy in appearance, stout and alert. Weight, 72.75 lbs. He was slightly deaf, membranes being retracted. His old pericarditis seemed to give no trouble at the time. His exercises included physical drill, half-hour weekly, and running. The case was one for supervision.

CASE XIII.—Male, aged thirteen years and eight months. *Irregular heart, second sound accentuated*. This boy was recorded as medium in capacity; good in attendance; pale, but not unhealthy in appearance; stout, alert. Weight, 80 lbs.

He had been at drill in the forenoon; he was examined in the afternoon. He was admirably developed, measuring about 5 feet in height. His exercises were—Drill, fifteen minutes weekly; football, half-an-hour daily; cricket, in summer, one hour weekly. He seemed to be in excellent training; but the irregularity of the pulse clearly indicated that the amount of severe exercise was excessive, and that a continuation of it at the same pitch would ultimately produce serious heart defects. Although the general health seemed excellent, the excessive attention paid to muscular training had resulted in temporary interference with the functions of the heart. This boy's exercises ought to be under skilled supervision.

CASE XIV.—Male, aged thirteen years and two months. *Irregular heart; thumping first sound*. This boy was good in mental capacity, medium in complexion, healthy in appearance, stout, very alert. Weight, 88½ lbs. He was admirably developed. He suffered from acute suppuration of the middle ear, with perforation of the drum. This was said to be the result of injudicious bathing at the public baths. His exercises were much the same as in the last case—military drill, half-an-hour weekly; football, three-quarters-of-an-hour daily; free gymnastics. The violent beating of the heart was painfully manifest, being quite perceptible at a distance. Possibly the excitement incident to the examination may have accentuated the condition; but this would apply equally to other cases, where no irregularity of pulse or violence of palpitation was found. As in the last case, so in this, the over-exercise had resulted in a disturbed heart, and, no doubt, would, in course of time, produce permanent defects. This boy ought to be under medical supervision.

CASES IV. to XIV. inclusive were found in one of the four schools.

CASE XV.—Male, aged six years nine months. *Mitral incompetence*. Good in mental capacity; bad in attendance; pale; bad in health appearance; thin; medium in alertness. Weight, 38.5 lbs. Slightly deaf. Specially noted as—'Slow, dejected, and underfed.' Father lived in a house of one room. Exercise—drill, one hour a week; playground games; marching. This child was not fit to be at school.

CASE XVI.—Male, seven years five months. *Mitral incompetence*. House, two rooms. Good in mental capacity; bad in attendance; pale; unhealthy in appearance; thin; bright and alert. Weight, 40.75 lbs. He suffers also from chronic ear catarrh and perforation of drum. Special note,—'smart, but dirty' and badly fed.' Exercise, as in Case XV. This child was unfit to be at school.

CASE XVII.—Male, nine years seven months. *Mitral stenosis*. House, one room. Medium in capacity; medium in complexion; good in health appearance; thin; alert. Weight, 40.5 lbs. Slight deafness; retracted membrane. Exercise—physical drill, half-an-hour weekly; football; swimming. This boy was dimiutive for his age; very spirited and restless. He seemed to suffer no inconvenience from the heart condition. But such a case should be under observation.

CASE XVIII.—Male, aged nine years five months. *Mitral incompetence; irregular pulse*. House, three rooms. Excellent in mental capacity and attendance. Medium in complexion, health appear-

ance, and nutrition; very alert; good carriage; clean. Weight, 57.5 lbs. Deaf; wax in ears. Exercise—drill, half-hour weekly; football, cricket, walking, swimming. The irregularity of the pulse indicated that this boy was indulging in excessive muscular exercise. He ought to be under medical supervision.

CASE XIX.—Male, ten years eleven months. *Mitral incompetence*. House, two rooms. Dull in mental capacity; good in attendance; pale; unhealthy in appearance; thin. Weight, 53 lbs. Eyes very defective; internal squint; hypermetropia of both eyes. Suffered from adenoids. Slightly deaf. Retracted membranes. Exercise—as in the last case. This boy was not fit for drill, and ought to be under medical supervision.

CASE XX.—Male, aged thirteen years ten months. *Mitral incompetence*, due to rheumatic fever at age of five. House, two rooms. Medium in mental capacity; perfect in attendance; pale; moderately healthy in appearance; thin; fairly alert. Weight, 54 lbs. Slightly deaf. Enlarged tonsils. Adenoids. Post-cervical glands enlarged. Special note,—'Wears 'no flannel.' Exercise—physical and military drill, half-hour weekly; football; cricket; playground games; swimming. This is a case for medical supervision.

CASES XV. to XX. inclusive were found in one school. There was a gymnasium; also a small swimming pond, which was very popular with the boys.

CASE XXI.—Female, six years six months. *Congenital affection of pulmonary valves and phthisis of right apex*. This child was of medium mental capacity; pale; unhealthy in appearance; thin; alert; of good carriage. She had well-marked consolidation of the right apex. Her mother had died of phthisis. There was a congenital affection of the pulmonary valves of the heart. The combination of this with phthisis is comparatively uncommon. Exercise—dumbbells twice weekly for fifteen and twenty minutes; skipping and other playground games. This child was quite unfit to be at school and ought to be under medical treatment.

CASE XXII.—Female, aged fifteen. *Mitral stenosis*. This girl was dull in mental capacity; good in attendance; pale; medium in health appearance; medium in nutrition. Weight, 89.25 lbs. Tonsils enlarged. Slight deafness. Exercise—free gymnastics, half-hour weekly. There were no symptoms to indicate that there was any inconvenience from the heart trouble. But such cases should not indulge in exercise without medical direction.

CASE XXIII.—Male, aged ten years six months. *Irregular pulse; slight chorea*. This boy was excellent in capacity; good in attendance; pale; unhealthy in appearance; thin; alert. Weight, 54.25 lbs. Exercise—physical drill, half-hour per fortnight. This is a case for medical examination.

CASE XXIV.—Male, ten years five months. *Pulmonary valves affected*. This boy was excellent in capacity; good in attendance; pale; moderately healthy in appearance; alert. Weight, 61.5 lbs. Exercise—physical drill, half-hour per fortnight. The slight heart affection did not seem to incommode him in any way. There was no indication of excessive exercise.

CASE XXV.—Male, thirteen years. *Mitral stenosis*. This boy was medium in capacity; good in attendance; pale; unhealthy in appearance; thin; medium in alertness. Weight, 58 lbs. Eyesight defective; slightly deaf on account of wax in ear. Exercise—drill, half-hour per fortnight; football, swimming. This is a case for correction of eyesight, examination of ears, and general medical supervision.

CASE XXVI.—Male, thirteen years two months. *Irregular pulse*. This boy was excellent in capacity; good in attendance; medium in complexion; good in health appearance; stout; very alert. Weight, 72 lbs. Slight long-sight. Exercise—physical drill, quarter of an hour weekly; football, cricket, swimming. The irregular pulse suggested the probability of over-exertion. This is a case for periodic medical examination.

Cases XXI. to XXIV. inclusive were found in one school.

(6). *Cases of Lung Disease—(A) Phthisis.*—CASE I.—Female, nine years seven months. *Phthisis.* House, four rooms. Mental capacity, good; attendance, good; complexion, ruddy; healthy in appearance; moderately well nourished; moderately alert. Weight, 52 lbs. Hearing defective; eyes slightly defective; well-marked phthisis, with moist sounds. This girl ought to be under treatment.

CASE II.—Female, eleven years five months. *Phthisis.* Mental capacity, medium; attendance, good; complexion, ruddy; health appearance, medium; stout; alert. Weight, 73 lbs. This is excessive weight for the age. Neck glands affected. Exercise—no gymnastics; usual school games and drill. Phthisical condition of lungs well marked. This girl ought to be under treatment.

These two cases were at one school.

CASE III.—Female, eight years one month. *Phthisis.* House, one room. This girl was dull in mental capacity; medium in attendance; medium in complexion, in health appearance, in nutrition. Weight, 49.5 lbs. Slight deafness in one ear. *Special note.*—'Badly sent out.' Neither clothing nor body was clean. Eyesight slightly defective. There was consolidation of the right apex. This child ought to be under medical treatment.

CASE IV.—Female, twelve years two months. *Phthisis.* House, two rooms. Mental capacity, good; attendance, medium; pale; moderately healthy in appearance; medium in nutrition; alert. Weight, 60.78 lbs. Enlarged tonsils. Glands in neck swollen; old operation. Incipient phthisis in right apex. Exercise—military drill, half-hour weekly; skipping, free gymnastics. This girl ought to be under medical treatment. Exercise should be under strict medical control, otherwise the disease will advance rapidly. *Special note.*—'Best teeth seen yet'—that is, after over 400 examinations.

CASE V.—Male, twelve years three months. *Phthisis.* Mental capacity, good; attendance, good; pale; medium in health appearance; thin; alert. Weight, 68 lbs. Slight deafness, due to retracted membranes; adenoids; right apex affected. Exercise—drill, half-hour weekly; free gymnastics, football; Boys' Brigade. This boy ought to be under medical treatment.

CASE VI.—Male, thirteen years five months. *Phthisis.* This boy was medium in capacity; good in attendance; ruddy; healthy in appearance; stout; alert; good carriage. Weight, 93 lbs. In every respect well developed. Exercise—including drill, half-hour weekly; football, half-hour daily; free gymnastics. There was nothing to indicate that the exercise was excessive; but the boy ought to be under medical treatment, in case the disease should develop rapidly.

These four cases—III.—VI.—were at one school. The striking feature is the co-existence of incipient phthisis with good, or even excellent, physique. This confirms the general contention that no violent exercises should be practised without preliminary and periodic medical examination.

CASE VII.—Female, thirteen years eight months. *Phthisis.* House, three rooms. Mental capacity good; attendance good; pale; medium in health appearance; medium in nutrition; alert. Weight, 89.5 lbs. Incipient phthisis of right apex. Exercise—free gymnastics, one hour weekly, usual outdoor games. This case should be under treatment.

In the school where it occurred, Case VII. was the solitary case of phthisis. It may be suggested that one factor to account for the small amount of phthisis in this school of very poor, underfed, and badly-housed children, is the early death of feeble infants in this quarter of the city.

CASE VIII.—Female, aged six years six months. *Phthisis and Pulmonary Stenosis.* Already described as Case XXI. in Heart series.

CASE IX.—Female, nine years, seven months. *Phthisis.* Mental capacity excellent; attendance

good; ruddy; medium in health appearance; medium in nutrition; extremely bright and alert. Weight, 56 lbs. Slight deafness of one ear. Right apex distinctly consolidated. Exercise—drill, half-hour per fortnight; swimming, skipping, walking, and other outdoor exercises. This child, if continued at school, may at any time grow rapidly worse. Under treatment she may recover.

CASE X.—Male, six years, four months. *Phthisis.* Mental capacity excellent; attendance good; complexion pale; health appearance medium; in nutrition stout; very alert. Weight, 43 lbs. Eyes slightly myopic. Exercise—drill, dumb-bells, two half-hours weekly, football, outdoor games. The right apex has distinct signs of incipient phthisis. This child should have been under treatment.

CASE XI.—Male, six years, ten months. *Phthisis.* House, three rooms. Mental capacity medium; attendance bad, owing to father's holidays; pale; health appearance medium; thin; moderately alert. Weight, 50 lbs. Tonsils enlarged. Adenoids. Eyes slightly hypermetropic and astigmatic blepharitis. Exercise—dumb-bell drill, twice weekly, usual games. This boy should be under treatment for incipient phthisis.

CASE XII.—Male, seven years, four months. *Phthisis.* Mental capacity excellent, attendance good; complexion medium; health appearance medium; in nutrition medium; alert. Weight, 50.5 lbs. Slightly hypermetropic. Cicatrices of suppurating glands in neck, recent. Phthisis of right apex. Exercise—as in Cases X. and XI. This child should be under medical treatment. He might become a source of infection to other children.

CASE XIII.—Male, nine years, two months. *Phthisis,* left apex. *Pneumonia.* Temperature, 102° Fahr. Mental capacity medium. Attendance perfect; pale; bad health appearance; thin; moderately alert. Weight, 50 lbs. Slightly deaf. Adenoids. Distinct phthisis of left apex. Pneumonia developing. This child is quite unfit to be at school. Slow in action. Exercises—marching and free exercises, half an hour a week.

CASE XIV.—Male, eleven years, seven months. *Phthisis.* Mental capacity good; attendance good; complexion medium; health appearance medium; thin; alert. Weight, 76 lbs. Exercise—drill, half-hour per fortnight; football. Phthisis established in right apex. This child should be under treatment and not at school.

In one school six extra cases were examined, all boys. These are not reckoned in the tables. Among them was found one boy, aged thirteen years, three months, with incipient phthisis of the right apex. He had had rheumatic fever two months previously. He was pigeon-chested. He was good in capacity, regular in attendance, medium in complexion and healthiness of aspect, stout. Weight, 104 lbs. Exercise—no gymnastics, but physical drill and swimming. This boy was over the height and weight appropriate to his age. He ought to be, and probably was, under medical supervision.

(B) *Bronchitis.*—CASE I.—Male, six years and four months. *Bronchitis.* House, three rooms. This boy was excellent in capacity; medium in attendance; irregularity due to illness; pale; unhealthy in appearance; thin; very alert; good carriage. Weight, 44 lbs. Slight enlargement of tonsils. This boy was unfit to be at school.

CASE II.—Male, eleven years and seven months. *Chronic bronchitis.* Mental capacity good; attendance perfect; medium in complexion; healthy in appearance; stout; alert. Enlarged tonsils. Nebulae on cornea. Weight, 74 lbs. Usual playground games. Ought to be under medical supervision. The boy seemed adapted to his chronic trouble; but will be handicapped for life.

These two cases were at one school.

CASE III.—Female, seven years and seven months. *Bronchitis.* House, two rooms. Very dull child. Attendance good. Pale; unhealthy in appearance; thin; weight, 35 lbs. Slightly deaf. Body not clean.

App. IX.

Special note.—'Very dull, underfed, poor hair.' Exercise—drill, one hour weekly, running, skipping, marching. This child was quite unfit to be attending school.

CASE IV.—Male, eleven years. *Bronchitis.* Mental capacity good; attendance medium; moderately alert; slightly deaf; tonsils enlarged; adenoids. *Special note.*—'Very depressed.' Bronchitis well-marked. Exercise—drill, half-hour per fortnight; usual school games. This child, at the time of examination, was quite unfit to be at school.

7. *Ears, Nose and Throat, Eyes and Eyelids.*—These are commented on in connection with the appropriate tables.

8. *Deformities.*—The small number of deformities found was at once surprising and gratifying. The patients were all boys. Eye deformities, *e.g.*, squint, are included in the Eye Table.

There was one case of bifid, or split uvula, but the defect did not amount to cleft palate and was not recorded as a deformity. There was one case that showed a complete, or almost complete, double set of teeth both above and below. There was no case of club-foot, only two cases of flat-foot, not aggravated, and only four cases of slight knock-knee. There were a few cases of bow-legs due to rickets. No case of hernia was discovered, although a very stringent examination was made of 100 girls and 200 boys, and a general examination in the others. One or two cases of very slight exomphalos (umbilical protrusion), not amounting to hernia, were found in boys.

9. *General.*—The total number of children showing some form of disease is very large, amounting to 70 per cent. of the whole. In mitigation of the conclusions that might be drawn from this enormous percentage, it has to be said that many of the diseases recorded are slight; they are of value rather as indicating the road to prevention of unhealthiness than as themselves constituting a serious disablement or interference with school work. Of this order are many of the enlarged glands, enlarged tonsils, and adenoids. The same is true, but in a less degree, of the recorded ear diseases. These, even when slight, do interfere to a greater extent with school efficiency. The seriousness of heart and lung diseases, both for school efficiency and ultimately for social efficiency, needs no enforcement. If we assume, as we are entitled to do, that the selection of

children was representative of the School Board children of Edinburgh, it follows that if the same rate of disease-incidence be applied as in the 600 examined, there exists at present among the 30,000 school children some 700 cases of incipient or developed phthisis, and some 1300 cases of more or less serious heart disease. By the same reasoning, some 50 per cent.—that is the great total of 15,000 children—would be found to show some slight affection of the throat, and some 40 per cent., or 12,000, some slight affection of the ear. Even if we assume that half the diseases found were such as not themselves to interfere with school efficiency—and this is much too large an assumption, since any affection of ear, or throat, or heart, or lung, tends to interfere with efficiency all through the daily life—we should still have some 35 per cent., that is 10,500 children, with some affection demanding more or less attention.

App. IX.

SUMMARY OF CONCLUSIONS.

On the basis of these facts and inferences, I have framed the following general conclusions:—

* *First.*—The large number of serious and minor diseases directly and indirectly affecting physical efficiency and mental efficiency constitutes an overwhelming case for a medical inspection of school children.

Second.—The facts as to physical exercise at the various schools demonstrate that a primary condition of any good result from increased physical training is adequate food and adequate clothing.

Third.—No systematic exercise ought to be practised or enforced without a preliminary medical examination of the vital organs, to ensure that irreparable damage shall not result.

Fourth.—That exercises should be organised—not as at present according to the Code Standard in which the child is studying, but—strictly in accordance with health, physical development and vigour.

(Signed) W. LESLIE MACKENZIE.

EDINBURGH,

C.—REPORT on the Physical Examination of 600 ABERDEEN School Children,

BY PROFESSOR MATTHEW HAY.

SCHOOLS VISITED.

(See TABLE I.)

The names of the schools are given in the above Table. They were selected by a Committee of the School Board, after receiving an explanation of the required conditions, and consisted of four elementary and two advanced schools. The latter were included mainly to obtain the necessary number of children at the higher ages. The Middle School is in a very poor and crowded district in the centre of the city, and is attended mainly by the children of the poorer of the working classes. Skene Square School is situated on the margin of a somewhat similar, but less crowded, district, from which its pupils are largely drawn. King Street School is also in a part of the city chiefly occupied by the working classes, but of the average type, and largely artisan. The immediately surrounding district is not overcrowded or slummy. Ashley Road School is in the west end of the city, and is attended almost wholly by children of the well-to-do classes. These were the four elementary schools visited, from which all the younger children were taken. Of the two advanced schools visited—the Grammar and the Central—the former is the chief secondary school for boys under the School Board, and is attended chiefly by boys of the better classes, including some boys from the country, while the latter is a higher grade school in the centre of the city for both boys and girls, but mainly girls, who are drawn principally from the middle classes and better-off working classes in the city.

Table I. also gives the size in rooms of the houses from which the examined children came, and shows that the children are divisible into three nearly equal groups, according to the size of house, viz.—one group from one- and two-roomed houses, a second from three-roomed houses, and the third from houses of four or more rooms. In Aberdeen, according to the last census, the proportion of the population occupying one- and two-roomed houses was 39 per cent.; three-roomed houses, 30 per cent.; and houses of four or more rooms, 31 per cent. Accordingly, the housing of the children examined corresponded approximately in character with the housing of the population generally.

MODE OF SELECTING THE CHILDREN.

I regret that the School Board considered it necessary for me to obtain the consent of the parents of each child before examination, as it interfered to some extent with the purely random choice of the children which had been intended. The procedure, as approved by the Board, was, in the first place, to make a chance selection of the required number of children at the desired ages, either by ballot or by taking, say, every fourth or fifth child on the class register. An addition of 15 to 20 per cent. was made to the number, to cover possible refusals. A circular, approved by the Board, was then addressed to the parents of each selected child, asking them to inform the headmaster if they objected to the proposed examination. The proportion of refusals

averaged not less than 15 to 20 per cent. over all the schools visited. The reasons for refusal were not usually stated. In one or two schools an impression had got abroad that the examination would involve considerable undressing, and this was objected to, especially by the parents of the older girls. It is not, however, believed that these refusals have seriously interfered with the fairness of the sampling. The fact of previous consent being required has diminished somewhat the proportion of children who were irregular in attendance, as these were most likely to be absent in largest proportion on the day of examination.

App. IX.

PHYSICAL TRAINING IN THE SCHOOLS VISITED.

Each of the schools visited, except the Central, is provided with a gymnasium, and in all the schools, except the Central, the accompanying 'syllabus of physical education' on a system arranged by Colonel Cruden, of Aberdeen, and approved by the School Board, is in operation, and every pupil receives half-an-hour of such education weekly. An additional half-hour of advanced exercises is obtainable by the older boys on payment of a fee. The older boys in the Grammar School are not obliged to undergo physical training under the syllabus. There is no physical training in the Central School in the meantime, but all the pupils are senior, and have been drafted from elementary schools, where they have had the usual physical exercises. The half-hour's training under the syllabus varies with the age of the pupil, and begins with free exercises, marching, and musical exercises, with dumb-bells and hoop-drill for the younger pupils, and ends with exercises with bar-bells and Indian clubs, and also military dumb-bell exercises, for pupils of the *Merit* and *Sub-Merit Classes*. Outdoor drill is also given in summer to pupils of these classes.

The playground games are of the usual type. In the playgrounds of all the schools, except the Grammar School, where the grounds are extensive, cricket and football are forbidden on account of the smallness of the grounds. A large majority of the Grammar School boys engage freely in cricket and football. There are few grounds for such games in the city available for boys attending other schools, but a proportion of the older boys are connected with boys' clubs.

There is no swimming pond in connection with any of the schools visited, but about a year ago arrangements were made under which pupils at the Grammar School have the opportunity of practising swimming in the pond at the Beach Sea-Bathing Station.

MENTAL CAPACITY, CLASS PLACE, AND REGULARITY OF ATTENDANCE.

(See TABLE II.)

It will be observed that somewhat more than one-fourth of the children examined belonged to the top fourth of their class, while considerably under one-fourth of the children were drawn from the bottom

fourth. The mode of selecting the children was probably, as already explained, in some measure responsible for this. The children examined in Aberdeen were, therefore, as a whole, somewhat above the average in class place, and this was true more especially of the girls.

In respect of mental capacity, 59 per cent. were marked as being 'excellent' or 'good,' while only 9 per cent. were entered as 'dull.' None were marked as 'defective.'

The 'dull' children belonged equally to the various social grades, and were not under the average in respect of health appearance, regularity of attendance, and cleanliness. Nor did their average measurements, which were separately made up, differ materially from the averages for other children of the same ages. They suffered, however, in distinctly larger proportion from eye and ear defects.

PERSONAL APPEARANCE.

(See TABLE III.)

In point of health appearance, state of nutrition, and carriage and general balance, and also cleanliness, the girls were somewhat superior to the boys, while the reverse was the case in respect of complexion. In brightness and alertness the two sexes were almost alike.

At all ages and for both sexes taken together it was found that 14 per cent. were of 'pale' complexion; less than 1 per cent. had a 'bad' health appearance; 9 per cent. were 'thin'; only one child was marked 'bad' in regard to brightness and alertness, and none in respect of carriage and general balance.

In less than 1 per cent. was the cleanliness of the clothing noted as 'bad,' and in only 2.5 per cent. in the case of the body. The previous notice of the examination which the parents received through the circular asking their sanction did, no doubt, help to improve the cleanliness, although the circular contained no information as to the actual day of the examination. The defective cleanliness was largely confined to the children in the Middle School; but this school, as already remarked, is attended by children from the most crowded and poorest district in the city. At the same time it is of interest to note that the children from this school were among the brightest and most alert.

It will be observed that the proportion of pale children increased with age, from about 11 per cent. at six to nine years, to 17 per cent. from twelve to fifteen years, and that the increase was much greater among girls than boys. The proportion of ruddy children was not, however, materially affected, the increment of the pale children having been drawn mainly from the 'mediums.' Possibly the confinement of school life is accountable, to some extent, for the increase of paleness.

It is satisfactory, however, to note that the health appearance, as distinguished from mere complexion, was scarcely affected by increase of age.

As regards state of nutrition, it was, on the whole, very satisfactory. Only 9 per cent. of the children were marked as 'thin,' and in no instance was there evidence of distinctly insufficient feeding. The state of nutrition, as judged by plumpness, diminished in boys as the age increased. In girls, after a slight falling-off at the middle age-group, it reached its maximum in the latest age-group.

It is of interest to remark that practically all the children examined were found to be sufficiently clothed. In some cases the clothing was poor in character, and occasionally dirty, but it was scarcely ever insufficient in quantity. Only two or three of the children were without boots or shoes. The clothing of the poorest children in the town is well attended to by certain clothing missions.

Carriage and general balance, as judged by a natural standard, was generally good, being marked by the examiners as 'good' in 84 per cent. of the children.

It was somewhat better in girls than boys at every age-group, but the difference, which was greatest at the earliest age-group, gradually diminished with increasing age. This was due, as the table shows, to an improvement in the boys rather than to a declension in the girls, and may have proceeded from a greater devotion to outdoor games. I am satisfied that although the carriage was largely marked as good, according to the standard used, it was capable of improvement under a sufficiency of suitable physical exercise and drill. This opinion is based less on the inspection of the individual child in the stimulating atmosphere of the examination room than on the general observation of the children in the playground and the streets.

TEETH.

(See TABLE IV.)

The cleanliness of the teeth was not satisfactory, only one-third of the children being marked as good in this respect. Not more than 12 per cent. brushed their teeth daily, and these belonged almost entirely to the better classes of the population. The attention to brushing increased only slightly with increasing age, and was somewhat greater among girls than among boys.

Only 3 per cent. showed distinctly irregular teeth, and only 5 per cent. had ill-shaped teeth. In one of these the teeth had the shape characteristic of congenital syphilis, and the same child suffered from choroido-retinitis of the eyes.

The development of the permanent teeth was delayed in nearly one-fifth of the children, and distinctly more largely in boys than girls, and the delay was more frequent at the later than the earlier ages.

The number of the permanent teeth in each child was counted, and the average for each yearly age and each sex is given in a separate table. The averages agree with the usual statements in works on anatomy, except that after the age of eight years the development in the Aberdeen children was half a year to fully one year behind.

Decay of the permanent teeth was present in fully one-third of the children of the lowest age-group (six to nine years), and had apparently begun in most of these almost with the first appearance of the permanent teeth. The last year (eight to nine) of this age-group witnessed a larger addition to the children with decayed teeth than any subsequent year. By the age of ten or eleven the proportion of children with decayed teeth had risen to nearly four-fifths; but it did not show a material increase at the later ages. The proneness to decay of teeth was, therefore, of early origin. Decay of the permanent teeth was usually associated with decay of the first set. Probably the early removal of decayed teeth among the first set would assist greatly in preventing decay of the second set.

The average number of decaying permanent teeth per child was a little over two in the first age-group, and increased to about 3½ in the highest age-group. The greater part of the increase in the last group was due to a sudden rise in the last year (fourteen to fifteen) of the group. The rise took place in both sexes.

COLOUR OF HAIR AND EYES

(See TABLE V.)

Very nearly one-half of the children had hair of a medium or chestnut-brown colour; one-fifth had black or dark brown hair; fully one-fourth had fair hair; and about one-thirtieth had red hair. The darker shades were more abundant at the older ages.

The eyes in about one-half of the children were blue; in slightly under one-fifth they were dark; in slightly over one-fourth they were medium; and in a little under one-tenth they were of a light colour, other than blue.

EYESIGHT.

(See TABLE VI.)

The proportion of children requiring correction by spectacles for errors of refraction was slightly under one-fourth of the whole of the children examined. In only a few of these had such correction been made, and several of the children were evidently suffering from want of it. The headmaster's attention was drawn to all such cases, with a view to the parents being communicated with. There is obvious need for a regular systematic examination of the eyes of the school children, if the best possible work is to be obtained. The proportion of children with vision requiring correction was slightly higher among girls than boys.

Diseases of the eye were not common; only 3 to 4 per cent. of the children had affections of the eye, but in several cases the affection was merely a slight and temporary inflammation. A few cases, severe enough to require medical treatment, were evidently not receiving it. Inflammation of the eyelids (blepharitis) was met with in 6 per cent. of the children, and in several instances was in need of treatment.

Nearly all the cases of eye and eyelid disease met with were remediable.

EARS AND HEARING.

(See TABLE VII.)

The results as regards hearing were good, only five children having 'distinctly defective' hearing, such as would interfere with the proper progress of their school work. In no case was there complete deafness. The proportion of children with 'defective' as distinguished from 'distinctly defective' hearing was 13

per cent., and the cases were irregularly distributed over the age-periods. There was a preponderance of the cases among girls.

The defective hearing was in many instances remediable, or capable of improvement, under suitable medical treatment. Some of the severest cases, such as those of otitis media (inflammation of the middle ear), were receiving no treatment; others were apparently being properly attended to. The attention of the teachers was directed to the cases which were in particular need of medical assistance.

The children marked as suffering from cerumen or wax in the ears include only such children as had sufficient cerumen to produce impaction or interfere with hearing.

NOSE AND THROAT.

(See TABLE VIII.)

One-fourth to one-third of all the children examined were suffering from some affection of the throat or nose, but it was in the majority of cases very slight, and scarcely requiring medical treatment. About one-fifth to one-fourth of the children suffering from enlarged tonsils or adenoids—that is, about one in twenty of all the children examined—would probably have benefited by surgical treatment. The affections of the throat were more numerous in the older than in the younger children, but the increase was slight and immaterial. More girls than boys were affected, and the disparity was more evident at the later than the earlier ages. The few unclassified cases of disease were suffering from inflammation of the nose, follicular tonsillitis, inflammation of the throat, or wart on tongue.

Only three children were found to have a defective sense of smell, and in each case the sense was not completely lost. All three were suffering from catarrh.

DISEASES AND DEFORMITIES.

(See TABLE IX.)

The following is a list of the cases of disease met with among the children examined:—

Diseases of Skin.—*In males*—Eczema, 12; impetigo, 2; scabies, 1; tinea (ringworm), 2; psoriasis, 2; ichthyosis, 2; urticaria, 1; pediculi capitis, 1. *In females*—Eczema, 3; impetigo, 1; tinea, 1; pediculi capitis, 5; pediculi corporis, 1. The diseases of the skin were chiefly among the younger children, and were most frequent among the poorest children.

Diseases of Glands.—*In males*—Enlarged glands, 10 (including 3 discharging glands). *In females*—Enlarged glands, 2. The glands found to be diseased were all cervical. Every case of obvious enlargement was noted.

Diseases of Bones.—*In males*—Rickets, 12; tubercular disease (tibia), 1. *In females*—Rickets, 5.

Such of the cases of rickets as were associated with deformity are again included under 'Deformities.' They amounted to seven. In the cases of rickets the following were the bones which more particularly indicated the existence of the disease:—Ribs, in 3 cases; tibia (curvature), 2; thigh bones (anterior curvature), 1; head, 1; head and chest, 4; general, 1.

Diseases of Joints.—*In males*, 0. *In females*—Rheumatism, 1.

Diseases of Heart and Circulation.—*In males*, 6 (all with mitral incompetence); *in females*, 0. The cases were equally distributed over the ages. There was also a case of high arterial tension.

Diseases of Lungs.—*In males*—Bronchitis, 5. *In females*—Bronchitis, 3; consolidated apex, 3. The cases of consolidated apex were probably cases of incipient phthisis. They were not, so far as could be ascertained, receiving medical attention.

Diseases of Abdominal Organs.—*In males*—Inguinal hernia, 3 (including one double, which had been cured by operation); umbilical hernia, 2; pot belly, 1. *In females*, 0.

Diseases of Eyes and Eyelids,
Diseases of Ears,
Diseases of Nose and Throat,
Other Diseases.—*In males*—Stammering, 2. *In females*, 0.

} See special tables.

The deformities were few—only 21—and were, in most cases, not of a serious character. They are detailed in the accompanying Table. It is possible, or even probable, that the method of selecting the children, with the power of refusal to the parents, prevented a proper proportion of the deformed children appearing among those examined; but in any case, as could be seen from a general survey of the children in the classroom or playground, the proportion of deformed children was small.

No case of club-foot was found among the children examined, and only two cases of flat-foot. No child was marked as having the latter deformity unless it was such as appeared to require medical attention. It may be remarked that the typical Aberdeen foot is, in the experience of the reporter, much flatter than the foot of southern populations.

Among the deformities noted were three pigeon-shaped chests in males, and two in females.

The kyphosis (hunchback) noted was in the same boy as suffered from bifurcated uvula.

MEASUREMENTS.

(See TABLES X. and XI.)

As the numbers examined at the different ages were small—only thirty-two to thirty-four at each year of age for each sex—the average measurements would probably undergo some modification if they were derived from larger numbers, but the numbers are probably sufficient to afford ground for broad generalisations.

Height (standing).—The boys were about two cms. or $\frac{1}{2}$ inch taller than the girls at the earlier ages; but the girls were taller than the boys at the ages of thirteen to fourteen and fourteen to fifteen. In other words, during the school-age period girls grow more than boys. This is in accordance with the findings of previous observers (see especially the reports of the Anthropo-

See footnotes to Table X.

metric Committee in the British Association Reports for 1879 to 1883).

Compared with the measurements for 'all classes' collected by the Anthropometric Committee, which were chiefly for English children, the height in Aberdeen was fully 1 inch above the average at the first two years of age (six and seven years) in the accompanying tables, and about equal to the average at other ages. It was about $\frac{1}{2}$ inch to 1 inch above the average at every age for the artisan classes of towns; but, at the higher ages, it was 1 inch to 2 inches less than that for the professional classes.

Height (sitting).—The measurements appear to show that in both sexes the limbs grow slightly faster than the trunk. At six to nine years the proportion of height sitting to height standing was as 1 : 1·81 in boys, and as 1 : 1·80 in girls; at nine to twelve years it was in both sexes as 1 : 1·85; and at twelve to fifteen years it was, in boys, as 1 : 1·89, and in girls, as 1 : 1·88.

Weight.—The boys were at every age heavier than the girls, except at the age of thirteen to fourteen. The statistics of the Anthropometric Committee show that this is usually true, except that girls at both thirteen to fourteen and fourteen to fifteen are distinctly heavier, as they are also taller than boys. The increase of weight with advance of age appeared to be irregular, but was most pronounced in both sexes in the later years of school life. Weight increased more rapidly than height—the height (in inches) being to the weight (in lbs.), at six to nine years, as 1 : 1·1; at nine to twelve years, as 1 : 1·23, and at twelve to fifteen years, as 1 : 1·5. The ratio was slightly less in respect of weight among girls than boys in each age-group. These ratios agree closely with the averages of 'all classes' obtained by the Anthropometric Committee, except that the weight ratio was higher among boys than girls during the last age-group.

Head.—The head was greater in all its dimensions among boys than girls, and the differences continued practically unaltered at all the ages examined. The difference ranged from 1·6 per cent. in the average maximum width to 2·8 per cent. in the average maximum length. The heads of the boys were, therefore, slightly more dolicephalic or 'long-headed' than those of the girls; and the cephalic index was slightly less in boys (about 79) than in girls (about 80). The cephalic index was less in the older than the younger girls. In boys it was practically the same in all the age-groups. The type of the head, as determined by the cephalic index, was what is known as mesato-cephalic, and is very slightly broader than the average English head. The dimensions of the head increased less with the age than any other measurements taken, the increases during nine years varying from about 10 per cent. for the width of forehead to 4 to 6 per cent. for the other dimensions. During the same period, the height of the person increased by 36 per cent. The width of the forehead as contrasted with the bi-parietal width, or width of back portion of head, was proportionally greater in the older than the younger children.

Neck.—The neck was thicker in boys than in girls at all ages, and by about 4·6 per cent. on an average, though, owing to the more rapid growth of the neck of girls, especially in the last two years, the difference was less at the later than the earlier ages.

Trunk.—Over all the ages, the *circumference of the chest* was, on an average, 4·4 per cent. greater in boys than in girls, but the difference was less at the later ages, due, no doubt, largely, if not entirely, to the commencing development of the breasts in girls. In both sexes the rate of growth of the chest was greater in the later than in the earlier years.

The chests generally were somewhat flat, and appeared capable of fuller development with a larger amount of properly-arranged exercise.

Compared with measurements given for 'all classes' in the British Association Reports, the chest measurements of the Aberdeen boys were under the average by one to two inches at ten years of age, but the difference rapidly falls with each year of age until at fourteen to fifteen it is only about half an inch. No chest

measurements are given in the Association Reports for children under ten years.

The *width of the shoulders*, as measured from the acromial tips, was greater, on an average, by 1·7 per cent. in boys than girls, but in the last two years (thirteen to fourteen and fourteen to fifteen) the difference became extinguished, and the girls showed the wider shoulders. The growth was fairly steady throughout the years, though somewhat more rapid in the later years, especially in the girls.

The *width of the pelvic crests*, or haunch bones, was greater in boys than girls until the last two years, when it became greater in girls. Within the ages dealt with, the width of the shoulders in boys grew more rapidly than the width of the pelvic crests, while among girls the reverse was true.

The *width of the hips*, as measured from the outside of the large trochanters of the thigh bones, naturally follows in its growth the width of the pelvis, but the increase was more rapid in both sexes. As in the width of the pelvis, it was greater in boys than girls until the last two years, when it was greater in girls.

Limbs.—The *girth of the forearm* was, on an average, about $\frac{1}{2}$ cm. or $\frac{1}{4}$ inch greater in boys than girls. At eleven to twelve and twelve to thirteen in boys the girth rapidly increased, and afterwards increased more slowly. In girls it grew slowly at eleven to twelve, but increased rapidly afterwards.

The *circumference of the wrist* was at most ages only slightly greater in boys than girls; at two ages it was the same or less; and at fourteen to fifteen the excess in boys was only 0·1 cm. or $\frac{1}{20}$ inch. If the average girth of wrist at each three-year age-group be deducted from the girth of the forearm, the following figures are got:—

Age-group.	6 to 9 yrs. cm.	9 to 12 yrs. cm.	12 to 15 yrs. cm.
Boys, . . .	4·9	5·8	6·5
Girls, . . .	4·6	5·3	6·1

From which it will be seen that the difference, representing the soft parts of the forearm, shows a fairly steady increase with age in each sex, and that it is, at each age-period, greater in boys than girls by 0·3 to 0·5 cm.

The *circumference of the calf* was greater in boys than in girls at all ages, except six to seven, twelve to thirteen, and thirteen to fourteen. The rate of growth of the calf is somewhat greater proportionally, in both sexes, than that of the forearm, being, from six to fifteen years, in boys, 38 per cent. for the calf, and 31 per cent. for the forearm; and, in girls, 35 per cent. and 33 per cent. respectively. This may point to insufficient exercise of the arms as compared with the legs.

The British Association Reports give the average calf measurements of the Marlborough School boys, from the age of ten upwards. Compared with these, the measurements of the Aberdeen boys are less, by about three-quarters of an inch, at all the ages above ten, except at fourteen to fifteen, where the difference is reduced to one-third of an inch. The boys of that school belong to the better classes, and freely indulge, in common with the boys in all English public schools, in outdoor games.

The *circumference of the ankle* was thicker in boys than girls at the earlier ages, but the difference gradually diminished, until, at the later ages, it was practically the same in both. If the girth of the ankle is deducted from that of the calf, the following figures are obtained:—

Age-group.	6 to 9 yrs. cm.	9 to 12 yrs. cm.	12 to 15 yrs. cm.
Boys, . . .	7·6	8·4	9·7
Girls, . . .	7·6	8·4	10·0

which, differing from the corresponding figures for the forearm and wrist, give (1) an equal or greater volume of soft parts in girls than boys at all ages, and (2) a much more rapid growth, in both sexes, at the later than the earlier ages.

A comparison of the figures, in the text, for the forearm and calf shows that the increase of the soft parts of the forearm, between the lowest and the middle age-groups, was about 17 per cent., and between the middle and the highest groups, 13 per cent. The corresponding percentages for the calf were 11 and 17. It may legitimately be asked if the greatly diminished rate of growth of the forearm at later ages, as contrasted with the greatly increased rate of growth of the calf at later ages, is not, in some measure, dependent on an inadequate amount of arm exercise.

The muscular power, as tested by the *grasping power of the hand*, was found to be practically the same for each hand in both sexes. It was greater in boys than girls at all ages, but the difference diminished with increase of age. Thus, at six to nine years, the grasping power was 20 per cent. greater in boys than girls; at nine to twelve years, it was 16 per cent. greater; and, at twelve to fifteen years, it was 14 per cent. This is almost contrary to expectation.

It is interesting to note that although the volume of the soft parts of the forearm was about 7 to 9 per cent. greater in boys than girls at each age-group, the difference in muscular power was greater than the difference in volume, indicating either that the volume of the forearm in girls contained less muscle and more fat than in boys, or that the muscle was less vigorous.

In keeping with the diminished rate of growth of the forearm at later ages, already remarked, the hand grasp was found to exhibit, in both sexes, less increase between the second and third age-groups than between the first and second.

It may be stated that the muscular power test used by the Committee of the British Association, which consisted in ascertaining the 'drawing strength' by one arm or hand pulling against the other, as in the use of a bow and arrow, a spring balance marking pounds being stretched between the hands and being used as the measure, gave a much wider difference between boys and girls than was obtained in the present inquiry. In the Committee's tests, the strength of the boys was at each age almost double that of the girls, though, as in Aberdeen, the difference tended to become less with advance of age. Such an enormous difference, which cannot be said to correspond fairly with the general difference in strength between boys and girls, makes it more than doubtful whether the test used by the Anthropometric Committee is a satisfactory one.

REMARKS ON THE TABLE OF DEVIATIONS.

(See TABLE XII.)

The number of children at each year of age, with measurements outside the 5 per cent. variations from the average for the particular age, affords an index of the degree of variability of the different measurements. The parts of the body most liable to variation are, presumably, those which are most capable of being influenced by physical agencies.

Thus determined, the parts or measurements may be placed in the following order, according to their degree of variability, beginning with the most variable. The figures give, for each sex and measurement, approximately the total *percentage* of children having a measurement more than 5 per cent. above the average or more than 5 per cent. under the average for their year of age. Roughly, about one-half of each figure corresponds to the downward variation, and one-half to the upward.

	Boys.	Girls.		Boys.	Girls.

	Girth of chest,	33	36	of head,	7	10
Trunk {	Width of pel-			Max. length		
	vic crests,	30	39	of head,	5	9

It must, of course, be admitted that the apparent great variability in the grasping power may be due in part to a deficiency in skill in using any test apparatus.

It is obvious that weight is greatly more variable than height, that the limb measurements are more variable than those of the trunk, and that this is apparent on a comparison, not only of the widths and circumferences, but also of the heights, sitting and standing; and that the least variable are the head measurements. It is also to be noted that width measurements of the skeleton are more variable than length measurements, as may be seen from a comparison of the width of shoulders or pelvic crests with height.

In any system of bodily measurements for the purpose of ascertaining the effects of physical training, it may, therefore, be proper to include a fair proportion of width and girth measurements.

With regard to the differences between the sexes, it will be observed that, while the girth of the wrist and ankle is nearly equally variable in the two sexes, the girth of the forearm and calf is distinctly more variable in girls than boys, due, perhaps, to the less general indulgence in exercise by the former. Further, all the trunk measurements, except the width of shoulders, are more variable in girls than boys; and so also, in a marked degree, is the circumference of the neck. There is scarcely any difference between the sexes in the variability of the height (standing), but there is an appreciably greater variability among girls than boys in the height (sitting). The measurements of the head, except the minimum width of the forehead, are, most of them, distinctly more variable in girls than boys.

The other measurements, including the weight, are of nearly equal variability in the two sexes.

As to the effect of age, deviations in weight and height were more numerous at the later than the earlier ages. This was also distinctly true of width of shoulders, in both sexes, and of width of pelvic crests and hips in girls. Variations in chest girth were not materially affected by age in girls, though in boys they were greater at the middle age-group than at the others. Variations in girth of forearm and calf rose markedly in girls at the later ages; they were more steady in boys. It is at the later ages that the difference between boys and girls in the effects of exercise are likely to be most obvious.

COMPARISON BETWEEN CHILDREN ACCORDING TO SIZE OF HOUSE.

(See TABLES XIII. and XIV.)

The size of house from which the child comes is one of the most convenient and reliable of available indications of the social condition of the child. In Aberdeen, 30.5 per cent. of the children examined came from houses of one or two rooms, 29.5 per cent. from houses of three rooms, and 40.1 per cent. from houses of four or more rooms.

According to the last census, roughly one-third of the whole population of Aberdeen was found to be living in each of these three groups of houses. The proportions of the children examined, therefore, represent approximately the social condition of the whole children, except for a preponderance in the proportion of children from houses of four or more rooms, which was due to the difficulty of getting sufficient children at the ages of thirteen to fifteen in the ordinary elementary schools in the poorer parts of the city. It has therefore been thought advisable in the accompanying tables not to carry the comparison beyond the ages of thirteen. Even with this limitation, the numbers for each group at certain ages are too small to be of much service, but a general survey of the Table may give fairly reliable conclusions. The comparison is confined to 'mental capacity,' 'state of nutrition,' 'cleanliness,' and certain representative measurements. A separate Table is given for each sex.

In point of *mental capacity*, the boys from one- and two-roomed houses were on an average appreciably better than those from houses of four rooms and upwards, who were in turn better than boys from three-

roomed houses; but these differences were most pronounced at the early ages, and were almost reversed at the later ages, when the boys from the large houses took the lead, and boys from the smallest houses fell into the rear. The girls from the large houses were, on an average, the best. Those from one- and two-roomed houses had, however, the largest proportion of 'excellents,' but also the largest proportion of 'dulls.'

In respect of *cleanliness*, the children from the smaller houses were, as might have been expected, less satisfactory than those from the larger houses, the proportion of clean children showing a distinct diminution with a decrease in the size of the house.

As to *nutrition*, the largest proportion of apparently well-nourished children—the sexes being taken together—came from three-roomed houses, and the largest proportion of 'thin' children from houses of four rooms and upwards. These results are derived from the ordinary inspection of the children, and are not so reliable as those deducible from actual measurements.

In regard to *measurements*, it is obvious from even a hasty perusal of the accompanying tables that, in each sex, the *height* of children from four-roomed houses was, as a rule, greater than that of children from three-roomed houses, who, in turn, were taller than children from one- and two-roomed houses; but this is not the order at every age. For example, at eleven to twelve, among girls, those from one- and two-roomed houses were the tallest, but this is the only instance in the male and female tables where this occurs. At several ages, however, children from three-roomed houses were the tallest—viz., among boys, at eight to nine, and eleven to twelve, and, among girls, at eight to nine, nine to ten, and ten to eleven. The difference in height between the largest and the smallest housed group at each age varied from 0·6 inch to 2·9 inches, and averaged about an inch for males and 1·3 inch for females; and the difference was practically as pronounced at the earlier as at the later ages. It did not appear to be an increasing difference.

As regards *weight*, there were corresponding differences to those for height, varying from 0·7 lb. to 7·4 lbs. at each age, and averaging about 3·3 lbs. in males and 3·1 lbs. in females. The differences were not uniformly in favour of children from the largest houses. At two ages—viz., nine to ten and eleven to twelve—boys from three-roomed houses were the heaviest; at the remaining five ages, boys from houses of four rooms and upwards were the heaviest. Among girls, at eleven to twelve and twelve to thirteen, those from one- and two-roomed houses were the heaviest; and at eight to nine, nine to ten, and ten to eleven, those from three-roomed houses. At only two ages—viz., six to seven and seven to eight—were girls from houses of four rooms and upwards the heaviest. The difference in weight between the lightest and heaviest group at each age averaged 3·3 lbs. in the boys, and varied at the different ages from 0·7 to 7·4 lbs. In the girls, it averaged 3·1 lbs., and varied from 1·4 to 5·9 lbs.

If a careful comparison be made in the tables between the weight and height for each age and group, it will be found that the difference in weight usually follows the difference in height, irrespective of age, and also largely irrespective of the group, especially when it is kept in view that the ratio of weight to height is naturally not constant for all heights, but increases with increasing height. On the whole, however, after due allowance has been made for these considerations, the balance is in favour of children from houses of three and four rooms and upwards, but it is not large.

There still remains the substantial difference in height already fully detailed, and it is proper to consider whether the inferior height of the children from the smaller houses is due to home conditions. A similar difference has frequently been noted by previous observers, but, while it may be admitted that deficient feeding hinders growth, it must not be too readily assumed that this rather than inheritance is the chief cause of the differences in height observed in Aberdeen. Scarcely any of the children had a starved appearance, and, as already remarked, the apparently 'thin' children were in larger proportion among the children from four-roomed houses than among those from one- and two-roomed houses. Moreover, the disparity in height between the different groups did not, as already remarked, advance with increase of age, as might have been expected had home conditions been exercising a continuously deterrent effect.

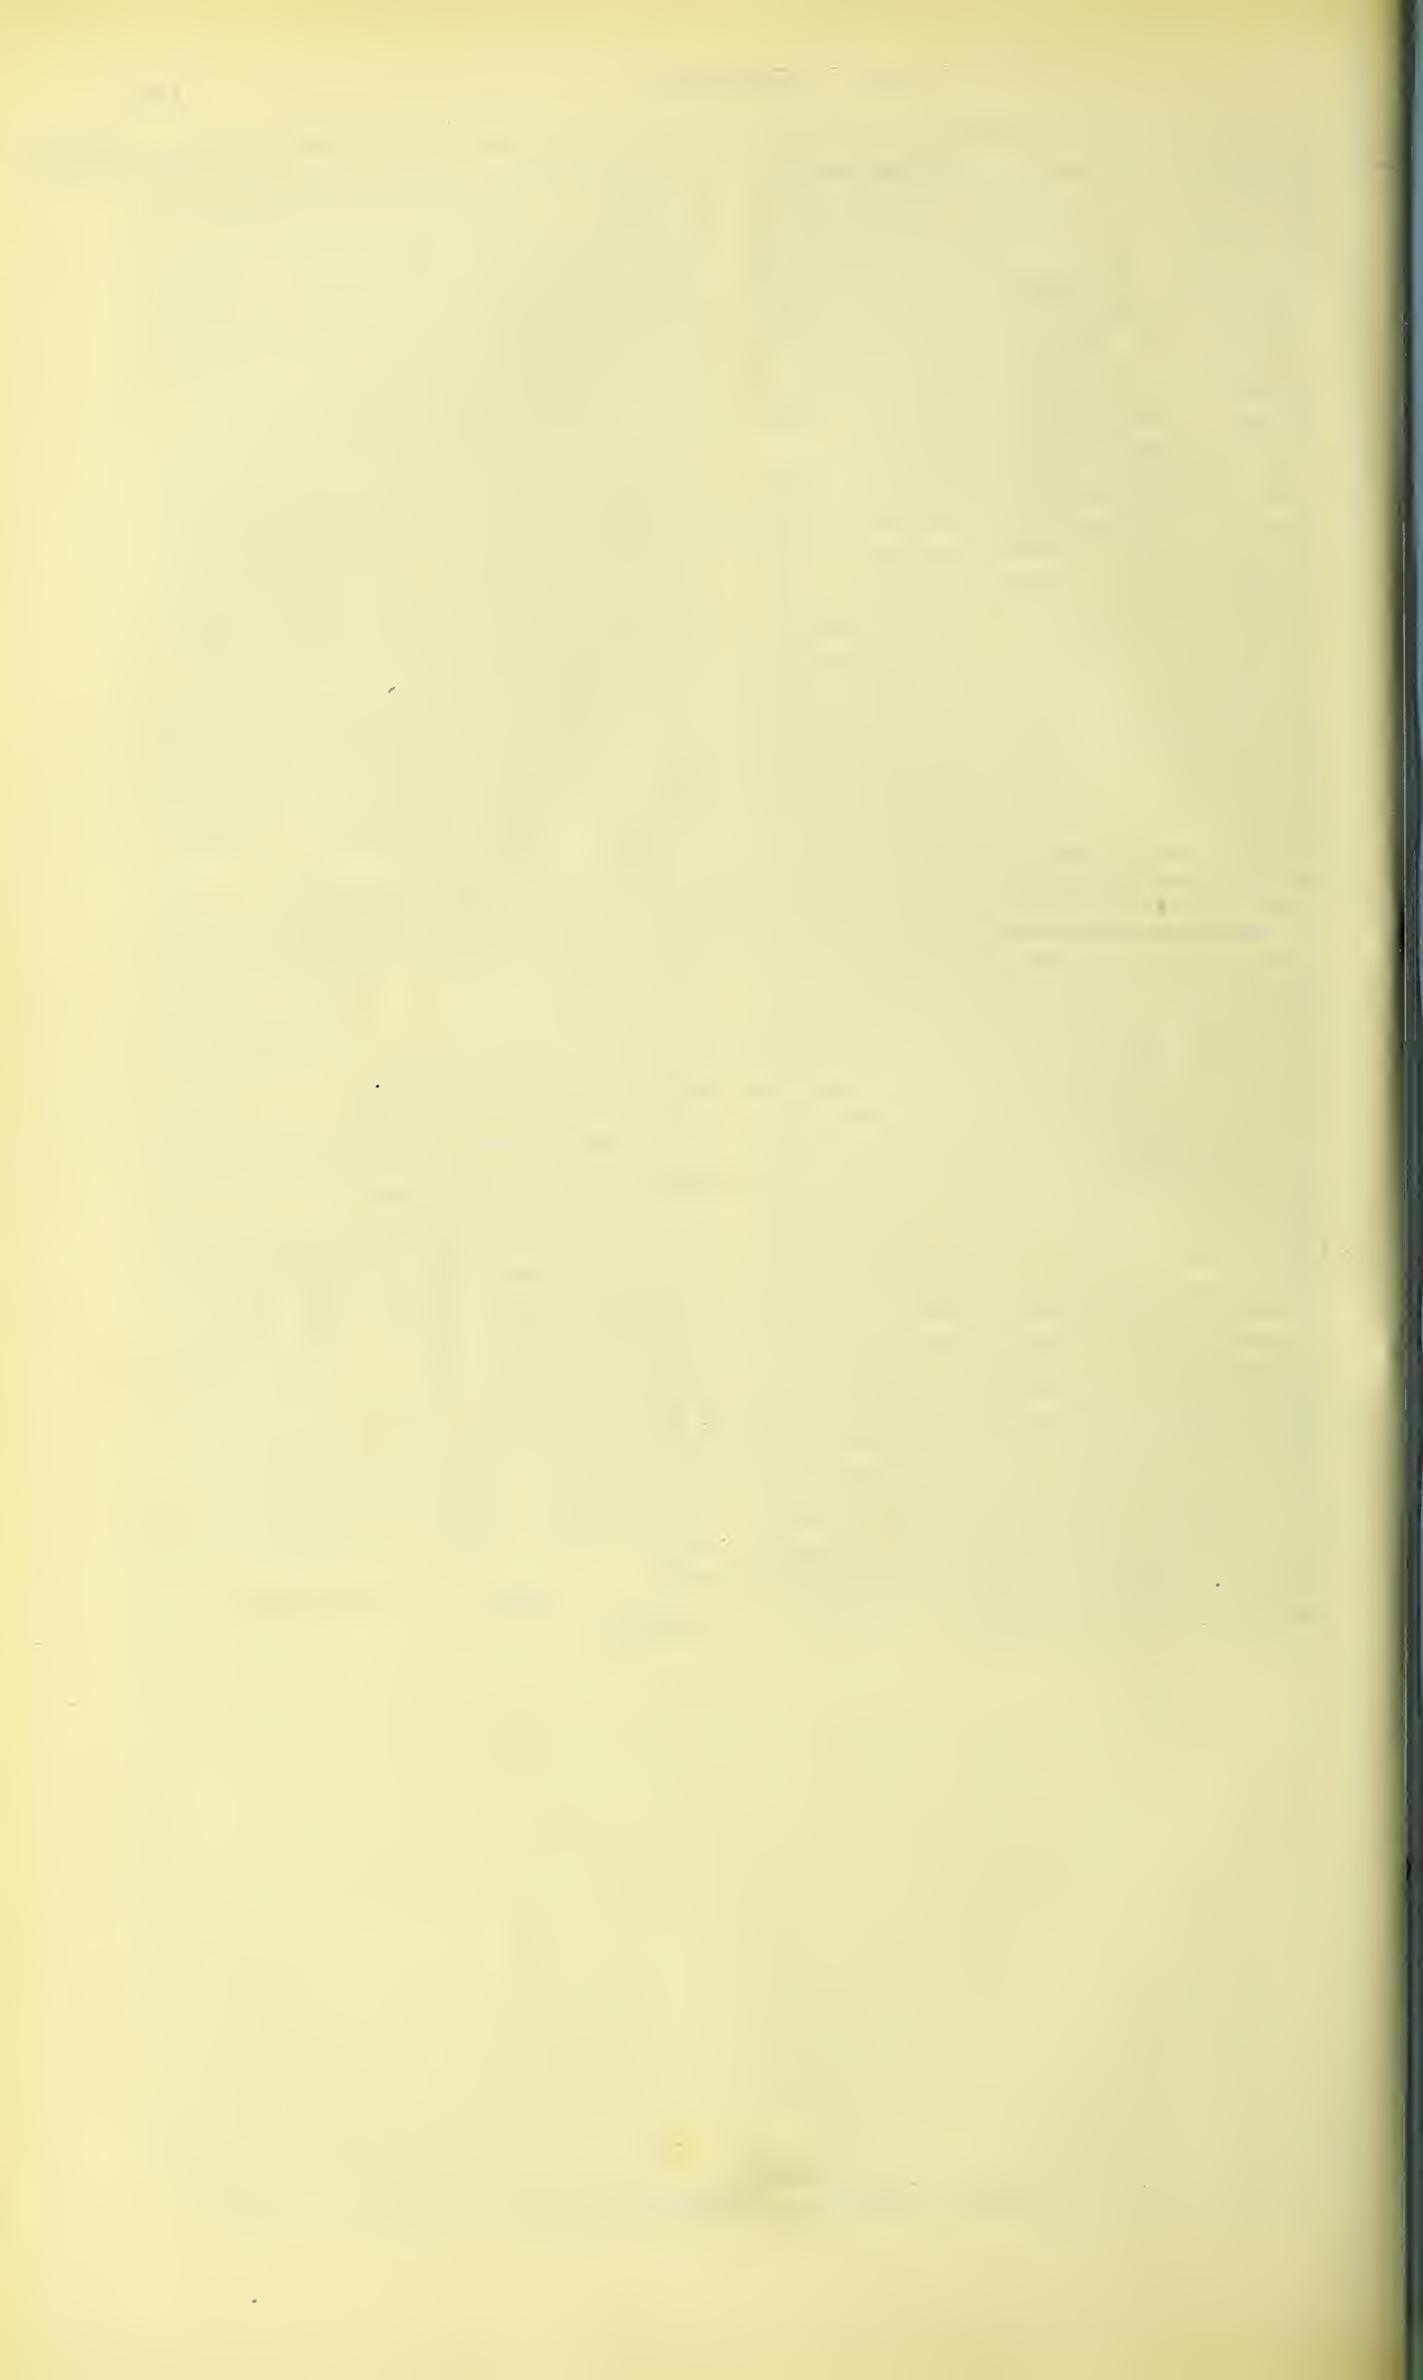

It is by no means inconceivable that the average height of persons entering or reaching the upper ranks of life may be somewhat greater than the average height of those remaining or dropping within the lower ranks. The battle is still to the strong. And the extensive observations of the Anthropometric Committee of the British Association show that, on an average, the tall live longer than the short, and are presumably the stronger and healthier.

These remarks are intended only to show that in Aberdeen the children of the poorer and working classes generally are probably not suffering greatly in physique from insufficient feeding.

As to the remaining measurements given in the tables, it may be said generally that they showed somewhat similar differences to those already remarked for height and weight. The balance of advantage rested most frequently with the children from the larger houses, but it was often very slight, when allowance is made for difference in height. In the case of the boys, on an average of all the ages, after such allowance, the advantage belonged, perhaps, to those from three-roomed houses rather than to those from larger houses. This is true of all the measurements except the grasping power of the hand. In the case of the girls, on an average of all the ages, the three groups were very nearly alike, when allowance is made for difference in height.

(Signed) MATTHEW HAY.

ABERDEEN.

CONTENTS OF VOLUME I.

REPORT AND APPENDIX.

MEMBERS OF THE COMMISSION.

THE RIGHT HONOURABLE THE EARL OF MANSFIELD (*Chairman*).

THE HONOURABLE THOMAS COCHRANE, M.P.

SIR THOMAS GLEN COATS, BART.

SIR HENRY CRAIK, K.C.B.

MR M. HUGH SHAW STEWART, M.P.

MR J. CARFRAE ALSTON.

MR JOHN B. FERGUSON.

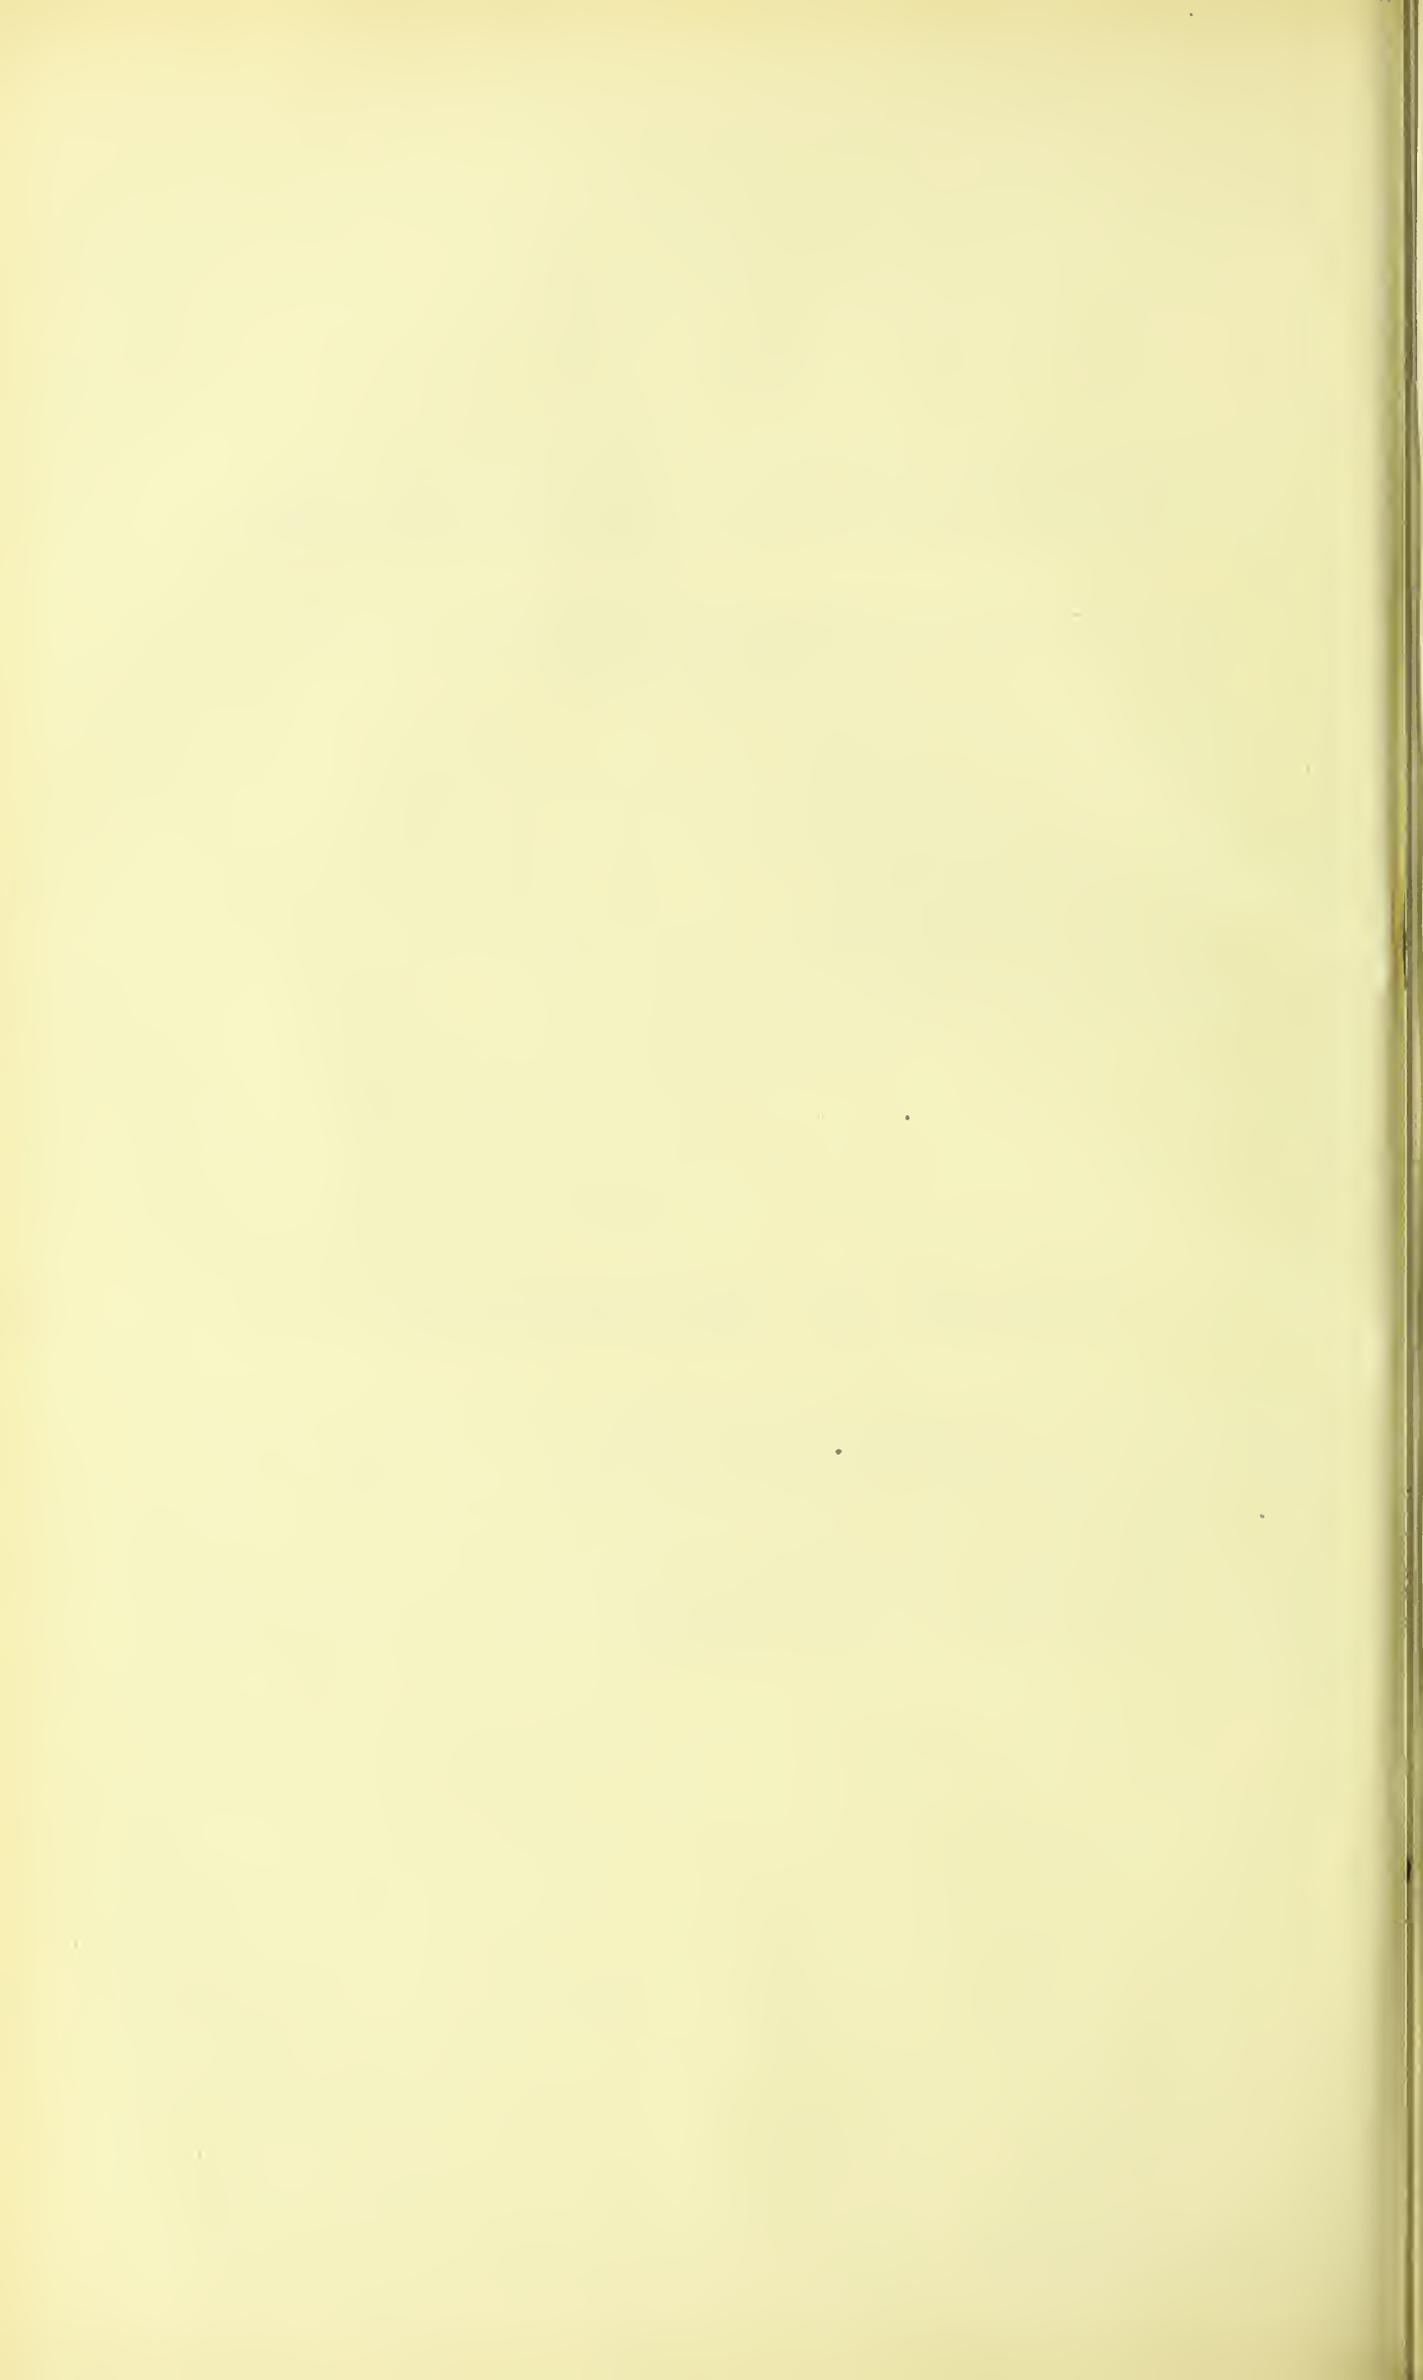

MR GEORGE M^cCRAE, M.P.

PROFESSOR ALEX. OGSTON, M.D., C.M.

MR R. B. PEARSON, Advocate, *Secretary*.

TERMS OF REFERENCE.

To enquire into the opportunities for physical training now available in the State-aided schools and other educational institutions of Scotland; and to suggest means by which such training may be made to conduce to the welfare of the pupils; and, further, how such opportunities may be increased by Continuation Classes and otherwise, so as to develop, in their practical application to the requirements of life, the faculties of those who have left the day schools, and thus to contribute towards the sources of national strength.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

ON

PHYSICAL TRAINING (SCOTLAND).

FIRST DAY.

Tuesday, 29th April 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Barr.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSON.

Mr GEORGE M^cCRAE, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr JOHN STRUTHERS, M.A., examined.

1. *By the Chairman.*—You are Mr John Struthers?
—Yes.

2. And what is your official position?—Assistant Secretary of the Scotch Education Department.

3. How long have you been so?—About three years, I think.

4. And before that?—Before that, Inspector from 1886.

5. In Scotland?—In Scotland; in various districts of Scotland—Aberdeen, Edinburgh, and Perth.

6. And therefore have as considerable a knowledge of all matters regarding schools in Scotland, I suppose, as any one?—Well, it is scarcely for me to say, but still I may say I have considerable knowledge.

7. You have been kind enough to send us a printed form. Have you got a copy of it?—Yes.

8. Well, I think it would be for the convenience of the Commission if you would proceed to go through that, please?

1.—The earliest reference to drill in the Code is to be found in Article 24 of the Code of 1873, which, under certain conditions, permitted time spent in drill to be reckoned as part of the school attendance for which grant might be claimed.

This provision was taken advantage of to some extent, and the number of schools in which military drill was taken increased gradually from 38 in 1874 to 495 in 1895.

The Code of 1895 enacted that the inclusion in this curriculum of drill or some other form of physical exercises should be a condition of the higher grant for discipline. That is to say, that a certain item of the grant, which might be either 1s. or 1s. 6d. on the average attendance, was paid at the higher rate only when some provision was made in the ordinary course of instruction for physical exercises in some systematic form.

As a consequence, the number of schools taking military drill leaped in the following year from 495 to 848. These figures by no means represent the full extent to which physical exercise, in some systematic form, is included in the curriculum of the schools. The Department's statistics take account only of military drill, but the Inspectors' reports for many years previous make frequent reference to the prevalence of other forms of systematic physical exercise.

In this, as in many other developments of school work, the zeal and devotion of women teachers pointed the way, and long prior to 1895, what is called musical

drill or infant school drill (excellent both as a means of discipline and of recreation) had become established as part of the regular routine of every well-conducted infant school, and from the infant schools gradually spread upwards.

In 1899 the Department undertook a considerable reconstruction of the Code, and it is substantially under the Code as then reconstructed that the work is at present being conducted. The article of the Code (Article 19, A. 4 (a)) which relates to drill, is as follows (I have sent round a copy of the Code to each member):—'Grants are made to schools upon certain conditions, *inter alia*, that the scheme of work of the school provides for adequate physical exercise according to an approved system. In the senior division this exercise may take the form of military drill.' That article is reinforced by Article 19, B. 2, which makes the provision of satisfactory arrangements for physical exercises or military drill a condition of the differential grant which may be allowed for general efficiency. That is to say, the school may get 6d. more than what is usually allowed, for good work, but in order to get that extra 6d. it must include drill in its curriculum. The importance of physical exercises in the estimation of the Department, and more particularly of military drill for the older boys, was further emphasized by Circular 279, of date 3rd February 1900. The effect of these measures is shown by the rise in the number of schools taking military drill from 848 in 1896 and 884 in 1899 to 1025 in 1901. That is the latest information that we have.

As already said, these statistics of military drill are only an imperfect indication of the extent to which physical instruction of a more or less systematic kind is given in the schools of Scotland. The Code requires that some provision for this kind of instruction shall be made in all schools which receive grants, and included in the series of questions as to the efficiency of the school, which the Inspector must answer before a grant is paid, is the following:—'Is adequate provision made for instruction in physical exercises (Article 19, A. 4 (a))?' Should the answer to this question be in the negative, the grant would be suspended till a special inquiry had been made, but I am informed that such cases rarely occur. The fact that about 75 per cent. of the Inspectors' reports make specific reference to drill, either by way of praise or blame, tends to show that the subject is not overlooked by them.

The present position, then, is this:—The Education (Scotland) Act of 1901 requires attendance at school in all but exceptional cases till the age of fourteen; the Code requires that the curriculum of every school shall make due provision for physical exercises; and the Inspectors' reports show that almost without exception an endeavour is being made to fulfil this condition to the extent to which circumstances for the present permit. No doubt the value of the instruction given varies indefinitely. Not much is to be expected from a teacher who has grown old in the service, and whose opportunities for keeping himself abreast of the requirements of later days are few or non-existent. It is greatly to their credit that the attempt in so many cases should have been made at all. But, fortunately, in the large towns, where instruction of this sort is of most importance, and, indeed, in every centre of population of even moderate size, there is a sufficient supply of younger teachers, to say nothing of special instructors, to enable this side of school work to be carried to any degree of perfection that may be required, or that the reasonable claims of other objects admit of. Much has been done already. Much more, doubtless, remains to be done. What is wanted with a view to further progress is a clear conception of what is aimed at, and a careful consideration of the means by which the end is to be attained.

Before we go much further I think we must have something like a scientific investigation of the multifarious systems of drill in vogue, with a view to determining their actual effect on the physique of children, and establishing, if possible, criteria of merit. Some systems are in origin systems for adults, broken

down, as it were, for children, and one would like to have greater assurance that the essential differences between the adult and the child, between boy and girl, and between the boy of nine and the boy of thirteen or fourteen, have been sufficiently considered. Others, again, have grown up within the school, and have proved of unquestionable value as disciplinary agents for securing attention, obedience, alertness, and precision; but though there is often much parade of physiological learning, there is a conspicuous absence of ascertained fact as to the effect on the growth and development of the children. Has the hour or two a week of school drill any effect whatever upon the physique, comparable to that produced in a well-fed healthy child by its many hours of play, by its walking and running to and from school, its contests in child's sports, and the help it gives in house or farm work? The answer is probably in the affirmative, but it might be as well to have that opinion supported by the positive evidence of statistics as to weight and height for age, and other signs of physical efficiency, as determined by competent observers with a medical training. An analogous question which presses for consideration is that of the relative value of games (I am thinking of the case of the older boys) as compared with school drill. It is at least significant that nations which were long before us in the field of physical education are beginning to have doubts on this point. Both in Germany and Sweden there is at present a very marked tendency to discard formal gymnastics in favour of games, and vigorous endeavours are being made in both countries to naturalise the traditional games of the English public schools. It may be that in secondary schools this branch of education has been overdone; it is quite certain, I think, that in elementary schools it has not been sufficiently developed. Q. By that do you mean in the secondary schools in Scotland? A. Generally; I was thinking of both England and Scotland in referring to these games. Q. But not thinking of abroad? A. Not thinking of abroad,—no. Interesting experiments in this direction have been made in London, Birmingham, Leeds, and other large towns of England (you will find an account of these in Vol. II. of the Special Reports issued by the Board of Education), while I can testify from personal experience to the beneficial results accruing from the football competitions between the Board Schools in Edinburgh introduced during my time as Inspector there. Then, again, the mere mention in this connection of the well-fed healthy child suggests that in considering how best to enhance the national strength, the question of physical exercise for the child may after all be quite a subordinate one. These are the kinds of questions on which it behoves the Department to obtain some light before it proceeds much further in the matter of regulating physical exercise in schools, and in resolving which this Commission may do invaluable service. The sort of points on which inquiries of this kind are meant to throw light are these: What is the proper amount of drill which ought to be given in the school? what time should be given to it? Secondly, Is it desirable to have anything like a uniform system of drill, or is it desirable to allow a considerable freedom of choice as to the form of drill that is to be adopted? That, of course, is a very important matter. Now, that is all that I have got to say about the drill in the elementary schools up to the age of fourteen.

II. Coming now to another portion of the subject, the following is a resumé of the information in the possession of the Department as to the opportunities now existing for physical training for children over fourteen, whether in schools under the Code, in secondary schools, or in other ways.

There are found in schools under the Code approximately 21,000 pupils over fourteen years of age, of whom it is estimated that some 10,000 are boys, and in secondary schools under the inspection of the Department 9700, of whom 5730 are boys.

The regulations for physical exercises for children over fourteen in schools under the Code are those

Scientific enquiry now necessary: problems to be solved.

already cited. It is a question for consideration whether the usual exercises for the older boys, say those over thirteen, are sufficiently differentiated from those for girls and for the younger children; whether greater use might not be made of games; and whether special exercises, such as shooting, the practice of extended order drill, judging distances, finding the way to a given point from a map, making rough maps of the neighbourhood, etc., might not be introduced with advantage. Exercises such as these have the advantage that, while involving active open-air exercise, they tend in a much higher degree to the development of individual intelligence than any system of routine drill. They, moreover, awaken fresh interest in the pupil, who may be already surfeited by years of squad drill. Article 24 of the Code was specially designed to give facilities for out-door instruction of this kind. It provides that—

‘Attendance of scholars at military drill or swimming lessons, under a competent instructor, or at any other form of instruction provided for in the time-table and approved by the Inspector as being of the nature of, or contributing to the efficiency of, the instruction under Article 19, A. 4, 5, 6, and 7, may be counted as school attendance for such number of hours as is shown in the time-table approved by the Inspector.

‘Should it be desired to count as school attendance, attendance at special lessons occurring irregularly, and not provided for in the time-table, due notice of the time and place of such lessons shall be given to the Inspector, and his approval obtained. Sanction under this Article for visits to museums, or any form of out-door lessons, will not, as a rule, be given, except in the case of military drill, for more than eighteen scholars at a time, under the charge of one teacher.’

The higher class schools are not subject to regulations of the Department, and precise information as to their provision for physical education is not available. They are, however, as a rule, provided with gymnasias, and it is, I think, matter of common knowledge that physical exercise in the shape of games is by no means neglected. It is possible that some of the interest and energy at present devoted to games might profitably be diverted to systematic drill and to exercises of the kind that I have already alluded to, and this is doubtless a point to which the Commission will direct its inquiries.

III. The population of Scotland between the ages of fourteen and eighteen, as estimated from the census of 1891, is in round numbers 379,000, being 193,000 boys and 186,000 girls. Of this number 21,000 are accounted for above as being still in attendance at schools under the Code, and 10,000 as pupils of secondary schools under the inspection of the Department. Allowing for the very small number in attendance at private secondary schools, it may be safely estimated that there are, broadly speaking, not less than 340,000 between the ages of fourteen and eighteen who are not in attendance at any day school, of whom something over a half are boys. The only State provision for the further instruction of such pupils is that of the Continuation Class Code. Articles 38-42 of that Code offer grants on certain conditions for instruction in physical exercises and military drill. The first session of work under the Continuation Class Code has just concluded, but very few claims of grant have been received yet, and it will not be possible for some time to give anything like a complete view of the work done. Sixty-one classes, however, with an expected attendance of 2541, made application for recognition under this section of the Code. This number includes some Boys' Brigade classes which made application for recognition, but doubtless there are other classes for physical instruction (probably few), conducted by philanthropic or church associations which, for one reason or another, cannot yet come under the Continuation Class Code. Making ample allowance for such cases, it is scarcely doubtful that the number of pupils between the ages specified who are receiving systematic

physical instruction outside of the regular schools does not exceed 3500.

As the classes in this Division I. are merely a substitute for attendance at the day school, there seems no reason why drill should not be made obligatory on them, though this has not yet been done.

The number in attendance at the Continuation Classes of all kinds for the present year has not yet been ascertained; and owing to the fact that the statistics of the corresponding classes in previous years have been kept under three separate heads, viz., Evening Continuation Classes, Science Classes, and Art Classes, the same pupils very frequently appearing under more than one head, it is impossible at present to make any accurate forecast. My deduction, however, from a consideration of the statistics for previous years, is that the number of pupils between fourteen and eighteen who are receiving any form of systematic instruction outside the regular day schools does not exceed 70,000. We have therefore probably somewhere about 270,000 pupils, of whom something over half are boys, at the age at which continuation instruction, and particularly systematic physical instruction, would be especially valuable, for whom such instruction is either not provided, or who are unable or unwilling to take advantage of it. This, to my mind, is the most serious educational problem of the day. It may be that the necessary facilities are not always provided where they might be, but that is a matter which can be easily remedied. Local authorities as a rule are not unwilling to start Continuation Classes where there is any prospect of a reasonable attendance, and the State offers what may be regarded as generous support by bearing three-fourths of the necessary expenditure if only a moderate attendance is secured. What is particularly disheartening is that when the necessary facilities are provided and instruction is offered free, there is apparently so little desire to take advantage of it. It can scarcely be for want of time, for of recent years employment for young people has been regulated, so as to diminish both its length and severity. And there are indications that the unexpended energy finds vent in other and less desirable directions. Hooliganism, a disease incidental to the age in question, seems to be much more rife in this than in continental countries, and Lord Balfour of Burleigh had occasion recently in Circular 347 to draw attention to the large number of convictions for juvenile offences in Scotland. He says, ‘It is impossible to overlook the fact that the large numbers of convictions of juveniles for police offences, as shown by the statistics of recent years, is a reproach to the school system of the country, and no effort must be spared to reduce the number of these offences, as well as to keep in check the disposition to rudeness and lawlessness which stops short of the commission of offences which are taken notice of by the Courts.’ Now, the essential difference between this country and continental countries in this matter is the all-pervading sense of discipline in the latter, which results from universal military service. As a result of military discipline, a public opinion has been created which will not tolerate the inconsiderate and irresponsible behaviour which passes without remark on the part of the British youth. The youth is made at every turn to realise his obligation to the State, and the necessity incumbent upon him to expend his energy in useful directions. With us he is too frequently left to consult his own interests and pleasures, unchecked by even a semblance of parental control, and that at an age when he is incapable of forming an opinion as to what his true interests are.

Now, I do not propose to say anything, one way or the other, as to compulsory military service; I do not even suggest that continuation instruction in the ordinary sense should be made obligatory, as it is in Saxony and several of the cantons of Switzerland; but it is, I think, worth consideration whether youths between fourteen and eighteen, who have left school, should not still be under obligation, to continue the physical training they have already received in schools, and to add to it certain exercises calculated to develop individual judgment, responsibility, and power of

initiative. I think it probable that in this way considerable improvement in the physique, morale, and intelligence of the nation might be expected to result from a comparatively slight sacrifice of the leisure which is not always at present too well employed. The exact manner in which a scheme of this kind should be carried out would require careful consideration. Regard would require to be had to the different conditions of employment, and to the very wide differences as between town and country in the facilities for bringing youths together. I am satisfied, however, that it should be regarded as primarily an educational question. What is wanted is a means of continuing in some measure the discipline and the influence of organised opinion to which the youth would have been subjected had he remained at school, and of gradually accustoming him to exercise, under guidance, that power of independent action and liberty of judgment with which he will be fully entrusted when he reaches years of discretion.

Youths who remain at school after fourteen would of course be exempted from this obligation, provided the curriculum of the school makes satisfactory provision for physical training, and I think that some reduction in the period of obligation or in the amount of yearly requirement might be allowed in consideration of satisfactory work in Continuation Classes.

IV. The Training Colleges have, I believe, for a long time past made some provision in most cases for the instruction of the male students in drill. As a consequence, a large number of teachers throughout the country are qualified in some degree to give instruction in drill in their schools. In addition, very many teachers are members of local Volunteer corps, but the Department possesses no statistics on this point. Up till 1901, however, drill, though generally taken, was no necessary part of the Training College curriculum; it was not included in the Department's scheme of examination; and was regarded more or less as an extra or voluntary subject, to be taken as the exigencies of other subjects allowed.

In 1901 the Department undertook (in Circular 329) a reconstruction of the Training College curriculum, and made drill and physical exercises a necessary part of the curriculum. It stands indeed first in the list of subjects, and reasonable proficiency will in ordinary cases be expected as a condition of the issue of a certificate.

The Colleges have been asked to submit proposals for the instruction of their students in this as in other subjects, and the nature of these proposals will be gathered from some of the syllabuses which I have here. In three of the Colleges the students are attached to local Volunteer battalions, and are exercised in all the regular work of the corps to which they are attached, including in at least one case (Edinburgh E.C. College) attendance at the summer exercise camps.

Perhaps if I read an extract from the syllabus sent up from that College, it would give an idea of the kind of thing they propose. In the Edinburgh College they have two courses, one for physical exercises and another more particularly for military drill:

'The students will, in addition, be expected to take part in the summer drills and training ordered by the Officer Commanding the 4th Volunteer Battalion the Royal Scots, to which they are at present attached.

'MILITARY DRILL.—Under this head the students will be exercised in all the movements necessary under the Volunteer regulations to qualify for the efficiency grant.

'In addition, opportunities will be offered to all the students, either during their course of training at the College or at the close thereof, of passing for the Sergeants' Proficiency Examination.'

10. *By Sir Henry Craik.*—That is the Church of Scotland College?—The Church of Scotland College at Edinburgh. The students of the Glasgow Church of Scotland College are also attached to a Volunteer corps; and those of the Free Church in Glasgow. Three colleges, as part of the regular instruction on this subject, ask or compel their students to join a corps of Volunteers.

11. *By Mr Alston.*—Are these the Normal Colleges?—The Normal Colleges.

12. The Normal Colleges, not the Theological?—Oh, no.

13. *By Sir Henry Craik.*—That means three out of four?—Three out of nine.

14. Yes, but of four that are male?—Yes.

15. Three out of four that have male students?—Three out of six; two in Glasgow, two in Edinburgh, and two in Aberdeen.

16. But there are very few males in Aberdeen?—A comparatively small number.

17. Chiefly females?—Chiefly, yes.

18. There would not be enough to form a Volunteer corps or anything of that sort of the males in Aberdeen?—Not by themselves, but they might be attached to a Volunteer corps in the district.

The syllabuses of work for the present session are provisional only. It is proposed to have an inspection of all the Colleges this summer by Captain Armytage, Superintendent of Military Gymnasia in Scotland, with a view to arriving at an understanding as to the kind of curriculum in this subject which may ultimately be accepted.

There is every reason, therefore, to expect that in time there will be an abundant supply of teachers well qualified to conduct physical training in their schools, and meantime the Department is endeavouring by classes conducted under Article 91 (d) of the Code, to give an opportunity to existing teachers throughout the country to qualify themselves in some measure for giving instruction of this kind.

Attendance at these classes, whether for physical exercises or for other subjects, is, and I think must be, entirely voluntary, but the willingness displayed by teachers to make considerable sacrifices, both of time and energy, with a view to enhancing their professional efficiency is very encouraging.

These classes were first started in 1900, and up to the present, ten courses for drill, attended by 479 teachers, have been held in various parts of the country. So far, these courses have been somewhat of the nature of an experiment, and vary greatly both as to the number of lessons given and the syllabus of instruction followed. These classes have been chiefly for military drill, but we take any programme of instruction, either of physical exercises or of military drill if it is reasonable.

Steps are being taken, as in the Training Colleges, to arrive at a more definite understanding as to the nature and amount of work that should be accepted as satisfactory.

In addition to the ordinary class teachers, there is probably room, as in the case of cookery and allied subjects, for a considerable employment of professional teachers of drill. These are, indeed, already employed in considerable numbers in the larger centres of population; and if any attempt is to be made to take in hand the physical training of youths between fourteen and eighteen, there will be a still further demand for their services. It is probably desirable, therefore, that steps should be taken, as has already been done in the case of special teachers of cookery, to formulate the kind and duration of training that should be required for recognition as special professional teachers of drill and allied subjects. In Sweden great importance is attached to the training of specialist teachers of drill, and in the Royal Gymnasium at Stockholm the course of training is long and comprehensive, extending over, I believe, three years. The only attempt with which I am acquainted to supply such a training in Scotland is made in the Physical Training College, Aberdeen, conducted by Lieutenant-Colonel Cruden, and the Commission may wish to make further inquiries as to this institution. In saying that, I ought to say that there may be others, but this is the one of which I know.

19. *By the Hon. Thomas Cochrane.*—Have you any reports from the Inspectors as to the results of this physical drill that has grown up since 1873?—We have reports from each school, which deal with the whole

work of that school. Sometimes these reports make reference to drill and sometimes they do not, but, of course, they are not published. They are merely in the portfolio of the school, in the office. A copy is sent down to the school managers.

20. Do they give a general impression, from the Inspector's point of view, as to whether the physical appearance of the children has improved since this system of drill has been in operation?—Frequently they remark on the improved appearance of a school when drill has been introduced, but, naturally, after it has become part of the regular work of the school, the difference in the physique is not so obvious, and they do not draw attention to it.

21. And, in the course of their duties, do they give any impression as to the manners of the children, whether they have improved where the drill was well carried out. You have put manners here; in one paragraph, I think, you draw some attention to that?—Yes. Well, of course, these reports deal with individual schools, and they frequently comment, as I have seen, on the improvement in the order and the general behaviour of the children in this particular school, which has been taken as the result of the introduction of drill, but I am not able to refer you to any general remarks applicable to the whole country that have been made by them.

22. Possibly we shall get that from the inspectors?—I think so.

23. Probably they will be able to give us their general impression as to whether the schools have benefited by this system of drill?—No doubt it can only be had from the Inspectors directly at present. We could, of course, obtain a report from each of the Inspectors, stating his opinions upon all these points, but I should think it would be better to ascertain it from such Inspectors as you think proper to call.

24. I see you mention here, 'Others, again, have grown up within the school, and have proved of unquestionable value as disciplinary agents for securing attention, obedience, alertness, and precision; but though there is often much made of physiological learning, there is a conspicuous absence of ascertained fact as to the effect on the growth and development of the children'?—Yes.

25. That is the point I rather wanted to know—how we shall get evidence as to that from the general point of view also of the Inspectors, and some particular evidence perhaps by a medical gentleman who would be qualified to speak?—Yes. What I suggest is, that we want something more than general impression; we want detailed statistics as to that, the children regularly measured and weighed, tested for various signs of physical growth and physical efficiency, and a definite record kept. Most people are satisfied that, in a general way, drill is beneficial, but exactly as to how it is beneficial, or to what extent it is beneficial—I am speaking as to the physical development—it is very hard to say. Drill in the schools has two objects. One is to use it as a disciplinary agent, to make the children more alert, more obedient, to have a better command of themselves. That, I think, can be achieved by almost any of the systems of drill that are used in the schools. At present it is much more a question of the teacher than of the particular system of drill; but the other point, whether any of those systems of drill have a distinct and definite effect on physical development, is, I think, a point on which we want definite information.

26. These statistics are not kept, I think, at present?—They are not kept.

27. That is what I wanted to get at. Generally we all judge that drill gives a certain mental and physical alacrity which is a general advantage, but we do not know quite why?—Yes.

28. Then you draw some attention to the fact that it would be desirable that there should be a difference of training between the girls and the boys?—Yes.

29. Should you think exercises good for boys would not be so interesting for girls?—Yes.

30. They do not so much care about the actual

drill?—I do not wish to express a decided opinion on the point; I merely make the suggestion that this is a matter which deserves inquiry,—whether the same kind of drill is suitable for girls, and what modification should be introduced. As matter of fact the drill in many schools for the older girls is different to that for the boys.

31. What sort of form does it generally take?—Well, a sort of complicated marches and exercise with bar bells, skipping rope exercises; dancing in some cases. These are things that are to be found specially in girls' schools.

32. *By Sir Henry Craik.*—You refer to the Circular 279. That circular has not led to any objections on the part of the School Boards to the idea of military drill?—I am not aware that we have had any complaints.

33. In one paragraph of that circular it is said the main object will best be obtained by the action of School Boards in combination with local associations. The Department would be able, if the School Board saw its way to it, to admit the authorities say of a Boys' Brigade, or of a Cadet Corps?—Yes, I think so. As a matter of fact a certain number of Boys' Brigades do come under the continuation school, and I think that, in some cases, these have a more or less indirect connection with the School Board of the district, though one is not able to say precisely what it is.

34. In some cases they go for other instruction to the Board Schools?—To the Board Schools; to the Continuation Classes under the Board.

35. Has it come under your notice—returning to the top of page 2, on the top of that circular—whether there has been any nautical training, or swimming, or anything of that sort?—In the Edinburgh schools, several of the schools are provided with a school swimming bath, and instruction in swimming is part of the regular work of the school. I think it is possible. In Perth, I believe, there is a provision made for giving to a certain number of the scholars in the Board Schools free tickets for admission to the public baths, and providing instruction for them there in swimming; also offering prizes, I think, for efficiency, and there may be other cases here and there in Scotland, where instruction in swimming is given.

36. Turning, Mr Struthers, to your evidence again, you speak of the comparative value of games as compared with school drill. There is one consideration on which I would like to have your opinion—whether the games may not have a tendency rather to push aside the weaker or less well-developed children, and to give a prominence to the stronger children at their expense, which could be obviated by military drill?—I should always regard the two as supplementary to each other; that is to say, that I do not think that games alone should be the means of providing physical exercise for school children, but that something more than a uniform drill for every scholar is wanted, is rather my point.

37. Sanction is given under Article 24 to visit the museums, and these out-door lessons are not as a rule to be given to more than eighteen scholars at a time, except in the case of military drill?—Except in the case of military drill.

38. That would permit, then, a large number of classes to meet together in such places say as the Queen's Park at Edinburgh, and to be drilled together on a Saturday afternoon?—Yes, certainly.

39. And the time counted as an attendance at a continuation school?—Yes.

40. Under head III. of your evidence you speak of the amount of the grant; that is, of course, three-fourths of the expenditure?—Three-fourths of the total expenditure.

41. And you think that the grant that is permissible under the head of physical drill would amount to three-fourths of the expenditure?—The grant, of course, is regulated by two things: first of all a maximum per attendance in the case of drill; it is 1½d. per hour. 2s. 6d. for twenty hours. 1½d. per hour of attendance for each pupil. They may get that full amount pro-

Circular 279. Military drill: no complaints from School Boards: nautical training or swimming.

Games and drill: comparative values: supplementary to each other.

Grants under Code: amounts available for physical training.

Mr J.
Struthers,
M.A.

29 Apr. '02.

vided it does not exceed three-fourths of the total expenditure; or you can put it the other way, that they will get three-fourths of the total expenditure if they have a sufficient attendance of pupils to earn that amount, at 1½d. per pupil per hour; that is to say, a class of 40 for drill at any one lesson would bring 5s. for that lesson.

42. Then the intention of the Code is that the grants should be so fixed as to coincide very much with the three-fourths of the expenditure?—Certainly.

43. And we presume that the expenses of a class for military drill are so much less than the expenses of another class that this lower grant would amount to three-fourths?—Probably less. Of course, the understanding at present is that these rates of grants are more than sufficient, that as a rule they ought to come to three-fourths of the total expenditure. They might possibly be reduced; they are kept at a higher rate at present in order to allow for some advantage to small places where they can only get a small number of pupils together, but if the rate under Division IV. was not sufficient in ordinary cases to enable the managers to get three-fourths of the total expenditure for a class of drill, then of course it would be for the Department to consider whether that rate should be increased; but we have not sufficient evidence to go on as yet.

44. At the close of the third section of your evidence, you speak of the possibility of requirement of attendance at a Continuation Class being made compulsory?—Yes.

45. Under the Act of 1901, School Boards have power to fix conditions as to granting exemption?—Yes.

46. Do you think, under that Act, that if they let a child away under fourteen from day school attendance, they might attach the condition of carrying on physical instruction?—I think so, but not beyond the age of fourteen.

51. You speak of those classes in Article 91 (d). In these classes I think the male and female teachers are very often joined together?—They are often joined together. Yes; but these classes so far are, as I have said, purely experimental. Further regulations may require to be made.

52. And possibly separating the classes?—Yes.

53. By Sir Thomas Glen Coats.—You do not make any mention, I think, of gymnasia in connection with Board Schools?—No.

54. Have you any knowledge of the gymnasia being erected in connection with the Board Schools?—Yes. I think most of the large boards have gymnasia in some form or another, either a separate gymnasium attached to the school, or they have apparatus for drill in the infant room, which is generally a large room. The desks are cleared out, and the apparatus is there for gymnastic exercises.

55. At special hours?—At special hours.

56. Are special school hours devoted to training?—In the Edinburgh schools the regular system is to have gymnastic apparatus in the infant room, which may be used after the infants are dismissed. They are dismissed earlier than the rest of the school, and the instruction in gymnastics is given in the infants room from 3.30 to 4 o'clock or 4.30, after the infant children are gone.

57. In the school hours?—Yes.

58. Then is it your opinion that this physical drill or physical development cannot be carried on with advantage during the school hours; that is, a portion of the time now devoted to other education should be devoted to this, as to a considerable portion of time?—Well, I think that a certain amount of physical exercise should be given per week. Whether that should be in addition to the time that is already given to other subjects or taken from it, is a matter to be determined. The essential point is that it should be given.

59. In the continuation classes, more particularly with regard to technical education, do you consider there would be time for, say, apprentices who are employed in engineering shops during the day, and attending these other classes in the evening, that they

would have time for physical training beyond what they give to the educational work?—Well, there is the Saturday afternoon, which they devote to exercise probably in many cases of some form already, and I would suggest that some portion of that time—not every Saturday, and not the whole of it—but some portion of that time should be given to systematised exercise or drill. Then, while it is true that some lads, apprentices who are attending technical classes in the evening, are so fully occupied with that work that they could not spare time for drill in the evenings, that is only true of a very small number. The great majority of apprentices are either not attending a technical class at all, or if they are attending them, they are attending them for one or two hours a week.

60. By Mr Shaw Stewart.—Have you any suggestions as to how games could be better organised?—Do you speak of Board Schools?

61. In Board Schools?—In Board Schools. Well, I think that you have got the suggestion already made in such associations as already exist in the Edinburgh Board Schools, for the encouragement of football, and in school competitions.

62. Do you see how the teachers could do more towards systematising these games?—I should not have too much of system. It is a matter which must be left very much to voluntary action on the part of the teachers, and to the goodwill of the children, and, as a matter of fact, in Edinburgh and in many other towns, it is the teachers who have promoted these associations for games, and who have devoted considerable time and trouble to coaching the boys and superintending and deciding as to what boys are to take part.

63. Then, as far as improving the organisation of games in Board Schools goes, that would depend upon the individual aptitude of the teacher?—To a large extent I think. Of course, I think that possibly something might be done to allow a larger number of children to take part in games. At present the school playground does not afford opportunity for a real game. They must have a field, or go to a public park. That is too far away from the school to be done every day, and on Saturdays the park is probably too much crowded to allow of anything but small sections from each school to play. Whether it is possible, I do not know; it is, at all events, a matter worth considering whether an arrangement might not be made by which different schools in the town had an afternoon in which the children of a certain group of schools were free on a certain afternoon, so that they might use the public parks, the recreation grounds, freely on that afternoon, while another set of schools took it on another afternoon. Then of course the question would have to be considered whether that ought not to be compensated for by an extra half-day attendance at school on Saturday.

64. Have you any suggestions to make as to how the system of gymnastics which is now in vogue could be improved?—You mean gymnastics as distinguished from drill?

65. No; perhaps I should say gymnastics and drill. Do you think that the time that is devoted to them is sufficient?—Gymnastics and drill together?

66. Gymnastics and drill together?—Well, I think that is one of the points upon which we want light. It depends upon what you want to achieve by your system of gymnastics and drill. If one is thinking only of cultivating habits of order and obedience and alertness, well, I think one gets very good results from a comparatively short time. A quarter of an hour a day, even a single lesson of an hour a week, has a very good result in that way, but if you are looking for something else, for a distinct improvement in the physique of the children, that may require a long time to be devoted to gymnastics and drill; but before the Department takes steps to make a longer time imperative, we must know what the actual result of this kind of instruction is on the development of the children. We must have absolute figures to show.

67. By Mr Alston.—You speak of drill, Mr Struthers. What do you mean by drill; do you distinguish between

Mr J.
Struthers,
M.A.

29 Apr. '02.

some portion of time on Saturday afternoons to systematic exercise or drill.

Games: not desirable to systematise them: must be left to voluntary action of teachers and children.

Playgrounds at present unsuitable: suggestions for improvement.

Gymnastics and drill: length of time to be allotted.

Gymnasia in connection with the Board Schools: special school hours devoted to training. Certain amount of physical exercise per week essential.

Continuation classes: great majority of apprentices able to give

physical exercises and drill?—Yes. Well, I think I can best answer by referring you to many of the manuals of drill and physical exercises which are to be found in use in schools such as I have here. Here is the 'Model Course of Physical Training for the use of Upper Departments of Public Elementary Schools' issued by the Board of Education. Well, that is called the Model Course of Physical Training, but a large part of it is what most people would call drill; that is to say, it has a certain semblance to military drill,—learning forming fours, marching, changing ranks, and so on.

68. Which either girls or boys could do?—Which either girls or boys could do.

69. Then, is this a model of what the training should be? That is to say, they must all do the same thing in the same way?—Well, I do not know whether that is published; whether it has been authoritatively issued. I suppose the intention would be that physical drill should be the same, but I could quite understand that that is not meant to be obligatory. They only publish that as a means of suggesting to teachers a course which they might follow, which they would then accept as thoroughly satisfactory, but I do not think it is the intention of the Board of Education in England to make that course compulsory, and to say that no other course should be followed, and personally I should be rather against trying to make any one course compulsory.

70. *By Sir Henry Craik.*—This is a model course, not compulsory?—The very name 'model' means that it is not.

71. *By Mr Alston.*—When the War Office issues a Red Book, they warn you most seriously against departing in any way from it?—Yes.

72. Now, suppose this physical exercise were introduced to the full extent, would it not be desirable that we should have a regular course, an authorised course, and all teachers should be instructed to conform to that?—Well, I think there is no question of the advantage, or rather the necessity, of uniformity for military purposes, but what we are dealing with is the drill or exercise for children under fourteen. Now, there is a big interval between fourteen and the time in which they could possibly be engaged in military operations. I think that uniform drill is wanted between fourteen and eighteen, if we ever do get powers of compulsory drill.

73. Oh, I was not so far on as that, because, as it is, the medical evidence shows that physical exercise should be conducted upon certain lines. Would it not be well that in any course of instruction the instructors should not be allowed to depart from it, because there are instructors and instructors, and some of them are anything but perfect as teachers of physical drill?—No doubt, but an inquiry might show that certain exercises were bad, and, therefore, ought not to be allowed; but I think the results of any inquiry would probably be that practically no objection would be found from the health point of view, or from the efficiency point of view, to most of the systems of exercise in vogue at the present time, such as are found in these text-books; and when you make one system compulsory, to the exclusion of the others, you stop the efforts of people to think out their own ideas. You get a system stereotyped, and no further progress is made until a revolution is made, and the system is found entirely unsatisfactory, is swept away, and something else is put in its place. Certainly, in other subjects, we have found it advisable to give up the practice of laying down hard and fast curriculums for schools. We would rather ask a school to propose a curriculum. We criticise it, reject it if it is absolutely bad, suggest where it might be improved, but we do not say, 'Here is your curriculum that you must follow,' and I am not sure that we have sufficient ground for taking a particular course in drill.

74. You consider that would be a better way than your laying down what you consider the best method?—I think so.

75. Constructed upon all the information you have got and all you can get?—After all, that perfect system has to be constructed by some particular man

or set of men, who, no doubt, are prejudiced in favour of certain lines of thought; and my experience is that no man is a less fair judge of systems of drill than an instructor who follows one particular system.

76. Apart from physical exercises, then, I think your drill must mean very largely squad drill?—Very largely squad drill. Sometimes it gets the length of company formation.

77. Well, squad drill becomes monotonous; then would it not be possible to introduce company drill?—I think it is introduced in some cases already.

78. We have it in the Boys' Brigade largely?—Yes.

79. I was thinking of their example?—Yes.

80. You also want discipline introduced as well as proficiency in drill?—Certainly.

81. Can you get discipline by mere squad drill under a teacher, who may be a perfect teacher, but who has no control of a military kind, unless he happen to be an individual who has a special power of control?—Well, I should think that the average teacher has pretty effective control over his children, and, on the whole, my experience is that the teacher of the school who takes drill in his school has a very much better control over the children than the drill instructor who comes in from outside.

82. Then the instructors are the school teachers?—The school teachers at present, who take drill in most cases, except in the large towns such as Edinburgh, where they have special instructors, but even there the teachers take part to a certain extent.

83. In Glasgow I think they have outside instructors?—Oh!

84. These teachers, of course, must perfect themselves in this drill, to whatever extent they carry it?—Yes, they ought to know it reasonably well.

85. Well, squad drill might become monotonous after a little; full company drill might be more interesting?—Yes.

86. And even the extended drill, under modern conditions, in which the individual is left more to his own initiative?—Certainly.

87. That might be carried out with boys, might it not?—Yes, but I think more especially after the age of thirteen; any attempt to teach military drill to the extent of company drill below thirteen would be rather a mistake.

88. I quite agree, probably fourteen?—Fourteen.

89. Probably fourteen to eighteen?—There I entirely agree. I should say the only drill that ought to be allowed there is military drill, involving the company as a unit, and involving all the latest extensions of the drill for extended order drill.

90. And for company drill under the proper officers?—Certainly.

91. In order to give the full value to company drill?—Certainly.

92. And I think in that way you would have more chance of getting discipline?—There is no doubt when you are going through a military manoeuvre there is greater sense of being under military discipline than in the mere teaching of exercises or quasi-military movements?—No doubt; at the same time, I just want to say once more that the time for the military drill and military discipline is after the age of fourteen rather than before it.

93. Was it not the case in the Code of two years ago in the evening continuation classes, that the Boys' Brigade companies were able to enter that field and get a grant in a few cases?—They still are, as far as I know.

94. I am afraid not, at least they feel that they are not. May I ask you on that point whether it would not be possible that they should still have the chance of carrying out those requirements that you desire to introduce?—Well I have no doubt if they stated the difficulties they feel by coming under the Code, they would be considered, but I have here a list of 61 schools taking drill under the Continuation School Code, and the very first on the list is in Aberdeen, 7th Company of the Boys' Brigade, with 40 pupils alone.

Mr J. Struthers, M.A.
29 Apr. '02.

Continuation Classes: Boys' Brigade companies able to earn grants.

Mr J.
Struthers,
M.A.

29 Apr. '02.

95. Working under this?—Working under the Continuation Schools Code, and getting a grant.

96. And getting a grant?—Or at any rate it is to be hoped they will.

97. Under what would they get that grant; would you refer me to the article?—Articles, page 11.

98. Well, in clause 39: 'These classes shall be open to all pupils who are free from the obligation to attend school as required by the Education Acts, but—except in circumstances specially admitted by the Department—grants shall be paid on the attendance of those pupils only who are shown to the satisfaction of the Department to be in regular attendance at a class in one of the other divisions for at least one meeting per week.' Is that not felt by the companies to be a difficulty?—No representation has come before me, in the course of ordinary official work, to say that that is so. If they felt a grievance on the point, they have not stated it.

99. Then probably some witness who may appear before us would give us information on this point?—Might I suggest that you may be cognisant of the difficulty they feel; do you know what is the nature of the difficulty they feel?

100. I have not any practical experience, but we can have three or four witnesses in Glasgow who can state exactly their difficulty, because three or four companies tried it under the Code of two years ago and found it very satisfactory?—Yes. Well, of course they require them to be in regular attendance at a class in one of the other divisions for at least one meeting per week; but then observe, 'except in circumstances specially admitted by the Department.'

101. Yes?—Well, if there is any reasonable cause for their not attending another class they have only got to state it, but if there is no particular reason why these children should not attend another class some one evening in the week, on the whole it is better that they should attend.

102. *By Sir Henry Craik.*—And these other classes need not be conducted under the management of the Boys' Brigade?—No.

103. They may be conducted under any other name?—Yes. The Boys' Brigade does not require to provide a class in drawing or in reading for the benefit of the pupils who are taking drill with them; all that they have got to do is to try and induce the boys to attend some classes that are already provided by the Board or other people.

104. That is under Article 40?—Yes.

104a. *By Mr. Alston.*—Suppose they could not attend these classes, does that make an end of it?—No, because the Code says, 'except in circumstances specially admitted by the Department.'

105. So that there might still be conditions under which they could get the grant?—Yes.

106. Then the 2s. 6d.; I presume it reads 2s. 6d. for 20 weeks of attendance by a pupil for one hour a week?—Yes.

107. That is equal to the old 1½d.?—1½d.

108. That seems to me satisfactory if they can get this grant under their own officers. However, we shall hear more of it?—Yes.

109. *By Mr Fergusson.*—Military drill is what you refer to; military drill and physical exercises. Now, might one say that military drill is hardly a physical exercise at all?—Well, there again, I think one has got to have strict regard to the age of the children one is speaking of.

110. I am talking of Board School children?—Up to what age?

111. Up to the age they leave school?—Of course they stay in Board Schools to seventeen and eighteen sometimes.

112. Well, up to the age of fourteen we will say?—Quite. Yes. Well, I should think that up to the age of ten the very elements of military drill, that is to say, forming fours, sizing companies, and so on, especially the marching. The marching at the double is good physical exercise for the children, but at the age of twelve or thirteen or fourteen you probably want something more.

113. Yes, I was suggesting that it was the physical exercise you wanted, and you might leave the drill alone. The drill is a matter of discipline, I suppose, mostly?—Quite, yes.

114. And you get all the discipline in the course of physical exercise?—Well, I think Mr Alston rather put the point that you do not; that there is something to be had from precise military discipline which you cannot get in the looser exercises, in the gymnasium, by the parallel bars, and so on.

115. Taking it from a military point of view, when they are teaching a recruit, when they are putting him through his physical exercise classes, they do not drill him at all. I think I am right in saying that the things are kept quite separate, drill and physical exercise?—Yes; but I certainly agree with what I think is your view, that physical exercise in the Board Schools below the age of thirteen should certainly be much more in the nature of physical exercise—what is understood to be physical exercise—than drill, and that drill should be deferred to a later stage.

116. Well, then, in the last paragraph but one you refer to the question, Is adequate provision made for instructions in physical exercise? and the answers by the Inspectors would seem to show that there is adequate physical instruction in most schools. Now I was certainly rather surprised at that from my knowledge of schools, but may it not be that Inspectors do not look much at drill—I know they are expected to know a great many things.—Yes.

117. But they are not competent to teach drill, are they, or physical exercise?—They could not put a company through its drill, or they could not teach physical exercise?—I should not think that most of them could; certain of them may have been, like myself, members of a Volunteer corps.

118. Do you think they are competent to examine in these subjects?—Yes, as competent as they are to examine in needlework and other things they have to examine in.

119. I would suggest they are not competent, that may be the reason for this statement here, that it is not a subject that Inspectors know much about, and that perhaps some of the older ones are not very much interested in, and the truth is that they do not take much notice of drill?—Yes.

120. Therefore this impression, that there is adequate instruction in physical exercises given in the majority of schools, may not be quite well founded?—Yes, I think that is true to a certain extent, because after all the subject has only recently been made—within the last two years—part of the regular school work which was expected to be found in every school. Then the Inspector in most cases is not an expert in drill, but then, as I say, he is not an expert in a good many things that he is supposed to report on, and I think that is a distinct advantage, because he looks at the various subjects of the curriculum in a common-sense way. After all, there is no mystery about drill; you are able, seeing it day after day and week after week, quite well, without having been drilled yourself, or gone through any lengthy course, to say whether it is being well or ill done or not. Similarly with drawing, and similarly with needlework.

121. Is there not a good deal of mystery in physical exercise? You may practise Sandow's exercises in the wrong way, and a great deal of harm may be done; a great deal depends on the way, so far as the health of the body is concerned; and it wants an expert eye to see when the thing is being done right, and when wrong?—Well, the expert eye in that case is generally only the instructor of the particular system. I suppose that Sandow would say that there would be no competent critic of the way his system should be carried out, except a person who had been trained in it.

122. You do not think you ought to have special inspectors for inspecting drill and physical exercises and gymnastics?—Well, I can only say that if we begin the special inspection of drill and physical exercise, we will have to begin the special inspection of a great many other subjects, with the result that

each of these sets of inspectors will be looking to the special interests of these particular subjects, and the life of the teacher and children will be worried out of them, and all proper balance of subjects will be destroyed. I certainly think we want some assistance to the Inspectors in the inspection of drill and other subjects; that is to say, that a specialist should be employed from time to time to go round a certain district and report through the Inspector, but I think his opinion—the opinion of an expert examiner of a special subject—should always be qualified by that of a man who is taking a general view of the work of the school.

123. In the second column there is a matter upon which I just want to ask you one question. You speak of the well-fed, healthy child?—Yes.

124. Is not that a very important matter?—Extremely important.

125. That the children should be well-fed and healthy?—Yes.

126. But at present, I suppose, one may say there is no supervision in Board Schools as to their health. Health is not considered much, or feeding, or any of these matters?—It is not considered sufficiently. Of course, such questions as ventilation receive their fair amount of attention in Board Schools, and I think that the careful teacher, and, on the whole, the most of them are careful, would make inquiries if they saw a child ill as to what was the matter with him, and to find out whether it was the want of food, and, if so, put him in the way—either go and see the parents and remonstrate with them—or put him in the way of getting help from some charitable institution. But, after all, that is only individual effort, and I do distinctly think there is very much need for some more systematic looking into the conditions of health of these children, including the matter even of feeding.

127. And it would become more necessary if we are doing the work which gives them bodily exercise?—Undoubtedly.

128. Physical training?—Undoubtedly.

129. Then both for their mind and their body it is of great importance to have them well fed and healthy. If you want to put any education into them at all, of any sort?—I think it is much more important than any amount of physical exercise.

130. Have any cases come to the Department's knowledge—any cases where it has been tried to feed the children, or do anything of that sort—have you any information?—Well, of course there are many districts in which voluntary associations provide free meals for children in the winter. In Edinburgh you have such an association, and in many of the other parts of the country, but of course that is not done systematically, and it has had effects as well as good, because if the feeding of the children were inquired into as part of the regular work of the school by an officer appointed for the purpose, let us say, then a parent who was able to feed his child and did not do it, or fed him improperly, would be brought to book. At present the philanthropic agency very often simply relieves the parent of work that he ought to do.

131. If it is free. But why should it be free?—Well, in some cases it will require to be free. I think that a certain discrimination should be exercised.

132. But still, you would be in favour of taking such steps as could reasonably be taken, by giving facilities, especially in the winter time, for seeing after the feeding of the children as far as possible?—I would be in favour of taking any steps that would improve the feeding of the children that were found desirable after a very thorough inquiry into the subject, but I do not think it is a subject in which one ought to improvise opinions. It is a matter which must be very thoroughly inquired into.

133. There is just one other matter in regard to health. Have you considered the question of children in country schools, who come long distances and arrive at school very wet, and sit in wet clothes all day? Do you not think that is rather a serious matter as regards health?—I daresay it is. There, again, I

should think if the children are well fed they can stand a good deal of that sort of exposure without any sort of ill consequences.

134. Then it comes back to the feeding again?—It does, I think.

135. Then as to the games, do you not think there may be some awkward questions raised about teaching children football. Is not the tendency to discourage football now?—As I have said, I think that games are possibly overdone in higher class schools—secondary schools, but I do not think they are sufficiently developed in elementary schools. Of course a game, from its very nature, can never be made part of an obligatory system. The essence of a game is that it must be voluntary, but what is wanted, I think, is the encouragement of voluntary games, especially by the action of the teacher.

136. Then as far as the instructors are concerned who teach the physical exercises or drill in towns, I suppose it is pretty easy to get a qualified instructor, but there are difficulties in the country?—Yes.

137. The Department has not got any system of providing instructors for large areas, where they can take several schools on the same day?—You see the responsibility for providing the instruction rests not with the Department, but with the School Board. We do not directly employ teachers, the School Board employs teachers.

138. But the difficulty that the School Boards have is, that it is a very expensive thing for one school to get an instructor, but if there was a large district in which there was an instructor available for a large number of schools, they only want an hour a week each school, therefore assistance in combining these districts would solve the money difficulty to a large extent?—Oh, no doubt; of course it may be done by a combination of School Boards even at present, but that is always very difficult to bring about, and probably effective action in that way can only follow upon enlarged school districts of some form or other. Of course, on the other hand, I ought to say that as regards country children I do not think that the systematic physical exercise is so much required from the health point of view. It is very necessary for making them smart and alert, and having control of their limbs, but not so much from the purely health point of view, and therefore may be given in the schools in quite a simple way, and still be effective for that purpose, effective for the purpose of discipline; it does not require any elaborate arrangement of a special instructor coming round.

139. *By Professor Ogston.*—I should like, in addition to what has been already asked, to make sure that we obtain from Mr Struthers all the help he can give in regard to the question of the health of the children connected with this physical exercise. I suppose the Department has never collected from its officials any statistics regarding the weight and height of the children—the Board School children at given ages?—None; we have no statistics of that sort.

140. And I suppose you know of no reliable statistics in Scotland which exist altogether apart from the Department?—None.

141. You can refer us to none?—Nor in England.

142. I suppose there are some in England. I have the impression that in some of the secondary schools in England, in their returns, they give the average height and weight of the average child, and compare it with the height and weight of a school child—an English school boy?—Yes.

143. Can you give us any authoritative direction to where reliable statistics of that nature might be obtained?—Well, the only thing bearing on the point that I know of is a paper in the second volume of Special Reports issued by the Board of Education on physical training in the Girls' High School at Sheffield, I think it is; at any rate it is one of the papers in that volume; it could easily be identified, and there the procedure is described which they follow; they take account of the weight and height and so on, and the various measurements at different ages, and record progress as the pupil goes on month by month, and

Mr J. Struthers, M.A.

29 Apr. '02.

Games, voluntary: should be encouraged.

Instructors of drill for country districts: School Boards have to provide.

Health of Board School children: Department not in possession of medical statistics: no medical examination.

Mr J.
Struthers,
M.A.

29 Apr. '02.

year by year, but I am not aware that any definite results of observations of that kind have been published. This is a description of the steps they are taking to get definite information, but personally I do not know any statement of ascertained results.

144. Then, in the next place, and somewhat kindred to it as regards the health of the children, have you, through your officials in the Department, any cognisance of the proportion of weakly children; have you any reports from your Inspectors or medical examiners regarding the health of the children?—Well, we have no medical examiners.

145. And so, in the case of epidemics, then you have no cognisance of disease?—That is a question for the local sanitary authority, not for the School authority.

146. They, so far as you know, possess no special information?—That I could not say.

147. Codified information regarding it?—I think it is possible that the Local Government Board or the authority for sanitary work may have information, but we have not.

148. You are not aware of it?—It is not part of the function of the Department really.

149. Then the question of a cripple, say, for instance, the proportion of cripples, has not been forced upon your notice in the Department in any way in connection with physical training?—No. Of course, we assume, and I have very little doubt that it is done, that if there is the slightest objection on the part of a parent to have his child put through physical exercise of any sort, the child is exempted, provided there is any reasonable cause shown, and a cripple certainly would be exempted. I would assume that.

150. Have you heard of any maladies such as sprains, joint diseases, and so forth being complained of—loudly complained of—as the result of anything of the kind?—I have never heard of any complaint of the kind.

151. No deaths, for instance, of boys bathing who suffered from ear disease?—Well, I am not sure; I do not know of any case, and I do not think that circumstances of that kind would in ordinary course be reported to the Department—I mean to say I do not think we are the authority to give information on the subject; it is a matter of public health.

152. There is a very interesting remark in the first page of your printed evidence, the second column near the foot, just some fifteen lines above No. 2, that you can testify from personal experiences to the beneficial results accruing from the football competitions between Board Schools in Edinburgh, and 'even during my 'time as Inspector there'?—Yes.

153. Could you help us by saying exactly how you judged?—Perhaps it would clear up that point if I say that I am thinking of the improvement in bearing and tone, that is to say, sense of honour, fair-play, smartness of behaviour, alertness, not of physical development at all. Of that I am not speaking; and as to the improvement in these respects, I have no doubt.

154. Might I refer you next to the second page of your printed evidence, to the second column of it, about the centre, just above where the first paragraph ceases. After referring to continental countries, you gave us the impression that it was due to the military system that so little Hooliganism pervaded the community amongst the younger people as compared with ours?—That was my impression.

155. Have you any special knowledge that would help us to be quite sure of that; say, that would enable us to be certain that it was not from better police inspection and fining system. I refer, particularly, to Germany just now, the way in which they impose fines and intervene through the police in all little minor matters that we do not do here. Can you give us any reason for supposing that it was really due to their military system or system of drill?—Well, I can only state that that is my personal opinion from such observations as I have been able to make in Germany, Sweden, and other countries, and France. No doubt, better police regulations have something to do with it.

But these better police regulations themselves are indirectly the result of the sense of discipline which pervades the nation. That is to say, I am pretty certain that there is a much stronger feeling of obligation on the part of the individual, and especially of young people, to the State, to do their duty in some specified form to the State, in continental countries than there is here, and that is the result of the compulsory military discipline. It has affected public opinion.

156. You are, of course, aware how vexatious those police regulations are in certain parts of the continent?—I have had personal experience of them of a very unsatisfactory nature.

157. Then, the last question I should like your help upon is, could you tell us—give us even a vague idea—of what the proportion of numbers is of large schools in connection with towns and populous localities, where there would be no difficulty in introducing some system of physical training and drill, and of schools in remote districts—I mean remote from one another—thinly populated districts, such as the Highland schools?—Do you mean the number of children?

158. Yes, the number of children?—Well, it would be rather difficult to do that.

159. Are they insignificant in the latter case; is the proportion of children in the Highlands insignificant?—Compared with the total bulk of school population in Scotland, I think that the population in the Highlands and in the rural districts generally is insignificant; that is to say, that the population of Scotland as a whole is predominantly an urban population.

160. And have you any suggestion as to applying a system of drill to such schools as I have referred to?—The outlying schools?

161. Yes, the outlying schools?—Well, I have got some ideas, but I am afraid they are not in such definite form that I should like to put them before the Commission. I rather regard that as a matter for the Commission to inquire into, and help the Department.

162. *By the Chairman.*—In the first place, may I ask you whether you take a great interest in this question yourself?—Yes.

163. Of yourself, or simply because you consider it your duty in your official position to do so?—Well, of myself.

164. Or both?—Both, I think.

165. Has it suddenly come to you, this interest in this question, or have you had it for a long time?—I have had it for a long time. Yes, I was always more or less interested in drill in Scotland.

166. The fact that there is not a sufficient amount of, you may call it play, as well as work, in schools?—I think so. Yes.

167. I am putting it on the highest ground, that you could instruct in physical training to be amusing, interesting, acceptable, as well as merely to do good?—Certainly. I do think I have long held the opinion, which I think was once very well expressed by Sir Henry Craik, that the time a child spends in school is, after all, a very considerable portion of his whole lifetime; that it ought not merely to be regarded as a preparation for what is to come. There ought to be a certain amount of enjoyment and sense of satisfaction in living during it.

168. Then, as regards all that, have you had occasion to hear the opinion of many of your Inspectors throughout the country, say in the last three years, say during the time that this circular has been in operation?—Since this circular has been in operation I have been in London, and have been very little in contact with my former colleagues, and so have had very little opportunity of learning what their own individual opinions on the subject may be.

169. And the same, of course, would not only apply to the Inspectors, but would also apply to the general class of teachers throughout the country?—I think so; yes.

170. I mean that you have not been in a position really?—No.

171. More properly, I should ask that question of an

Physical exercises: children exempted on reasonable cause shown.

Hooliganism; absence of in continental countries; result of compulsory military discipline.

Str

Drill : disciplinary effect good : desirable to have it in small quantities and between lessons : middle of day most advantageous time.

Leisure time : employment of children on Saturday afternoons unpopular ; but not impracticable if reasonably supported.

Inspector instead of you, as you have necessarily been out of the way?—Quite. I have not been in direct contact with the schools or the Inspectors.

172. So you do not know really how this physical training development, if I may call it so, has pleased, or otherwise, both Inspectors and teachers throughout Scotland?—No, I have no direct information. Of course, I wish to make quite clear that these recent developments of drill in the Code are very new, two years back.

173. Yes, exactly?—And that any change in the school system of a country takes a very long time to work out. When you introduce a change such as this one year, you cannot expect to find very marked results or very marked evidence of it in any way for three or four years to come.

174. Now, following on the various questions that have been asked you by others, has it not occurred to you that, in promoting physical training in schools, you are doing something which may have an effect on the health. I know you have said that you have nothing to do with the health, but has it occurred to you that in bringing forward some kind of system of physical training, you are thereby tending in some measure to alter the health, either for good or for ill, of school children?—Certainly; and as I have said, I think that is a point upon which we require very thorough inquiry before we proceed further.

175. Then if you do understand it, may I ask has the attention of public health authorities, whether County Councils or their delegates, been called to it in any way?—By the Department?

176. Yes; I mean, do you not think that in making a change of this kind, something might be done in calling attention?—I think that very probably before any definite steps were taken in the way of extending the system of drill in schools, much communication with the local authorities of various kinds would be necessary.

177. Because I mean a local authority *quâ* local authority is not to be expected to know all the different rules that come out?—No, of course not.

178. And you quite grasp what I mean, that the mere fact of an extended physical training might require a great deal more nourishment; put it on that point that was raised by Mr. Fergusson, might require a great deal more nourishment in the children than they have hitherto had?—Yes, it is possible.

179. I mean you may sit still, write, do your figures, and so forth, without taking so much out of you, as if you have to go through a certain amount of physical exercise?—Yes, undoubtedly.

180. Whether training or drill, or any other kind?—Yes, except that I think we have sufficient evidence that the ordinary drill that is given in schools for the quarter of an hour or half an hour between classes is seldom of anything like an exhausting nature, so as to make any sensible difference in the food required.

181. Do you allude principally to schools in towns or schools in the country?—I think both, but principally to schools in the country.

182. I am so far right in saying that it is possible that a child in the country of a certain age, say ten years old, might have to walk very nearly six miles in the day?—Yes.

183. To and from its home?—Yes.

184. And over very rough roads sometimes, or no roads at all?—Yes, which would be a very excellent exercise itself.

185. Exactly. I mean if you put physical training to any extent on to the top of that, it must be of a very small nature—a slight nature?—I think so.

186. Principally, I may say, affecting the arms and the organs of the body, but not affecting the legs?—Principally affecting discipline; that is to say, the power of doing what they are told quickly and alertly.

187. That, of course, is in the country, but in the towns you have little doubt that the actual physical exercise is necessary?—I think it is probably necessary. That is a point, of course, on which inquiry requires to be made, but my own impression strongly is that it is

necessary that if it is to be made compulsory, we must make sure that the children have a physique to bear it.

188. You mentioned swimming. That prevails in certain places. Do you know whether attention has ever been called to that by the Department, as recommending such a means of exercise as a physical training?—I do not think that we have. Of course, it is mentioned in the article of the Code which I read to you, as one of the forms of exercise which may be counted as part of the school time.

189. Then what is your own individual opinion as to the time of a school day in which the physical training should be given; should it be given when the children come early in the morning, before they begin their studies, or should it be given at the close of the day? Have you any definite opinion on that point?—The definite opinion I have is, that the value of drill, school drill, such as is usually given in schools for the purpose of discipline, is undoubted, and that the value can be obtained by comparatively short intervals of drill, and that it is not very essential when that time is taken. If it could be introduced between lessons, so much the better.

190. Then do you believe, as I do firmly, as an old soldier, that the mere fact of drill smartens the men up?—I think it does.

191. Then in that case, do you not think it ought to precede any other instruction?—Well, of course, children come in the morning with their minds pretty fresh and alert; they have come in from the open air.

192. You would give them a fillip up in the middle of the day?—The middle of the day is the more necessary time. On the other hand, I do not think late in the afternoon is a very advisable time, as the children are then more or less exhausted with the work of the day.

193. And in the country districts, have a long walk before them?—Have a long walk before them home.

194. You mentioned employing children on Saturday afternoon: do you not think that would be very unpopular?—I am pretty certain it would.

195. I mean, do you not think it would be so unpopular as to be almost impossible to bring it about?—That I cannot say; it depends.

196. On penalties practically?—Well, of course, if there are penalties introduced, it will make the thing still more unpopular; but penalties are necessary. You are speaking of the compulsory drill from fourteen to eighteen?

197. Quite so?—Well, I think the public would have to have it put before them very clearly that there was, if not an absolute necessity for this form of discipline, at least a great advantage in it.

198. Put it another way—that this Commission, should it recommend such a course, would not wish to recommend anything which would be impracticable?—Quite.

199. In your opinion, supposing this Commission were to recommend such instruction on Saturday afternoon for such children, or boys and girls, whatever you like to call them, between fourteen and eighteen, would it be impracticable?—I do not think so, because I have great confidence in the reasonableness of the people of Scotland; and if the case is put before them well supported—if the law is instituted without rhyme or reason, they certainly would object; but if the Commission makes this recommendation, and puts before the public good grounds to support it, I think it would be well received in Scotland.

200. I was going to ask you a question on football, but it was asked before I got to it. I was going to ask you whether you thought that football was likely to improve the behaviour of children?—In my own experience in Edinburgh it did, but then it was played—

201. Under supervision?—Under supervision; and under pretty strict supervision, I should say.

202. In fact it was played as a healthy exercise?—As a healthy exercise.

203. And not something else?—Yes.

204. You mentioned early in your evidence some-

Roman
Catholic
schools: drill
a favourite
subject; and
adequately
done.

thing about some Established Church College in Edinburgh. I think you also went on to say that there was no United Free College of the same kind, did you not?—The United Free Church College in Glasgow has apparently a Volunteer corps; I mean to say, rather asks its students to join a Volunteer corps.

205. May I ask, further, whether you have any knowledge of what is done by the Roman Catholics?—In the matter of drill?

206. Yes. I should rather like to know, generally speaking, how far you have any knowledge of Roman Catholic education altogether?—Well, so far as Scotland goes, I know it pretty well, and I should say that drill is rather a favourite subject with Roman Catholic schools, and is, on the whole, better done there, certainly for the younger children, than it is in the other schools. That is my impression.

207. Now, when you say they are, would you give the Commission some examples of the different schools you are talking of, first in the towns, and, perhaps, secondly in the country districts?—I am afraid I have not got a sufficiently definite—

208. I do not want anything definite, but how are they placed as a rule?—Such schools as the Catholic Schools of St Patrick, in the Cowgate, are very good specimens of what could be done in the school, in the playground, in the way of drill.

209. And in the country places?—In the country places? Oh, the Catholic School at Broxburn, I think, if I remember rightly, is a very good example.

210. In Haddington?—In Linlithgowshire.

211. Do you know any in the Highlands?—I have no knowledge as an Inspector in the Highlands.

212. Of course you would have in the Perthshire Highlands?—In the Perthshire Highlands; well, Roman Catholic Schools in Perth are very few.

213. It would depend on the population. In Dundee, for instance?—Oh, they are numerous there, but I have no knowledge of the Dundee schools.

214. You have no knowledge, in your present position, in receiving reports from Inspectors as to Roman Catholic schools?—Well, the reports, under ordinary circumstances, do not pass through my hands; they are dealt with by junior examiners in the office.

215. Exactly so. I mean your personal knowledge in the matter is really confined to what you knew yourself when in Scotland?—As an Inspector.

216. In those two places principally?—In those two places principally, but also to some extent in Aberdeen. The Aberdeen district, including Aberdeen and Kincardine.

217. But your general opinion is that the physical training in such Roman Catholic schools is adequately done?—At least as good on the average as it is in other schools.

218. The most important thing for the future is, how do you propose, or has it struck you to propose any way in which instructors or teachers should be taught any more than they are at present? I mean, that in the future, is it your opinion that teachers should have to have passed something before being eligible to become a teacher of a Board School?—They have at present to pass an examination to become a teacher. You are speaking specially of the subject of drill?

219. Oh, of course; of physical training?—Hitherto there has been no examination required, and all that we know is that a certain number of men have had a certain amount of instruction on the subject, but we have not required a special certificate of competence to teach drill from anybody. Now, the students going through the Training College will be specially examined as to their capacity to instruct in drill, and will get a special mention on the certificate that they are capable to instruct in drill.

220. Will they be examined, if you will allow me to say so, by an expert, or by a man of impartial mind?—They will be examined, this summer at all events, by Captain Armytage, Inspector of Military Gymnasia.

221. He is actually the military expert in the country?—Yes.

222. At the Normal Schools?—At the Normal Schools, yes. Of course, we rather propose that the instructor, being himself satisfactory to Captain Armytage, should by-and-bye determine to a large extent what the individual proficiency of the student is, and report it to him, leaving Captain Armytage, or any other special inspector who is employed, to make such further inquiries as he thinks necessary; but our point is, that the actual instructor, provided he is a competent and an honest man, is better able to say what the real ability of the student in the matter of teaching is, than an inspector can possibly ascertain from a single visit.

223. Now there is one more question, please. At present, does the training take place in the school or in the playground as a rule?—The drill is in schools; it varies very much.

224. I mean, is there anything laid down as to which it should be done in?—There is nothing laid down; we have no regulations.

225. I mean in fine weather, that it should be done out of doors?—I do not think we have expressly said it should be done anywhere.

226. Therefore you have not taken into consideration at all the size of the playgrounds. I rather wanted to get at that. Is there any uniform size of playgrounds laid down?—There are building regulations.

227. The reason I ask is, that if you go on to have extended order drill, you will require a certain amount of room?—I fancy such room as it would not be possible to find in an ordinary playground. It would have to be done in public parks or fields.

228. At the same time, a great deal could be done on the present playgrounds, or could be in different lines, and so on?—It could be, yes.

229. But that has not been mooted?—I do not think so.

230. Not the question of size of playgrounds?—No.

231. Is there any general rule as to the size of the playgrounds?—I believe there is something in the building regulations as to the size of playgrounds.

232. *By Sir Henry Craik.*—They have to be modified according to circumstances; about three-quarters of an acre, but we cannot insist upon that entirely.

233. *By the Chairman.*—No; I mean, if you are going on your ground to do anything of that kind, it might be advisable in new schools rather to encourage the idea of a bigger playground if you can?—Of course, in the denser parts of the town, where precisely these exercises are probably needed, it would be impossible to get anything like a large playground for each single school.

234. But, on the other hand, take such a part as the Cowgate of Edinburgh, they are within a hundred yards of the open ground of the Queen's Park.

235. *By Sir Henry Craik.*—With regard to this question of playgrounds, there is no objection under the Education Act to a School Board acquiring a field which should be common to several schools, even although not immediately attached to the premises?—I think not.

236. I do not think the Department would have any difficulty in sanctioning it. Then, with regard to inspection, our inspectors, as you explained, act upon the general experience they have gained, without being experts in particular subjects. The Department will endeavour to bring them into contact from time to time by paying visits in company with Captain Armytage or other expert?—I should think so. Yes.

237. With regard to the qualifications of the teachers who are to act as instructors, the Department has now begun the issue of certificates following these classes under Article 91 (d)?—Yes.

238. And these certificates are granted on the advice of the expert, and after a stipulated course of instruction?—Yes.

239. So that the teachers will have an opportunity of becoming specially qualified, and we will have also the

Teachers:
further in-
struction;
examined by
an expert.

opportunity of knowing which of them have become specially qualified?—Yes. At present the certificate, or hitherto the certificate, certifies only to satisfactory attendance and progress; and, as I have said before, these classes are experimental, and, no doubt, we shall change the regulation on that subject, develop it, and get a more definite certificate as to what the man is really capable of.

240. *By the Hon. Thomas Cochran.*—There is a very striking expression in your notes, in which you describe the pupils who may be already surfeited by years of squad drill. Could you give any explanation of what exactly that means, or how you arrive at it?—Well, one must speak from his impressions—from his experiences.

241. Yes?—But I have seen cases in which children, older children, went through their drill in a lazy, dis-

satisfied sort of way, and the explanation that occurred to me was that they had had too much of this sort of thing for many years.

242. Has any inquiry been made from the children themselves on the subject?—Well, I could not say. I do not remember any specific inquiry.

243. I can quite recognise the point that they may become surfeited with squad drill. I am very much in sympathy with what is your general line of encouraging a variety of exercises, but I should like to know from the children's point of view whether the dullness you refer to is due partly to the teacher, or whether it is due to the monotony of the drill?—I think very often it is due to the teacher, but I would not be prepared to exclude the other cause as well, namely, the monotony of the drill.

The witness withdrew.

Mr T. A. STEWART, LL.D., examined.

244. *By the Chairman.*—You are Senior Chief Inspector of Schools in Scotland?—Yes.

245. Well, I think, perhaps, it would be more convenient if you would just read what you have put before us, please, and then any question that may come up you will answer?—I have put this together from some notes which I hurriedly got together. I thought perhaps it might be of use. First of all, I have got what I call historical references.

At the time of the formation of the Volunteer corps (1859) interest was aroused in the physical training of youth, and some attempts were made to teach them military drill. But the experiment failed to be a success because—

1. The exercise was usually taken after school hours, or during play hours.

2. The drill was mechanical and uninteresting, and was conducted by non-commissioned officers who had served for twenty-one years or more in the army, and whose methods would not be tolerated nowadays. Since 1870 or so this training has died out and been replaced by gymnasia, where the teaching was given by ex-army instructors. The object was to make men stronger. The exercises were too severe for growing lads, and there was a tendency to produce acrobats. In 1884 a team of foreigners at the Health Exhibition, London, aroused much interest, and it was seen that a more suitable system of drill was desirable. The pioneers of the movement were Colonel Onslow, then Superintendent of the Military Gymnasium, Aldershot; Colonel G. M. Fox, his second in command, and at present head; and Sergt.-Major Noakes, the chief instructor of the army; and Mr Alexander Alexander, superintendent of Liverpool Gymnasium.

The 'short service' system was introduced into the army about this time, and Colonel Onslow's system was found more suitable for young men, often mere boys, who joined the army.

About 1887 the National Physical Recreation Society was started, with its international competitions. The object was to supply gratuitously physical training for the children of the working classes, while teachers were trained in teams drawn from the larger towns.

Squad exercise, with musical drill, was a main feature.

The system was of a voluntary nature, and if not based entirely on physiological principles, several useful varieties of exercise were introduced which were free from the rigidity and monotony of military movements.

In Scotland, Aberdeen was the first town to take part in these international competitions.

Although nothing like a universal system of physical exercises was introduced till 1895, when it was included in the Code as a necessary element in education, the teaching of the subject in the North of Scotland at least has been the rule rather than the exception.

The opening of the Aberdeen Physical Training College in 1889, and the recognition of its certificates

by the Scotch Education Department, gave a great impulse to the movement. Major Cruden, who pioneered it, was supported by a number of Aberdeen gentlemen, who took a personal interest in the subject. Teachers were trained, examined, and sent out to the schools fully qualified to give a thorough training in the subject.

Military drill of a sort was found in stray schools, but it has never yet been a general success in elementary schools. Carbines were sometimes procured to stimulate a flagging interest, and in some cases, as in Hutchesons' Boys' School, Glasgow, the personal enthusiasm of the drill instructor inflamed his pupils with an adventitious interest.

Military Drill *versus* Physical Exercises.—

(1) I am strongly of opinion that physical exercises should be regarded as the foundation of military drill. A very large amount of the advantage gained in the practice of military drill is secured by physical movements and evolutions.

Physical exercises are based on physiological considerations in connection with the laws of health. Military drill is, I understand, subservient to the exigencies of active service. It may be healthy and it may not. It is meant to make men good soldiers.

(2) I shall suppose, therefore, that in all schools a full course of physical exercises should be given, both to boys and girls, till they reach the age of fourteen or so, *i.e.*, till they leave the elementary school. In the higher grade or secondary schools, boys might at this age be formed into a cadet corps, in which they might remain for three years, and then join the Volunteer corps. Some grant might be furnished as an encouragement. In New Zealand, so many rounds of ammunition and a small grant are allowed. In this way we should have a stepping-stone between the secondary schools and the Volunteer corps.

(3) Boys' Brigades.—

These are very useful organisations, and do a deal of good in many ways to the boys, but it seems doubtful if *drill* is their strong point. I learn that few join the Volunteer corps, one of the reasons given being that they dislike to have to undergo the same drill a second time. It is probable also that, as their drill is sometimes of an amateurish nature, it will not compare favourably with that which is given to a cadet corps.

In Scotland, an attempt has been made to have a cadet corps at the Aberdeen Grammar School. Some difficulty has arisen regarding the costume.

In Glasgow, Kelvinside Academy, the High School, and the Academy have all formed corps. In Edinburgh, Fettes College and Merchiston Castle have corps.

At Glenalmond and Blairlodge there are two well-known cadet corps, which have competed at Bisley.

In the Training Colleges here—Church of Scotland and United Free Church—a company has been fully equipped. General Chapman expressed the highest opinion of their efficiency on a recent occasion.

Scheme suggested.

Generally.—

(a) Physical exercises should be taught in all schools up to the age of fourteen, for the purpose of improving the pupil's health, developing his muscles—enabling him to hold himself up properly, and accustoming him to precision of movement and instantaneous obedience to the word of command.

(b) In every higher grade or secondary school, where pupils attend after the age of fourteen, I would have a cadet corps, and some similar evolutions in the way of marching, dancing, or games for the girls.

(c) It should be kept in view that *every* child—unless he is too delicate—should be exercised according to his needs and ability. Crack teams and spectacular displays have their advantages; but better to see a poor, sickly child performing an exercise, in however ungainly a manner, to add something to his physical strength, than to witness the perfect precision either of physical or military evolutions.

246. May I ask what is your district, or what districts are you familiar with as Inspector?—Well, I have been Chief Inspector in all the districts of Scotland.

247. What districts?—I have been Chief Inspector in the Northern division, in the Western division, and in the Southern division.

248. Northern, Western, and the Southern?—Yes. At the same time my own personal district has been confined to a limited portion of each of these areas.

249. And which is that?—My present district consists of the city of Edinburgh, Midlothian, and Linlithgow.

250. Then at the present time we will take your own district, the actual district that you are familiar with at the present moment. What would you say in answer to the question,—To what extent are physical exercises in some systematic form included in the curriculum of the schools?—Well, in the country schools, in all the schools I may say, they are reasonably included as part of the curriculum. More attention, of course, is given to them in the larger schools, where, as a rule, they have special drill instructors, whose efforts are seconded to a certain extent by the class teachers—a system which I highly approve of; but it may be said that the teaching of some portion of physical exercise is universal in my district.

251. And in the town part of it?—Yes, entirely so; in some cases military drill and swimming.

252. Well, I wanted to know to what extent is military drill taught; is it only in the towns?—I cannot say that military drill is taught at all in my district.

253. In any part of your district?—No, except in the Training Colleges to which I have referred.

254. And you mentioned swimming; is there any other form of systematic gymnastic exercise taught?—If you include gymnastics, we have twelve gymnasia in Edinburgh,—parallel bars, horses, rings, and so on.

255. That would only apply to Edinburgh; and any other big town—Haddington?—Haddington is not in my district.

256. What other big town is there? Edinburgh and Leith would be one?—Leith is not in my district either; it goes to the inspection of East Lothian.

257. What other towns besides Edinburgh have you in your district?—No town of particular size.

258. As to the country districts, there is no military drill you say, and nothing else but ordinary physical exercise?—Yes, and gymnastics, marching, and so on. Of course, physical drill is not confined to Swedish exercises and dumb-bells, or that sort of thing; they generally go in for a good deal of voluntary work. Marching, counter-marching, forming squares and so on in the drill class in the playground.

259. It is done in the playground?—In fine weather it is.

260. Is it done in the playground, or is it optional on the part of the teacher to take it where he likes?—There is no regulation on the subject.

261. Neither by you nor the School Board?—If we

find they are exercising children in the playground in bad weather, we remonstrate with them very strongly. In Glasgow they have special gymnasia for the purpose. They have spent a very large sum—the School Board of Glasgow—in erecting proper gymnasia for conducting all these various exercises.

262. Then to what extent does musical drill prevail?—Musical drill is confined almost chiefly to the younger classes. We recognise it as an interesting element in the subject there. We are also quite aware that for absolute precision, drill without music is preferable; but one great advantage on the whole teaching on the subject is to make it attractive to children, and to make them regard it more as a piece of recreation than of actual work; and I think music helps to make it so, as well as to add to its general gracefulness—the æsthetic side of the subject.

263. There is a Code which was issued in 1899?—Yes.

264. In which this physical training, so far as it goes, appears?—Yes; it is necessary to have physical training.

265. I mean, according to that article in the Code?—Yes.

266. And what is your opinion in your district as to the general efficiency; do you find that it is well carried out?—It varies a good deal. If the teacher is at all an enthusiast, he teaches it well; if he is not, he teaches it as well as he can, so that we may be able to report favourably on it.

267. And then the grant that is given?—There is no special grant nowadays; it is all included in the general efficiency of the school. If we find it defective, we may say the whole grant may be refused, or some deduction may be made.

268. But you make a point, in your ordinary visitations, of taking that into full consideration?—Most distinctly. I consider it a most important part of school work.

269. The most important?—A most important.

270. Then, from your own knowledge, what would you say the effect is on the physique of children?—Oh, I should think it was most salutary in every way.

271. I mean you think it ought to be, but do you happen to know that it is so; have you any means of judging?—I can judge of the appearance of the children—the way they comport themselves.

272. You have no metric means of judging?—No.

273. No statistics, in fact?—Well, the only case I know is the High School in Edinburgh, where Dr Marshall has adopted the regular calendar expressly, and all the boys are measured and weighed from time to time; and if he finds a boy is falling off in weight, he makes inquiry as to how he has been doing his work.

274. Do you believe in that being a good thing?—To a certain extent.

275. If you believe it is such a good thing, have you ever reported in its favour; have you ever brought it to the notice of the superior authorities?—No, I have not. I am not sufficiently acquainted with the merits of the system—or the demerits.

276. Although it is a matter that comes before you in every visit that you pay?—Yes. But of course one can judge in a general rule of thumb way as to the advantage.

277. Quite so; I just want to ask, it has never occurred to you to ask or to bring forward anything?—Not in the case of the ordinary average school. I have never brought forward anything, if that is what your lordship wishes to know on the subject. I have never made any suggestion in my reports.

278. I suppose there is no reason why you should not bring forward anything that strikes you?—Certainly not; I am encouraged to do so always.

279. Full encouragement to do so?—Entirely.

280. Can you tell me whether there are any competitions in any schools or other institutions in your districts to encourage sports and games in the Board Schools?—Yes, the Board Schools all compete for a football cup given by the inspectors.

281. Where is this, please?—In Edinburgh.

Physical exercises: included as part of curriculum of all schools in districts.

Mr T. A.
Stewart,
LL.D.

29 Apr. '02.

Development
of training
since 1874:
good results
noticed.

282. Yes, in Edinburgh?—A number of schools compete for this cup every year, and it passes from school to school, as it is gained, on every occasion.

283. Is that under the authority of the School Board?—No; the School Board has nothing to do with it. It was originally, I believe, given by Mr Struthers when he was inspector, or a number of Inspectors agreed to present this trophy, and it is yearly competed for.

284. This football cup, is it played for only in one or in frequent games?—Frequent games.

285. Is there any supervision in any way?—Masters of the schools take a personal interest in it.

286. Each master accompanies his own school?—Yes.

287. What are the ages of the players?—Under fourteen.

288. Are they over or under fourteen?—Under fourteen.

289. That is to say, they are still actually at school?—Under fourteen; still at school. There may be a few older ones, I should not like to say there are not, but they are mostly under fourteen.

290. By Sir Henry Craik.—Of course we are not limited in attendance to fourteen?—Not at all. Very few do attend after fourteen, except in higher grade departments.

291. By the Chairman.—Another thing I wanted to ask you was in connection with physical training. Do you consider that, as a rule, playgrounds are large enough?—In the country they often are, but very seldom in the towns.

292. Have you ever represented anything about that?—In connection with physical drill?

293. Yes, in connection with the size of the playground?—Yes; I have frequently in Glasgow and Edinburgh remarked that there was little room in the playground, and suggested that a special building should be erected for the purpose, and that has been done in both cities in several cases.

294. In the country, in your district, so far as you are aware, you think the playground is large enough?—I should say it generally is.

295. As a rule?—Yes, I think so.

296. Then what opportunities are there now existing in your district, and to your knowledge, for children over fourteen. I mean, if there are none, say so, but if there are any?—I was trying to think.

297. Try and let us know what they are?—We do not know exactly yet what the continuation schools are going to develop upon that subject.

298. No, but I want to know what is the actual state of things at present?—In the Edinburgh schools?

299. No, what opportunities there are for physical training for children over fourteen?—There are none in our own schools, as far as I am aware.

300. Not at the present moment?—No.

301. But it is possible there may be some before long, that is what you mean generally to say?—Yes, quite so.

302. Part of our inquiry is to find out the existing state of matters?—Yes, quite so.

303. And is that the same in schools under the Code and also secondary schools; the same thing at the present moment?—Well, of course secondary schools have got their gymnasia and so on, which the elementary schools have not.

304. Gymnasia is most distinctly a part of physical training, and therefore in the case of secondary schools in your district such opportunities do exist at present?—Yes, in those that have got gymnasia, but not in the ordinary elementary school.

305. Then, in the case of children of both sexes over the age of thirteen, is there any difference made between the exercises of boys and the exercises of girls?—Yes.

306. I mean, do you lay yourselves out to see that there is a distinct difference?—Not necessarily, but if there is a satisfactory difference I take a note of it; if there is not, I suggest that there should be; that the girls should not be occupied with such heavy bells and clubs as the boys, and should rather go in for some more graceful evolutions, such as dancing, hoop, or fan drill.

307. But I mean about the age of thirteen or so, there is a distinct difference, and they are not training in the same way?—No.

307a. By the Hon. Thomas Cochrane.—I suppose you have had very great experience, have you not, as Inspector?—Since 1874—a quarter of a century.

308. You will have watched, then, the general development of some form of physical training or drill. I think it has taken effect since 1873; I think a first step was taken by the Scotch Education Code, was it not?—Yes, about that time.

309. You have noticed generally the effect, in your experience, since 1874 on the children?—Yes.

310. Of this increasing amount of physical training?—Yes.

311. What is the general impression you have come to as the result of it?—Well, my impression, not only in a general way, but from special instances I have had of it, is that the general health has been improved; that the children have been made smarter, brighter, and more obedient to the word of command. That, I think, is a very important lesson for them to learn, instantaneous obedience, and in some particular cases I have been informed by headmasters that delicate and sickly children, who received a judicious amount of drill, had developed appetites and become quite strong and healthy. And, if I might mention two particular cases—this same Colonel Cruden, to whom we have been referring, was a very delicate boy. His parents were advised to put him through a course of drill; and now not only is he a man in vigorous health, but he is a bit of an athlete himself. And one of his assistants, a lady, Miss Cruickshank, was a particularly delicate creature, but she is now thoroughly robust. She was a very delicate girl till she went through a similar course, and now she is one of his chief assistants, and appears to be in vigorous health, as far as an outsider, a non-expert, can judge.

312. From your general experience, you notice an improvement in the appearance and the alertness of the pupils generally?—Yes.

313. Is that due to a form of drill or to physical exercises; you differentiate between the two, I think?—Yes, I should not confine the result to any particular form of drill. I think, if they are put through a variety of exercises, especially if they are taught precision of movements and instantaneous obedience, and how to stand erect, use their hands and legs properly, that is all an education in itself, and is always thought to be so.

314. You would rather divide the two; there would be certain advantages gained from drill, such as precision and ready obedience?—Yes.

315. And from physical exercises, you would consider rather improved physique, and general health and appearance?—Precisely.

316. You think there is room for the two—a little drill to give obedience and discipline, and physical exercise to develop the physique of the children?—Precisely.

317. I see that in your report you say, 'the drill in the old days'—I think that was in 1874, when you were first Inspector—'was mechanical and uninteresting'?—Yes.

318. Have you had any complaints from the children that they have found it uninteresting?—The children would not speak to me about it, but the teachers said they had great difficulty in getting them to take part in it. That was not perhaps the fault of the system of drill so much as the men who taught it. They were generally rather objectionable, retired non-commissioned officers. They had no interest in the children, and they knew nothing of them, and so on; but the whole thing was uninteresting—there was nothing to attract the children in any way.

319. Very mechanical?—Purely mechanical.

320. And repeating the same exercises over and over again?—Yes.

321. We can quite understand that. Now, do you think that, generally speaking, the manners of the children in Scotland have been improved by this

Drill and
physical
exercises:
both
desirable.

Mr T. A. Stewart, LL.D. system of training, or has it had no effect on their manners?—By manners, do you mean courtesy and politeness?

29 Apr. '02. 322. Courtesy and politeness?—Oh, I do not think it has had any connection with that; I do not see what the connection is.

Manners of children: no connection with system of training.

323. You think the general discipline would not have an effect upon the manners too?—If it simply means that the drill-sergeant insists upon them making a salute, I think that is mere—

324. I meant a wider courtesy?—I do not see any connection, to tell you the truth.

325. You appeared, towards the end of your evidence to indicate that you would rather see, I think, 'a poor, sickly child performing an exercise, in however ungainly a manner, to add something to his physical strength, than to witness the perfect precision either of physical or military evolutions.' Do you think that physical exercises you have seen have had an actual effect on sickly children?—Yes, if they are carefully administered; if the child is not asked to do too much—that is to say, if the child has not got sufficient exercise without it.

326. You think a wise caution should be exercised; you would not put all children through the same amount?—Certainly not.

Feeding: must be good.

327. Have you come across children who have been insufficiently fed to enable them to go through these exercises with advantage?—I should not allow that at all; I have often remarked in schools where drill has been gone through, 'All you want now is a plate of soup.'

328. A plate of soup would do them more good than an hour's drill?—The two might go together.

329. A quarter of an hour's drill?—Yes.

330. You regard the good feeding of the children as being very necessary in order to enable the physical exercises to have their proper effect?—Yes, entirely.

Games: cannot be organised to give pleasure.

331. One other point I should like to ask you, which is suggested to me by what you call the mechanical and uninteresting drill: do you think that some form of organised games would help to develop the physique of the children?—I do not quite see how a game can be organised so as to give any pleasure.

332. Well, I would rather put it in this way: it is suggested to me by so often driving through the streets of our Scotch towns, and seeing them full of the rising generation, who do not seem to be occupying themselves either in anything interesting to themselves or very useful; throwing stones, and running across the road in front of a horse that is being driven; whether there would be any way of interesting these children in games which would take them off the streets, and do them physical, and mental, and moral good?—I think it would be an excellent idea if the teachers were to arrange to meet them, say on a Saturday, in their playgrounds, if playgrounds were open, and they could teach them to play certain games properly.

333. What I had in my mind was suggested in a paragraph of Lord Balfour of Burleigh's memorandum, dated February 3rd, 1900, in which he says, 'he trusts that combinations may be formed in convenient centres by leading and public-spirited inhabitants,' and I believe that in some parts of England, I do not think it is done in Scotland, public-spirited inhabitants have supplied five courts in unoccupied waste bits of land. They have made some little bits of alterations, levelled up the flooring, and supplied balls to the School Board children, and also footballs, and got local inhabitants who would take charge of these and give them out. Something of that sort would be in your mind, and would it be of any advantage?—I suppose it might.

Swimming.

334. Perhaps that is rather beyond the immediate scope of our inquiry. Do you find advantage from the swimming?—Oh yes, an excellent thing. We have five schools, I think, in Edinburgh that have swimming baths. These baths are confined to the schools that possess them with one exception, where the children of two neighbouring schools are allowed to participate in the advantage,

335. What schools are those?—Abbeyhill, Broughton, Bruntsfield, and Sciennes are the four that have swimming baths of their own, and another school has a small swimming bath.

336. Could you say how many children take lessons in swimming?—They have a succession of lessons each day, perhaps 30 or 40 at a time, the boys in the forenoon and the girls in the afternoon, as the case may be but the baths are in use every day, and the children like them very much.

337. You do not know how many take advantage of it?—No, I cannot give you the figures; I have not got them here; I could easily find them for you.

338. Do you see them swimming?—Yes, I frequently have seen them playing games—water polo and water football.

339. Enjoyed it thoroughly?—Enjoyed it thoroughly, but the blind children in the swimming bath are still more striking.

340. Have you carried your researches to this extent with these children you have seen enjoying themselves in swimming—have you noticed any improvement in their work?—I have never examined into individual cases at all.

341. That is a point I may suggest for inquiry?—Anything that tends to usefully react upon their intelligence.

342. That would be my impression; but I would like to have it verified by the actual experience gained?—I really could not speak upon that.

343. *By Sir Thomas Glen Coats.*—Mr Cochrane has elicited some information just now that I was going to ask, about this physical drill, whether it brightens the children up or not; made them more fit for their schooling?—I think so, if it is not overdone.

Physical exercises desirable to have them begin on day or immed after d hour: not fol mental impos devote time in school

344. At what part of the day would you give physical training; at the beginning of the day or at the end, or between the lessons?—Oh, I think at the beginning, or immediately after the luncheon hour, because in the earlier hours of the day we always have the heavier portion of the work; in the forenoon or after luncheon, that is to say, arithmetic and grammar, these heavier branches; and I think it would be better to have their exercises immediately after the assembling, because the children are apt to get tired out—fagged.

345. Do you think an interlude of this school drill would brighten the child up, make him better fitted to continue his work?—I think not. I think the physical drill is a strain upon the mind as well as the lessons. I would not approve of physical drill following lesson work. I would rather have some easy work, like singing, because there is no doubt that physical drill involves mental effort.

346. Do you think that considerably more time could be given to physical drill than is given at present, without interfering with the teaching of the children?—Well, I am afraid not. The curriculum is so much overcrowded with essential subjects nowadays; that little more time could be spared, unless we took off the time from some other branch considered of less importance.

347. A case has come under my notice where children—girls—attending a half-time school, *i.e.*, attending on alternate days, and with certainly a larger staff than is generally provided in the ordinary Board Schools, were able to pass the same examinations, and gave an equally good result as regards their pass as the children in the Board Schools; that is why I asked you whether you thought that considerably more time could be given to physical drill, or to some other work, without interfering with the actual progress of the children?—Yes; but I expect the children to whom you refer have home advantages, and pick up their school lessons more readily than other children.

348. I do not think so. Of course, they have a regular attendance, that is ensured?—Are you talking of the same class of children?

349. I am talking of children attending the Ferguslie Thread Works, in Paisley?—Yes.

350. They are children just of the same class as

Mr T. Stewart, LL.D.
29 Apr.

Mr T. A. Stewart, LL.D.
29 Apr. '02.

would be attending the Board School?—Yes; no better and no worse.

351. And why do they make so much better progress, then?—I do not know. They are at work one day; I suppose they come with a fresher mind to their work the second day.

352. They take the ordinary pass work, and they are quite abreast of the other children?—A good deal depends upon the children themselves, and their regular attendance. If the one class attends regularly, and the other does not, it is easily explained.

353. There is perfect attendance, of course, in this case?—Yes.

354. *By Sir Henry Craik.*—With regard to that question, you think there may be a difficulty in finding time; but is it the case that there is asserted to be a very large employment of children outside their school hours—children who are actually attending school?—Yes.

355. The ordinary time of attendance is five hours a day, leaving nineteen hours for food and sleep; that leaves a very large amount of leisure?—Yes.

356. Do you not think that some part of that, without a strain upon the child, and really preventing his getting into mischief, might be used for physical training?—Oh, certainly it would be much better that he should be employed in such exercise than that he should be employed in selling newspapers or running messages.

357. Or even running in the street?—Quite so, certainly.

358. Necessarily there must be many of those who can do nothing else but run about the streets for many hours of the day?—Yes.

359. Have you any instances in your district where a common playground for several schools is provided by the School Board?—Not for several schools; but the other day the School Board came to terms with the Town Council to open a certain number of their playgrounds, as an experiment, for their children to play in after hours.

360. But there is nothing to prevent the School Board getting hold of a field in the neighbourhood of a town, which would be common to all the schools?—Not if the ratepayers did not object; it would be an excellent thing, I think.

361. There is nothing preventing it in the Act of Parliament?—Nothing at all.

362. And if they could be brought out of the streets and into that place there might be time found for some sort of physical exercises?—Yes, certainly.

363. Have you ever made any inquiry as to the feeding of the children in the town schools?—In town schools. No, not to any extent. I have ascertained that in the winter time a number were fed in the soup kitchen, and I have once or twice changed my interval on the day of inspection to allow these children to go and have their dinners, which are all handed out to them.

364. I quite understand that; but I meant rather in the methods pursued in their feeding. Have you seen any change in the course of your experience in the food that the children generally get?—I cannot tell what they get; only when I have asked them what they had for breakfast, they say 'Tea.' I say, 'You should not drink tea at all; you should take porridge and milk.'

365. Tea is the prevailing thing nowadays?—Yes, because it saves trouble. I have warned them.

366. Have you seen any difference or contrast in that respect between town and country?—I cannot say I have. The tendency in the town is to drink tea. In the country I suppose they have a better chance of getting milk. They say they cannot get good milk in the town; they cannot afford to buy it.

367. It is not altogether want of food, but perhaps wrong food that is the evil?—Yes, very often, especially among the Irish population in Glasgow; particularly I have been struck with the diseased appearance of the children—rickets and so on; simply because they are badly fed.

368. If you made such a suggestion, and the Department were to attempt to carry it out by having any statistics or measurements or ascertained fact in regard to the health of the children, do you think that that would be received very readily by the parents, or would it be objected to?—I do not think they would object to it, because they probably would not understand what it was all about; but of course an expert would be required for such an investigation. The inspectors are not in a position to deal with it.

369. And the School Boards have not, so far as you know, made any inquiry?—No.

370. Into eyesight, for instance?—That is a point I have urged once or twice, both in Glasgow and Edinburgh—that the School Boards should have some expert or set of experts to visit the various schools, and to make inquiry into the eyesight and hearing of the various children, and to make recommendations accordingly; in fact, last night I was reading an article in the *British Medical Journal* by Mr Cheatle, who had examined 1000 children, and 50 per cent. were suffering from various forms of auricular disease;—which confirms me in the opinion that School Boards would do a most valuable thing in having some expert to visit these schools.

371. You think there would be no rational objection to such an arrangement if adopted?—The local doctor might say that this was interfering with his prerogative.

372. We could neglect that if the parents did not raise an objection?—I do not think they would object.

373. With regard to the uses of this drill, you think that it has no connection with the general bearing and conduct. But using these words as rather wider than mere manners, do you not think it has an influence?—I do think it has a most close connection with the general bearing and tone in regard to standing erect and occupying a proper attitude, and so on, and also instantaneous obedience to drill and precision of movement. I regard it as all tone to a certain extent; but I could not make out, in regard to Mr Cochrane's question, any absolute connection between politeness, which I understand to be more an innate feature, innate courtesy, which you cannot teach by any form of drill.

374. *By the Hon. Thomas Cochrane.*—I think everyone notices how polite, for instance, a soldier or a policeman very often is, largely the result, I think, of drill and discipline?—Is that not rather abstract politeness?

375. No, I do not think so; it becomes deeper than that?—It is a habit, of course.

376. It is a consciousness of the duty they owe to their neighbours?—That is their influence, but external and abstract; they do not take off their cap because they wish to show respect, but because they have been told to do so.

377. I was not thinking so much of that. There is a roughness often noticeable about juniors in Scotland that I think you would be aware of—roughness of manner?—Yes.

378. *By Sir Henry Craik.*—Would you not agree with these words that Lord Balfour used in the circular we issued, that these exercises—the military drill, as well as physical exercises—are 'pre-eminently useful' in developing those habits of comradeship, of responsibility and of individual resource, which are of supreme importance, not only to the nation as a whole, but to the individual pupil. Indirectly they bring the individual into contact with the principles which lie at the foundation of national defence, and they bring home to him his duties and responsibilities as a citizen of the Empire, and develop in him also, as it goes on to say, 'a certain self-respect and a respect for others.' Do you not think that there is all that to be got out of something in the form of military drill?—Well, there is a strong sense of duty and obedience.

379. But is not that a very necessary element?—Most distinctly.

380. And an element that, perhaps, is a little failing in the present generation?—Yes; I quite agree.

Mr T. A. Stewart, LL.D.

29 Apr. '02.

Health of children: investigation by expert; objections by parents unlikely.

Drill: its bearing on conduct and tone: relation to mental improvement.

Playground: no instance of common one provided for several schools: no objection unless by ratepayers.

Feeding of children in town schools: wrong kind of food.

Mr T. A.
Stewart,
LL.D.

29 Apr. '02.

Continuation
Classes :
physical
exercises
made more
interesting :
not com-
pulsory.

384. Then, besides that, there are certain forms of these physical exercises, especially if they went into the direction of practice in extended drill or in shooting, which would also develop the faculties of observation?—Yes.

385. And tend to a mental improvement as well as a physical and moral improvement?—Yes, no doubt.

386. With regard to the children over school age, you spoke in your evidence of the children in the secondary schools: have you not seen these physical exercises in your continuation classes?—Not to any great extent.

387. They are carried on in some places in Edinburgh?—Yes, but they are only slightly; and the difficulty there, Sir Henry, is that the younger children do not, of course, I think, do much in that way. The older lads form squads; but many of them have been occupied all day in various exercises, and are pretty well exhausted, but even then they seem to take an interest in the subject. But I think the thing might be made very much more interesting if physical exercises were dropped out at that stage, and something in the military direction introduced.

388. But do you not think it important that there is a considerable amount of leisure in the life of almost all boys between fourteen and, say, seventeen or eighteen years of age, which they are at a loss to use properly?—Yes.

389. Should you think that it might not be made compulsory, to have a form of some sort of drill or form of physical exercise during that period?—I do not think the compulsory idea is a good one, because it would make them take a dislike to it, and then you would never get them to join the Volunteer force, to go over the same mechanical routine again.

390. But at present the proportion without compulsion of those between fourteen and eighteen who come under any form of training of that sort is very small?—Very small.

391. The voluntary element has so far failed to secure a large number?—Yes. Well, no particular effort has been made in continuation schools to develop the subject; yet, I think, much more might be done than has been done in that direction.

392. But you would be afraid of making it compulsory?—Unless you make it attractive at the same time in some way, I would rather have some other inducement I think.

393. The only other subject I wished to ask you about was, your impression of the special teacher for these subjects as compared with the ordinary schoolmaster; which do you think is best?—I think a combination in this way—that there certainly should be a special teacher, to put the teachers upon proper lines, and to see that they conduct their classes properly; but I think every teacher should be in a position to drill his or her own class, and the drill should not be confined to any special visit or visits made by a special teacher, but, as a useful variety in the day's occupation, that the class teachers should be in a position to carry out the ordinary forms of drill, each for his own class.

394. You think that that leads to the best results?—I do not mean to say that the class teacher would ever drill a class so well as the specialist will; but, at the same time, it means that a larger amount of drill will be given, and possibly because the class teacher is better acquainted with the characters and dispositions of the children, they may be better trained than if they were simply taught by an outsider.

395. Have you in your eye men who have gone through a course of physical training, or merely the usual teacher who has come out from the Training College, and has no special qualifications of this kind?—I certainly prefer the one who has special training, as in the case of Aberdeen, in the Physical Training College there. I do not think that the ordinary teacher can learn a sufficient amount of drill from the specialist to be able to teach the children. I think they should all receive a special training in drill at some Training College.

396. Then that implies that any teacher should be able to take up this work?—Certainly.

397. And take it as a part of his ordinary professional work?—Yes. Of course, as you know, all our Training Colleges are teaching it—it is distinctly well taught there.

398. Then he must be able to carry it on if he moves from one school to another? He must be able to carry with him the physical instruction?—Yes, certainly.

399. Then that implies, does it not, that the physical instruction should be according to a uniform system—otherwise, he might come into a school where a different system was pursued?—Yes; but I do not think that there is so much difference between the systems as to cause so much trouble. They are all based on the same principles; the details are different, so far as I know.

400. But I mean if he did not follow, for example, the War Office drill-book, it would be confusing to his pupils and to the rest of his staff?—Yes; but I have no doubt that at the Training College he would get some insight into the various methods—he ought to, at least.

401. On the whole, you are inclined not to have a special teacher, but to have the ordinary staff of the school doing the work?—Yes, or both. As I have said, the specialist to guide these, but certainly the teachers should be able to drill their own classes.

402. Have you ever studied the question of the number of children who, out of our schools, get into the hands of the police, and the reasons for that?—No; I cannot say I have.

403. You have not turned your attention specially to this circular under the Youthful Offenders Act that we issued lately?—Yes; I got it and read it; but I have not been able to do anything in that direction yet.

404. That was Circular 347?—Yes; I have the circular. In Edinburgh, of course they say the impression is that it is not the children but the parents who are to blame; that the children would be willing to attend school regularly, but the parents compel them to remain at home by going messages and selling newspapers and so on, to bring money to them.

405. Exactly; and if we compulsorily laid hold of a certain part of that leisure so employed, we would probably interfere with a right of the parent—to a right that at present you think he abuses?—Yes, distinctly; I quite agree with that.

406. *By Mr Shaw Stewart.*—One or two more questions on the point Sir Henry Craik has been asking you about—the teachers being drill instructors. I suppose you would agree with the view that drill, if not effectively carried out, is worse than nothing?—Yes, certainly.

407. You feel pretty confident that it would be possible to make all teachers efficient instructors of drill?—Not in the highest sense; but then they would be able to do something.

408. Sufficient to make it interesting for the children?—Oh, I think so, in a small school; perhaps not in the large schools, where you expect more knowledge and experience.

409. But I suppose there would be an alternative way of teaching drill in Board Schools, by having expert instructors going round?—Yes.

410. One instructor for a certain number of schools?—That is frequently done, in the country especially.

411. But you would say that one system is as good as the other. Would you not say that the latter system would be more likely to be conducive to interesting and instructive drill?—Certainly, if the teachers are properly qualified to teach it.

412. Certainly; I am supposing certified drill instructors?—Certainly; I would much prefer that the teachers themselves should teach a branch like drill, assuming that they are competent to do so.

413. Why would you prefer that?—Because, for one thing, they know the children; and in the second place, they keep order; and some of these peripatetic drill instructors neither know the children nor can they

keep order. I think one teacher should teach as many branches as possible to his or her own children; it gives more unity to the school. I would avoid visiting-masters altogether, except in the case of necessary experts.

414. Would you?—Yes.

415. Just one question about boys joining the Volunteers. You said that compulsory drill to older boys might become unpopular, and might deter them from joining the Volunteers, because they would have to go through certain ground over again. Might that not be obviated by some form of certificate being issued to boys proficient in drill, which would exempt them from some of the more elementary drill when they join the Volunteers?—If such a certificate were accepted, of course, I think that would solve the difficulty.

416. That, of course, would rest upon the Volunteer authorities?—That would certainly remove the difficulty, so far as I can see.

417. *By Mr Alston.*—To refer to what Mr Shaw Stewart has said just now, of course that certificate would be from the school?—The drill instructor.

418. The drill instructor of the school?—Of the school, yes.

419. It would be available as far as it went, but the Adjutant of the regiment would still have to insist upon the examination of this boy before he passed him into the ranks. The certificate might not come up to his standard, his requirements?—Quite so.

420. I quite agree that that was a stumbling-block; the fact that the War Office insisted upon sixty recruit drills for a boy who had already mastered his drills?—Quite so.

421. That brings me to ask another question upon one of your remarks here, 'Physical exercises are based on physiological considerations in connection with the laws of health. Military drill is, I understand, subservient to the exigencies of active service. But it is surely available for a great many other things than the exigencies of active service. Does it not bring out all this obedience and respect to which Mr Cochrane referred. It is not a mere matter of 'mechanical use and wont.' Is there not something in military drill under proper supervision—complete military drill—that would bring out these qualifications?—Of course I meant to say nothing against military drill at all. That was written in a hurry. Military drill is not based directly upon any consideration of the laws of health or upon any general moral conceptions. That is the sort of idea I had in my mind; but, at the same time, I am quite willing to allow, of course, that military drill involves a very large portion of what may be called physical drill, with all those advantages; and it is only when specialised that I regard the subject as we were saying, 'military drill.'

422. But it not only has all the advantages of the physical drill, but it is plus something else which the mere physical drill will not give at all?—Quite so.

423. With military formation, military commands, military supervision, military discipline; you introduce a new element altogether?—Yes, quite so.

424. Then you remark further down, at the end of the page, as to some organisations in which a deal of good is done to boys, but it is doubtful if drill is their strong point. Have you any reason for pronouncing that judgment upon these organisations?—Well, I have heard it said frequently that Boys' Brigade drill is not the essential element that is taken into consideration; the social element enters, the element of conduct which drill may affect, also church connection too. Drill in these brigades is not so effective generally as in a cadet corps, say.

425. I am afraid that is rather too general?—I dare say.

426. Because, while the Boys' Brigade is a religious institution, drill and discipline is its strong point?—Indeed.

427. Drill and discipline, and, with the Red Book in hand, not a mere pretence of drill, but the actual drill itself is there. It, of course, depends on the capacity of the officer. We must have officers who can

drill effectively, and happily we have many who can. I can vouch for the fact that a Boys' Brigade company has been, in the matter of new requirements and alterations of the drill-book, in advance of Volunteer corps. Indeed, many of the Boys' Brigade companies drill better than the Volunteer corps; so that, other things being equal, drill is their strong point?—Yes.

428. Then it certainly produces, as Mr Cochrane brought out, the qualities arising from discipline, self-respect, *esprit de corps*, smartness, orderliness, obedience. We have been asking questions about the class teacher. You think it would be better that the class teacher should be the instructor in drill?—If properly qualified.

429. But you would make him properly qualified?—Certainly.

430. That is, you would drill him to the required standard?—Yes, quite so.

431. And then use his qualification as a class teacher, with due control over his boys, so as to produce the best results?—Yes, exactly.

432. *By Mr Fergusson.*—I am afraid I have not quite got into my head, the difference you make between drill and physical training. I rather understood at the beginning that you said you gave a preference to physical training, and you include in physical training a certain amount of marching and counter-marching, as, I think, you expressed it?—Yes.

433. That you prefer physical exercises?—Up to a certain point.

434. I mean for children up to fourteen?—Yes, quite so.

435. With a certain amount of drill, but you do not want any elaborate movements?—Quite so.

436. Then, as to its being popular with the children, do you find any difference? Do the children like the drill, or do they like physical exercises?—Oh, the physical exercises.

437. And the gymnasium?—Yes.

438. And the drills they get a little tired of?—Well, they do sometimes, I think.

439. There was another thing, looking at it in that way, that we need not be so concerned about the size of the playground, if we are not going into any more military manoeuvres, because the physical exercises do not take up much room?—It depends on whether the classes are individually exercised, or a large number of classes are taken together, in which case you require a large space.

440. Even if they were all taken together it would require a much larger space, if they were all marched up and down?—Yes.

441. There is a certain amount of discipline done—of marching—in the class-rooms. The children in a well-ordered school are all under word of command. They march in, they take their places at the word of command, they get up and file out. That is all in the way of discipline?—Yes, certainly.

442. Then you laid considerable stress on health. May I take it that you think more notice ought to be paid to health in several respects than is paid at present?—Yes; I think it would be an improvement and an advantage.

443. But would you be prepared to say that some official notice should be taken of the question of giving children food? It is left at present, you say, to voluntary effort?—Yes; I do not think it was ever proposed officially that the children should be fed.

444. Have you ever considered the question of doing it and making the parents pay?—Yes; a halfpenny a day, or something.

445. You have never considered that?—In the country I have. They get a basin of soup, for which the parents pay a halfpenny.

446. You think that is a good thing?—Distinctly a good thing.

447. More particularly if you are to give them physical training?—Yes. Teachers have told me that whenever this soup was introduced, the children were as bright in the afternoon as they were in the forenoon, fit for another hour or two's work.

Mr T. A. Stewart, LL.D.

tors qualified
by experience
to inspect.

449. That was my experience: I wanted you to confirm it?—Yes.

450. As to the inspection of the work by His Majesty's Inspectors, do you think that it is best that the drill should be inspected by the school Inspectors, or would you have special expert military men or others who are accustomed to drill and physical exercises to examine in these subjects?—I think that an Inspector, although not an expert himself, might by experience learn sufficient of the subject to be able to say whether physical exercises are conducted with precision and success or not; and if military drill is to be carried on to any extent, it would be desirable to have some military expert to pronounce an opinion.

451. In physical exercises it makes a great deal of difference whether it is done in precisely the right way or not?—Yes.

452. Nobody but an expert can form a very good estimate of that, can he?—An expert is a man of experience. If he has had the experience of a quarter of a century he must have picked up something about it, or else he is very foolish.

453. And about sewing as well?—Quite so.

454. As to the special teacher. I rather gather that you want to make the schoolmaster the principal teacher of physical exercises, with some supervision. I will put it to you what is done in my experience, and ask if this is what you mean, that the teaching staff should do all the ordinary drill and physical training at different hours through the week, and, say once a week, for one hour, a gymnastic expert should come to the school to supervise—it is like an examination every week—to supervise the work that is being done. He points out the weak places; he teaches not only the children but the teachers?—Yes.

455. That is the sort of system you would approve of?—Yes; an excellent idea.

456. Just one other question. We have been talking about the strain on the children; but what about the strain on the teachers if they are to be given all this extra work, and they are also to teach the children games and everything. I quite admit it is an excellent thing, but we are making a large claim upon them surely if this is to be done. Is there no way in which they might be relieved of some of the detail work that they have to do; some of these tables and returns that they have to make. Could we not relieve them in some way?—Well, I do not draw up the tables and returns. Sir Henry Craik can tell us whether or not they can be relieved from them. For the children, it is a relief to have change of occupation.

457. Is there an overcrowded curriculum?—There are so many subjects, really, in education; you cannot leave any of them out, otherwise people say you are

neglecting that subject. We cannot confine ourselves to one or two subjects. It is a very severe strain on the teacher to be expected to do all these things in and out of school?—Yes. I quite agree with you.

458. *By Professor Ojston.*—Have you ever known an injury from the system of physical drill as at present conducted?—No, I have never heard of a case; at least, I have no recollection of such a case.

459. Therefore you do not consider that in the medical system, as at present worked, medical inspection of the delicate children you refer to, is required?—Oh, I approved, in my former remarks, of medical inspection generally; not only with regard to ear and eye diseases, but to the general appearance of the child.

460. And if a more extensive system of physical training and drill were introduced, do you consider that a special set of medical inspectors would be required to prevent injury to the children?—The same inspection, I suppose; to report upon all the children in a school.

461. A medical man?—Yes.

462. But you have at present none, as I understand?—No. None that I have heard of.

463. Therefore some such system would require to be introduced simultaneously?—Yes. It was talked of in Glasgow some years ago; it was recommended very strongly there.

464. At present you find no difficulty in the drill of female children, such as to require the adoption of a special dress?—No. In secondary schools they usually have a special dress, but not in the ordinary elementary schools.

465. And if a more extensive system of physical training could be introduced, could it be done without a special dress for the children?—Certainly.

466. I should like to know who was the author of the paper in the *Medical Journal* about 50 per cent. of the children?—Mr Cheatle.

467. *By the Chairman.*—I suppose you can say so as well as anybody else. It is perfectly in the power of the Local Authority of Health, which is the District Committee in Scotland, to order the medical authority to inspect every school?—I should think so, but I should prefer Sir Henry Craik to answer that question.

468. I am talking of nothing to do with this occasion?—I do not see why he should not.

469. You have never known a medical officer of health inspect a school, have you?—Not for that purpose; but on a recent occasion I found the sanitary arrangements all wrong, and I found they would do nothing. That is a different story, but I got the medical officer of health to work with me then, and he has co-operated with me.

470. Not for the actual animal question—the children question; it was the other kind of animals?—Yes.

The witness withdrew.

Sir LAUDER BRUNTON, M.D., F.R.S., examined.

Sir Lauder
Brunton,
M.D., F.R.S.

29 Apr. '02.

471. *By the Chairman.*—It is very good of you to come here, and I am afraid you have been rather hurried in what you have had to prepare, have you not?—Well, I have thought over the subject a good deal before.

472. I think it would be better if you were to speak to the Commission from your notes?—I have no notes, but if there is any line upon which it would be more convenient for me to speak, I would follow that line; or if you have got a series of questions there upon which you wish information, I could give, as far as possible, information upon them.

473. Well, the system of drill, physical training, etc., in vogue; its general effect upon the physique of children up to fifteen, then also from fourteen to eighteen?—Upon that I can give no definite information.

474. You are not sufficiently acquainted with what goes on?—I am not sufficiently acquainted with it.

475. Secondly, the system originally intended for adults and for children, what the effect of that would be. That you can hardly say, but as to the general

effect on the growth and development of children that is likely to result from physical training, upon that you will be able to say something?—Yes; the point that struck me first of all when I began to think over the subject was the necessity for it, because, although I made no personal observations upon the subject, I think one may take it for granted that the physique of the rank and file in this country has undergone a deterioration.

476. By this country do you mean England or Great Britain, or do you mean everywhere?—I mean England, Scotland, and Ireland, the United Kingdoms, from which the recruits are drawn for the army, though probably this has occurred to a greater extent in England and Wales than in Ireland. My reasons for believing this are the statements which have been made, and which have not so far been called in question, that (1) the standard for recruits has been lowered; (2) notwithstanding the lowering of the standard, a number of men who have come forward have been rejected; and (3) even of those who have

been admitted, a number are spending a much larger proportion of time in hospital than ought to be the case.

477. May I ask 'time in hospital,' from what cause principally?—No; I was only taking the general account as given by others of their spending time in hospital, more especially as indicating a general want of stamina. Of course, if one were to enter into the causes of the men spending a long time in hospital, we should cover too much ground.

478. I have a certain amount of knowledge of military hospital life. I merely wanted to know whether it was from want of development, or something of that kind. I mean, you cannot go on a list of hospital patients?—No; that is quite true.

479. And I should further ask whether, in your opinion, such a want of development and such weakness in that way is attributable to any racial cause, or very largely so; and if so, whether an amount of physical training would in any way help them, or could in any way help them?—Well, I think it is not the racial cause, inasmuch as the race is to a great extent the same. I mean the race is the same as it was in the time of the Napoleonic wars, so I think that we cannot attribute any failure to come up to the standard to change in the race, and that we must rather look for the cause in the altered habits of the individuals, and possibly to the draining away by emigration of those who are fitted both mentally and physically for war. It is the energetic men and the strong men who emigrate, and the weaker and less energetic are often left behind, but, in addition to that, there has been a tendency for the population to aggregate in large centres, in cities, and to leave the country districts. Life in cities is not so favourable to the development of the individual as life in the country, taking it on the whole, and the confinement, the want of fresh air, and the want of exercise are certainly things that tend to deteriorate the health. Of course, on the other hand, we may say that men coming to towns earn larger wages, and get better fed; and although this may tend to a certain extent, yet it does not seem altogether to make up for the other deteriorating influences upon the progeny of the men who come from the country, so that there is a tendency for them to become poorer, weaker, and, it is stated upon what I believe to be fairly good grounds, that they tend really to die out in cities after perhaps the third generation. If we are to keep our men up to the standard, we must try and counteract these things. We cannot prevent emigration; we cannot prevent the congregation of people in cities, and if they are to come to cities, as they almost certainly will do, we must try to provide something in the city to counterbalance the effect of congregating together, the want of exercise, and the want of fresh air. Efforts have been made so far to provide fresh air by parks, but there is a great want of providing anything like the exercise that children get in the country, and I believe that a good deal of the depreciation is due to the want of the opportunity of getting exercise amongst children in large towns.

480. May I ask what your opinion is about the idea of children, instead of being in the open air, being shut up in all the brightest and best parts of the day in what is very often a very stuffy school?—Objectionable. I believe if school hours were distinctly shortened and the hours of play lengthened, provided the children could be occupied fairly during these hours of play, they would do very much better work; and I may say that in Germany, from what I have heard lately, they are beginning to recognise the disadvantage of long continued strain upon the children, so that instead of giving them lengthy hours together of mental work they are giving them a quarter of an hour interval at the end of each hour, that is, a quarter of an hour interval spent in play, or at least in some sort of exercise that the child regards as comparative play; and more especially, I think, it is very advisable that in such intervals the child should be allowed to shout and scream as much as it likes. Children take an enormous amount of pleasure in simply shouting and yelling. It is very disagreeable for their neighbours,

but it is awfully good for the child. It is the kind of exercise that allows the child to develop its lungs, and if we can introduce exercises that will develop the lungs, we will not only make it fit for everything it attempts in after life, but we shall probably do a great deal to abolish what many men are so anxious to abolish now, the curse of consumption. At the present time there is an attempt to abolish consumption which is a one-sided one. We are directing our attention chiefly to the germs of consumption, and trying to abolish them, but we have not been paying the attention we might do, although we are beginning to do so, to the soil upon which those germs have to fall, and upon which they grow—to the human body. It is now known that if a person is perfectly healthy he does not take consumption even when exposed to germs; that in consumptive hospitals the attendants as a rule—in fact the attendants with very few exceptions—do not take consumption, because they are healthy. If you bring a weakened person into contact with an affected person it is very probable he will catch the disease and die from it, but if the person in attendance on the consumptive is perfectly healthy, there is very little chance of him or her getting the disease, so that if we can by proper exercises develop the child's lungs and develop its circulation, develop its limbs generally, we shall lessen the tendency to consumption, and how far we may lessen the tendency to other diseases it is difficult to say. We shall not abolish them, but we may greatly lessen them. Now it is not amongst the upper classes that there is the want of physical exercise, because amongst the upper classes there is perhaps too much physical exercise. At Oxford and Cambridge, and at public schools, perhaps too much time is devoted to physical exercises, and there is no doubt that individuals are, if anything, coming above the old standards, because again and again the records have been broken in almost every department of physical exercise, so that it is quite clear that those who have the opportunities for exercise are not deteriorated, that they are coming, if anything, above the old standard. It is those who do not have these opportunities who are deteriorated, and it is to supply to them who have not got it in sufficient measure the exercise that some of the upper classes have got in too great measure, that one would like to introduce some such system as this.

481. Then, as to the matter of food, I suppose you are very much of opinion that if extra physical exercises are given, extra food should be insisted upon?—Yes.

482. Even though the amount of food which is given would be more than the children of what we call the lower classes are, as a rule, accustomed to in their daily life. It is quite correct, I think, to say that there is a tremendous difference in the amount of food that is consumed by one class and another class?—Oh, yes; but I do not know that we can insist upon the fact. I rather think that if we insist upon exercise, the children demand the food; and if we give children exercise, we will thereby give them an appetite, and the appetite will regulate the amount of food the child takes.

483. Then it is perhaps questionable, particularly as a loaf gets dearer, how they will get that food, is it not, in your opinion; if we do urge an increase of physical training in ordinary schools for children, we should equally urge some increase in the way of food. Do the two things not go together? Is it fair to urge the one without urging the other?—Yes; I think it is. I think it is fair to urge the exercise without the food, because I think that the exercise will regulate the question of food by itself. I do not think it is necessary to take up the question of food.

484. By Professor Og-ton.—I should very much like if you would allow me to ask Sir Lauder's opinion upon one or two points. As a medical man, do you think that physical development, physical superiority, would favour brain development. Do you think that it would tend to improve the intellect of the individual if his physical system were developed by training?—I do. Shall I say why? It is not necessary to say why.

485. As we are dealing mostly with children, can

Sir Lauder Brunton, M.D., F.R.S. 29 Apr. '02.

proper exercises most important.

Food; exercises if introduced will produce appetite; amount of food regulated thereby.

Brain development promoted by physical development.

Sir Lauder
Brunton,
M.D., F.R.S.

29 Apr. '02.

Medical in-
spection
advisable.

you help us in the matter of statistics of the weight and height of healthy children. Do such exist in any reliable form?—That I cannot help you with, but I can tell you, I think, who can. I think you will get that from Dr Kerr, who is now the medical officer of the London School Board, and who, while he was at Bradford, I think, took a great deal of interest in the height and weight of healthy children, and in the effect of exercise upon them. A good deal of work has been done also upon the growth of children, by Professor Henry Bowditch of Harvard, and if you are anxious for it I could get someone to abstract his papers.

486. Then you do not know whether any statistics of disease amongst children exist either in England or in Scotland?—That I cannot tell you.

487. Have you had any experience of injury to children from physical training, say the production of rupture or the favouring of heart disease?—Heart disease I have seen.

488. To a considerable extent?—No; I cannot tell you, because I have not any statistics on the subject. I can only say that I have had cases come before me of boys who had overstrained their hearts.

489. And do you think you should give the Commission any cautions in regard to that from the result of your experience?—I think, certainly, that while exercise is exceedingly good, over-exercise is exceedingly bad.

490. Has it come under your observation that children with ear disease, perforated drums, have got serious brain disease from swimming?—Yes; at least from having their heads under water.

491. And do you therefore think that a medical inspection of children is at present a necessity?—Certainly, very advisable. I do not know that I should say absolutely necessary, but very advisable.

492. Would it become a necessity if there was an extended system of physical training introduced into the schools in Scotland, including swimming drill and physical exercises?

493. *By the Chairman.*—Perhaps you would allow me to add, bearing in mind, that in the case of soldiers they are constantly under medical superintendence, and sailors too?—I think they ought to be under medical supervision, to avoid any risk of mischief being done.

494. *By Professor Ogston.*—Then the last question in which your experience might help us is this: Do the urban children differ in their standard of health and resistance from the country children?—My experience does not help there, but that question was gone into by Dr Cantlie, who wrote a book upon the subject.

495. Dr James Cantlie?—Dr James Cantlie.

496. This corollary to it, whether urban children need drill more than country children, you also would not give an opinion upon?—No, I cannot give it absolutely. I should think that they would need much more, because they do not have the same opportunity for exercise. The country children take a lot of exercise of their own accord. They have got larger scope for outdoor exercise of all sorts.

497. *By Mr Fergusson.*—On the question of food, you said, I think, that it was very desirable that children, especially if they were being given physical exercise, should be as well fed as possible, and you would not have this Commission have anything to do with the food question. You thought, if physical training created an appetite, the child would find food somewhere?—Yes; I think so.

498. But where?—I should think simply where it got it at present. The father and mother of the child would provide the food.

499. But the father and mother are not there, you know. Take a child that leaves home. I am thinking more particularly of country schools, and in Scotland a child has to breakfast at seven o'clock or so, and goes to school, and is not back at home until, perhaps, five o'clock in the evening. Now, we in the school are creating this craving for food. Where is the food to come from? There is no father and mother for several miles?—No; the child takes it with it.

500. Yes; the child has food, of course, if it has it with it?

501. I suppose you have not had much experience of what children in country districts in Scotland do bring to school with them?—Oh, yes; I have had my own experience—a bottle of milk and bread and cheese.

502. Certainly; but I am afraid they do not always fare so well as that. But that I would consider very well fed. Then that is all they want?—Yes.

503. If they are not getting that—if they are not being well fed, it would be almost necessary to take some steps to see that they got as much as a bottle of milk and some bread and butter, or something of that sort?—Yes; but it seems to me that the parents would provide that.

504. Certainly. I was not suggesting it should be given them. Let me put it in this way, that it would be a good thing, as far as possible, to make arrangements so that this craving might be supplied in some way or another?—Oh, surely.

505. You do not think that food is immaterial?—Oh, very far from it. I perhaps have not really understood what you meant. I have no doubt whatever that if the child gets more exercise, it will want more food, but the amount of extra food that it will want cannot be arbitrarily determined.

506. No?—Because it varies for every child as it does for every man. It is well known, for example, that you can get much more work out of certain races than you can out of others upon a definite amount of food, and that some of those races are really winning in the struggle for existence because they are the cheapest machines. The Italian, perhaps, in Europe, and the Chinaman in Asia, are probably about the cheapest machines going. They can do more work upon a given amount of food than others who want a very large amount of food and do not do anything like so much work.

507. While we are on the question of health, and while very desirable for educational purposes to increase the health of your children, did it ever occur to you, for instance, that children coming and sitting for hours in wet clothing is not conducive to health?—Oh, far from it.

508. Then, when we want to make men healthier, would it not be desirable to try and deal with that matter in some way?—Yes, undoubtedly. The only reason I did not take that up at all is, that it did not seem to come quite within the scope of the physical training.

509. Except, of course, if you are going to give them physical training, you must attend more to the health; therefore, in health, the question more or less comes in?—It is quite true, but that would come in the ordinary course of things. Practically, if you are going to introduce physical training, that is really of less importance than it is at present, because, by increasing the strength of children by physical training, you make them more able to resist the effects of such adverse conditions as sitting in wet clothes.

510. *By Professor Ogston.*—Would it be convenient for you to abstract for the Commission the opinions of Bowditch of Harvard upon the growth of children?—Yes, I will do it.

511. You, I think, offered to do so?—Yes, but for the health I think Dr Kerr should be applied to.

512. Might I ask who Dr Kerr is?—Dr Kerr is now the Medical Officer of the London School Board, and he was formerly Medical Officer to the Bradford School Board. I believe he has just recently been appointed.

513. *By Mr Alston.*—You spoke about the condition of the populous towns being inferior, of course, to that of the country. I remember a recruiting officer remarking that he got his best recruits from London. Would he be justified in saying that with regard to the physical condition of the men?—No; but he would be quite justified in saying that in another respect. The same thing was found in the American war. It was not the country boys who, I think, stood the greatest privations, but the town boys. The reason, I think, is simple enough; that the town boys are all the descendants of country boys, and after one or two

generations, if they are not all dead, they are either so far depressed in physique that they do not get into the army, or if they do get into the army they may be the survivors of the strongest men, and so the best recruits may come from the towns, because they are simply the survivors of strong men—all the descendants of strong men in favourable circumstances; and although, when put in adverse circumstances, they may not be up to the same mark as country boys, yet when you come to treat the whole lot of them with the poor food, privations, and so on, the recruits got from the towns may be even better than those got from the country. The general impression, I fancy, hitherto has been that it was the country bumpkin who made the best soldier on account of his physical strength, not on account of his endurance. I was struck with the remark, and wanted to know whether it was on the ground of his physical condition that he was warranted in making it. It is not so much the physical strength; it is rather the power of enduring privation, and going on under adverse circumstances, and then in addition to that, you have, as a rule, the quicker mental powers.

514. Probably one of the examples of Kipling's 'Soldiers Three'?—That is all.

515. Then again, you spoke of the shouting and screaming and running and jumping as being necessities of child life. Is there not a remarkable display of that in the street?—Yes; but at the same time if a man is tired, has been sitting a long time, the way in which he rests himself most thoroughly is to yawn. It is to expand his lungs to the utmost, and the child, as a rule, does not yawn so much. It simply opens its mouth and yells, and that is the child's equivalent, I think, for the man's yawning.

516. Then would you introduce that yelling at a certain period of the day?—Yes.

517. And would you do it *versus* physical drill?—Oh no, as an accompaniment to physical drill, for the purpose of developing the child's lungs.

518. Probably your object would be attained by supervising games?—To a certain extent, though not entirely, by supervising games, but you should have a certain amount of regular physical drill as well, because in games you get only certain muscles exercised, whereas in physical drill you would get regular systematic development of the body.

519. With reference to the point Mr Fergusson has brought out about the feeding, of course, as you know, in large towns the tendency of the parent is to hand over his child to the public, and make them feed and clothe it, and in every way care for it. If you increase the physical exercises you must increase the food, and someone must provide?—Yes.

520. By Sir Henry Craik.—At what period of life do you think that this physical exercise is most required? In the early years of school life, from five to fourteen, or older?—Between five and fourteen, I think.

521. Of course there is a great waste after that, from fourteen to eighteen, of energy that is misused?—A great deal.

522. What you think is most urgent is to improve the physical exercises during the actual school life of the boy before he gets to fourteen?—I think so.

523. You spoke of shortening school hours. What do you think is a fair school day for a boy of that age, from six or seven to thirteen or fourteen?—I think, if you were to work them, really work them, for four hours, you would get as much out of them as they could stand.

524. We do not give them more than two hours in the morning and two hours in the afternoon. Then if we add to that, you would add physical exercise beyond that?—But I should take off so much from those hours; I should do as the Germans do.

525. Yes; interrupt them?—I should not only interrupt, but I should cut off. I should make the three-quarters of an hour equivalent to the whole hour, and I believe that by giving them an interval of a quarter of an hour you would make the three-quarters of an hour quite equal in time for learning.

526. That is to say, about three hours a day as the ordinary teaching?—Yes.

527. And you think that the physical exercises would make a greater strain upon the organisation than the brain work, and will raise the appetite?—I think so.

528. More than the brain work?—More than the brain work, I think.

529. Exhaust the whole physique more?—Well, it is simply a question of combustion, or chiefly a question of combustion. The muscles require more energy than the brain. Although the work turned out by the brain is of a higher quality, yet the muscles require more actual energy. It is very like the comparison between a clock and a windmill.

530. That is, the physical exercises, I take it, in your view, would be useful in the later years, but, from a physical point of view, more important in the early years?—Yes.

531. One more question. Do you draw any distinction between the sexes as regards the necessity of such physical exercises?—No.

532. You think they both require it?—They both require it.

533. And, as a national necessity, it does equally embrace them both?—Equally, I think, and some would say perhaps even more necessary for girls than for boys.

534. Is your own experience that the effect of it is wanted more in the boys?—No. That is not my own experience, but that is the opinion come to by Professor Mosso, who came over here to investigate the whole question of physical education both for boys and girls, in order to report to the Italian government.

535. By the Chairman.—When did he come over?—It was, I think, about twelve or fifteen years ago. I could easily get the date.

536. By Sir Henry Craik.—I should have thought that, to a certain extent in the case of boys, the object of physical exercises was to develop the muscles; in the case of girls, rather to prevent the disorder of the nerves, to prevent hysterical or nervous illness?—Yes, that is true; but then, on the other hand, that is one of the questions into which Professor Mosso has gone. He has written a little book, quite a small pamphlet, about it, on the physical development of women, and he discusses the necessity of the muscular development of women in regard to child-bearing.

537. By the Hon. Thomas Cochrane.—I hardly like to ask you, with regard to the information you have given us, but you are evidently a sympathiser with child life. I should like just to ask you. You have mentioned, I think, less work and more play?—Yes.

538. And I think the general tone of your evidence rather points in the direction of games and amusements for the children than the daily squad drill?—Surely.

539. You would rather that their physical exercises should not be too mechanical?—Certainly.

540. Might I ask you, have your investigations led you to examine any particular systems of physical exercises?—I have not gone thoroughly into the systems from the point of view of development especially, but from the medical point of view I have studied the subject of physical exercises to a considerable extent, and I am quite sure some of the most useful exercises are those of simply moving the arms without apparatus, waving the arms about, and extension in various directions from the shoulders.

541. Something in the nature of what is associated with the name of Sandow?—Yes; Sandow's method is a good one, because most athletes get hypertrophy of the heart.

542. By the Chairman.—You say Sandow's is a good system?—Sandow's is a good system. Most athletes get hypertrophy of the heart, and some years ago Sandow exhibited himself and allowed medical men to examine him. I thought that I should certainly find hypertrophy in any man who was lifting such enormous weights as he had been, and I found that he had not got it, and his heart was a regular, steady, normal heart, and I came to the conclusion that if he

Physical exercises : useful in later years, but more important in early years : both sexes require them.

Games preferable to squad drill.

Physical exercises : the most simple are the most beneficial.

muscles : physical drill well ; never only exercise certain muscles.

physical exercise : most tired for and thirteen.

school hours : hours of work efficient : able to face hours three-quarters of an hour, and in physical exercises.

*Sir Lauder
B. unton,
M.D., F.R.S.*
29 Apr. '02.

were able to do such extraordinary feats of strength without getting hypertrophy of the heart, his system must be good.

545. *By the Hon. Thomas Cochrane.*—In instituting any system in connection with School Boards, would it be a good thing, do you think, to have some expert, someone like Mr Sandow, to start the system, or to advise upon a system in the Board Schools?—I think it would; I do not know whether Sandow would be the best.

546. I am merely mentioning him as a man who had a system—some expert?—Surely. Of course most of those things have been worked out very thoroughly in Sweden. Ling was the first man who worked it out, and he had a number of successors, and there are a great number of books for physical exercises for boys and girls, published both in Germany and France; not only in Sweden, but translated in Germany and France; and if it is of any use, I have got a number of these books, and I should be very glad to send them down here for any one to look at.

547. In connection with this, do you happen to know Professor Montzi, a professor of physical culture?—No; I do not know him.

548. A Swede?—No.

549. May I ask you, have you seen the effects of these different systems, these Swedish and French and German systems in operation?—No.

550. You could not, from your experience, tell us the appearance of the children, whether they seem to have benefited by these systems?—No; I have had no opportunity of studying children.

Physique of
nation
deteriorating:
standard for
recruits
lowered:
possibly
owing to
getting dregs
of classes.

551. Now, as to this most interesting but rather alarming statement that you made in evidence, that the whole physique of the nation seemed to be showing a certain amount of deterioration?—Except in the upper classes, and the reasons—the data—I took secondhand. The data that I have got, and which I have seen in periodicals, are, that the standard has been lowered. That I believe to be the fact. The physical standard for recruits has been lowered. Notwithstanding the lowering, a number of the men who come up as recruits are unable to pass into the army, because they do not come up to the standard. All those who do come up to the standard physically, I

mean as regards height and size, are not up to the standard of proper health, because, after getting in, they break down, and are unfit for the work of a campaign.

552. I believe there is no doubt that is so, but I hardly like even suggesting it to you, but might it be possible that we are now taking a greater number of recruits from the same classes, and also that wages in civilian life are higher, and the pay of the army has not increased for some forty or fifty years until quite recently. It has not had any effect yet, and that, therefore, you only get the dregs of classes, instead of getting better developed ones?—That might be so.

553. It is not quite sufficient, this unsupported testimony that the physique has deteriorated?—I should think that the man who could give you the best information about that would be Colonel Notter, the principal medical officer at Aldershot.

554. And then, again, the improvements in the standards of the public schools; you base that partly on the fact that in athletics they have broken what are commonly called records?—Yes.

555. Is that due altogether to an improvement of the general standard, or is that due to a specialising of individuals—a better system of training, for example?—Well, that is hard to say. I took it simply that the record had been broken all round. It gets broken all round, excepting possibly the high jump. That jump does not get much higher, but in almost everything else they seem to be breaking the record; and although, as you say, it might be simply specialising of individuals, yet there are so many of them that one might almost take them as a class.

556. You form the conclusion that, on the whole, public school boys are better now than they used to be?—Yes.

557. And that in the upper classes the physique is rather improving than deteriorating?—Yes.

558. But you are still under the impression that in the lower classes it is sadly falling off?—It is sadly falling off; yes.

559. And that some system of physical training might have an advantage on the general health of the nation?—Yes.

The witness withdrew.

Adjourned.

SECOND DAY.

Wednesday, 30th April 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT :

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr ALEXANDER WALKER, examined.

*Mr
A. Walker.*
30 Apr. '02.

560. *By the Chairman.*—You are Inspector at present in the Aberdeen district, are you not?—I am—Aberdeen and Kincardine.

561. And how long have you been there?—Five and a half years.

562. Previous to that you were?—I was nearly twenty-seven years in Perthshire.

563. Perthshire?—Well, when I say Perthshire, the

Perth schools were the only ones that I inspected all that time, but I was in Fife, and Forfar, and Kinross and Clackmannan. I began with the schools in connection with the Church of Scotland, real or nominal, in the whole of Fife, and the whole of Forfar, and the greater part of Perthshire. Then, after the passing of the Act, my district was confined to all the schools in Perthshire, and Kinross and Clackmannan. Then, as

*Sir L
Brun
M.D.,*

29 Apr. '02.

Physiq
upper c
tending improv

*Mr
A. W
30 Apr. '02.*

the schools began to come in after the passing of the Act, my district was restricted to Perthshire, and again, after a little, the part of Perthshire adjacent to Stirling was attached to that district.

564. In the paper which you sent in you say, you wish first of all to say something about the rise and progress of physical drill in Perthshire?—I think I should say something about that.

565. Before you go on to say that, will you tell us something about what it is in Perthshire?—Well, when I began in Perthshire I may say that drill was non-existent, there was very little even of school drill. The children were allowed to come into the school anyhow and with any amount of noise until the work actually began, and to rush out in the same manner after the work was done. We tried as much as possible to introduce school drill, so as to get orderly coming in and going out, and an orderly changing of classes. Well, that had some effect, and it went on to some extent, and then, by-and-bye, when the towns began to find out that it was cheaper to build one school for 1200 children, than to build, say, four schools for 300, or six schools for 200—they generally attached to these buildings a janitor's house, and the janitor was very often a retired soldier, a retired sergeant that is, and he took charge of the children while they were in the playground, and, naturally, they availed themselves of his services to give them some drill. This drill consisted always of the old-fashioned military drill—marching and forming fours, and turnings, and changing rank, and so on, along with two or three of the extension motions that were prevalent at that time. Well, the marching was a very good thing; it is one of the very best exercises a child can have. The extension motions were good in their way, but they generally consisted of three minutes' minute instructions as to the position of the thumb with regard to the seam of the trousers, and so on, and three seconds of the motion on the part of the scholars, and then they waited another three minutes until they got their next order, and then they went on again. Well, practically, that amounted to very little. It was good in its way, but it did not give the boys the continuous exercise that they require. Sometimes the sergeant would say, after giving them their orders and getting the thing started, 'Continue the practice,' and they would continue the practice for perhaps half a dozen times, and then they went on to the next one. Well, that was the rule generally. Those sergeants had very little control over the boys, and they did not keep order, and they occasionally got into barrack-yard language with them, which was not very good either for the scholars or anybody else. That was the sort of drill that prevailed.

566. That was only in towns, was it?—That was mostly in towns.

567. Mostly in towns?—I may say it was confined to the towns.

568. In the case of Perth, did that include the Academy and Sharp's Institution?—I had not anything to do officially with either of them. I had only the elementary schools, and they had them in the big schools. In the Caledonian Road School there was a sergeant, and then they had one in Balhousie School and one in Craigie School. The janitors there were sergeants, and they had a man employed, Sergeant Smith, to go round the other schools they had there for drill. The only exception to that form of drill I had was in Blairgowrie. There was a Sergeant Wilson there, who had learned a good deal of the new drill somewhere—at Aldershot perhaps—I do not know where, and he put them through a good many exercises of a better kind—the new motions, a little leg practice and arm practice, and he had them down on their faces occasionally to stretch their limbs, and that I considered to be of importance in many ways, although some of the exercises I thought were not quite suitable for boys; they were more for grown men. Then, towards the year 1888, perhaps—I cannot give the exact year—a Mr Davidson came to Perth to be instructor in physical exercises. He brought in

an altogether new sort of thing. He brought in musical drill, and he put the boys and the girls, from the youngest to the oldest, through their exercises to musical accompaniment, and I considered that a very great improvement indeed. It is the sort of thing that prevails now in all our elementary schools, and I consider it to be a very great improvement upon the old thing.

569. Then when you went to Aberdeenshire, what did you find?—Well, when I went to Aberdeenshire I found that Colonel Cruden's system of physical exercises was in pretty universal use. He has kept up this for, I suppose, something like thirteen years now, and he trains a great number.

570. Was this mainly in the town, or in the country districts?—In the town.

571. Entirely in the town?—He is an Aberdeen advocate. He is an advocate in the town, one of a firm of lawyers there; but he has made a hobby of this physical exercise, and he set up a physical training college about 1888, I think, and trains people, and sends them out to the schools wherever they are required to drill the children, and that prevails in all the schools in Aberdeen. They are supplied—a good many of them—by his drill-sergeants, men and women. And then he has classes in the summer time for teachers. He takes them by relays, gives them a fortnight's drill at a time. Teachers from the country were always very willing and very ready to avail themselves of that, and willing to spend a part of their vacation in that way; and they come in larger and larger numbers, and they go back to their schools more or less prepared to put their scholars through the same kind of drill. When I went to Aberdeen the work was pretty much confined to the Aberdeen county, but he has extended it now to Edinburgh and Glasgow, where he holds summer classes for teachers, and he has trained up a great many teachers in that way, and they go through his drill, which I think a very good form of drill for children.

572. How many schools are there in Aberdeen?—In the town of Aberdeen there are, counting all sorts, forty elementary schools.

573. And to some extent does drill of this kind prevail in all of them?—In all the schools.

574. In the town?—In the town and in the country.

575. And in the country too?—Oh, yes. Drill is now universal, because the Department took up the subject very warmly, and they advocated the thing, and in 1896, I think it was, put into the Code that the highest grant for discipline would not be awarded unless drill—some sort of physical drill—formed a part of the curriculum, and that, of course, set them all agoing. They all set agoing some drill of some sort, and that made it universal in the schools.

576. Do you examine these schools at your inspections?—Oh, yes. I see them drill.

577. Do you find any difficulty in making yourself a drill examiner?—Oh, no. I don't put them through it myself. I see the thing done.

578. I mean, you never had any experience of drill yourself?—No.

579. But from practice, you have become sufficiently well acquainted?—I can judge of drill just as I can judge of sewing. I could not sew a seam, but I have examined so many thousand specimens of sewing that I know when it is well done or ill done, and it is pretty much the same with drill.

580. There is one thing I should like to know: what is the usual custom as to the time of day at which this instruction is given?—Well, it varies very much. It is according as they find time, and there is, perhaps, a little complaint to be made on that head. I think they trust rather too much to the half hour a week or so that the drill instructor from outside gives, instead of making it part of the daily routine of the school.

581. Who has the control of that—the School Board or the teacher?—Practically, the teacher. He makes out his time-table, but I think the thing is left rather too much to the outsiders. Instead of say half an hour a week, I should prefer men or women from outside coming to drill the scholars; they should get from their

own teachers ten minutes in the forenoon, ten minutes in the afternoon, or ten minutes at any time, should they seem to be required.

582. Then do I understand you that the instruction is only given, say, once a week, not every day?—In certain cases it may be only once a week, but when the teacher overtakes it, it is taken every day at the time it occurs in the time-table. There is generally a time set apart for it daily.

583. But sometimes it is missed?—Sometimes it is missed.

584. And held over until the professional arrives on the scene?—Yes, very often it is; but I think the kind of exercise is well suited to that. The kind of exercise that Colonel Cruden's people put them through is what I think they want, that is to say, the furthering of the pupils' health. What you want is to expand their chests, and to develop their breathing power, and in that way to send more blood through their bodies, so as to keep up the heat, and to keep up the growth, and to keep up the nourishment. That is what you want.

585. Now, you have no statistics as to the children's health in any way, or development?—No, I have not. That is a great defect in our school system. There ought to be a regular medical inspection of schools, and everything connected with them.

586. May I ask whether you have ever recommended such a development?—Yes.

587. You have?—Yes, I have in my reports—my general reports to the Department. I have recommended that there should be regular medical supervision of the schools and the children. In the first place, it is a regular thing, every autumn and every spring, to have a sweep of epidemics all over the district. They take measles, whooping-cough, mumps, diphtheria and scarlet fever, and all these abominations, and I think a great deal of that might be prevented with medical supervision. Things are not so bad as they were, because we visit schools now at irregular intervals. They do not know when we are coming, and they try to keep things shipshape all round, in case we should come down upon them and find them lacking. In the old days it was very often the custom for the privies to be cleaned out just the day before we arrived for the year, and the school got its annual wash the day before, so they kept us marching over wet floors reeking with ammonia. They had been cleaned only once a year, and they required a strong man to stand it.

588. But you quite understand that people cannot always live at high pressure?—Well, the Department tries its best to make us do it, I know.

589. You consider that an improvement in the children's health, or the health that has been exhibited to you as inspector, has resulted from these surprise visits?—I think so, because they keep the place clean—they keep the place cleaner. It is regularly swept out now and regularly washed, at least much more regularly than before, and the outside premises are kept in a better state, but still they would be the better for the medical supervision.

590. Then, putting it shortly, you rather seem to say that what is going on at present is sufficient, in your opinion, as regards the physical training?—Well perhaps not exactly; there is this lacking in it, that a good many of the teachers do the thing by rote. They have no proper knowledge of the physiological ground of the thing, and they may give them exercises that are not suitable to the children all the time, or exercises that are not quite suitable for some of the children, and they do not know which it is suitable for and which it is not.

591. There is no common system; there is no manual, as it were?—Oh yes, there is this manual.

592. And do they stick to it?—Yes.

593. What manual is it?—It is Major Cruden's manual that is used all through.

594. But is not that manual drawn up with regard to different ages, and so forth?—Of course there are exercises appropriate to this department of the school, exercises for the other, and so forth.

595. Do you make a distinction as to what exercises

you give to girls, and what you give to boys?—No, I do not think it is at all necessary up to the age of fourteen.

596. Up to the age of fourteen?—I think the exercises are quite suitable for both of them, and the exercises should be such as have nothing to do with endurance; indeed, they should not be exercises to promote endurance; they should be exercises involving speed, involving as many of the muscles as you can bring into operation for a short time, with intervals of rest.

597. Is there any practice, in the town of Aberdeen, say, in swimming?—A little.

598. In connection with schools?—In connection with schools, yes. There was an exhibition of that last Friday night for the scholars of one of the schools in Aberdeen, the Hanover Street School, down at the Public Baths. There are no baths attached to any of the schools in Aberdeen, but the swimming baths are quite handy. There was a swimming exhibition there. I could not go myself, but one of my men went, and he was very much pleased with what he saw. I should very much like to see that extended.

599. Is that for both sexes?—Yes; I have no objection to that for both sexes, girls as well as boys. It is quite suitable for girls as well as boys. The display at the exhibition went on very well. There was swimming, diving, life-saving, and so on. It was very successful, and I should like to see that extended to all scholars.

600. I should like to have your opinion on physical training of those over the age of fourteen—between the age of fourteen and eighteen?—Oh yes; then, of course, you require to modify the thing when they come to that age. Up to fourteen there is very little development of muscle. Muscle is not, as I understand, well developed up to the age of fourteen, and the physical forces do not tend towards the development of muscle, but after that age you can begin to draw upon muscle more, and at that age I think gymnastics should be introduced to a considerable extent—gymnastics along with the muscular drill, and the elements of military drill, if you choose, at that age.

601. Do you think there would be any difficulty in bringing that about, with those who have left school considering themselves emancipated?—I do not think so.

602. Not in towns?—Not in towns.

603. But what about the country?—They are quite willing to crowd into these places in towns, but, I think, it is more for the physical drill and the gymnastics and the military drill that they come in. I do not think they are altogether very fond of the military drill, it is the other thing that attracts them. I should very much like to see that extended to the country. Some of the population there get plenty of exercise in walking, no doubt; but they get into a lounging habit of body, and they do not know what to do with themselves at night, and if evening classes for gymnastics and physical drill could be instituted in the country, it would be a great advantage, I think.

604. But still, from your practical knowledge, you know perfectly well that a great many of the boys, at the age of fourteen, who leave school, go to farms; those who remain in the country and work—and a day at the plough and carting and so forth is rather severe work—and they are in the habit of going to bed about eight o'clock at night?—Yes.

605. Simply being tired out. How would you suggest anything further for lads like that? It is not at all uncommon, in your experience, that boys are at once put to farm work?—I suppose not; but it is also not uncommon that these plough lads roam the country at night from this farmhouse to that farmhouse, rousing out the servant maids.

606. Or even going into towns on bicycles?—I should think that happens in towns too; but I do not think they are so tired out at eight o'clock at night, or six or seven at night, as to prevent them attending evening classes. It would be of infinite benefit to them, to set them up, to get them out of that lounging habit that they have.

607. Then, as regards the town, I suppose it is the same in Aberdeen as elsewhere, that Saturday is a holiday, is it not?—Saturday is a half-holiday.

608. Only a half-holiday?—You are speaking of the schools; a whole holiday for the schools; a half-holiday for the work-people.

609. Do you imagine the children would do better on holidays if they were given some physical training instead of spending it running about the streets, and practically doing nothing?—Well, I do not think they would like interfering with their Saturday holiday.

610. Possibly not, but I mean as regards their own benefit, would it be to their benefit or not?—Undoubtedly, it would be to their benefit, but I do not think you could interfere to that extent with their individual liberty.

611. You do not think that anything in the way of physical exercises—I will not specify them particularly—would be so popular as to suit them better than simply running wild on Saturdays in the streets?—I doubt it very much.

612. You doubt it yourself?—I doubt it.

613. *By Sir Henry Craik.*—Have you found any cases of objection by parents to their children taking part in drill?—No.

614. With regard to the medical supervision, do you mean that there should be medical supervision of premises or of the children—of the individual children?—Of both.

615. You would have a medical inspection of the children?—I would, just at stated intervals.

616. And you would have that under the School Board or under the Department?—Oh, I should say the School Board, but they would likely look to the Department to help them with the expense of it to some extent.

617. Do you think there would be any objection on the part of parents to such examination?—I do not think so.

618. Or to the taking of statistics?—I do not think there would be any objection.

619. Have you found swimming practised in any of the seaboard villages in Kincardineshire?—No, nothing; I do not think the School Boards have taken it up anywhere except in Aberdeen.

620. And in these seaboard villages the children very often cannot swim?—The children very often cannot swim.

621. Although there are more opportunities?—There are more opportunities, yes, but you find that sailors generally cannot swim. They think it better to be drowned at once than have a struggle.

622. Are you aware of any cases of continuation classes under the Continuation Class Code where physical instruction is taken up in Aberdeen?—Oh yes, there are several of them, in fact long ago I had several classes of that kind in Perthshire after the international gymnastic contests came on. The young men in several of the towns in Perthshire formed classes. There was one in Alyth, one in Blairgowrie, and one in Dunkeld. There was, I think, more than one in Perth where they went through a regular course of gymnastics on parallel bars, and jumping and so forth, ropes and ladders and trapezes, with a view of preparing themselves for these contests between the big towns, and that I think was of very great use to these young men; it kept them out of mischief and braced them up.

623. And are such classes in operation in Aberdeen now?—There are a whole lot of Boys' Brigades. There is a Boys' Brigade in the town of Aberdeen, with some ten or a dozen companies.

624. But they have not brought any of those classes under the Continuation Code?—Oh, yes, they have. You paid grants last year for three or four of them. There was a Company No. 4, Company No. 5, Company No. 7. They went through physical drill and gymnastics, and as the Code requires a second subject, their second subject was ambulance drill. They got their two subjects in that way I think, and they got the grant on that score. I forget

whether there were three or four of them altogether, but there were a good many companies.

625. Under the present Code?—Yes, under the present Code; and I sent in to report one of these classes the other night. They go through their drill with very great spirit; but, of course, the sort of uniform they wear is an attraction. They mainly go for the physical exercises and gymnastics. They are of more attraction to them than the military drill, although it, perhaps, is of as much use.

626. You think that anything like compulsory attendance at those Continuation Classes would be resented?—I think it would.

627. Of course, it is usual, in continental countries, even if the Evening Continuation Classes might be for physical instruction drill?—I do not think we are ready for compulsion in this country.

628. There is no doubt that it is a very important time in the life of the boys—fourteen to eighteen?—Oh, undoubtedly.

629. And a great deal of mischief is done?—Undoubtedly, if you get hold of the boys at that age, and keep them occupied in the evenings, it would be of immense service, both to themselves and the country.

630. Although public opinion would not be prepared for it, you think the benefit would be very great?—The benefit would be very great; but I do not think we have got that length in this country.

631. *By Sir Thomas Coats.*—In regard to the drill or physical exercises, I understand you to say that you consider it would be inadvisable to give children under fourteen years of age gymnastics, that is, practice on the bars and ropes?—Yes.

632. You think it would not be advisable?—No. I do not think it would be advisable; their muscles are not ready for it.

633. Do all the children in the school get physical drill?—They do.

634. From the youngest up?—From the youngest up; from the infants up to the oldest class.

635. Then do you consider it would be advisable to devote more time to physical drill than is at present given. I mean to say, could you take a certain portion of time off what is now given to lessons, and give it to physical drill, without interfering with the training of the child mentally, with advantage to its body?—Yes. I should be glad to take it at intervals of a few minutes all through the day.

636. At short times?—At short times.

637. Then do you find, with regard to games, are games practised much in the Board Schools?—Oh, yes.

638. I mean to say regularly. Is there any system of games?—No, I do not think there is any system of games. They are left to their own devices, and for the games of running, hopping, and jumping, and so on.

639. Do you think it would be an advantage to have compulsory games, that is, superintended by the teachers during the intervals of school?—No, not for these young children.

640. You do not think so, either football or anything else?—Not for the young children.

641. Do you consider games like football advisable for children of that age?—No; it is too violent.

642. It is too violent you think?—Yes, it is too violent. There is one thing I should very much like to see, and that is the diminishing of work in secondary schools. If you could institute some system of gymnastics that would take them up, I should like very much indeed.

643. For what schools?—The practice in these secondary schools is for each teacher to give out lessons for the next day. The consequence is that the child's time is entirely taken up preparing lessons for the following day, and that in the school there is not so much teaching as hearing of lessons. It is quite a common thing for a child to have four or five hours' work every night grinding away at lessons. Now, if any system could be devised by which that could be abolished, I think that would be of immense advantage. If you could get evening classes of gymnastics in these

and advisable.

secondary schools it would be a good thing ; they get very little physical exercises at all.

644. Talking of the medical supervision, do you consider it would be practicable to have the weight and measurement—chest measurement—and other dimensions of children taken and recorded, and noted from time to time, with the view of seeing whether they are being physically developed or whether they are going back. Do you think that would be practicable at the Board Schools?—I think so ; it would not take long.

645. And advisable?—Yes. I do not see why that should not be done. If you have a proper apparatus, a weighing machine, you could pass over twenty scholars in a very short time.

646. Would it lead to any practical results, do you think, finding out whether the children are properly fed, or whether they had sufficient exercise without this physical drill talked about?—Oh, you could not exempt them from physical drill on the ground that they were sufficiently trained and nourished already ; but it might be an advantage in enabling you to keep back those for whom the drill was not suited. I would not drill a child, for example, unless it were gaining in weight ; I would not drill a child if it were losing weight.

647. *By the Chairman.*—But at present, if I may interpolate a question, you do not know whether it is losing weight or not?—You do not know ; they are simply put through the mill all together.

Code. Art. 24,
outdoor
lessons.

648. *By Sir Henry Craik.*—Might I ask one question. You know Article 24 in the Code, which allows school attendance to be counted for visits to museums, or for any form of outdoor lessons?—Yes.

649. Is that used in your district on Saturday afternoons, for instance?—It is to some extent, yes.

650. But not for drill?—Not for drill, no. It is generally used in connection with botany, and with what is to be seen and observed in the fields, and so forth.

651. There has never been any attempt to bring together a large number of the children of different schools on Saturday afternoon and count it as an attendance?—No. I know of no example of that. I know several of the teachers who take out their older boys and girls for a walk from time to time, and they point out to them what they see, and what they might see, and what they ought to see.

652. *By Mr Shaw Stewart.*—I would like a little more information about Colonel Cruden's Training College?—Yes.

Cruden's
system :
training
college.

653. How are the pupils sent there ; that is to say, would you kindly give me a few details about the school?—I think I have got the whole thing here on a printed paper, which I cannot unfortunately leave, because I have to give it back to him. He has a number of drill-sergeants, men and women, and he is prepared to send them out anywhere where they are wanted. There is a governing body attached to the thing, and then there is a staff of men, and a staff of women, and then there is a syllabus here of the physical training adopted by the Aberdeen School Board for the use of the public elementary schools. First, for infants and Standard I., next for Standard II., next for Standard III., next for Standard IV., next for Standard V., next for Standard VI., and so on, and then there is a syllabus of physical training adapted for Training College students. That is an important part of his work.

654. It was rather more in that direction that I wanted a little more information?—In connection with the students?

655. In connection with the Training College?—He has the supervision of the two Training Colleges in Aberdeen, both the men and the women. They go through their drill according to his system. They are regularly trained, and the girls have a suitable dress for the occasion, and the lads in their ordinary dress, and they go through this drill, which includes preliminary instruction, then physical drill without apparatus, and physical drill with apparatus, and then general

instructions. When the students are being instructed the teacher will pay special attention to the backward pupils, pointing out their mistakes and encouraging them to persevere.

656. I understand it is a good system?—Yes.

657. But who have access ; what pupils are taken into the school?—The Normal School pupils—the students, you mean.

658. What students and what pupils attend these schools?—The whole of the Training College students are trained by Colonel Cruden to be able and fit to teach the children when they have schools of their own.

659. They are obliged to go there?—Yes. His own training instruction has to deal with teachers only in so far as they voluntarily come to him ; in vacation time they come in relays for a fortnight's drill, with a view of preparing them to undertake the thing in their schools when they go back.

660. Just one question about the gymnastics part of the secondary schools. You said you would like to see rather more gymnastics at the secondary schools?—I would. Yes.

661. Do you think if more time were given to gymnastics and less time therefore to lessons, would the results be as good as they are now?—I think so, most decidedly ; and if you in any way by means of this Commission diminish the number of home lessons, it would be an immense advantage. That is the crying evil of our secondary schools. Each teacher gives the scholar enough to do for the whole night for his own individual class, and the consequence is the poor creatures are overworked and driven off their heads sometimes. They have far too much work to do.

662. *By Mr Alston.*—Would you advocate that the masters of the schools should be the instructors in physical training, as against the bringing in of the outside instructor once a week?—Oh, I think so.

663. It would be better?—I think so ; much better.

664. The masters and mistresses, of course, are not equally perfect in their teaching?—No. Of course they do not know so much as those professionals ; they want, to some extent, the physiological training, and they proceed by rule of thumb, but so long as the system on which they proceed is a good one, I think the advantage is in that.

665. Would it be a good plan that all the masters and mistresses should be taught at such an institution as Colonel Cruden's?—Practically they are.

666. The outside expert, the old sergeant, or whoever he may be, could be dispensed with, and all the teachers in the schools should become proficient in physical training?—Quite. He would still have his function, you know, in training these teachers.

667. Or such an institution as Colonel Cruden's?—Exactly ; yes.

668. And would the physical drill be all on the same lines, modelled after one form?—Generally. Get a good system and keep to it, and if the teachers know their work, they will be able to modify it, according as circumstances require.

669. But would not uniformity in physical training be an advantage?—Yes, I think so.

670. *By Mr Fergusson.*—With reference to that matter you have just been speaking about, I think you said that you preferred a system by which there was a certain amount of physical training each day, instead of an hour once a week by the trained instructor?—Yes.

671. But would you be prepared to do away with the trained instructor altogether, or would you prefer a system by which the teaching staff gave their instruction every day, and a trained instructor came at intervals and saw what had been done, and put them through their drill or their physical exercises, and pointed out what was wrong, and said what was to be done before his next visit, and so on ; or would you like to abolish the trained instructor altogether?—I would not abolish the trained instructor until the ordinary teachers were sufficiently well up in the subject to do without him.

674. They are not at this moment?—No, I do not think so. They have only practically—many of them—this fortnight's drill in the summer time. The subject is required now by the Code, and they are always very willing to prepare themselves, and spare no pains to do so in everything that is required. They devote their Saturdays to drawing classes and to gymnastic classes, and classes of other sorts, with a view to carrying on the schools.

675. In your experience, the children themselves like this physical training?—Oh, they are very fond of it.

676. It gives a pleasure to the whole of their school work?—Exactly. They are very fond of it indeed, and that is one reason why I think it should come at intervals daily.

677. You said that in some schools, at anyrate, the teachers do not carry out sufficient daily physical work, but leave it for the trained instructor's visit, but is not that a matter of which the inspectors have the ordering? If you state in the time-table that there is to be a certain amount every day, the teacher has to do it?—Practically I could do that, but it would be, perhaps, a little despotic; but it could be done. All time-tables have to pass through my hands, and I have to say whether I approve of them or not, and it is quite within my power to say I disapprove of this, because there is not a sufficient amount of physical drill at intervals.

678. As to games, I think you said the teaching of games was not very desirable. Football was rather too violent?—Yes.

679. But do you think, for boys over twelve, a little football or cricket is too violent?—Oh, well, cricket: I would leave these to their own desires.

680. You would not teach them how to play these games in a proper way?—Oh, they will do that themselves; they will pick it up themselves.

681. Do you think so?—On the other side of the Border we do not attach so much importance to cricket as is done on this side.

682. Then, on the question of health, do you find, as a rule, the children in your schools in Aberdeenshire and Perthshire are well fed?—Mostly.

683. We were told that physical training would probably increase the child's appetite?—Yes.

684. And the question is, where is the increased food to come from. Is that a matter you find any trouble about?—Well, there will be in the towns. Yes, in the towns there is a number of poorly fed children—neglected children.

685. But the country children, in your district at any rate?—Oh yes, they get plenty to eat.

686. They get enough, do you think?—Oh yes.

687. But I suppose, without suggesting that you should give them food for nothing, if any arrangements could be made which would facilitate the feeding of the children, you would consider that desirable?—Yes, I think so.

688. So as to secure as far as possible that the children, especially if they were getting more physical training, should be fairly fed—get a good meal in the middle of the day?—Well, that is provided for in many of the country schools.

689. It is?—Yes.

690. They do not get it free?—In some cases they do, and in most cases they pay a nominal sum, a halfpenny or so for the dinner.

691. Do you approve of that?—Distinctly; it increases the attendance of the scholars while that is going on.

692. Do the parents favour it?—Yes, and they have the same thing in Dundee. They have a free system of feeding in Dundee. There they subscribe, and they give dinner tickets out to children that need them. I forget how many thousands they gave out last year. The consequence is that during the time of the prevalence of these dinners the attendance is almost perfect at the schools.

693. And that, of course, increases the grant?—That increases the grant. Yes; it increases the working power of the children as well.

694. They only do that in winter I suppose?—They only do that in winter.

695. Not all the year round?—Not all the year round.

696. *By the Hon. Thomas Cochrane.*—I should rather like to know, from your long experience, whether you could give a sort of model day of what you think would be appropriate for a child—say, in a town, an artisan's child. How much physical exercise a child should do during the course of a day, or in the course of a week. What would you think, from your experience, would be the best to develop its physical qualities?—Well, I should give them ten minutes or a quarter-of-an-hour's drill in the morning when they assemble, march them into their classes, then I should give them another quarter or ten minutes at the forenoon's dismissal, and I would give them another ten minutes at some time in the course of the afternoon, between two o'clock and four. That would be half-an-hour a day—that would be quite sufficient.

697. Some of that would be drill pure and simple, marching, and that sort of thing, and the rest would be physical exercises?—Yes.

698. And would you give the same training—the same amount of training—to children of all ages, or would you give them varied training as they got older? Would you vary it?—Well, ten minutes should be quite enough; I think half-an-hour a day.

699. At all ages?—At all ages.

700. Give them all a certain amount of training?—Yes, the exercises being graded to the different ages in the school.

701. Could you give any idea what you suggest should be done after the compulsory school age? Can you give any idea what you would do in the case of a boy who left school at fourteen years of age?—Well, I suspect you cannot compel him to do anything; you may induce him. You can institute classes, and try and persuade him to come into them; I do not know if you can compel him to come.

702. What would be the nature of the classes you would suggest from your experience?—I would suggest the physical drill and the gymnastics. I would begin with gymnastics, then exercise his muscles a bit with a view of strengthening them, and I would not begin altogether with military drill.

703. And who would impart the instruction after the school age?—Oh, you will always get plenty of people to do that.

704. That would be some separate department under the School Board?—Yes, that might be done.

705. Have you any idea in your own mind as to what you can suggest to the Commission as being a line they could adopt?—No, I do not know that I have.

706. There is a suggestion given by one of the witnesses before us that greater use might be made of games; and where there are special exercises such as shooting, the practice of extended order of drill, judging distances, finding the way to a given point, and making rough maps of the neighbourhood, that he lays down as a suggestion?—These are all very good things to do certainly.

707. But you can give no idea how it would be possible to get these young fellows to do so?—No, I am afraid I cannot.

708. You are opposed to compelling them to do it?—I think so.

709. *By the Chairman.*—As regards compulsion, I suppose you agree so far that we have progressed a certain way along the compulsion road, have we not?—Yes.

710. I mean that there was no compulsion before 1872 or 1873, whatever it was?—No.

711. And that there has been a good deal since?—Yes.

712. Well, you say it could not be done. If it has been possible to do it up to now, why should it not be increased as a matter of possibility? I mean, did you seriously mean that, or did you only mean it would create such a stir?—Well, it is a political question; I am not inclined to go into it, but you can try it.

*Mr
A. Walker.*

Secondary
education
committee
proper autho-
rity to move
in the matter.

713. *By Sir Henry Craik.*—But you give us your opinion that for the benefit of the boys it certainly would be important?—Oh, undoubtedly it would be.

714. *By the Chairman.*—Now, are you in any way acting as assistant or as a trainer at meetings of the Secondary Committee in connection with the County Council in Aberdeen?—Yes; I am a member of the County Committee and the Burgh Committee of Aberdeen, and of the County Committee of Kincardine.

715. When you said just now that you could suggest no authority, do you not think that would be one of the authorities that might be moving in the matter?—Yes.

716. I mean, it all comes in to further education, does it not?—It comes in to further education, yes. They have a very considerable sum of money at their disposal, and I am sometimes inclined to think that they waste it.

717. But is it open to them to waste it or not as they like?—No; the Department has the pull over them there.

718. Very well. Would it not be possible by that

means?—It might be possible if the Department would allow them to spend part of their money in promoting classes of that sort.

719. But does it not seem to you a very obvious way really of meeting the difficulty?—Yes, it does.

720. If it were not done by the School Board itself, taking the fact that the children were over a certain age?—Yes, that might be done.

721. And it would clearly come within their purview, within their powers, would it not?—I think so; it would come under the heading of technical education.

722. No, not technical education yet; that may be combined, but it is not technical education. That affects the Secondary Education Committee. At present there is a separate Technical Education Committee, is there not?—Well, the two bodies are practically one.

723. No, they are not in Perthshire; I do not know whether they are in Aberdeenshire. The Technical Education Committee is not the same body as the Secondary Education Committee at present; is it not distinctly different?—Ah!

The witness withdrew.

Mr J. G.
Legge.

Mr J. G. LEGGE, examined.

724. *By the Chairman.*—You have very kindly put in a good many notes. I think it would be convenient to the Commission if you would go through them?—Well, my lord, it seems to me essential to get some definition of terms as to what really does cover Physical Training. I should suggest as a convenient classification the four headings—Gymnastic applied, that is to say, in conjunction with fixed apparatus, and secondly free.

725. Just one moment. Is this physical training for children or for those over the age of fourteen?—For all.

726. From the youngest child who goes to school?—From the youngest child. Free gymnastics are body movements without apparatus forming a fulcrum. Of both applied and free gymnastics we have the national system in vogue at Aldershot. Foreign systems, especially those of Sweden and Germany, have been ransacked to form the Aldershot scheme. Under free gymnastics I should classify what is known as Swedish drill, the old-fashioned calisthenics, and what is known as physical drill, with or without arms, bar-bells, dumb-bells, etc., various forms of physical culture, promoted by individuals such as Sandow, and also skipping and dancing. Then come second, the various kinds of field sports; then come third, nautical exercises.

727. And you specify cricket, football?—Cricket, football, hockey, athletics, swimming. Then nautical exercises—rowing, management of sailing-boats, work on masts and yards, work with a field-piece ashore; and swimming comes in here too. Lastly, fourth, the arts of self-defence—boxing, wrestling, fencing, single-stick, and shooting.

728. May I ask, do you give those in any sort of rotation as to school age—say, (a) is for the younger ones, (b) is for the more advanced—in any way, or is it simply merely classifying them under certain heads?—Simply a general classification under certain heads.

729. You do not apply shooting, for instance, to the smallest child that goes to school?—No, nor would I give applied gymnastics, for instance, before the age of twelve. I think free movements up to eleven or twelve, but I do not think twelve is a day too early to begin good hard work with apparatus, or to shoot at a Morris Tube range, or anything of that sort.

730. Then your next is the existing provision in reformatory and industrial schools in Scotland?—Yes. Well, we have twenty-three boys' schools. There are gymnasia at the Mossbank Industrial School, Glasgow; the Fehney School at Perth; the Paisley Industrial School; the Kibble Reformatory at Paisley (they have

one in the course of building). There is one at the 'Empress,' and there are two gymnasia, not quite as good as the others, at Aberdeen and at Dumfries, so that at all those there are applied gymnastics. There are applied gymnastics in addition on the 'Mars,' at Arbroath, Stranraer, Dundee and Greenock, and Trauent, near Edinburgh. That is to say, out of the twenty-three schools, fourteen take applied gymnastics. I should say that the work on the 'Empress' and the 'Mars,' the two training ships at Greenock, Mossbank, Stranraer, and Arbroath is decidedly good. It was also good at Fehney until the disastrous fire interfered with them. I should like to point out that the work at Stranraer and at Arbroath is especially interesting, because at Stranraer you see what the energy of an individual can accomplish under very straitened circumstances, and at Arbroath the school is so small that it shows that it is even worth while in a tiny school to make an effort. Free gymnastics may be said to be given at nearly all the above, and in addition at Kilmarnock, at Ayr, and to some extent at Leith. That is to say, at eighteen out of the twenty-three, you get either free or applied gymnastics. At the five or six remaining schools you find physical training of a miscellaneous kind, not very good. Now, take the next heading—field sports. The great feature of this is the football league competition. There is a league formed amongst the reformatory and industrial schools in Scotland, and they play regular league matches, and about nine schools play the game extremely well.

731. Which football is it that is played?—Association.

732. Always?—Yes.

733. Only?—Only. There is not much cricket. Of course, it is not so much developed in Scotland, but there is very good cricket to be seen at the Wellington Farm Reformatory, near Edinburgh. Athletics generally, such as running and the rest of it, are not so well developed as I should like to see them in Scotland. In the South we go a good deal further; but there is a very good feature in the harriers at the Kibble Reformatory. The boys form a regular pack of harriers, and take weekly runs; and then when they come in from their run they go into the lavatory and a hose is turned on them.

734. Where is this?—At the Kibble Reformatory, near Paisley. They sometimes join the runs of the harriers attached to the Young Men's Christian Association and so on. Swimming is not so much developed as I should like to see it. Recently we have had two fine swimming baths erected in connection with the Paisley Industrial School and the Mossbank Industrial

Game

Swim

School, now perhaps the most completely equipped in Scotland.

736. Where is that?—That is near Glasgow. It is under the Glasgow Juvenile Delinquency Board. The ships also pay a good deal of attention to swimming. As to nautical exercises, I can only refer you to what is done on the 'Empress' and the 'Mars,' the two training ships. I should like to call especial attention to the excellence of boat-pulling in connection with the 'Empress,' which I believe is quite remarkable, and also to the work with the field-piece ashore in connection with the 'Mars.'

737. What, gun drill?—Yes. I think if you see that you will see what can almost be done in any shore school if you have an old field-piece to work with. Then as regards self-defence, you will see boxing and so on on the 'Empress,' but people are a little shy of developing it as I think it ought to be developed. There is one Morris Tube range in connection with an industrial school, that is on the 'Mars' at Dundee. That is capable of infinite expansion. So far as regards boys. As regards girls, there are twelve schools. None of them take applied gymnastics, but all physical drill of one sort or another. The work is fair in a few of them, but the majority of them want waking up. The outstanding school giving an elaborate course of physical culture, amounting to a course of free gymnastics to girls, is the reformatory at Chapelton, near Glasgow. That school also sees to swimming. At the other girls' reformatory—the Dalry, at Loanhead, near Edinburgh—there is a good feature, the girls play hockey vigorously. There, too, some attention is paid to dancing in a quiet way, with a view to improving the gait of the girls. Dr Guthrie's Girls' School at Edinburgh gives some attention to quiet dancing. The schools where really good work is being done in free gymnastics, or work with clubs, dumb-bells, etc., are Chapelton, North Lodge, Aberdeen, Kilmarnock, and Maryhill. This last named is likely to soon reach the level of Chapelton. They are building a special hall for the purpose of providing proper facilities.

738. That more or less exhausts what you have to say as to what exists at present. Now, as to what future steps might be taken?—I think the first thing wanted is a physical census, and the value of that will only tell in time after you have repeated it at stated intervals. The last physical census of any importance in Great Britain was that of the Anthropometrical Committee of the British Association in 1882 and 1883.*

739. Has there been anything of the kind since?—There has been absolutely nothing since.

740. I do not know whether it was the same?—Yes. There has been absolutely nothing since, except isolated efforts here and there. I got out a census as regards my own schools last year, and I shall be glad to hand into the Secretary the results.† I may just call attention to two points which may interest the Commission. The first is, that these results do not go to show that there has been any physical degeneration in the town population during the last twenty years.

741. That there has not been?—That there has not been any physical degeneration. They go to show that the town population is not worse off physically now than it was twenty years ago; if anything, rather better.

742. By Professor Ogston.—During what period?—The last twenty years; since 1882.

743. In what class of population?—I am speaking of the slum population, the lowest class physically. Then, the other point I should like to take is this—they show the effect of systematic physical training, which is more developed in England than in Scotland among reformatory schools for boys. It has reached a higher pitch, and schools have been rather longer at it; the reason for that being, that they are wealthier. They receive more support from the rates in England than they do in Scotland. Well, the result of this is, that when I compare the physique of reformatory boys in Scotland and England, I find that at the age of fourteen, boys in Scotland

have a slight advantage physically. That showed that the raw material in Scotland was slightly better than in England; but when you turn to the age of seventeen, after every boy must have had at least a couple of years' training, you will find the English boys have a marked advantage, and that seems to me to show perfectly plainly what the result of a little careful attention to physical training is. A general census would bring out very clearly whether the agricultural labourer's child has, as a matter of fact, much advantage over the artisan or the town labourer's child. I think the census would bear out what the old figures of 1882 elicited, namely, that although there is a slight advantage in favour of country-bred children, it is not very great; and the point I should like to make in connection with this is, that physical training would probably be almost as much to the advantage of the poorer classes in the country as in the towns. A little point in connection with inquiries of this sort that I should like to call the Commission's attention to is the teeth. That seems to me a most important matter; and my observation, after visiting both countries, is that the state of the teeth is rather worse in Scotland than it is in England. I think, if possible, more precise data should be obtained on the point, because on the state of the teeth depends such an enormous amount of consequences. Now, I do not see well how one can insist on the provision by every school authority of a fully-equipped gymnasium. It is an expensive matter, and it requires skilled instruction; but I do think that applied gymnastics are absolutely essential to a certain extent, because whatever free gymnastics do for the mere physical development, they have nothing whatever to do with courage, and you want something which calls for a certain nerve.

744. By the Chairman.—Perhaps it would be convenient if you gave the Commission a little explanation as to applied gymnastics; let us have it on record, the difference between the two, shortly?—Free gymnastics are movements, extension movements, either slow or vigorous, either with or without movable apparatus, but not dependent on the use of any apparatus to form a fulcrum. That is the point. Now for applied gymnastics, you require some apparatus to use as a fulcrum, such as the horse for vaulting over, the horizontal bar, the parallel bars, the ladder, and so on; the trapeze, and the rings.

745. Leaping poles?—Yes.

746. That is shortly the distinction between the two?—Yes. I think a certain amount of applied gymnastics is essential, and I think every school should be provided with a vaulting horse, and I do not think any janitor or school-keeper should be appointed to his office who is not capable of taking boys over the horse. I should suggest that free gymnastics for at least half an hour three times a week on the Aldershot principle should be made compulsory. A good model course suitable for children of school age has recently been drawn up for the Board of Education in England by the War Office. I should deprecate, however, anything more in the way of marching drill than is required in connection with free gymnastics, and for the purpose of moving children conveniently in and out of the school or class room. I should also deprecate the use of fancy systems. I should, as far as possible, make the Aldershot principle compulsory.

747. Do you call Sandow's system fancy?—I should. But, of course, the Aldershot principle has drawn upon Sandow to a great extent. The great argument against too great freedom of choice is the hardship on teacher and instructors of having from time to time to get up new methods, to suit the caprice of a new inspector or a new School Board. I should suggest that no Training College should be without its fully-equipped gymnasium, under the direction of a gymnast trained on the Aldershot lines. I should strongly encourage the Highland fling; I believe it to be a most excellent exercise. There are some minor difficulties. The immobility of schoolroom furniture, and the gallery or step system; and a very great difficulty is the question of boots, especially among the poorer classes.

Mr J. G.

Legge.

30 Apr. '02.

Gymnastics : free and applied : differences.

Uniform system desirable : free gymnastics on Aldershot principle should be compulsory.

Suggestions : for boys.

* See Vol. I. Appendix VII. † See Vol. I. Appendix I.

Mr J. G.
Legge.

30 Apr. '02.

Games: com-
petitions
organised.

As to the immobility of school furniture, I should say that all school furniture should be made movable; and as to the question of boots, well, I should get rid of boots altogether, and encourage working with bare feet.

748. At all times of the year do you mean?—Indoors; yes, certainly. As regards field sports, I should encourage football; not mere kicking about, but the scientific game. Leagues, I think, should be formed in every inspector's district, and an inspector commended where his league is an enthusiastic one. Competition is a great stimulus. I do not see why we should have King's Plates, and so on, to promote the breeding of race horses, and not also some official recognition of sport for boys. Then I think a strenuous effort should be made to form old boys' clubs in connection with schools. Old boys might in time take a good deal of the burden of organising games, and so on, off the teachers' shoulders. I should like to see the Boys' Brigade system closely with the school system.

749. Explain yourself a little, please, on that?—Well, I mean I should try and work the Boys' Brigade so that schools formed separate units, and that the officers were all attached to the same school. I think the school should form the unit. Then I do not think any school should be without a jumping pit for long and high jumping, and that work should be supervised by the janitor. Jumping is one of the weakest points in the physical training of the country. At any military depot it is quite striking to see the recruits at the practice of jumping. You will see grown fellows of eighteen to nineteen who cannot clear thirty inches in height, and some of them as strong men as you could wish to see, simply through want of training. Then long distance running, paper chasing, and swimming should be developed for field sports and athletics. Time should, of course, be found out of school hours or in recreation intervals. I think there is some need, in certain districts, of impressing on people the truth that holidays and half-holidays are the property of the children—that they are not the parents' property—for the purpose of games.

750. Up to what age do you mean when you say that?—Up to fourteen.

751. Not beyond?—Not beyond; no. Then, as regards nautical exercises, I think it eminently desirable that in seaport towns and fishing villages, as far as possible, the physical training should take a nautical turn. Free gymnastics, jumping and the horse, are just as useful for sea as land, but the nautical twist might be given in various ways. For instance, in a playground, or on a convenient plot, a mast and yard, with stays and ratlines, with a net underneath, might be fitted up. This is a simple piece of apparatus, but excellent gymnastic work, in the way of escalading and so on, can be done. Then boat-pulling should be encouraged, and competitions in rowing, as against competitions in football or cricket, should be encouraged. To facilitate this, a type of boat should be specified for use, for example, the lightest in use in the navy, and also the dinghy, so as to teach sculling. I suggest the lightest in use in the navy, because there, you see, boats can be got cheap; very often when condemned for the navy they are good enough for use in a little harbour or on a river. Then, if possible, the management of a sailing-boat might be taught to boys.

752. Do you know anywhere where a sailing-boat is used in Scotland?—Only in connection with the training ships.

753. Anywhere else at all?—No.

754. There is in England, you know?—There is in England. I know several.

755. Several?—Yes.

756. Not in Scotland?—Not to my knowledge. Then, as regards self-defence. As regards boxing, I know public opinion is sensitive about that, but I think, besides a great physical advantage in that exercise, there is a wonderful moral training to be got from it. Fencing I do not think one can do much with; it is too elaborate. Singlestick is possible, and also

shooting with the Morris Tube range. One advantage of all the physical exercises connected with self-defence is that they are so extremely attractive that if they were only permissible, well, then, the thing would run of itself.

757. That is all as regards boys. Then you come to the question of girls?—Yes; I need not dwell on that at the same length. My own opinion is that the ideal system for girls would be pure Swedish drill, coupled with dancing and skipping. A lot of skipping is done by girls, but it is not developed as it might easily be. Far better skipping can be generally seen done by boys than by girls. It ought to be systematised. As regards the pure Swedish drill for girls, I do not see why every teacher should not be obliged to qualify herself. At the women's Training Colleges the Swedish drill might take the place of the Aldershot gymnasium, free and applied, for men. We have in the Aldershot system a national British system for men. We have not got a national system for women, so we may as well adopt the Swedish system as any other. Applied gymnastics are certainly not as valuable in the case of girls as in the case of boys. The best game for girls is hockey.

758. Provided they play with one another?—Provided they play with one another. Generally speaking, for both girls and boys I should suggest as much work in the open air as possible. As physical training, agricultural work is not first-rate; the great advantage of it really is that it is in the open air. One ought to make this point, because one is often told, 'Oh, such and such a boy does not need ordinary games, and so on, 'because he is working in the garden'; and I have found that in some farm schools, where the boys have plenty of healthy work in the open air, at gardening and so on, their physique will not compare for a moment with even a town school which gives real attention to gymnastics. I should say with skilful management, and where good discipline obtains, a great deal of school work in the summer can be done out of doors. Then there is a good deal to be done with these various movements in large towns for summer camps and fresh-air fortnights, such as they have at Glasgow. Some of the industrial schools which go to camp have developed a very fine form of exercise available when children are at camp, and that is scouting—a sort of sublimated form of the old game 'I spy,' but capable of wonderful variety and development. I have indicated, perhaps, that the brunt of the work falls upon the teacher, and I should like to suggest that a point for the Commission's consideration will probably be how to lighten the burden on the teacher. I might suggest something might be done first of all by introducing as much uniformity as possible, so as to obviate the necessity of getting up new methods; secondly, by appointing as janitors or school-keepers retired petty officers and non-commissioned officers, duly qualified to give instruction; third, by special appointment of visiting teachers from military depots, or coastguard stations, or gymnasia; fourth, by enlisting, and especially for field sports, voluntary help from the Young Men's Christian Associations, Boys' Brigades and boys' clubs, and the like; and I feel, of course, that the successful development of the whole thing will largely depend upon a Government grant in aid.

759. In other words, increased taxation. Is that so?—Well, yes. But I think the money would be more economically spent in this direction than others that might be mentioned. My last point I need not enlarge upon. I do not know whether you will consider it within your reference, but I might just mention it for your consideration.

760. Ah, very much so. What is to be done with underfed children?—If we are going to develop the physical training of children, we must be on our guard against overworking them; and, of course, underfed children would be positively injured by even light exercises.

761. And your suggestion is?—My only suggestion is—I make it with diffidence—of course, I am not an authority—that the head-teachers of the school should

Mr
L

ch
en.

be responsible for reporting to the managers or directors of the school those who, in his opinion, are unfit for the regular physical training of the school; that the matter should be referred to a medical man, and he should decide whether the incapacity of the child was due to constitutional infirmity or underfeeding. If to the former, of course exemption must be granted. If the cause is, in his opinion, underfeeding, well, then, the parent or guardian should be warned; and where the warning is ineffectual, the child should be fed at the school, and the cost recovered from the parent or guardian. Finally, where sheer poverty is established as the cause, then the parochial—

763. The Parish Council?—The Parish Council must take up the case. I may mention, in that connection, that when I visited Sweden last spring for the purpose of studying Swedish gymnastics, there I noticed at one or two of the schools—day schools—that they had canteens; and at one school I remember, in particular, children could either buy their lunch at the school—a very simple lunch, bread and so on—or some children had tickets which they could just hand in.

764. In towns?—Yes; in Stockholm. My views, I might add, which are in favour of applying compulsion, and developing, as far as one possibly can, the physical training in schools, may be coloured by my consciousness that in the schools I have special knowledge of, it is of such enormous importance. They take the lowest class physically in the whole population. It is a sort of thing that hits you in the eye when you go into one of them, that everything must be done to work them up to a decent physical standard.

765. And feed them?—And feed them.

766. Then you have one or two suggestions that you would like to bring forward as to physical training after the elementary school age?—I have not much to say on that point, save as regards Evening Continuation Schools. I should like to see compulsory attendance in force up to the age of sixteen. I do so for special reasons.

767. In town and country?—In town and country—particularly in town, where it would be easier. I am quite sure that if it were enforced, the population of the reformatory schools would go down, which is not a thing to be regretted; and of the evening school time, I should give up, roughly speaking, one-third to physical training, very much on the lines that I have sketched for elementary schools, though, of course, going further as regards applied gymnastics. Exemptions would have to be granted freely; and I do not think, after the school age of fourteen, it is desirable to give official encouragement to field sports.

768. You do not think it?—No. I think human nature, especially with the stimulus which will then have been given in the elementary schools, will carry it far enough, otherwise you may make it a passion, the whole attention being devoted to it. Then, as regards the ages from sixteen to eighteen, there, I think, I should be prepared to go to great lengths in the way of compulsion. I should positively like to see a poll tax on every youth of from sixteen to eighteen; and to obtain remission from the payment of this money, force him to appear on certain occasions, and produce a certificate that he has gone through a certain course of training, or is certified as efficient.

769. When you say that, are you applying that to this country, as you know this country?—Yes.

770. And in that way you think it is quite feasible in this country?—I think it is just as feasible, if we do it by means of a poll tax, as the collection of any other tax, and just as feasible and reasonable as compulsory education. I should not make the tax too heavy, because one advantage of having a tax at all would be to enable people to obtain reasonable exemption, and I do not think one, certainly at the outset, should be too severe. But as to how the training is to be got, I can only suggest that it should be by some reorganisation of the Volunteer system. I suppose the name Volunteers would have to be given up in the event of any drastic measure of that sort. Perhaps it might be called civilian training, or anything one pleases, but it is on

the lines of the Volunteer system, screwed up to a high pitch of efficiency, that, I think, the training should be given. I feel certain that, properly worked, there is no need why there should be any falling off in the amount of power in the country available for working in factories or mines or commercial pursuits. The time taken need not interfere to any very great extent. I am convinced there would be so much greater energy introduced into the national physique, that it would more than counter-balance any loss between the ages of sixteen and eighteen. At eighteen you would have an army of men thoroughly disciplined, and by disciplined I do not mean trained in military notions and that sort of thing, but I simply mean men formed in good habits of mind as well as body. In fact, loafing, which, to my mind, is one of the curses of the big towns in the country, would be reduced to a minimum. The reformatory schools are simply choke-full of loafers; yet, by hard work, and compulsory physical training, they turn them into extremely active men. I should like to mention, in conclusion, significant figures to show what can be done by physical training, both in affecting the bent of disposition of lads, as well as affecting their physique. The growth of physical training in the reformatory and industrial schools generally has been very marked in recent years. The total number of inmates of these schools who joined the army in the three years 1894–1896 was 1343. The total number of those who joined the army in the three years 1897–1899 was 1939. The totals of the latter period were rather smaller than in the former period, so that the increase is even greater than it looks; and it is important to bear in mind that every single one of these was a purely voluntary enlistment, and that in fact, for this last period, out of every six boys trained in the reformatory or industrial schools, one entered either the army or the navy.

771. *By Mr Alston.*—Do you include the training ships in those?—Yes.

772. Necessarily you would?—But the important point to me is that the numbers have gone up so enormously in the period 1897–99, which period, of course, does not bring in the enthusiasm about the war. It is purely because the constant drill, and so on, physical training and the promotion of open-air active life, made them look at the services as a congenial sphere of operations later on. When I said just now that the reformatory schools were full of loafers, I should like to modify that term, because I have a great respect for the reformatory boy. If he is either a loafer or a lurcher it is true in many cases it is only circumstances that have made him so, and he may soon educate himself out of that tendency if he is properly handled.

773. *By Professor Ogston.*—You gave us some very important evidence based upon the physical census of the boys. You mentioned a Commission of 1882, of which I did not gather the name?—It was a committee of the British Association. It was called the Anthropometrical Committee of the British Association. The moving spirit of it was Mr Charles Roberts, the surgeon, who died last autumn. Physical census and data.

774. And you compared the results obtained by it with those of your own of nineteen or twenty years later. I do not want you to enter into minute details, but can you give the Commission in a few words sufficient information to show what were the data on which the first Commission referred to went—the physical facts, measurements, and the like, similar to those of your own physical census. What measurements were taken, roughly—height and weight, I suppose?—And chest girth in the case of boys.

775. And any muscular test, such as the girth of the arm?—No, but in a few isolated terms they get such additional measurements as arm stretch.

776. And those were the chief data?—Those were the chief data.

777. And from what class were they obtained?—All classes; and the class which I compared was the class committed to industrial schools.

778. Then could you make a plan showing how far

Mr J. G.
Legge.
30 Apr. '02.

your own physical census was capable of being compared with that of the British Association Committee?—Yes; I took the stature following their rule, that is to say, without boots. I took the chest girth with the chest empty. The weight, of course, I also took with clothes as they did, only the reformatory and industrial school boot being rather a heavy object, I made them take off boots.

779. The results that you obtained by comparing the two showed that there was no physical degeneration of the race in those twenty years in the case of towns?—In the case of the slum children in towns, yes.

780. You will be able to lay before the Commission, now that we understand that the facts of the two observations were comparable, the exact figures regarding that, and bring out that there was no physical degeneration in towns?—Yes.

781. Then we may pass that over as we will get that, and also you will be able to give the Commission the data which show that at the age of fourteen the Scottish boys were rather superior in their physique to the English boys?—In the reformatory schools.

782. Also you will be able to supply it with similar data from which to deduce that the country children have no advantage in physique over the town children?—Have no great advantage.

783. Have no great advantage. Of course, that is a point, as we are aware, on which there is difference of opinion, and it would be very important to know the facts upon which you went?—I admit there is some advantage, but I do not think there is any great advantage.

784. And similarly also, you will supply us with figures referring to the teeth, and presumably digestion?—No; that I cannot do.

785. On what were you going in drawing the inference?—On observation.

786. General impression?—General impression. I may say that I was at school as a boy in Scotland, so that I know the country well. If I might suggest one means of getting a comparison between England and Scotland in that regard, it is that the possible source from which the information might be obtained would be the Post Office. They have to examine large numbers of young girls with a view to Post Office appointments, and I believe the teeth are very carefully looked into.

787. So that we have already records?—I should think they very likely have. The proportion of rejections, for instance, on account of the teeth would probably be known.

788. *By the Chairman.*—The last point that I wanted to ask your evidence upon was with regard to these physical observations upon youth in schools and reformatories. There is, I suppose, no very great difficulty in applying them. Any intelligent teacher provided with a weighing apparatus and measuring apparatus could obtain and supply the Department with the data?—Yes.

789. If it were once made imperative that they should do so?—Yes.

790. There is no particular skill required to obtain such information as would be valuable with regard to the health and the improvement, and the existence of weaklings?—None, I should say, though, if I may just add, I think there would be tremendous difficulty if any effort were made to get elaborate measurements, such measurements, for instance, as Dr Francis Warner is anxious to obtain.

791. My question referred, however, to the observations which are made in many of the English public schools regarding height, chest measurement, and weight?—Yes.

792. *By Mr Fergusson.*—You are talking of the boys up to fourteen?—Yes.

793. Would you not be in favour of giving them games or sports?—Very strongly in favour.

794. Of teaching them games?—Yes.

795. We were told that there was no great necessity to teach boys games. They would pick them up for

themselves. Do you agree with that?—Not in the least.

796. Then, as to the inspection that is required for this physical training. Do you think that can be properly done without some supervision? I do not say that it should all be done by a trained inspector, but some occasional supervision by somebody who had been trained to physical exercises and drill?—Oh, I think that is eminently desirable.

797. That you should have a trained inspector?—Yes.

798. Specially trained—that is to say, a specialist? Yes; and that he should keep the local inspector or inspectors of districts posted up in the points.

799. What I rather meant is, could you leave the whole of this training to a schoolmaster?—No, certainly not yet.

800. You said that boots were a difficulty; but you do not suggest that all this drill and everything should be done barefooted, do you?—Well, the boots are a very serious difficulty in the schools in poorer districts. It is impossible for a boy to take up the proper position in the boots that one often sees him in. He cannot properly carry out, for instance, the Aldershot system of free gymnastics unless he has a comfortable pair of boots.

801. *By the Chairman.*—Or canvas shoes?—Yes, or shoes, and that is a most expensive item.

802. *By Mr Fergusson.*—Canvas shoes, of course, would be the most desirable?—The most desirable.

803. But you suggest, to get over the expense, that they should go barefoot?—Yes; I might mention that this question of boots has been a great difficulty in the reformatory and industrial schools, because they have to cut down the expenses as far as possible, and so they provide them with very heavy iron-shod boots, in which they cannot drill properly, and so I have suggested bare feet; then the difficulty arose of an asphalt playground on a cold day, or a gravelled playground, and that has been got over in cases by having large strips of cocoa-nut matting, which are kept under a shed and rolled out, just as before a house in London when a carriage drives up.

804. Well, then, there is another difficulty connected with boots, talking of the ordinary school child who comes to school with wet feet?—Yes.

805. If you had shoes provided, they would serve the double purpose. You would be able to put dry shoes on to the child if wet, and also satisfy the physical exercises?—That would be the best solution of all.

806. You would kill two birds with one stone in that way?—As part of the school apparatus.

807. I think you deprecate marching in physical drill. You do not want much of that, not more than a certain amount for discipline?—Just enough for discipline.

808. But free gymnastics is what you wish?—There are all the turnings, and so on, to be acquired in free gymnastics.

809. And you consider the feeding question a very important one?—Yes, I do.

810. *By Mr Alston.*—Do your remarks apply only to reformatory and day industrial schools—those remarks you made before the interval? For instance, you quoted all boys' schools?—Oh, no. I mean all day schools. My remarks were of general application, though I thought I ought to suggest that possibly my views might be highly coloured in some respects, owing to my connection with a special class of schools. I mean them to be of quite general application.

811. You think that a very full and safe course of physical exercise and gymnastics might be applied?—Yes, I do.

812. And as Mr Fergusson has mentioned the question of food, of course in reformatory and day industrial schools the dietary is ample?—Yes. The question does not arise there in the same way.

813. That remark would not apply to the ordinary Board School. Then you would be in favour of systematizing all games? As we know, in Scotland the games are very rough-and-tumble, without any

Mr J.
Legge.

Clothing
boots.

Games
should be
taught.

Games.

G. science as in England?—With the exception of football. Football is the game which Scotland has developed, and I should place football in the first place in that country, and cricket second.

814. Would you play always under the supervision of someone in authority?—No, not always; but I should certainly insist on boys being taught, and I should even employ professionals to teach them.

815. That is to say, the game should be scientific?—They should be taught the scientific game. It would not make them dislike the game. I have known many young children intensely dislike the kindergarten games of an elaborate kind which were all teaching, and very little play, but the ambition to excel in field sports is quite enough to get over the *ennui* of training.

816. Apart from the necessity of a professional teaching football scientifically, what about the supervision against all the evils of football, which has become one of the roughest games we have?—Well, I dispute that.

817. I am afraid, whether with the professional team inside, or the crowd outside, it is considered one of the roughest types of entertainment we have got. We had this remark made by a clergyman the other day upon the recent Glasgow event. He alluded to 'the roar of the football beast.' Is there anything of that kind?—I was at the last international match in Glasgow before this unfortunate one, and I have heard the roar this last season on a dozen football fields, but I never heard anything worse than the roar along the Thames on the occasion of the University boat race; and I may say this, that in the opinion of some of my friends who are experts at the Association game, the roughness has largely disappeared of recent years; that is to say the type of professional football player has improved, and the behaviour of the crowd has improved.

818. So you think that the boys of the reformatory school would not need any supervision in the playing of the game?—No, I do not think so on all occasions.

819. It is not a necessity that a master should be always on the spot?—I do not think so.

820. Controlling the conduct, suppressing bad temper, and so on?—No; I do not think so.

821. Then would you advocate, in the teaching of physical exercises and free and applied gymnastics, professional experts as the teachers?—As far as you can get them.

822. Not the teachers of the schools?—No; not the teachers of the school.

823. Would it not be possible that the teachers of the schools could be so trained that they could undertake all this work?—It would be possible in certain instances.

824. Would it not have the advantage that they having already a control over the boys and the girls, the control would be further exercised in its application to drill?—That would be of great advantage.

825. Would you advocate that the system of training in physical exercises and applied and free gymnastics should be uniform?—Certainly.

826. And that teachers, or whoever were to teach, should be brought up to that standard?—Yes.

827. You name the standard of Aldershot?—Yes, as far as you can go.

828. *By Mr Shaw Stewart.*—There are just two points I should like to ask a question upon. You said that at the age of twelve children could be taught gymnastics?—Yes.

829. We had a witness before us who gave his evidence to the effect that a child should not be taught gymnastics until he was fourteen. Can you give us any reasons why you think twelve is a suitable age to begin, as against a later age. I think you added that they might begin hard work at regular gymnastics at twelve years?—Yes.

830. It is rather an interesting divergence of evidence if you could give us some definite reason?—I wish I could give you what might be called evidence. What

I can say is, that in reformatory and industrial schools they do begin applied gymnastics at twelve.

831. Without any harm?—And I have seen no harmful results. Possibly, when I take out my next census, as I hope to do in three years' time, we shall see the position then of those who last year were measured at fourteen years of age and younger, and I shall be able to see whether the schools who have obtained the early training in gymnastics have suffered at all. I have had, in one or two of my schools, to express condemnation of teaching applied gymnastics to boys of eight, but I must say the results were astonishing. The boys were young acrobats, but I do think that a mistake, and I mean to stop it as far as I can.

832. Then one other question: Are you familiar with Colonel Cruden's system of training?—I am not familiar with it, but I know of it.

833. What I wanted to ask was, whether you consider it to be founded on the Aldershot principle, because you laid great stress on the Aldershot school?—Yes.

834. Do you consider that Colonel Cruden's system is as good as the Aldershot principle; I will not say as good, but at any rate as founded on those principles?—Yes; I think it is on the same principle.

835. *By Sir Henry Craik.*—You mentioned, I think, Mr Legge, that in the Straunar schools the athletics were of specially good quality?—Yes; they are good, and they are particularly interesting, as showing what can be done under awkward circumstances.

836. In what way do they show that?—Well, they are getting a pretty complete course of both free and applied gymnastics, although they have no gymnasium and a most indifferent play-yard, and no instructor. The superintendent himself is a man of great energy and an old soldier, and has a thorough knowledge of the system, in fact, he was gymnastic instructor at Mossbank Industrial School; he turns benches aside, and so on, in one of the big workshops, and rigs up the apparatus there.

837. Can you in any way, in your schools, encourage it by differentiation of the grant?—I am sorry to say I cannot.

838. The grants do not vary according to the results at all?—They do to this extent, that, in the case of the highest contribution we pay, a certain amount is supposed to be dependent upon efficiency of management, which is a very vague term.

839. But you may include in that physical exercises?—In future we might—yes.

840. What is the age of the boys in your reformatory schools?—In the reformatory schools—the senior schools—the bulk of the boys are admitted at fourteen, and they can be committed up to the age of sixteen; they stay at the school until nineteen.

841. And have you no boys under fourteen?—Oh, yes; a few. In the reformatories and in the industrial schools—the junior class of schools—the bulk of the boys admitted are above eleven, and the maximum age to which they can be detained is sixteen. There are two classes of schools, as it were, senior and junior.

842. Then your observations cover age from about eleven to nineteen?—Oh, from six to nineteen, because some few are admitted earlier than ten or eleven. I was giving you the ages at which most would be admitted.

843. Is there any payment made by the parents for those boys?—Yes; we collect contributions from the parents. The class we deal with being the criminal or the semi-criminal class, the collection is a matter of considerable difficulty, but, as a matter of fact, we do collect over £1 a head per annum. We collect about 6d. per week per child; but bearing in mind that the bulk of the parents from whom we collect money are not receiving in wages anything like 20s. a week it is a fairish amount. I mean, it is not so insignificant as it looks.

844. What I rather wish to arrive at was the comparative burden between the different authorities.

Mr J. G. Legge.

30 Apr. '02.

Mr J. G.
Legge.

30 Apr. 02.

The parent pays about £1, and the local authority and the imperial grant together—how much would they amount to?—You are taking Scotland now?

845. Yes?—Well, in Scotland, in reformatory cases, the Government pays £10,000 where the rates pay under £3000.

846. What is about the amount per head?—The amount per head is £18 per annum.

847. Of which the Government pay about?—The Government pay about two-thirds.

848. Yes, rather more than that if they pay £10,000?—Ah, but there are other things to come in. The schools make money, and there are voluntary subscriptions.

849. Do the amounts spent in the different reformatories vary very largely per head?—They do not vary very much in Scotland.

Where food insufficient, corresponding inefficiency of the physical training.

850. Do you think that the amount of food, the sustenance, and the amount spent in food, is about the same in the various institutions?—There is no great variation; the cheapest are the Roman Catholic.

851. Do you find anything in the physical condition of the children that corresponds to that cheapness? Is there any insufficiency of food in those more cheap institutions?—I am afraid there is.

852. And do you find that with that insufficiency of food, or something tending towards insufficiency of food, there is a corresponding failure in the physical development of the children and in the excellence of the physical training?—I know this, that the death-rate is higher in the cheaper schools.

853. And probably the physical exercises are less satisfactory?—Yes.

854. You never heard from managers whether such physical exercises have increased the appetite and have led to larger expenditure for food?—No; but I have generally found that the same spirit which will lead a body of managers, for instance, to provide a gymnasium, will lead them to improve the dietary.

855. Of course, you have in these reformatory schools conditions generally of food and premises of salubrious situation, which you would not have in the ordinary town schools?—Well, I should not think our school buildings compared favourably with the public schools, certainly in the big towns.

856. Yes; but surely the living-rooms of the children will compare favourably with the living-rooms of the ordinary children in towns?—There I agree.

857. So that these scholars are living under more healthy conditions generally than those of the ordinary pupils in our poorer schools?—Yes; they are.

858. How long, as a rule, do they stay? Do you give those licensed out?—In the junior schools, the industrial schools, the average term, I suppose, will come to about four years.

859. But sometimes now under the last Act they may be licensed out after three months?—Yes; but still, as many of them will be committed for five or six years, the mean will come to about four I should think, but in the senior schools or reformatories the mean term will come to less than three.

860. You can arrange their time? You can see that they do not waste their time? You can see, at all events, that they do not eat unhealthy food, which cannot be done in the case of ordinary children?—No; there is control in that regard.

Disciplinary results good: much can be done under bad conditions with a system properly applied.

861. About the disciplinary result of this training, have you found that very good?—Very good. I mean that in two respects I think I can say it is absolutely true that in the last few years the serious difficulties in the management of those schools have sensibly lightened. One is the question of immorality, as to which one has always to be on one's guard. Well, since physical training has been pushed vigorously, there has been a decided diminution in the amount of immorality one has detected. Then another very important point is that absconding has almost disappeared. Hardly any one of these institutions has any real means of restraint, that is to say, in almost every one of them if a boy wishes to go, he has only got to take his hat and go, but the training and life

seems to suit their characters and dispositions. There is practically no absconding at all now.

862. Of course you draw from a class of children who are perhaps, as they are physically, also morally below the average?—Yes; and very decidedly below, physically and morally, but as regards certain human qualities of an estimable kind, such as courage, I am convinced they are incomparable; they have reached a higher state of development than the better cultured classes.

863. What sort of courage?—Well, they are absolutely fearless. At gymnastics, for instance, they never have to be coaxed to tackle anything. The trouble of the instructor is always to keep them back from attempting anything straight off which will break a limb if they are not skilful.

864. Well now, to what do you attribute that—to their being left freer and perhaps more neglected, and resting upon their own resources?—Yes; because they have had to fend for themselves in the streets. In fact they have led the life of young Boers. They have had to hunt for their meals, and it has done them good in certain ways.

865. The general result of your experience may be summed up in this way: that even with very unpromising physical conditions and moral conditions, and previous training, an immense deal can be done by a system properly applied?—Quite so.

866. And with very good results?—Certainly.

867. Then with regard to exercises in self-defence you said that you were in favour of these. What results do you find in your experience they lead to amongst the scholars in these schools? Do they lead to roughness often?—No; in some schools where boxing is allowed there is practically no fighting. I believe it is the natural result. Speaking, of course, from the reformatory managers' point of view it is an extraordinary good discipline for the temper; and then I believe, if you carefully train a boy to strike a fair blow, his instinct will prevent him from striking a foul blow.

868. And he will not get into a row—into a street row—so quickly if he knows something of the science?—Oh, no.

869. Then with regard to the compulsory question, you have no doubt whatever it would be greatly for the advantage of youths up to eighteen that they should have some sort of compulsory training?—Yes; eighteen I do.

870. And you do not feel that the ordinary compulsory methods which are applied to younger children would be possible there?—I think they would be possible.

871. But not exactly in the same way. You substitute for these ordinary methods a poll tax or a certain fine for failure?—Yes.

872. Upon whom would that fine fall, the youth himself or his parent?—It ought to fall on the youth.

873. At eighteen one would think it ought to. If he did not pay it you would almost need to resort to imprisonment?—Yes; or you might prevent any employer taking into his employment any youth who could not produce his certificate on the same principle that the factory acts are worked.

874. You have not formed any idea as to the amount of the fine?—No; I should put it low to start with. By low, I mean a sovereign.

875. Yes; that is just about the fine that might be placed upon failure to send a child to school?—Yes; but I think in time it would be possible to stiffen that a great deal as people appreciated the position.

876. But for a lad between sixteen and eighteen you would put it upon himself?—Yes.

877. By Sir Thomas Glen Coats. —You talked of the superior mental and moral effect of physical training. Do you, in this way, account for the high percentage of boys who turn out well after they leave the industrial and reformatory schools. Do you trace a connection between that and their physical training. We know, of course, that the percentages are high?—I think I should say that what you would find is that where the physical

Mr J.
Legge

strongl
cated fo
youths
eightee

Physic
trainin
moral t

training is highly developed, the boys turn out better. It is most certainly the case with reformatory schools. That can be proved to demonstration.

878. Would that apply to girls as well as to boys?—Well, on that I should like to wait for more experience. It is only in the last year or two, but particularly at this reformatory at Glasgow and in another at Sunderland, that the girls have really been put through a scientific course, and I should like to watch events.

879. With regard to this compulsory physical training between sixteen and eighteen, I suppose you would propose to do that in evening schools?—Certainly.

880. Not during working hours?—No; the best work done in all the Y.M.C.A. gymnasia in the country, and the famous gymnasia in Dundee and Aberdeen, is all done at night, or most of it done at night.

881. You said, I think, that you proposed to associate this with the volunteer system?—Yes.

882. How would you do that; I was rather puzzled to know how you would associate the two?—I cannot say I can see a way. I rather hinted, I think, that the volunteer system wants to be swept away, and something else take its place.

883. *By the Chairman.*—The volunteer system?—The volunteer system—yes.

884. You would put it in place of the volunteer system?—I would substitute some arrangement calling it civilian training, or calling it anything you please, for the volunteer system.

885. By volunteer system you mean serving in Volunteer corps?—Yes.

886. You must define it a little bit, I think?—I mean the system that has obtained for the last thirty years.

887. But I mean only as applied to Volunteer rifle corps?—Yes, to Volunteer rifle corps.

888. *By Sir Thomas Glen Coats.*—Supposing you had these evening classes for physical training, and you allowed those who passed successfully through these classes to go into the Volunteers, and we had at that time a compulsory system for the army, these young men might be exempted from that training, having got their physical training and joined the Volunteers, would that be a practical scheme?—I think they ought to have something beyond the physical training indoors. I think they ought to do a certain amount of such work as route marching and skirmishing, and pass shooting tests.

889. These men would be privileged to go into the Volunteers, of course, as at present constituted, or varied, instead of being called up to serve two years in the army?—Yes. I think that would be a reasonable system.

890. Supposing those boys who pass a successful examination in gymnastics were allowed as a privilege to join the Volunteers instead of going into the army under a compulsory system of army recruiting?—I think that would be a reasonable system, but I do not believe you will ever get compulsion.

891. *By the Hon. Thomas Cochrane.*—You have told us that out of about every six boys in the reformatory and industrial schools one went into the army, or else the navy?—The army or the navy, yes. Very few from the reformatories go into the navy, because the navy will not take them.

892. Can you tell me how many boys there are in those industrial reformatory schools? I do not think we have had that figure?—I can tell you the figure that left in those three years. That, perhaps, will do.

893. Yes!—The total number that left the schools in the three years 1897, 1898, 1899 was 13,390, and of these 2382 entered the army or navy.

894. Can you tell me why it is more definitely that the navy will not take boys from the reformatory schools?—Well, because the Admiralty regard the navy as a sort of Young Men's Christian Association. They are afraid. They say no one will be admitted into the navy who has not got a thoroughly good clean sheet. It is monstrously hard on the reformatory boy, because, as a matter of fact, we know cases where relatives are in the navy. I know of a lot of cases of

reformatory boys who have brothers or cousins who are in the navy. The damning fact against the one who is in a reformatory is that his record is open to inspection; it is known.

895. *By Sir Henry Craik.*—But you said very few join the navy. Do any join the navy?—Oh, yes.

896. How do they get in?—Well, that I do not know, but what I do know is that the regulations will not keep a fine fellow out of the navy if he wants to get in. The number is, of course, few, and, after all, it is a regrettable thing that a fellow should forswear himself.

897. *By the Hon. Thomas Cochrane.*—They would be more numerous if they got a little more encouragement?—Yes. The bulk of those who join the navy, of course, fulfil all the Admiralty requirements, and they come from the junior schools. They have not been guilty of crime. The Admiralty can say with regard to them—announce to the parents and the country generally—that they only take boys of good character.

898. Your boys in the army, generally, do well, do they?—They do extremely well. The proportion of non-commissioned officers from one school—I may mention that fact—that from one school, of the old boys who have joined the army, forty per cent. are non-commissioned officers.

899. *By the Chairman.*—Forty per cent.?—Forty per cent. That is to say, they have taken it up as a profession, and they do well.

900. *By the Hon. Thomas Cochrane.*—You speak very highly, and with great experience, of the marked improvement that results to the physique of the boys from your system of drill and training, and there are two questions I should like to ask on that. Do you find any marked mental results as well—mental and moral results—from the training?—Yes. I find, as I say, that the moral results have most distinctly improved. In fact, a school where there is first-rate drill and gymnastics is quite a different place from one of the old-fashioned reformatories, but I have got a few still left for the purpose of comparison.

901. *By the Chairman.*—Would you mind mentioning those, not, perhaps, under that head, but so that we might take them down in case we wish to visit them?—If you want to see unprepossessing boys, go to the Reformatory at Parkhead. Still, they are making an effort. They are crippled for funds, but they are making an effort there. But there was no comparing those boys last year with the lot you would see at Stranraer, or with the Kibble boys coming in from a cross-country run. Then I also find that almost invariably where you have a good gymnasium you have a good schoolroom.

902. You mean, as far as brains are concerned?—Yes; the things hang together.

903. *By the Hon. Thomas Cochrane.*—It is a point that the best-drilled boys are the cleverest?—Certainly. I find that the best gymnasts are the best in school.

904. I should like to ask you what course of training, from your experience, would you give to boys in the Board schools, from fourteen to sixteen and sixteen to eighteen, who have left, who are beyond the school age?—I should give them gymnastics free and applied, only the applied gymnastics would go further, and I should encourage their playing games. I have guarded myself against the idea of suggesting any official recognition of their games. I do not think that would be necessary in their case; but I should also like to see them doing some work, such as route-marching, skirmishing, and something of the military drill which I deprecated in the case of the boys of school age.

905. And what length of time would you devote to that?—Well, supposing the evening continuation school, with three evenings a week, I would either give one evening at the physical drill, or I would give one-third of the time in each evening. I would give, roughly speaking, one-third of the whole time; but, as regards the open-air work, I think that ought to be done on Saturday half-holidays.

906. There was one other point. You tell us that

Town and
country
children :
comparisons
in physique.

you could not, from your experience, see that country children in physique had any very great advantage over town children, and I wanted to know did you compare the country children—what class of country children would those be?—I was going partly on the figures I got from my own schools, and also on those of the Anthropometrical Committee. There they took elementary school children.

907. Ordinary Board school children?—Ordinary Board school children—Yes. And they divided these children into classes, agricultural labourers and artisans in towns, then factory hands in the country and factory hands in towns; and, at the age of eleven, the agricultural labourer's child is less than half an inch taller than the town artisan's child.

908. That is on an average?—Yes. The agricultural labourer's child has just about half an inch advantage over the child of the factory hand in towns.

909. You have drawn it not so much from your own observation, as from the tables you have studied?—But, then, from the figures I got out myself, I found that in our farm schools, after a few years of training, the children had not any marked advantage over those in the industrial schools in towns. The country schools, it is perfectly true, had been hugging the delusion that healthy work in the open air in the garden was quite enough. These figures seem to show that, if in a town school you only give attention to gymnastics, swimming, and open-air games as far as you can, you can really establish a fair equilibrium.

910. And, of course, your observations are the more favourable, that I presume the food is practically the same in the town and the country schools?—Practically the same.

911. Practically the same?—Practically the same. Any advantage would be in the shape of more milk in the country schools.

912. Which makes it all the more significant?—

913. *By Mr Alston.*—You mentioned that this physical training is co-equal with the moral training, that is to say, physical training produces good moral results?—Yes.

914. But we know that in the reformatory, and even in the day industrial schools, the moral influence secured in the ordinary teaching in the schools is perhaps in greater proportion than in the physical training. Do you not lay stress upon that as a means to the same end?—Oh, yes; but what I mean is, that I do not think that now there is more moral enthusiasm in the work than there was five or six years ago, but there is more physical influence brought to bear. Therefore, I think it fair to ascribe what, I believe, is perfectly true, an improvement in the tone and *morale* of the children to the increased attention given to physical training.

915. There may have been a small amount of improvement before, but since the introduction of complete physical training there has been a greater?—I think there has been a greater improvement; yes.

916. At Mossbank they do gardening and field work?—Yes.

917. So those boys there have the double advantage?—Have the double advantage.

918. But you still think that the mere outdoor exercise in digging is not sufficient. It will not produce the same results?—I do not think so.

919. Then another point. You gave interesting figures as to the boys who went into the army. Can you say from which schools they went? Was it from the reformatory or the day industrial schools?—They went from all schools, including the day industrial schools. They went from the reformatories and the boarding industrial schools.

920. But is it not a fact, with regard to the Rottenrow Day Industrial School in Glasgow, that it is a special feature of that school?—Yes, of all the day industrial schools in the country, that one stands second, I think, on the list as to the number of soldiers.

921. Can you tell what tempted the boys to go into the army? Was it the drill, or did they not go into the bands?—About one-fourth of the boys who went into

the army entered it as musicians, but many left the band for the purpose of seeking promotion in the ordinary course.

922. Then, as to the training ships, are they accounted reformatories by the Government?—Not the 'Mars' and the 'Empress.'

923. But they are reformatories?—No, they are not; they are industrial schools; they are junior schools.

924. We threaten boys in the day industrial schools who are very disobedient, and will not be amenable, and continue to be truant at school, and say, 'Now, boys, it will be the "Empress" or "Mossbank."' Still, they are not in that sense reformatories?—No.

925. Another point. You seemed to indicate that the food was not sufficient in these schools. Is that the case?—I will not say that, but I do not think the dietary is well enough thought out in some cases.

926. Yet, where will you see rosier-cheeked children than in the Industrial Schools?—In the majority of them, I admit, but I am not now thinking of a few starved schools where the death-rates are high. I have taken out the death-rate for a long series of years, and I am anxious to see things improved.

927. If we improve the dietary, can we ask the Commissioners or the Government to give us more money?—Sometimes schools are accused of being extravagant in their feeding. Well, I think there is a claim on the Government for a higher grant if a Government inspector is instructed to make requirements for improvements.

928. *By Sir Henry Craik.*—You said, Mr Legge, that you thought that what was required for boys between sixteen and eighteen was one evening of an hour a week out of three evenings a week. You thought that would be sufficient?—One evening out of three, or a third of the time on each of three evenings; I imagine you could hardly compel attendance for more than three evenings a week.

929. But your limit of compulsion would be just one evening a week?—Yes, for purpose of physical training.

930. *By the Chairman.*—Now, I have got two or three questions I want to ask you to start with. Would you mind telling the Commission what your previous training and experience was before you became an inspector?—I was at school both in Scotland and England. I was at the University of Oxford. I was always, more or less, devoted to athletics; still, I was a scholar of my college. Then I entered the Civil Service, first of all in the Admiralty, and went on thence to the Home Office, and I was secretary there to the Inebriates Committee and also the Prison Committee, so I got a general insight into that sort of work. Then I became private secretary; and this post being vacant, and one which rather attracted me, I applied for it and succeeded the late Colonel Inglis.

931. As inspector of what?—As inspector of reformatory and industrial schools.

932. Where?—Great Britain.

933. And Ireland?—No.

934. I suppose, to start with, you would allow that the best of all physical exercises, really a drill, is walking, is it not?—No, I would not; I think running. I think walking for a child is a tiresome exercise. It wearies, without working the muscles sufficiently.

935. Supposing a man can start, or even a girl can start, and walk a proportionately long distance, and is in the habit of doing that to a large extent, do you not think that the physical development of training is better kept up by walking exercise than anything else, or do you not think so?—No, I do not. I think, after the age of thirty, but up till then not.

936. You mentioned, to begin with, about the national system in vogue in Aldershot?—Yes.

937. That system, of course, is enjoyed by the Scotch people as well as English?—It is the British system.

938. It is international so far as Britain is concerned?—Yes.

939. You regret the non-development of cricket?—No, I do not regret it.

940. Well, you say that cricket is not developed. Perhaps I should put it in that way?—Yes.

941. Do you mean that to apply principally to schools under your inspection, or do you mean it to apply to Scotland generally?—Oh, I mean it to apply to Scotland generally.

942. When you say it is not developed, do you mean it is not successful, or that there are not many cricket clubs?—It is not much played.

943. Do you happen to know that there are an enormous number of cricket clubs, great and small?—I learned the game there, but it is not played to anything like the extent that football is.

944. But at the same time football would not prevail in summer, not to that large extent?—Well, I do not know. I have seen football being played hard in Dundee in August.

945. Oh yes, in August, I daresay, but before that? What I mean is, I rather wished to make the point that there is no reason why cricket should not be played under certain conditions in the summer months in lieu of football?—Exactly.

946. When you say cricket is not developed I rather take issue with you, because I happen to know, to my cost I may say, that there are an enormous amount of cricket clubs in Scotland?—Well, it is not much developed in our schools.

947. You mentioned about Morris Tubes. Do you happen to know the approximate cost of putting up a Morris Tube? Something under £100? May I put it at that?—Oh yes, much less than that.

948. At about £50?—I think it could be done for about £45.

949. You said that there was a certain superiority in English development at a certain age to what there was in Scotland?—In the English reformatory or senior schools.

950. At a certain age, I think you said?—Yes.

951. Do you mean that that is the result of more food being habitually eaten in England than what is eaten in Scotland? Do you gather that it is the custom of children in England or young people in England to eat more than the same class would do in Scotland?—No, I do not know that; but what I do know is that there is a great deal more spoon food in Scotland.

952. Either kail?—Well, the meat is all minced. I know there are schools under my inspection which never have a knife and fork dinner from one year's end to the other. They eat their porridge, of course, with a spoon, and they eat their broth with a spoon, or they eat their mince collops, or whatever else they have, with a spoon.

953. On that point do you happen to know whether there is a greater consumption of milk in Scotland than in England?—No, it is about the same in our schools.

954. There was one rather important thing, which I think perhaps Mr Alston would have referred to about the Boys' Brigade. You recommended that they were to be closely linked with the school system?—Yes.

955. As a general rule, have you considered that the Boys' Brigade is more or less sectarian in character, that they have a certain amount of religion instilled into them, of different sects. In large measure I think I am right in saying that. Being a religious movement, and the ordinary school movement being distinctly a non-religious movement, how could you link them together. I mean, I see a difficulty in it. I do not know whether you do; I want to ask you?—I do not realise that difficulty.

956. *By Mr Alston.*—I may say, my lord, you cannot link them.

957. *By the Chairman.*—No, I wanted to know whether the witness had realised it?—Well, that being so, I will go so far as to say that it is the duty of the managers of schools to promote cadet corps.

958. Yes; but that is a difference, is it not?—I

meant that there should be a supplemental organisation to the Boys' Brigade; only I thought that the Boys' Brigade corps was an organisation which had taken root, and that it would be well, if possible, to attach one's self to it.

959. Now, when you say that time for all these things, in the way of physical training and so on, should be found in the intervals of recreation out of school hours, do you mean by that the holidays—Saturday?—Yes; that is, for field sports. I think half an hour three times a week—

960. Three times a week?—Half an hour three times a week for free gymnastics or applied gymnastics should come out of the school time.

961. You are aware that there is a great deal to be done when the children get home at night. Those who are at school there, their work is not over when they quit school?—Well, they would be all the better able to do it if they had this half hour three times a week.

962. Yes, but will there be time, that is the question?—Oh, yes; you mean for the field sports and that sort of thing. Q. Will there be time for all this work to be done?—A. I should think so. The jumping in the pit in the playground I should think would be a matter that they would just do in their ten minutes' recreation.

963. Now, as regards teachers; with all these different new proposals, if a teacher of a school is to know all these things, which, I believe, you say he might do or she might do to a large extent, it will naturally lead to a very large increase of salaries of teachers, will it not?—It would.

964. I mean that is a point to be raised here?—Yes; but I indicated my preference for the real physical training being done by the school-keeper. Most schools have to appoint a janitor.

965. But not in the country; in the town, I agree; but not in the country, in the wild districts—in the far away parts?—No.

966. You must fall back on the teacher; there is nobody else?—No.

967. Even in the country the teacher needs a little more than he did before. He would want more money?—Well, the way to relieve the teachers, as I was saying, is to have uniformity of system.

968. I want to ask you a question about the girls. Do you consider that they, in the same measure as boys, if under comparatively severe physical training, require more food too?—Yes; but I do not think they ought to have anything like the same severe training that boys should.

969. But it may be comparatively severe to what they have been accustomed to?—Yes, quite so.

970. They do require more food in the same way?—They do.

971. As far as you know?—Yes, certainly.

972. I suppose you are a great believer in physical development—muscular development, I will put it in that way—being a good thing?—Yes, I am.

973. But you are aware, I presume, that it leads to a considerable increase of rheumatism in later years?—I was not aware of that. I daresay that would be the case if you went in for simply muscle-developing exercises. The danger of that is that a man becomes muscle-bound, as they say; but then these free gymnastic movements are calculated to develop all sets of muscles. I should have thought you might suffer from rheumatism if you developed some particular sets of muscles at the expense of others, but if the development is uniform, I think you might possibly hope to be saved.

974. Then there is one very interesting point which I think quite within our province to ask. The whole thing that you have recommended, for it is a most interesting one, has been rather to get everybody—all classes, both boys and girls—to be brought up in an entirely uniform manner, is it not?—Yes.

975. Do you not think that would destroy individuality to an enormous extent in the country; and if so, do you think it would be a disadvantage to the

Uniform system might relieve burden on teachers.

Girls require less severe training than boys.

Uniform system recommended.

Mr J. G.
Legge.

30 Apr. '02.

country generally that individuality should be destroyed?—No; I do not.

976. You would like everybody to be alike?—No.

977. To walk by a common rule—I put that case. I take it that is one of the things?—No; but I think, as a compromise, you will get better results if you have uniform physical training than if you have a free development of idiosyncrasies, and I do think that a certain amount of uniformity is desirable in this country.

978. From a national point of view?—From a national point of view. I think we are suffering from individualism.

979. May I ask, are you acquainted with the Swiss system of raising what I may call their wonderful army?—No; I am not.

980. I will just read this. They say, 'by law the Swiss raise their army by the simplest possible means, and by laying on the citizen a burden wonderfully light in comparison with the results obtained. By law every adult Swiss is liable to serve. In practice the doctors select only about 52 per cent. of the strongest and fittest, and the remainder pay the tax instead. As a matter of fact, this tax is not exacted

'from the very poorest, and the rest bear it cheerfully as a natural national burden, for which they know they get their money's worth.' Have you heard of that before?—Now you read it, I do remember to have heard of it.

981. Was that at all, may I ask, in your mind when you advocated something in the way of a poll tax?—It was not. It may have been unconscious cerebration, but I quite agree with the advantage of such a system.

982. I am sure the whole Commissioners are very much obliged to you indeed for your most interesting evidence.

983. *By Professor Ogston.*—Would you kindly allow me one brief question, supplemental to one which your lordship asked, but which did not seem to me to be exhaustively answered. That was, Mr Legge, in your testimony you stated that the physical training gave rather better results than the Scotch?—In the one particular class of schools.

984. Is there any respect in which you can say that we could learn from the English system anything, and that we could introduce into the Scottish system, which would render them equal?—Simply the provision of fully-equipped gymnasia.

The witness withdrew.

Mr J. C. COLVILL, examined.

Mr J. C.
Colvill.

985. *By the Chairman.*—You are one of His Majesty's Inspectors of Schools for England?—I am.

986. Have you been so long?—About twenty-seven years.

987. And consequently, of course, have a large experience of schools in England only?—In England and Wales.

988. I should like you to go through the *précis* you have prepared, so that the Commission may hear?—I wrote this very hurriedly last night on receipt of the telegram, and I am not sure that it is always lucid.

989. You are not bound to stick to it, if you like to elucidate it on the way.—

For many years 'suitable physical exercises' have been recognised as part of the curriculum in public elementary schools in England and Wales, without, however, any direction as to the time to be devoted to them, or as to the character of the exercise.

It was only in the Code of 1900 that explicit requirements were made and instructions issued to His Majesty's Inspectors on the subject.

Up to 1900 the provisions of the Code were practically inoperative in the great majority of schools.

His Majesty's Inspectors had, as a rule, little knowledge of the subject, and in the absence of definite requirements, seldom asked to see what, for one reason or the other, they were not prepared to criticise.

Some of the larger School Boards did appoint drill instructors, who evolved and often published systems of their own, and in some cases were allowed to require teachers to learn their system, and to assist in giving the teachers instruction. A notable instance is the London School Board, which has always done so.

In most of the men's Training Colleges Volunteer corps existed, and on such instruction as was obtained in these or in local Volunteer corps most new teachers had to depend for knowledge of drill, but of drill unaccompanied by physical training, while they received no training as instructors. I think I may say that this is generally the case still. Women teachers were generally attracted by the various systems of musical drill compiled by publishers, and designed mainly for display.

Except here and there, drill was generally intermittent, and of no physical benefit to the scholars, and was taken generally in the desks, with children standing too close together, and almost avowedly as a mere distraction rather than as a profitable subject of instruction.

Here and there the personal interest of a manager, or the personal liking for the subject on the part of a

head teacher, or under some of the large Boards, the personal keenness of the Board instructor, produced better results, but, speaking generally, there was no systematic physical training, and possibly in a given dozen schools no two would be taking the same system, and none would be taking any one system in its entirety. That was what prevailed up to 1900.

In 1900, for the first time, physical training, as such, became 'an integral and important part' of the school curriculum. When I say school curriculum I refer to all elementary schools, whether voluntary schools or Board Schools—all schools under the Code.

The Board of Education, moved by the Lads' Drill Association, published the 'Model Course of Physical Training' as a minimum obligatory on all schools, except those in which, on the application to the managers, the Board should expressly sanction the use of some other system 'having the same scope and aim.' At all other schools the model course is supposed to be obligatory. That was on the initiation of the Lad's Drill Association—Lord Meath's Association.

The Board also required that this training should occupy 'not less than one hour in each week, and not more than half an hour on any one day,' that it should be given by the teachers of the school, and in the open air.

Other recommendations as to (1) the training of teachers; (2) the issuing of certificates to those who proved to be competent instructors; and (3) the provision of qualified inspectors, the Board of Education has not, so far, adopted.

This step, on the part of the Board of Education, has, on the whole, met with a favourable reception from the great majority of the teachers, and has had a marked effect upon the aim of physical drill in schools, and upon the interest which both H.M. Inspectors and teachers are giving to the subject. Certain circumstances militate against it.

1. The vested interests of certain publishers and of some drill instructors under large Boards in the sale of drill-books published or compiled by them. The drill instructors, I may say, of large Boards have obviously a considerable local sale for their work, which they would be sorry to see interfered with.
2. The want of training of the great majority of existing teachers.
3. The absence of any provision for training teachers, or for distinguishing those who have had such training.
4. The absence of expert inspection and supervision.

Physical exercises in England and Wales: history, development, existing conditions.

Gym need fully in Sc

M C

5. The too frequent lack of adequate playground, and the overcrowding of schools with desks, so that space for drill is difficult to obtain. I mean desks which are practically immovable on account of their weight.

990. (1) The Board of Education proposes to publish a new illustrated edition of the 'Model Course,' which it is hoped may be as attractive as those published by private persons. But the real remedy is to make the 'Model Course,' which is identical with that which has been introduced with such success in the army, universally obligatory, while allowing it to be supplemented by private systems.

(2) Competent physical instructors at a moderate cost should be provided for all acting teachers who desire instruction. As a matter of fact, the teachers in my own district have shown a very great desire to qualify themselves. As a result of an exhibition last year at Aldershot Gymnasium, at which Sir Henry Craik was present and a large gathering of teachers, about 800, they on their own initiative, without any pressure from me in any way, engaged instructors from among the men at the gymnasium. There have been no less than twenty-three classes in my district, and at least 700 teachers drilling once or twice a week under these instructors, in West Surrey, and Sussex, and they not only attended, but they paid for the instruction themselves. It having been ruled by the Board of Education that school funds were not available in any way for the purpose, the teachers paid. Most teachers had to pay as much as 10s. and all their travelling expenses, and in spite of this, they formed and attended these classes simply because they recognised the advantage of it. The same desire, to qualify as instructors in the subject, has been shown by teachers in several other districts.

991. *By Sir Henry Craik.*—Is there any possibility of getting a grant for these classes under the English Code?—No; none.

992. They have never been opened as Continuation Classes?—No.

993. Do you know Article 91 (d) in our Scotch Code?—No; I have heard of it.

994. You know that we have several classes of that sort for teachers of physical instruction, where there are authorities and expenses paid?—Yes, so I have understood. I have tried to point out that that was worth doing in this country, but, so far, without success; and it has even been ruled, as you know, that School Boards may not help the teachers out of their funds. That is in connection with the Cockerton judgment.

995. But could not the County Council or any other local authority establish them?—They could, but, so far, I have not been able to find any County Council that would do so. With our own County Council in Surrey I have tried. They have been very good at helping teachers in other respects, but at that they seem to draw the line.

996. It is largely the County Councils in the case of Scotland. We have the same difficulty in School Boards. School Boards can hardly train teachers; we do not think that it is the function of School Boards to train teachers for the whole country?—No.

997. In the Continuation Classes in England have you got classes for the boys apart from the teachers, where there are classes allowed?—Oh, yes; they exist in the evening schools. This year I know nothing about the evening schools at all. The evening schools, you see, with us have all been transferred to South Kensington.

998. Who inspects them?—Chiefly our sub-inspectors.

999. But do you not have a general supervision over all the schools in your district?—Not at all; not the evening schools. In September of last year the evening schools were all transferred from Whitehall to South Kensington.

1000. Are they not assigned by you to the sub-inspectors?—No; we simply lend our sub-inspectors to South Kensington for so many nights in the year.

1001. I thought South Kensington was amalgamated with Whitehall by a recent Act of Parliament?—Well, I believe that is so.

1002. And now the fact is that apparently they are divided?—They appear distinct as much as ever, except in name.

1003. Then, really, your observations are confined to the children of school age up to fourteen?—My most recent observation. Of course we had the evening schools till last year.

1004. But you had, no doubt, formed your opinion as to the advantages of such classes for boys of older than school age?—Oh, yes; I have a strong opinion in favour of them.

1005. Have you an opinion of such training being made compulsory?—Yes. I think I should advocate it.

1006. *By the Chairman.*—In what ages—up to?—Between leaving the elementary school and—

1007. Fourteen to eighteen?—Fourteen to eighteen, I should say.

1008. *By Sir Henry Craik.*—Fourteen to eighteen?—Fourteen to eighteen. I should think there is no doubt that, at present, those four years are years after leaving school of great falling back on the part of all the boys. Even boys who have been hard-working, intelligent boys at school go to pieces in those four years. Of course, you would have to institute compulsory attendance at evening schools altogether to secure that, would you not?

1009. Yes; and you think that public opinion, so far as you have been able to gauge it, would not support that?—I doubt it; I doubt whether it would in this country.

1010. But you think it would be for their benefit?—Oh, it would be for their benefit certainly.

1011. Taking your own district. Do you think public opinion would be as much against the application of compulsion to physical training as to other forms of school training in these years?—Perhaps if you took it at this particular moment—no; but I think that, later on, it might be. I am sure it would have been four years ago or five years ago.

1012. But if it could be proved that it really imposes no undue burden upon the youth, that it did not lessen the resources of the country by interfering with employment or work unduly, that it was certainly necessary in order to preserve the object for which we strive in our elementary schools, do you think public opinion might not be brought over to agree?—I think it might be; but such proposals would be very easily misrepresented to the class of people that would be chiefly affected.

1013. At all events, public opinion would prefer that rather than a compulsory system of military training?—I think so, if put strongly as possibly the only alternative.

1014. Whereas we require, if necessary, the whole time, and prevent employment at all for boys up to fourteen—after fourteen we leave them entirely free—and we consider it an undue interference with their liberty if we ask them for only a single evening in the week for their physical training?—My own personal feeling would be distinctly in favour of it, but there probably would be a fight over it.

1015. Having studied the subject, as I know you have done, what form would you think this physical training for such youths should take? If you have a similar physical training to what you have in the elementary school now—that is, where the military element may not be too marked—you would get rid of a certain amount of the objection?—I would like to see an avowedly military form of training.

1016. The Saturday afternoon might be used for that?—Yes.

1017. You have, I think, a great deal of experience as to the expenses this physical training involves in schools?—It is most trifling. Quite a large school might be amply equipped for less than a sovereign, I think.

1018. In certain cases you have school bands, have

Mr J. G. Colwill.

Mr J. C.
Colwill.

30 Apr. '02.

you not?—Well, Mr Burrows can tell you more about that. They prevail in Portsmouth chiefly; there they have school bands, I think, at nearly every school, at a cost of something under £10 for each school.

1019. Have you ever found any objection on the part of parents to their children taking part in this part of the school work?—Practically none. One has heard of such cases, but it is nearly always traceable to a reluctant teacher, I think.

1020. Or a cantankerous parent?—Here and there, of course, a cantankerous parent. There are such people, but no general objection certainly.

1021. And you think that it has improved the intellectual calibre of the schools?—Very much. It has improved their alertness of mind very much, I think, and all the teachers I have had the opportunity of talking to would agree in that strongly.

1022. And you think it equally necessary in town and in country schools?—Yes, quite as necessary, for different reasons possibly.

1023. What are the different reasons?—Well, the actual physique of the town child is very miserable. He gets no exercise to develop his frame, and he wants training for that reason. The country child is often sturdy enough, but he wants to be taught to use his strength. He moves in a lubberly, awkward way, and he has to learn to use his limbs.

1024. Do you find the want of food interferes with it to any extent in the town schools?—No, certainly, in my present district, because it is a wealthy district; there is no poverty in it really.

1025. Are you acquainted with the North of England?—I have seen some schools in Lancashire. Two years ago I went all through that part of England.

1026. Can you draw any contrast between these and the schools in the southern part of England?—No, I do not think any general contrast.

1027. *By the Chairman.*—I mean the children, the aptitude and quickness?—I certainly saw some remarkably good work, and from children who at first sight looked unpromising material.

1028. *By Sir Henry Craik.*—In the North?—In the North, at Bolton, under a military instructor in the Board Schools, and under a civilian instructor in the voluntary schools. I saw some very good work.

1029. You made, I think, a tour through England to report upon this?—Yes; all down the West of England.

1030. And was there any contrast between the attention given to it in different parts of England?—No. I think that depended entirely upon the accident of some local enthusiasm existing here and not existing there, efficient physical training was not more characteristic of one country than of another.

1031. But how would you have characterised some of the great manufacturing districts, for instance, in the Black Country and certain parts of Lancashire—was the physique of the children worse?—No, I don't think it was. It was very hard to tell, because, in my tour I only saw the schools in which physical training was taken, except by accident. In one town these would be many, in the next town there were perhaps none. I hardly saw enough of the children who had no physical training. Those who had efficient training were brought to a similar level in very different parts of the country.

1032. And what effect do you think that had upon the schools generally?—Oh, the schools where drill prevailed were very much smarter in every way. The children were more alive, and they had much more notion of organising even games and things of that sort. They had much more notion of how to organise and how to play them than in the other schools.

1033. Then the result of your journey was that it depended upon the accident whether the system was scientifically carried out, and the trouble and effort spent upon it, rather than anything in the character of the population or of the children?—Certainly, in my opinion. I believe Colonel Fox is coming. He can tell you that from his observation of the training of recruits gathered all over the country; and he told me some

months ago that material of all sorts coming from London and from other places was brought by this training to very much the same condition.

1034. It was the training really that was the important element?—It is the training that does it. Yes.

1035. *By Mr Shaw Stewart.*—Just one question on the point you referred to first, about the teachers going to their gymnastic classes. What certificate would they obtain?—None. It has been represented to the Board of Education that it is desirable to issue a certificate of some sort, and the teachers would like to have one very much.

1036. If they are keen enough to go through the course, they would naturally like to have a certificate?—Yes. At my suggestion the Lads' Drill Association proposes to organise examinations by competent people over the country, and to give its own certificate to teachers who prove competent, but a Government certificate would be valued more highly.

1037. *By Sir Henry Craik.*—You are aware that we do in Scotland issue such a certificate under the continuation schools?—Oh, yes. I know you do.

1038. *By Mr Fergusson.*—In mentioning the difficulties, I think you mentioned the absence of expert supervision—that was, over the teachers?—Yes. Over the work generally done in the schools.

1039. In other words, you think that expert supervision is necessary for physical training; you could not leave it all to the teaching staff?—No. You must have supervision to keep it uniform even in the army.

1040. Then another drawback, you said, was the want of space, which was very much aggravated by the immovable furniture and the graded floors?—Yes.

1041. But is there any strong necessity for that from a teaching point of view—for the immovable furniture and the floor off the level?—In my opinion, there is absolutely no necessity for it. Desks must be heavy, but they need not be nearly so numerous as they generally are. The graded floor is really a survival of former ages, and it is popular, I think, with architects.

1042. It renders the rooms absolutely useless for any other purpose whatever?—Precisely. The overcrowding of the desks has sprung from a misreading of the Code, more than from anything else.

1043. *By the Chairman.*—In your district, is swimming ever practised?—Yes.

1044. Extensively?—Well, in every place, I think, where there is water available except Guildford.

1045. As a school physical exercise?—Yes, classes are taken.

1046. I do not think you mentioned anything about Girls; what is your experience about them, and what are your views generally on their physical training?—I believe that, up to the age at which the children leave the elementary school, there is no reason to discriminate between boys and girls whatever.

1047. And, after fourteen, should you recommend that girls should be induced?—If girls go on with it after fourteen, the same system of exercise will do with them just as well; it will not be hurtful in any way. All the girls in the Training Colleges have to go through it now, or rather they go through Chesterton's system, which is analogous, and can do it perfectly well. In the elementary schools the girls there often do it better than the boys.

1048. I suppose it is correct, in England—you are the first witness we have had the pleasure of seeing from England solely—to say that there is no sort of medical examination of schools?—None.

1049. Either schools or scholars, or both—none?—None.

1050. Have you an opinion on that point as to partly the examination of buildings, partly statistics for future reference, and so on, and for measurements, and so forth, and, in fact, partly for actual ordinary health of children at schools?—I should think it was desirable most certainly; there are many school buildings that I know which would be better for being medically inspected.

1051. But, as a rule, as far as you know, in England, it is not done enough?—No, it is not done.

1052. In any systematic way?—There may be individual cases in which it has been done, but it is certainly not done systematically.

1053. Only for some reason probably?—Yes; for instance, some four years ago, Dr Crichton Browne made an inspection of the eyes of pupils at certain schools, that was simply a work done on his own suggestion.

1054. Of a Scotsman?—Yes.

1055. *By Sir Henry Craik.*—Is there a medical officer under the London School Board?—Yes, I believe so.

1056. You do not know what he does?—I cannot tell you precisely what functions he discharges.

1057. *By the Chairman.*—But now, supposing such an examination was made, it would be quite competent, I suppose, for the local medical county authorities to do so if they wished to, under the County Council?—If the schools in England are to be in future under the County Council, probably the county medical officers could arrange to do so, but I do not know whether they could do so now. During the smallpox scare there has been a certain number of cases in which medical officers have proposed to visit schools, and I have seen in the papers that certain School Boards have objected, and said that a medical officer had no status in their school; that he ought to see the children at home.

1058. May I ask whether you have any Roman Catholics in your district?—Yes.

1059. That you inspect?—Yes.

1060. What is your opinion about their physical training in schools, as at present existing?—Here and there it is very good, because perhaps some Roman Catholic sergeant at the barracks comes and trains them, if not for love, at any rate for very little money; but a large number of schools are taught by sisters—sisterhoods—and there the physical training, as a rule, is very poor.

1061. Because they do not know anything about it?—They know nothing about it, nor does their dress allow of their doing very much; and in no case have they been allowed to go to any of the classes for acting teachers, even those for women only.

1062. Have you any acquaintance with Boys' Brigade companies in your district?—One has come across them from time to time, or one has known people who have tried to get them up or have tried to carry them on; but no direct knowledge of them.

1063. No direct knowledge?—No.

1064. And you have never seen an inspection, or anything of that kind?—I have seen that; yes.

1065. Do they happen to take the class in that we were talking about just now, between fourteen and eighteen?—Yes, but they only take a section of that class. Everything depends upon the local influence of the person who works it.

1066. It is not a generally useful movement in that part of the country?—No. It is not done at all in the parish in which I live. There were two in our immediate neighbourhood, and they have both disappeared. One was run by an enthusiast for a short time; the moment he left the neighbourhood it went at once; there was nothing left.

The witness withdrew.

Adjourned.

THIRD DAY.

Thursday, 1st May, 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSON.

Mr GEORGE M^CCRAE, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr A. LOBBAN, examined.

1067. *By the Chairman.*—You are Mr Lobban, His Majesty's Inspector of Schools?—His Majesty's Inspector of Schools for Ayrshire.

1068. And have been so for how long?—Fully two years.

1069. Where were you before?—Banffshire, for about two and a half years.

1070. In the same capacity?—In the same capacity.

1071. And before that?—Caithness, Sutherland, and the mainland of Ross-shire.

1072. Also in the same capacity?—Also in the same capacity for about seven years. My experience goes back for twenty-two years.

1073. Also in the same capacity?—Well, not in charge of a district, but I have been an Inspector for twenty-two years.

1074. Of Board Schools?—Yes, but not in charge of a district. I had experience for a short time in Glasgow; for a longer time—five or six years—in Renfrew, Argyll; and previous to that I had two years' experience in Forfarshire and Shetland.

1075. You have some notes? You have not sent in anything in advance?—I have not sent in anything in advance. Time was rather short. I was called upon rather hurriedly.

1076. Perhaps you will let the Commission hear what you have got to say, please?—I was asked to give

*Mr J. C.
Colvill.*

Existing opportunities: varieties.

Cadet corps.

Teachers.

Time given.

Instruction: lack of properly qualified teachers: large proportion untrained

Teachers: classes by Cruden: suggestions.

some evidence as to the existing opportunities for physical training in the schools that had come under my observation and inspection. Well, I think I may say with confidence that there is scarcely a school—I am speaking more particularly of my present district—I should say there is not a single school of any consequence where there is not some form of physical training. The value of the training varies very considerably, according to the qualifications of the teachers, and also according to the opportunities which the premises may afford for training. It varies also in a variety of forms, the physical training. In many cases, where teachers have very little in the way of qualification, the movements take the form of what we may call free gymnastic exercises—simple extension movements of the arms and body. In other places these are combined with dumb-bell exercises, bar-bell also, especially for the girls, and occasionally—they are becoming more numerous—the cases where Indian clubs are also used. In the more important towns in Ayrshire, schools, most of them, have some form of military drill. Two of the schools that are State-aided schools, where the scholars stay on to a more advanced age than in the ordinary elementary school, have a cadet corps. One, I think, has actually been sanctioned; the other is in process of being sanctioned. At least, they wish to obtain sanction for it. The training is given in the summer time, largely in the playground; in many cases, at any rate, in the playground. It cannot be taken in that way in the winter time, as it has to be taken in the ordinary class rooms, many of which, especially the older ones, are quite unsuitable, comparatively unsuitable, for the purpose. In the newer class of schools, very few of them have gone in as yet for special drill halls or a gymnasium, but they are having a central hall into which the class rooms open, and where a large amount of drill can be taken. There is one school which has come recently under my observation that has a very well fitted up gymnasium, but the Chairman of the Board is one of the Commissioners. That is the school of Alloway, which I regard as one of the very best types of schools for drill and for other purposes. With regard to the teachers, in the majority of cases it is taught by regular members of the staff, who may or may not have special qualifications for the work. In towns, a local drill instructor is frequently made use of, and in the larger schools, janitors are being freely appointed who are reserve men or retired soldiers, and part of whose duty is to teach drill. The time given is not long; I should say about half an hour a week for the formal lesson, as it appears in the time-table. No doubt, it is supplemented to some extent by class movements, and some form of drill, as the children are leaving the school and entering the school from their intervals, but, generally speaking, all that appears in the time-table is about half an hour a week. With regard to the Alloway school, I have only seen it once, and I had not prepared anything special, knowing that a member of the Commission was Chairman of the School Board and he would be in a better position to speak about it. The worst feature about the teaching of physical drill, as far as I have been able to judge, is the want of suitable qualifications on the part of teachers. In Ayrshire a very large proportion of the teachers are untrained. In the Training Colleges, special attention is paid nowadays to this subject. I am not quite prepared to say what proportion of teachers are untrained, but it is a very large proportion. I should not be surprised to find that at least half the teachers in Ayrshire are untrained, and these are the teachers whom I think incapable of teaching the subject in any rational or effective way, unless they have themselves had opportunities. Since I came to Ayrshire, two years ago, two very successful teachers' classes in drill were conducted by very competent men. One of them was organised by Colonel Cruden, of Aberdeen. He did not quite teach the class himself, but sent one of his men, and kept in touch with the class, and came and examined it. Colonel Cruden is a man who has done a very great deal for physical training in the schools of Scotland, especially in the North of Scotland.

Mr A. Lobban.
1 May

These classes were very well attended, and I am bound to say that in the schools taught by the teachers who attended those classes, I have seen a considerable improvement in the drill. I think that if it were possible, something more should be done in getting at the teachers who have not gone through the Training Colleges. It might be possible for the County Committees to do something in that way. I think it might very fitly fall under the head of technical education, and give them an opportunity of doing something. I am not quite sure whether the Education Department might not do something, because those teachers who go through the training of the Normal School—well, they all get an opportunity of going through a course of physical training, and I think it might not be a bad idea if the untrained teachers were required to submit to some similar course of training, and perhaps even to show, sooner or later, that they held a certificate for it. I think in all my experience the best military drill that I have seen was in the town of Greenock in Renfrewshire. The schools were all taught there by a keen enthusiast, a retired army man, but apart from that, the schools were pitted against each other once a year. There was a cup—I cannot say who presented the cup—for competition among different schools. Selected teams from all schools met, and some local army officer of standing was always available to decide, and I know that that had a very healthy effect on the drill in the schools. With regard to the school premises, which are not always suitable, even in the towns, the class rooms, especially the older ones, are not generally of a type that lend themselves very readily to drill purposes.

1077. Perhaps you would say why?—Mainly from want of floor space, being taken up mostly with desks.

1078. Immoveable?—Immoveable desks. I do not think it would very expensive to fit up some central hall or gymnasium for a town of some considerable size, where the schools could go by rotation to take the drill. And I do not know whether it would be possible, but if it were possible I think it would be very desirable that the older boys should be taken occasionally to the local drill hall—the Volunteer drill hall. I think it would be a very good thing if they were brought into touch with the Volunteer system before they leave school. They might in this way be directed in a practical way at an early stage towards joining the Volunteer movement later on. I do not know how far the country is prepared for it, but I think some form of compulsion should be brought to bear upon every lad when he leaves school, to undergo a course of training, either in a continuation school, or elsewhere—I think that was practically the substance of what I had thought out.

1079. *By Sir Thomas Coats.*—Regarding the time devoted to this physical training, you say that practically there is only about—according to the time-table—half an hour per week given?—Yes.

1080. Would you consider that half an hour to three quarters of an hour daily could be devoted to physical training without interfering with the progress of the pupils in their other classes?—I think that is making it too long; that is taking up too much of the day.

1081. How much could be devoted to drill without interfering?—Well, I think that it would not interfere at all with the regular course of the day's work if at these interval periods, that is to say, they all have either ten minutes or quarter of an hour's interval in the forenoon, and say ten minutes in the afternoon. Now, if they were all dismissed and assembled in a regular, orderly way, and put through five minutes before and five minutes after coming in—before they go to their class places—if they were put through some regular form of drill, then that would go a long way to keep it up. That could be done every day perfectly well.

1082. Do you mean when they come in the morning, and when they assemble in the afternoon?—Not quite these intervals, but there is an interval in the middle of the forenoon of a quarter of an hour, when they all

get out in the playground, and the same in the afternoon, but rather a shorter interval. Now, I think a part of that quarter of an hour could be devoted very readily, either in the class room before they go out, or in the playground after they do go out. I should not interfere with the children's play. I should not deprive them of the whole of their play, but I think something could be done in that way.

1083. You have mentioned play just now. Do you believe in the systematic teaching of games?—Well, I think I would rather let the children just find out what suits them in that way.

1084. You would not instruct them, say, in football or cricket, or anything of that sort, with a professional man qualified to teach them?—Well, there are very few of the State-aided schools where the boys are of an age to make it worth while bringing in a special coach, say for cricket or games of that sort. No doubt there are a few, and I think in these they do that. I think they have cricket clubs. I may mention, for example, Kilmarnock Academy, which has a fairly good cricket club of its own.

1085. I was referring more particularly to the Board Schools; children up to fourteen?—Of course it is a Board School too, but the fourteen year old children—

1086. Yes?—They do play, and their time is fully occupied in playing. I have not considered the question very fully, but I do not see any great advantage in organising a system of instruction in games.

1087. You talk of, in towns, bringing the children to a central hall for drill purposes. Would not that take up a good deal of time? What time would you devote to that? Take them on Saturdays, or what?—No; I would have each school have their own day, and each class their own hour, and let them be marched by their own teachers to the central drill hall. That, of itself, would be a good training for them; and in a case like that, perhaps the instruction had best be given by an expert.

1088. That would take up, I suppose, an hour to an hour and a half for each school?—Well, that would be once a week.

1089. *By Sir Henry Craik.*—You speak of the possibility and expediency of having a central hall. Do you know any case where the School Boards have attempted a central hall?—No, not one.

1090. Of course, in your present district, you have no crowded areas?—There are no crowded areas at all, and the question of playground does not trouble much. I mentioned Greenock before. I remember once seeing a play court on the roof of a building. I believe that is not uncommon—at least, I have heard—in London; but I never saw any case of it in Scotland, except one case in Greenock, where the children were taken away up to the zinc roof, which was well railed in, of course.

1091. In towns, of course, that central playground might enable them to go together in much greater numbers to drill?—Yes, I think it would be a good thing to have them brought together occasionally in masses.

1092. It would give a greater feeling of mutual interest between the different schools?—Yes, and a healthy rivalry.

1093. Then you spoke of the appointment of janitors as having come into this latterly. Is that common in your district, in the country schools?—In the country schools they very rarely have janitors. Well, in cases where the Board has both town schools and country schools, the town man generally goes out to the country schools and does the drill there; but, after all, it is only a limited number of rural schools that have the advantage of an expert.

1094. And, in the rural schools, they have to trust to the teacher?—To their own teacher mainly.

1095. You have never known any case of itinerant drill instructors, who are moved from one school to another?—No. It may so happen that the same drill instructor is employed by two Boards, but there is nothing more than that, and very little of that does.

1096. But that might meet your difficulty?—That might meet the difficulty in the rural schools.

1097. If he had the help of the teacher to maintain discipline and respect?—Well, the expert goes in at a particular hour, but I hold that drill should be more constant and regular throughout the week than that, and that the only man who can give it is the teacher, who ought therefore to be specially qualified, working, if you like, under the expert.

1098. The occasional advice of the expert?—Under the advice of the expert—yes.

1099. Now, as a means of training the teachers, you spoke of Colonel Cruden's classes. He sends those who have been instructors at his institution to various parts of the country?—He does.

1100. He does not frequently take part in the instruction himself?—No; he keeps in touch with the classes. Of course, this was in Ayrshire, and Ayrshire is a long way from Aberdeen, but he was two or three times down in Ayrshire during the course of his classes.

1101. Who grants the certificates? Who guarantees the qualifications of those who carry on classes under Colonel Cruden's system?—Well, I think he issues the certificates himself.

1102. And at a certain fee?—Yes.

1103. He charges a fee?—He charges a fee.

1104. And if he examines a class of teachers, he issues the certificates and charges a fee for those certificates?—Yes.

1105. Well, do you think that is a very satisfactory system?—Generally speaking, I should regard it as not entirely satisfactory. In this particular case, I know that a great deal of valuable work has been done. I have seen him examine several.

1106. But there is no other subject, for which a public grant is made, in which the qualifications of a teacher are tested by a private individual who charges a fee?—No, but better have it tested in that way than not at all. If the Education Department is not doing it, it is left pretty much to private individuals.

1107. You say the Department ought to do some thing, but has your attention been directed to Article 91 (d) of the Code?—But that is for teachers' classes. Code, Art. 91 (d).

1108. Yes?—Yes.

1109. Well, you are aware that the Department pays three-fourths of the expenses of such classes?—Yes.

1110. And that we do send an expert to examine the teachers; and upon his report, do issue the certificates. Have you not had any experience of that?—We have had a 91 (d) class in Ayrshire.

1111. For drill?—No, not for drill; and I am afraid, just at the present moment, I was not aware that drill was one of them.

1112. Oh, yes?—So that whatever I have said that appeared to reflect on the Education Department, I must withdraw, because I am afraid that was not present to my mind when I spoke of 91 (d).

1113. In various parts of Scotland we have classes of that sort, which are carried on very often by the County Council or by any local authority?—Yes.

1114. And they get three-fourths of the expenses?—Yes.

1115. And, of course, our certificate is issued without a fee to the persons who qualify?—But is not the Department rather objecting to pay the expense of travelling—to count that as part of the expenses?

1116. You are speaking of classes for teachers generally, and not for this subject only?—For the teachers generally.

1117. I think we paid fares for a time, but I think we saw that the charges were rather large, and we fixed a limit to the amount that would be paid for travelling expenses?—Because in a county like Ayrshire you could only have one or two centres, and many of the teachers have long distances to go, and I think it is rather hard to insist on their going through a course of training, and making them pay it out of their own pockets.

1118. They would have nothing to pay except travelling expenses?—But the travelling expense is the bulk of their expenses.

1119. We pay up to a certain limit for travelling expenses—a certain amount each night?—That handicaps the teachers in the more remote districts, and they are generally the worst paid and the poorer class.

1120. That is a detail as to certain regulations which may be wrong; they might be modified, but we do make such provision for existing teachers obtaining physical training. That is all I wanted to bring out. You said that, in your opinion, if the public would agree to it, some form of compulsion would be to the advantage of the pupils?—Of the individual, and of the country too.

1121. Do you know that they do have such opportunities in the continuation schools in your district?—They are not much taken advantage of. There are very very few schools—I am not prepared to say even if there is one at present in Ayrshire.

1122. That would only be accomplished by some local authority—by some one taking an interest in it, and forming such classes?—That might do much.

1123. None of the Boys' Brigade companies have formed themselves into such classes, and have sought grants?—I think not in Ayrshire; I am not quite positive about it, but I think not in Ayrshire.

1124. Nor a cadet corps?—Nor a cadet corps.

1125. You are aware we would readily recognise a cadet corps as a continuation class, if it should propose itself?—Well, in a cadet corps, the work is all done during the day in connection with the regular day work.

1126. The continuation classes may be carried on during the day. They are not confined now to the evening?—I know, but in regular day-schools. The two I have in my mind were the Ardrossan Academy and the Kilmarnock Academy.

1127. You are not aware of any cadet corps except those that are connected with schools?—No.

1128. Have you found, keeping in view the possibility of compulsion at present, any objection on the part of parents to their children taking part in this military drill?—None whatever.

1129. You never found the existence of it?—Never, unless in the case of a delicate child.

1130. There, of course, he would be exempt?—Yes.

1131. There would be no difficulty in his being exempted, but there is no feeling that it is an interference with the rights of the parents or of the child?—No; I once heard of a Board that had some conscientious scruples about the matter, because it fostered the military spirit too much; but I do not think that that feeling is very general either.

1132. Have you noticed yourself what is the effect of excellence in such drill upon the general tone of a school?—Generally speaking, where there is excellent drill, I should not say it betokens a superior school, but the superior school is generally there also. They go together very much.

1133. You speak both of moral tone and intellectual excellence?—Yes; but I should say, on the other hand, that many superior schools, from the intellectual point of view, do not go in much for drill. That may be a mere accident, that the headmaster is not very much of an enthusiast or an expert in the matter of drill; but I should say that where there is thoroughly good drill, there is also a thoroughly good all-round school.

1134. In the poorer schools of your district, have you observed any deficiency in the physique or in the feeding of the children?—In the country schools not much, and there are not very many, even in the towns of Ayrshire, in the very poor schools. One or two might give evidence of poor home circumstances. You can see that from the children, but that is rather exceptional in Ayrshire. But about the feeding: occasionally, especially in the rural districts—I may say it is altogether confined to rural districts—they have a system of providing a meal for them in the middle of the day.

I think that is a very good thing for the children that come from a distance, provided they pay for it.

1135. Do you think there would be any difficulty in insisting upon this physical training being carried further, from its being an overstrain upon the strength of the children? Do you think that that would occur frequently in your district?—Scarcely at all. The ill-fed child is an exception in Ayrshire.

1136. *By the Hon. Thomas Cochran.*—I would only ask you about the general effect upon the health of the children. You have spoken to Sir Henry Craik to the effect that where there is good drill, there is generally a good standard of education in the schoolroom?—That is so.

1137. And have you noticed the health of the children also; has it any effect on the health of the children individually?—Well, I am not prepared quite to say that I have noticed much in that way. At present the drill that they get, as I have said already, I do not think it is sufficient in amount to show very appreciably in the health of the children. I think there can be no possible doubt that it is good for the health.

1138. That is your general impression. You have seen the gradual rise of physical exercise, of drill, in Board Schools?—Yes.

1139. From 1873 onwards?—It has been compulsory in recent years. They insist upon it in every school now, I think, practically.

1140. I think it was originally since 1873—and afterwards in 1895?—Well, it was not compulsory so far back as 1873. I really forget now; it is comparatively recently that compulsion was introduced.

1141. And what opinion have you formed compared with the days before compulsion was in force?—Well, my opinion is formed altogether in favour of drill, and more of it.

1142. And what particular kind of drill do you think is most suitable for children?—I should think drilling, say, with dumb-bells, for boys combined with military drill; but if the teacher has any particular form that he prefers himself, I should think he would get the best work by following his own bent provided his system is based on some rational principles.

1143. Do you find the children get wearied of constant, rather monotonous drill—squad drill, and so on?—They never have so long of it to get wearied.

1144. You think some kind of physical exercise would have as good effect, and is rather more enlivening for them. By squad drill, I mean the ordinary marching and forming fours and marching about?—Well, I should not confine it to that exactly.

1145. Both?—I think a mixture of both. In fact, I should say that the physical exercise would be, in many ways, infinitely preferable to forming fours and that kind of drill.

1146. You have seen the Code for schools in England—the Model Course?—I do not know the English Code.

1147. The first course is practically squad drilling, marching, and forming fours, and the second part is a variation, very much of a similar kind, to physical drill given to soldiers, rising on the toes and stooping?—Yes.

1148. A less formal kind of drill?—Yes.

1149. Do you think that would be generally better for the children?—Well, I would rather not express an opinion. I am not by any means myself an expert in drill, but as to the general benefit of it, I have no doubt whatsoever.

1150. You say that you think delicate children should be exempt from drill?—Yes.

1151. Who determines at present whether the child is delicate or not?—Oh, well, the parent, in the first place, would probably make an application to the teacher, and if he is satisfied that it is genuine, then he does not go further. The child is simply exempt.

1152. But there is no medical inspection at present in Scotland?—No. If there was any difference of opinion about it, probably then a medical opinion would have to be called in, but I should fancy that

4. L
1 Ma
Drill :
favour
amount
recom

generally the appearance of the child is suggestive of inability.

1153. The intelligent teacher can at present?—Pretty well. Yes, I think so. It might very well be left to the headmaster to determine in a case like that, I think.

1154. But there is no medical inspection of school children in Scotland?—There is no medical inspection of school children.

1155. Do you think, from your experience, that that would be advisable, including the medical inspection of school buildings as to their sanitary condition?—Well, I think it would have more effect in inspecting the buildings than in inspecting the children.

1156. Regarding the food of the children, do you find that there is generally in Scotland a feeling of responsibility on the part of the parents to feed their children?—They generally desire to feed their children well in Scotland.

1157. Good, wholesome food?—In some towns I am not prepared to say that there is quite the same independent spirit in Scotland that we used to boast of in olden days; but, generally speaking, there is still on the part of the parent a desire to do the best he can in every way for the child.

1158. There is no indication of a tendency to throw the burden on the State, to get free meals for their children?—Not generally.

1159. They would prefer to pay their penny for the meal, if meals were provided by the School Board or some other authority?—Many of them would prefer to do it; and those that did not prefer, I think, should be made to do it.

1160. *By Professor Ogston.*—You have had very varied experience of towns and countries: do you think that since physical drill became an important element in the schools, the intelligence of the children has improved?—Schools are improving; we are improving our methods of teaching; but I have little doubt that the attention that is being given to drill has some appreciable effect in accounting for the general improvement.

1161. Do you think it would be possible in any way to verify that by figures; say, for instance, the proportion of prizes and rejections in your standards?—There is no such thing as passing and rejecting now, I am glad to think. We used to examine them individually and pass or fail individually, but we do not do that now.

1162. And there is no way in which the test might be applicable?—I do not think there is any figure test. I am afraid it must be left to one's general impression from year to year of what the school is doing, at least I cannot think of any figure test that could be available.

1163. *By Sir Henry Craik.*—The number that obtain the merit certificate—would not that be a test of the accomplishment of the school at the time when the curriculum finishes?—The merit certificate is a matter of recent origin, and, apart altogether from the question of drill, it was bound to go on advancing by leaps and bounds, and I am not prepared to say how far the question of drill has entered into that question.

1164. *By Professor Ogston.*—I suppose, in the case of younger children, say up to twelve, the effect of drill in improving them both physically and mentally would be less than in the case of children over that, say fourteen?—Yes, I think I should agree with that.

1165. But in regard to those, you do not think there are any existing data that could be available to us in any way to verify or contradict the idea that physical education was beneficial to intelligence and to accomplishment?—I cannot think of any way of getting at data such as you suggest.

1166. I observed you spoke of some of the headmasters of the schools being chary of introducing physical education; do you think there is any increasing opinion that physical education has been overdone?—I do not think that they can be possibly of such an opinion in Scotland, where we are really only on the threshold of the question of physical training. It certainly has not been overdone, and I have never

heard any suggestion that there was any prospect of its being overdone.

1167. In Scotland?—I think the Scotch schools have been very very far behind in the matter of physical training.

1168. And have you any opinion that you could supply the Commission with, regarding the question of overdoing physical training education elsewhere than in Scotland?—I am not prepared to speak of any other set of schools than Scotch schools.

1169. Or in higher educational institutions, such as the public schools—universities?—I cannot speak of them.

1170. In the case of the introduction of physical training into schools, would the records of sickness, or absences from illness, show anything that would prove the advantage or disadvantage of physical training?—Well, I should question it very much.

1171. Perhaps I should first have asked whether there are any records of sickness kept in any form that might be made available?—I do not think that there is any permanent record of absence through sickness. The child is absent, a note is brought from the parent as to the reason of the absence, but I do not think that there is any permanent record kept of such cases.

1172. So that all that you can say is, that your general impression is from observation—that you cannot actually produce any figures of the physique and intelligence having improved since the introduction of physical training?—No; I think it is too early to begin to generalise in that direction myself.

1173. *By Mr Ferguson.*—There is no school record why a child is absent. At present, as far as the school returns are concerned, I do not think anything is known of them?—I do not think so.

1174. The only way perhaps you get at something such as is wanted is from the returns of the clerk of the School Board, because when he returns to the School Board for their information the number of children absent, he gives the reason for absence?—Quite so.

1175. So many are sick, and so many are one thing or another?—But, generally speaking, it is only in cases of somewhat prolonged absence.

1176. And unless these records are preserved there are not any tables which would supply what Professor Ogston wishes?—No.

1177. Now as to physical training, you say that in Ayrshire, in most of the schools there is some sort of training?—I think practically in every one there is some form of training.

Some physical training given in most schools of Ayrshire.

1178. You know the words used in Article 19 of the Code is, 'adequate provision made for instruction in physical exercise?' and we are told that in the great majority of cases inspectors answer that in the affirmative, does that mean adequate, considering the opportunities they have?—We are bound to answer many things in the affirmative.

1179. We need not take that as meaning that you are satisfied?—It does not mean very much; it means that there is provision of some kind.

1180. I was very glad to hear you make some complimentary remark about Alloway School? I understand you have been asked, or are going to be asked, to recommend the names of certain headmasters of certain schools where the work is done well, who might appear before this Commission. It would save my asking you a lot of questions if you would tell me, if you are going to name the headmaster of Alloway School as one of the schools in your district?—It occurred to me, as soon as I knew that such was going to be asked of me, but I thought as you were present it would not be necessary, but he would certainly be one of the men that I should have before the Commission.

1182. You consider Alloway is a good example?—Yes; I should consider it a very good example indeed.

1183. There, as you know, more than half an hour a week is devoted to physical training and drill?—That is so in Alloway.

1184. Has that had any bad effect on the general

Mr
A. Lobban.
1 May '02

Mr
A. Lobban.
1 May '02.

education of the school? Did you find that there were deficiencies in other departments?—Not at all. It is a strong school at every point.

1815. Strong at every point?—Ycs.

1186. Well that seems to show that you can devote a good deal more than half an hour a week without injuring the general education?—Yes; but then it is very possibly not very much more than half an hour. Alloway, after all, is a fairly large school; and though it may be that they are getting much more than half an hour in the week, is it not possible that when you come to individual pupils they may not have very much more?

1187. Of course the time-table will show that, and we can ask the headmaster?—But the time-table is somewhat misleading.

School
premises:
fixed
furniture:
central hall.

1188. As to the difficulty of finding space in schools for this training, you referred to the fixed furniture and graded floors and the want of a hall, and so on, but does it come within your knowledge that this system of having fixed furniture and graded floors is becoming universal in your schools?—It is not so bad in the old schools, but in the new schools that is always done. I think it is, generally speaking.

1189. Perhaps you do not know whether or not the Department insists on this being done?—Oh, I think the Department gives them an entirely free hand in the matter. There is no condition laid down about desks.

1190. When you are building a new school?—No; provided the furniture is suitable—that is all.

1191. Then the same as to central halls—do they encourage central halls?—They give the Boards there, too, an entirely free hand.

1192. I am afraid not, Mr Lobban. I fought very hard for our central hall, and it was only because I stuck to my point for months and months that I carried it?—I beg your pardon. I was rather thinking from the other point of view, whether they put any difficulty in the way; whether they insist upon free halls.

1194. Is the town of Ayr in your present district?—Oh, yes; the whole county is.

1195. Is there much physical training given in the Ayr Burgh schools?—Well, not very much.

1196. And still they have every advantage. It is a military centre, with instructors at their hand, and everything else?—Yes. I think it would be a very important advantage if the local military instructors could somehow be brought into touch with the education system of the country.

Military
instructors
should be
brought into
touch with
education
system.

1197. Then you spoke about prizes for competition among the schools, but do you not think that that might lead to the children, or a squad of them, being trained for show—rather to the neglect of the others?—No doubt there is a little risk in that way. I quite admit that.

1198. While you think the healthy spirit of competition would be good?—Yes.

1199. But it would have to be carefully done?—Yes, quite so.

Games
supervised.
Playground
inadequate.

1200. Then on the question of games. I suppose one of the troubles about games is that there is no place even in the country for the children to play games?—No, except the playground itself.

1201. A good many playgrounds, I suppose, are not suitable?—Well, they could not play cricket, and they cannot even play football.

1202. The village green unfortunately does not exist, but do you not think that it is desirable, even if it is only elementary football in the school playground, to start children well, and tell them how to play the game. I do not mean to give it to them as a lesson, as a piece of their school work, and stand over them and interfere with them, but put them in the right way of playing the game?—Well, if it means that the supervision of the teacher is to extend to the playground I entirely agree, and I think that as long as they are in the playground or on the premises at all, they are quite as much, or ought to be quite as much,

under the supervision of the teacher as they are in the classroom.

1203. Then so far you would be in favour of games being taught?—Supervise them. Leave the children free to select their games, but let them play in the playground under the supervision of the teachers.

1204. I was more supposing they are out of the playground. Supposing they had a field handy to the school where they could play, do you not think that it would be well to teach them how the games ought to be played?—I do not think it would become general very readily that there should be a play field for them—for the Board Schools.

1205. That may be; but if there were one?—But if there were one.

1206. You would not be against giving games more consideration?—No, certainly not; but I see very little prospect of ever having a playing field in connection with the ordinary Board School.

1207. You spoke of some of your School Boards objecting to the military spirit. Do you find that it is the general use of the words of 'military drill' to cover all sorts of physical exercises that has among a good many people exercised an adverse influence. They begin to say you are just trying to make soldiers of the children, whereas all the time you are only trying to teach them to breathe and walk properly?—I do not think I ever heard any Board or member of a School Board express to myself any objection or opposition to physical training. I think it was more a matter of hearsay; in fact, I think it takes me away back to the days when I was in Paisley. I think I heard some members of the Board there express an opinion adverse to military training—I mean that it fostered the military spirit; but I do not think it is general now, and if it had been in the early days it has entirely disappeared. I think we may take that for granted almost.

Milit
objec
have
pract

1208. Then, as far as the feeding is concerned, of course I suppose we may take it that if you increase the physical exercise you may increase the appetite of the children?—That is so.

Foo
of n
cost
very

1209. Taking it as you said, that the majority of the children in your district are fairly well fed, I understood you to say you would favour any system which enabled the children readily to get a good meal in the middle of the day?—Most decidedly.

1210. And you think that the parents—of course, all the parents can do is to give the child 'a piece' to take to school, or very often a penny which you know goes in sweets—you think that the parents would favour a way of making it easier for the children to get a good meal in the middle of the day; and they would not grudge to pay for it?—I think the parents would be too pleased if any reasonable arrangement of the sort could be made.

1211. You think it would be a good thing for the children as well?—Well, I have no doubt about that whatever.

1212. *By Mr Shaw Stewart.*—Just one question on the point of a field for the children to play in. It was suggested by a former witness that, in populous places, possibly schools might group together and get a field among them on different days. If that were done, would the teachers welcome that, do you think—would they be willing to go out and help the boys in their games?—I do not think that there would be any objection on the part of the teachers; but, in any case, if it were for the benefit of the children, I do not think that the opinions of the teachers would bulk very largely in the matter.

Gal
ple
ed
rea
ab

to
ch

1213. No, except so far that a great deal falls on the teacher during the week. Of course, he might do it under compulsion, or he might do it because he enjoyed it and liked it?—I think that teachers would be quite willing to favour such a scheme as that, but, of course, it would have to be by Boards you know; it could not be individual schools. Such a thing ought to be done by the Board of the place.

1214. Quite. I was speaking of groups of Board schools?—Yes.

1215. *By the Chairman.*—You stated that the time-table was very often rather misleading. Am I correct in saying that every time-table is revised and sanctioned by you before it is applicable?—That is so.

1216. Would you explain, then, what you meant by saying misleading?—Well, drill may appear two or three times in the time-table, but this drill may be confined to a section of the school, so that it would hardly do to reason that, because drill appears perhaps three half hours in the time-table, every child in the school is getting one and a half hour's drill; it may be only three sections of the school, each getting half an hour, so that if you just merely look at the time-table—that is what I meant by saying it might be misleading if you do not have that in your mind—that it might apply only to sections.

1217. But if it might be misleading, are there any means by which that could be rectified. Do you consider it satisfactory that it possibly should be misleading, or would you prefer to leave it more or less general in terms?—Oh, I think it might be left more or less general in terms.

1218. You would hardly perhaps devote sufficient time to every individual time-table to go into the details?—I daresay we ought to do it.

1219. But, I mean, you have hardly time?—It is not easy.

1220. At the same time you do actually inspect every time-table before it is passed?—Every time-table comes under our supervision.

1221. You said also that you were not an expert in any way. I suppose you have to conduct an examination in drill the same as you do in sewing?—Or see it is conducted.

1222. Well, but practically it is you, because you are the person who reports?—I report upon what I see.

1223. Then practically you examine?—But I do not put them through their lessons, as it were. I do not myself give the word of command.

1224. But I suppose, from the frequency of these inspections that you had, that you became insensibly a sort of expert. You know that the thing is done well or badly?—Well, at any rate we institute comparisons, and know when the thing is well done.

1225. What I rather want to get at is, do you think you know sufficiently well, or do you think that perhaps inspectors coming on in the future ought to be more instructed in the matter?—Well, I should be very glad if I knew more of it, realising the importance of it as I do.

1226. For that reason you would rather that in future the inspectors should have a certain knowledge of it?—Yes.

1227. I mean at some period. Of course you cannot do these things all at once—in the far future say?—Or else have a man specially told off to look after the drill of the whole country.

1228. That would cost money, though, would it not?—Well, one man. He does not require to go to every school; he might select.

1229. When you have those inspections, if you do not like examinations—inspections of drill—do these not occur at your surprise visits?—Yes, we may ask them to be drilled at our surprise visits, just to satisfy ourselves that the instruction is regular and systematic throughout the year.

1230. Then, with regard to the physical exercises, you thought that at least very likely dumb-bells would be advisable. Who would you propose to be the deciding authority as to the weight of dumb-bells for different sized children and children of different ages?—Well, the dumb-bells that are in general use in the schools are merely wooden affairs, you know. It gives them something to hold in their hands, but the weight does not come in as a question at all. I do not think that the schoolmaster should be the man to settle the weight.

1231. You agree with me that that would be rather a question of health and scientific knowledge?—Health and scientific knowledge decidedly.

1232. And a man of skill?—Decidedly.

1233. There is another subject that I do not think you have touched upon at all in particular, and that is the physical training of girls. Have you any views about that—I must rather take you back, I am afraid, because you have only expressed it generally; but I should like to ask you particularly, on the subject of girls, as to whether you think such training is not only necessary, but has, in your opinion, been of value?—What I said was meant to apply to both boys and girls, except in the case of the older boys, who might be taken away to the drill hall, or anything like that. I do not propose that for girls.

1234. You do not propose anything in the way of special training for girls; you think boys and girls, up to the age of fourteen, ought to be able to do the same, as far as you know?—As far as I am able to judge in the matter.

1235. In the inspections that you now conduct, pretty much the same is the case?—Pretty much the same. There is a form of drill for girls, I see, giving hoop drill.

1236. Yes, and what about skipping: do you ever see that?—Not in schools.

1237. Not in schools?—Not in schools. I have never seen skipping in schools, and I have not seen dancing in any of my schools, though I believe it is done in some places.

1238. You revise the time-table for drill, but you do not revise the squad drill, do you?—Would it be within your power to suggest certain changes in the drill performed?—Oh, yes.

1239. Has it ever occurred to you to suggest dancing?—Well, I have had occasion to point out that there seemed to be no point, no aim in drill in a certain school; it was altogether a feckless, fusionless affair; and what I have in my mind just now is just a sort of mere arm exercise, where it does not go beyond the arms, where the body is not thrown into it at all; and these are just the cases where the teacher has no concern, no compulsion or aim to work it up.

1240. Because they have not been trained?—Because they have not been trained.

1241. Not for want of will, but for want of experience?—From want of training, and want of knowing what to do; and that class of teachers bulks pretty largely in my district, and I hope that we shall be able to do something to remove that at any rate.

1242. It is very interesting to know exactly the state of affairs at the present time. Then as regards the good feeding—general good feeding in towns as well as in the country—I suppose you are aware of the unfortunate number of convictions through the agency of the Society for the Prevention of Cruelty to Children that occurred not only in Ayrshire, but also all over Scotland?—All over the country. Yes.

1243. And where in many cases the child is found to be poorly nourished, and yet such and such a child to be a school child?—Yes.

1244. You will admit that there are a great many?—Oh, there are cases; and it is a very serious social problem that must be solved in some way.

1245. You had that on your mind when you said to the Commission that the children were well fed in towns. You rather suggested that the children in towns were better fed than in the country?—No, I should think not. I should think it would be rather the other way—that there is a stratum in the towns, where the children do come poorly fed, and a very difficult class they are to deal with too. That is rather a wide subject. I do not think that the children who come from those homes are able for the effort, either physically or mentally, that the school demands from them. It is a very serious problem. I admit it fully.

1246. *By Professor Ogston.*—Would you kindly allow me to put one single question. Suppose that an accident happened during the games or physical drill of any kind in a school in the neighbourhood, would it be reported to you as inspector, and by you to the Board, or would you obtain knowledge of it in any way?—Not in any way, except purely accidentally.

1247. By chance that means?—Yes; quite so.

*Mr
A. Lobban.
1 May '02.*

Girls: physical training same as for boys.

Teachers: lack of proper training.

Feeding of children in towns generally worse than in country.

Mr
A. Lobban.
1 May '02.

1248. *By Mr Fergusson.*—Might I ask a question about the time-table, because, as you described it to the Chairman, it did not seem to be a very useful document. Does not the time-table show what the different classes are doing?—Well, some of them do, and they all should.

1249. But a properly constructed time-table?—A

properly constructed time-table would show without any misleading. Yes, you are quite right.

1250. A time-table should show what each class is doing at each particular time?—In many cases they give in a very extended form what each class is doing. They do not all do that, and I do not know that we are quite entitled to insist upon it. I daresay we should.

The witness withdrew.

Mr ALAN TUKE, M.B., C.M., examined.

Mr
Alan Tuke,
M.B. C.M.

1251. *By the Chairman.*—Are you a medical man in Dunfermline?—I am.

1252. In practice?—In practice.

1253. Have you got a copy of what you sent in?—Yes.

1254. I may ask you to go through it, please, and then we ask you questions that occur upon it?—Dunfermline has 30,000 inhabitants, and is a good type of a Scotch manufacturing town. In it physical training, as carried on in the Board Schools, is of the most haphazard description, without system, and therefore is certainly not beneficial, and at present is so much wasted time.

Physical
training,
in Dunfer-
mline: no
system.

Remedies.

Remedies.—Physical training, to be of any use, must be carried on thoroughly and systematically. The following is the scheme I would propose to carry out in all Board Schools:—

'(a) That all teachers and pupil-teachers be instructed 'in the theory and practice of physical training by a 'competent instructor, and that they all have a 'certificate of proficiency to teach this branch of 'education.'

Instructors.

NOTE.—*Instructors.*—The difficulty in this case, to my mind, is to get suitable men. The army is at present the main source from which this class is derived. This, I think, is open to objection, because they are men accustomed to instruct only the strong and healthy; whereas in the case of schools it is the very young, a distinct proportion of which is of feeble health. It is most important that all instructors hold *Diplomas* from some of the accredited bodies which grant diplomas for physical training, such as 'The National Society of Physical Education,' 'The 'Teachers' Gymnastic Association,' or the Government Aldershot Certificate for army instructors.

'(b) That at the beginning of each session a scheme 'of physical training be drawn up for all the different 'classes, from the infant department upwards; the 'same scheme to apply to all schools in the town and 'district under the jurisdiction of the Board governing 'that district.'

Uniform
system for
particular
district:
graded accord-
ing to
physical
strength.

NOTE.—*The Scheme of Training.*—The children to be graded according to their physical strength, not by their mental attainments.

Class I. (Infants).—Marching, and marching on the tip-toes, and free-standing movements. Free standing movements are what are known as the free exercises, that is, practically exercises which move every single muscle of the body, beginning with the muscles of the head, the neck, forwards, backwards, sideways, the muscles of the feet, arms, legs, movements whereby every single muscle in the body can be moved systematically, which are put down in the various books.

Class II.—Marching, and marching on tip-toes, and advanced free-standing movements.

Class III.—Marching, and marching on tip-toes, free exercises, and running drill.

Class IV.—Marching, and marching on tip-toes, knees raising, advanced free exercises, and running.

Class V.—Marching, and marching on tip-toes, knees raising, hopping exercises on the march, free exercises, Indian clubs or wand drill, and running drill.

Class VI.—Marching, and marching on the tip-toes, knees raising, hopping exercises on the march, free exercises, Indian club, wand, or dumb-bell drill.

All these exercises can be done quite well in a moderate-sized classroom; in the summer time they can be done in the open air. There is no doubt all new

schools should be built with accommodation suitable for physical training. The *time* to be taken daily should be: infant classes, twenty minutes, and higher classes up to forty minutes. In the winter the most suitable time is the morning; the training never to be done when the children are tired. By tired, I mean mentally as well as physically.

'(c) That a qualified instructor in physical training 'inspect each school fortnightly or monthly—the classes 'to be exercised before him in order that he may see 'the advancement made, and that the approved-of 'exercises are being properly carried out, and also 'that the teachers themselves are keeping thoroughly 'conversant with the subject.

'(d) That H.M. Inspector of Schools have along 'with him at the inspection an expert in physical train- 'ing, to report specially on that branch.' I mean, to report to the Board specially.

Moral and physical condition of the youth of the country between the age of fourteen and eighteen years.—

Personally, I can speak as to the great benefit the Carnegie Gymnastic Club, Dunfermline, has done in this matter to growing lads. Keep the young animal physically fit, and this greatly tends to prevent it going morally wrong. There is no doubt that between the ages of fourteen and eighteen the larger part of the community are, physically, distinctly defective, and to a medical man, who has watched closely physical training carried on in a gymnasium, the effect of a course is wonderful.

1255. *By Professor Ogston.*—Did I understand you to say that between fourteen and eighteen the majority were distinctly physically defective?—No, I did not say that, sir. There is no doubt that that is not correct. There is no doubt that between the ages of fourteen and eighteen a large part of the community are physically distinctly defective.

1256. *By the Chairman.*—Between fourteen and eighteen a large part of the community are physically distinctly defective, and to a medical man who has watched closely physical training carried on in the gymnasium, the effective of a course is obvious?—

Continuation Classes.—The Continuation Classes, as they exist here, are an attempt in the right direction. The lads come for an hour and a half once a week, but are debarred from the physical training class unless they take two or three other subjects as well. An hour and a half once a week is not of much use. Three lessons of three-quarters of an hour each would be a great benefit; the present system further demonstrating the want of method at present existent. This class should, undoubtedly, be carried on in a gymnasium, because the lads are of an age to use apparatus and to undergo a more vigorous course. In a town in which there is a gymnasium, why should not every lad who has left school be allowed the privilege of a course of instruction for two or three years free, so that the work done in school may be more permanent, and thus add to the national strength?

Post Office Service.—Every lad in the Post Office should undergo every year, until eighteen years of age, a course of physical training. By so doing we would hear less of flat-feet and general ill-health in that service.

1257. You mean that that would be a sort of Continuation Class?—A sort of Continuation Class.

1258. You must say that, I think, in order to bring it within our proper view?—Yes.

1259. You see what I mean?—Yes.

1260. We have nothing to do with the Post Office here actually; put it as a Continuation Class?—As a Continuation Class.

In a factory town such as this, the young men and girls employed in the factory suffer most markedly from flat-foot. Physical training is the preventative of this complaint and many others.

1261. That is Dunfermline?—That is a sample of a Scotch manufacturing town. In this town, 1300 pupils have passed through the gymnasium in six years. The gymnasium is kept up almost entirely by fees from the pupils and private subscriptions. Teachers and pupil-teachers have been trained in the theory and practice of physical training by Dr Tuke and Mr Hughes, the gymnastic instructor. I have been in close contact with the Carnegie Gymnastic Club for the last ten years. During that time I have followed the work most closely, and feel very certain of the good that has been done. We have also had to face the difficulty of carrying on such a club by voluntary subscriptions. All that has been done in the past is only a drop in the bucket, and I look forward with great pleasure to possible legislation in the matter, as of the utmost importance to the future of the youth of this country.

1262. *By the Hon. Thomas Cochrane.*—I should like to ask you for more information as to the physical defects that you find in lads between fourteen and eighteen?—In lads between fourteen and eighteen, one of the main defects one finds is undoubtedly deficient chest development. What is known as pigeon-chest, a protruding front chest bone, is a very common thing indeed. Again you find, markedly about the age of sixteen and seventeen, especially in lads who work in factories, most distinct evidence of commencing flat-foot; arch of foot going. It makes them useless for the public service; in fact, no one would take a postman who had a flat-foot. Then you find what is known as *Hælux Egidus*, stiff great-toe joints. There is no doubt that proper physical training, to a large extent, prevents this very painful disorder, which makes young lads very useless for any public service. Again, you find a great want of muscular tone, flabby muscle, dry skin, dry hair—all showing a general want of healthy condition—but this more especially applies to the young men working in the closely confined factories.

1263. *By the Chairman.*—Do you include coal pits?—No, I do not, because I consider the young collier is distinctly a superior animal, physically, to the other young men in the town, most undoubtedly, and I have a large experience amongst the colliers: I consider him physically very fit.

1264. On what data have you formed this conclusion? What opportunities have you for inspecting these young men?—Well, the opportunity I have is this, that I am in the gymnasium every night from eight till ten at the beginning of every season. When the young lads come in they strip to a pair of pants, that is all, and I thoroughly examine them and go over them. First of all, I examine their hearts and their chests, because, if any lad was there with any marked heart-disease, or any incipient heart disease, one would at once put him—I would not say altogether out of the gymnasium, but modify his work there greatly. I then examine them very carefully for spinal curvature, and examine them very carefully for flat-foot, or the commencing signs of flat-foot,—in fact, strip them to the skin and examine them all over.

1265. Examine them thoroughly?—Examine them thoroughly.

1266. Have you got any records of these examinations?—Yes, I have a few notes, a few records, but they have not been, I regret to say, very carefully kept.

1267. They would be most valuable?—Yes, if I had kept them as accurately as I should have kept them, they would have been most valuable. One summer they were actually kept, the measurements of the boys

arms and legs were taken; but then I found that an ambition of one to get a little bit more muscle than another caused them to begin to develop muscle, to use exercises to bring up their biceps alone for the sake of measurements, so that was dropped because I think that is not required. You want to retain in the thing as long as you can their agility and their lightness and their quickness, and their putting on of muscle does not tend to that.

1268. And your general experience, you mean, was that the general development after a course of gymnastics is marked?—Oh, it is more than marked; it is extraordinary. I look back now upon two young men, both of whom I thought would be perfectly useless in the athletic world, so to speak. After a year one of them developed into one of the champion gymnasts. When he came he was knock-kneed and he was pigeon-breasted, but a lad of extraordinary perseverance, of great pluck; and he stuck to it, and at the end of one year I did not know him again hardly—he developed into a big, fine man. That is, to my mind, one of the most outstanding cases. Another one is a young man who happened to be a barber, not an occupation tending to muscle at all. He was very very defective, knock-kneed, and of poor nutrition. He has now developed into a first-class gymnast. But, of course, these two lads happened to have very great pluck and endurance. Even in the most unlikely cases it is wonderful what can be done; and with lads who are already in fairly good condition, it is very easy to bring them into really good condition, presuming, of course, that they are well fed at home to begin with.

1269. And apart from these special cases to which you have alluded, you think that the general health of both boys and girls is promoted by some form of properly regulated physical exercise?—That is simply undoubted; there is no doubt about it at all, that it has the most beneficial effect upon them. No medical man, I think, who has carefully watched it would speak too strongly upon that point.

1270. And if carried out in a proper manner it would have a distinct advantage on the physique of the nation?—There is not the slightest doubt about that—have a most marked effect.

1271. You alluded to the desirability of gymnastics free, or at small expense, being provided for all young men between the ages of fourteen and eighteen three times a week?—Yes.

1272. Would you apply that to girls too?—I most decidedly would.

1273. In either or both cases, in cases of either boys or girls, would you make it compulsory?—Well, where one could, there is not the slightest doubt it would be a very great benefit if it were done. One would like them to come in willingly, but the large proportion do not. I undoubtedly think it would tend very very greatly to their improvement, bodily and mentally—three times a week—of course, not going on the whole year, but with a break into sessions.

1274. Girls from fourteen to eighteen?—Girls from fourteen to eighteen—of course, special care being taken to make the exercise suitable to those girls. That is a time in a girl's life, and a lad's life as well, when one has to be very careful. Injudicious treatment or overwork at that age is, of course, extremely bad, but there is no reason why girls between the age of fourteen and eighteen should not undergo the course of physical training suitable to the female—of course, different from that of the male.

1275. *By the Hon. Thomas Cochrane.*—Would there be any general resistance to such compulsory training?—Yes, I think there would; certainly as regards the girls in the factory. They go into the factory at 6 o'clock in the morning and they leave at 6 o'clock in the evening. There would be very great difficulty of course in getting the time, first of all, away from their work to do it, and I think that there would be a resistance undoubtedly, because they would not see it at all in the light that 'this is going to do me good.' At that age I do not think they think very much of that sort of thing.

Mr Alan Tuke, M.B., C.M.
1 May '02.

Gymnastics most beneficial.

Physical training, if properly regulated, promotes general health: most beneficial for physique of nation.

Compulsion, desirable for girls from fourteen to eighteen: probably objected to: with boys less difficulty.

Mr
Alan Tuke.
M.B., C.M.
1 May '02.

1276. They would rather think, perhaps, it was taking away half an hour of their free time?—Yes, that is the way I think it would be looked upon.

1277. In the case of the boys, do you think there would be the same thing?—No, I do not think there would be the same thing. In certain cases it would crop up, but I do not think there would be the same difficulty in the case of the boys, because in the case of the girls there would be a great innovation to begin with, and it would undoubtedly meet with opposition to begin with, but it would in time break down. To begin with, however, I think there would be difficulty. With boys, I think, there would be very much less difficulty.

1278. And if proper facilities were offered you think that a good many would avail themselves of them?—I am sure of it. When you think of the apprenticed lad between the age of, say, fourteen and eighteen, who has got a very small salary—5s., 7s. 6d., 8s., or 10s. a week—if he has to pay for a course of instruction 10s. for a year, and if there are two in the family, the parents look upon it as being too big a bill altogether. That I have found a practical difficulty; it is not an imaginary one at all; it is one I have to deal with generally in the gymnasium—the question of fees. Though the fees are small, still we require fees to keep the thing going.

Applied gymnastics: fixing desirable ages greatly depends on physique of particular cases.

1279. *By Mr Shaw Stewart.*—We have had a little conflicting evidence as to the age at which applied gymnastics should be taken. I will just mention that one witness said applied gymnastics should not be taken before a child is fourteen, another witness advocated very strongly the age of twelve; would you give us your views on that?—I have had a good deal to do with this in the gymnasium, because we have them there beginning at the age of six. You mean by applied gymnastics, putting them on to the bar and simply little apparatus work.

1280. Yes. Perhaps I should add that the witness who advocated waiting till fourteen said the muscle was not properly developed till then; did not begin to be developed till then?—Quite so. I think it is very hard and fast to fix down a line, so much depends on the boy—the stage of development the lad is in. You will very often see a lad of twelve and a lad of fourteen, the lad of twelve being quite as strong and big as the lad of fourteen. I think in that a discretion must be used by the instructor, or by a medical man who takes an interest in the gymnasium. It is so hard to fix down an age as twelve or fourteen; but between the age of twelve and fourteen, depending on the development of the boy, the physique of the lad.

1281. In fact you would be in favour of some expert or medical advice as to that?—Oh, yes. There are many lads of fourteen I would not allow on to the apparatus at all; and while you are mentioning that point, no apparatus should ever be used in a gymnasium until the class has had at least twenty minutes' physical training in the gymnasium. In Dunfermline the rule is that no lad is ever allowed on to the apparatus until there has been preceded a quarter of an hour or twenty minutes' physical training. That either means free exercise, dumb-bells, or bar bells,—the reason for that being that apparatus is inclined to develop one set of muscles, and we wish to have all the muscles exercised before he goes to specialise any of them.

Gymnasium: courses and fees.

1282. Would you give us a little information as to the fees and the general cost of this particular gymnasium?—Well, I have brought the fees. We divide the year into two. In the winter time we go to the baths, which are boarded over, and made into a gymnasium. The fees, we will say, for the Carnegie Gymnastic Club are, for the winter session 7s. 6d., three nights a week instruction for six months. The summer session we allow them, if they have taken the winter one, to come into for a summer session of about three and a half months, for 2s. 6d.

1283. 2s. 6d. for the summer?—If they have taken the winter; if they have not taken the winter they are charged 3s. 6d. Children's classes, for instance,

little boys' classes, we charge 4s. If we charge more, and there are two or three in the family, it means we only get one. Girls' classes are charged the same. Shop-girls, Wednesday afternoon class, the only afternoon we can get them, we charge them 3s. Teachers and pupil-teachers, we charge them 6s. For that they get their course of sixteen lectures on the medical aspects of physical training, a short resumé of anatomy and physiology, and applying it, and showing how physical training trains and improves the system generally. The School Board, however, pay for the teachers when they go up for their examination—pay their examination fees—so you may say the fees vary from 3s. 6d. to 7s. 6d.

1284. And do the teachers obtain any form of certificate?—We train them, and then they go up to Dundee. They have always gone to Dundee, where they take the diploma of the Dundee Physical Training Society.

1285. Just one question as to the cost of the gymnasium—I do not mean the cost of the building? What is the fee of the chief instructor?—The instructor is paid £2, 5s. a week. The Town Council allow £1 a week for six months, and 2s. 6d. on every pupil. There is left about £35 a year to be made up by private contribution to carry it on. Every year we are £35 to the bad.

1286. On the subject of Continuation Classes, you advocated free lessons for boys who have left school?—Yes.

Continuation Classes desirable

1287. Do you think they would really take advantage of them?—Yes; I think they would. There is no doubt about it, that in many cases, especially amongst the poorer lads, the fee is a distinct drawback.

1288. *By Professor Ogston.*—I suppose, Dr Tuke, that you are not solely a specialist in regard to this, but rather in general practice?—I am in general practice.

1289. And you doubtless have to advise your patients, and children in the classes altogether different from those who come to you for physical training?—Oh, yes.

1290. And in that way you are familiar with the questions of their health, and their progress, and study, and so forth, as well as with the question of whether physical training is an advantage?—Quite so; that is so.

1291. You have been some years in practice?—I have been seventeen years in practice.

1292. And how did you come to interest yourself in physical training as a specialist?—That is a little difficult. I was always very keen upon athletics when I was younger myself, and the gymnasium was started after I was in Dunfermline about seven years. It began with a very large number, with a casual instructor. It began, I think, with sixty, and rapidly, I think, fell down to ten. I took it in hand because I was very much interested in the subject, and I worked it from ten up to now over two hundred; but exactly how I came to take an interest in it is a little difficult to say. I drifted into it, and once I got into it I got intensely interested in the subject, and I have worked at it ever since.

1293. How did you get your own training?—Well, in the usual haphazard way that every ordinary school-boy does nowadays.

1294. There was one point in your evidence that you stated that a large number of children are feeble. I forget exactly how you worded it. I suppose it referred to what Mr Cochrane asked you about the defects between fourteen and eighteen; but as I understand, it was under that age that a large proportion of children were feeble?—Yes; in bearing out that statement the *Times* newspaper published a report which was taken up by the *Lancet*, and was freely commented upon by the *Lancet*, and the statement was this:

Defects children fourteen benefited physical training

'That out of 100 boys, varying in age from eleven to fourteen, medically examined before entering one of our large public schools, that 60 per cent. showed some physical defect. This clearly demonstrates the

Alan Tuke M.B. 1 May '02

'advisability of gently graduated training from the day of the nursery.'

I have hunted up the *Lancet*, and unfortunately I cannot find the leader upon that subject; but there was a leader written upon the subject, taken from the *Times* newspaper.

1295. And from your experience, you cannot tell us what these defects are; whether say, for instance, a very large proportion of them were somewhat defective in the refraction of the eye, myopia, or astigmatism, or something of that kind, that has not a direct bearing on their physical training?—Quite so; that may apply to that. Personally, I have not examined their eyes in connection with the gymnasium, except in cases where there has been very marked short sight.

1296. *By the Chairman.*—The words that you used were 'distinct proportion.' I said a distinct proportion—yes.

1297. Of the very young is of feeble health?—Of feeble health—feeble physical health—that is referring to.

1298. *By Professor Ogston.*—Your own experience in Dunfermline rather points to such static defects as flat-foot, knock-knees, pigeon-breast, spine, and so on?—And rickets.

1299. Things that would be all benefited by physical training?—Things that would be all benefited by physical training.

1300. Have you met with any cases of injury from physical training in your own experience?—I have never met with one.

1301. Let me cite, for instance, rupture, just as an illustration?—I have never come across a case of rupture following any course of physical training or gymnastics; but I have stopped lads, of course, who had commencing rupture, from ever going on the apparatus.

1304. Could your measurements be of any assistance to the Commission in giving us a standard of health of the children at various ages, as to their height and weight, and so forth?—No, I do not think they could. If that were done, that would have to be done most thoroughly and elaborately, really to be of benefit.

1305. And in regard to training, physical training, of female children, what are your views regarding special clothes?—Oh, I think, undoubtedly, where special clothes can be used, the divided skirt, of course, is very much better. It gives them a much freer movement. I fail to see how free exercises can be very comfortably done with corsets.

1306. Then, a different point,—what is your opinion about games, such as football and cricket, as a substitute for physical training, or to be used along with it?—Well, they are no substitute at all for physical training, because a boy goes out to play football, and it is entirely his own individuality as to how much or how little he does. He may overdo it,—possibly, again, he may underdo it. Again, in football and cricket, it is not all steady systematic use of all the muscles of the body.

1307. I have just one question more. That is, you have been a student in more than one University?—Yes.

1308. Would you name that?—Leipsic and Berlin.

1309. And at home?—Edinburgh University.

1310. Have you seen any drawbacks to the use of athletics in the Universities?—No, I cannot say that I have. No, at least I cannot at the present moment put my finger upon any drawbacks at all.

1311. I mean, does it harm the least intellectual, who devote themselves to athletics?—Well, they waste their time a little bit too much every day. But if they do that, undoubtedly they improve in their general health. No, I do not think that athletics are carried to extreme. In moderation, I think they are most excellent, but if carried to extreme, like everything else, I am afraid they are a little apt to produce bad results.

1312. *By Sir Henry Craik.*—You began your evidence by saying that you thought the disadvantage of the physical instruction in the Dunfermline schools was that it was without system?—Yes, that is so.

1313. And that, as a consequence, you thought it was not beneficial?—Is not beneficial. It is neither one way nor the other; it does not do any harm.

1314. You have formed that conclusion from having examined the schools, and from having seen that instruction going on?—I have, from having seen several inspections.

1315. Of the physical instruction?—Of the physical instruction, yes.

1316. Was it carried on, do you know, to any extent by sergeants, or was it entirely in the hands of the teachers?—At one time, partly by the sergeant, who is also the janitor,—at other times by the teachers.

1317. And in what way do you think it failed?—It failed, to my mind, not so much from what one actually saw at the inspection, because what I saw there was pretty light work,—taking to the eye, but by no means work that I would have called exercise, that I have described as beneficial.

1318. You did not look, of course, for gymnastic exercise?—Not purely physical training.

1319. Free gymnastics?—It was Indian clubs, very pretty, very nice, but one could hardly describe it as being beneficial; more, from this point of view, I knew it had not been worked up to by what I call the systematic course and the grinding of free exercise; it was a superstructure without anything below it.

1320. Was it carried on to the accompaniment of music?—To the accompaniment of music.

1321. Entirely?—Yes.

1322. And that, you think, is so far a weakness?—No; I have no objection to that, if it is the outcome of a good steady systematic course.

1323. But does not the accompaniment of music rather take away from the spontaneous effort?—Well, we never like to train any pupil in the exercise with the music; but when they are fully trained, and know the exercises well, one does not object then to music; but I think they are undoubtedly far better trained if they are trained by word of mouth, and to keep their own time; but for a thing like a display, or anything of that sort, music is used to make it a little more effective.

1324. Then you think that it ought to be carried on according to a uniform system?—According to a uniform system. That I think is the point, and the system to be drawn out at the beginning of each term, so that all the schools, each grade—the infant department, Standards II., III., IV., V. and VI.—should actually each day take the same exercises.

1325. Take the same exercises?—Take the same exercises; to be applied to all infant departments and all the school. And then for the second class all the same exercises, and the third, and so on.

1326. And do you think it is necessary to give all those six divisions that you give?—Well, I think they might be cut down to four.

1327. It struck me that there were some exercises which in their earliest form might be used even for the young children?—For instance.

1328. Raising the knees?—Well, in the infant department I would not do that. I think to hop, especially round the room on one leg, does cause a very distinct amount of exertion.

1329. To hop round a room; but even a short hop?—Well, then, for a short jump the authorities seem to think, and in that I must say I agree with them, that for the infants I would be inclined to leave that out.

1330. Do you base your system on the Aldershot system?—One can hardly base one's system on the Aldershot system, because they deal there with the strongly developed healthy man.

1331. But they have it adopted in the military schools for children?—Is that so?

1332. It is carried out very fully, completely there?—Is that so?

1333. Adapted and modified to suit the young children?—Is that so? Then do they use that Aldershot system?

1334. Exactly?—We have been inclined, so far, to accept the marching—marching on tiptoes, and the

free standing movements in the infants' department. It will be a debateable point whether the children should not go a step further forward.

1335. You said one great desideratum was that the teachers should be trained?—Yes.

1336. You prefer to have training given to the ordinary teachers rather than to have special experts brought in for this?—No; my idea would be to have a special expert, a really thoroughly trained man, to train everyone; but I do not see how that would be practicable; it would require so many of them. Of course, I would prefer a really first-class expert to the teacher, or pupil teacher, who has been trained.

1337. You feel no doubt as to that?—I feel no doubt as to that at all.

1338. You think it is not to a certain extent counterbalanced by the fact that the teacher is responsible for the general discipline of the school, that he is acquainted with the scholars, that he knows their idiosyncrasies, and that he can work it in with the general work of his school better than an outsider?—Yes, there is something in that.

1339. But you think it is not counterbalanced by the other consideration?—No; the expert, I think, is always better than the amateur, a well-trained expert.

1340. And from what class do you propose to draw that well-trained expert?—That, of course, is difficult—to get good instructors; I know nothing so difficult. The instructor that we have had now these six years, I drew from the amateur class of gymnasts; a man with a thoroughly good reputation, who was himself the best gymnast in Scotland; but, much more important, he had been training teams for physical training competitions. That is the reason why I took him. But he was not a trained instructor, and had a good deal to learn in that line; but being a man of first-class intelligence, he has now trained himself to be a first-class instructor; but I admit that the first year his power of imparting knowledge was rather weak. Only, he found out his faults, found out his mistakes, and has rapidly improved, to be now, I believe, a very first-class instructor.

1341. You prefer such an instructor to a non-commissioned officer from the army?—Yes, I do.

1342. Therefore you reject, in an ideal system, either the ordinary teacher who has obtained special training, or the non-commissioned officer, familiar with military drill, and you think you must look to a class of more or less professional gymnasts?—More or less professional teachers of physical training. I am very anxious for the word 'gymnast' and 'gymnastics' to be left out, because it is so associated in people's minds with wheeling round upon a bar and doing various exercises upon a bar, which is only a sport—the outcome possibly of physical training—a sport the same as football or cricket is.

1343. But do you think that you would ever, apart from this gymnastic training, develop the class of people who will devote their lives, not to military drill, but solely to the physical exercises that may be used in schools?—Yes, that is the class of man that I should like to have—the man of good intelligence, who is well trained, not only in the theory, but in the practice.

1344. It must be very rare to have such a man in the ordinary State-aided school in Scotland?—You do not have such a man in the State-aided school in Scotland.

1345. No, we have two classes of men; we have the ordinary teacher?—The ordinary teacher.

1346. He may have some training?—Yes.

1347. And we have, in many cases, encouraged the employment, as instructors, of firemen and non-commissioned officers in the army; but these classes you set aside?—I do not set them aside; you understand what I mean. I only set aside the ordinary non-commissioned officer in the army, who has only a knowledge of ordinary military drill. The ordinary janitor you get is not a man with an Aldershot certificate, but simply a non-commissioned officer—most likely a sergeant—who has taken his discharge, and is conversant

with the ordinary military drill, and the physical exercise as used in the army in his time, which I do not think is the system useful for children.

1348. What length of training would be necessary to equip a person who was to take this sort of instruction?—I would say six months' training, with an examination at the end of that time, and also with, once a year, a course of, perhaps, one month to six weeks for the next two years, afterwards to see that they are still remaining fully conversant with it.

1349. If ordinary teachers devote, say, six weeks for, say, four years to such work, you think they might get training that was sufficient?—Quite so.

1350. Are you aware that they might do that at the present time under the regulations of the Department?—I believe that is so; that they might do it.

1351. And would have assistance in doing so?—And would have assistance in doing so.

1352. You spoke of the teachers in Dunfermline obtaining training at your gymnasium paying a fee for a certificate which was granted to them?—For the examination, yes.

1353. Why have the authorities of Dunfermline not made use of these opportunities offered by the Code for the training of teachers?—The School Boards have paid.

1354. I am not speaking of the School Boards; I am speaking of the opportunities offered by the Department from Imperial grant?—Ah! that I cannot answer, because I do not know.

1355. Why do the teachers pay for their certificates when they can obtain certificates through the Department?—I have already said that the School Board have paid.

1356. Yes, the School Board; but why should the School Board, or anybody else, pay for a certificate which can be obtained from the Department without any charge at all?—I do not know that; I cannot tell you; I do not know.

1357. Then, perhaps, lack of organization and arrangement in Dunfermline is partly due to ignorance of the conditions that are offered?—That is quite possible.

1358. With regard to the gymnasium, with which you are specially conversant, that applies of course only to a very small proportion?—It applies to a small proportion.

1359. You said two hundred in a population of 30,000?—Two hundred in a population of 30,000.

1360. And the age of those who attend is probably between fifteen and eighteen?—Oh, no; a large number of children from the age, I should say, of eight or nine.

1361. Children of school age?—A large number of school children, schoolboys' classes and schoolgirls' classes.

1362. Then they belong, I presume, to a class that is above the class attending the ordinary State-aided school?—No; they are simply the ordinary little boys and the little girls that go into the Board Schools. We have special classes for the better-class children—that is a better thing altogether—much higher fees are charged; but these are the ordinary boys attending the various schools—Commercial School, Queen Anne's School, and so on.

1363. And why should not the School Board, if they consider this instruction to be for the benefit of the children, subsidise it as a branch of their own school?—I wish to goodness they would; I cannot tell you why, but they have not. There is no aid at all given to the children to pay the fees in connection with the gymnasium; it is purely a voluntary matter; either children in part or the parents in part pay to be trained.

1364. Of course the training there is more in the nature of gymnastics?—No; that is the one point that we have always kept. 'Gymnastics' it is not called; it is the 'physical training.' For instance, it is never called 'gymnasium'; it is called 'Carnegie Gymnasium' 'Physical Training School.' My object has been to keep out the word 'gymnastics.'

1365. That is, so far as the children of school age are concerned?—Yes.

Gymn
in Du
line:
who a
'phys
traini
'gymn

1366. But you spoke of those classes which were attended by young men for three nights a week?—Yes.

1367. I presume that the object of these young men is to develop their muscles in gymnastic exercises?—Well, that is partly it; but the main thing is the physical training. As I have already said, there is no young lad allowed to go to the apparatus until he has taken the preliminary quarter of an hour, twenty minutes, or the half hour as the case may be, of physical training. For instance, in support of that there is a programme of a display given in which there is a mass work of physical drill; of eleven items, four items are mass work. The mass work is one of the most essential things.

1368. I think the two instances you give us were those of pupils who had become very expert gymnasts?—They had become expert gymnasts, the result of physical training.

1369. An object that these young men have in giving up their evenings must surely to a large extent be to acquire dexterity in gymnastic exercises?—Yes; one would think so; but I tell you, that out of a class of fifty it is difficult to get twelve to come forward and be gymnasts.

1370. Be gymnasts?—I mean to go in for apparatus work entirely; the preponderance come for the physical training. There is a large number who come who never go near the apparatus at all.

1371. You say that those young men from fourteen to eighteen give up three nights a week, for what number of hours each night?—They are supposed to be there from eight till ten, but they are not that time under instruction; I should say from a quarter past eight to a quarter to ten.

1372. One and a half hours three nights a week, simply for marching?—Dumb-bells, bar-bells, Indian clubs, free exercises.

1373. And what number do that?—I should say the class would average about forty each night. Of course, towards the close of the session a certain number drop off. After the physical training is done, then they get the opportunity of going to the apparatus, but never until the physical training is done.

1374. Then you think that for a large number of the youths of that age, you might get them to come up for that sort of work three nights a week?—Of course there is no doubt that the gymnastic part of it is undoubtedly an inducement to some; but there is just as large a number come for the purely physical training part of it alone, some who never go to the apparatus at all.

1375. That of course is contrary to our experience with regard to Continuation Classes. There are very few Continuation Classes where we could get anyone to give such an amount of attendance?—Well, the Continuation Classes that we have in Dunfermline are just treated on the same lines. First of all a course of physical training, and then after that they are broken up into squads and go to the apparatus.

1376. And do these Continuation Classes come under the inspection of the Department and seek for grants?—I do not know; they have never been inspected that I know; but there is a grant.

1377. They could not get a grant without inspection from the Department; the grant must come from some other source?—It may come from some other source.

1378. With regard to these Continuation Classes, you made a statement which, I think, must be based upon a misapprehension, that these physical exercises could not be recognised without the pupil taking two or three other subjects?—That is the fact, sir, in Dunfermline. I will read it again.

1379. I have not misrepresented you?—No, sir; that is down absolutely in black and white.

1380. I suggest that it was based upon a misapprehension?—Well, what the higher powers are I do not know, but that is as it is represented to us; they have to take two or three other subjects as well.

1381. It might be well that it should be known that all that is required is that as a rule they should

be in attendance at a class in one other subject?—In one other subject.

1382. And you stated at another part of the evidence that you gave lectures on hygiene. Well, we have in many cases accepted lectures on hygiene as the other subject?—Is that so? That has never come under my personal knowledge at all.

1383. You think that probably were better understanding of the opportunities opening, these Continuation Classes might be considerably extended and made more efficient?—Very considerably extended on what you have said, that is; as it is undoubtedly possible we may have taken it up wrongly as it has been represented to us.

1384. And in the Continuation Classes that are carried on in this way you speak of fees?—Yes.

1385. Fees are very unusual in the Continuation Classes aided under our Continuation Class Code; I am not aware that they are charged in almost any case?—But the fact is, we do not charge the individual lad fees, you see, but the authorities pay us—pay the gymnasium so much per lad—per head, for the instruction that is given here.

1386. What authorities?—The authorities under which these Continuation Classes are carried on—the School Board.

1387. But I thought you said it was one difficulty in the attendance of scholars at these Continuation Classes which you thought might be of great use, that they had to pay a fee which was too heavy for the bulk of the young men?—No, sir; you took me up wrongly there. I think that was not applied to the Continuation Class at all, but applied to lads after they have left school.

1388. Do the Continuation Classes only apply to lads after they have left school; they apply to no other?—But I suppose lads do not attend the Continuation Classes till they have left school; do not want to have any Continuation Classes; I suppose they want to come to the gymnasium.

1389. Why should not that be called a Continuation Class?—I should very much like to have it so; but in Dunfermline, at the present time as the arrangement exists, they have to take out other classes as well before they are allowed to take out a class for physical training.

1390. *By the Chairman.*—By whom?—That is a very difficult question for me to answer. By those in authority; by the School Board, I presume, who manages.

1391. *By Sir Henry Craik.*—You pointed out one objection to the Continuation Classes?—Yes; that they had to take two or three classes.

1392. That they had to take other subjects; well, I pointed out that that was to some extent a misapprehension. You pointed out another objection, that they had to pay a fee which for boys of fourteen to eighteen employed on scanty wages was too large a fee?—Yes.

1393. That seems to me to be based on another misapprehension; because in almost no case of Continuation Classes is any fee charged. I could not at this moment name in the whole of Scotland a case where a fee is charged in an ordinary Continuation Class?—Then may I take it from you that any lad who has left school can come to the gymnasium to take a course of physical training there, and that count by itself a Continuation Class if he takes no other Continuation Class whatever.

1394. You are carrying it too far; I know nothing about the gymnasium. I can only say that if a Continuation Class were opened by the competent authority for physical exercise, combined with lectures upon hygiene, the Department would be prepared to give grants to such a class—to the authority starting such a class upon the ordinary conditions, and that the grant that we give, as a rule, enables these authorities to dispense with fees altogether?—Well, I can safely say that is not as we understand it in Dunfermline. I never had it put to me in that way before, and the practical outcome has not been that.

1395. To return to another point. You stated that

Physical
training:
time to be
devoted per
diem.

the time in the ordinary schools that you thought ought to be devoted to this work was twenty minutes daily for the infants, and forty minutes for the older classes?—Up to forty minutes for the older classes. I would make forty minutes the limit.

1396. Are you aware of any school where it even approaches that amount?—No, none of them.

1397. Forty minutes of drill is a good deal?—It is not continuous drill.

1398. How would you break it up?—I would break it up: in the infant department, say twenty minutes—5, 5, 5, with a five minutes' interval broken up in between; that is actually fifteen minutes' drill.

1399. How would you break up the forty minutes?—Supposing they had five minutes.

1400. Five minutes' drill?—Five minutes' marching; that would include taking as it stands here, marching and marching on tip-toes.

1401. I am not speaking of what it would include; but would you just explain how the time would be broken up; you would give them five minutes?—Of marching and marching on tip-toe.

1402. How long interval?—Supposing you give them two minutes' interval after that, then five minutes of the free exercises, and then a short march at the finish; the twenty minutes would be left to the discretion.

1403. The forty minutes would cover an hour and a half a day of school time at that rate?—No; forty minutes, as they get up to the other classes; the whole thing forty minutes.

1404. Forty minutes, broken up as you describe, would mean an hour and a half?—I want the twenty minutes, from start to finish, to include the interval, and the forty minutes includes the intervals.

1405. *By Mr Fergusson.*—When you said that physical training was haphazard and a waste of time, were you speaking of your knowledge of Dunfermline only, or have you any knowledge of schools all over the country?—My statement was made simply as I have seen it carried out in my own town of Dunfermline, which I am referring to want of system.

1406. Though you said you admitted that an untrained person who went to look at this work might find it taking to the eye?—Yes.

1407. I suppose that means that you think an untrained eye is not capable of understanding the niceties of physical training?—I do not think an untrained eye is able to see whether those movements that the pupils are doing are actual beneficial movements or not; that a person who is going to inspect them must be an inspector of physical training, as he is of reading, writing, and arithmetic.

1408. I suppose you would say that though any of H.M. Inspectors who are not trained to physical exercise report that the training looks well, it does not follow that it is correct; they are not sufficiently expert in training to know?—They are not experts; that is the difficulty, they are not experts.

1409. In your answer as to instructors, were you dealing with the instructors who were to teach the children in schools, or the instructors who were to teach the schoolmasters?—I want an instructor to be over all the teachers and the pupils as well—an inspector, to see that the teachers, first of all, know their work thoroughly, and are carrying out their work thoroughly.

1410. That is, a man who goes to the school now and again?—Who would go to the school regularly once a fortnight—go round every class once a fortnight.

1411. And that man, you say, should be a specially trained man; you do not like an old soldier?—I do not.

1412. When you said that, I suppose you meant a man who had been a drill-sergeant; you want an Aldershot-trained man, such as you find in a military gymnasium?—The instruction there is, I believe, splendid; exactly.

1413. You gave us a scheme of work divided into classes?—Yes.

1414. May I ask you, how did you arrive at that scheme—did you make it for the purpose of to-day, or had you seen it in practice?—Well, that is one we

have been following out for some time in the gymnasium as we have it at present; of course it is somewhat difficult there to class your children exactly as you want, but undoubtedly the infants must be handled lightly and gently. It seemed to me that by dividing them into six, one could best divide up the children as to their physical strength.

1415. But you have evolved that out of your experience?—Yes.

1416. It interested me because, curiously enough, it is exactly—you could not have stated it more exactly—the system of training we have adopted in a school of which I have some knowledge?—Is that so. In this I have some great assistance from our gymnasium instructor, who is a man of great ability.

1417. You said nothing about gymnastic work—applied gymnastics—do you consider that is not desirable for children of fourteen?—Well, I have got a note here as regards that. I said in class C, dumb-bells to be made of wood, and, if possible, once a week gymnasium, to make a pleasant break and induce further attendance there. If once a week the senior class were to come to the gymnasium, and there take advantage of the apparatus, I think that would have a good effect to have the apparatus most carefully applied to them, and it might make them a little brighter and throw some interest in it, and in fact make them take to it.

1418. There was another point, because there seems to me a practical difficulty in carrying out what you suggest. You say the work should be done in the morning?—Yes.

1419. And never at the end of class time?—

1420. *By the Chairman.*—I think he said never when the children were tired?—I said never when the children were tired.

1421. *By Mr Fergusson.*—I suppose you mean by that about the end of lesson time?—My idea of doing it in the morning is, the children come into the school cold, and by giving them the advantage of physical training, it seems to me, you create a good healthy warmth in them. That would be in winter.

1422. That would be for the ordinary training done by the teacher?—Yes.

1423. But then the regular instructor comes once a week?—That would be an exception.

1424. You would not insist on doing his hour in the morning. You see the practical difficulty?—You could not take anything so good in the morning in the winter time; it would warm the children up and put their circulation in good condition, and in the summer time, if possible, in the open air, outside, in the playground.

1425. Of course to carry out all this grading of children, and not give them work which is past their strength, you would require some system of medical examination?—Yes, and I may also say in the grading; there is one point I want to bring out there. After grading the young children, if I found any with spinal curvature, I would take them all out and send them, if possible, to the gymnasium to be put under the expert, because it seems to me by doing that one might stop very often spinal curvature. The child might lose a certain amount of its school, but certainly it might have a straight back. You see what I mean—that a young child who really showed signs of weakness, and physical training would affect it, I would send those children to the instructor, who is a trained man.

1426. Do you not think that the ordinary schoolmaster and schoolmistress, men and women who are accustomed to children and know about children, seeing these children every day, may be safely trusted to see for themselves the weak ones and to pick out the weak ones?—Yes.

1427. And do you think it is necessary to have a doctor to come and examine all these children at short intervals?—No. I do not know that it is absolutely essential to have a doctor coming round examining them, but I think it would be a very good thing at the beginning of each term if some medical advice were given as to grading the children.

pupils.

Scheme of
work pro-
posed: when
to be done.

Medical
examina-
tion on
occasion
desirable

1428. But not very frequently?—No. You do not want a doctor trotting about constantly; I should go at the beginning of each term. I think it would be wise, especially at the beginning of such a system, until it got into working order.

1429. *By Mr Alston.*—Is it correct to classify these branches of exercise as physical exercises, gymnastics, and drill—does that cover the ground, would you say?—Well, physical exercises—gymnastics and drill. I should be perfectly pleased if physical exercises were carried out thoroughly alone.

1430. What do you include under physical exercises?—Oh, every exercise, including marching, step marching, and what is known as the free exercises, dumb-bells, bar-poles, Indian clubs. The apparatus I do not look upon as essential, but I look upon it as a very useful agent; but the essential parts I lay down are the free exercises, in their fullest extent.

1431. And you think the term 'physical exercise' covers that ground?—Ought to cover that amount.

1432. That was without music, I suppose?—That was without music.

1433. Then you use the word 'gymnastics.' Does that mean with apparatus?—Gymnastics distinctly brings in the apparatus.

1434. Then, apart from marching and wheeling in military exercises, you still think you deal with drill?—I still think I deal with drill, undoubtedly.

1435. In the evolutions of bodies of boys and girls? and these three terms do cover the ground under physical exercises?—Completely cover the ground.

1436. You would say that those who instruct in these departments should be thoroughly conversant with the work?—Thoroughly conversant with the work.

1437. You are dead against what may be called the old-soldier janitor?—Oh, impossible; absolutely no use.

1438. Then would it be possible to teach the male and female teachers in a school to instruct thoroughly?—Quite possible. It will not come all at once—in time it will come. Get first a good course. Take an outsider, and keep up to the mark—keep thoroughly up to the mark, not only in any new drill that may come out, but in the mode of instruction, because in the course of instruction they actually have to do the drill themselves and to instruct a whole class of 20, and every one of those 20 instruct the other 19.

1439. By whom should the teachers be instructed?—By a qualified instructor in the department.

1440. Appointed by whom?—Well, appointed by—it would be very much better if they were appointed by authorities.

1441. You mean the Government, the War Office, or the School Board?—The Government—the School Board—those in charge of scholastic affairs.

1442. No matter who appointed him, he should be a first-class instructor—an Aldershot instructor?—It is, no doubt, a splendid school.

1443. And you think the teachers, male and female, could be brought to perfection as instructors?—I do not see why in time they could not be made as good inspectors of physical training as they are of reading, writing, and arithmetic.

1444. Would it not be an advantage to have some teachers who teach the children other branches, teach them physical training, thus having the children always under their care?—It would be no disadvantage in knowing the children, while they would be able to bring them forward in their various mental attainments as well as in their physical.

1445. Therefore you would not require to bring in the outsider?—Except as the inspector.

1446.—Would it necessitate dispensing with many sergeants and non-commissioned officers who are now instructors in Scotland, many of whom are very competent?—Surely those non-commissioned officers in schools are janitors as well.

1447. No, not necessarily; they are brought in from the outside. Why should they not be instructed as well?—Well, they are supposed to have been instructed.

1448. They are purely in a military system?—Yes. You do not want to see a boy at ten or eleven with a

stiff military march, fingers sticking hard down. I think that is objectionable. I want to see him light, agile and quick.

1449. The man I have in view is a non-commissioned officer who has not long left the army, who instructs the boys and girls in these schools?—If he is a capable instructor.

1450. Oh, very capable?—That is the man you want.

1451. He would be a certificated instructor?—A certificated instructor.

1452. And from those certificated instructors the male and female teachers could get certificates and go as instructors in various schools?—Along with a course of lectures in anatomy and physiology by a medical man, who trains them in that department.

1453. Then it follows from that that the ordinary school inspectors practically know nothing about it?—That is quite true.

1454. He may from observation have gathered up certain details?—He is not an expert.

1455. He is not an expert?—He is not an expert as he is in their mental attainments.

1456. But the other method would cost something, but it would be workable?—I look on the scheme as being, comparatively speaking, a cheap scheme.

1457. I think we may argue that too; we may come to that too.—I cannot say that it is a very expensive scheme; each district with a number of schools requires a thoroughly qualified instructor—I cannot see a much cheaper one.

1458. If it is not that old soldier, at any rate it is not merely the retired military non-commissioned officer who is suitable, unless he is competent to instruct?—Unless he is competent to instruct.

1459. On the other point, after school age, would it be a distinct advantage for the race that boys and girls after school age should receive any inducement to go on with physical exercise and gymnastics, and in the case of boys, to be put through a thoroughly complete military drill, say company drill, and its changes?—Yes, I think it would be of the very greatest advantage—I do indeed, after the age of fourteen—between the ages of fourteen and eighteen.

1460. You would go on with the girls with suitable exercises?—With suitable exercises.

1461. In the case of a boy of that age, military, as far as company drill, would be an excellent training?—Yes, and that includes free exercises in that full physical training?—Yes, it might take all that; but I was thinking of a complete military drill, as distinguished from free drill and marching,—that is to say, company drill, such as the Boys' Brigade.

1462. Such as the Boys' Brigade?—Yes. I think part of the time might be spent in that, but all other part might be a great deal better spent in the physical training and free exercise, and the various forms of free exercises, which are numerous.

1463. Would you have ambulance?—Yes, but not from the point of physical training. As a point of usefulness you might have ambulance.

1464. Still, it is all a part of training the boy to be alert and thoroughly useful?—And thoroughly useful.

1465. We may gather from your remarks, then, all that would be worth the cost?—I think it would be amply worth the cost.

1466. *By the Chairman.*—One or two questions—some of them have been rather overtaken by other gentlemen. About the question of the feeble health of children in Scotland, I rather think Mr Fergusson touched upon it; he asked two questions upon that; I wanted to ask you in regard to your knowledge of people in feeble health, how do you know?—Well I judge of that first of all from my knowledge as a general practitioner, having to see a large number of people constantly.

1467. The second question is, how do the authorities know?—They do not know.

1468. That is so?—Yes.

1469. What is your opinion about the value of swimming?—A most excellent form of physical training.

*Mr
Alan Tuke,
M.B., C.M.*

1 May '02.

Ordinary school inspectors know nothing of subject because not experts.

Boys between fourteen and eighteen: desirable they should continue physical training: girls also.

Swimming: excellent form of physical training.

Mr
Alan Tuke,
M.B., C.M.

1 May '02.

Rheumatism
and muscular
development.

1470. Any knowledge of it in Dunfermline?—Yes, swimming baths, which are kept going all summer time, where the children are sent in free; Board School children come in with tickets, and the children taught swimming. I have not got the numbers at my finger ends, but all the schools there are, nature of the swimming matches and so on.

1471. And you do not hesitate to recommend that?—I do not hesitate to recommend that, kept under tight discipline—children not allowed to stay in the water too long.

1472. That is another very useful exercise?—Unhesitatingly—a splendid form of physical training, one of the best.

1473. Professor Ogston asked you about rheumatism, as affecting highly muscular development?—I have never come across it.

1474. You would have nothing to say to it?—No.

1475. Are you not aware—I will take the case of cricket players who have been accustomed to throw cricket balls and so forth—after a few years discontinuance of that, are you not aware that they suffer most intensely from any attempt to do the same thing again?—Because their muscles have all got out of play after two or three years. They have not been doing it. They begin to do it, try to do it as they used to, and overstrain the muscles; the muscles have got out of tone.

1476. No, because the muscles are so well developed, I put it to you?—

1477. I want to ask your opinion?—I certainly think if a man, a very good cricket ball thrower, gave it up for some years and then began to do it, he would suffer great pain. I think the reason is very obvious why he suffers pain, because during these intervals he has not been doing it; the muscles have got out of play.

1478. You do not consider an older man having developed his muscles suffers from rheumatism?—No.

1479. Have you any experience, have you studied it, have you thought about it?—No; except putting it as an ordinary medical question, it would apply to the commonsense of medicine.

1480. On a point of rheumatism—where do you find rheumatism generally. In those who have done much or those who have done little or nothing?—Rheumatism you do not find in the young at all.

1481. No, I am not asking about the young people—later on?—Later on in life? Well, that is a question; you find it in men who are getting up in years, and I should say that the feeble are just as much afflicted with rheumatism as the strongly developed people. For instance, a very elderly thin woman constantly suffers from rheumatism. With women who have no physique at all I do not think one can associate rheumatism.

1482. I do not want to talk about old people, but middle-aged people, or verging on middle age?—Well, people verging on middle age; I cannot say.

1483. As a general practitioner you have come across a great deal of rheumatism?—I have come across a great deal of rheumatism.

1484. Dunfermline is not so rheumatic a place as some, but still you must come across a very great deal?—We come across a very great deal. I am not at this moment able to say whether it is most prevalent in powerfully developed people or not. Of course, if a man is exposed to damp and cold—he may be a very strong, big man—but if he is exposed to a damp wet occupation, then he may develop rheumatism, but not because he is a big powerful man.

1485. Have you ever had any experience outside Dunfermline?—Yes, I have.

1486. Beyond Scotland?—Yes, I have had medical experience in the East.

1487. Not in England?—Well, a very short period in England.

1488. Not the West of England?—Not the West of England. My experience was very limited. I may say little or none; but rheumatism depends more on a man's actual surroundings than upon his physical

development; I do think so; if a man kept in good physical training he would not have rheumatism.

1489. Supposing you have a man properly trained by your system of physical training—that is to say, you put him into what you call a thoroughly good state of health, to be a blessing to his country—how long do you expect that condition to last; I mean you must look to the future in considering all these points?—Well, first of all you put this man into that thoroughly fit condition. That means that not only is his muscular system fit, but his heart, lungs, liver, all his internal digestive organs are fit.

1490. I venture to ask you for how long?—Well, that is a question that is most difficult to answer.

1491. You know what I mean. If this physical training drops?—He will always retain the traces of it. I will tell where you will see that—in a man who has left the army, has come to civilian life, is slack and lazy; when you see him strip you say, 'There is a good man, a well, powerfully-developed man, who has gone a bit to seed, put on flesh.'

1492. Possibly from drink?—Very possibly. You see he has gone but you see the remains, and doctors can always judge of a man of that character and say, 'There is the remains of a rattling good chap.'

1493. I am rather pleased to hear you say that, as what has been said seemed to indicate rather a prejudice against old soldiers?—I have not. I am very keen on the service; I am a keen Volunteer myself, but, when it comes to this work, I do not think the old soldier is able to do without a modern training. I have no objection to the old soldier if he has a modern training in physical training.

1494. No?—Without a modern training, but an expert old soldier is as good if he has a modern training.

1495. Training has altered within the last six years; there is not so much of the stiffness and rigidity?—I know that is perfectly true.

1496. Those who have been in public schools—ordinary public schools—and for some years past; I mean to say, of your own age—have you experience of them?—I have.

1497. Do you consider there is any difference, or any great difference relatively between them and their fathers, taking the two ages and remembering the fact that all the physical education that they have gone through has been of what you might call a distinctly haphazard description. I do not mean to say it has not existed very largely, but it has been under no rule or guidance; it has been principally free-will exercise?—It is a terribly difficult thing, you know, to judge a boy of fourteen and a man of fifty—I mean to say, to compare them together.

1498. I was trying to get them down to anything you would compare in your own knowledge?—No; I would not care to answer that question without very careful consideration.

1499. Speaking generally, from those you remember when you were young; those of that class, of that type, and those that you know now of a similar age?—I would not like to say there is not deterioration.

1500. You do not say there is very much difference?—I do not think in the upper classes you have very much deterioration, because you have compulsory football and cricket in the public schools.

1501. Not necessarily. You know there are a great many loafers in public schools?—A great many loafers, but still football is compulsory; racquets or something comes in.

1502. Not altogether; a little of it?—In Scotch public schools, you know, it is a terrible job to get off football, and a worse job to get off cricket; and then you have very much better food.

1503. That we have no public evidence of?—I could not answer that question.

1504. I think it quite fair to take a class that has more or less been under the same conditions for a great many years past, and those conditions have certainly not been very much altered. There may be a little more obligatory physical exercise than there was.

There is in some cases, no doubt, but still to a large extent that is a class which has taken that considerable amount of exercise. I want to know from your medical experience if you could tell us whether there was much difference?—It is rather a difficult thing to compare, and I do not think that there is in the class that you refer to. I do not think so; no, I would not like to say that there was.

1505. You see my point?—I see your point perfectly well, and it is a terribly difficult one to answer. The difficulty is to get it all into your mind's eye.

1506. May I put it to you as a medical man whether you think on the whole the want of difference is owing to the continued regular good feeding of that time?—The continued regular good feeding, no doubt, is a very, very powerful factor.

1507. Do you not think that is largely at the bottom of differences between one class of society and another?—There is not the slightest doubt about that.

1508. I mean it is a very, very important point, almost as important a point as physical exercise?—You cannot give a man physical exercise unless you feed him.

1509. You can give him feeding without exercise?—Ah, but the combination; it is the combination point; to give him physical exercise without feeding is doing him a lot of hurt, and feeding him without giving him physical exercise is also doing him a lot of harm.

1510. I want to put this to you; I daresay you will join with me in saying that there have been, and are even to this day, a very great number of intellectual men who are of the utmost importance to their country who are absolutely deficient of any sort of physical exercise whatever. I do not want to mention names, but I could do so. You will agree that that is so?—That is so.

1511. I think it is only fair to put that forward when you are trying to get a general system, that everybody is to be educated upon exactly the same broad plan; I think it is quite fair to realise that there is and there has been such a class of people, of mind—mind prevailing over body to that extent that they have been the rulers of the country without having any physical education whatever?—That is perfectly true. The ablest man I know has not left his study for twenty years; one of the ablest men I know has not left his bedroom and his study for twenty years.

1512. And yet the want of that physical education has not merely not affected his ordinary health, but it has not affected his influence?—No, not a bit.

1513. His actual influence over his fellow-creatures and over the world's history?—That is quite true.

1514. Put yourself in that way so as to say there is another side to the question?—There is another side to the question.

1515. Is there anything you can say further in backing that up?—I look upon those men as being the complete exception. We do find them; men of exceptionally brilliant power who have never done a day's severe hard work or physical work in their lives, and we do find those men occasionally.

1516. And yet with those examples before you, you will go so far as to say that as an ordinary general rule physical training will not affect high mental training?—No.

1517. And not only will not affect it, but will rather improve it?—Will rather improve it.

1518. I mean so far as you say having these examples before you?—Having these exceptional examples before me,—having these exceptions before me.

1519. Are they exceptions, or are they exceptions in what you would wish to see?—In my experience I can say that they are the exception. There is many an able man I know would have been a great deal better by a great deal more physical training; would have been a much fitter man, and his mental attainments much more useful, had he had a stronger constitution and a stronger body.

1520. I might take you back historically. What

have you to say to what was going on, let us say 100 years ago, at the peace of Amiens; what have you to say to that?—There was not much physical exercise except for country people in those days.

1521. Are you able to say from a medical point of view whether there was much deterioration?—No, I am not able to say; I am not able to answer that question.

1522. Yet you can imagine from what you saw, and what our soldiers and so forth were able to do, which is perhaps the only means we have of judging what physical courage and endurance they were capable of,—you cannot say much against what there was at that time?—But still, in those days our soldiers, a larger number of them, were not drawn from great big towns like Liverpool, Dundee, Glasgow.

1523. Do you happen to know there was a regiment—the 90th Regiment—raised in Perthshire by Col. Graham, principally composed of prisoners drawn out of the prisons—'Graham's Grey Brecks,' in 1795 or 1796—the scum of the universe?—Yes, the scum of the universe are physically very often quite fine men sometimes.

1524. Provided they do not suffer from gaol-fever?—But they had not died of gaol-fever; they had got rid of it—the survival of the fittest.

1525. Within six years of the time I gave you—a hundred years ago—there was an instance; I do not say it was actually true—to a certain extent it was true?—The conditions of life were different then; probably more porridge and milk used; less tea.

1526. The conditions of life in towns were not very different, were they?—As regards feeding.

1527. The exercise in towns was almost nil?—The feeding element comes in; probably they ate much more wholesome food. That is a very problematical point; I do not feel equal to giving you any opinion.

1528. I am trying to get you to put yourself on the other side of the hedge, as it were?—Oh, I admit there is an opposite side.

1529. In order to go against that, you would have to show that a totally different system of conditions prevailed at the present time?—Well, I am not sufficiently up in the conditions existing then, to compare them with the conditions existing now.

1530. At all events, I may say that you are an enthusiast for physical training?—I am, because I have seen the beneficial results during ten years' experience.

1531. And that you firmly believe that the more the people of the country have of it the better they will be—of both sexes?—Within certain limits.

1532. As far as they are able to bear it?—Within the limits of reason. I was talking to a colonel of a newly-raised battalion, and he told me that physical training had made his battalion. That he had raised a new battalion from the very first; he got a hundred from the first battalion to start it; and he told me, coming up in the train last night, that he considered physical training had made his battalion.

1533. As regards country children, have you any experience of them—as a medical practitioner?—I have.

1534. Do you consider that, in Scotland, the comparatively long distances that they have to go to school go in any way towards a lessening of physical exercise that might be required of them in school?—Most decidedly it would; because you have taken so much more out of your child before he arrives at the seat of operations; most distinctly it would.

1535. Therefore, in making a recommendation, if we were to do such a thing, as a Commission, we would have to differentiate a little, I think, in some cases—not in all cases, of course; some country children are close by the school?—Quite so.

1536. There might be a differentiation required?—I think that would be most distinctly required. Any children who have to walk long distances to school, I think, most distinctly, you would require to differentiate.

1537. *By Mr Shaw Stewart.*—May I ask one more question on a practical point. In dealing with very

small children you laid some stress upon the tip-toe work?—Yes.

1538. That brings in the question of boots, of which we have already heard a little; and we were informed it has been a difficulty in movements of that sort; and one witness advocated work without boots?—Yes; that is perfectly true; a large number of the boots have absolutely a sole as unyielding as that to walk.

1539. *By the Chairman.*—Clogs, for instance?—They use clogs in England.

1540. In Scotland there are clogs?—For boots; I have not come across them. The boots are absolutely unyielding; and in the gymnasium they wear gymnastic shoes. That could be very easily obviated by twenty or thirty pairs of india-rubber slippers being procured; they would only cost a very small sum of money.

1541. *By Mr Shaw Stewart.*—I would put it in this way: in the ordinary Board School would you say that the tip-toe exercise is so important that some means should be found to deal with the boot question, or would you overlook this particular form of exercise?—As a medical man I would not on any account overlook it, with the extraordinary prevalence of flat feet that we have got to face.

1542. You consider it very important for the child's early training?—To get rid of flat feet. It renders the boy absolutely useless for the services; the Army or the Post Office, or the Police Force; they will not touch them with flat feet.

1543. It forms a practical difficulty in the Board School?—It forms a practical difficulty in the Board

School. I have not thought of that. In the gymnasium they get the shoes at once.

1544. Can you think of the best way of obviating that difficulty in the Board School?—I should say thirty pairs of gymnastic shoes at about 10d. or 11d. a pair. That could be done, or slip off the boots for the time being.

1545. *By the Hon. Thomas Cochran.*—Sailors do their work barefoot?—Barefoot; there is no reason why they should not do it barefoot, or in their stocking-soles. In the summer time, in the Board School a very large proportion are barefooted anyway; it is only in the cold winter months.

1546. *By Mr Shaw Stewart.*—But you attach great importance to the tip-toe exercises for small children?—Most distinctly.

1547. *By Mr Fergusson.*—One question, arising out of what the Chairman said about country children who had long distances to walk. You mean you took into consideration, in settling what physical training you are to give them and in grading them into certain classes, which child had a long way to walk and which had a short?—Yes, quite so.

1548. You would not alter the general grades for country and town children?—No, I would not; because many country children live quite close to the school, but as to those who have a long way to come they would use their discretion.

1549. You would take that as a matter that ought to be considered?—A matter that ought to be considered.

The witness withdrew.

Mr J. L.
Robertson.

Mr J. L. ROBERTSON, examined.

1550. *By the Chairman.*—Now, will you just say what you are?—I am one of His Majesty's Inspectors of Schools in the north of Scotland.

1551. Will you say what you are at the present moment?—Acting Chief Inspector of schools for most of Inverness-shire and part of Ross-shire (including Lewis and Black Isle).

1552. And have been so for some time?—Yes, a number of years.

1553. Do you know how many at all, more or less?—About twenty-two years since I was appointed to the staff.

1554. But I mean in that particular district?—In that particular district about thirteen years.

1555. Before that where were you?—In the more northern part of the mainland of Scotland: part of Ross-shire, and all Sutherland and Caithness, with the outer Hebrides of Inverness.

1556. And you kindly produced a little *précis* of evidence. Have you got a copy of it—would you mind going through it for the Commission?—The first point I give here is, some form of physical drill is now universal in the schools in my district, and since it has been more methodically introduced it has had a very beneficial effect on the discipline of the schools. That is very marked indeed. Military drill, however, is given in only a very few schools in the very wide district that I have charge of, and the want of competent instructors checks the development of military drill a good deal in the schools. There are only five or six places in the whole district where formal military drill is given as part of the regular school drill, but the County Committees of the two counties that I have specially to deal with favour the establishment of Classes for Teachers under an Article of the Code—Article 91 (d)—for training the headmasters of those schools at centres in physical and military drill, and that instruction has been extremely popular. We carried through a large class in Stornoway for the benefit of the whole island of Lewis. We had about thirty teachers trained under the local Volunteer drill instructor, and in Dingwall we had a considerable class, and we have one going on at the present

moment in Inverness on Saturdays. We take all the teachers right round from Beaulay round to Dalwhinnie almost, and down to Fort Augustus for the mainland section. The instructor—a sergeant attached to the Barracks, Inverness—was recommended to me by a military friend as a man singularly fitted to give physical training, with the accompaniment of military drill. He is supposed to be the special instructor at the military Barracks, Inverness, in the matter of physical drill, and the County Committee, of which I happen to be chairman, agreed to engage him, and he gives, according to a graduated syllabus, a course of physical and military drill to our teachers. We expect that they afterwards, in their schools, will introduce the subject. These classes are carried on under Article 91 (d) of the Code. Under that Article the County Committee expect to be reimbursed part of the expense; three-fourths of the expense is paid by the Department. Under heading 3 of my *précis* I deal with this item: I say a syllabus or text-book of physical and military drill should be issued under the authority of the Department. We ask instructors who are teaching those classes in every case to be very careful to have a graduated and methodical syllabus made out, so that they should not be overlapping. I also made a point of asking the instructors to make each teacher, during the course of his training, act as drill instructor of the rest of the teachers, with a view to habituate him to the teaching of a class of his own school, of his own older boys. I think it is most important that some syllabus of physical and military drill should be issued, and that, with the authority of the Department. Possibly a small grant under the Code might be given where the physical or military drill is of a very efficient kind, but I would not be very strong on that. I think, now that the Boards have got used to regarding physical or military drill as essential, it should not be dependent for its efficiency on any extra grant, but still the point might be considered if Boards had to appoint special instructors. One of our difficulties in the rural districts is to get good instructors. In the island of Lewis there is a large proportion of the population who bear arms, of 30,000

there are 2500 in the Naval Reserve at Stornoway, 800 in the Seaforth Militia, and 500 or 600 in active and other service. There is hardly a village in the island from which there is not a man who has had some connection with the war at present, so there might be soon a very ample supply of local instructors there. In certain School Boards with which I am specially connected, under a minute of the Department, in Lewis, we not long ago passed a resolution agreeing in a sort of general way to fill up all vacancies in the compulsory officership of the schools by the appointment of a drill instructor—an old soldier if we could get one. Of course I do not mean to say for a moment that all old soldiers would be good drill instructors.

1557. *By the Chairman.*—You would like a retired sergeant, or something of that kind, who had had some experience, that is what you mean?—That is what I mean as a beginning. Then I say in the fourth item, all instructors recognised by the Department should have recent qualifications in the latest form of physical and military drill. Everyone knows that these subjects have been very considerably amended or extended of late, and I think it would be very desirable that any qualification should be of recent date. It is quite easy for even drill instructors and retired soldiers to come occasionally to centres where they could have the latest form of instruction. Then I would put a good deal of emphasis on the point that a certificate of efficiency in drill should be granted to pupils. I am not so sure about the day school. Some statement as to efficiency of drill might be indorsed on the merit certificate, which is now a recognised award in public schools, certifying, of course, to a thorough knowledge of the elementary subjects.

1558. Would you simply add it to the merit certificate?—Endorse it 'drill,' to make it be seen that an efficient elementary education involving drill is an essential. Then, to leave the day schools (the ordinary schools where attendance is compulsory up to fourteen), and come to the schools where attendance is voluntary, the continuation schools, I think drill might be made a compulsory subject under the Continuation School Code—that is, looking at the matter from the point of view that it would not be perhaps at present desirable to make drill compulsory beyond the school age and outside that Code. But if drill be still kept on in connection with the school system of the country, the continuation school is the only available way in which it can be done in rural districts. Then, while making drill there a compulsory subject, I would grant a certificate for drill there also. I should not be disinclined to go further, and to recommend that after the school age the Boards should have control over children beyond school age up to a certain age—up to seventeen or eighteen perhaps—and insist upon some qualification in drill, for boys, of course, I mean. I do not think it would be possible to extend it in the case of girls. If between the ages of fourteen and seventeen, eighteen and nineteen, scholars took, or were compelled to take, some form of drill, I think it would be very desirable that the certificate granted on regular attendance at a recognised course of drill and efficiency in that course should be imputed towards the diminution of attendance at the Militia, or a Volunteer corps or the Naval Reserve, or other service. If a young fellow from the country, seventeen or eighteen years of age, has gone through a thorough course of drill—forty or fifty meetings—in the course of two years, I think, more or less, it is rather discouraging to him that he should be compelled to go through the same dull monotony when he goes into, say, the Militia or the Volunteers. A drill certificate would be of very practical value.

1559. And make drill more popular, you say?—Far more popular. In any case, I am perfectly sure in the district I represent it would be extremely popular; even if it were made apparently compulsory.

1560. I should like to ask you just this: the island of Lewis, I think I am right in saying, is almost exclusively Gaelic-speaking?—Almost exclusively; barring the town of Stornoway—three or four thousand people—practically the whole island speak Gaelic at home.

1561. Would there be any difficulty in getting training in England?—A very large number of the population bear arms; there were about 800 of them in Egypt lately. They all speak English; they use it constantly in the schools. Gaelic is a medium for training in English, but there is no young fellow of fourteen in Lewis but understands practically any colloquial English.

1562. You understand children, a certain amount of training for children—small children?—Oh, yes. From five years of age up to about ten Gaelic is very much used in the schools, with a view to bilingual training for the benefit of English. The vocabulary of drill is a very limited one.

1563. In your district it is the rule rather than the exception that children have to go a long way to school, is it not?—In many parts of my district they have to go long distances.

1564. In country districts anyhow?—The schools are very well placed; and in Lewis, which has a very congested population all round the sea-board (except two villages), the schools, as a rule—nineteenth-twentieths—are very well placed, I mean for regularity of attendance.

1565. But still, I am right in saying that they have to go very often considerable distances?—Yes, considerable distances.

1566. What is your opinion on that point as to the necessity for giving the same amount of physical instruction to children who have had a long walk; do you think that you ought to let them off easier than the others, or not much more?—Not much more.

1567. In fact they would prefer joining with the others instead of claiming an exemption?—I think so, instead of roaming about when others are at drill.

1568. Do you notice much difference in the health of children lately, I mean since you have been Inspector in that district?—No, I could not say I have noticed any marked change in that regard. I have no doubt that such does exist.

1569. You are not in a position to state that since the physical training became obligatory there has been any improvement?—I could not say that there has been any that I have noticed.

1570. You do not think it has been going long enough for you to notice?—No, I do not think so.

1571. Have you ever attempted to look at it from that point of view?—No, I cannot say that I have; but one thing I do know is that the children are much smarter in their movements—their class drill as they call it; during the class drill, instead of slouching and floundering about, they move very smartly.

1572. Is there much difference in the schools under you as to room space?—Yes; that would always be a difficulty.

1573. Except in summer, when it could be done outside?—Outside, yes. Even already the physical drill in the school involves a lot of extension motions and all that sort of thing. You can only take a section at a time.

1574. Do you find that your time-tables are pretty accurately drawn out?—Yes, and overcrowded, I can assure you.

1575. You pay great attention to your time-tables?—Yes, we watch them.

1576. And do you find they are sufficiently descriptive of this drill? Do they describe clearly in them what occurs in the school?—Yes, as a rule; we occasionally have to object to them.

1577. Yes, but after you have passed them, do you consider they are correct, or are they misleading?—I think I should say on the whole that they are correct. Any visits we pay without notice to the schools we generally find the work being carried on according to the time-tables. I do not favour too elaborate a time-table.

1578. Do you call it military drill?—Drill.

1579. Just ordinary drill?—Drill.

1580. What does that mean; marching about?—No, generally physical exercise and marching about, in some cases.

Mr J. L. Robertson.

1 May '02.

Country children: not much difference should be made.

School time-table.

Mr J. L.
Robertson.

1 May '02.

Physical
training
or drill:
length of time
allotted.
Benefits.

1581. When you put that down in the time-table, is it meant to include every child, or only a certain proportion? so many as can be exercised at that particular time?—The intention is to include all.

1582. It is meant to include all?—It is meant to include all.

1583. You told me they have not space enough. In that case it would not?—No, as a matter of fact.

1584. What length of time do you propose in your district for physical training, or what is called drill, for children per week?—I should say about 1½ hours.

1585. Per week?—Yes; per week, I should say.

1586. But you split that up; so far as you know it is split up into smaller intervals?—Yes; in fact it is found to be a recreative exercise in school after a prolonged period of work.

1587. You would recommend the drill to be done when the child was freshest?—Yes; for it I would say this, that drill being more or less of a recreative exercise in schools, it is desirable to give it perhaps after a long turn of teaching in the school.

1588. *By Mr Alston.*—You mentioned, I think, Mr Robertson, that there was a distinctly improved moral tone and conduct in consequence of the instruction in physical exercise?—I hardly put it so strong as that, but I have not the slightest doubt that obedience and promptitude have been developed by the physical drill in the school.

1589. How does obedience come to be developed by it?—Well, I mean to say, prompt obedience to orders and all that. I have not the faintest doubt that it has a very strong reflex beneficial effect, such as you suggest.

1590. And the strengthening both of mind and body; it has a tendency in that direction?—Yes.

1591. Do you find in the Highlands, as we find in the Lowlands, that the boys have a natural aptitude for marching?—I do not know anything they are fonder of; they are extremely fond of it.

1592. It is no tax upon them?—No tax whatever.

1593. You are in favour, evidently, of getting the best instruction?—The best available instruction.

1594. Are the school inspectors competent to say whether the instruction is perfect and the results perfect?—Most of them I know have had very considerable time as Volunteers themselves. I was in two Volunteer services myself.

1595. But those who have not been, would you advocate an expert inspector, to see that the thing was properly carried out?—Well, I think in a very considerable area it would be very desirable that the War Office might assist to give a general supervision, but I think the inspectors would be perfectly well able, or some of the assistants. Nearly always there is some member of the staff who is quite capable.

1596. *By Mr Shaw Stewart.*—Will you just give me a little more information about the physical training given to teachers. You spoke of the instruction they got from an instructor from Inverness?—Yes.

1597. Do they go to Inverness or does the instructor come to them?—They go to Inverness for Saturday classes.

1598. The teachers go to Inverness for Saturday classes?—For Saturday classes. There are now about fifty teachers being trained at Inverness at the Inverness centre. We pay the travelling expenses of these teachers—the County Committee do,—and most of those who are at physical and military drill are also getting special instruction in drawing, and the female teachers are to get special instruction in domestic economy. The classes last from about ten o'clock on Saturday till about three, with half an hour for luncheon. Physical and military drill is part of the scheme of general instruction.

1599. How many Saturdays?—The Department insist upon us giving sixty hours for drawing, at least sixty hours' instruction. Well, that means nearly twenty Saturdays, taking them in at this good time of the year. Then I may tell you that the present class is only for a large part of the mainland part of

Inverness, the teachers of which can reach Inverness easily by train or boat. In September we take in the Hebrides (Skye and the islands) to Inverness, with the Western mainland seaboard, giving them a whole September course of instruction in drawing, drill—and household economy (cooking and laundry) for the women. We are gradually, as it were, leavening the whole mass in that way for the benefit of the school children.

1600. By that time every teacher will have an opportunity of going through?—Well, certainly nine-tenths of the teachers. We have no power to compel them. We hold it out as an attraction. Those from the Western County seaboard and the outer islands we give 10s. a week lodging money to, and reasonable travelling expenses. It is a nice pleasant time, I believe. We give them plenty to do; the class costs us initially £300—the County Committee.

1601. I should just like to ask one or two questions on points you mentioned which are of particular interest. You said that nearly every adult in Lewis bears arms either in the naval reserve or in the militia?—Yes.

1602. I have some knowledge of the state of Lewis; I think I had the pleasure of meeting you on the Deer Forest Commission ten years ago, and we heard a good deal then of the congested districts and the bad feeding of the children get there?—I was in Lewis then.

1603. What is the general physique, would you say, of the children in the congested districts of Lewis. I do not want to go into the political question?—If you had seen the militia—400 of the militia—going to Fort George the other day, certainly from their very appearance on the steamer and in the station at Inverness, you would say that it is a strange thing that destitution should breed bone and muscle of that kind. I do not believe there is chronic destitution in Lewis. I know Lewis most intimately; there is rude, substantial comfort in the rural villages. From the men in the naval reserve you could see walking about Stornoway after drill at night all dressed in their uniform, I should say there is no evidence there of general underfeeding or discomfort.

1604. I have seen myself very ill-fed children in Skye, in very poor surroundings; do most of those children, do you think, grow up to be able-bodied men?—A great number from Skye go into the army, you know, and a few into the naval reserve. We do not regard a Skye man as a sailor. The Lewis men further out in the ocean adopt the sea; men do not do so much of that in Skye. It is quite a sight in Skye and Lewis to see the crofter children looking rather thin in the springtime of the year, when they have not got bronzed by the sun, but after fourteen or fifteen years of age they blossom out into big strong men. The local doctor says it is a very marked fact in his experience, and he says it is a racial strength, strength of race altogether.

1605. The physical training which has now commenced, and which we hope may be extended, will still further improve the physique of these people?—Yes, I think so.

1606. *By Mr Fergusson.*—One question about what Mr Shaw Stewart was asking you just now—the expenses of the teachers coming to these classes. We were told by one witness that these expenses were not paid, but you say that they are paid?—They are nearly all paid by the Department. They give us back about three-fourths, but the travelling expenses have been lately cut off by the Department.

1607. *By Sir Henry Craik.*—Limited?—Limited, rather because it was found that the free scope was rather developing a tendency to extravagance.

1608. *By Mr Fergusson.*—All reasonable expenses are paid?—All reasonable expenses are paid.

1609. Some discredit has been cast on the capabilities of the old soldier as an instructor because he had not got modern training; do you agree with that?—Yes. I think that no man should be allowed to be an instructor of drill unless he is thoroughly up in all the modern developments and had his power of teaching certified to.

1 May '02.

1610. But you did not quite carry that out in your own case, because you thought that you were competent to inspect though you were an old volunteer?—One may be competent to inspect without having quite the capacity of teaching.

1611. Do you not feel the want of a little up-to-date knowledge in the physical training?—Certainly.

1612. You would not mind having some expert assistance?—No; I should not mind having that, but I think it would enormously increase the cost and the complexity of school management if expert assistance were wanted in all places, because in this wide district, one has to go to so many remote schools.

1613. In your district it would increase the cost more than others, but still one man can cover a great deal of ground. You have a full day's work when you go to a school; this inspection would only last half an hour?—Quite so.

1614. There is another point. You found it expensive to employ competent drill instructors to teach the children; you cannot get them very readily, and when you do get them it is expensive?—Well, we do not pay much to the army sergeant to give us the drill at these centres, but if you had to send them away to remote places and give two hours a week, say of drill in a school, then it would come to be a very considerable tax upon those Boards upon whom the burden of taxation presses so severely just now. If men could be got locally they might, with the co-operation of the military authorities, have access to barracks and other centres to learn the modern style.

1615. They might be taught the modern system themselves first and go home and teach others?—Certainly.

1616. You could always combine several schools in one district?—Yes. At the Butt of Lewis, there are three schools, of three hundred, two hundred pupils, and one smaller one. One compulsory officer there, who happens to be a naval reserve man of twenty years' standing, told me the other day that he would undertake some drill for the schools; he said he would be willing to go his round, calling at the schools as compulsory officer and also give some drill, but even in his case I would like—

1617. He might go and have some training himself?—Yes.

1618. You think it would be very desirable if you had an authorised school drill book?—I think that is most essential. Yes.

1619. And the feeding question—is there any attempt made to feed the children in any of your schools?—Yes; in a good many schools in the winter time, soup is given, and coffee.

1620. Do the children pay?—In some cases they do, and in most cases they do not, but it is not a very large effort as yet.

1621. Do you find any unwillingness on the part of the parents to pay?—Well, I think down about the Strathspey district they pay willingly enough. Payment is seldom asked. I know in Skye one of the proprietors gives cocoa once a day in winter. Then I think down about Glen Urquhart parents give a little, but there is nothing done in Lewis.

1622. You think when it is done, that it is a good thing?—Well, I am rather sceptical about it, because when I went on a special administrative mission to rural Lewis some years ago, I found the place was more or less demoralised by free rations of that kind; they were giving them brose and clogs, and ship biscuits, and all that sort of thing. My impression was that it was not doing very much good at all.

1623. That is given free?—Not at present.

1624. You are against that?—I am distinctly against that. I do not see any difference it makes.

1625. If they would pay, do you see any reason why arrangements should not be made for them to get a convenient meal?—Oh, certainly not.

1626. By Professor Ogston.—Do you include Ross-shire in your district?—Part of Ross-shire—the Black Isle and the island of Lewis. I do not go north of Beaulv,

1627. Caithness is not within your district?—No.

1628. West through Skye to the Hebrides?—All Skye, Lewis, and Harris (including St Kilda).

1629. Is St Kilda the only very outlying island in your district?—The nearest land to St Kilda is Harris.

1630. It is the only inhabited one beyond Lewis?—Well, it is far away to the west; it is 45 miles to the west, in the Atlantic, from Harris, and since they started a school there I go once a year or send someone.

1631. Would you like to tell us whether any difficulty might emerge in arranging to apply this system of physical education to any of the outlying islands in your district?—Yes; there would be some difficulty, especially, of course, as far as military drill was concerned. They have a large number of small schools taught by female teachers. I heard that some of them in the Inverness class are taking really a good deal of the military drill in conjunction with the other drill.

Physical education in outlying districts: some difficulties: how to be avoided.

1632. But you think that by modifying it in some way, so that women could impart it, something useful in the line could still be applied to every school, even in the most outlying part?—Yes. I should have the proposed syllabus of physical and military drill sufficiently elastic to cover any reasonable difficulty of that kind.

1633. I suppose, too, there are considerable racial divergences between the various parts of your districts?—I did not notice any; I find human nature—physical human nature—very much the same there. I think the people of Lewis, especially towards the northern parts, are of much bigger physique than, say, the people of Harris.

Conditions in various districts.

1634. Do you notice any difference racially in their intellect?—I cannot say that I do.

1635. At the school age at any rate?—No, I cannot say that there is anything marked.

1636. Any difference between their disposition to disease, say in the Hebrides, Strathspey and Ross-shire?—I think that is very much a matter of social conditions otherwise. In regard to housing; in Lewis, of course, the housing problem is a very urgent and serious one, matters are very backward as yet, though improvement is setting in very rapidly. The common type of crofter house in Lewis in the large section that I have to deal with is the old thatched house, where the cattle are under the same roof as the people. But that order is changing very rapidly. There is hardly a year I go to any of the villages but I notice several new houses, I mean of a modern type—cottages. One of the difficulties in Lewis in connection with the housing question is, that there is practically no lime, not an ounce of limestone, in the whole island, no wood, no slates; all building material, therefore, has to be imported, and that makes the building of modern dwellings expensive.

1637. And do you notice in the classes of the children before you, in a school of that sort, a very great difference in regard to their strength, their health, or the proportion of diseased or weaklings amongst them?—Well, I should say not. I think there is a pretty fair average of comparatively weakly children.

1638. Not sufficient to throw practical difficulties in the way of applying the system of physical training?—No. When whooping cough or scarlet fever sets in in Lewis, the difficulty is in eradicating it. These diseases very often embarrass the school system very much indeed.

1639. In no other way does the racial difficulty come out in the disposition with which they would receive and adapt themselves to this?—I do not think so. I do not think that would be in any sense material. They would all fall in with it.

1640. Is there anything you would like to tell us in connection with the necessity in any special part of your district for teaching, say first aid or swimming?—Well, the County Committees of Inverness and Ross have been giving, for years back, ambulance lessons at centres. We take three centres each year, and we had a good centre in Harris lately, and we have had some-

thing done in that way in Lewis. The classes go on very well, and were inspected by medical men.

1641. I presume, however, that they are mostly attended by older people?—Oh, yes; not school children. In connection with any cookery classes for school children, we encourage a little teaching of practical hygiene.

1642. *By Sir Henry Craik.*—You spoke of physical exercise being spread throughout the ordinary day schools, but that military drill is very rare?—Yes, very rare.

1643. How do you draw the distinction?—Just the very obvious distinction between formal military drill with formal words of command, and the ordinary exercises; they tend to fade into one another at certain stages.

1644. You would like to see the military drill increase more even in the schools for boys under fourteen?—Yes.

1645. You think its effect upon school children is good?—Yes; I think it has an excellent effect on the discipline; its moral effect is greater than the mere physical exercise as such.

1646. And gives some idea of comradeship?—Yes, and all that.

1647. So that you consider in comparing physical exercise generally and military drill, that the military drill has in certain respects real advantages beyond the physical?—Yes, I do think so, and it gives the scholars a sort of practical application of the value of many of their exercises.

1648. Then I gather that you would prefer that the instruction should be given by the ordinary teachers after special training in this subject?—Yes; I think first of all it would be the cheapest arrangement and the one that would be most likely to be uninterrupted, because the teacher is always there and he is acquainted with the style of the children and also with the necessities of his own curriculum. He would adapt the thing better; not that I for one moment would discredit the occasional coming about of someone of a purely military kind.

1649. We have heard of the employment of janitors as instructors in drill, but in schools throughout your district generally these are very rare?—Very rare.

1650. So that you have not only considered, but actually carried out the proposal which is novel of its kind—I am not quite sure if the Commission noticed it—of employing the compulsory officer for drill?—Yes; we agreed lately at the Uig, Barvas, and Lochs School Boards that in the event of vacancies in the office of compulsory officer, we should appoint if possible a man who had some military training.

1651. You think the combination of the duties of compulsory officer and drill-sergeant is not a disadvantage but an advantage?—A very great advantage, because he is looked upon as more or less a detective agency in each parish. He knows all the boys, and would be very helpful I think in every way, and would be able possibly to increase his knowledge of the boys by this means. Yes.

1652. Have you known any cases where this has been used in towns?—The Inverness School Board had one or two cases of old soldiers who acted as compulsory officer and janitor, and also acting as drill instructor.

1653. And no inconvenience was found to arise?—None whatever. I should say that in the island of Lewis I expect that there will hardly be a village that will not have a retired soldier soon, because there are over three hundred fighting at the front in the army—I mean regular soldiers.

1654. In country districts where there are no janitors, you might still with great advantage employ old sergeants as compulsory officers and as drill instructors?—As drill instructors. Yes, I think so.

1655. Then I come to the question of the continuation schools. First with regard to the boys of the age fitted for continuation schools, what do the boys in your district of that age do; how are they employed?—They work about the land and loaf

about a lot. I have driven through villages on a Saturday afternoon and I have seen them loafing about, sitting on the hillside smoking and talking, and waiting to get off to the Militia at Fort George. That is the ambition of the Lewis man, or to get into the Reserve.

1656. And if there were Continuation Classes, not necessarily evening classes, but classes, we will say, on an afternoon in the open air for drill, these classes would very often meet the very wish of these boys?—They would be extremely popular I am positively certain, and they would be no interruption to the industrial work of these districts. There is a great deal of spare time in these combined crofting and fishing villages—a great deal.

1657. It would be difficult, of course, to get them together at night, especially in the winter time, but you could gather them into continuation schools on the Saturday afternoon?—Oh, yes.

1658. By doing so you would not interfere with any profitable employment?—Not that I can think of in these rural districts of the counties; there would be ample time for drill.

1659. Then you suggested one or two means of advancing the physical drill in those classes. In the first place, you said that you advised that it should be made a compulsory subject in the Continuation Class Code?—Yes, in the Continuation Class Code.

1660. That, of course, is a different thing from showing that attendance at these schools shall be compulsory?—Oh, quite different; but I would go even further than that. I do not see why you should not make it compulsory.

1661. I will come to that. The first is a thing we might do by the Code at once?—At once; yes.

1662. In the first section of the Continuation Class Code, certain elementary subjects are necessary; we might add physical instruction to them and say you shall not have a Continuation Class in the first division of the Continuation Class Code unless you have physical exercise?—Just so.

1663. That would be in the power of the Department itself?—Quite.

1664. You also thought that an inducement might be offered by the War Office in recognising the training given in those continuation schools in the case of recruits?—Oh, yes. That a drill certificate should be given—some record which would make it a matter of practical advantage, especially in districts where a lot of men went in afterwards to the Militia or the Volunteers or the Naval Reserve, that it should be a practical tangible advantage in lessening the number of compulsory drills. A man, instead of being compelled to take six weeks his first time as a Naval Reserve man, might be let off with a month if he had gone through the course; the monotony of the military routine might be made less deterrent.

1665. What you desire, then, would be the issue of a certificate by the Department?—Yes.

1666. And secondly the co-operation of the War Office, I think, without any legislation?—Yes.

1667. Next we come to the point of legislation, a much more important point in regard to compulsory attendance at these continuation schools—do you think that would be, first of all, in the interest of the people concerned?—I do think so; most decidedly.

1668.—And do you think that it would meet with great objection?—Well, I do not think so. I am inclined to think that in the districts that I come from, it would not be so looked upon.

1669. If it was not made over-irksome or over-troublesome?—Quite so; yes.

1670. You mean that a lad should be required to go two or three hours a week to such classes?—Well, I would not be inclined to state definitely the amount of time he would give, but that a certain number of drills a year should be put in, and a certificate to that effect given.

1671. And that it should simply be looked upon as part of the necessary educational equipment of all?—Just so.

1 May '02.

1672. How would you enforce that?—That is a point that would require a good deal of consideration. I think the powers of School Boards should be extended to cover that age at least. Of course you would require some penal or executive means by which you could enforce such a statutory arrangement.

1673. A fine?—It is very difficult to say exactly whether the School Fund should be more or less liable for efficient work of that kind.

1674. The School Fund would supply the teaching, but I mean what penalty would you impose—would it be a fine on an individual who failed to comply with the regulations?—Well, I do not think it would be advisable to put it in that form. I would rather go at the general body. If the School Board had statutory jurisdiction all over—then the obligation would be on the School Boards. If the School Board fails to provide sufficient instruction, take off a certain one-tenth of the grant.

1675. I am not speaking of providing means of instruction; no doubt the School Board would do that, and that would be part of its duty; but I am speaking of the enforcement of compulsory attendance at these Continuation Classes, by what means would you enforce the rule?—At present a Volunteer is liable to refund the amount of grant lost by his failure to qualify.

1676. Supposing you say you shall attend a continuation school, how are you to enforce that rule? Are you merely to extend the present rules of school attendance and give additional compulsory powers to the School Boards?—Well, the only plan then would be to come down on the guardian of the pupil.

1677. But has the School Board to face the duty of compulsion?—Yes.

1678. Then they are to prosecute?—Yes, they are to prosecute.

1679. And would the punishment be a fine?—A fine or imprisonment.

1680. Would you place that upon a young man himself or upon his parents?—His parents—his guardians.

1681. Would you make the parents responsible for a strong young fellow of eighteen?—At eighteen years of age a young Lewis crofter is thinking of getting married, and sometimes does get married at that age; you could hardly say his guardian should be responsible in that way.

1682. It has been suggested to us that there might be a poll tax upon youths of that age, from which they would be exempt if they could provide a certificate of attendance at such a school?—I do not think I would favour that; I think it looks rather drastic.

1683. What would you propose instead?—I would try, if possible, and push at the general body that has the statutory power—such as the School Board.

1684. They have not the statutory power except to appeal to the magistrates?—Well, let them go against the individual before the magistrate for the reimbursement of any loss caused by failure to get a sufficient attendance at drill.

1685. What would be the loss?—Well, I would think that something in the nature of a grant might be given for it from fourteen to eighteen years of age—an Imperial grant.

1686. But suppose no boys from fourteen to eighteen came to the class, then the Board will not have any expense, they will not have to provide the teaching. I do not see how that absence would involve any expense?—None; but if it is made compulsory by statute that drill be taken, and a grant given for efficient drill by the Imperial authorities, then the School Boards losing part of the grant from inefficiency in drill could either go against the individual or the parent.

1687. You would advise a totally different process from any that is at present known?—Yes.

1688. That is not the way we proceed to enforce the compulsory clauses just now. You do not proceed against the parent because his child has not earned the grant, you proceed against him because there has been neglect to provide the child with education?—Yes, I

admit that; I must say I have not given much thought to that aspect of it.

1689. At all events, all I wanted to bring out was that by whatever means you think some compulsory attendance at such classes would be not only an advantageous thing for these youths but would not lead to any great objection on the part of the father?—That is my distinct impression.

1690. *By Mr Alston.*—It has been represented to us that the instruction in drill should be of the very highest quality and the most modern kind, such as you find at Aldershot; that all instructors, therefore, should be qualified to give such drill. You could not expect from your compulsory officer drill of that kind?—The ex-soldier compulsory officer?

1691. The ex-soldier compulsory officer?—I would bring him to a centre, say to Stornoway for the island of Lewis, where he would get special instruction probably covering a fortnight every four or five years, to bring him up to the most modern requirements. It would cost very little to bring him there.

1692. But it would be a wise course that he should be fully instructed, just as Volunteer instructors have to go to headquarters to learn?—Yes.

1693. So it is perfectly feasible?—Quite feasible.

1694. Those men returning from the front, none of them have any instruction?—No, it would come in time.

1695. Take St. Kilda, for instance. Of course, in your scattered district, you have great difficulty in getting this physical training fully carried out?—Oh, yes. I think there would be a few places where it would be almost impossible to get anything like a modern instructor.

1696. In St. Kilda is there a young population?—There are twenty-four children in the school; it is quite a special school; it is not worked just now.

1697. *By Professor Ogston.*—In some parts of your district it would be impossible to give physical education in Scotland?—Of the most modern type. There is some form of physical education in all the schools.

1698. *By Mr Alston.*—Just one other point. It is a general impression that the race is deteriorating, particularly in the cities. Some witnesses have said, not. Do you find there is any deterioration throughout the Highlands on account of change of food from porridge and broth, let us say, to tea and slops?—Well, I cannot see much evidence of it as yet. There is a good deal of plain rude food, I believe. In the case of women the amount of tea-drinking is decidedly great, particularly, I am told, in Shetland, where it is simply appalling the quantity of tea they take. A great deal of indigestion occurs in consequence.

1699. You do not see any change in the children on that account?—No.

1700. *By Professor Ogston.*—Is Shetland not in your district?—No, it is not. My statement is from hearsay. With us in the Western Highlands I do not see much evidence of deterioration as yet.

1701. *By Sir Henry Craik.*—Are there any schools that you would suggest that the Commission ought to see in your district, or any places that it would be desirable that they should visit?—

1702. *By the Chairman.*—More than that, any evidence from such schools—or from such schoolmasters—teachers?—Unfortunately there are very few schools having military drill outside the town of Inverness, which is the biggest town in my district; but Fort William and Kingussie have it, and also Stornoway. These are the four leading places.

1703. *By Mr Fergusson.*—May I ask this: you have told us that you think these young men who sit on the hillsides smoking, waiting to go into the Militia, would not object to having drill made compulsory from fourteen to eighteen?—I do not think so.

1704. I suppose you admit your district is rather exceptional?—Yes.

1705. The people in your district have much more military ardour about them than in the ordinary Scotch counties?—Still, one cannot help seeing, when passing south by train, a large number of young fellows idling

Instruction: must be up-to-date.

Deterioration of race in Western Highlands not observed.

Mr J. L.
Robertson.
1 May '02.

about the country. There is a large lot of loafing about in the villages as you pass them. I think if shooting clubs were ultimately started in a number of these

places it would give an immense impetus to physical and military training, now that shooting can be done so easily—Morris tubes and all that.

The witness withdrew.

Adjourned

FOURTH DAY.

Friday, 2nd May 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr GEORGE M^cCRAE, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr A. E. SCOUGAL, examined.

Mr A. E.
Scougal.

2 May '02.

1706. *By the Chairman.*—You are His Majesty's Chief Inspector of Schools for the Western Division of Scotland?—Yes.

1707. Have you been long in that capacity?—A little over two years.

1708. And before that?—I was stationed in Edinburgh; Inspector of what one might call the Leith and Lothians district there.

1709. And the Western Division, where you are at present, comprises what counties?—Well, it is really all the West of Scotland, beginning with Argyleshire; Argyle, Dumbarton, Bute, Renfrew, Ayr, Lanark, Dumfries, Kirkcudbright, and Wigtown, I think, are in that division.

1710. Have you got a copy of your notes?—I have.

1711. Will you please read them?—I thought I might mention preliminarily that, besides my experience as an Inspector, I have always personally taken a very keen interest in athletics and sport from my early school days, and I carried this on by playing football regularly, I think, for thirteen years after I was an Inspector. I have been interested personally; and then I was for seventeen years an officer in the Border Rifle Volunteers, which gave me some insight into these things

The first point that was referred to me in the Secretary's note was the *existing opportunities for physical training*, and I have put this in the forefront, I think, as a point of considerable importance, especially since the year 1895, when the Code made a change emphasising the importance of physical drill in connection with the discipline. We have had since then physical drill in practically every school that I have seen in Scotland; physical drill as distinct from the military drill which was so far encouraged in the Code. I forget exactly when the reference to military drill came in, but it must be a long time back. I cannot quite remember seeing much military drill in my first district, which was in the North of Scotland, when I was in Aberdeen for between five and six years; but in the Border district I saw a great deal of it. I have inspected drill in a lot of individual schools and in towns like Hawick and Galashiels. I helped some officers of the Border Rifle Volunteers to adjudicate in competitions in drill amongst the companies from different schools; and I have sometimes had a sort of

Existing opportunities (1) in elementary schools.

battalion parade and inspection and march past done with spirit and thoroughness. I may mention that even when I encouraged the military drill solely from my own experience and personal liking, I used to urge the paying of a very great attention to the extension motions, what may be called the physical setting-up part of it, because I feel convinced that, as far as school is concerned, the point in the military drill is what one would call the drill part of it, not the merely military part of it. The military evolution part of it is not of the same importance, I think, educationally as the physical benefit in setting up, and neither of them perhaps of quite as much importance as the disciplinary effect of the drill. That really covers the ground as to what one sees in the ordinary inspected school.

Then, secondly, with regard to the higher class (2) High day schools. I never officially inspected any of them until I went to my present district. I have now seen a good many large schools of this kind in Glasgow, and I have found very careful, almost enthusiastic, attention paid in many of them to drill—drill of all kinds. I take them just in the order in which I happened to see them first—Glasgow Kelvin-side Academy, Glasgow High School (that is, the High School for boys), the Glasgow High School for girls, and the two Glasgow Hutchisons' Schools, one for boys and one for girls; and in all of these I saw with much pleasure and delight the classes in gymnastics and physical drill, including military drill, company drill. Then in the Kelvin-side Academy I was greatly delighted to find—it had been in existence for some few years before I saw it—a very good cadet corps indeed, exceedingly well equipped and turned out in a very bright and taking Highland uniform, and doing very good drill work. Quite recently the High School in Glasgow has started a cadet corps also. I saw it in a sort of elementary stage, I think about its seventh appearance on parade; but about one hundred did remarkably well for the time they had been at it, and there was another squad of about another hundred just waiting to be enrolled and taken in hand when arrangements could be made for instructors. And then I think I have been successful in doing something in connection with the Glasgow Academy. I spoke to the rector about the matter at a previous inspection, and this year they also have started a cadet

corps. They are still waiting, I believe, for the War Office sanction, but they have a corps of a little over one hundred, and it is getting on. Of course they are pretty much in the raw state yet.

1712. *By Sir Henry Craik.*—Do you know to what corps they are affiliated?—I am afraid I could not quite commit myself. Kelvinside, I think, to the Cameronians (Scottish Rifles).

1713. *By Mr Alston.*—Yes, that is so.—And the High School is the 1st Lanark.

1714. Yes, that is so.—And I am not exactly sure to which corps the Academy is attached.

1715. The Glasgow Academy is one of the Volunteer Battalions of the Highland Light Infantry—the 5th or 6th, I forget to which.

1716. Colonel Mackenzie?—Yes, it is his name I heard in connection with it.

1717. And the High School the 1st Lanark Rifles?—Colonel Reid.

Evening and Continuation Classes.—Personally, I have not seen much of the work there. It has not fallen to my lot to see a great many of the evening and Continuation Classes; in fact, that falls more to the lot of the junior officials. I have gone there to see schools which presented a specially advanced curriculum in other subjects; but I know that, under the stimulus given to physical exercises by the previous Evening School Code, work of that sort was taken up—not so much military drill—physical exercise, probably more from the recreative point of view than any other; and the present Continuation Class Code makes specific provision for work of this kind, and it is going on pretty briskly in Glasgow as far as I can gather, a good deal in connection with Boys' Brigades. They fall in under Division IV. of the present Continuation Class Code. I think that practically exhausts the statement of fact with regard to what I know as to what is done.

I thought it might be of interest to the Commissioners to know that quite recently I got a note from the Corporation asking me to co-operate with a committee of theirs to make the best success of a sort of gala day that they propose to have at the Coronation time for older scholars, scholars above the elementary school stage. These elementary school scholars have been provided for for the past year or two under what is called the Glasgow Children's Day in the Parks. They have a sort of gala day, with sports and different prizes, and the different elementary schools are told off to the different public parks, according to the division of the city they are in. But this was an idea started to do something in the way of marking the Coronation time for the scholars above that stage who are not touched by that scheme, and the idea was to get a special park, make a sort of private affair of it for these scholars and their friends; and I think the Corporation thought I might be of use in bringing together, as it were, the Board schools and the purely secondary schools, who might rather stand aloof otherwise. I have been very much encouraged by the hearty way in which the purely secondary and socially higher-class schools—like Kelvinside Academy and the Academy—have taken the matter up, and I think we shall make it a success. The only misfortune is that, this year, owing to the Coronation week, the schools in Glasgow practically break up on the 20th of June instead of a week later, and the 27th is the day mentioned for this schools' gala, so that there may be some difficulty in getting really a good turn-out of the secondary schools, because the Glasgow people are exceedingly ready and anxious to get away to the country as soon as holiday time begins. But I may mention that, just before I came up, I had a note from the rector of the Kelvinside Academy, in which he says he put the matter before his senior scholars, and he expects about fifty of them, although they are out of town, will be able to come back, and are ready to do so, for the purpose of giving a kind of lift to this meeting of ours.

School games occurred to me in connection with their value as physical training. I do not know

that there is any physical exercise of more value; and, from the educational point of view, I think we are apt to neglect in our educational arrangements the fact that one of the best things the school can do for a fellow is to teach him how to make a good use of his leisure. I should like to see the children imbued with a liking and respect for all good hearty games. And then, of course, there is the disciplinary point of school games, because in every school where they are properly organised they create a *camaraderie*, and a putting shoulder to shoulder and a give and take, which are of great value from the discipline point of view. I say this merely in passing; I recur to the point in connection with some of my suggestions.

I hope I may be excused for stating frankly that I was a little unable to logically differentiate the heads of the specific references that were sent to me. They seemed to involve a good deal of what you might call cross classification; and looking at this second head—*the extent to which use is made of existing opportunities*—I thought I might deal with that rather by making suggestions as to what might be done to better the way in which the opportunities that do exist are utilised. I have put these under six headings. I was not quite sure what was asked for, but I think the main point is that we want the matter a little better systematised. There are no lines of official guidance as to what the Code means by *adequate* physical training. The word 'adequate' is used in the Code, and there is no sort of definition of that. It is left to the intelligence of the teachers or managers, and then to the personal influence of the inspector to make them realise what is adequate. I know many managers and teachers would welcome some general lines of guidance, and I think the inspectors also would be the better of a power of consultation with some thorough expert who can speak with authority upon the matter. I daresay most of us can learn to know what is respectable in that way from what is not, but I think it gives the subject a greater dignity and place when teachers and managers feel that there is an expert at the back of the whole thing, as in some other matters that I am glad to see the Department are taking up in this way. For example, a subject like cookery. Well, we can learn to know something about it, but a special inspectress has recently been appointed. I got word of this just before I left, and I am very glad of it, because it gives us a backing from an expert. I should like to see needlework, for example, dealt with in the same way. Some of us have learnt in thirty years to know a good deal about it, but you can understand the difference. Much of the physical drill done, especially in small rural schools, is most perfunctory. Much is undoubtedly wrong in system, and sometimes even worse than useless. If it is not frivolous, I think I should best make the Commission understand the point of view of the small rural school by a little story of a personal experience. When I was trying to find out the date at which the clause as to these prizes for physical drill first appeared in the Code, it was recalled to my mind that travelling somewhere on the Clyde—when I was stationed in the Edinburgh side of the country—I heard a curious discussion between two teachers about this very point, this new 'fad' which had been introduced into the Code. They wondered how they were going to manage it—where the time was going to come from, and what they were supposed to know. They were two Highlanders, one a country and one a town teacher evidently. They did not know me; I was smoking forward on the deck. My ears were pricked up first by hearing them discuss personally some of my colleagues in the West whom I knew very well. Then they began about this. To make it short, the country teacher was very much distressed—How was he to get the thing right? What did he know about it? The town teacher was trying to encourage him. They discussed the thing up and down. The town man said, 'You must just do the 'best you can.' The other did not seem to know where that came in. Then an ingenious point was started by the town man—that probably the inspector

Code, 'adequate' physical training: some guidance desirable: expert's help necessary.

Country schools: drill often perfunctory.

Mr A. E.
Scougal.

2 May '02.

did not know any more about it than the teacher did. That was an element. They discussed it a little further, till a bright idea evidently struck the town man, and he said to his friend, 'I will tell you; your boy John 'plays the fiddle, does he not?' 'Oh, yes, yes.' 'Well, 'I will tell you what, this first time anyhow. You will 'get John to play a tune on the fiddle, and the children 'will just wave their arms in decent time, and it will 'please the inspector very much.' That is what I mean by 'perfunctory.' They get the children stuck up on the school benches, and they 'wave their arms,' and that is about the whole of it with some of them. I would like to see some guidance given; let them understand that something more than that is wanted.

Code: Art. 91
(d) classes:
training of
teachers.

This leads to my second point. I think that, as in all our work, especially along the lines on which guidance is most needed, everything depends upon the proper training of the teachers—everything; and I am glad to say that we have already for Physical Drill several of what are technically 'Article 91 (d) classes'—classes meant specially for the training of teachers in subjects which they have to teach to children. I saw Captain Armytage, who is to appear before you, at the class at the High School a few weeks before I left, and we were both very much delighted with it: it was thoroughly satisfactory. I should like to point out, in connection with the instructor question, that, just as we find in other subjects, it is not the man who technically knows most himself—a military instructor—who is of necessity the best instructor either of teachers or of children. He wants to be trained how to teach, as well as to know his subject thoroughly. I have found some Volunteer drill instructors, who used to be very much employed in that way, splendid men. On the other hand, I have found some of them very unsatisfactory. I am strongly of opinion that, for the success of physical training in the common schools, the right method is that such training should be mainly in the hands of the teaching staff. I am quite clear about that as a principle in all our work in the common school. Where you have to import a special teacher for a special purpose, at some odd special time on the time-table, the subject is not recognised as an integral and an essential part of the curriculum, and it is apt to be looked upon by headmasters as a kind of fad or excrement or bore; it is not done with thorough spirit as part of the work of the school. The main element, I think, is that we want everything of the kind realised as being part and parcel of the school curriculum, not somebody's addition for some private—what you may call 'faddy'—idea. Then it seemed to me to follow, as I was hinting before, that something in the way of official guidance or inspection by a specially trained expert would be of use, at any rate preliminarily, until we get more system thoroughly introduced,—a kind of man who, with authority, could see to the carrying out of a system officially approved and enjoined. I might say, however, with reference to officially approving and enjoining, that 'enjoining' is perhaps a little stronger than I mean. I am not sure that it would be a healthy thing to put out officially, a Code, as it were, of physical drill which was not to be departed from in any way—to tie teachers down within rigid limits, either as to amount of time or anything of the sort. That destroys a great deal of the initiative and individuality of the teachers in the schools; and it is very difficult to make any guide of the kind that would fairly meet the varying circumstances of different schools. But I think officially we might do very much with the drill as has been done with subjects of a similar technical kind, like drawing for example—make the school authorities send up a scheme of their drill for approval, and leave them freedom to a good deal of individuality, but yet have somebody watching the thing, to see that there was nothing wrong, and that there was nothing essential omitted. But I am not clear that any good would be done by going back to the old rigid prescribed Code, or standard, or regulation idea.

Instruction:
should be in
hands of ordi-
nary teaching
staff.

Uniform
system not
beneficial.

Here we are doing a great deal in the way of physical

training. It is done everywhere; but the whole thing wants to be recognised as more essential and more important in the work of every school; not to be treated as an outside thing, shoved in at somebody's dictation who does not understand school work. The teachers—they are very conservative as a body—are apt to look at anything new of that sort as just a fad, shoved in by some influential person, and I think they need to realise that the physical side of a boy has to be trained thoroughly in every way as much as the moral and the mental. Physical training should be better recognised as an essential and important part of the school work. It should not be, as it often is at present, looked upon merely as one of those almost outside things, or 'fads,' that must (for grant-earning aims only) be stuck on somewhere, and anyhow, in the curriculum. That is to say, a lot of the schools obviously do just the minimum that will save their being come down upon, and their grant being docked. They do not do the thing for its own sake. It should have more time devoted to it than it generally gets now. I have a paper in connection with that, that I will put in, which came to me since I left home. In the large Glasgow schools, the pupils in the junior and senior divisions, that is, above the infant stage—pupils, say, from eight upwards—I am allowing a little margin: the infant school age technically ends at seven, and the junior division is supposed to include from seven to ten, and the senior from ten upwards—well, these children get nominally, as per the time-table, only half an hour of physical training exercises per week; and I find that before they are assembled, fallen in, and dismissed, that is practically reduced to twenty minutes, so each child in those closely-packed schools in Glasgow gets only twenty minutes of this healthy exercise per week. That is by the approved time-table. And further than that, as I pointed out before, generally he gets this from an outsider—maybe an old and somewhat crusty drill-sergeant—who may have little sympathy with children, and who never sees them at any other time than this one short period per week. Even now, however, in the infant divisions—and for a long time back in the infant divisions—matters are very much better. They enter very heartily into the physical exercise for its own sake and for its recreative sake, and it is always there in the hands of the ordinary staff, just part and parcel of their work.

A point to be noted here is that some people will say, 'Well, if you are going to put this on 'to the curriculum, where is the time to come from? 'You must give up other things.' Should it in consequence be necessary to let progress in some of the other branches of the curriculum be slower than has hitherto been the case, I see no objection to this. Indeed, I am persuaded that hitherto no little harm has been done by concentrating teaching effort upon the earliest possible 'passing' of certain prescribed standards in exclusively intellectual (or book) attainments, to the detriment of the natural all-round development of the child, and to the fostering—especially given to 'ordinary' teachers and the very class of pupils whom we have most need to educate by our elementary schools: I am speaking perhaps more of the poor slums schools in a big city like Glasgow—of a type of 'cram'-work, swallowed with mere dumb stolidity, if not with actual distaste, never assimilated, and rejected or thankfully forgotten at the earliest opportunity. Well, what I wish to draw from that is this, if we go a little slower, especially now that we are to have the children till they are fourteen, and do not try to do more, as it were, beyond our present curriculum, but rather concentrate upon seeing that the children have a thorough and intelligent grasp of what is included in the present curriculum, we shall do very well; and in that case I see room—quite room—for a good deal more attention to physical training. We have practically before us, under the new Act regulations, two years of school life that we did not have before. The majority of the children in a place like Glasgow

left school absolutely when they were about twelve, —the great majority of them made an exodus from the school at the period of the old fifth standard. Now we are compelling them all to stay till fourteen, and I would rather see the curriculum widened, and the whole type of instruction changed, to be more stimulating and probably more permanent and fruitful to the child, than try and teach them *more*, as it were—either further subjects or a wider amount of any given subject; and so, I think, there would be plenty of time for a good deal more time spent upon physical training. There has been too much neglect in our common-school education of the *physical* side of the child's nature—taking 'physical' in its widest sense—as an inevitably important factor towards a healthy, useful, rational—and why not *happy*?—adult life. I think there has been a tendency hitherto to neglect what we call hand and eye training and the use of the physical powers and senses, all for the sake of getting the children up to a certain pass line in reading, writing, and arithmetic, and some other subjects.

I return at last to the importance of organising school games. The important use of *organised school games* seems to me to be insufficiently recognised in the elementary school. While physical training is undoubtedly of most importance for the children of the unwholesome congested areas of our large towns, my experience is that in the matter of school games it is the children in rural districts that need most guidance and encouragement. It has often seemed strange, and even pathetic, to me that in so many small country schools the children—I refer more especially to the boys—seemed to have no occupation for their play 'interval' except to stand with their backs to the wall and their hands in their pockets. In large schools, of course, the mere numbers help to more life in the playground. On the training, both physical and otherwise, to be got from good games it is needless to enlarge. In my experience teachers can do much for their pupils by kindly and judicious encouragement here, and I should be glad if that could be put before them even more strongly than it has been done in official documents. In my former district I had much pleasure in taking a personal interest in the inter-school football contests so successfully and beneficially started and carried on by the Leith teachers among the boys of their schools. As far as my observation went, the results of this movement were in every way good. I am here reminded that *swimming* was also an important feature in the physical training of the Leith children. As a healthy exercise it stands in the very front rank, and I think that everything possible should be done to encourage it among the pupils of our schools, not to speak of the advantage to any man and woman of being able to swim.

In connection with this schools' gala day in Glasgow, I saw the rector of the Glasgow Academy just before I left home, and perhaps I might be allowed to mention something upon which he laid considerable stress—in regard to school cadet corps. I should be very glad indeed to see cadet corps encouraged in connection with every school that keeps children beyond fourteen years of age, at any rate; but there is an undoubted difficulty in the way of expense, and more particularly as regards uniform. I think if we take up the cadet corps idea systematically, there is a case here for prescribing by definite 'regulation' some useful cheap uniform. I do not think it is wise or of much value to have the cadet corps of schools imitating full regimental uniform. It is all very pretty, but I speak with some personal experience. It is an expensive matter for the unfortunate parent to pay £3 or £3, 10s. for the turn-out of a small boy, for whom the uniform is of no use about eighteen months afterwards, because he has outgrown it. Of course, they do try some scheme of passing on the uniforms, but no boy likes to have a secondhand uniform when he can have the glory of a new one. And I sympathise with Mr Temple, the rector of the Academy, who takes a keen interest in athletics and sport too, in thinking that there should be a prescrip-

tion of some regulation uniform for boys' cadet corps, with perhaps some variation in the facings, or something of that sort, for distinction. What he suggested was a sort of loose jacket, knickerbockers, and a useful cap. The cadet corps of one of the schools in Glasgow has turned out in a full imitation of the service kharki uniform in South Africa, with a big slouch hat; and to see these little, wee bairns going about in these putties and great big slouch hats is very absurd—a little dot about that height (*indicating*)—I think it is rather derogatory to the dignity of the regulation uniform.

Just before I finish I might put in this letter, and paper along with it, which I received from the clerk of the Glasgow School Board in reply to my queries as to the teaching of drill—with reference to the time allowed for the drill, and the system of instruction; whether it was done by the class teachers or by outside instructors. The teachers in several cases carry it on during the week, with the expert instructor as organising and directing officer. Then the analysis of the time is that in the infant departments the time devoted to drill each week—drill and other physical exercises—varies from thirty to one hundred minutes. In the junior and senior divisions—that is, as I explained before, from the age of seven to say about fourteen—it varies from thirty to sixty minutes; and certainly my own experience is that the thirty minutes is the more common entry on the time-table. In the higher grade departments, where they keep children after they have gained the merit certificate, it varies from thirty to forty-five minutes. And so, I think, one might very safely say that from thirty to forty minutes a week is the average in Glasgow schools.—I shall be very glad indeed to answer any questions and to tell you anything I can.

1718. *By the Hon. Thomas Cochrane.*—I am sure you have given us a very full and excellent statement. I do not know that there is anything very particular that I would like to ask you about it. I suppose your experience has been more with boys of the school age up to fourteen?—Up to fourteen; yes.

1719. And you have found very great benefit from the physical training they have had under your inspection?—Undoubtedly. I think the teachers, who fought very shy of it at first, soon began to see the advantage—the disciplinary advantage to school life, outside the mere physical setting up.

1720. It makes them better scholars?—Yes; it gives them a better tone altogether, and especially it affects school discipline very much. The habit of acting promptly on a given word of command saves a great deal of slovenly talking.

1721. That applies to the girls as well as to boys?—I might mention that from the very first—in my Border district, and all through—I have insisted that the term 'physical exercise' applied to the girls as well as the boys. They must provide for the girls as well. There is even more need in their case.

1722. They like the physical exercise, the girls, do they?—Oh, yes; they do. I have seen some of the schools where they have been very proud of being able to 'show off' as it were.

1723. Marching?—Very beautifully and vigorously and gracefully done.

1724. Would you make any difference between the drill—I will not call it drill: physical exercises—you give to the girls and the boys up to fourteen?—No, I think not much, except that the older girls of course require very careful watching. In fact, I should mention that as a corollary to pushing attention to physical exercise we should almost need some medical supervision, I think.

1725. So as to determine who were the more delicate children?—Yes; to make sure no harm was done by overstraining delicate children. Of course, in the slum schools in Glasgow there are very many children who are neither fit nor physically fit for anything more than a mere minimum just worked up very gradually. These are the poor creatures to whom the physical training is of most value.

Mr A. E. Scougal.

2 May '02.

Drill: amount of time given under Glasgow School Board.

Physical training very beneficial for boys and girls.

Medical supervision desirable.

Mr A. E.
Scougal.
2 May '02.

Country
children
require disci-
pline and
smartening.

1726. You perhaps would like to couple the physical training with some scheme of feeding the more delicate ones?—That is leading me farther than I should care to go; but I should like to have some medical supervision—some recognised medical officer in connection with a given group of schools, who could be appealed to and consulted, and who would be responsible for no harm being done in that way,—some authority in that way. I might mention that I have spoken of the slum children in big towns. For country children I think the great elements are the disciplinary and the setting-up elements, not so much the physical exercise, because these country children walk miles to school, and they are out in the open air, and they get a great deal of physical exercise in many ways; but they are not smart, and the disciplinary effect in the country schools is very marvellous where the clodhopper kind of chaps learn to act smartly.

1727. It gives them a certain amount of physical and mental alacrity?—Certainly.

1728. It wakes them up?—It undoubtedly affects the mind as well as the body.

1729. Your opinion is that it has had an advantage on the health of the children generally?—Oh, undoubtedly.

1730. You have not got any facts or statistics of any kind which bear upon it?—I had no time to get anything of that sort.

1731. Are there any available; have any measurements been taken of the children?—I should doubt it. Possibly a school or two, where I remember the teacher as an enthusiast, may have done that sort of thing, but certainly there has been no system.

1732. It would be very interesting if we could have some figures?—Oh, very.

1733. But do you think a consensus of the opinion of the teachers would all be in favour of physical exercise?—I think that all the teachers whose opinion would be worth paying any attention to would be in favour of it. There is always a certain type of them who would object to anything.

1734. To any change?—Yes.

1735. Now, I should just like to lead you from that up to fourteen. You have every experience of what has taken place, and do you think that if that were extended to the ages of fourteen to eighteen, there would still be an advantage to the pupil of some system of physical exercise?—You mean compulsorily extended?

1736. Yes, compulsorily. Is it feasible, from your point of view, a compulsory system of physical exercise after fourteen?—Well, personally, I should be quite in favour of that being attained openly, by legislative act. I should like some means of insisting upon it for youngsters at that stage. But, educationally—well, it is rather beyond the limits of our educational administration, and I cannot commit myself as to how it should be done in that way. Educationally, the feeling that I have is, that I should like this subject taught, like every other subject, so as to give the child a liking for it and actual pleasure in functional exercise, be it of mental function or of physical function. I should like the children to leave school with a thorough respect for and liking for all that active physical exercise; and, as far as educational administration goes, I should like everything done to encourage them to keep it up; but when it comes to a question of legislative compulsion, that is outside of my considerations. In fact, I have not looked at the matter in that light.

1737. I was not quite leading on to compulsion, but I would like to ask your opinion about that, as to whether you think there would be an objection on the part of the parents to, say, an hour a week, or something of that sort—to three half hours a week?—I should think not; not if it is honestly and squarely put before them. But I think a Scotch parent would object, if I may put it so, to being hoodwinked into anything of this sort.

1738. If he thought he was being convinced against his will?—Yes, by a kind of side-wind; but, from the interest I have seen parents take in the physical

displays and these drill exercises and the games we had in Leith, for example, I should think they would appreciate it if it were fostered through stimulus and encouragement.

1739. Would compulsion be necessary if these classes in physical exercises were made sufficiently interesting? Would a very large number of the young men, fellows between fourteen and eighteen, be willing to avail themselves of it?—I am afraid that is rather in the realm of prophecy.

1740. Do they go out readily to these gymnasia?—Certain of them do; but one cannot say, for example, in a place like Glasgow, with the denser and poorer parts of the population, that there would be any keen desire, in the meantime, on the part of the youngsters themselves. I think that might grow, as I was saying, if we made more of it at the lower stages, and made them appreciate the benefit of it, and especially if, in a place like Glasgow, a more systematised use were made of playgrounds and open spaces for the purpose. I think that is what towns like Glasgow should face—forming organised clubs for physical exercise and physical training.

1741. You think something might be done, but you would not get at the whole of the young population without some system of compelling them to attend?—I am afraid not; and, naturally, the dregs, who would remain outside the voluntary system would be the very ones you would most like to get hold of. This is always the case as to compulsory education work.

1742. You would like to catch up the Hooligans?—

Yes, I think that is an element that is of very serious importance. I think the extension of our school age should do a great deal to do that, if we make the two new years interesting and fruitful. I am perfectly certain—I speak from personal experience of places like Hawick and Galashiels—that a great deal of the Hooliganism was due to the children's breaking away from school at an early immature age—leaving a couple of years or so before they could go to work. They simply got out of hand altogether.

1743. You would like to find them some beneficial occupation for their surplus energy?—Most certainly.

1744. You think that might work off their high spirits—some form of physical exercise?—Yes.

1745. *By Sir Thomas Coats.*—You talked of the average time devoted to this drill at present as something like half an hour per week, or practically twenty minutes?—That is a very common time, I find, in the Glasgow schools.

1746. What time would you advise should be devoted to it?—Well, that is a little difficult. My own feeling would be that every child should get it for, say, half an hour every day. I think that there is much more value in the repetition of such exercise pretty frequently than in continuing it too long at a time at infrequent intervals.

1747. How would you divide that half hour?—It might be taken in two portions, or it might all be taken in one. I do not think half an hour is too long, if the drill is judicious, for a child. I should not like to keep a child under that kind of exercise for more than the half hour certainly, and even then he would need rests. Might I mention, in connection with that, that I have seen in one or two of the Glasgow schools what seems to me a very good idea, and a very good conception of the kind of use of physical drill? At the inspection of one large school, just as I was shifting from one class to another, a loud stroke on the school gong sounded, all the classroom doors and windows were thrown open, and for ten minutes, to the leading of a piano played in the school hall, the children in every class went through physical exercises. I commended the teachers very heartily for that. I thought it was a most excellent utilisation of the physical drill for its right purposes. That was one of the schools where the teachers had trained themselves to take charge of the work in that way.

1748. Then you think that if physical drill were made a very special subject or taken up as part of the

ated.

school work, half an hour a day would be sufficient for that work to develop the children properly?—I think if they got half an hour a day, it would make a very great difference and do a great deal of good. Of course it is very easy at much less than half an hour a day to make children do their drill well enough to make an admirable appearance at a given inspection; but then that is not utilising drill for its real purpose. We do not want the drill taught for a show inspection business—we want it taught for the benefit of the children; and unless it is repeated as often as I say, or nearly so, I do not think they get the good that they should from it.

1749. You think that time could be quite well spared with the additional year or two years?—In fact, I think the benefits accruing from it would make it pay for itself, as it were; I mean the additional life and spirit put into the other work would repay the teachers for giving up that time. It would have the same effect as the introduction of a good many things which have been objected to on the score of time: where they have been taken up, I think the teachers find this has brightened and intensified the other work to such an extent that there is no loss of time in the end.

1750. You said something about cadet corps in schools—have they any tendency to specialize the physical training, that is to say, that a certain number of the scholars are trained specially, to the disadvantage of the general run of scholars in the school?—I think not, from the schools that I have seen, because they have systematic gymnastic training. I find that both in the Aeademy and in Kelvinside Academy, for example, systematic gymnastic training is given to every boy in the lower forms up to say the third form. After that the gymnastics are voluntary, and then of course the military training in the cadet corps is given only to those who enrol. I do not see why it should have any evil effect in that way. I think it is a sort of voluntary coping-stone, that would rather stimulate interest in the whole of the physical work.

1751. Then, in regard to the medical supervision which you recommend, would you have the children examined at the beginning of each term, or how?—I cannot help thinking it would be a very good thing to have children medically examined periodically. At the beginning of each term would be a very good time, except that we cannot get our elementary teachers to understand what a school 'term' is, I am sorry to say, yet. They have been so habituated to grinding from one year's end to another, from inspection to inspection, for a particular required standard, that they do not quite understand the term system yet. I think the natural terms would be three terms a year, say, at the beginning of the session, about the Christmas break, and then about the Easter break. Such examination is a matter more for experts in that line to speak of, but I cannot help thinking it would be a very useful thing to introduce into our schools.

1752. Would it be practicable to have a record of the size and weight of the children in the school, and to keep track of that, to see whether they are advancing physically?—I think the thing would be of no use without a record. Of course it follows necessarily that there should be a school record in that way.

1753. So that you would find out whether, for want of food or for other reasons, the child was going back?—Yes, that is one of the main elements. Of course it would be useless unless the facts were carefully recorded each time.

1754. Could you take advantage of that, supposing you found that a child was not being properly fed, and not fit to go through much physical training. Could you bring pressure to bear on the parents, by advice or otherwise?—That is a matter which we, officially, would have to hand over to the managers—the School Board or the Managers of the school; and I know that they do have that before them in the meantime, as regards food, at least, and clothing. There is a great deal done in Glasgow, not directly through the School Board, but with their co-operation, and in the way of helping them, by charitable organisations of different

kinds. Food and clothing are provided for children who are in absolute need. And I have known, even, several cases where the teachers—to their credit be it said—have given starving scholars a penny or a half-penny to go and get a bite of bread. I have seen children, over and over again, who have come to school without having tasted food that day.

1755. But do you think any influence could be brought to bear upon the parent? That is, of course, doing it more as a charity, giving it in that way?—I fear that is just one of these questions that raises a wide sort of administrative problem, that is not exactly in my line. I should be glad to see something done for these children. I did all I could in my rural districts before to get a sort of midday dinner plan established, which was found to be a most useful thing. It was under voluntary management, and the children got, at a very cheap rate, a basin of soup and a good piece of bread in the middle of the day, instead of waiting about, wet and tired, and getting really nothing. It had a capital effect upon the afternoon's work in the country schools.

1756. Then you spoke about the value of games; Games, that they ought to be organised, the teaching of games; would that be done by the school teacher or by specialists?—One is always shy of meddling there. That is a matter to be dealt with, with great tact, by teachers; but I should like the teachers to realize more that it is for them a field of usefulness and of good influence upon the children morally and physically. But I do not want them to meddle or interfere. Of course the older the children, the more they should be left to work out their own games.

1757. But you would teach them to play these games according to those recognised rules?—Yes. I have had some fun starting the children to prisoner's base, when I had plenty of time, waiting in the country, just to give them a kind of impulse to start something for themselves instead of loafing about or sitting up on a paling with their hands in their pockets. The girls are more inventive; they have their own special games; they do more in that way than the boys in the country districts. But the average juvenile 'hind,' in places like Berwickshire or Roxburghshire, when he has nothing to do, has a great faculty for doing absolutely nothing. As far as I can see, he just sits upon a paling, or leans with his back against the wall. He is more like a vegetable: he seems to have no mental or physical spring in him at all.

1758. We have had some evidence of the desirability of teaching or giving to country children this regular physical training, properly taught; that the ordinary exercise they get by walking to school, or the out-door work they have, does not properly develop all the muscles but only certain muscles, and the evidence we have had from other witnesses shows that it is just as necessary to give them physical training as the others. Is that your experience?—Oh, I think so. As I pointed out, it is more necessary for them from the disciplinary side. They are less nimble and active mentally and physically; and that is where I think it is of great importance for the country children—just to stir them out of that vegetative existence they are so apt to lead.

1759. *By Sir Henry Craik.*—Do you know if in Glasgow the School Boards have obtained any playgrounds: quite feasible for Boards to secure a recreation ground common to several schools, ground of a size sufficient for games?—I do not know that they have actually annexed, as it were, anything of the sort. There are some very good playgrounds, quite big enough for a good deal of drill, and a good deal of running-about exercise.

1760. Not for a game of football or cricket?—Oh, yes; I have seen football played in its own way. Most of the playgrounds in Glasgow are asphalted or concreted, for the sake of cleanliness, but I have seen the boys playing football there with great energy.

1761. But is there a field in connection with the High School?—Yes, with the High School.

1762. The Higher Class School?—Yes.

1763. But for the elementary schools, they have never attempted to get hold of any field which they might

Mr A. E.
Scougal.

2 May '02.

use for the play of the children in these schools?—No, not that I know of, except in connection with the children's gala day in the parks. They get from the Corporation the use of all the parks, and then there is an arrangement for systematised children's school games on that particular day.

1764. As an act of grace, and occasionally; of course it would be considered to be an interference with the general use of the parks if it were done frequently?—Yes. I think, sir, what you seem to be suggesting would be admirable. If a Board like Glasgow would secure a recreation ground, to be used in turn by these schools, I think it would be a splendid thing.

1765. And the Department would not refuse sanction to a loan for that purpose?—I am very glad to hear it. I must get them poked up.

1766. The other question is a more important one, which to you and me must bulk very largely, looking back upon the many years in which we have been engaged in this work. You have seen a good deal now, both of higher class and of elementary schools?—Yes, I have.

1767. Now, how would you say that these higher schools turned out their scholars equipped for life as compared with our ordinary elementary schools under the Code?—Well, what I have to say would be very much to repeat what I have said before: that, unfortunately, the turn-out every year from the elementary schools has been absolutely premature.

1768. That is the first point?—Absolutely premature.

1769. They left at ten or eleven years of age?—Or a little above that.

1770. The Act of last year gives School Boards power of very largely improving the elementary schools in that respect?—Yes; undoubtedly.

1771. Then would you not say that there was in the education of these elementary schools, in spite of anything we might do to counteract it, a necessarily somewhat wooden curriculum as the inheritance of the system of standards and of individual passes?—That is what I practically did say, pretty strongly. I think that has been the bane of the whole system hitherto. Of course, as you are aware, under the recent change of Code, matters are improving steadily in the other direction.

1772. Well, that is a second point from which perhaps the great mass of children suffered, as compared with a few privileged children in the better class schools, and that point we have to a large extent counteracted by the changes in the Code?—I think so.

1773. There is now much greater freedom and elasticity in the work of the schools?—And also a potent change for the better in the abolishing of the old labour exemption standard examination.

1774. Now, in two respects, we have brought these elementary schools nearer to the higher schools, first by extending the age to which a lad attended; and secondly, making the instruction more elastic and free?—Yes.

1775. Now, I suppose you would agree with me, that the hard and fast passes that had to be made, and the rigid curriculum that had to be followed, did tend to narrow the opportunities for the physical training of the children?—Oh, undoubtedly. They absorbed the whole ideas and energies of the teachers and the children.

1776. And the consequence was that there was a marked contrast in the physical training of the higher class pupils from that of the ordinary elementary scholar?—Of course not solely in consequence of that, but that was a very strong contributory cause. Of course one must remember the different social condition and environment of the higher class children.

1777. By the Chairman.—I should like a little exemplification of what is meant by higher class. What class?—Well, I should say schools that are meant for the children of professional people, the higher middle class, as contrasted with the schools under the Code, meant more especially for the children of the

working class and lower strata of the population: schools, for example, like the Glasgow Academy, the Kelvinside Academy, the Edinburgh Academy, George Watson's College, etc.,—schools marked out by a social differentiation. In nearly all these schools the children pay very considerable fees.

1778. Would you go so far as to call them public schools or not?—That is a somewhat technical term.

1779. By Sir Henry Craik.—Public school has a technical meaning in Scotland quite distinct?—They are nearer the analogy to the English public schools than anything else.

1780. By the Chairman.—Grammar schools?—Yes; and some of them are on the same footing, so far, as the English public schools: take a school like Fettes.

1781. I want to imagine myself quite ignorant?—Fettes College, or Glenalmond, or Merchiston—schools where they make provision for boarders, the masters keep houses for boarders: these are the nearest analogy to the English public school that we can give.

1782. And not in the same class as those that you were talking about quite?—They are differentiated only by the fact that they have some boarding establishments in connection with them. Those other schools that I am speaking of are day schools, doing practically the same level of work as these advanced schools.

1783. But are they doing the same level of play?—Oh, I think so. Take a school like the Edinburgh Academy or the Glasgow Academy: they devote a great deal of time to cricket and football; they have their own field; the boys must turn out for games.

1784. By Sir Henry Craik.—I quite agree with your classification of these schools. We have in the elementary school, it is quite plain, a large leeway to make up in regard to the physical training, if we are to bring them to anything like the level of the opportunities which are open to the boys of the better class?—If one views the question as having regard to school games and that sort of thing, they have nothing like the same opportunities for games,—no fields, no regular system of play—no games in that way; but I should think that as far as the mere physical training exercises inside the school are concerned, the elementary schools are fully up to the others.

1785. Of late years?—Yes; perhaps the thing is more thoroughly systematised there than in the better class school.

1786. Yes, but only of late years?—Especially since 1895; since that matter was put in the Code.

1787. Have you found any objection amongst parents to their children taking part in these physical exercises or military drill?—Not personally, except that I remember a case, which, probably, you may have seen or heard of, where the matter was taken to the law courts. The parent objected to send the child to school because they insisted on giving her physical drill, and he was prosecuted for not keeping his child at school, but lost the case. The Sheriff very sensibly decided the case against him. That occurred in Scotland not very long ago.

1788. I may mention, in regard to that case, that the parent had previously objected to another child doing the ordinary school work?—I see.

1789. So that probably there was some twist on the part of the parent—objection to the teacher, or something or other; it was not a conscientious objection?—No, no. Might I mention something you suggested to me in connection with the curriculum, and the further broadening of things in our elementary schools nowadays? We have in the Code, linked on to the Elementary stage, the Higher Grade stage, which is practically a stage in what, to all intents and purposes, is one of the elementary schools, but one that carries on a curriculum in higher subjects—university and scientific subjects—quite equal to that, say, of the English public schools. I should say the best work in classics and mathematics in Glasgow is done in one of these schools, not in one of the purely secondary schools.

1790. But still it is probable that in such a school there are not the opportunities for physical training schools:

Mr A.
Scougal.

2 May '02.

Higher and elementary schools compared: lately improvements in latter.

Physical exercises drill: no objection parents.

Definition of term 'higher class' school. classification.

Higher schools:

that there would be in a school for better class children?—I should very much like to see all these schools, if it were possible, obliged to have a field, a recreation ground. In Glasgow they might at least have one common to these higher grade schools.

1791. Boys attending these higher grade schools would go on to the age of sixteen and seventeen?—Sixteen, seventeen, and eighteen, I have seen them; and these are the very fellows we want to get bracketed with the secondary schools, such as the Academy and Kelvinside, for this gala day for older scholars: that is the notion.

1792. And a very good notion; but at present they have not the opportunity for games in any organized way?—No; they have to go to some of the public parks, where anybody can go.

1793. I asked you about an objection amongst parents: have you heard amongst people who are engaged in education any doubt expressed as to the efficacy of physical instruction?—None whatever, that I remember; no.

1794. You have never found that any people took up the other side, and said that much time might be wasted?—I do not think I have. I am afraid I should not have paid much attention to that. I have heard objection to the playing at soldiers, as they call it—the military drill, pure and simple.

1795. If carried too far?—I have heard most extraordinary objections to it. I have even heard of objections to the singing of secular songs at ordinary schools. This was at Cockenzie, where some of the people are of very peculiar religious views. These parents objected utterly to the children being taught secular songs in school.

1796. And, of course, you have heard objections, we have at the Department, to dancing forming part of the instruction in schools?—Yes. I should like to have spoken on dancing.

1797. For girls it is a very good form of exercise?—Oh, very good—and also for the boys. I have seen it done in the infants' schools, and in the bigger ones; I think it is a pity it is not carried further.

1798. I think you will probably agree with me that the Department was fully justified in not paying much attention to such objection?—I think so, decidedly.

1798a. *By Mr Shaw Stewart.*—You mentioned that you have often seen children who had not tasted food at all in the morning coming to school?—That is to say, I have been told by the teachers, who ought to know; I could not answer for it myself.

1799. I only want to know where that was most prevalent?—In certain poor schools in Leith: in towns—in the large towns—not in the country, I should say, as a rule.

1800. I suppose in the country that would be unknown?—Unknown; in fact in the country one of the great drawbacks was that when sent off from home in the morning with what they call 'a piece,' you know, the little rascals used to make a habit of eating their pieces on the way to school, and so they had nothing left for the rest of the day; they simply got rid of the piece in that way.

1801. Then, with regard to the system of physical training in schools, you said you thought any code of physical training should not be too rigid?—Yes, I do think so.

1802. That there should be liberty to the teachers to vary it as they thought fit?—I think so.

1803. But I suppose you would be in favour of a code, if it were drawn up, being most carefully drawn up?—Most certainly.

1804. And the limits of variation carefully defined?—I think so, if you leave sufficient room, as it were, for variation. That is the element I want to get at. I have seen so many so-called systems which all practically come to much the same thing—except where you have this just 'waving of the arms,' you know.

1805. Yes, but do you not think there would be more likelihood of teachers diverging from even a very strict system than of their adhering too closely to any system?—I am afraid not, from my experience. I am afraid if

you laid down a strict system, the heart and soul of the teacher would be eaten up into toeing that line in every detail, and on no account, especially, doing anything towards carrying out any further development of it that he found his children might be fit for. That is the great danger of drawing these fast lines, which will not be elastic in actual practice. My own feeling would be strongly in favour of dealing with these systems on the analogy of our dealing with drawing, and that sort of thing. Make the school submit its own system in detail, and have that criticised in the office under the guidance of expert advice; sanction the system in the school, as it were, and not impose a universal system upon all. It comes pretty much to the same thing if it is well watched, but I think the moral and educational impulse given is in the one way very much more valuable than in the other.

1806. But, at any rate, would you be in favour of the standard—to which these subsidiary systems should be referred—being very carefully drawn up and directed by the best expert advice?—Yes, I think so, decidedly.

1807. One question on the inspection by the trained experts, on which you laid some stress. Do you think the trained expert should accompany the school inspector?—I would rather put it the other way about, that where it is possible, the school inspector, for his own benefit, should accompany the trained inspector.

I mean, I want them to help and strengthen us—not to do so much the regular everyday inspection of this work, which would come to us. We want to be informed and kept fresh in a technical subject like that ourselves. I think any sensible inspector would gladly welcome the help of a man like Captain Armytage, whom I met the other day, simply because he knows more about it.

1808. *By Mr Alston.*—Mr Shaw Stewart has just mentioned an important point, which I thought of asking you about, namely, your objection to the hard and fast system of physical training exercises, but would it not be the case that the medical profession alone can tell the exact exercises that are necessary to produce certain effects upon the human frame, and that these can be laid down on hard and fast lines, from which there ought to be no departure?—Yes.

1809. Therefore you put in the text-book these physical exercises, laid down, so far, on hard and fast lines?—Yes, if you left a good deal of room for selection and variation within healthy limits: because you must recognise the difference between individual teachers, their capacity for taking up and managing the thing; you must face the thing as it stands; and then you must recognise the great difference between schools, the material that has to be dealt with. I do not think you can possibly teach exactly the same course in every detail and in every fulness in certain schools which you could teach in others.

1810. If you had the text-book, you would still advocate a selection of the exercise?—Yes. I should quite like to see a text-book of that sort, a text-book that put forth a good recognized course, for guidance and selection from.

1811. That is what I mean—laid down by a competent authority?—So long, again, as you allow the text-book room to grow as we grow in knowledge and experience in the matter—even suppose it is an official text-book, it should be quite open to revision and improvement.

1812. By whom?—By the authors of it, the official authors of it, on the advice of experts, as we gain more experience. I do not think they have exhausted all the information on the subject that is possible now.

1813. The opinion of medical advisers, that is to say, competent authorities, who could construct such a text-book. I fancy they know now, and will not know any better, what is the proper exercise for the muscle of the arm, or the wrist, or the spine, or the muscles of the back or the legs. These must be laid down once and for all; you cannot improve upon it by new information and new discovery; but you may select a series of movements for the exercise of these muscles and joints, and I understand you would like the teachers to have the

Inspection: school inspector should accompany trained expert.

Uniform system necessary for guidance; but some liberty must be allowed.

Mr A. E.
Scougal.
2 May '02.

power of selecting what they think most suitable for their class, according to the age of the girl or boy?—I should like it impressed on the teachers, and even upon the scholars, that one of the essential points of getting good results from physical exercise is that they shall know exactly what they want to be at. I think the teacher, and even the scholar, should know exactly what he means to do, what part of him, or even what muscle, he means to affect by a given exercise, because, unless he puts the will into it, it becomes a mechanical pulling of strings.

Teachers the
proper in-
structors, if
properly
trained.

1814. You are quite clear that the teachers in the school are competent to undertake this?—Oh, quite competent.

1815. And you are also satisfied that the physical drill should be largely improved and enforced in the school curriculum?—Yes, quite.

1816. Without any danger?—Without any danger.

1817. Of adding to the labours of the teacher, or of the children?—I do not think so. As regards the competency of the teacher, I am not prepared to say that all existing teachers in the schools are at present competent, or could be made competent even; but the teachers, under a system, could be trained.

1818. And you would much prefer that, to the bringing in of the outside expert?—Oh, certainly, for the actual instruction of the children.

1819. But you would like the opinion of the expert at stated periods as to how the children are doing their work?—Yes; I think, for the information of the Department afterwards, and the country generally, there ought to be some man watching the whole thing, to see how it is working out.

Definition of
terms.

1820. The term 'drill' has been frequently used before the Commission, perhaps a little confusedly; it has not been understood what drill meant when an inspector has used the word. Do you distinguish between the physical exercises and gymnastics, and drill?—I should prefer to use 'physical training' as the comprehensive term.

1821. And you would include drill?—I should include gymnastics and drill (meaning *military drill*) as specialized kinds of it, though almost beyond the stage of the ordinary school.

1822. And you would say applied gymnastics involved apparatus?—By 'gymnastics' I mean exercises needing special appliances or apparatus; by 'drill,' technical military drill.

1823. Do you define drill, as military drill?—Well, I think the two words ought to be used together; we ought to say *military drill*. 'Drill' is sometimes used as a technical term with us, meaning *school drill*, without reference to physical training at all. It is drill in class movements and arrangements—the shifting of classes, assembling and dismissing school, and things of that sort.

1824. Then does the disciplinary effect result from physical training, or only from the military drill?—Oh, from any of them; because the essence of drill—without specifying any particular form of it—is the same all through—the quickening and the smartening, and the concentration of attention, the promptness to move on the word of command, and the setting-up. In military drill, as far as school is concerned, the essential part of it, to me, is the *drill*, not the *military* side.

1825. You get these results from that?—I think that from any good system of drill, whether exactly on military lines or not, you could get it.

Cadet corps:
simple dress
desirable.

1826. Then about cadet corps. These cadet corps are to be found, I suppose, in the better class of schools, such as the Glasgow and Kelvinside Academies?—Yes. One I mentioned—Hillhead High School—occupies a sort of intermediate line. Knowing Glasgow, you will understand.

1827. Is that under the Govan School Board?—It was originally a Board School. It has now assumed to itself the name of a High School. It is still managed by the Board, and is not quite of the same social status as the Glasgow Academy, for instance.

1828. Do you see your way to introduce cadet corps

in connection with Board Schools?—Yes, in schools like 'Whitehill' or 'Kent Road' or 'Woodside,' with higher grade departments where you have children above the merit certificate stage to the number of some 200 or 300.

1829. In the cadet corps, of course, you are entirely with military drill then?—Yes; but the setting-up drill and extension motions and that kind of thing are, physically, the best features of the military drill.

1830. But you have the officers and non-commissioned officers in the cadet corps?—It gives a sort of higher finishing drill.

1831. Is it not more allied to the Volunteers than to the Board School?—You mean the cadet corps?

1831a. The interest lies with the Volunteer corps to get up a cadet corps in connection with a higher class of school?—I think the impulse came from the other end; it was the schools that wanted it.

1832. When the Volunteer movement began?—Oh, yes; but as far as I know the Volunteer officers do not work any propaganda in the way of stimulating the formation of cadet corps.

1833. They had a little competition over getting the Glasgow Academy?—Indeed; perhaps you are further 'ben' in that way than I am.

1834. In the cadet corps you would like to see a much simpler uniform?—Decidedly, a common-sense boy's dress.

1835. After school age have you anything to suggest how physical exercises or drill, military or otherwise, could be carried on, particularly amongst boys in connection with Continuation Classes?—I should like to see every encouragement given to the thing practically; but that is not an aspect of the matter that I have ever faced, and I have not had time to think over it in this connection.

1836. The encouragement would require to be sufficient to induce the boy to sacrifice evening hours two or three times a week. I do not think the boy consults his parents on this matter at all. It is his own liking, and you would require to tempt him to come?—I should like to see him tempted by a healthy appreciation of the value of it rather than by any money temptation—anything of that sort. I should like to see employers, for example, giving every facility for youngsters' having the opportunity.

1837. It might be for the School Board to tempt by grants to those who get the boys together in Continuation Classes?—That is introducing an element that I do not like in the matter.

1838. But you would still advocate that after school age the boys should get further inducement?—I should, as a citizen—not looking at it from an official educational point of view; but I would go heartily with any national legislation that would insist upon that.

1839. By Mr Fergusson.—With regard to this term military drill, when you say 'military drill' you only mean the sort of drill which is taught to soldiers?—Yes, the Red Book drill, 'Company and Battalion.'

1840. That is the official term; one finds it over and over again 'military drill,' but you mentioned that you had met with an idea among some people, that when military drill was talked of, one was seeking to turn boys into soldiers?—There is a certain type of parent who takes up that attitude.

1841. Do you not think that it would be far better to drop the term 'military drill' altogether and just say physical exercise, which covers the whole work?—That is my own impression—that the thing may be solved by dropping the term 'military drill.' Let it be military if you like, but not necessarily.

1842. Then as to the work in continuation schools. I think you said that your junior inspectors were more conversant with that?—Yes; they have seen most of the work of that kind, actually.

1843. Is there any one you would name who would be able to give us useful information?—I think my sub-inspector, Mr M'Leod, would be one who could speak to it.

1844. May I ask who your sub-inspectors are?—Mr M'Leod and Mr Calder are, technically, 'Subs.'

M
Se
2 M

1845. Do you think we should learn anything we have not heard of?—I do not think so; really, I do not think so.

1846. As to games, which you advocated as teaching boys to make a good use of their leisure. When you come to think of it, is it not rather more difficult to find any place for the children to play in the country than it is in the towns. In the towns there are a certain number of parks and vacant spaces. In the country is there anywhere for children to play?—I think in many places they have unlimited scope.

1847. Have they?—One Highland teacher said to me, when I was insisting on some such requirement, 'They have all the way from here to the North Pole.'

1848. Think of the Lowlands; have they anywhere except the public road?—Nearly all the schools have playgrounds.

1849. Then a playground is not much of a place for games, and I suppose it is not open on Saturday or after school hours?—Well, I am afraid in most cases it is never shut; but I do not think it would ever occur to the children to come back to it out of school time.

1850. Do you not think it would be very valuable to give School Boards encouragement to provide a place for children to play their games—a field. It need not be a very expensive matter, need it?—No. I think it would be very valuable to insist upon their making the playgrounds fit for use by the children in that way. Think of the country playgrounds, rough and uncared for: one could quite understand the children not caring to run about on them very much. But there are many country schools where the playgrounds would be quite suitable for any such games as prisoner's base, rounders, etc.

1851. Not for cricket?—Not for cricket.—I am afraid cricket is rather an exotic in rural Scotland, though I should be delighted to see them playing it. But for football.

1852. You say, as an Inspector, that you feel the need of expert assistance in such matters as cookery and needlework and physical training?—Any special technical branch—drawing, also, and music.

1853. Then on the question of not having a hard and fast system of physical exercise, do you not think that might increase the difficulties of the teacher? If they had a different sort of system in each school, would it not be difficult with the teachers coming and going, to have one system in one place and another in another?—But I think we should get at a very healthily defined *system* through the Art. 91 (d) Classes for Teachers. It would be absolutely necessary, of course, that instructors sanctioned under the authority of the Department should teach those classes, and teach them upon a uniform system—such classes, I mean, as I saw at the High School, where we had a lot of the Glasgow teachers who were up there for physical training for themselves and for training in the methods of imparting it to their children. Of course these classes are under Government inspection, too; and the teachers of these classes would have to work upon the Government recognized system; but thus getting a system successfully introduced through the influence of the training of the teachers is a very different thing from starting at the other end and imposing upon all the schools a uniform system which perhaps five-sixths of the teachers would never understand or master. I hope I make myself clear. You are getting the influence of a permanent system through the Department's training of the teachers, instead of by imposing a Code upon the schools.

1854. Then you said something about the number of subjects taught. Did I put down the word right, when you called the curriculum over-loaded?—No, sir, I think that can hardly be right. I might almost say that it has been under-loaded, in one way—that there has been too little variety in it. The schools have been confined to too limited a range of certain specified standard subjects, and could not lift themselves beyond

that to treat the training and development of the child on broad lines.

1855. But is there time to teach any more? Is not the school day very fully taken up?—I do not think so, if the time is properly utilized. There is a lot of waste of time; for example, on such a subject as arithmetic. I am perfectly convinced of that.

1856. You would approve of some medical supervision of school premises, as well as of the children?—I think that that would be a very useful field as well.

1857. I will not go any further with the feeding question, because I think all the evidence we have heard has been the same way, you think that to give facilities for feeding the children is of very great importance, both for their physical training and for their mental training?—It is a most admirable effort of voluntary work, wherever it is done. I mean there is no doubt about the benefit to the children. As to how it is to be done, that is another question.

1858. *By Mr McCrae.*—In speaking of the rural districts, I think you said that the teachers there, without any special training, gave considerable attention to the matter of physical education?—Some teachers. That was in connection with the times even before the matter was specified in the Code.

1859. Apart from that very interesting illustration which you gave us, what form does that physical training take?—Ordinary free or dumb-bell exercises, as a rule; and I should think that, in those earlier days I was speaking of, it took more especially the form of what we used to have, as the old extension motions and company drill movements—very often due to the fact that the teacher had been a volunteer.

1860. Then what sort of exercises do they give to girls?—Oh, very much the same. I used to have a lot of the schools where the girls took the military drill with the boys, and did it capitally too. Of course, latterly, things have been more variegated and developed, as it were, under the lots of 'systems' that have been published.

1861. I suppose in very few cases will they have any appliances for physical exercises?—Oh, it is wonderful—dumb-bells, mock rifles, wands, and so on. I have seen very pretty things done in the way of scarf drill, or with flags, wreaths, etc. I do not attach much importance to these from the physical training side, but they add a little interest and picturesqueness to the thing. They do not do any harm physically. I think they make the children take more interest in the matter. Dumb-bells and bar-bells and rings are very common.

1862. And with regard to jumping, for instance, you have nothing of that kind, on horses?—Yes, of course; I have seen lots of schools where they do that.

1863. That would be more in the towns?—Not necessarily, at all. Jumping, I think, would make splendid exercise, if boys were set to it systematically; skipping for the girls.

1864. How are the Glasgow schools situated with regard to these higher appliances?—A great many of their gymnasia are systematically fitted up with all the appliances—vaulting horses, parallel bars, slanting ladders, swinging rings.

1865. And do the girls take part in those to the same extent really as the boys?—Yes, the system is applied all through.

1866. With regard to the time spent on physical drill, I think that Maryhill is really the school where they give most time to it in the senior classes?—That is the one as to which the return came to me first. I think their lines are very much the same as the Glasgow ones.

1867. In Class V. I find they give an hour on Tuesdays. Then in Class VI. they give an hour on Tuesdays and Fridays?—Yes.

1868. But you have no hesitation in saying that a great deal more time could be devoted to physical drill without detriment to the intellectual advancement of the pupil?—Taking it over all, I think so, decidedly.

1869. With regard to the continuation schools, have you any idea of the kind of drill they give there?—

Mr A. E. Scougal.

2 May '02.

Medical inspection of school premises useful.

Country districts: forms of physical training.

Gymnasia in Glasgow: girls and boys attend.

Time devoted to physical training should be increased.

Mr A. E.
Scougal.
2 May '02.

Much the same sort of thing, and more especially in connection with the Boys' Brigade classes—the military drill.

1870. But in the continuation schools, do they take advantage of the appliances which are used in the ordinary day schools?—As far as I know, a good many of them are held in the schools where these gymnasia are fitted up.

1871. And they get the advantage of the gymnasia?—They take advantage of them, yes.

1872. There was one remark you made: in Hawick and Galashiels, I think you said, there was often an interval of two years between the time the boys leave school and the time they begin business?—Yes; of necessity, because a smart boy could pass the old exemption examination at eleven, and he could not get into a factory for full-time work till thirteen.

1873. But in the large towns has your experience not been that they go direct from school to business, even at a very early age?—Only a few exceptional ones.

1874. Do you think there is really much of that in the towns, that there is an interval between the time a boy leaves school and the time he goes to business?—Oh, undoubtedly. I have made a lot of inquiry into that, and I am quite persuaded that there is no great hardship, as regards juvenile employment, in keeping the children in school till they are fourteen. I am quite clear about that. There are exceptional cases which might be dealt with after special investigation.

1875. As far as my experience in Edinburgh goes, there is hardly such a case as a boy having such an interval between leaving school and going into business?—You mean getting employment—getting employment, say, as a message boy? That certainly was not my experience in Leith, Hawick, and Galashiels; and not in Glasgow, on the testimony of the Roman Catholic managers, who deal with the lowest stratum of the population. An inquiry I made some years ago proved to me that that was *the* source of juvenile crime—outside of inherited criminality—the mere casual employment of children.

1876. Then with regard to the code for physical drill, you said that you thought the better course would be for each school to submit a scheme to the Department?—Yes.

1877. Well, do you not think that if this be done on medical evidence, that the better course would be, as has been suggested, that there should be a code, with, perhaps, power to make exceptions from that code, it would be drawn up very carefully, and having skilled medical advice in drawing up the various forms of exercise, do you not think that that would be much better than each school submitting a scheme of its own?—If I might make a technical distinction, which Sir Henry Craik will appreciate, it would be that I would rather see the thing done by a circular than by a compulsory code—an advising circular that would indicate what the Department thought were the lines to go upon.

1878. Then with regard to games, you said that in Leith they had school football games, and I know they have in Edinburgh. How does that obtain in your present district?—I don't think there is any organized arrangement of that sort. I believe they do play matches amongst themselves, you know; and it is a very large area, Glasgow, of course.

1879. Do you attribute that perhaps to the want of ground to play the game?—I should think that had a good deal to do with it. I don't know whether the Glasgow football grounds would be available; it is too big a place and these are too much run upon. It would be much better for the Board to have a place of its own.

1880. Do you know what facilities the Corporation give for games in the public parks?—I could not say without investigation.

1881. *By Professor Ogston.*—My inquiries refer very much to the working out of physical training in the schools, as you expressed it, under a wisely drawn up scheme, sufficiently elastic, and capable of being

rapidly and frequently, perhaps, adapted by the teachers, under the guidance of an expert. Do you think there are any possible difficulties in the carrying out of such instruction in every school?—No—more or less. It is bound to vary somewhat in quality, in finish, with the teacher; but I should expect the whole thing, under a well organised system, to improve generally, as the teachers as a body acquired more knowledge and more practice in the work. You cannot eliminate the variation in the individual teacher, under any regulated system whatever.

1882. I suppose that the schools that are in your eye vary very much in quality as far as they are adaptable to the introduction of physical training. You have some knowledge it is already introduced into some so favourably situated, that little further could be done—but you must have some others in your district of the opposite?—Yes; there are schools where it is not carried very far—where it is done in that perfunctory and casual manner that I was speaking of. It is done because it has to be done, and not because they believe in it themselves.

1883. Yes; but I rather refer to the condition and the situation of the school itself. You have some, I suppose, very remote, poor, and unsuitable districts?—I don't quite catch what you mean.

1884. Well, what is the poorest school that you have? Have you any fishing villages in any poor little islands?—Yes; but I have schools there that do perhaps in some ways the best work in that direction. It all depends upon the teacher.

1885. What is the most remote school that is under your inspection?—The most remote school is one that is away in the very west of Mull.

1886. Could you tell us a little about it? It would be an instance of what, to my mind, would be the worst school—the least adapted for physical training?—No; it is a school where they really do wonders in that way. It is rather a favourable specimen. The teacher takes an interest, and he has got the children to take interest, in it. I remember seeing the girls there dance the Highland reel in the playground to music furnished by one of the children, and I thought that was a capital and sensible development of physical exercise.

1887. You have, I suppose, some of the buildings less adapted?—Yes; there is no doubt about that. That would occur more frequently in the crowded town districts than in the country.

1888. And I suppose the rainfall in the district—the bad weather—is about as bad as it is anywhere in the British Islands?—Oh, yes; in certain districts—in Mull and Arran, for example—it must be very heavy.

1889. But still, on the whole, not so bad as to forbid a reasonable outside adaptation of the physical training?—Oh, no; at this season. Just now, for example, I have just been in Arran, and we had two or three cases where we had the drill out of doors, most comfortably, and with benefit to the children.

1890. And the playgrounds in these places are also relatively fairly adapted?—They are, quite, as far as size is concerned, when they are too often in an unsatisfactory condition.

1891. They do not absolutely veto the instruction being given in them?—I should say not, certainly; but the playgrounds are not used, as a rule, for that purpose. In some of these country schools they are too apt to do this physical exercise work inside the schools, just because it is a school business. I am getting them educated to take it out of doors as much as they can.

1892. Some of these smaller schools, I suppose, would be exclusively taught by male teachers?—Yes, the small ones.

1893. And some of them exclusively taught by female teachers?—A few also. This is a smaller type still—usually.

1894. Could you tell us the proportion of schools taught by both male and female teachers, those taught by male teachers alone, and those largely by female teachers? Could you give us any indication of the proportion?

1895. *By the Chairman.*—I think, if he cannot

Town children: casual employment of children after leaving school and before going into business.

System of physical training by advising circular rather than by rigid code.

Games.

Mr A. E. Scougal. 2 May '02. School mises: not ad for phy trainin princip towns.

answer that, he might find it out and let us know. If you would not mind doing that?—I should need to have the area defined.

1897.—Oh, in your own district?—My own personal district?

1898. *By Sir Henry Craik.*—I think that could be got from the Department more readily.

1899. *By Professor Ogston.*—Then your teachers, when they are being trained, I suppose are subjected to a medical examination before they enter as pupils for a normal or training school?—Yes.

1900. They are medically reported on?—Yes, they must have a medical certificate.

1901. And do you know what would exclude them from the profession of teaching, in the way of health or defect; do you insist upon them being perfect individuals?—If we look at the Code, practically what is mentioned in connection with the admission of pupil teachers, I should think, would apply. It is in schedule I of the Code, the health certificate required for pupil-teachers:—‘Scrofula, fits, asthma, deafness, great imperfections of the sight or voice, the loss of an eye or from constitutional disease, or the loss of an arm or leg, or the permanent disability of either arm or leg, curvature of the spine, hereditary tendency to insanity, or any constitutional infirmity of a disabling nature, or is a positive disqualification in candidates for the office of pupil-teacher.’

1902. And the teachers also are examined medically, certified as bodily fit?—I believe they have now to send up a doctor's certificate in connection with the Superannuation Scheme.

1903. *By Sir Henry Craik.*—It may be more easy for myself to explain that scheme. Since the Superannuation Scheme was passed which imposes the burden of a pension upon the teachers, we are more strict in these matters that weakness or a bad life might be rejected, just as an insurance office, by the medical officer. The strength of muscle and measurement and all that is not taken. We examine them much as a medical officer of an insurance company would examine them.

1904. *By Professor Ogston.*—Do you know is there in your district any instance of physical unfitness amongst the teachers, male or female?—No; I do not recollect any.

1905. No such thing as a cripple or a club foot?—Oh, yes, I have seen that; but the teacher is quite a competent teacher notwithstanding.

1906. You know some instances at the present moment of cripples or maimed?—Yes; I came across a teacher under the Glasgow School Board just the other day—an old man who has not the use of his right arm at all. Of course he is a sort of survival from the earlier days before this medical examination was so strict.

1907. *By Sir Henry Craik.*—Such a teacher would not be accepted now?—No.

1908. *By Professor Ogston.*—Such a teacher would not be accepted now; I should like that to be put down in the evidence, as that is important?—No.

1909. Well, now, regarding the average teacher with whom you have to deal. Do you think that, say, a lady, is physically able to pick up and practice so as to teach the exercises that would be required for the children under her care?—Undoubtedly; the ladies have been the best teachers of the physical drill in my experience.

1910. And you, knowing the burden of a teacher's life, think it would not be unfair to load those ladies, perhaps already bodily fairly well occupied or strained, with the picking up of physical drill which would be applied to supple little children?—Not a bit; they enjoy it themselves, and they find the benefit of it themselves.

1911. So that I take it all your teachers could reasonably be expected to qualify themselves?—Quite; I do not think there is any difficulty about it.

1912. And that statement would also apply to the male teachers?—Oh, yes.

1913. Even all those who are no longer quite

young?—Well, yes; I think you would not get many cases where these had not, perhaps, some juniors—I am referring more to the big towns—who, under their direction, could manage the thing.

1914. *By Sir Henry Craik.*—You understand the Superannuation Act requires a teacher to retire at sixty-five; he cannot go on longer.

1915. *By Professor Ogston.*—Do you find many instances of failing health amongst your teachers, requiring special holidays, a special grant of leave, and the like?—No; they are a wonderfully healthy class. In a large town like Glasgow, where the staff is so very big, there always will be one or two off in a casual way from illness, but serious breakdown from ill-health is a very exceptional thing.

1916. And I suppose that in the case of threatened breakdown of health you deal sympathetically or liberally with leave allowance?—Of course that is a matter in the hands of the managers.

1917. Of the managers?—The School Board or other managers; it is entirely with them.

1918. But they are fairly well dealt with?—Oh, yes.

1919. My last question is this: would you extend the medical inspection, that I think you approved of, for children and buildings, to the teachers also? Would you have the teachers medically inspected?—It did not occur to me. I do not quite see why you should inspect a responsible individual, an adult, who can look after himself or herself.

1920. You think it unnecessary?—I do not think it necessary.

1921. *By the Chairman.*—I understand your questions as regards leave to teachers and that refers to their state of health?

1922. *By Professor Ogston.*—Yes.

1923. *By the Chairman.*—From their state of health point of view?

1924. *By Professor Ogston.*—Yes, exactly.

1925. *By the Chairman.*—I mean, your object in bringing that out was to show whether what they were doing, excluding these physical exercises, affected their state of health.

1926. *By Professor Ogston.*—Precisely; whether it would be a reasonable burden to put upon them from a hygienic point of view, that they should acquire and teach these exercises. It has never yet been brought out, and I wished this witness particularly to bring it out.

1927. *By the Chairman.*—Quite right; I think that is quite within our remit. (To witness) You have a very large district in point of population, have you not?—Very large.

1928. Is it so large that you hardly feel that you are able to answer thoroughly for the whole of it?—I am getting more able to than I was.

1929. You have been two years?—Nearly three now.

1930. Nearly three years?—Two and a half years fully.

1931. Well, I should like you to name, to start with, the principal towns—irrespective of Glasgow, about which we have heard a great deal—the principal towns in your district?—As my district stands at present, I do not have a town almost at all.

1932. You do not have a town?—No; I have the whole city of Glasgow; and then I have the three islands of Mull and Arran and Bute, and, of course, in them there is really no large town at all. Rothesay is by far the largest town outside of Glasgow. There is the little town of Tobermory in Mull, and there is no town at all in Arran.

1933. But is that the extent of your district? I understood you to say that you went down to Dumfriesshire?—That is my Division as Chief Inspector.

1934. Very well. I want to ask you whether you have any experience of that division, or whether it has been too large for you yet to overtake it?—Unless in very exceptional cases I have never been actually working outside my own personal district. I am responsible for the inspection of a district as a district inspector, in addition to my diocese.

Medical inspection of teachers unnecessary.

District and division of witness: responsibility.

Mr A. E.
Scougal.
2 May '02.

1935. I wish you could tell the Commission as to how far your responsibility goes in the rest of that rather enormous district. I really want to know how you come to be in any way responsible. What you say is that you work your own district, or a district in Glasgow, and these islands; but how far are you in any way responsible to your superior authority for the rest of the district that you told us you were entrusted with?—I think that is almost a matter that Sir Henry Craik could explain even better than myself.

1936. Oh no, but I want to ask you?—I am responsible for doing all that I can.

1937. I think it very important for the Commission to know exactly how far you are really responsible for that large district?—I am responsible in the way of what you might call conference with my district colleagues, who are just as independent in their own districts as I am.

1938. But I understood you to say at the beginning of your evidence that you were really in charge, did I not—in supreme charge?—You asked me as to what my 'division' was.

1939. I do not know whether it is division or district. I tell you I come before you quite ignorant. I want information?—Well, I am what is called the Chief Inspector of a division, which gives me a certain official superiority over all the inspectors who have districts in that division.

1940. Exactly?—Of whom I am one, having a district of my own as well.

1941. But it does not entail your presence personally in the rest of the district, except that part which is under your immediate control?—Not of necessity. I am there—

1942. As a referee?—As an officer for reference from the Department about any special matter.

1943. *By Sir Henry Craik.*—Does the Department ask you, when you feel able to do so, occasionally to accompany the other inspectors in some of their visits, just to see whether their methods had your approval?—I have only been able to do that in one case.

1944. *By the Chairman.*—You must not think me too intrusive, but I would ask you what part of your district other than your immediate district you have been to?—I have been in Ayrshire with Mr Lobban—officially that is, since I came into this division. I have also inspected, along with my colleague Mr Barrie, in former years in Wigtownshire and Kirkcudbrightshire; and I have officially, in connection with the higher class examinations, been in Mr Boyd's district in Renfrewshire.

1945. But not in Dumfriesshire?—Yes, I have been with Mr Barrie in schools in Dumfriesshire too, but not in an official capacity.

1946. *By Sir Henry Craik.*—But in case of special difficulty, we might send you there specially?—Yes.

1947. *By the Chairman.*—I understand. I did not understand that before. I am bound to say I am glad to have got it.—I might put it that each Inspector in his own division is practically independent as far as the conduct of the work goes, and is directly responsible to the Department, not to me.

1948. Then you do not even travel so far as Paisley?—I have been there for that higher class inspection; it is not in my regular beat. In the course of my work I think I have inspected officially in nearly every county in Scotland now.

1949. Sufficiently to be able to tell us. What I want rather to get at is in this division, which you call it, which is under you, is there anything unusual in any of the subsidiary towns, such as would not be found in Glasgow?—No, I do not think so.

1950. Taking it generally, all those little towns all the way down your division, beginning up at Dumbarton, down Paisley and Ayr, and down towards the Solway by Newton-Stewart, and Castle-Douglas, Dumfries, and Annan, and all the way along—there is nothing special, you think, other than what would be found in a large town?—Except that so far as the physical training matter is concerned they are

very favourably situated. There is more fresh air about them, and not the same congestion of population.

1951. Not the same amount of smoke?—No.

1952. Except Paisley, perhaps?—Well, Paisley is a good deal better than the Gallowgate of Glasgow.

1953. And Greenock—what about Greenock?—Well, Greenock is pretty much like Paisley, perhaps a shade worse, I should say, in the general quality of its atmosphere.

1954. Now then, just one or two questions—I will not keep you long. You were talking about the curriculum, and you rather gave us to understand that you considered a strict curriculum on the whole was rather a mistake?—I do, positively.

1955. That is to say a lazy teacher might avail himself of the liberty given him to do as he pleases?—It is one of our special functions as inspectors now, to watch that the liberty is not abused.

1956. You agree with me, do you not, that that is the fault of not having a distinct curriculum?—That is the danger certainly.

1957. The danger?—Yes.

1958. Do you know this, that there is an idea that owing to the latter-day Codes the extra smart boy or girl has been somewhat damped or thrown back or kept back?—Oh, there is no doubt of that.

1959. I mean the 'lad wi' pairts' that we used to hear about does not come to the front now so much nowadays as used to be the case; you have heard of that?—Yes. I think it has been overstated.

1960. You do not think that a common curriculum carried on at the same time to a common result in physical as well as mental matters would have the effect of reducing all to too common a level without any superior plant of excellence appearing?—It has that tendency.

1961. That is the objection?—Yes.

1962. I can only go here into physical matters. You would say that you do not want any super-excellence in physical training?—No.

1963. So long as all have a certain measure of the training that is necessary to make them better physically than they were before?—That is my feeling distinctly. The element is the training. It is not a matter of accomplishment that you can gauge with respect to an individual's attainment in it.

1964. Exactly?—You do not want the children to be going out as professional gymnasts.

1965. That is the point of difference between physical excellence and mental excellence?—Yes.

1966. You do not want superior excellence in physical matters, whereas some people rather hunger after it in mental matters?—Yes; you must have that chance given to superiority of mental excellence. I do not see the same need for that in physical.

1967. Well, now, we have had put before us that there would be some value, particularly in children after school age, in being accustomed to handle rifles and being able to shoot with Morris tubes in default of other things. Do you think that would be of any value. You have perhaps hardly considered it up to that point?—I have only been looking at the thing from an educational point of view, and I do not see any particular value in that *educationally*.

1968. Not as valuable as swimming?—No, certainly not; oh, no.

1969. At the same time, you don't see any objection from the point of view of any boy being able to handle a gun, do you?—On the contrary, I should go the length of making it as nearly as possible compulsory; but not from the educational point of view.

1970. But from what point of view then?—Say, from the national point of view.

1971. But, then, is not that education; is not physical education national education? I do not want you to be narrow. I want you to be on a broad plan, because the essence of this inquiry is physical training becoming a necessary part of education. Will you stretch yourself out sufficiently to that?—I should say that military training is not necessarily an outcome

Mr A.
Scougal.

or part of physical training. Physical training does not of necessity lead to military drill.

1972. The ability to handle a gun, do you call that military training?—Oh, I think so.

1973. But you don't call it part of general education?—No.

1974. And you could not include it in a part of general education?—I would not be inclined to call it so from an educational point of view.

1975. Not what we call advanced education, that is to say, after the age of fourteen?—No, not unless you are going to postulate, say, the German principle, that the State is entitled to compel every man to be a soldier and bear arms.

1976. Do you think you cannot bear arms without being a soldier, having regard to the Volunteer principle which has been so prevalent in this country?—Why should you want to bear arms, if you are not going to use these arms for some special purpose?

1977. Do you differentiate between the soldier and the volunteer?—Yes.

1978. Do you think the volunteer is not a soldier. I do not want to take you too far?—No, I think the volunteer is the material for making a first-rate soldier, but he is not a soldier. He is a citizen who has voluntarily qualified himself.

1979. And has specially qualified himself to carry arms?—Yes.

1980. Which you think to be a good thing?—I think a very good thing.

1981. I put it to you again as a further education. Do you not think it might be a part of every boy's education to so far qualify himself in a citizen capacity, not as a soldier as you put it, to bear arms and to be able to use them?—Taking it from the citizen's point of view—the duty of the citizen—I go with you entirely, but I am not prepared to say it is a necessary part of education in the school.

1982. But you see no objection to that?—None whatever, if you get the people with you.

1983. You are naturally well educated and well to the front in every way, but do you not think there would be considerable objections from other portions of the community?—I do not think I should anticipate any very serious objection after the first struggle, if the matter were put plainly.

1984. If there was any objection at all, from what type or from what class should you expect it to spring—from the ordinary parent?—Not the ordinary parent, perhaps as a class.

1985. The extraordinary parent?—This is getting a little on the political verge—but I was thinking of the sort of ultra-radical Hawick or Galashiels weaver, for example, who would take objection to being compelled to make his child a soldier, or even an imitation soldier. Now, I think that man would be best taken by its being simply stated that it is the duty, in the opinion of the nation and of the legislature, that every fellow who is physically fit should qualify himself more or less to bear arms and to drill along with his fellow-men. I should like to see them forced to go into the Volunteers or else go through a course of training otherwise.

1986. Have you any acquaintance, so far as you have been concerned, with the prevalence of inferior eyesight in children?—I have.

1987. I should rather like to ask you on that point. Do you consider it is increasing in your knowledge, or do you think that it always was there, and we did not give them spectacles before?—Yes; I should think that is probably as much the line in which the evidence would go as any other—more attention has been paid to the children. I may mention that I made some investigations, and called special attention to this matter in my general report last year in connection with the Glasgow schools.

1988. Would you mind summarising, very shortly indeed, what you said in your report?—It turned up in connection with the lighting and internal arrangements of classrooms in some of these large Glasgow schools situated in very dull, dingy, dirty localities; and I found that the ordinary rules

and the proper methods of seating were entirely neglected. I found children, for example, sitting in a dark gallery here (indicating), with the only light coming from there (indicating), and the gallery blocking up about one-third of the window, and the children sitting with their backs to the light and set to do drawing and writing exercises, working in their own shadows, and with a very poor light at that. This led me to make some inquiries, more especially through one of my colleagues, Mr Andrew, in Govan, where I knew that the Board had taken the matter up. He sent me a copy of the report of a lady doctor, Miss Gilchrist, who had been investigating the matter for the Govan School Board, and her statistics were rather startling. She found, I think, that over forty per cent. of the children were more or less defective in vision, and a very considerable number, too, to a serious extent, and pleaded very strongly for the medical inspection of them, and for the use of glasses in good time with them, as relieving them from much strain and worry in their bookwork.

1989. And that rather bears out your previous recommendation, does it not, that a medical inspection periodically of schools is almost all-important?—And it would be, I think, very valuable indeed. Periodical medical inspection very valuable.

1990. And it does not exist?—No.

1991. In any sort of way?—Not officially, as far as I know.

1992. May I put it to you, as far as you are able to answer, would it not be quite feasible for the present local authorities of health in all districts and counties to order their medical officer to inspect all the schools—there is a medical officer to every district committee?—I should say that, probably, in country districts there would not be a great deal of difficulty, but I should rather fear that the amount of work in large congested areas would involve the necessity, perhaps, of some addition to the staff. But I really could not speak definitely on that.

1993. But it is quite within the power of any district committee, as the local authority in Scotland for public health, to order their medical officer to inspect anybody or anything, is it not?—I could not say what the powers are exactly. It is not a matter I have looked into, so I could not say what powers they have.

1994. *By Mr Shaw Stewart.*—We heard from an expert witness this, that it was important for physical training in schools that children should be graded according to their physical strength, and not according to their mental attainment?—Quite so. Children should be specially graded.

1995. Now, do you think that would be at all practicable?—Oh, perfectly; that is very much what we are trying to carry out in connection with different subjects of instruction. I maintain that they ought to be graded in different classes for different subjects.

1996. *By Sir Henry Craik.*—One of the new points in the new Code is that we permit the grading of the scholars according to their proficiency in each separate subject?—It is even stronger than that; that plan is recommended distinctly. Code, Art. 19: grading recommended in each separate subject.

1997. We do not classify them in standards now; by our Code we have absolutely abolished the very name?—Perhaps I might read the clause—it is at page 5 of the Scotch Code, the last sentence of the third paragraph of Article 19, at the top of the page:—'The arrangement of work within each division and the classification of the children need not correspond to the sub-divisions of the Standards of Examination (Schedule V.), but they shall be such as are fitted to secure the attainment of the Merit Certificate stage by easy gradations.' And then comes the point:—'The classification should be such as to afford due opportunity for promotion, and promotion in one subject, e.g. Reading, should not be made dependent on proficiency in another, e.g. Arithmetic.' That is to say, it is recommended that the classification for the two subjects, reading and arithmetic, be entirely different. A child may be in the fourth class for reading and only in

Mr A. E.

Scougal.

2 May '02.

Mr A. E.
Scougal.

2 May '02.

the second for arithmetic, if that is all his capacity. And, of course, the physical drill would be taken very much at one given time. There is no difficulty in the teacher's arranging so that the squads in physical drill should be squads at a level of physique and advancement in the work.

1997a. *By Mr Shaw Stewart.*—It would throw a little more work on the teacher, but you do not think there would be any difficulty in carrying the provision out in the sense you speak of?—No; I would consider it a proper part of the headmaster's duty.

1998. In fact it would be insisted upon?—Yes.

1999. *By Sir Henry Craik.*—Just as it would be insisted upon in any other part of the instruction. If we found that scholars were put into a class that was unsuitable for them in arithmetic because they were up to a certain class in English or in any other subject; we would consider that school ill-taught and ill-organized, and reduce the grant.

2000. *By Mr Shaw Stewart.*—I am very glad to hear it is so feasible.

Medical
examination:
further defects
might be
revealed.
Code, Art. 20.

2001. *By Mr Alston.*—Would you push the medical question a little further? It is believed that the eyesight is defective to a much greater extent than people imagine; is it not possible that further medical examination of the school would bring out other defects of which the teachers know nothing?—I quite think so.

2002. For instance, cripples are known at sight; they can be arranged for; but is it not the case that there is a large class almost on the border line of imbecility?—Yes; we now have special provision for them, those called 'defectives' and 'epileptics.'

2003. *By Sir Henry Craik.*—That has been made in the Code for this year.

2004. *By Mr Alston.*—It is now receiving attention, I understand?—From the Glasgow School Board I got word of three special centres where classes for these children are held and organized. Of course they are all medically examined; there has to be a medical certificate in connection with them. They are not imbecile; they are mentally weak and defective, for some reason or another—not fit to progress with the normal child.

2005. Then is that medical examination a regular examination authorized by the authorities?—Oh, yes, required by the Department.

2006. *By Sir Henry Craik.*—This is a new article introduced into the Code this year. You will find it at page 11, Article 20.

2007. *By Mr Alston.*—The remark was made more than once that medical inspection would be very desirable in the schools, implying that there was none. Does that refer to the general state of health of the

child, or to the insanitary condition of the classrooms, because here we have a sufficient medical examination as to this mental defect at any rate?—Well, both I had in my eye, and also the very thing you mentioned—that is to say, defects that an ordinary teacher, any ordinary unskilled person, might not notice—defective eyesight, defective hearing.

2008. Would it not be of advantage that there should be an official medical examination in order to bring out all these facts in all the schools, first as to the sanitary condition of the school, the position of classes in relation to light, upon which you remarked, the atmosphere in the classrooms, as to the children who have defective eyesight, defective hearing, who are defective in the mental sense, and so on, so that there should be no School Board which was not thoroughly posted up in the condition of the children under its charge?—I should like to see it certainly; of course it is a matter for Departmental administration.

2009. *By Sir Thomas Coats.*—There is just one question I would like to ask with reference to some questions put to you by Mr McCrae. You said, I think, that in the case of boys, after leaving the school there were two years during which they were not regularly employed; do you refer to the present time, or to the time when boys, after passing these standards, could get exemption?—To that time, specially.

2010. To that time, not to now, when they are fourteen years of age?—We now keep them in school till they are fourteen.

2011. They can begin work at once?—They ought to be fit for it, if they could get it.

2012. It would not apply now—to the conditions now prevailing?—No.

2013. *By Mr Shaw Stewart.*—You are in favour of the physical inspector working with the school inspector at school inspections?—Yes, presuming we had a specialist inspector appointed.

2014. Do you think that the physical training inspector should report direct to the Board, or should the representation come through the school inspector?—Presuming that he is an official, the normal plan would be for him to report to the Department.

2015. Direct?—And let the Department deal with the report as they thought fit. That is the sort of arrangement with regard to cookery.

2016. *By Sir Henry Craik.*—Nobody reports to the Board; they all report to the Department.

2017. *By Mr Shaw Stewart.*—I should have said the Department. The point I wish to get at is whether his report should be quite independent of the school inspector?—Oh yes, I think so.

The witness withdrew.

Captain G. A. ARMYTAGE, examined.

Captain G. A.
Armytage.

2018. *By the Chairman.*—You are the Superintendent of Gymnasia in the Scottish District?—I am.

2019. And have been so for how long?—Since November 1899.

2020. Now perhaps, before you begin to say anything for the information of the Commission generally, you would give us a short description of what your duties and powers are as Superintendent of Gymnasia in the Scottish District?—As regards military work?

2021. Well, as regards work in any way applying to you. Do you come before us in connection with schools, or do you come before us in connection with military gymnasia only?—Well, I believe I come before you as both.

2022. If you have got anything to do with schools let us know about it?—As far as the teachers' classes go?

Duties and
powers.

2023. If you please?—As far as the military gymnasia go, I have practically charge of the whole of the gymnasia in Scotland. I have my big gymnasium in Glasgow, and I have to inspect every dépôt in Scotland that is under the War Office; and as regards

schools, I have been inspecting the Teachers' Classes under Article 91 (d) of the Code.

2024. Where?—At Cupar-Fife for two years, and this year at Hamilton, Falkirk, Dumfries, and Glasgow High School. Hamilton is of course the only one completed this year; the other three are going on now.

2025. And the result of such inspection at these educational establishments is reported by you to whom?—To the Secretary of the Scotch Education Department.

2026. As well as to any military authority?—No, sir; as far as military authority goes, I have simply got the consent of the General Officer Commanding to help the Scotch Education Department as much as I can.

2027. You do not have to make any similar report to the General Officer Commanding in Scotland?—No, sir, not as regards schools.

2028. Well, then, with that preface, would you mind going through what you have to tell us, and then, after you have made a certain statement, anyone will ask you

Mr A.
Scougal.

2 May

Captain
Armytage.

Teachers
classes
Art. 91
Report
Secret
Scotch
Education
Department.

7. A. questions that may suggest themselves?—As regards the opportunities for teachers learning, there are the classes which are under Article 91 (d) of the Code. These have been carried out under various instructors, whose names, I believe, have been submitted to the Secretary of the Scotch Education Department by the different School Boards, and they have been taken sometimes from non-commissioned officers at depôts, gymnastic instructors, sometimes from retired non-commissioned officers, and some of them have been taught by Colonel Cruden, of Aberdeen, and Mr Sturrock, of Dundee. I have seen both Colonel Cruden's work and Mr Sturrock's work. Mr Sturrock's work I saw at Cupar-Fife, and Mr Cruden's work I have seen at Hamilton. In both cases I found that the work was not what you could call smart. Looking at it from a gymnastic point of view, and rather putting it in general terms, it was certainly not up to the quality of the work done at Aldershot. On the occasion of my first inspection at Cupar-Fife, I had not had the syllabus of the course at all, so I had to learn what had been taught by seeing the thing worked. I asked Mr Sturrock to put the Board School teachers in Fife and district through as a class, and he put them through under an instructor, who, I believe, was a corporal of the Volunteers. I saw him put them through about three movements. I called out Mr Sturrock at once. I said, 'Do you realise that the instructor has already made several mistakes, and has not checked the teachers in the least? You must understand that this class has been a class for teachers, and these teachers have got to instruct children afterwards. If they are not instructed properly themselves, they cannot be expected to know how to instruct.' That was the main point of the thing. Then I also discovered that they had only been taught a very limited amount of the course—in fact, I believe Mr Sturrock was under the impression that he was going to examine the class until I appeared, and I found that the work had not been thoroughly done. They certainly knew what they had been taught, but it was too limited. I cannot remember what the size of the class was—I should say from thirty to forty. The next year it was better at Cupar-Fife. Then, as regards Colonel Cruden's course at Hamilton, there the whole syllabus was sent to me, and I again wanted to see the class work as a class. There was the same sort of number in the class, just about thirty there too. I found there that they had not been taught enough as regards teaching. They had done the whole work as a class, but they had not been taught enough as regards teaching. They could only teach about six movements, whereas they ought to have been able to teach the whole lot, but the time was too short. Twenty attendances are not enough. Twenty attendances, of an hour each, are not enough to expect a teacher to learn the work in. These attendances were done one day a week, at a certain time, that day probably Saturday. That was the case at Hamilton, I think. It is not always a Saturday, but I know in most cases it is Saturday. I believe they were all teachers or pupil-teachers. I think I am right in saying that the Cupar-Fife course was a continuous course of a fortnight. It was not like the ones in the big centres like Hamilton this year. Colonel Cruden had the course there, and that was a course of which I was saying that again the teachers had not been taught to instruct. The other classes are in progress now, and I have inspected them owing to the Hamilton case. I started them on that course, and I think they are going as they should do. I mean, I pointed out what mistakes might be made. About military gymnasia. Do you wish to know what we do there? Our system there is gradually training the recruit after he joins. The regular military course is for any man over eighteen, you may say—it is supposed to be. We take drummers and buglers, and we give them exactly the same course, only slightly modified. If the instructor is any good, he has got the sense to modify the course according to the pupil. A drummer can enlist at fourteen. They get three months of an hour a day

in the gymnasium in the depôt. That is nearly all exercise, without apparatus, with the exception of horizontal bar, and parallel bars and dumb-bells. If they are not up to the standard then, they are reported on by the commanding officer and the medical officer, and a Board is held on them, and it is decided whether they shall stop longer at the depôt, and go through a longer course. Then, besides that, they do three hours' drill outside. They practically have four hours' drill in the day, counting gymnastics. If they are reported on as fit at the end of three months, they go to the battalion, or provisional battalion, whatever the case may be, where they go through a further two and a half months' course of gymnastics of an hour a day; five hours a week. If they are not considered fit then, another Board is held on them, and the question is whether it is desirable for them to be kept in the service or not. This work is done with the following apparatus—the horizontal bars, the parallel bars, and dumb-bells. These are of four pounds weight. We consider it good progress if a man, after a month's service, can pull up to the breast twice with hands reversed without assistance, and if he can press up on the parallel bars four times. That it should increase at the end of three months to ten pulls and fourteen presses. That is, following on the Aldershot course. As superintendents, we are brought up at Aldershot. We go through our six months' course there, and then we have to go down and carry on the same course in the districts.

Captain G. A
Armyleage.
2 May '02.

Apparatus
used.

2029. *By Sir Henry Craik.*—The services that you have given to the Education Department date only from about eighteen months off, now?—Yes; the first inspection I made was at Cupar-Fife, when you asked General Chapman if he could send an officer in. That was before it was really recognized by the Education Department.

2030. So far, it has been confined to the examination of Classes for Teachers under Article 91 (d)?—Yes, sir.

Teachers'
classes:
inspection
necessary.

2031. And there you found that inspection was considerably required?—Yes, sir.

2032. Previously to this, these classes for instruction had been carried on under the auspices of Colonel Cruden and Mr Sturrock, and certificates had been granted by them?—Yes, sir; I believe it is the case.

2033. There was some surprise when it was announced that the certificates were to be granted by the Department upon a report from you?—Yes.

Granting of
certificates.

2034. Did your experience lead you to think that some outside official authority in the granting of these certificates was urgently required?—Certainly.

2035. And, of course, now it will be enforced?—At all these, yes.

2036. Were there men and women together in these classes?—Yes, sir.

2037. Then that would to a certain extent limit the character of the training, I should think?—To a certain extent, but there is very little in the training that a woman cannot do as well as a man. There are only two or three exercises that have to be cut out.

2038. Was the defect in these teachers' classes that they have not learned enough themselves, or that they have not learned to teach these things?—I think they have not learned to teach enough. I think they knew the work, but they did not know how to impart it.

Teachers'
classes:
defects.

2039. Do you think that out of these classes of regular teachers, properly instructed, and carefully examined before the issue of the certificates, you would get a better class of teachers than from military experts?—I do not say better; no.

Instruction in
ordinary
schools should
be given by
ordinary
teachers
properly
trained.

2040. I mean, would you prefer that teaching in our ordinary schools was left to the classes whom you saw under instruction, if that instruction were well given, or would you rather that it was handed over to experts brought in from the outside for a certain time each day?—Well, I think every teacher in a school ought to be capable of taking their own classes in the physical training that is necessary.

2041. So that if classes like those under Article

Captain G. A. Armytage.
2 May '02.

91 (d) were thoroughly well taught, well inspected, and the certificates only granted after careful examination; you think that from them you might get the best class of teachers?—Certainly.

2042. You have consented, I think, at the request of the Department, to take part in the examination of the Training Colleges?—Yes.

2043. Where the students who are preparing for the professional career will be under instruction?—Yes, sir.

2044. You will be associated there with the Inspector of Training Colleges?—Yes.

2045. You have not yet seen any of the work actually in the elementary schools?—With one exception.

2046. Where was that?—At Alloway.

2047. Then you did not visit officially?—No, not officially.

2048. But you found that very good?—Yes, sir.

2049. Have you seen it in any of the secondary schools?—No; I have seen no secondary school work.

2050. You have not seen any of the cadet corps in connection with any of the schools?—Not in connection with the schools; at least, I could not identify them with the schools.

2051. Do you think it would be possible for yourself or any expert with the same sort of experience, by occasional visits and by communication with the inspector, to ensure the excellence of the teaching throughout the schools?—I think that it would want more than an occasional visit from one man.

2052. If you yourself or some expert grant the certificate to the teacher, if you were there when the work is carried on by a teacher who has earned such a certificate, and if when you happen to visit you find that the work is creditably done, do you think that a very occasional visit would be sufficient from the expert?—It should be, if the teacher is properly taught to start with; of course it should be.

2053. And if the expert found defects he might call the attention of the ordinary inspecting officers, and ask them in their ordinary visit to keep their eye on such and such a school?—Yes.

2054. You do not propose that there should be a military expert paying as frequent visits to the school as our ordinary school inspectors do?—I certainly think there ought to be, I will not say a military expert, but I say an expert, whoever he may be.

2055. An occasional visit and conference with the inspector, and the ensuring thoroughness of teaching by having certificated teachers, would not, to your mind, be sufficient?—It would take a very long time to get that. Certainly, to start with you would want more inspection, until you were thoroughly satisfied that it would work.

2056. Well, that leads directly to another question. Would you have a uniform system or would you have each man to devise his own system?—I should certainly feel inclined to say a uniform system. Because teachers go from one school to another, I believe, and if you got teachers going from one school to another and found they have to teach another system it will upset them; but I would say this, that every teacher ought to know one system, and if different schools liked to vary their exercises to a modified extent, to suit local circumstances which may have some effect; I do not see any harm in it, but I think every teacher ought to be taught the one system, a good thorough system—I will not say which is the best.

2057. *By the Hon. Thomas Cochrane.*—Why not say which is the best?—I mean that is a matter to be found out, I think. I think it is a thing that still demands a certain amount of investigation.

2058. *By Sir Henry Craik.*—But a uniform system, if it prevailed, and if we were satisfied that a teacher who earned his certificate was qualified to teach that system, would render less inspection necessary, and would render the inspection more simple when it did take place?—Certainly, if there was a uniform system.

2059. Of course, if there is to be an infinite variety

of systems, then you must have an expert to give a judgment on each occasion that the school is visited?—He has practically got to learn what is going to be taught before he can inspect.

2060. And he must pronounce whether the system is efficacious or not?—Yes.

2061. Whereas if you have a uniform system any man would understand whether that system was being properly carried out, and the fact that it was properly carried out would attest the efficiency of the teaching?—Yes.

2062. You have not been able to see as yet anything of the scholars in our schools. Probably your experience is not long enough to enable you to compare the physique of the recruits in Scotland, but from general knowledge do you know if it is improving or falling off?—As far as the physique of the scholars, it is going on.

2063. The recruits, I suppose, are all that come under your observation?—At present, yes.

2064. Is it better or worse than it was?—You mean when the man actually enlists?

2065. Yes?—Well, I cannot say. Of course, these last two years have been a very bad time to judge that; I mean to say we are getting infantry recruits at present at a shilling a day, and the best men are going to the Yeomanry at five shillings a day.

2066. But where do you find the defect? Is it in racial or constitutional matters, or in defective training; is it the want of any training whatever beforehand?—I think it is the want of feeding to a great extent that they come up as bad as they are.

2067. And they are exceedingly awkward in the movement of their bodies?—Yes.

2068. And in the use of their limbs?—Yes.

2069. You find they improve?—There is no doubt about it.

2070. It is not so much constitutional defect as want of training?—Want of training, to a great extent. You must remember we get our recruits at what the doctor calls physically 'up to the standard of 18.' Well, of course, without the birth certificate it is hard to judge what the man's age is. Well, those men may be under weight—three or four pounds under weight. They may be under chest measurement; they may be under height; but we have to take them, and they are called 'specials.' Well, every 'special' gets his three months' training like everybody else at the depot, and at the end of his course he is examined. Well, it is very seldom we have one of these 'specials' who has not made up to the standard in the three months.

2071. That means that the defect has not been in any congenital weakness?—No; the doctor will not pass a man like that.

2072. But that he has not had the training that ought to have developed him?—Yes; and the feeding.

2073. And do you find that many of the defects are such as you can clearly trace might have been removed by early training?—Oh, certainly, sir.

2074. Such as?—Well, you find men with narrow chests and sloping shoulders, and flat feet, and bandied legs and knock-knees.

2075. Evidently neglected through their school career?—Certainly.

2076. How much time do you think would be required in a school curriculum for this work to do it thoroughly for children. How much is given to those who come into your gymnasias?—Into the military—oh, an hour a day in a military gymnasium; they should never get less.

2077. But you could not get as much as that in a school?—No; but if you can get a full half hour for every child in a school every day—a full half hour—

2078. It would have removed many of the difficulties that you have found in the recruits coming up?—I think so; I am certain of it.

2079. *By Professor Ogston.*—From what you saw of the teachers that were being instructed by Sturrock and Cruden, do you think that those men and women, male and female teachers, were capable of being taught to teach?—Certainly, sir.

2. A. 2080. There was no physical disability or stiffness caused by their age that would prevent them learning the perfect system that you advocate, so as to teach it to others?—I do not say that they were capable of carrying out the work themselves, because they were not—you cannot expect a man or a woman of forty or fifty to be able to do what a boy of fourteen can do.

2081. Precisely?—But I see no reason why, if they have got common-sense and brains, they cannot learn what position a child ought to be in, and know whether they are doing their work properly.

2082. Though they could not actually demonstrate it they could teach it?—Yes.

2083. Just one other point. I suppose a great number of your recruits are rejected on physical grounds?—Yes, sir; that is before they reach me.

2084. Before they reach you; by the medical inspectors?—Yes.

2085. Do you think that the teachers, male and female, who subsequently will have to teach physical training, ought to be themselves subjected to an examination similar to what recruits are subjected to; should they be examined for knock-knee, flat-foot, rupture, and so on; is it essential that they should be?—The teacher?

2086. The teacher who is afterwards to teach?—No, not absolutely necessary.

2087. *By Mr Alston.*—In reference to these teachers, at present those who come to take instruction are of advanced age, I should say?—Many of them.

2088. Forty or fifty even?—Some are.

2089. Are there any younger than that?—Oh yes; I should say they range, judging by their looks, from eighteen.

2090. Both male and female?—Yes.

2091. Have you noticed anything in the capacity of these male and female teachers; their standard will be very much higher mentally and educationally than that of the army recruits of whom you speak?—Oh, of course, in many cases.

2092. Their capacity to acquire what you are teaching them?—Yes, sir.

2093. In that way it is rather an advantage to have such a class of people to deal with, and I suppose there is nothing to prevent them acquiring a power of communicating to the children what they have learned?—There are certain people whom you can never teach to instruct, who will never make an instructor, as the most of them ought to do.

2094. Would you propose to ear-mark those who never could instruct?—Oh, certainly; that could be done at once in the inspection.

2095. Suppose under the present conditions—of course you are now dealing with male and female teachers rather up in years—but suppose under this new condition of things, when the local authorities and the training colleges came forward year by year with a large batch of younger teachers to put under your instruction, what would you suggest as a proper course to go through, both as to time and matter?—For the actual teachers themselves?

2096. Yes.—I take it they are about from sixteen to eighteen years of age.

2097. They would be older than that—from eighteen to twenty-two?—I talk from a military point of view—very much the course that we teach in the military gymnasia.

2098. A stiff one?—It is not too stiff, sir.

2099. Three hours a week?—Five hours a week is nothing. We have to do five hours a day when we go through our course of six months to qualify for superintendents.

2100. So it would not be too much for them; you would give them a hearty dose of it?—I do not call it a hearty dose at all.

2101. Supposing it were left to you to suggest a course of training for teachers of that kind, to be sent back to the Board Schools competent to teach the children in their charge?—And to give them an hour a day.

2102. The half hour you recommended?—That is the children, I mean.

2103. Suppose you had a free hand, what would you insist on for the teacher; suppose the time was found, and the money was found, what would you say they must go through before you would give them a certificate that they were competent teachers in physical training?—I should say certainly not less than two hours a day for six months.

2104. And you would be rather inclined to give them more?—Certainly.

2105. Then you would give a certificate only to those that you believed were thoroughly competent?—Yes, certainly; everything hangs on that.

2106. What would you do with those who failed?

2107. *Sir Henry Craik.*—You would not give them certificates.

2108. *By Mr Alston.*—You would not allow them to teach.

2109. *Sir Henry Craik.*—That subject.

2110. *By Mr Alston.*—Then those with that certificate would leave your school perfectly competent to teach the children of school age, from the infants upwards?—Yes.

2111. And you recommended rather a standard course of instruction, with certain variations to suit the locality and the state of health and accommodation, and so on?—Yes; but all those teachers, if they go through that course, after six months ought to be thoroughly able to understand when they saw a child, that he was doing too much for his strength, and that should all be taught them in their course. All our non-commissioned officers are able to see a recruit, at once, who is overtaxing himself, and stop him.

2112. That is the medical side of the training?—I say the common-sense side.

2113. You say that for half an hour every child should be put through physical exercise?—To do them any good.

2114. Have you any preference for any half hour—morning or middle-day?—The morning would be the best.

2115. Before they begin lessons?—Yes; give it about an hour after their breakfasts.

2116. *By the Chairman.*—Not on food; not absolutely on food?—Not on food.

2117. *By Mr Alston.*—Rather the morning than any other half hour?—You get more out of them in the morning. I know personally, from my own experience in work and my own experience with recruits, that one works better at that time of the day.

2118. Then as to the subsequent supervision of these competent teachers, would you recommend that an expert should go round at intervals to see that they are working up to the mark?—Certainly; that is the system that we have at present in the army.

2119. *By Mr Fergusson.*—That is to say, that you would look forward to the teachers being able to give the bulk of the instruction, but that every now and then an expert would come round to see that things were all working right?—Yes.

2120. Then as to the system being uniform I rather gathered that your idea was that there should be a uniform system as the foundation, but variation in detail might be allowed?—Yes, sir.

2121. As to the recruits that you get, of course your worst class are what you call 'specials,' I think, but then there is a very large number that do not come up to the standard of specials, who are rejected altogether, that you never see at all?—We do not see, yes.

2122. So you have not very good means of judging of the really bad class, if you never see them?—Those men who are rejected before they reach us have generally got some deformity that will absolutely prevent them being fit for service.

2123. You said you had visited Alloway School, and you were pleased with what you saw?—Yes.

2124. Would you mind telling us what you did see; for instance, did you see all the children at drill?—I first went into one room and I saw infants at drill under a mistress.

2125. They were drilled by a mistress?—Drilled by a mistress.

2127. Was it well done?—Yes, quite, for the size of the children, and it was just the sort of amount that they ought to do. You cannot expect children—I do not think I am wrong in saying they were all about six or seven—to do a lot of complicated exercises.

2128. What was it, was it a sort of tip-toe drill?—Marching on tip-toe, arm bending and arm swinging, quite simple exercises, and just simply taught and instruction given in a way that appealed to the children and not like a drill-sergeant.

2129. Was it done to music?—No, no music.

2130. Then?—Then we went on and saw the elder children at work again under another instructor, also a teacher of the school, and a still senior class under a gymnastic staff-sergeant from the depôt at Ayr—I think I am right in saying that I saw no less than four teachers taking different classes, and they all had evidently a very good foundation on the work, and seemed to know all about the work; in fact, I look on it as what is most to be aimed at, that the teachers can take their own classes in physical training, as there is much difficulty in getting classes told off even for an hour a week; if every teacher could take their own class, then half an hour a day or even a full quarter might be easily arranged; this would be much more advantageous.

2131. I may take it the work you saw generally all through, from the infants upwards, were such exercises as you would approve; it met with your approval altogether?—Yes, quite, and they were in fact founded on the course that we do in the military gymnasium; in fact, the staff-sergeant coming from the depôt at Ayr, had simply taught them to that with slight variations to suit the age and size of the children.

2132. We have been told that there is great difficulty with children doing a lot of these movements, because their boots do not lend themselves to standing on tip-toes and so on?—Yes.

2133. I suppose all your recruits are put into shoes in the gymnasium?—They are; yes.

2134. But do you agree with that, that it is almost impossible to do these exercises properly in a boot?—It makes all the difference, of course. I mean you cannot get a child on to his tip-toes in boots that are two sizes too big for him.

2135. And they are hard and stiff?—And they are hard and stiff, and they do not bend; you cannot get their insteps to work and their ankles to work.

2136. You cannot get the advantages out of the training with these boots?—No.

2137. They have nothing on their feet at all in some schools?—Yes, that would be better.

2138. Bare feet; would that be all right?—I do not see any harm in bare feet except the splinters and nails and that sort of thing.

2139. In the ordinary playground it would be pretty sore on them?—Except in Scotland, where it is the custom to go barefooted.

2140. *By Sir Henry Craik.*—What do the gymnasium shoes cost?—I think somewhere about 1s. 2d., or something like that.

2141. *By the Hon. Thomas Cochrane.*—I should like to ask you about your experience at Cupar with the class you had there. What sort of physical exercise do they put them through. Is it squad drill, or is it physical exercise?—Well, it was chiefly squad drill, if I remember rightly now without looking up the thing; they had been taught very few exercises, which were not sufficient.

2142. Hardly the kind of physical exercise that you would really recommend for young children?—I remember now that they did do dumb-bells and Indian clubs; but that would not have done for quite the infants.

2143. The toes rise, and all that sort of thing?—Oh, that is all right.

2144. You have seen a model course of exercises?—Yes.

2145. You think that is rather a good one?—Yes; I quite approve of that.

2146. And when you gave advice to these people, were they willing to take it?—Yes.

2147. They were pleased on the whole?—Well, the proof of it was in Cupar the second year I went there.

2148. Much better?—Much better.

2149. Who is Mr Sturrock?—Superintendent of Dundee Public Gymnasium.

2150. *By Sir Henry Craik.*—I think you saw two schools with me, one in Govan and one in Edinburgh?—Yes, I did.

2151. These were rather higher schools?—Yes, exceptions.

2152. And they were very well done?—Yes.

2153. Yes, the Merchant Company's School in Edinburgh and the Govan School?—They were well done, but they were exceptions; I should not like to say that that was the ordinary daily work of the school.

2154. *By Mr Alston.*—But the result of the ordinary daily work?—Yes.

2155. *By Sir Henry Craik.*—I think General Chapman remarked that in the case of the girls in the Merchant Company's Schools in Edinburgh he had seldom seen it so well done?—The thing was beautifully done, sir; and I do not want in the least to disparage the training that they had; but I feel that that was an exception, and it was a thing that was expected to be seen. I mean they knew some months before that they had got to do it.

2156. *By the Hon. Thomas Cochrane.*—You spoke of the great benefit in the army from the system of physical training which we have now?—Yes.

2157. I suppose a great many of the recruits really are a little over fourteen years of age?—That is what I guess sometimes.

2158. Sixteen would be a good average?—Certainly. I should think many of the men who say they are eighteen are sixteen. The usual answer is 'eighteen past,' if you want their age.

2159. And it does them a great deal of good, the training you give them?—Oh, there is no doubt about that.

2160. Are there any statistics kept of the development of these boys under training?—Well, we are not supposed to do it.

2161. They are not kept in the gymnasium?—They are kept in the hospital.

2162. I think those would be very interesting to us if we could get any authentic statistics as to physical development.

2163. *By Mr Shaw Stewart.*—Referring to the system you recommend for training teachers for two hours a day for six months. Would that include any lectures on physical training?—Well, I think that the two hours a day ought to be actual physical training; I think the lectures ought to be extra. I mean, I put it at two hours a day at the lowest.

2164. But you said, at the end of that time the teacher would be qualified to know when this or that child had done enough, and so on?—Yes.

2165. How would he acquire that knowledge during the course?—By actual observation. If he is going through a course like that, to do it thoroughly he must have children to teach, or at any rate a squad of young people to teach whom he can work so that he sees it.

2166. But I mean, during the six months' course he would not be specially taught to look out for that kind of thing?—Oh, of course while he is actually doing his exercises.

2167. He would not be working the children during that course?—No, not at first; but he would be doing these exercises practically himself; and there is no better way of knowing when you are done than by what you feel yourself.

2168. *By Sir Thomas Glen Coats.*—At the end of these three months that the recruits get at the depôt, those who pass through—are they of uniform muscular development?—Some are much better than others.

2169. Do you find that their health generally improves as well as their physical development?—Certainly.

Teachers'
class at
Cupar.

2170. By the physical drill?—Oh, yes. At first one finds that when they get on to proper food and regular work they are inclined to what you may call 'break out,' and you see them with spotty faces and all that sort of thing; but that is simply a matter of change of food; it all works off after a bit.

2171. I was going to ask you about food. Do they require to eat more while they are going through this physical training?—You see it very often comes to this: when they join they have been very badly fed before, and the ration which they get when they join is very much more than they have had before, so that in that way it rather works out; but there are some cases where I think more food is necessary.

2172. I think you said if not 'special,' though passed by the doctor there was a number of men who were flat-footed and knock-kneed, and, I suppose, the other way too—bowlegged. Well, can you straighten these men's legs?—If the man is still growing.

2173. And for flat-feet—I suppose you can improve them?—Oh, yes; we have a special course for the flat-footed.

2174. *By the Chairman.*—A special course?—We have to make special reports on them.

2175. May I ask your service?—Eight years next month. In 1894 I joined.

2176. Regarding the question that Sir Thomas Glen Coats raised about rations. You said that a recruit never complained, when he came to join, with his dinner ration. I suppose you meant that it was more than he had been accustomed to previously?—I think in many cases it is.

2177. Even the three-quarters of a pound of meat?—Yes.

2178. And what Sir Thomas asked, I think, was whether, in addition to that, he required to supplement it at the canteen. That would be at the canteen, or the regimental institute?—Yes, sir.

2179. From your experience, have you been in dépôts?—No.

2180. Never?—No.

2181. Only as an instructor of gymnasia?—I have always been with my regiment before.

2182. But never been at your dépôt?—No.

2183. It so happens that you have not been actually there?—Not serving at the dépôt.

2184. Therefore you have not served much with the recruits?—No; not until after they have had their three months.

2185. So you can only judge by the gymnastic results?—Yes.

2186. And of course you are not the trainer, but you are the examiner?—Yes; I have to superintend the training.

2187. But in several places?—In several places, but I have recruits absolutely.

2188. You do not watch them from day to day?—Yes, I can, sir; because Glasgow happens to be an Artillery dépôt, and the Artillery dépôt recruits are trained in the gymnasium.

2189. So you are in a position possibly to give us some information as to the difference, which I do not think you quite answered fully—as to the difference of the food as the physical instruction of a recruit progresses. Do you quite understand what I mean; have you found that although he cannot increase his ration as a rule, as far as I know, he does increase the amount of meat that he gets at the canteen or the institute very largely?—That, of course, I cannot really answer for, because I do not see them outside the gymnasium at present.

2190. That is what I wanted to know; although it is a dépôt, you are not sufficiently acquainted with the interior economy of the dépôt to be able to tell us?—No; not outside my own department.

2191. Do I understand you to be very much wrapped up in gymnastic work, to the exclusion rather of ordinary drill. There was one remark that fell from you that made me think that you considered gymnastic exercises—I may call them by that general term—I mean that sort of thing—very much superior

to ordinary drill?—As far as physical development goes. *Captain G. A. Armytage.*

2 May '02.

2192. Therefore, what I want to get at is what we have to consider. Supposing we were to recommend anything for boys over the age of fourteen, between that and eighteen, you, as our temporary adviser, would recommend us not to recommend anything in the shape of drill as against physical exercise and gymnastic training. What I mean by 'drill' is rather more military drill, handling a rifle, shooting and all that sort of thing; the ultimate object being to improve the physical status of the youth of the country, male and female?—If it is simply to improve the physical status of the youth of the country, I should say that the free gymnastics ought to come before the other. *Free gymnastics.*

2193. I rather gather, of course, as a specialist?—If that is the only object.

2194. That you are rather tempted in favour of the one as against the other?—I am not against the other in the least, sir, but for actual physical development.

2195. If you are not against the other, and applying that to boys and girls from fourteen to eighteen, what benefits do you think the other would produce; I think I may ask you that. What I mean is a little more of what we understand as military drill, handling a rifle, and shooting and so forth in that sort of way as purely muscular development. I mean its effects not merely physically, but effects with regard to muscular development, and something a little beyond mere physical things; have you got anything to say in favour of that which is not exclusively physical and gymnastic training?—Of course it instils a discipline into them in exactly the same way as the other does.

2196. Not more so; neither more nor less; you think it equivalent?—The ordinary drill, if it is thoroughly done, the ordinary marching drill, barrack square drill, if it is thoroughly done, of course makes men think; but it does not make them think so much as the physical training does, and, of course, the shooting is a most excellent thing.

2197. The shooting?—Oh, yes; that must make a man think, and keep him steady as well. I mean no man can shoot if he is not in proper health.

2198. I very much included extended order drill, you know?—Yes, of course; it is rather going outside the question.

2199. As how?—Is the military drill to be part of a school course or after they have left school?

2200. Why should it not be; I do not say why 'Military' should it be, but why should it not be?—I do not know why it should not be, but I have heard lots of people say that if military drill is introduced it would not be popular, and all that sort of thing; I mean only the word of the people, that is why I purposely talk about physical training, and not military drill. *drill: introduction might not be popular; therefore desirable to call it 'physical training.'*

2201. Is it the man in the street or the people of Scotland that you have heard that from?—I have heard it in Scotland, sir.

2202. I mean from parents, and what I call that class of people, or from people of your own standing?—More from people who have had to do with the schools, who have heard from the parents.

2203. Do you mean School Boards or the teachers?—Well, I should say more individuals.

2204. *By the Hon. Thomas Cochrane.*—You think they do not want their sons to be made soldiers by stealth?—That is exactly what it is.

2205. A general feeling of that kind?—They have got a sort of impression that it is to save conscription, and that it is a stealthy way of getting at it.

2206. But as far as the physical training of the child, you think they would be very willing to have it taught?—If it is called physical training, and the word military is dropped. I am perfectly certain that they are perfectly satisfied with it.

2207. *By the Chairman.*—Even so far as physical training with arms?—Even with arms, but why not give them a broomstick?

2208. *By the Hon. Thomas Cochrane.*—There is nothing in the physical training with arms that would

Captain G. A. Armytage.
2 May '02.
Boys' Brigade. really fit them much more for a soldier's life than ordinary physical training without arms?—A broomstick is just as good, or a bar bell. You can do just as much with it as you can with a 7 lb. rifle, as regards development.

2209. *By Mr Alston.*—Have you inspected a first-class Boys' Brigade company at Glasgow?—I have inspected one company.

2210. Or seen any of them at work?—I have seen them at work; I have inspected one company.

2211. They do not, of course, drill with broomsticks?—No, they do not; they have got a miniature rifle.

2212. And probably would not thank you to substitute a broomstick for it?—No, they would not. That is a different thing altogether; they are budding soldiers, you may say.

2213. No, but Lord Mansfield has indicated that this military drill might actually form part of school education after school age, beginning during school age and going on after school age; and of course that is an example of what could be done with the boy between twelve and seventeen?—Yes.

2214. *By the Chairman.*—Mr Alston wants to get from you that their condition is not altogether unsatisfactory, although they have military training?—Their

condition is perfectly satisfactory. It was only two days ago that I saw General Hunter, and he inspected the whole of the Glasgow Battalion of the Boys' Brigade on Saturday last, and he said it was perfectly marvellous to see them.

2215. *By Mr Alston.*—His report was exceedingly satisfactory?—Yes, very good.

2216. We were talking about uniformity in the Physical Exercise instruction book; here are six; would it not be of advantage to have one uniform code?—That is exactly what I think.

2217. *By Mr Fergusson.*—Do you hear people, School Board people, talk about military drill, as trying to make the boys soldiers and all that sort of thing?—Yes.

2218. You think yourself if the word 'military' was dropped out, it were always called 'physical training,' that it would have a good effect?—I think so.

2219. *By Sir Henry Craik.*—But when you say you heard School Board people saying that, can you give me instances?—Well, I can only speak generally.

2220. *By the Chairman.*—The witness is unable to give instances?—Yes; I could not give you definite instances.

The witness withdrew.

Mr E. H. Burrows.

Mr E. H. BURROWS, examined.

2221. *By the Chairman.*—You are His Majesty's Inspector of Schools in charge of the Portsmouth District?—Yes.

2222. And have you been so for long?—About seven years.

2223. Were you in charge of a district elsewhere before?—Yes, for twenty-five years.

2224. Where?—First of all, in Yorkshire—the Sheffield district—not in charge, second inspector. Then in charge of South Devon and part of East Cornwall for about seven years; then for some ten years of nearly the whole of Hampshire, and for the last seven years of East Hants and West Sussex, which is called the Portsmouth district, including the country all along the South Downs stretching as far as Arundel and Bognor.

2225. You have got a copy of your notes?—Yes, I have.

2226. Would you go through them, please, for the benefit of the Commission; you can elaborate anything that strikes you on the way?—The notes take the form of a report, written some little time ago, upon the state of physical training in my district, which covers apparently all the ground mentioned in the reference to me, so that I thought it would save time and trouble if I had some copies made for you. May I refer, before I mention the state of affairs in my present district, to that which did take place in my previous district, as you have asked me for my previous history in this matter? I find that, some years ago, I reported on physical training in the district that I then had charge of, which was South Hants, including the Isle of Wight. I have an extract here, which was made from a general report for the year 1894, in which I see it stated that in the district I had charge of, military drill, comprising company and battalion drill, and military and extension motions, was taught then in every boys' school, either by special instructors, or by teachers holding the necessary qualifications. Many schools possessed drum and fife bands to lead the drill, and in all cases, whether in town or country, the movements and exercises were performed with great smartness and steadiness. I also reported at length on musical and Swedish drill as taught in girls' and infants' schools, and upon the general lines of physical education which I had then started for some years before 1894 in South Hants and the Isle of Wight. I also stated that in certain small schools even in those days women were proving themselves equally capable with men in the matter of drill,

even for boys as well as for girls. I only mention that in order that I may explain to you that it is now some years back that military drill has formed an important feature of districts under my charge. I left that district about six years ago, and was transferred to the Portsmouth district, where the matter has been still further carried out and developed, and I am able to say that in the district now under my charge, not only in Portsmouth, but in the schools scattered throughout the Downs and the forest country, and all East Hampshire and West Sussex, physical education forms one of the most important parts of the secular education in the schools. In all boys' schools or departments throughout my district some approved form of military or physical drill, with or without arms, generally accompanied by music, is regularly practised, and in all girls' and infants' schools or departments, and in nearly all mixed schools, some kind of physical training, with music, is the rule. This has been the case for many years, long before public interest was aroused in the matter. In a considerable number of boys' schools the drill is purely military, including extension motions and company drill. In other schools physical training based more or less on military methods is adopted. I have not yet proposed a uniform scheme, as it seems best that each school should take its own line, within due limits, so long as the result arrived at is genuine physical and moral training. I have a note to the effect that since this report was written, a model course of physical training for the higher classes in elementary schools has been compiled and issued by the Board of Education. I may perhaps explain that the model course is, of course, an elementary one, and that after the years of practice we have had in my district, we have gone far beyond the limits of that course, but it is readily accepted by all managers and teachers as a foundation, a uniform foundation of their work, and I have pressed that upon them as a necessity, but have of course encouraged them to keep up as additions the various developments which have been carried on with success for some years past both in boys' and girls' schools. I find that in the schools under my inspection there is no subject so popular with children as drill, which is taught during the ordinary school hours. The teachers are unanimous in stating that this training not only produces steadiness, obedience, smartness and concentration, but certainly strengthens and brightens the intellectual power of the scholars. I have had a considerable amount of correspondence from

Historical references.

Captain Armytage.
2 May

Mr E. H. Burrows.

Existing condition

Model course

Drill very popular effects.

employers of labour to the effect that they find it of very practical value in the case of boys who receive a course of physical training during their school days, that they make better clerks, and they were better in all respects both morally and physically. Throughout the whole of my district it is now clearly understood that physical training forms one of the most important parts of elementary education. For much of the merely mental instruction is forgotten when the short school days end, but physical and moral training, inseparable if taught aright, will abide by the scholars, and will form the sturdy stuff sorely needed by England and the empire. A display of drill always forms a prominent feature of my annual inspection of all schools, whether large or small, whether in town or country. I may perhaps add that I found physical training or military drill taught hardly at all when I first took charge of Portsmouth district, so that what has been done has been done during the last five or six years. There was hardly any beginning made of it before that. This is a point which I should venture to put before the Commission, because I am inclined to think that Portsmouth is almost unique in its progress. To its importance at the annual inspection, and to the unflinching readiness and enthusiasm with which the subject has been taken up by managers and teachers, I attribute the remarkable progress made since their attention was drawn to it six years ago. Portsmouth set such a zealous and successful example, as was to be expected from the schools of the first naval port of the kingdom. Much of this progress is also due to the energetic formation of School Bands, to lead the exercises and marching. All large schools, and many smaller ones, now possess bands of six to forty performers, using drums and fifes in the boys' and violins in the girls' schools. These bands are composed of teachers of all grades and of elder scholars. The use of these instruments does away with the necessity of costly pianos, and enables the band to be maintained at a trifling expense, and to be moved into the playground to lead open-air drill in fine weather. When I first took charge of the Portsmouth district I found that the Board at Portsmouth, being economical, did not like to face the expenditure upon pianos, and I pointed out to them the strong advisability of some music to lead the drill. I then suggested that if they would pay a little towards the provision of violins and of drums and fifes, they would be distinctly better even than pianos, and far better than the usual worn-out harmonium which is the music in Board Schools. They adopted my suggestion; they gave a small grant of 50s. down to each school, which did not go far, but went some way towards providing instruments. All the other instruments wanted for these large bands have been invariably provided by the efforts of the teachers and children. They have collected money by school entertainments, by subscriptions amongst parents, and so on, so that the public, whether subscribers to voluntary schools or ratepayers, have practically had no expense entailed whatsoever by the formation of these large, strong, and efficient bands, and it is to these bands that I really do attribute a large part of the progress we have made with drill. They have been of the greatest possible value to the schools themselves, because they have brought teachers and pupils together. The instruction in the various instruments has been either paid for by the parents of the children or the teachers themselves, assistants and pupil-teachers of all grades, and now that the thing has been established the instruction is practically handed on from the one set to the other after school hours. Recruits are never failing, and the bands keep up to considerable strength there. In the case of children who are playing in the bands, I make it a rule that they should not escape physical drill. They are told off in rotation to go in for the drill, so that they get their fair share as well as leading it with their instruments. Physical or military drill thus practised entails little or no extra outlay, for with few exceptions no special instructors have been employed. To the certificated teachers who have

willingly and successfully undertaken the instruction, the highest praise is due. Without their cordial co-operation, success would have been impossible. Many of them are capable of teaching the subject, as they have belonged to the volunteer corps of their training colleges, and in the case of women, very many of them have been fairly well trained in the women's training colleges. Now, I have a few remarks about the necessity of further training for teachers if I am in order in following out that point. I should say that I have not gone so far as my colleague Mr Colvill has in providing classes under military instructors for the teachers hitherto, because it has appeared to me that the young masters who come down to Portsmouth from Winchester and other training colleges, have hitherto been able to produce results in physical training and military drill which have met with approval not only of civilian authorities, such as the managers of schools and myself, but if I may say so, have met with the appreciation of inspecting officers such as Lord Frankfort, who has for three years come down to inspect us at Portsmouth, and of Sir Baker Russell, General in command of our District, and of Colonel Fox, Director of Army Gymnasia, and they have notified to me, as inspecting officers, and to the managers and children, their satisfaction with the exercises as performed by the boys and girls. That, therefore, is my reply to the question as to whether military instructors are required. I can produce drill in Portsmouth which has satisfied general officers, who have seen it, without the interposition of military instructors, and I have found that the civilian teachers of our elementary schools are, so far as my experience goes, somewhat against the interference of a sergeant on their drill grounds or playgrounds, and much prefer having the instruction in physical training entrusted to them, but are perfectly willing to accept any further instruction for themselves that may be required, and I think they would be ready at any moment to attend classes opened for them to improve them further under military instructors to be obtained from the local gymnasium or not as the case might be. The chief difficulty with reference to definite instruction from experts that I have felt hitherto has been that of women, because, although the training colleges for the men in England have provided a certain amount of very fairly satisfactory drill instructors, the colleges for women, judging from results, have not been equally successful. Some few training colleges have taken the matter up, but some, apparently, still neglect it, and it is much more difficult to find women capable of teaching drill satisfactorily in girls' schools than it is men, and I am now hoping to get some advice as to opening classes for women teachers under some expert who can come and give them instruction in Portsmouth. I think that is the next move that we really require. I have added a remark as to the necessity of these teachers that have done so well in the schools that I have mentioned to you, getting some kind of recognition or form of certificate as to their proficiency, and I ventured to make a remark to that effect in an appendix which appeared in the last Report of the Lads' Drill Association. It seemed to me that the zealous desire of teachers to qualify themselves as instructors of physical training should receive official encouragement by the issue of certificates of proficiency after examination by experts. I have not dealt with the matter as to how these certificates should be issued, whether by the Board of Education and the War Office together or by the General commanding the District. They would then, in my opinion, be better qualified than military instructors to teach drill to boys under fourteen years of age. That concludes the evidence that I have to put before the Commission, with the exception of the fact—and I think it may be rather an interesting one—that, as regards my district, I may say that I have had the most unanimous support with reference to physical training from every kind of school authority, whether managers or teachers. I have put down here a list of persons to whom reference on physical training in elementary schools is

Mr E. H. Burrows.

suggested in my district; and I find it comprises the Roman Catholic Bishop of Portsmouth, the Mayor of Portsmouth, the Chairman of the Portsmouth School Board, who is a leading Baptist minister of the town—one of the councillors, various clergy, and all the teachers. Practically, they are all ready to express their appreciation of what has been done; and not only teachers in Portsmouth, but I have put down here a large number of managers and teachers in smaller schools in the neighbourhood, for the feeling of approbation of the subject is absolutely universal. I have not had the slightest trace of opposition, or of neglect, or desire to put it aside, or a single instance of complaint from any parent. Parents have come forward with reference to the formation and the support of the bands; they come forward in supplying little uniforms; the caps, haversacks, belts, and so forth. I think that should be taken as a proof of the parents' desire to support the movement.

2232. *By Professor Ogston.*—Just one question regarding the women teachers. Suppose that you had to advise upon this matter, could you say exactly where you would think it best that the women teachers should be trained, and how they should be trained?—I am afraid my reply must be in the negative. I cannot make up my mind in the least where to get at present satisfactory training for women teachers. I had hope of a solution of the difficulty by applying to the British College of Physical Culture; but I do not find them speak with a certain voice in the matter. There are so many experts belonging to the College that it is very difficult, amidst the rivalry of various systems, to discover any definite means of training teachers provided by the College. I am utterly at a loss at present for finding any kind of central organization which should provide experts to train women, or that could be entrusted with the issue of certificates for them when trained. That seems to me the great want at present that England is suffering from, and too many people, I think partly for that reason, neglect this physical training for the girls, and I find that boys are receiving due attention, whereas the girls are not. I venture to impress on the public in my district that the physical training for the girls is quite as important as it is for the boys. My teachers now are clamouring for further instruction, and I do not know where to get it from.

2233. *By Sir Henry Craik.*—You spoke, Mr Burrows, of the great advance made in your district during five years. Had you any financial way of encouraging it through the grant?—Some years ago, physical exercises, I think they were called, were vaguely mentioned in our English Code. Then there came—you will forgive me if I am a little uncertain about the dates of the Codes—an entry to the effect that the higher grant for discipline, which was 1s. 6d., as against the lower grant of 1s., would only be paid if some sort of drill were separately performed at the various inspections in schools. To begin with, we had that lever for meeting the subject, but I may say, long before we had that bribe of an extra sixpence, I found the managers and teachers in my old districts were very willing, after consultation and conference and encouragement, to come forward and teach it, for the welfare of the children. They welcomed, of course, the extra sixpence, which I told them, as soon as it was put in our Code, would only be given where the subject had received attention already, to drill that really deserved it; but I may say that the progress made in Portsmouth has been quite as remarkable since the financial chance of getting an extra sixpence has disappeared.

2234. *By personal effort?*—I think so.

2235. And you have had the encouragement of manufacturers, you say?—The encouragement of employers of labour, that is to say; in Portsmouth they are not a very large or influential body as they are in the larger northern towns, but such as they are, they have certainly encouraged it.

2236. And the parents and others interested in the school have been prepared voluntarily to subscribe for the band?—They have helped the band.

2237. Then the parents have had no objection to this?—I have had no instance of any complaint made.

2238. Or any fear that it was giving rise to militarism?—None whatever from parents. I had first of all some difficulty with members of the Portsmouth School Board, and one or two other small School Boards in the matter, and I thought that we should have some act of opposition, but I was able to disarm it by dropping all kind of army and military terms and organization, and dwelling upon the necessity for the physical training. As an instance I may quote the present Chairman of the Portsmouth School Board, who is a Baptist minister, is strongly opposed to anything like military spirit, but keenly in favour of the physical training we practise.

2239. About the teachers; have you any teachers' classes in your district at present?—None at present are being held; we instruct the teachers. I am told the mistresses have had some lectures from a lady who came down, but it was not to my knowledge, and she did not apparently prove very satisfactory or know very much more than they knew themselves, so that practically the teachers have got information from their own colleagues who have been lately trained—the younger ones—at men's or women's training colleges.

2240. There is no opportunity in the English Code for having such classes and obtaining grants?—No, we have had no encouragement for that at all.

2241. But if there were such classes, and if an expert visited them and examined them, you think that that might be a basis of issuing a certificate which you desire?—Certainly. I think the teachers, speaking for a large body of them, would appreciate that very much indeed.

2242. Have you in your district any instance of continuation classes for the older scholars which are occupied with this subject?—I had a few, and in one of them, belonging to a large voluntary school in Portsmouth, physical training and drill proved very attractive.

2243. An evening class?—An evening class, but that was the only one that took it up. I am sorry to say our continuation classes have lately almost disappeared in consequence of further official changes, and therefore I cannot speak with much knowledge of continuation schools. Even in Portsmouth now they are dying out.

2244. But such classes would be a very effective way of getting hold of boys between fourteen and eighteen?—Certainly.

2245. And what would be the feeling, as far as you have been able to test it in your district of England, with regard to making the attendance at such classes compulsory?—For all subjects, or only for the physical training?

2246. Well, give your opinion on both?—It has not yet been actively debated, nor has it been before any school authorities or teachers, so far as I know, in any collective meeting; it has only been discussed personally, and I have heard nothing but approbation of any such scheme as would enable the teachers to carry on the physical and moral influence which they now have over boys up to fourteen, between the ages of fourteen and seventeen.

2247. Then without giving an opinion upon whether it is possible, you are quite convinced that it is for the advantage of the boys if it could be done?—If I may say so, and go further, that a great deal of the hard work that has been put into boys in this respect up to fourteen is now too rapidly forgotten between the dangerous ages of fourteen and eighteen. I am finding that by personal experience in the streets of Portsmouth every day. The only remedy for this appears to me to be compulsory service in Cadet Corps, between the ages of fourteen and seventeen.

2248. *By the Chairman.*—In what you have done since 1894, I think you speak?—That report in 1894 said for some years before when I began; I think I may fairly speak for the last fifteen years.

2249. In what you have done have you done it off your own bat or have you done it under the authority

of the Board?—I have had no encouragement; I have had no recognition whatsoever of anything that I did until I happened to write the report, of which you have a copy, which happened to arrive at Whitehall shortly before the Lads' Drill Association drew the attention of the Board of Education to the necessity of something being done for physical training. I was then asked to attend a conference on the subject.

2250. That report was sent in on your own initiative, and was not called for?—Yes, it was one of many; I have reported frequently on the subject.

2251. One of many reports on the same subject?—One of many reports on the same subject. I think my reports have all been pigeon-holed, and I have had no information that they have received any attention at all.

2252. *By Mr Shaw Stewart.*—I did not quite gather from your paper how your military drill, as distinct from physical exercise movements, enters into your scheme?—Well, we have done quite as much military drill as is included in the model course which some of us drew up, and which has been lately issued by the Board of Education, and which includes, as you know, roughly speaking, company drill. We have gone as far, in some large schools, as a certain amount of battalion drill as well, but lately I have found it wise, as I think I said, to keep the drill more physical and less military as regards the elementary school in order to conciliate those who, on account of their own opinions, were opposed to anything really military.

2253. I quite understand, but further than that, do you not consider that physical exercises are more valuable for developing boys than military drill. I may say that we have had one witness, an expert, I may call him, who told us that he thought drill does not make the boy or man think as much as physical drill does; would you agree to that?—I should answer that by saying that I am sure the right thing for a boy is a combination of the two. I should be very sorry to see simply what used to be called 'extension motions,' what we now call free gymnastics and other things, taught only, because I think that the old barrack-yard company drill is of great value in teaching steadiness, obedience, and smartness to boys.

2254. Provided it is properly taught?—Provided it is properly taught and military discipline maintained while it is being done.

2255. But then would you apply that to boys under fourteen or boys over fourteen?—I am speaking only of boys up to fourteen in the day elementary schools.

2256. You would still lay some stress on the importance of company drill?—On the importance of company drill, provided that it is accompanied by a large amount of free gymnastics or physical training. I should not like to see half the time devoted to company drill and half to gymnastics; I think one-third of the time should be given to the old-fashioned drill and the other two-thirds to physical drill.

2257. Would that apply to children who had to walk any distance to school, or are your schools mostly composed of children who have not far to walk?—No; I have many schools, of course, scattered about on the South Downs and in the forest country, in East Hants, where children have to walk a considerable distance, and these are purely rural schools. I have not had any complaint from children who live some distance off. I have generally found, both in body and mind, the distant children are superior to those close by, and they are quite ready to take the drill. I have had no such complaint put before me.

2258. *Mr Fergusson.*—In your schools you seem to do a good deal with music?—Nearly all with music.

2259. Do you think that is a decided advantage?—Distinctly, for many reasons. It increases the interest of the children and of the teachers. It, of course, is a much better way of marking time, to my mind, for children than the old-fashioned singing which the children used to go in for then. I disallow all singing on the part of the children while the drill is going on, of course, for obvious reasons.

2260. Who teaches the children to play instruments?

—In Portsmouth it has been very fairly easy, because so many parents themselves play violins and that kind of thing. Many of their fathers have literally taught their own daughters, whether they have been teachers or scholars.

2261. In ordinary country districts?—In ordinary country districts I have always found it possible to find some one who can teach boys the use of drum and fife, or boys can learn playing fifes almost by themselves as they do, and the parents can generally be found in the country to pay for some music master who can give a lesson or two to the teacher and she imparts her knowledge to her colleagues.

2262. This is rather an appalling idea, teaching all the children to play instruments. You do not have to depend much upon public funds for this. You seem to have funds?—I have always found the easiest way to raise money is by a school entertainment, as there is always such a large audience to draw upon. Certainly the School Board of Portsmouth is the only body that gave any money for instrumental music, and they gave 50s. three or four years ago to each school.

2263. You say you never had any real experts to examine. Your teachers did not like them; general officers inspect, but the general officer need not necessarily be an expert in physical training?—No. Inspection:
not by ex-
perts.

2264. He is in drill, but not in physical training, and you do not have any expert examination?—We have not hitherto had any expert examination of the physical training as given in the schools; because no such expert has been provided for us by the Board of Education. We have made various suggestions, but no suggestion has received any encouragement, and nobody has ever come round as an expert to inspect the physical training. It has always been left in the hands of the local inspector.

2265. But is your own knowledge, your own training in these matters, sufficient to enable you to say that it is a really good training that is being given?—My knowledge of physical training is simply that of a man who has had a good deal of gymnastic and athletic work, both at Eton and at Oxford, and carried it on since in various gymnasias whilst I was a youngster. I have done nothing more in that way. I know nothing more than the average man who has been through it himself.

2266. *By the Chairman.*—Could you advise the Commission as to where they could go to see any; is Aldershot in your district or not?—No; it is not; it belongs to my colleague Mr Colvill, who has been before you. I come in just below Aldershot—South Hants. Petersfield is my northern boundary. Obviously the place for seeing what has been done in my district is Portsmouth, including Gosport.

2267. Supposing we were to go down to see—what time of day ought we to be there?—Well, I may venture to say that we would arrange an exhibition for the Commissioners on any day at almost any hour that suited them. We are well accustomed to it. Sir Henry Craik knows we could get an exhibition up in a very short time.

2268. In the day-time as well as in the evening?—It would suit us better in the day-time, because the children are young; it is not like lads in the continuation schools. We have the use of the Town Hall, and we have a most enthusiastic Mayor.

2269. Would those schools include the Board Schools and the Voluntary Schools?—Yes, we could make a selection for you.

2270. And, may I ask, any Roman Catholic schools?—Two of the Roman Catholic schools are leading features of our exhibition. They are always encouraged by their bishop—the Bishop of Portsmouth; so that we can show you schools of all denominations.

2271. Are you in the habit of brigading these schools, as it were?—No; each school has hitherto come in and drilled as a separate company, with its own teachers and with its own band.

2272. That is very interesting for the purpose of comparison. It would be of interest if we went down, probably?—We can parade for you ten companies,

Mr E. H. Burrows.
2 May '02.

showing ten different schools, ten minutes each, perfectly prepared to march on and march off at a moment's notice. If I may show you a programme of what we did the other day—it is similar to what Sir Henry Craik saw two years ago. We can repeat that programme for you at a day's notice.

2273. *By Sir Henry Craik.*—Do you as a seaport give any attention to the training of boys in nautical subjects?—No; we have done nothing in the way of nautical work yet.

2274. Not swimming or rowing?—No; we have done nothing at all.

Swimming recommended. 2275. *By the Chairman.*—On the point of swimming; have you any opinion on that point as a physical exercise?—I think it is one of the best.

2276. For both sexes?—For both sexes. I encouraged it in the Isle of Wight; and had some quite successful swimming classes there for boys' and girls' schools. That was in years gone by.

2277. These exercises, are they from any particular manual?—No, they are not.

2278. How are they evolved then?—To a large extent from lectures and advice I have given to teachers.

2279. It is really your system?—To a large extent my suggestion.

2280. That is very interesting to know?—And from books, various manuals which I have used; because, as I have ventured to tell you, I have not hitherto, until the model course came up, thought it well to prescribe any special scheme. I have let the teachers go as they pleased, provided they satisfied me as regards the value of the work they showed. Therefore each school has taken up an independent line.

2281. And you have been sole inspector?—Hitherto, I am sorry to say.

2282. But as a matter of fact?—As a matter of fact, yes.

The witness withdrew.

Adjourned.

FIFTH DAY.

Monday, 12th May 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr GEORGE M^CRAE, M.P.

Professor OGDON.

Mr R. B. PEARSON, *Secretary.*

Miss FLORA C. STEVENSON, examined.

Miss F. C. Stevenson.
12 May '02.

2283. *By the Chairman.*—You are Chairman of the Edinburgh School Board?—At present I am.

2284. And have you been so since?—?—Since the last triannual election.

2285. Two years ago about?—Two years, yes. I have been a member of the Board for twenty-nine years.

2286. Will you please go through the evidence you have prepared?—Since 1873 I have been a member of the Edinburgh School Board, of which I am at present Chairman, and I have taken a deep interest in the development of physical education in the schools under the management of the Board. We have thirty-two schools, of which two have higher grade departments and six advanced departments, in addition to the Royal High School (scheduled as a higher-class school under the Act of 1872), and the St John's Hill Day Industrial School, under the Act of 1893, which is under the control of the Home Office—and is a Truant School. Thirteen of the Board Schools are provided with fully-equipped gymnasia, six are provided with swimming baths. Two of these are rather small, and are used more for purposes of cleanliness than for actual instruction. A seventh swimming bath is in course of erection in connection with the new school at Craiglockhart. Apparatus for physical instruction is provided in all the schools. The amount and kind of instruction varies in different schools.

The kinds of instruction embrace gymnastics, calisthenics, military drill, Swedish drill, and in every infant department musical drill is given, the usual kindergarten drill. Gymnastic instruction is given by special instructors appointed by the Board, and by the ordinary class teachers. From the last annual report of the School Work Committee for 1901–1902 I see that in the ordinary schools 8453 boys and 8218 girls (pupils in juvenile, advanced, and higher grade departments) received instruction from the regular gymnastic instructors in addition to what they get from the class teachers. In some of the schools military drill is given to the older boys by the janitors, and many of these are old non-commissioned officers—old soldiers. The time given to physical instruction varies very much in the schools. The subject is now compulsory, as the higher discipline grant depends on physical training being given in the schools, but many teachers grudge the time taken from the ordinary work of the schools, the ordinary school lessons. The Edinburgh Board has always been anxious to encourage this branch of education, and before the Department made it so very prominent in their regulations we had this instruction given, and in 1882 we erected the first gymnasium we had in connection with any of our public schools.

Swimming is taught by special instructors. From the School Works Committee report, to which I have

Physical education in Board Schools of Edinburgh: descriptive account.

Gymnasia: swimming baths: apparatus provided.

Instruction; amount and kind.

already referred, I see that 1349 boys and 521 girls received instruction in swimming during 1900-1901. In regard to the physical instruction of pupil teachers, I regret to find that the number of pupil teachers taking advantage of the gymnastic instruction in the schools has been decreasing. I attribute this to the shortened apprenticeship now allowed, and to the increased requirements necessary for entrance to the Training Colleges and the University. The Board has not seen their way to make attendance at the gymnastic instruction compulsory for the pupil teachers. I understand that training for carrying out physical education is provided in the Training Colleges—but although almost every certificated teacher has this subject on the certificate from the Colleges, I do not find that every teacher is qualified to give it. In some cases where the teacher is an enthusiast, excellent work is done—but it appears to me that the time (so far as I can learn) which is given to the subject in the Training Colleges is not sufficient to ensure proficiency on the part of teachers. Of course I cannot speak with any authority on the subject. My information is gained chiefly from what I have heard from the certificated teachers—particularly the women teachers employed in our schools. Of course the Commission will have opportunity of getting all that information from the managers of the Training Colleges, but that is the impression I have from the inquiry I have made from our teachers. In regard to the evening schools, as this subject will be spoken to specially by two of the teachers in the service of the Board, I need not enlarge on it. Hitherto in the evening schools the subject has not been generally introduced, chiefly, I think, because in the case of backward pupils who had returned to attendance at an evening school after leaving the day school at an early age, all the time has been required for the ordinary subjects of instruction—and we found that in some of the advanced evening schools the young men and young women objected to any interruption to their other studies. Latterly, however, I am glad to say the subject has become more popular. One of the most serious difficulties is the amount of time required; and although school managers have now much greater freedom in regard to the subjects to be taught in the public schools, a non-earn-ing subject which is not compulsory cannot compete with those which can earn high grants. Another difficulty we have, especially in the case of girls, is the prejudice and the objection that parents take to their receiving this kind of instruction. I also consider that the want of a properly-systematized graded course of instruction interferes with the success of much of the physical instructions given in many of the schools throughout the country. I do not think this applies so much to the large town schools as to the schools in the country places. What I mean by that is, I find, on going through the schools, that we have various kinds of instruction being given by teachers who seem left at present pretty much to the freedom of their own will as to the kind of exercises they give. Another great difficulty we have in our very poor schools is the physical condition of the children. They are half-starved and ill-clad. I have found, however, in a recent visit in one of our poorest schools, that boys who, before the raising of the age (by last year's Act) for compulsory attendance at school, would have left school with a labour certificate, to go to work, went through a series of physical exercises with apparently great satisfaction to themselves and to their teachers. Most of these boys were wage earners, being employed before and after school hours. I believe that if they had been prohibited from being employed before and after school hours, there would have been much greater difficulty in getting them to attend school, and the same difficulty in giving them physical exercises, because their underfed condition would have continued. My opinion is that, in the case of those very poor children, too much should not be required from them in the way of physical instruction till they become a little stronger. They improve very much as they go up

through the school. In our day industrial school we have a very well equipped gymnasium, and although it is only a very few months since a regular gymnastic instructor was appointed, the boys have made extraordinary progress, and already it has told on the discipline of the school. Before that the drill was given by the janitor of the school. In this school many of the pupils are very much of the same class as those who attend our schools in the poorer districts, but of course they have the advantage of being well fed, because they receive three good meals a day. In regard to the Royal High School, I consider that the physical instruction given there could not very well be improved. There is a splendid gymnasium and swimming bath. There are two specially qualified instructors of gymnastics, fencing, swimming, and drill, and in the case of the High School boys, attendance at these classes is compulsory, unless they are exempted under a medical certificate. The instruction in the gymnasium goes on during all the school day, so that provision is made for every class being taught, and the results of the teaching I consider are admirable. I have very few suggestions to make, but the first is in regard to this subject being made compulsory. Unfortunately, all school managers and teachers and inspectors do not appreciate the necessity for it, and do not realise its educational value. I would suggest that in every scheme of education submitted for approval to the Education Department, this subject should have a place on the time table, and that a graded scheme of instruction for each department of a school should be submitted. By that I mean that the scheme of instruction should be made much more definite than I understand it is at present. The testimony of very many of our most enlightened headmasters is that physical education conduces to better discipline and to better educational results. Another suggestion I would make is that in connection with each school, or group of schools, it would be a great stimulus to interest in physical education if cadet corps were formed. I do not know of any such corps in connection with our Board Schools, but there are corps in connection with some of the secondary schools. Of course I recognize that the Boys' Brigade attracts a great many boys who are still in attendance at school and after they have left school, but I believe it would be of immense advantage if the interest in that corps could be connected with the school in which the boy has been brought up. The cadet corps in connection with Merchiston Castle school has had a most distinguished reputation, and I believe the Commission would receive very valuable information in regard to that corps. For the lads and young men who attend our Board evening schools, I believe that a central public well equipped gymnasium would be an enormous advantage, both for those who come really to study, as well as for those who require to be bribed to come to school by the attractions of games and other recreations. I think that public gymnasiums should be as essential for every town population as public swimming baths. I understand that the municipality in Aberdeen have such a public gymnasium, which is taken advantage of by all classes of the community. There is one important kind of drill which I should like to see introduced into every school, and that is the fire drill which is successfully carried on in the schools of America and in Germany. I cannot speak from anything beyond hearsay knowledge in regard to that drill, but the chief points in it seem to me to be that it enables a school to be emptied rapidly and quietly. There have been great improvements lately in the methods of arranging for the entering and exit of children from schools, but I understand that very special attention is given to these two points of rapidity of movement and great quietness, and all the movements being conducted by means of signals. I read a report—I think it was in the town of Rochester, in the United States—that one school with a population of between 800 and 900 children was emptied within forty seconds owing to the rapidity and the precision of the drill. I think that would be a very

excellent thing if it could be introduced into our schools. Then, in conclusion, although it has nothing to do with my work as a member of the School Board, I am Governor of the Edinburgh Royal Blind Asylum and School, and we have recently erected a large gymnasium there for the blind children—boys and girls—who have been now under instruction for about nine months, I think with most excellent results both as regards the health of the children and the discipline. I do not know that I have anything further to say.

Boys and
girls :
proportion.

2287. *By Sir Henry Craik.*—You mentioned the number of boys and girls who were receiving such instruction. Can you say what proportion that is of the attendance at your schools?—I think about half; we have enrolled in our schools about, I think, 30,000 children. I think this session we have over 33,000.

2288. Then rather more than half?—Rather more than half.

Teachers :
certificate of
proficiency in
physical
training
desirable.

2289. You spoke of the reasons which have led this instruction to be rather neglected by the pupil teachers; do you think that the increased requirements necessary for entering the Training College is the cause of this?—Yes.

2290. Would you suggest any remedy?—Well, my remedy would be a most drastic one; I would do without pupil teachers altogether.

2291. Well, of course, a good many people agree?—But I think that it would be better if we had still a longer apprenticeship. At present pupil teachers claim a two years' apprenticeship, and our teachers say they require all the time to get them up in the subjects necessary for their examinations. They have so many things added now; they have to take science classes and different kinds of drawing, and so on, which were not formerly necessary.

2292. But would you think it well to count as an element in the competition for entering training colleges their physical instruction?—Yes, certainly; I think it is quite sufficiently important for that.

2293. And in the granting of a certificate to teachers at a later stage, would you also count proficiency in this to be one of the elements?—Certainly.

2294. And require a certificate to that effect as one of his qualifications?—Yes, I think so. Well, it might be rather hard in the case, especially of women, who might be excellent teachers, and yet would not have the physique to go through a very strenuous course of instruction in physical drill.

2295. But I suppose for infants that instruction can be carried on with very little exertion?—For infants, certainly.

2296. You say at one part of your evidence that it is very difficult that a non-grant earning subject, which is not compulsory, should compete with those who can earn such grants; what do you have in your mind when you say that?—Well, I was thinking of the grant for attendance at cookery, or a grant for attendance at woodwork instruction, and so on.

Physical
instruction
should be
compulsory.

2297. But those are the only subjects that we specially pay for?—Those are the only subjects, yes.

2298. Then would you prefer that we should proceed by the method of making physical instruction necessary in the curriculum of every school, or that we should pay specially for it as we do for cookery?—No; I should not like it paid for specially.

2299. Would you like it made a compulsory subject?—Yes, and that it should be more systemized.

Playgrounds :
fields for
general use.

2300. You speak of a swimming bath and playgrounds; have you attempted in Edinburgh to have any playgrounds which would be common to the schools—any field, I mean?—No, we have not in connection with the public Board Schools. In connection with the Royal High School there are two fields.

2301. That is a higher class school?—Yes; it is a higher class school.

2302. But do you believe it would be within the power of your Board to acquire a field for general use?—I do not think so.

2303. Have you ever taken legal advice on the

subject?—No; I think we have the fear of the ratepayers too much before our eyes.

2304. But, legally, I am not aware that any objection has been raised?—I do not know; that is a question I could not answer. To my non-legal mind I should say we had not such a power; we are required to find a certain amount of playground for each school.

2305. It need not be contiguous to the school; I see no reason—nothing in the Act—which would require it to be contiguous to the school?—Possibly not; I never considered the subject, I confess.

2306. But you say the ratepayers acquiesce in your acquiring a playground for the High School?—That is a different thing; the High School has two playing fields, towards the upkeep of which the School Board contributes £100 per annum. One of the fields is at Holyrood, just opposite the Palace, and the use of it is granted by the Crown to the Royal High School. The other field is at Corstorphine, and is rented by the cricket and football clubs of the school; I think we got special leave to make a special contribution to the rent and upkeep of these playgrounds.

2307. You got special leave?—I think so, but I speak under correction.

2308. But you got special leave from the Department?—Well, the payment has been passed by the auditor; it was recognised that the playground really is paid for by the High School Clubs, the High School Athletic Clubs.

2309. But none of the grant-earning schools can claim such a privilege?—No.

2310. Then with regard to feeding, you feel a difficulty as to that; have you any suggestion as to improving matters there?—No, I am afraid not; I do not think that that really is a question for educational authorities, as for the Parish Councils, and—

2311. *By the Chairman.*—Parish Councils?—Yes; I mean that there is a great deal of relief given by the Parish Council to the children of widows, and to children who have a claim on the rates, from the parish, but I do not see that it is a matter which it would be desirable even for School Boards to interfere with. Of course there are a great many philanthropic agencies in most large towns for providing dinners for poor children.

2312. *By Sir Henry Craik.*—But do you think that the School Board might not take the organization of some sort of system of providing, which would be paid for by the pupils?—Well, I hardly like to answer that question in the affirmative. I think School Boards have quite enough to do without undertaking work of that kind.

2313. As to the instruction you would have given to girls, are there any elements that you would bring into that as distinct from the boys?—For girls I like the Swedish drill, which can be given with almost no apparatus at all, and it can be taught in any ordinary class-room, and I think it is a very excellent kind of drill if it is given really by a properly graded system advancing from one stage to another.

2314. Then as a rule the instruction, such as it is at present, is given to the boys and girls separately?—Certainly the instruction given by the gymnastic instructors. The ordinary class drill that is given at the interval of the different classes is given simultaneously by the class teacher both to boys and girls. I refer to the instruction which is given probably at the beginning or the end of each school lesson. The practice varies so much in the schools. In some it is considered important and in others not. It depends greatly on the interest of the headmaster and on the ordinary class teacher whether it is carried out regularly or not.

2315. With regard to the Continuation Classes and the pupils over fourteen, do you conceive that it would be possible to enforce a certain amount of compulsory attendance at these evening classes?—I think it would be difficult to enforce it; but if attendance at a well-equipped central gymnasium were recognized in the scheme of education in advanced continuation schools, I do not think much compulsion would be required. The great difficulty is to fit into the very short hours of the

evening school scheme sufficient time to make any instruction that would be given there very satisfactory.

2316. But you have no doubt that if it were possible to enforce it, it would be for the advantage of many of those youths from fourteen to seventeen?—There is no doubt it would be to their very great advantage.

2317. *By Sir Thomas Coats.*—With regard to the time required for giving physical training to children in Board Schools, do you think the time table ought to be arranged so that they could give, say, half an hour per day, more or less; would you suggest a longer time or a shorter time?—Half an hour each day.

2318. Yes?—I think it would be very desirable if that could be given; but, as I stated, there seem to be so many other subjects that claim attention, and very often we find that the time given depends a good deal upon the value which is attached to this instruction by the inspector. He may claim that longer time shall be given to some other subject, and the headmaster says, 'Yes, but that takes so much off the drill.' Well, he encourages the subject that he thinks is the most important. That really is the difficulty. I quite realise that up to this time school managers and headmasters have not yet fully realised the freedom under which we now work, and I think it will take some time before we fully take advantage of it. I should like to emphasize the fact of the influence which the inspectors have in regard to that. There is a very strong tendency on the part of our teachers to encourage those subjects to which they find individual inspectors attach importance. As to the actual time that should be given, I think half an hour a day would perhaps be excessive; I would rather have a shorter time every day, and then for, say, one hour in the week special instruction in the gymnasium.

2319. Is that in addition?—You see the school day is not a very long one, and there are so many things to be got in, especially in the case of girls. In addition to the boys, they have needlework, drawing is now compulsory for them—it was not formerly; then they have to learn cookery, and they are very much handicapped in regard to that. Then if you were to tack on another half hour a day for physical instruction, I think it would overburden the curriculum of their school day too much. I would rather have more definite instruction, say one day in the week for one hour, and a short course of exercises given by the class teacher for a few minutes every day.

2320. Then do I understand that you would give a short course every day?—Yes, quite short.

2321. And also two hours a week at some special time not during class hours?—Or one hour a week at any rate for set instruction in the gymnasium.

2322. After class hours?—Regular gymnastic instruction not necessarily after class hours; no, I would let it be one of the four hours of secular instruction which is the minimum we are obliged to give in our schools.

2323. You talked of the unwillingness of some parents to allow their children, especially the girls, to take part in this physical training; to what do you ascribe that unwillingness?—They think it is not a fitting thing for girls; they think it is not proper. I have come across several instances of that, especially in regard to the older girls, chiefly with those who probably have come from other schools. With children that have been brought up wholly in our Board Schools, who began this sort of thing in the infant department and have had it all through, there is not the same difficulty, but I found in one of our higher grade schools—I was making inquiry about it—it happened that in the higher classes there were very few of the girls who would take the regular gymnastic instruction simply because there was a strong prejudice on the part of their mothers.

2324. That would be for regular gymnastic exercises, not for the ordinary physical drill?—They object to that; they think it is unsuitable; that is the word they use.

2325. With regard to the teaching of this drill, do

you think the teachers in your schools could be so thoroughly trained, or ought to be so thoroughly trained, that they could impart all that is required in the way of drill, or would you bring in special instructors?—Oh, I think there ought to be special instructors, because it seems to me that it is exceedingly important that anybody who gives gymnastic instruction should do so with intelligence, and I do not think it would be possible to leave the whole of the instruction in the hands of the ordinary class teacher.

2326. You do not think they could get sufficient instruction to give it?—Some could do it, but I think in the case of teachers in country schools it is especially desirable that they should have sufficient training to give some systematized course of, say, extension exercises; but where you give regular gymnastic instruction I think it is most important that that should be given by fully qualified gymnastic instructors, and there are means of getting such instruction now in large towns, both for men and for women, outside even the instruction given in the training colleges, which, I am afraid, is rather of a perfunctory nature.

2327. *By Mr Alston.*—You say there is another class of objectors, and that is the young men and the young women who object to any interruption of their other studies; they think, I suppose, that the other studies are of more practical use to them?—Certainly; that is so.

2328. Then you would require to attract them towards physical drill in order to induce them to take it up?—Yes.

2329. But as we have no compulsion that might be difficult. Could you suggest anything which would attract those men and women to take some part of the time for physical drill?—I would trust more to the force of public opinion in regard to that. I believe that if opportunities were given to them to receive instruction of this kind, not necessarily at the evening schools proper, but, as I said before, in some central gymnasium where they could have the instruction for a sufficiently long period—I mean for, say, an hour at a time or half an hour at a time on one evening in the week—they would not find that such an interruption as if they got it during the usual hours of evening school work.

2330. Would you say that public opinion would also remove the prejudice of those parents who object to physical drill for girls?—Yes, I think so; we find in one or two schools where it is popular with the girls the parents do not make much difficulty, but it is extraordinary the influence that the opinion of one or two people has in discouraging it.

2331. Then I gather from the general tone of the evidence that the teachers in your Edinburgh Board Schools are not so much in favour of teaching physical drill?—Oh, I think they are very much in favour.

2332. There are one or two remarks which seem to point the other way?—I am afraid I have not made it quite clear, what I said really refers to the inequality of the time given to it in the different schools and to the kind of instruction given. All our headmasters, I think, are strongly in favour of it, but they do feel that, in many cases, it is a question whether, to some of those children, especially to those who are backward, it is more important for them to give the time to physical drill or to some other more purely educational subject.

2333. I take these two sentences: 'Many teachers grudge the time taken from the ordinary work of the schools?'—Yes, that is so.

2334. And the other is: 'I regret to find that the number of pupil teachers taking advantage of gymnastic instruction in the schools has been depleted?'—That is so, and for the reason I stated, because of the shortened apprenticeship, and also the large number of subjects which they have now to take.

2335. But it would be possible by a rearrangement of the whole school curriculum to get in your physical drill in due proportion?—Yes; I think it would be quite possible.

12 May '02.

Underfed
children.

2336. And that all these teachers might take their part in instructing them?—If they were qualified.

2337. And they might become qualified under proper expert instructors?—Yes.

2338. *By Mr Shaw Stewart.*—With regard to the underfed children, you made the remark that they improved wonderfully as they go up in the school—the condition of the children?—Yes.

2339. Would you explain how that comes about; is it because they get better fed as they get older?—I think that is so, and also, that as they get older and are able to work for themselves so far, before and after school hours, they are better fed.

2340. Do you say that they work for themselves?—Yes. Very many of the children in our poorer schools are employed both before and after school hours, therefore I think that if they were prohibited from earning in this way it would be an unfortunate thing for those children so long as the employment is kept within reasonable limits. There is no doubt that as the children go up through the school, being in better air and having a more regulated life altogether, I think they do improve, and improve wonderfully.

2341. That is to say, I suppose, you are speaking of children over twelve?—Well, even before that, even as they go up from the infant school into the juvenile division.

2342. *By Mr McCrae.*—I think you said there were about 33,000 children attending the Board Schools in Edinburgh?—I think so.

2343. Can you tell us what proportion there is of girls in that number—just roughly?—I am afraid I cannot without referring; I could send you these statistics more fully in regard to the proportion of the school populations.

2344. I think it might be useful if you could do so?—I think we may say roughly about one-half.

2345. About one-half?—In our advanced and higher grade departments we have a larger proportion of girls, I think, than boys.

2346. So that as far as physical training is concerned I see that the proportion of training given is about equal to boys and girls?—About equal; yes.

2347. So that if it is about one-half, the proportion to the total number of children is just about the same?—Yes.

2348. Can you tell us how many professional instructors you have in Edinburgh—what you call special instructors, I think?—I think we have six; we have six special instructors, and the instruction in one of the schools is given by one of the ordinary masters who has a special appointment in regard to that; he will give evidence as to that before the Commission—Mr Whitton of Castle Hill School.

2349. That is seven altogether, counting Mr Whitton?—No, there are six, counting Mr Whitton, and then there are in addition the two in the Royal High School, and there are the two instructors in swimming.

2350. So that small number really teaches the 16,000 who receive special instruction given by the instructors?—Yes.

2351. Then can you give us the time really devoted; you said it differs in various schools?—That I cannot give you; I am sorry.

2352. What do you think the average would be?—I could send it in to you; it varies so very much in different schools. In some schools there are more hours a week than another, but I could also send in that—the actual number of hours.

2353. You said that the headmasters present an annual report?—They do; and in that annual report we get expressions of opinion on various subjects, and in this particular report to which I refer there are very strong expressions of appreciation of the value of this kind of instruction on the part of several headmasters.

2354. Well, so far as I can gather, I think in only eight of the thirty-two reports is there any mention of physical training?—I think the reason of that is, the reports from the headmasters as given in the annual

report are mere excerpts. It is generally referred to in all the reports.

2355. Then you speak strongly of the want of system?—Yes; that we feel is a very great want—want of system.

2356. Would you be in favour of a uniform course of training?—There are various systems of physical training. I understand some people approve of one and some of others. The one I like is Swedish drill, but I think it would be desirable that whichever system is adopted should be carried on all through.

2357. You do not approve of a suggestion that was given that the various schools send up systems of their own to be approved of by the Education Department?—That is what I would approve of, and that it should be a system. A system having been sanctioned, that should be carried on through the school.

2358. But you do not quite follow me, I think. The suggestion that I referred to was that each school might have a separate system, and that should be sent to the Education Department for approval?—Yes, that is what I mean.

2359. You would not rather favour the idea of a general system which would be applicable to all schools, with perhaps a little latitude in its application?—It would depend, I think, as to the teachers who would be employed in carrying it out. Of course you would have to have all your teachers trained in one particular system in order to carry out a definite, a central system, as I might call it, and we find such variety of training, such as it is, in regard to our teachers.

2360. Have you many female teachers in the Board Schools who can really be said to be qualified instructors?—I cannot tell you what proportion, but there are some who could do it.

2361. With regard to the continuation classes in the evening schools, how many hours are devoted to those classes?—I cannot tell you; Mr Whitton will be able to give you that information.

2362. Here is a matter upon which I think you will be able to give us some information. I think you said that in many cases the children were employed before school hours and after school hours?—Yes, that is so.

2363. Do you think that in Edinburgh there is any interregnum between a child leaving school and getting employment; is there a period, say, of a year or two years during which they are running about wild?—I think there is a period, at least there was formerly. Until this recent Act which enables us to keep them till fourteen years of age there were a great many children who were casually employed. I think there are very few children who when they left school were left absolutely idle; they were employed selling newspapers or matches or carrying milk, things of that sort; I do not think there is any very large proportion who would not be employed in earning money in some sort of way.

2364. Then with regard to those who were employed before and after school hours, does before and after apply to the same children; I mean, are some employed both before and after school hours?—Some are employed before school hours and after school hours.

2365. Does that obtain to any large extent, do you think?—I think it does; I do not think it obtains to such a very large extent as to be an evil in Edinburgh, such as I understand it is in Glasgow. I have come to that conclusion from the report which was got out by the Women's Industrial Council, I think. They made an inquiry, sent out schedules to various of our schools asking for the number of children employed before and after school hours, and the times of their employment; and as far as I could gather from the replies they got, there was a considerable number of children so employed, but there did not seem to me to be a number which would call for any special restriction; and I understand that the mere fact that inquiry was being made had put an end to the over-employment of children in some cases, where undoubtedly they had been employed for quite unreasonable hours.

2366. Then it does not obtain to such an extent, you think, as to interfere with the fitness of the child

to receive physical training during school hours?—I do not think so except in some cases.

2367. You suggested that there might be a central gymnasium provided by the municipality?—Yes. I think that would be a most admirable thing. There was a proposal—possibly you may remember—in regard to that some time ago. It fell through.

2368. Do you not think that you would be keeping hold of the children better if that was really under the Education Authority; would there not be a divided authority if the municipality were providing the gymnasium and looking after it?—I do not think so; you see the gymnasia that would be suitable for teaching boys and girls under fourteen would not be perhaps sufficiently large or the appliances be suitable for older lads and young women.

2369. That system of training would, of course, be entirely divorced from the continuation classes?—Well, it might be part of the scheme for the continuation classes. The Department recognize teaching in connection with these classes not necessarily given in the actual Board Schools. I think that is so, Sir Henry?

2370. *By Sir Henry Craik.*—Yes; certainly.

2371. *By Mr McCrae.*—Then do you think the municipality provides suitable facilities for outdoor recreation for the children—for outdoor sports?—I think they might do more than they do. There are many gardens, I think, in the city which might, with advantage both to the citizens and to the children, be opened up in various parts of the city. The municipality have applied to the School Board for the use of some of our playgrounds.

2372. Has that been granted?—Under certain restrictions we have granted it, but I do not know whether they have accepted these restrictions.

2373. Does that apply to school days or also to Saturdays?—It applies to every day.

2374. *By Mr Fergusson.*—In your notes you say under the time given to physical drill: 'This also varies in different schools. The subject is now compulsory, and although the Higher Discipline Grant depends on physical training being given in the schools, many of the teachers grudge the time taken from the ordinary work of the school'?—I confess that sentence is not very clear; it is rather a contradiction.

2375. Do you mean that the inspectors do not pay very much attention to the physical training, and therefore, naturally, the teachers do not pay very much attention to it either?—Well, it depends a good deal on the inspector. For instance, an inspector may object to the amount of time and attention that is paid to nature knowledge or free-arm drawing, and the headmaster may say—'Well, I am afraid we cannot give more time to it without taking part of the time from physical instruction.'

2376. The matter would be cured if the Department made it clear that they expected more attention given to physical drill?—Yes; that is so.

2377. Then the inspector would give more attention to it, and then the schoolmaster would have to find time somehow?—Yes, that is so.

2378. But is it not within your experience that elementary schools where they have good teachers manage to do a good deal of physical training without any harm to the other work of the school?—Oh, they do; there is no doubt a good deal is done.

2379. Then the curriculum is not really overloaded as we are told sometimes?—I think hitherto it undoubtedly has been.

2380. Well, but as we are now, are we not very much better than we were?—If we take advantage of the freedom that we have.

2381. There are not very many subjects—reading, writing, arithmetic, history, geography, nature knowledge, drawing?—Free-arm drawing, laundry work, manual instruction, and for girls, sewing, and then if you add on physical drill.

2382. It is not really a heavy list of elementary subjects that?—I think that if this physical instruction

is to be carried out satisfactorily there must be some modification of the mere, what I may call the book, instruction as given in our schools.

2383. Then you said: 'I find in our schools where the physical instruction is sufficiently given, still the other instruction is improved,' which shows that it can be done?—You refer to the ordinary public Board Schools.

2384. Yes, the elementary schools; you will find in some schools the inspector says all the ordinary subjects are very well taught, and the children know them very well, and still that master has found time for adequate physical instruction, which seems to show it can be done if you get the right men to do it?—It can be done, but I think it may be done a little at the expense of the children.

2385. Is there anything you could throw overboard in the present list of subjects. You would not like to cut out reading, writing, arithmetic, geography, history, or drawing, or nature knowledge?—Well, I am not sure about the nature knowledge.

2386. Perhaps not so much in the town; we like it very much in the country?—What I feel is wanted in our ordinary Board School education is that there should be more emphasis placed on the reading, the writing, and the arithmetic.

2387. Your proposal would be that the ordinary physical instruction should be given by the teachers, supervised by an instructor?—By an expert.

2388. But if it is real gymnastics, then you think that few teachers would be able to cope with that; you would have to have a special teacher?—They would have to have a very special training. I think very often harm is done by this gymnastic instruction being given by people who are not thoroughly competent.

2389. Of course that would be only in the town; you would not expect to find a gymnasium in the ordinary country school?—Oh, no.

2390. I should just like to ask you one or two questions upon the point of the children not being properly fed. Of course you agree that it is a very important matter that children should be as well fed as possible when they come to school?—Of course I agree.

2391. And it is almost impossible to get any good results out of them unless they are fed?—That is so.

2392. Then do you not think that that being so it almost becomes a necessity for the School Board to take some notice of an underfed child and try and deal with it in some way or another?—It is a very difficult question. I still feel that it would be undesirable that the School Board should have power to spend money on feeding children.

2393. Oh, yes, I was not suggesting that?—No.

2394. But do you think that the School Board should direct its attention to trying in other ways. You know you get a child that has obviously not had any breakfast, and there is no probability of its having any dinner; do you not think it would be well that the School Board should try to find out why that child's parents have neglected to feed it?—I think that would be most desirable if there was any possibility of enforcing the duty of feeding his child on a parent, but such power does not exist at present unless they become chargeable—the parents of the child become chargeable to the parish.

2395. I think a parent who does not feed his child can be dealt with now if somebody will report the matter to the proper quarters?—Only in the case where that neglect amounts to cruelty.

2396. Well, no breakfast and no dinner comes pretty near cruelty?—But there is an amount of neglect which falls far short of actual cruelty. I may say that in Edinburgh we have two Societies, there is one with which I have been connected for many years—a voluntary association; we offer the help of our Association to the School Board in the case of children who are ill-clad and ill-fed. These cases are reported to us by the School Board attendance officers and further investigated by our committee, and in respect of promise to attend school, clothing is provided or children and two meals a day in very poor cases, dinner only in cases which are not so clamant, and that is kept

Instruction given by ordinary teachers supervised by an expert.

Feeding of children: voluntary effort: neglect by parents: suggestions.

Miss F. C.
Stevenson.

12 May '02.

up by voluntary contributions. The School Board meets us so far that they keep a special register of those children, and the regularity of their attendance during the winter months while these children are being fed is quite beyond that of the ordinary school. We assist children not only in the Board Schools but in the Roman Catholic and other denominational schools.

2400. That is very important; that shows clearly how important it is that the children should be fed?—The difficulty is that we do not get enough money from the public for it; we spend annually between £700 and £800.

2401. Without getting into that part of it, do you not think that if the School Board, say through its compulsory officer, was to inquire into why the child came to school badly fed, if it amounted to cruelty and you could deal with the parent under the existing law, it should be done?—I think it would be very desirable, but I do not see there is any law which can take hold of the ordinary average parent who just keeps his child alive and underfed.

2402. Do you think it desirable that there should be some means of getting at him?—I think it is very desirable that there should be.

2403. If the parent cannot feed the child because the parent has no money, then you think it is a case for the parish; it is a case for out-door relief from the Parish Council?—I am afraid in the most of those cases the evil is due to the neglect of the parent. And it would be extremely difficult to relieve the parent further of his responsibilities; by doing that you might be creating a greater evil in the one case than in the other.

Public
gymnasium.

2404. Might I ask you about this public gymnasium. I gather you think the municipality ought to provide a gymnasium; I confess I cannot understand why the municipality should. I think it would be an excellent thing, but I think the municipalities would say it was hardly their business to provide a gymnasium; and that it was for either the educational authorities or the military authorities or somebody else?—Well, they have supplied swimming baths.

2405. Well, yes, an enlightened municipality such as Edinburgh, but I am afraid not many others?—They have done it in Aberdeen, too, with great advantage. My difficulty about the School Board's undertaking more in this way is, as I understand the object of this inquiry is, to find out what would be the best means of continuing this physical education of the children—the young men have gone beyond the reach of the School Board, and while the instruction would be given in connection with continuation schools, the difficulties are such as I have stated.

2406. Then, of course, if the educational authorities were to have their control of the children extended from fourteen to, let us, say, eighteen, and it were made compulsory that a certain course of physical training should be taken, they would have to provide some gymnasium or other place for them to be trained in?—Of course they would; they would have to accept the responsibility of it.

2407. I am not quite sure that the town would see why they should provide it out of the town rates?—It is very much the same thing; it would be the ratepayers.

Weak and
underfed
children:
principally
under twelve.

2408. *By Professor Ogston.*—You refer in your evidence to the physically weak condition of many of the children. Have you any idea of whether the proportion of physically weak children is great or small?—I am afraid I cannot give you any figures in regard to it. We have a school population of 46,560 altogether who attend the State-aided schools. Various associations, I think, provide for about 2000 children in the course of the winter with dinners and so on.

2409. That would represent the proportion?—I can only say that that represents the proportion of the children we have funds to provide for, but I do not think it represents the proportion of children to whom it would be a benefit to have such help.

2410. At what ages do you think this underfeeding is greatest; it has been already asked but not quite so

closely answered as I should wish; I think you said under twelve?—I think the large proportion of children to whom our society gives dinners are about, I should say, six or seven till about twelve—

2410A. Under twelve?—Yes.

2411. I notice you talk of instructors in the Royal High School who teach gymnastics, fencing, swimming and drill?—Yes.

2412. Are there many of the pupils taught fencing?—A good many of the older boys, I believe.

2413. A fair proportion?—A fair proportion; I do not know how many.

2414. And my next question is, what kind of physical instruction do you find suitable for the Blind Asylum children?—Ordinary gymnastics.

2415. *By the Chairman.*—Free—more than free, applied gymnastics?—Oh, yes; applied gymnastics.

2416. *By Professor Ogston.*—Regarding girls, do you consider that any particular dress is necessary for the instruction of girls in physical training such as you recommend?—Oh, certainly, if they take the regular organised gymnastic instruction, and that possibly is somewhat difficult.

2417. I understood you to say you preferred Swedish drill for girls?—That is for the ordinary class drill which can be given by an ordinary class teacher. That can be given quite satisfactorily by women teachers.

2418. Have you to deal with the provision of instruction for children in any incurable hospital in Edinburgh?—No, I think not.

2419. And do you think that, when you mentioned that the parents of older children objected to physical training, there was any special cause in Edinburgh for this being true?—No, I do not think so; none whatever, just the prejudice on the part of parents.

2420. Does it refer more to girls than to boys?—Certainly, and to the class of parents whose children attend the Board Schools. In the secondary schools for girls there is no objection made at all I think, as far as I understand, on the part of the parents. The question you have asked me reminds me that at first, when we started the very large gymnasium we started in connection with the Stockbridge School in 1882, there was a very strong objection on the part of the parents to the particular dress that the girls were asked to get, but I think that has been overcome in the case of parents who do allow their children to take it.

2421. *By Mr McCrae.*—Was that on account of expense?—Partly that and partly on account of the dress too.

2422. *By Professor Ogston.*—Are you aware whether in Edinburgh there are any medical men of great influence who object to physical training altogether for girls?—No; I have not heard of that.

2423. And you have heard of none of them who consider that it is overdone at present for girls?—No; I have not heard that. I have heard objections taken to certain games for girls—hockey; I have heard objections to that.

2424. *By the Chairman.*—May I ask, have you any acquaintance with country schools?—Very little. Any schools I know about are in the remote Highlands; very little schools.

2425. Just enough to make it interesting to realise the difference between country schools and town schools?—Yes.

2426. You would say, I presume, that there is no medical inspection of schools and scholars at the present time, at such?—No; I think it is very desirable that there should be.

2427. That is what I want to ask you; do you think so?—I do think so—most desirable.

2428. And especially with the view to anything like a regular system of physical instruction?—Certainly.

2429. Rather more so than before. I mean if you increase your physical instruction so much more, ought you to increase your medical supervision?—I think so. We have no medical supervision at all; the only medical examination we have is in the case of the candidates for pupil-teacher appointments.

2430. And, consequently, not only no medical supervision, but no statistics as to development in any way?—None at all.

2431. I mean height and weight?—No.

2432. And muscular development?—No, nothing of that kind has ever been done, so far as I know, in our Scottish schools, except in one or two of the Roman Catholic Schools in Edinburgh.

2433. You say that underfed children should receive very gentle physical exercise; you leave it solely to the teacher to judge?—One would have to do that.

2434. But you might do worse; I mean, a good teacher should be able to know them?—Oh, I think so.

2435. Provided the thing were allowed not too rigid, and that the licence was given to the teacher to discriminate?—I think any intelligent headmaster would be able to regulate that.

2436. Have you ever thought, in physical instruction, whether it should be given according to the ages of the children, according to the heights of the children, or according to the classes, the grades of the children?—That is one of the practical difficulties.

2437. It would be very inconvenient to have to change your classes?—Very inconvenient indeed, and of course one finds a variety of physique of children in different classes. It would be difficult to organise the instruction to suit the children according to size. You could suit them pretty well very nearly according to age.

2438. It would be a point to have, only physical instruction is a totally different subject?—It would be more satisfactory undoubtedly.

2439. Instead of having it interspersed in the middle of the other instruction?—Yes.

2440. You mentioned that you would be very glad

to have a union between Boys' Brigades and schools?—Or some cadet corps; something of the sort.

2441. The only reason I wanted to ask you about the Boys' Brigades is this; you understand that the Boys' Brigade has an essentially religious tendency?—That is the intention, I believe.

2442. I mean, do you think that would be compatible with the union between it and the Board Schools; do you not think there would be difficulties?—I think there might, but I do not believe much in the religious difficulty with regard to the association of children.

2443. Not in Scotland?—No.

2444. There is just one other thing; you said that there were difficulties in some cases on the part of parents. Supposing you had compulsory instruction either to children under fourteen or to those over fourteen on Saturdays, do you think there would be a tremendous objection?—I am afraid I cannot answer that question.

2445. Do you think there would be?—I have no means of forming an opinion.

2446. I am asking you as one well acquainted not only with children but also with grown-up people?—I have a great belief in the force of public opinion; people get reconciled to new ideas.

2447. But to start with, probably there would be?—I think there would probably be considerable objection.

2448. If there was to be additional instruction given on Saturdays, it would rather relieve the overworked curriculum of other days?—Oh yes; in that view of it I would entirely approve of it.

2449. Although it would go rather against the unfortunate teacher who has had perhaps enough to do during the rest of the week?—Yes, I think the teachers would not like it very much.

Miss F. C. Stevenson.

12 May '02.

Cadet Corps and Boys' Brigade.

Compulsory instruction.

The witness withdrew.

Mr S. M. MURRAY, examined.

Mr S. M. Murray.

2450. *By the Chairman.*—You are headmaster of the Sciennes School, Edinburgh, and Vice-President of the Educational Institute of Scotland?—That is so, my lord.

2451. I think perhaps it would be convenient for you to go through your evidence without my asking you any questions. Any questions we want to ask we will ask afterwards?—I have had experience as a teacher of both country and town schools. I have taught military drill myself, and I have superintended the instruction, both by the ordinary staff and by a skilled instructor. I have also been one of the managers of an advanced continuation evening school in Edinburgh which makes it its purpose to try to attract a certain class of lad who does not attend the excellent system of the Edinburgh School Board, and therefore I have some experience of the value of drill and other forms of physical exercise from that connection. Then as Vice-President of the Educational Institute of Scotland I meet teachers throughout the whole of the country, and know a good deal of the difficulties that these men would experience if they were going to add a new subject or develop the present subject more fully than they have it in the schools. And therefore I claim to speak to some extent for the Scotch teachers in this connection as well. In the following summary I have tried to give an account of the work as it goes on in my own school at present in Edinburgh. Sciennes school was opened in 1892. It accommodates 1520 pupils in 22 classrooms. It has workshop and laboratory—that is, physical and chemical—gymnasium, and swimming bath additional to that. I speak more particularly for the gymnasium just now, a room fifty by thirty by seventeen feet, fitted up with a complete supply of both fixed and movable apparatus of the usual kind. The swimming bath—the water—I am not speaking about the room, but the bath—measures fifty feet by eighteen feet. The deep end is six feet and the shallow end three feet,

to suit the different ages of pupils. It contains about 25,000 gallons of water, which is changed at frequent intervals, and we take classes up to thirty-six at one time, the present box accommodation permitting of that. Both gymnasium and swimming bath are in use during the whole year on certain days of the week, at varying times, which I shall give separately; the gymnasium for two days per week for eight hours, and the swimming bath for three days per week for eight hours, inclusive. In physical drill the instruction takes the form of gymnastics and military drill, in the hands of a special visiting Aldershot instructor. The scheme includes three divisions:—

- (1) The use of apparatus (fixed and movable), according to its suitability to the age of pupils.
- (2) Free exercises (without apparatus).
- (3) Military drill for older pupils, including recruits' drill, turnings, forming fours, etc., marching, all being done at the word of command, without music.

In addition to the instructor we have work done by the ordinary staff mainly in the junior and infant classes, when this work is taken under the supervision of the skilled instructor. The length of the lesson is half an hour for the ordinary pupils, one hour for the oldest pupils. All pupils take the physical lesson unless a medical certificate is given for total exemption. Of course we take the parents' certificate for a temporary exemption. The time is taken off the ordinary school day. Failing a certificate the child is supposed to be able to take it, and, as a matter of fact, we find the exemptions are very few in number indeed. Then, additional lessons are given by the staff at odd times more as recreation lessons than formal lessons in drill. In swimming there is pretty much the same arrangement. Of course the numbers are smaller because the class is a voluntary one. We have a special instructor in swimming

Physical drill: scheme of instruction: instructors.

ment desired.

Obstacles.

Suggestions.

who gives full instructions both in and out of the water. I do not think there is any special system of swimming practised. The swimming includes, swimming, diving, rescue, and the resuscitation of the apparently drowned. We give instructions to pupils in all these respects. Then I speak of the need of the employment of a skilled instructor. In such a school as Sciennes there is need both of the skilled instructor and of the ordinary class teacher to help and supplement his work, especially in military drill and gymnastics. Such an instructor should be an Aldershot man to begin with, and arrangements should be made for him to visit Aldershot, or, still better, Edinburgh Castle, at frequent intervals, to keep in touch with army methods. Our man went up to Aldershot and came back with the improvements on recent lines, and the school benefited very greatly by this visit of his to headquarters. As to the result of this on the pupils, from long and close observation of classes and of individuals (this applies to both scholars and pupil teachers), I am of opinion that the inclusion of physical exercises, and especially of military drill, in the work of the common school has had results wholly admirable, both as to the direct effects on the physical development and as to its reaction on the general school discipline. The value of absolute, unquestioned obedience to the word of command inculcated in the drill lesson cannot be easily estimated, but greater results might be expected if more time were given to this subject. There are difficulties in the way of that. We still err in attending too much, and especially too prematurely, to the mental development of the pupil; but with the greater freedom as to schemes of work granted in the Code some effort may be expected to redress this unequal balance. I think that in Scotland our traditional system has been too much given to the head, so to speak, to the intellectual development of our pupils, getting up a rather fictitious state of excellence that evaporates too soon after they leave the common school, and we have devoted too little time to the physical part of our education, in order to get up our pupils rather prematurely to a certain intellectual stage. We are away from that now, as I say, because the scheme of work of the school, being very largely in the hands of the teachers and the managers, permits of a more equal division as between the mental and the physical development of the pupil. There are, however, certain obstacles to be removed before you can expect more development—

(1) The objection of managers to incurring additional expense;

(2) and, very important, the overcrowded state of the curriculum;

(3) and—on this I speak for a good many more teachers than myself—the reluctance of teachers to take in hand an additional subject when they are expected by their School Board and H.M. Inspector to do as much as before in the other subjects of instruction;

(4) the dangers of overburdening the already heavily-weighted pupil.

In other words, if we ask pupils and teacher to do as much in the ordinary subjects of instruction in the same time, there is a danger that we are putting a new burden upon them if we extend this subject further than we do at present. But if the objections of managers are overcome as to expense, and if the overcrowding of the curriculum is modified, then, of course, the other objections would naturally fall to the ground. But I should object to a special grant being given for the inclusion of physical drill in the schools. What is wanted is a block grant of sufficient amount to cover all necessary expenses, both of equipment and teaching. In other words, the scheme of work is all-important with the necessary corollary of freedom in its practical working out. If the teachers and managers prepare a scheme of work for presentation to His Majesty's Inspector of Schools, then it ought to be right that His Majesty's Inspector should inspect the school upon that scheme of work alone. Granting this—I look upon that as an important element—I believe teachers

generally would welcome the opportunity of devoting more time to physical instruction. As a teacher who takes a deep interest in the future of his pupils, I have constantly regretted that the admirable foundation laid down in my own day school was only imperfectly, or not at all, followed up in the evening schools.

The School Board of Edinburgh is making provision—I say, making provision, because it has hitherto been rather imperfectly done—in their system of continuation schools for the teaching of this subject; but objections are taken to it on the ground that it is difficult to find time for it, and also that it is paid at a lower rate than other subjects for which provision is already made in the schools. Now, you may say it is a matter for managers; but, as a matter of fact, in many parts of the country the remuneration of the teacher ultimately—I will not say for the current year—depends upon the amount of grants that the evening continuation school earns, and therefore, if you are asking for the inclusion of a subject paid for at a lower rate, you are asking a pecuniary sacrifice practically from the teacher. That it is popular with pupils I know from practical experience in the working of another continuation school—the 'Fifteen Club' Continuation School—of which I am a manager. A certain type of lad, not wholly admirable and not at all bad, requires to be attracted from the street corner and its incipient hooliganism, and experience shows that one of the most potent agencies is a continuation school, where he gets a generous amount of physical instruction, sandwiched in between smaller, but still useful, courses of mental instruction.

Such a school—nay, many continuation schools—should lead directly to a cadet corps, for which a special equipment grant might well be given.

For lads beyond the age of the day school I would suggest—

(1) Greater provision for this subject in the continuation school on the part of the School Boards, and commensurate grants for the same.

(2) The building and equipment of suitably situated gymnasia, and drill halls for cadet corps, at the expense of the Corporation. That is in Edinburgh only, but that must be modified. There are admirable drill halls that are empty for practically three-fourths of the year. They might be utilized in that way. The Town Council would soon be recouped by the increased sense of law-abidingness in juveniles, and by the decrease of petty offences such as playing football on the streets. Many a breaking of the police laws is due to the lack of other and less harmful outlet for juvenile and even adult energy. In Edinburgh we have got a very complete system of school football that some headmasters are taking considerable exception to. I am one of those who think that it is being overdone at the expense of other and better forms of physical instruction, and, therefore, I have given expression, not only to my own views, but to those of a considerable proportion of the headmasters of Edinburgh on this subject.

While school games have their uses, on account of both their physical and moral effects, they cannot take the place of a proper scheme of physical instruction and military drill in a State-aided day school. In Scotland the only popular game is football—cricket being merely an exotic from across the Border—and there are numerous objections to an undiluted dose of football in a city. I am speaking of the city schools of course.

(1) It is difficult to get ground large enough and suitably near.

(2) Only a few pupils participate at a time, eleven or twenty-two as the case may be. When we have 800 to 1500 lads in one school, that is a very small proportion. And we find the element of competition gets to be so keen between school and school that it is practically narrowed down to the coaching of eleven or fifteen, or thereby, lads in order to show well in competitions. We find

(3) That it is difficult to exercise proper supervision in the presence of excited onlookers.

(4) The attendant circumstances (crowds, their

partisanship, language, etc.) are discouraging to the lads' well-wishers.

(5) The outcome is too often to encourage lads habitually to attend professional football matches as spectators—the worst form of sport by deputy.

In other words, what may be admirable in a school with a private ground has serious drawbacks when taken in earnest in a Scotch common school. For these reasons I do not now encourage school football, although our school team carried off the 'Inspector's Cup' on the first year (1892) of the constitution of the Edinburgh school contests.

In conclusion, speaking as a headmaster interested in all subjects of school instruction, and not prejudiced in favour of one subject more than another, I am, in the interests of the proper development of my pupils both as to mind and body, emphatically in favour of a due and proper proportion of physical instruction, including military drill, in the curriculum of the common school. As head of a staff numbering altogether 47 teachers, and also meeting many teachers elsewhere, I have taken the liberty to jot down a few of the difficulties that I would have in doing more myself and in having my colleagues do more in the country, having regard to the equipment of the teacher himself. As it is impossible for many schools, especially rural schools, to have a special drill instructor, this subject will, in the great majority of cases, fall to the regular certificated staff. The proper and adequate training of such teachers is therefore important. Here, as elsewhere, the outcome of any scheme of instruction will depend on the efficiency of the teaching staff. Then, beginning with the pupil-teachers, I should insist, as I do myself—I have ten pupil-teachers, I may say—that they should (1) participate in the school instruction in this work. Then when such pupil-teachers go to the Training College, (2) all students in training, both University and non-University, and all King's students should take physical exercises and drill (Circular 329). Such training, given without exception to all future teachers, should take to do with the theory as well as the practice of the subject. Then I attach very great importance to the association of a Volunteer company to the training college and therefore to the school, and I should therefore like to see a Volunteer company recruited from the students of every training college and officered by the local training staff, if possible. In one Training College we have that now. (3) A point that must be very difficult in the country—while there should be due recognition of existing certificates, all teachers under forty years of age not already qualified (including all candidates for the Acting Teacher's Certificate) should be required to take qualifying classes under Article 91 (d), this subject being included under the important article of the Code. (4) Special arrangements should be made for the periodic visitation by a certain number of teachers to some important military centre, say Aldershot (or Edinburgh Castle), in order to keep the schools in touch with army methods. (5) In all cases, teachers should, for a time, at least, keep in touch with the Volunteer movement in the district in which they are placed, and if the initial expense of becoming a junior officer were lessened, or if a grant were made to recoup the outlay, it would be well if some of them became officers. There are numerous cases of this already, and the results are promising.

2452. *By Mr McCrae.*—I think that you are strongly in favour of having a professional instructor to teach the scholars gymnastics?—I am, sir, where the number of pupils would permit that to be done. In a school like my own it could not be done without the professional instructor; it could not be adequately done without him.

2453. Then I suppose at present that department is very much under-staffed so far as the Edinburgh School Board is concerned; you have a very small proportion of professional teachers to the number of scholars to be taught?—I believe that is the case generally. I cannot complain; I have two men, a swimming master and a gymnastic master, for sixteen

hours, which, I think, is the maximum number of hours under the School Board; I cannot complain of my share of it at any rate.

2454. Do you think that headmasters generally realise the importance of physical education?—I do not know.

2455. Do you think that is really from a want of knowledge of the importance of it, or is it on account of the system of inspection?—I think, sir, that it is partly due to the permanence of Scotch traditions, as regards the work of the school and the natural conservatism—I am speaking generally—of teachers to take up a new subject. I know it is very marked in other branches of education, and, I believe, as much here as elsewhere.

2456. I suppose you think that we should really have a uniform course of physical training?—Considering that the conditions of school are so varied, I would deprecate any uniform system applicable to the whole of the country. I should think it right that any important School Board or a County Council might have a system suitable to their individual requirements, but I would deprecate any cast iron system applicable to the whole country, and I will tell you why, sir. We have a gymnasium; it would be a pity not to utilise that, but very few schools have a gymnasium. Country School Boards would have a difficulty in getting covered grounds to drill in if the building was not suitable—a small school. Town schools could do that easily, therefore these are objections to a uniform system.

2457. Then you would suggest that each School Board should compile a system of its own, and perhaps submit that system to the educational authorities for sanction?—Certainly, have the same as we have with the other subjects of school instruction; we must practically submit our scheme to His Majesty's Inspector, or to the Department and get approval thereof—drawing, for instance.

2458. Do you think that would be preferable to a scheme that had been very thoroughly considered from a medical standpoint, and otherwise approved of and perhaps variations allowed to the various School Boards?—Well, I should prefer the other method; I should prefer the initiative to come from the local authorities, the general supervision could come from the skilled instructors at headquarters to keep us on the right lines.

2459. With regard to the continuation schools, do you think there would be any difficulty in giving some physical training there?—I do not know. The Continuation Code gives great freedom as to scheme of work, and lads who do not want to take it need not take it, but I think a very much larger proportion of lads would take this if it were offered to them.

2460. What is your opinion of a central gymnasium to be provided, say, by the municipal authorities?—That, I think, would be admirable; I would agree with that.

2461. Would that not rather detach a scholar from the continuation school; I mean you would not have the same power over him, would you?—It would depend altogether on the supervision of those. I should prefer the school to be the unit certainly if the equipment were in the school; but there is a difficulty with buildings frequently, and the equipment that is suitable for lads in the common day school is too small very frequently for the grown-up boys of the continuation school.

2462. But for the purpose of keeping touch with these scholars, it would be much better that they should be under the control of the education authority?—Certainly, I should prefer it.

2463. Do you find that your scholars leave the school and go to employment, or is there any interregnum between the time of leaving school and getting employment?—Well, sir, if you mean by employment casual employment, there is no interregnum. If you mean settling down to a regular steady apprenticeship, very frequently there is an interregnum.

2464. What do you call casual employment; a message boy, for instance?—A message boy.

Mr S. M. Murray.

12 May '02.

Uniform system undesirable: reasons.

Continuation Schools.

Central gymnasium.

Casual employment.

Mr S. M.
Murray.

12 May '02.

2465. You could hardly call that casual employment?—I should then say there is no interregnum; there is no week passes in which I have not applications from employers to send them suitable lads, and the applications include junior clerkships in the numerous law offices in Edinburgh. I have many applications, and really I could place twice as many lads easily and a far bigger proportion than that, in suitable offices, if I had them. I never take such a letter to a boy. I always wait until the boy wishes to leave school.

2466. However, the difficulty is to get a sufficient number of boys to fill situations, rather than a large number seeking employment?—Emphatically so in Edinburgh.

2467. *By Mr Fergusson.*—I suppose when you spoke of the teachers going to Aldershot or Edinburgh Castle that means that you are in favour of what is called the Aldershot system?—Certainly.

2468. And I suppose any other depôt where there is a military gymnasium would do just as well as Edinburgh Castle?—Admirably; yes.

2469. In a course of physical training which do you think is most important, the physical exercises or the drill?—Well, I should be inclined to differentiate. There comes a time when drill becomes a little more important. I should put physical exercises first in point of age, if I am to differentiate between the two, and drill a little later and more important then, but I deprecate the separation.

2470. But you would begin with not very much of the marching part?—Yes; my impression is that young lads do not appreciate the niceties of movement that make excellent drill; it is looked upon as a bore rather at an early age.

2471. I notice you also talked of military drill, by which I suppose you mean the sort of drill that recruits are taught?—That is so. Yes.

2472. Have you ever found any objections raised to military manœuvres being taught the boys, that it was said that it was trying to teach them to be soldiers?—No, sir.

2473. You never heard that?—No, I never heard that. I may say we had a public exhibition of drill, in the Waverley Market in Edinburgh some time ago. Sir Henry Craik was present at it, and it was highly popular with the average parents in the city. They were only too proud to get their children into the team to take part in it.

2474. I understood you to say, with regard to the system that was to be followed, that you did not wish a hard and fast system set up to be followed?—Certainly not.

2475. But the Aldershot system is a hard and fast system?—Yes; but you would have to modify the Aldershot system to your school and to the capabilities of your teachers.

2476. Would it not be very difficult for teachers if there was a different system in different schools? If a teacher went from one school to another he would be rather in a difficulty; and would it not also be difficult for the instructors. An Aldershot man is taught a system, and he has it all at his fingers ends, and would it not be rather difficult for him, instructing and inspecting in a lot of schools where each one was working under a different system?—Well, if you could get every teacher properly qualified under the Aldershot system, I should prefer a uniform system as far as the teacher is concerned, but then he would have to modify his teaching according to the exigencies of his work, his building, and the rest of his staff, and so on.

2477. But these modifications would not amount to very much; the system would be a fixed system?—Well, I should deprecate a fixed system, sir; it is totally contrary to the whole tendency of the Scotch Education Department within recent years, which is to leave the initiative very largely to local requirements, and to give general supervision, and to keep us on right lines; and I am sure you would have less difficulty with teachers and with managers if you followed that course, rather than if you laid down a

fairly rigid system—even a better system, it may be—from headquarters.

2478. You spoke of the difficulty of finding time for physical exercises; you spoke of the overcrowded curriculum, but do you think now, under the system as it is to-day in Scotland, you can say in the elementary schools the curriculum is overcrowded. It is full, I grant, but is it overcrowded?—It is full, yes. From my experience, personally, I quite agree that it is not overcrowded. I am a strong believer in what may be called a 'broken time-table,' having as much variety in the work as possible. I do not think that the head work suffers from a large inclusion of physical drill, but you will find that many teachers take an opposite view from that, and they do think they already have too many subjects of instruction, and that some are getting undue prominence, and therefore another subject would meet with objection from their point of view.

2479. Yes, but then do you not think they might take this view of it, if it were put before them, that this extra subject that you are going to put on to them will make all the other subjects very much easier, consequently they will take shorter time; that is an aid to the others?—They will say that that argument has been used before, I am afraid, regarding other subjects.

2480. Supposing you were going to lighten the curriculum, what would you cut out? What is there now in it that you could dispense with?—I would not lighten it from any other subject, but I would spread over a greater number of years the amount of work that we have undertaken in a less number of years. But I say I agree we can do that now under this freedom we get with our scheme of work. But there again, sir, we are hampered by tradition both of the teacher, and the inspectorial tradition, and school managers' tradition, for they object if children are not up to a certain standard at a particular age; they want to know the reason why—both parents and school managers.

2481. But that is not the fault of the curriculum?—No; we do not take advantage, as I say, of our freedom as yet.

2482. You are rather inclined to the belief that the curriculum is just about as good as it can be at present?—Well, I could not suggest anything that would improve it.

2483. You would not like to strike out free arm drawing, would you?—Certainly not; I think free arm drawing has got a future, sir, as well as a present.

2484. With regard to the continuation classes, you say where a boy gets a generous amount of physical instruction sandwiched in with a course of mental instruction, that it is very popular and beneficial. Would you be prepared to make some form of physical instruction between the ages of fourteen and eighteen compulsory?—Yes, I should.

2485. And would you couple that with any other compulsory instruction?—Certainly. I would deprecate any lad going to the continuation school merely for physical instruction, if you mean that.

2486. That is what I wanted to know?—Oh yes; certainly.

2487. Then if you made physical training compulsory, you would have to make some other subject compulsory?—What I should like to see would be that if a school is recognised as a continuation school, physical drill be one of the subjects that must be taken up in the continuation school, but not necessarily the one; emphatically not the only one. And there are difficulties from the point of view of the grants. Just now, as you know, the continuation schools are in three divisions practically.

2488. Yes?—And the grants for the same number of classes—keeping away from special subjects which are paid at higher rates, eliminate these grants—40 pupils in the elementary subjects come to 4s. 2d. as against 2s. 6d. for physical instruction.

2489. That is to say, the physical instruction is paid less than others?—Is paid less, yes.

2490. One question about the gymnasium; you are very much in favour of a public gymnasium in a town, gymnasium

Aldershot system approved.

Physical exercises plus drill.

Military drill: no objections heard.

Uniform system undesirable.

Mr Murray
12 May '02
Curriculum

Continuation Class

Public Gymnasium

but you say it should be at the expense of the Corporation. Do you not think it is more for the school authorities and the volunteer authorities to combine for a gymnasium than to ask the town to do it?—I have been making some more inquiry about the Volunteer part. I quite agree with that; I would be inclined to modify my evidence so far as to rather suggest the School and the Volunteer hall, than the Corporation separately.

2492. One question about the training of teachers. It is impossible for many schools, especially rural schools, to have a special drill instructor, but why should rural schools not have a special drill instructor, not one for each school but one for a number of schools?—Well, there again, you have so many small School Boards that will not combine practically.

2493. You might make them combine?—If you get the county area teachers not to object.

2494. As a matter of fact it would be much cheaper for them?—Quite so.

2495. We have to pay 5s. an hour for an instructor's services, whereas an instructor if he were taking four schools in a day would not want £1 a day for his work?—Well, I think the line of least resistance would be to employ the teachers.

2496. Oh yes, but I thought you agreed the teachers would do the bulk of the work, but you must have an instructor going round, perhaps once a week, visiting the schools and seeing that the thing was working properly and helping the teachers and supervising the work?—That is what I do with my own instructor in school; he supervises the other teachers.

2497. That is the system you would like to see?—I should like to see it.

2498. *By Mr Alston.*—You remarked, when you were asked by Mr Fergusson whether you would approve of uniformity in the method of giving instruction in physical exercises, that you thought not, and yet, at the same time, you referred to the Aldershot expert who came to inspect. Of course, he is a man who is drilled under a uniform system?—Yes, but our Aldershot instructor modifies his uniform system to suit the equipment and the conditions of the school and its building; and the conditions of schools in equipment are so various that I foresee great difficulties in applying a uniform system to such various conditions.

2499. I think the Commission has been a little puzzled when they have been asking questions about uniform system. We have had upon our table six different books on physical drill; probably these six different books are in use in various schools. Well, we can conceive a course of physical drill, a standard, being laid down once and for all which might be accepted, we will say, by the Education Department, and which all School Boards might be bound to use, giving the teachers at the same time a free hand to adapt it, or parts of it, to their schools; would that not be possible?—No, sir; you would be applying to drill a principle and a method of working in schools which are not found in any other subject of school instruction. I do not think that this Commission could get at finality in regard to the method of drill and instruction in schools to such an extent as would warrant them laying down the law for even any length of time regarding the proper method of instruction in schools.

2500. And yet the law might be laid down by experts, such as medical experts, who can, once and for all, tell you what physical exercises are suitable for different parts of the body?—Well, sir, doctors differ to start with, and in regard to education generally it has been a process of evolution, and the evolution has been in the way of freedom, because I suppose the reason being that the results of freedom are found to be better than those of the cast-iron, that is, the old standard system we have had in schools, and as a teacher I should deprecate and I should expect some failure from your working out in schools a system such as you indicate.

2501. Then would you allow your teachers to search amongst these six books of instruction in physi-

cal drill for the one that they liked best?—I should prefer if the Department would, as usual, indicate the general lines upon which they propose to develop this system and leave the school managers, in advice with their teachers, to formulate a scheme in consonance with that of the Department and also to agree with the general lines that the Department would indicate.

2502. You would rather, then, that the teachers in the School Board schools should formulate a scheme of physical instruction and ask the Department to approve of it, rather than that the Department should formulate a scheme and send it down to you?—Certainly.

2503. Well, the War Office in the matter of drill, which is, of course, what is practised in the advanced stage of these physical exercises, lay down a Red Book; that is the Manual which they have laid down for your guidance. You must not depart from that; you may take from it simple formations in preference to more complicated movements, but you abide by the standard laid down. When you do 'right about turn' you must do exactly 'right about turn' as they instruct?—Would it not be possible to get all the methods, general school methods, of doing individual movements to agree to one general standard?

2504. That is the point I desire to bring out; you want a certain freedom in the application?—A certain freedom; very much freedom indeed; the point upon which I see a difference between your army methods and those of the school would be that the conditions under which the various army depôts or instructors go on are absolutely the same; are approximately the same. In schools they would be very various; diametrically opposite almost regarding the equipment and the size of the school and the ability of the teachers to carry through the system. The conditions are so different that you could not apply army methods with a chance of success.

2505. I am supposing that the army practice is the perfect practice, that they have brought it after due consideration to a point of perfection which probably cannot be done in any other school of instruction?—At present, sir.

2506. I am supposing so?—Yes, sir.

2507. Well, one would think that you might safely follow the Aldershot method of instruction in physical drill?—I am an old enough teacher to have seen a good many different standards adopted in schools, and I have seen them very seriously modified in my short time of teaching, and I should deprecate any fairly successful system even at present applied to the schools. I think the true line is freedom, and I cannot say any more, sir.

2508. I think your opinion coincides with a good deal that we have heard from gentlemen of your profession; still it has been a puzzle to the Commission?—Of course I deprecate books; I do not at all believe in books—any publisher's book.

2509. And the Department does not dictate that?—The Department does not dictate that. Take, for example, drawing; it may illustrate the point. There have been numerous changes in drawing recently; the Department have indicated generally upon what line those changes are to move, and they leave me to suggest, through the School Board, to the Department what course of drawing I shall suggest for my particular school. I would suggest that method for drill or any other such subject as you are proposing to do.

2510. *By Mr Shaw Stewart.*—I should like to ask one further question upon this same point, because I think it is a very important point; are you yourself familiar with the Aldershot system?—Generally, but not as to details. I am familiar with it so far as my man is an Aldershot man; he carries through the Aldershot methods.

2511. Well, would you be in favour of those teachers being trained strictly according to the Aldershot system, and then that each teacher should be left free to modify the training according to his own judgment in his own school, and that the teacher should account to the expert inspector for any modifications that he might introduce into his school; do you follow me?—I do

Mr S. M. Murray.

12 May '02.

Mr S. M.
Murray.
12 May '02.

follow you quite. Generally, I approve, if you make allowance for existing teachers not being qualified under the Aldershot system at present, and for the fact that many of them are above forty years of age, and would have a difficulty in coming up to that Aldershot standard.

2512. Oh, I quite see that; I was alluding to the future?—For the future, certainly. I am quite at one with you on that.

2513. For the future training of teachers?—And even I would go a good deal with the existing teachers if due allowance is made for the age of present teachers.

Games.

2514. Then I understood you to say that games are not so valuable as physical training?—Quite so, sir, in a city school.

2515. A former witness told us that he thought games are no substitute for physical training, for in games each boy may overdo or underdo his own work, and in physical training each boy gets a systematic training?—That is so, sir.

2516. You agree with that?—I agree with that; and it has this disadvantage, sir, as far as my experience goes it is confined to a few expert lads who get the special training to show in competition.

Grading of children.

2517. One question about the grading of children. An expert witness—I think I may call him an expert witness—on physical training told us that in his opinion children must always be graded according to physical strength, and not according to mental attainment, for physical training?—I understand. In theory that is quite right, sir; it will be utterly impossible to apply it in the school.

2518. It would?—It would, yes. You must have some general standard upon which you classify your school, and while all classification is a rough approximation to truth, if you introduce a classification depending, say, upon age alone or upon physical attainment, there would be very great practical difficulties in carrying it out—so great as to make it impossible of attainment.

2519. Well, that agrees with the evidence of the last witness, but we had another witness who told us that in Board Schools he thought it would be feasible?—Well, sir, I disagree strongly.

2520. You do not agree with him?—I do not agree. I have had experience of schools ranging from 100 children to 500, 1000, and 1500, and I can see difficulties in the whole of them, especially in the 1500. You would make drill practically the pivot for the school classification, and that would be an undue preference for drill, with all respect.

2521. I understood the witness who thought it was feasible was of opinion that children would be graded in the school for ordinary lessons according to their mental attainments?—Yes.

2522. But for physical training they would easily fall into different squads and classes according as they had been sized, as it were, beforehand?—Quite so, sir, if you have separate teachers, all qualified, and separate rooms to take the drill in at the same time. That is possible; but the unit for drill instruction must be the class unit of the school—the class unit—and that is only a rough approximation even in mental ability to equality—and not certainly in physical ability. But you get a fair approximation to equality to obviate any great dangers. I would certainly deprecate any separate classification for drill.

2523. You would be content with the mental classification for the physical training?—I should, making allowances as we do at present.

2524. You would rely upon the teacher to make the necessary allowances for each individual child?—Oh yes; otherwise you would be making it a very difficult matter to carry out practically.

Physical exercises, gymnastics and drill.

2525. By Mr Alston.—May I ask one more question? On a former occasion we got from a witness a distinction drawn between physical exercises and gymnastics, and drill; the word 'drill' was used somewhat freely, and apparently the moving of the class in file or in fours was called 'drill,' but I think the distinction was

drawn, ultimately, that physical exercises meant all those movements with dumb-bells, bar-bells, and extension motions of various kinds with the arm; that gymnastics meant applied gymnastics with apparatus, and that drill properly meant military drill in squad or company formation; do you think that is correct?—I agree that that is generally correct.

2526. And it would follow that the true military drill could be applied only to those past school age or just on the outer margin of school age?—True military drill; but there are certain simple movements in which lads of thirteen or fourteen take great delight, in company marching and so on quite feasible with boys of that age; but I would certainly incline to keep military drill in point of age to the latest part of a lad's school life.

2527. Could that be applied in the continuation classes after the school age?—I think the military drill might take up a more prominent part in the continuation classes than it does at present. Keep in mind again, sir, that the ordinary lad likes the gymnastic apparatus; he is very fond of it.

2528. Then suppose military drill could be made to take a more prominent part in the continuation classes, of course after school age, would it be sufficiently attractive to keep the lads?—No.

2529. It would not in itself?—No, it would not. In these continuation classes of which I am a manager we give the lads boxing as well, and we have a harrier's club on Saturday; we have a swimming club on a special night, for which we get grants under the scheme approved for that particular school, and we find all those things are extremely popular with the lads, not so much the drill part of it, though we take the drill.

2530. Well, suppose it comes about, as the result of the work of this Commission, that drill is deemed essential among the older boys, would it of necessity involve compulsion after school age before you could get the boys?—Compulsory school attendance.

2531. No, I mean compulsion after school age?—Do you mean compulsion after school age?

2532. Would it involve that before you could get this so-called military drill?—I do not think it should. I do not think it necessarily should do that.

2533. But you say it has not sufficient attraction in itself?—I would deprecate the separation at all of physical exercises from military drill, as applied to any class of school; I think you are making a serious mistake if you call it military drill alone to start with.

2534. You mean after school age?—I mean after school age; if the school is to be the unit, there ought to be a judicious blending of physical exercises and military drill, but not to the exclusion of either.

2535. By Sir Henry Craik.—With regard to this question of uniformity, the Department has, as you say, given much freedom to the schools?—That is so, sir.

2536. And you think by analogy there ought to be the same freedom given in regard to physical exercises?—Yes, sir.

2537. But, of course, at the start of a subject we must rather give more guidance to the schools, do you not think?—Well, sir, we are not at the start of this subject.

2538. You think it sufficiently well developed to allow of the same freedom as any other subjects?—I think so, sir.

2539. Within certain limits, just as, for instance, in regard to spelling, we do not permit phonetic spelling in the schools,—within limits you would allow the same freedom in physical exercises?—Certainly.

2540. But there are other ways of bringing about a certain uniformity, I suppose, if we get teachers subjected to the same sort of preliminary training, and if we have an examination upon which we give certificates, naturally the teachers would come, more or less, to teach according to one system?—That is so.

2541. And you would prefer that uniformity were worked out by the method of uniformity in the training of teachers rather than by laying down a hard and fast rule upon the schools?—Emphatically.

2542. You have been asked questions about getting

Murray.
12 May '02.

time upon the curriculum for this physical exercise, one point has been left out of sight: you have now a longer school life than you had till 1901?—That is now, sir, quite so.

2543. And do you not think that, now that boys have to attend till fourteen, room might not be found for this physical training without displacing any of the other subjects?—That is absolutely my own opinion personally; but I am afraid, sir, you will find objection taken from the point of view of the school manager, who wants lads to pass the merit certificate examination as soon as they can, and get into the advanced department, or the higher grade school, to earn the higher grants that are earnable.

2544. But a certain amount of physical instruction would not do him any harm?—I would not object to it; I quite agree with it.

2545. And there will be a little more time for it?—There will.

2546. Therefore this is a peculiarly appropriate moment to develop anything of that sort, when the school life is being added to?—Certainly.

2547. You speak of taking up this subject in continuation classes, and you speak of the financial difficulty in the fact that it was not paid for as well as other subjects?—That is so.

2548. I presume the expense is not so large as in the other subjects?—In the Edinburgh system, of which I am speaking just now, they are skilled instructors who take it up, and they are paid practically at the same rate as the ordinary assistant teacher who runs the evening school class.

2549. Would you say that, with regard to the special subjects that we are now developing in the continuation classes?—No, sir; I am speaking just now about the elementary subjects.

2550. Very well; then you mean the subjects that they have under Division I. of the Continuation Class Code?—That is so.

2551. The payment in these classes under Division I. is not so very much differentiated from the physical instruction classes under Division IV.?—As 3 is to 5, sir—30d. as against 50d.

2552. But you do not wish that we should pay for the physical instruction at the same rate as we pay for advanced subjects under Division II. or Division III.?—Oh, no; that is quite apart from that.

2553. Then you spoke of football as one of the games which you were inclined to discourage. Are there any other games that you think might take its place?—No.

2554. You never have had any revival amongst the schools you have seen of the old game of 'Prisoners' Base' or games of that sort?—No.

2555. It would hardly be possible in a town school?—No, it would not be possible. It is a very hard life that a boy lives in town; he is not allowed to play in the street, and in the public parks in Edinburgh his games are very circumscribed, and the places in which he could play these circumscribed games are also very small.

2556. Have you ever turned your attention to Article 24 of the Code?—By number I cannot recall it.

2557. Article 24, by which it is allowed to take outdoor lessons?—Yes, we do that.

2558. To a large number of scholars on the Saturday afternoon?—Yes.

2559. Well, do you not think it might be possible to take some of your scholars under proper supervision on a Saturday afternoon and, counting it as a school attendance, to put them through some good physical exercises, either military drill or a thoroughly good game?—Certainly; these are the lines upon which development might be expected.

2560. But you have never attempted to develop it under this article?—We have visits to the museum and the country walks, but not the games.

2561. Yes, but you understand the visits to the museum are not so profitable, because you cannot have more than eighteen scholars, but you could take all the scholars in Edinburgh and join them together and

count an attendance for every scholar, on the Braid Hills we will say, on a Saturday afternoon?—But then again would that amount to very much in the point of money? because you increase the number of possible school attendances upon which your block grant is paid. I am afraid the outcome in money would be very little from the financial point of view, never mind the educational just now.

2562. Why would it not pay as much as any other attendance?—Well, while you are increasing the number of attendances, you are increasing the number of school openings *pari passu* but no more, and when you divide to get your average at the end of the year it will come out pretty much the same if you have fifty boys in school and you are open 410 times, or if you have fifty boys in school and you are open 420 times; you are increasing your divisor, while you are increasing your number of attendances, and there would be no corresponding financial result for the increased attendance to warrant that.

2563. No; except of course, with a large number of scholars under a comparatively small number of teachers on a Saturday afternoon?—Suppose you take fifty; would the Department approve of fifty going?

2564. I would not disapprove of 500?—Of course that makes a difference. I was thinking of the class teacher.

2565. If they were under proper supervision?—You increase the number of class teachers and the expenses with the numbers commensurate.

2566. Well, I need not pursue that; you say you have had experience both in town and in country schools. How do these schools contrast in regard to their need of some development of physical exercises?—Well, in the country the only available place, as a rule, is the school playground, which is sometimes a very unsuitable place for drill from the bad footing very frequently. I agree that that has improved now and is improving. Then military training must be taken at a certain specified time of the time-table, unless you note deviations in the log-book of course which agree to that, but one would be expected to take it as a rule upon that particular day. Weather conditions are very important in the country.

2567. But does not the Department expressly permit deviation on account of that?—I say any deviation can be noted in the log-book.

2568. There is no difficulty?—Teaching drill will be difficult in the schools, for you must alter all arrangements for it.

2569. You understand the Department puts that permission to deviate with mention in the log-book expressly in order to permit of meeting weather conditions?—Yes; but then you see drill is only one of numerous subjects, and it means the total dislocation of the school work for that particular day if it is not taken at the proper time.

2570. But I ask you how you compared the town and the country in regard to the difficulty of this subject?—Well, we are doing much more in the town than in the country.

2571. And where is the need greatest?—The need is greater in the town; oh yes, much greater in the town.

2572. Do you not find that in the country the children want a certain quickening, and perhaps smartening?—Yes; from the point of view of drill they do. I do not know that the drill would do it, because it is rather mental alertness than physical that you want in country children.

2573. But would not the mental alertness come with the drill?—Yes, it would have a beneficial effect; not very great I think, sir, but still it would be on the proper lines.

2574. You have still not given me quite an answer as to whether you think there is more need of the developing of this physical drill in the town or in the country?—I would say, if I might differentiate, that there is more need of military drill in the country, and more need of physical exercise in the town.

2575. By Sir Thomas Coats.—In your evidence I

Town and country schools: more need of military drill in country: more physical exercises in town.

Mr S. M.
Murray.

12 May '02.

Physical
training:
graded course.

think you said that you advocated military drill more largely than physical drill for the more advanced pupils in the Board Schools?—Yes.

2576. And also in the continuation schools. At what age or what standard would you begin to give more military drill in the school?—Yes; I should suggest the last year of school life for the greater proportion of military drill; I would begin it sooner of course, but would keep it as late in the senior school curriculum as possible, give musical drill in the junior classes, free exercises, including the gymnasium, as far as possible in the intermediate stages, and a larger proportion, an increasing larger proportion, of military drill as the time would go on. It would be difficult to state a definite age, but I should suggest the last year of school attendance at the day school.

2577. Then, in the continuation classes, you would still give a very much larger proportion of physical drill than you would of military drill?—I should like to see it a condition of the recognition of every continuation school, sir, that there should be at least a part of the time given up to physical exercises, physical training, to use the words of your Commission, understanding that to include military drill.

2578. Have you thought whether this military drill given in the Board Schools and continued in the evening classes at the continuation schools, might not satisfy or more than satisfy the children with that kind of thing, that they might be less apt to join the Volunteers or go into the army, because they were satisfied with the amount of military drill which they got in the school continuation classes?—Well, sir, they would be tackling a different subject very largely; there would be shooting in the Volunteers and they would be the possessors of a rifle, which counts a great deal with a lad. I think you would have a new set of attractions which would, I think, obviate that danger. That is purely theoretical, of course.

Volunteers

2579. Then there is one other question I would like to ask; you say there should also be a Volunteer company recruited from the students of every training college and officered by local training staff, if possible. Could you get them for, say four years, in a Volunteer company?—Two years, sir.

2580. Two years?—You might get a few for three, but you must take two to be the number of years in training college.

2581. That would not pay, as far as the capitation grant is concerned?—No; I suppose it would not pay. It is run in one of the colleges in Edinburgh, and my colleague, who is an officer in that corps, could tell you better on that; on the general point I agree.

2582. Regarding the new conditions of Volunteering, could the students in the training colleges go into camp for a week once in two years?—Easily; quite easily, and would be delighted. They would get two months' holidays in the summer time.

2583. And these holidays would probably be at the time when a Volunteer Brigade was being formed?—Certainly.

2584. What time of the year is it?—Practically August and September.

2585. That is, of course, later, as you probably know, than we are likely to have any brigades for instruction at the present time?—I am speaking generally; it may be the middle of July, but I think it would correspond with what I am saying. But they get numerous other holidays in the course of the year, holiday weeks and holiday fortnights. It could be arranged quite easily subject to the supervision of the Department, which has practically the management of that in their hands.

Apparatus:
use deter-
mined by
teachers.

2586. *By the Chairman.*—Who settles suitability in schools as to the use of apparatus?—I do.

2587. Why do you do so; because you are supreme?—I am ultimately responsible to the parents of the children and the School Board; somebody must do that.

2588. Do you consider that you are properly able to do so?—Yes.

2589. I want to know whether you think that your

previous training, and that of your colleagues, has been such as to warrant you?—I think so.

2590. It is a very important thing?—Yes; still at the same time I would not say that we are any more skilled in that than we are in the other subjects of school instruction; but, as a matter of fact, school keeping ought to be common-sense to a very large extent.

2591. And any one who has been at it some time ought to be able?—Quite so.

2592. You had previously, you stated, considerable experience in country schools, had you not?—Yes, I had.

2593. I do not think you have quite given us sufficient advice as to how we should carry out our remit as regards country schools?—From my experience I should rather like to see the teachers better trained for the purpose to start with, and those who are imperfectly trained at present to take advantage of the Article 91 (d) classes which, no doubt, will be started in connection with this subject.

Country
schools
suggest

2594. But you do admit there are some old, some infirm, some short and stunted teachers who are physically incapable of doing much themselves?—Oh yes, I quite agree with that; special arrangements would have to be made for that. I have done so already.

2595. You would allow anything of that kind could not be allowed to come into the general operation for a great number of years to come?—A considerable number of years to come.

2596. But in any case, where any young teacher was apprenticed, such teacher should be proficient?—Yes.

2597. As regards country schools?—Yes.

2598. Then I think you said you thought drill was more important in country schools than it was in town schools?—Because of the different physical conditions under which boys and girls live in the town.

2599. Not so much physical conditions as mental conditions. You thought their mental conditions would be improved by a little rubbing up in drill?—Yes, but I do not attach very much importance to that, as I think the country boy is pretty much on the same level of intelligence as the town boy.

2600. In Scotland?—In Scotland except in the matter of expression; and that does not count for a great deal. I deprecate the idea that the town boy in Scotland is smarter than the country boy.

2601. Well, you referred incidentally to the inspections; of course, inspections made nowadays of schools are haphazard. I will not say they are not scientific, to use Lord Beaconsfield's term—the time the inspection is made?—That is not my experience.

2602. You know exactly when your inspection is coming on?—Well, I know that this last year I had Dr. Stewart.

2603. I do not want you to give yourself away?—I had Dr. Stewart three days in the school, and you could see the result to be pretty much the same as before so far as thoroughness is concerned.

2604. When I asked you about its being haphazard, you said no, it was not haphazard?—No, certainly not.

2605. The inspection is not haphazard?—It is a much more thorough inspection as to methods, and much more valuable from the point of view of the teacher than it was before.

2606. That is all very well as to intellectual subjects, but does that apply to physical training, that is what I want to know?—Even more so, because an inspector coming into a school on a show day—take the parade day, the annual examination day—he would not have time to see more than two or three classes that would be got up to a fictitious stage of perfection, whereas, coming upon the present system, taking it at its best, coming in, say, three times per year at unspecified times, he sees the work going on under the actual conditions, and I should think it is far more thorough under the present system than before.

2607. You were asked a question as to how your Grad would grade classes for physical training, and I think class

Mr S

Murr

12 May

Country
schools
suggest

Insp

Grad

of

you said it must be done by the classes as they stood educationally?—I think so.

2609. And not as regards age, size, or anything else?—Or physical development.

2610. I mean for general convenience?—For general convenience.

2611. The practical work ability of the school?—Quite so; I am very strong indeed upon that point.

2612. Just one more stock question: there is nobody to decide as to the medical state or the statistical condition of pupils in ordinary Board Schools?—There is nobody.

2613. What is your opinion about that; should there be any advance in that direction?—I should like to see an investigation—a medical investigation—at certain periods, of the Edinburgh schools.

2614. I ask you specially with reference to physical training?—I should like to see it. I do it very imperfectly and very unscientifically myself, but I think there is room for careful observation if it were only of one school in a system, either a town school or a city school in each district of Scotland. I would deprecate wholesale investigation; we should only multiply results on parallel lines.

2615. *By Mr Fergusson.*—Might I ask one question about that? You expressed a very strong opinion about the classification; I do not myself quite see what the practical difficulty is. Supposing you put in your time-table that at three o'clock on Wednesday the whole school is to take physical exercises. When three o'clock comes, why should not the children be all taken out of the classes they are in, and re-classified for physical training?—Taken out—where to? Would you continue, sir? Would you have your drill, excuse the question, in the school or outside?

2616. Oh, outside if you can, but anywhere, wherever they are going to be put through their physical training?—It presupposes a simple condition of the time-table that would be very difficult to work with to start at the beginning.

2617. Would it?—It would, and in the second

place it presupposes that all your teachers are equally qualified to take drill in the playground; it would not be in the school, because the school building as a rule is very unsuitable for that. Take Edinburgh, now for example, where we have a special sewing staff, and I have to make the sewing instruction the pivot of many arrangements in the school in order to employ my special sewing staff. I have a gymnastic instructor coming at certain times, a swimming master, a singing master, a woodwork instructor, and all these would have to be turned adrift from three to four on that particular day, men and women, because they could not teach and were not expected to teach drill in the school, and you would make a very difficult practical complication of the time-table in trying to do it. The game would not be worth the candle, sir.

2618. But still, I suppose, it would be a good thing if you could do it; you might allow schools to do it, if it could be so arranged; you would have no objection to them being classified if it does not upset the other arrangements?—Quite so, sir; but I do not see any benefit to be got from it. From seven to fourteen years of age my experience is that children are fairly equal in physical development.

2619. It is done, is it not, at least there is an Article in the Code, Article 19, which provides for varying the classification in other subjects; the Code suggests that the classification should be such as to afford due opportunity for promotion, that a child's reading should not be made dependent on proficiency in, for example, arithmetic. That in practice, I suppose, is difficult to carry out?—It is difficult to carry out. You, sir, are introducing a double classification. In a big school you classify, horizontally, according to age and attainment shown; if you also classify perpendicularly according to special subjects, it would be an insurmountable difficulty.

2620. But you do not think, if you could carry it out, there is much practical advantage in it?—No, sir; you would be making difficulties without any commensurate result.

The witnesses withdrew.

MR KENNETH WHITTON, examined.

2621. *The Chairman.*—You have been kind enough to give us these remarks, would you go through them, please, for the benefit of the Commissioners?—To begin with, I say, I am conversant with athletic sports. I have practised them nearly all my life, and at the present time I am president of the Scottish Amateur Athletic Association and lieutenant in the College Company of the 4th V.B. Royal Scots. I teach physical exercises in Castle Hill School. I am the only assistant master in Edinburgh that does that. The rest of the work is done by drill instructors. The Board asked me to take it, because I have specialized in that kind of work. I am head teacher of the North Canongate Continuation Classes for girls, and assistant master in the Castle Hill School, Edinburgh. I have given here briefly the physical exercises that we give, because I believe that there should be a gradual development, from the very simple exercises to begin with, until we finish up with some military drill in the upper standards. I am very strongly of opinion that military drill should be taught in the upper classes. The bayonet exercises, manual and firing exercises, marching and turning, should, I think, be made compulsory in the highest class in the day school, and I lay stress upon physical exercise, for I do not believe it is intended primarily to make strong pupils stronger, but to make the weakly ones fit for the battle of life, and the course of exercises that I have adopted, I think, tends towards that. I also lay stress upon musical drill. Drill is, I think, to a very great extent recreative. By drill I mean physical exercises; not military drill really, but physical exercises with Swedish drill, and all done to music.

2622. Drill to music in the ordinary term. Does it not rather strike you as a march past to a tune? In

the strict sense of the word, drill with music?—Military drill is done now very largely to music.

2623. Physical training?—Well, bayonet exercise, which is, of course, part of the military drill, is done very often to music.

2624. *By Mr Alston.*—And the manual drill?—And the manual drill; all physical exercises, of course, in the army. I believe very thoroughly in musical drill. Then, with regard to drill instructors also, they should be well educated men as a rule, and gentlemanly in their manner. Sometimes the effect might be that they might introduce, perhaps, a little hard discipline with regard to children, by introducing the army system. With regard to gymnasia, I think that there should be no gymnastics given to children until they had passed fourteen years of age. That should be done in advanced departments or higher grade schools.

2625. *By the Chairman.*—Any kind; free or applied?—I mean physical exercises, pure and simple, with dumb-bells and Indian clubs. That is all that is necessary for children until they reach fourteen years of age. That is my experience, and I have taught it for twelve years. I teach the subject myself in a continuation class. This continuation class is for girls, and I find it is very popular. I give them the option of taking in Division IV. singing or physical exercises, with the result that they nearly all wished to get physical exercise. I taught it myself, and found that they enjoyed it very much. There is one objection, however, to its being popular, I think, in Edinburgh, and that is that it is not paid at the same rate as other subjects. It is paid at the rate of 2s. 6d. per pupil per hour per week; whereas the pupils might be employed in some other subject that would bring in a

higher grant, and some teachers are very anxious that they should get a high grant for their evening schools. The result is that perhaps they do not encourage it to such an extent as they might otherwise. The grant is not an element at all with me. What I consider really is the benefit of the pupils. It is such a popular subject. Where my evening school is placed is a very poor locality, though the girls are particularly robust. We probably get a better class of girls to come. They enjoy the exercise very much, and I have sometimes difficulty to get them to leave at the proper time; they wish to take it a little longer, for they enjoy the thing so much. They take it the last half hour on Thursday evening. The evening schools meet on Monday, Tuesday, and Thursday; they take drill on Thursday evening. Another suggestion might be made, viz., to hold central classes for evening school pupils, but they would require to take some subjects in the evening schools. They could hold these central classes in well-equipped gymnasia, with thoroughly competent drill-instructors on Wednesday and Friday. The classes could meet there, and by doing so all might have it; I think it would be the very best system, the central classes, though personally I should be sorry to lose the girls. I am so much interested in the work I would like to teach the girls in the evening school, but I am in favour of the central classes system, and it would have this benefit that it would simplify the organising of the school. We are allowed just half an hour for physical drill in the evening, and no subject can be taken for only half an hour, so that leaves us very often with half an hour that we get no grant for with the result that we have to take a subject, say arithmetic or commercial geography for one and a half hours, so that if the classes for physical exercises were held in a central place that would be obviated. With regard to the facilities in Edinburgh, I think they are very good; where there are gymnasia they are very well equipped, and when we want to get apparatus the Board at once agrees to any requests; they are particularly good in that respect. Then, with regard to physical culture outside schools, I must just make this remark, some schools specialize very much in doing what they can for the development of the pupils. One school I make special mention of here, London Street School. They have got a very good swimming club there, which has been in existence ten years. An annual gala is held, and prizes are presented, and the competition is very keen. They have a very good tennis club for past and present pupils, and they hold matches with other clubs. The great objection in Edinburgh to the continuation of physical education is want of a public gymnasium. There is nothing of this description. There are several private gymnasia that I know of very well, but the fee is almost prohibitive to working lads; if there was a large public gymnasium it would be for the benefit of physical education. I went to visit the chief constable the other day with regard to what was being done, and to get the number of open spaces. In five districts in Edinburgh there are open spaces where swings have been put up for children, and rings, but these are only for very small children; and he tells me that school boys give him very little trouble, except in playing football in the streets. The class who make his acquaintance most are those between fourteen and seventeen who are engaged in factories, and who, after they come out, have nothing to do but loaf about the streets. Well, I advocate for that cadet corps, as I did the other night at a meeting of the Watson's College Athletic Club very strongly. A cadet corps at Watson's College, probably the largest secondary school for boys in Scotland, would be an excellent thing, and I believe the Managers and Head Master are considering the matter. But there should be cadet corps, I think, for all classes of lads, working lads just as well as those in secondary schools. These, I think, should be attached to the Volunteer corps, the Royal Scots or the Queen's Edinburgh in Edinburgh. They should be under thoroughly good drill instructors, the ordinary drill instructors in fact, and after the lads have finished their cadet corps, knowing that they know

their work thoroughly well, they could then join the Volunteers without going through the recruit drill, which is the most tedious part, as we all know, of the military drill. I have said a good deal about football, and in connection with that I say a good deal of football is played in the Edinburgh streets. I have played it myself—not in the streets, but I have played under both codes, Association and Rugby, for many years. I prefer Rugby, but Association is the game that is played in the Board Schools, and I may make a suggestion here which would be for the good of Edinburgh, and especially for that part of the town that I know so well, that the King's Park should be thrown open not only for school boys, but for those lads who make the acquaintance of the Chief Constable—those from 14 to 17. They could come and get rid of their spare energy in the King's Park without getting into mischief and developing into Hooligans in the Cowgate or in the High Street. The King's Park might be opened, say, from 4 o'clock, when the schools get out, until 9 o'clock—4 till 9 in the summer time. This is a very much felt want, and the Chief Constable said he hoped something would be done in that respect—getting the King's Park open. I believe the only objection to it is that only two or three years ago it was ploughed and sown, and they want to let the grass get a grip before they let people on it. But it is very much wanted for the youth of the High Street, Canongate, Cowgate, Abbeyhill, etc. With regard to school football, this is carried on in Edinburgh very successfully. A system of inter-school contests takes place for two cups, one presented by His Majesty's Inspectors, and the other by the Board School Football Association. They do very good work. There are perhaps one or two objections. One is, the matches are over-advertised. The result is, there is an element among the spectators that would be better away. The class I refer to is those who have no connection with the schools and who come for an hour's excitement and gladiatorial display. They are not interested in the sport purely from the physical point of view or for the good of the country. Then a match has lately been played with London, and I can hardly say I am in favour of that, because I think it takes the children away from school, and it also takes them away from home, and the tendency, I daresay, is to make them men before their time, and perhaps give them an undue sense of their own importance; I do not think that is good. I know something of the Training College Company of the 4th Royal Scots, and I would be prepared to answer any questions dealing with that.

2626. *By the Hon. Thomas Cochrane.*—You spoke of ill-fed some of the children being poorly fed and poorly clad poorly in your district?—That is so. children

2627. A large proportion?—A fairly large proportion, I should say.

2628. Do you find that the physical exercises do any harm to any of those children?—Not in the least. I have never had any complaint from any parent that the physical exercises did them any harm. Occasionally I get lines—doctors' lines and lines from parents—stating that the children have been ill, and they would like, for a short time, that the children would get free from their exercises, and I at once give in to that.

2629. In fact, you exercise a wise discretion?—That is so.

2630. And you have no difficulty in exercising it?—Not the slightest.

2631. You can tell pretty well by the look of the child whether it is suited for it?—Pretty well.

2632. And I suppose you make it as interesting as you can?—That is so. I am very fortunate in having the assistance of two ladies who play beautifully. The airs are principally Scotch, and sometimes I get the children who perform these exercises to sing. I consider it is one of the finest chest exercises that children can have.

2633. That was spoken of by medical witnesses, also the great advantage of children shouting and using their lungs?—That is so.

2634. You find that is the same thing?—The same thing.

Mr
K. Whilton.
12 May
Games.

2635. It has a good effect?—Yes; and I also note the fact that there are very few malingerers: the subject is a popular one. In some cases they want to get away on some excuse. Some bad children do want to get away occasionally, but the cases are rare.

2636. They would rather get away from some other form of lessons than physical drill?—I think so.

2637. I see you have evidently a kindly disposition; you say that everything should be done to make the children happy in the school?—I believe in that very thoroughly. I think they should be as happy in the school as possible.

2638. You find from their general appearance with it has that effect that the physical exercise makes them better in health and therefore happier?—That is so; they are always very cheery there, and I also note this, the senior girls, when they come to me for drill, will hardly go away out of school unless I give them a march to music. They enjoy it thoroughly, they walk splendidly, and they perform different evolutions, and once they have got that they go away quite happy and delighted. It is not often they want to stay long in the school, but on this special occasion they do.

2639. You have had experience, I see, in Germany and Russia; you have seen the physical training there?—I have travelled a little.

2640. You apply a phrase to Germany and Russia that I have heard in our own country, that "we take our pleasures sadly." You think we take them more happily than they do in Germany and Russia?—I think we do. Our children have a spice of frolicsomeness and humour in them that is totally wanting in the German child, and I have seen German children with swords and helmets, and faces as long as they could be; there was no suggestion of any fun of any description. That is not my experience of Scotch boys or girls.

2641. Then, I suppose, you do not confine it altogether to the military evolutions; you use more physical training than actual squad drill?—Physical training, yes, with a judicious amount of military drill. Especially in the upper classes I wish to train the boys to go through the manual and firing exercises, so that when those cadet corps come off, as I hope they will, these boys will be able to enter into them and be thoroughly well equipped. I may say also, in the regiment of which I am a member, that many of my former pupils are in the same regiment—the 4th Royal Scots, and they make splendid soldiers. They already have gone through physical development, and they are smart active men, especially in camp. I know them and take special notice of them.

2642. You think there is enough discipline in the ordinary physical exercises to suit children?—Quite.

2643. And it improves them generally in manners and in every other way?—Yes, and especially in implicit obedience. That is one of the great factors in physical training, to make them thoroughly obedient to their employers and everybody whom they come in contact with.

2644. But you find that, after leaving the school, the pupils are obliged to give up their exercises?—Unless they go to the Boys' Brigades and even that is only for a certain class of boy at a certain age. They leave that, and they are probably too small to enter the Volunteers; the result is there is another break there.

2645. And just at that age—from about fourteen to sixteen or seventeen—is the one at which you would prefer to see them employed?—I would distinctly; and a very critical age for boys, I think, when they either become good men or bad men just at that particular time.

2646. The physical training would have a moral as well as a physical effect?—It would.

2647. You spoke of there being excellent gymnasia in Edinburgh, but the fee charged is prohibitive to working lads?—It is.

2648. Could you suggest any way in which that could be overcome?—Well, a public gymnasium. I

would suggest that it would be a good thing if the city built one, or some public benefactor.

2649. Some public gymnasium for the use of all schools in Edinburgh?—Well, it would not be necessary for schools; I mean for these lads who have left school, because those who are in school can get a certain amount of physical training.

2650. But would you have a gymnasium for lads over fourteen?—Certainly.

2651. And under eighteen?—Yes.

2652. After that age you think they could provide their own physical exercises?—Well, they would naturally, I think, go into the Volunteer corps, and every Volunteer regiment ought to have a thoroughly well-equipped gymnasium at head-quarters. In our Edinburgh regiment we have not, but the Queen's Edinburgh are having a new place built with a splendid gymnasium. It will require to be a big one, because there are three battalions in the Queen's.

2653. Will that be made available for any boys when it is not being used for volunteers?—It probably might, with the permission of the commanding officer.

2654. With the permission of the commanding officer, and if some contribution were made towards the expense of it?—Yes.

2655. You would throw that out as a suggestion to the Commission?—I would.

2656. You say that some of the school playgrounds are unsuitable for football?—Quite unsuitable, on account of the fact that they are mostly overlaid with concrete, and if the boy comes down of course the result is bad. It is far better for them to play out in the streets for that matter, and they do play there, but they have got a splendid system of scouting; the boys herald at once the approach of the policeman.

2657. Do they play hockey in the playgrounds on the asphalt?—No; the playgrounds are too small for hockey, but in the country districts it is played. Hockey is the game there; it is called 'shinty,' it is practically the same game.

2658. They can play that on asphalt?—In country districts it is the popular game.

2659. You advocate the opening of the King's Park at Edinburgh; in whose power is the opening or the closing of the park?—The Office of Works.

2660. The Office of Works at Edinburgh?—At Edinburgh.

2661. Have they been approached, do you happen to know?—I believe they have on a former occasion, but not by the School Board. I forget who approached them, but it was refused; but I think a suggestion coming from a Commission such as this would do a great deal to having it opened, and the Chief Constable wishes it, which means that it would be a good thing for the town.

2662. What form of games would you suggest should be played by the children in the King's Park if it were thrown open?—Football.

2663. If His Majesty's Office of Works gave permission to open King's Park what kind of games would you recommend?—Football, cricket, and they would also have an opportunity of training for the annual school sports held at Powderhall.

2664. And could one or more schools meet at a time in the King's Park?—Oh yes; it is a very big park.

2665. Is there much Hooliganism in Edinburgh?—Not much; we have got an excellent Chief Constable, a new man who is working on the proper lines.

2666. You say credit is due to many masters who sacrifice much of their business time for the advantage of the boys; do they try to teach them games—the masters?—They do. They go with them to the parks that are available, and they explain to them the rules. They show them the proper way to play, and in that way they play very excellent football. As I say, the result of it is that a very strong feeling of friendship springs up between the masters and boys. They look upon them more as personal friends. And they also go to the matches that are played, and do all in their power to induce pupils towards gentlemanly behaviour and also the onlookers.

Mr
K. Whitton.
12 May '02.

Mr
K. Whitton.
12 May '02.

2667. Generally you find great advantage from physical training so far as you have seen it in Scotland?—Generally; that is my opinion very strongly.

2668. And there is no fear of it being still further extended with advantage?—My opinion is that it should be very much extended. It is a subject in which I am very deeply interested.

2669. You are a good example of physical training?—I have practised sport for a number of years.

Games.

2670. *By Sir Thomas Coats.*—You were talking about football in Scotland and match playing; does that limit the playing to a certain number in schools, or do you have compulsory playing of football for all boys?—Oh, there is no compulsion; it is purely voluntary, but the best boys are selected. It is a case of the selection of the best. You put the best boys into the team, but they all play almost every day in Edinburgh. Every boy plays football; he will play.

2671. And do they play it systematically; do they play it as a scientific game?—Oh, yes; probably they do not play it with eleven aside in the recognised way, but they have always matches. For example, in the school in which I am, at the back of the Castle, my boys come in and tell me that the 5th beat the 6th to-day by so many goals. They play one standard against another even in the public streets. Of course, we have no playground worth speaking about. There is a playground, but it is immediately below the school; the space is very limited.

Cadet corps :
teaching of
drill to boys
between
fourteen and
seventeen
practicable.

2672. You advocate cadet corps, I think, for taking boys of between fourteen and sixteen or seventeen off the streets?—I do.

2673. Do you not think there would be a practical difficulty in drilling these boys?—I think not.

2674. Of course, as you know, the drill halls belonging to the various volunteer corps are taken up in winter almost entirely for the drill of the corps?—They are.

2675. Could you drill these boys in the summer when the halls are not so much taken up in that way?—Yes; or drill them out in the open air; you know, sir, that there is very little drill supposed to be done now in the drill halls; it is all outdoor exercises.

2676. The setting-up drill?—You must have outpost drill and skirmishing; that cannot be done in the drill hall; in fact, work in the drill hall is tabooed, except for recruits. Manual and firing exercises, and ordinary drill are done in the King's Park; outpost duty is done all in the open air, so that is a thing that would suit those lads.

2677. That is after they have been instructed so far in the hall?—Oh, yes; I think arrangements could be made.

Volunteer
corps : no
difficulty
about the lads
joining

2678. Regarding these boys afterwards joining the Volunteer corps, I suppose you know that we have been told that quality and not quantity is what is required nowadays?—That is so.

2679. Would you not have a difficulty in drafting these boys into the Volunteers unless the number of battalions were increased or the number of men increased in these battalions?—I think not. The tendency at the present time is not to have so many recruits as formerly, on account of the fact that going into camp is compulsory, and many who would join the Volunteers will not join it now because they cannot get away from business, and I think that there would be plenty opportunities for these young cadets joining the Volunteer corps, and they would make undoubtedly the best volunteers, because they have been already trained.

2680. So that you think there would be plenty of room?—There would be plenty of room.

2681. Looking at the new conditions forced on Volunteers now of attending camp?—Yes. Of course there are several corps in Edinburgh; Leith one, and the Queen's Edinburgh three battalions, the Royal Scots, and the 9th; plenty of opportunities for them.

2682. You say: 'I am prepared to answer questions dealing with the training of the College Company of the 4th V.B. Royal Scots'?—Yes.

2683. Would you just give us a little information

about that; it would be interesting?—The company is composed of students in the College at the present time, and also a few ex-students who are teaching in the neighbourhood of Edinburgh. We call it the College Company. The captain of the company is the instructor in physical exercises in the Church of Scotland Training College, Mr Macnee. He holds the Aldershot certificate, and knows the subject very thoroughly. They are very well trained, and they get lectures from a physiological point of view. At camp they are a splendid addition to the regiment that we belong to, the 4th, because they are well educated and gentlemanly, and their behaviour is magnificent, and altogether I think it has been one of the best things that has been done for Volunteering in Edinburgh to have this College Corps, were it only for the good they have done in raising the athletic tone among the 4th Royal Scots, which is composed mostly of working lads. To give you an idea of our work, on Friday next we take the train to Hawick, we march about nine miles and stay at a farmhouse, and for the next four days we walk across the borders, across to Otterburn, and then on to Almouth, and come back by Flodden Field. Major Watson Armstrong is to give us accommodation, and we finish up on Tuesday night in Sir R. Waldie Griffith's. We are getting his barns, and his stables for the men; we will be very comfortable there. Each of these days we count two drills, because we accustom the men to outpost work, and generally the work that you do on route marches.

2684. How long do they remain in this company; is it purely a cadet corps?—It is a Volunteer corps under the same regulations as the ordinary Volunteer.

2685. And earning grant in the ordinary way?—And earning grant in the ordinary way, yes.

2686. How long do you get the men to remain there?—Well, they must be there for two years at least; some, I say, will stay on for any number of years, those who get situations in the city of Edinburgh. Some of our non-commissioned officers are excellent men, and we wish them to stay on. They are employed in schools in town, and they are splendid men.

2687. Have you not a financial difficulty about running this company?—Not in the least.

2688. Two years does not pay for uniform and outfit?—Well, I have heard of no financial difficulty. Of course the corps is part of the regiment, and the regiment supplies the uniform.

2689. They encourage the thing?—They encourage the thing, but we pay our way because the uniforms last more than two years. You do not require to change them very often. We pay our way very well, and we are getting a very handsome grant from the regiment to assist us in this route-marching across the borders.

2690. Then will you go into camp?—We will go into camp. We were at Aldershot last year. It was very popular with the lads; they enjoyed it splendidly. We were a month at Lochcote. It was a splendid thing for them from a health point of view; they have their holidays at that time, and when they were at Lochcote they were paid; it suits them very nicely.

2691. How long were they at Aldershot?—We were there for a week, and we go to Crianlarich for a week. We are not part of the army corps—all army corps lasts for a fortnight.

2692. But you go with your regiment?—We go with our regiment, oh, yes. There is a brigade up at Crianlarich this year. One thing I should like to remark about the Volunteer corps is this, that in country districts there is a great scarcity of getting good officers, men cannot devote the time. Now, I hold these are the men, these young students, many of them University men and gentlemanly men; these are the men who will supply that want. They go to a country district, they become officers there, they make Volunteering popular; and not only do they make Volunteering popular, but they are so well instructed and so well qualified that they can instruct their own pupils in physical training; that is one of the greatest

Mr
K. Whitton.
12 May '02.
Volunteer
College
Company

Volunteer
benefit of
College
Company

benefits, I think, of the College Company of the Royal Scots.

2693. Could you draw officers from this company for these proposed cadet corps that you talk of?—They could be drawn, and they make very suitable ones too, because they know how to manage lads.

2694. *By Sir Henry Craik.*—You are now head teacher of North Canongate Continuation Classes for girls?—I am.

2695. What has been your training previously: did you go through the Training College?—I did; the Established Church Training College.

2696. Then you do not confine yourself in teaching to the physical exercises; you teach other subjects?—No; I am an assistant master in Castle Hill School.

2697. You only took up this as a feeder to your ordinary work?—Yes; the Board wanted me to take up the matter because I had studied the matter in Aberdeen, and taught it there before I came to Edinburgh.

2698. Did you have any opportunity of practising it in the Training College?—Not in my time.

2699. What turned your attention to it specially? Was it your own taste?—Well, for years I happened to hold the amateur championship in Scotland for hammer throwing and weight putting, and all my inclinations were towards physical exercises, and I went in a lot for cricket and football. I was captain of a football club, cricket, rowing clubs, and golf clubs. I was very much interested in the work, and that is how I went in for it.

2700. You are in the exceptional position of being what we might call a very thorough expert in those physical exercises, and, at the same time, having had the training, and taking part in the ordinary work of a teacher in the school?—The same.

2701. We cannot hope that that should be repeated in many cases?—Not in many cases, I daresay.

2702. And if you had to choose whether you would have a physical expert or the ordinary teacher who has had a certain amount of physical training?—For standard work in the ordinary school, I think that the certificated master would probably be the better. At the same time, I should think that there should be a drill instructor to assist.

2703. Of course you are in an exceptional position for giving an opinion upon this, and therefore I am anxious to draw out exactly what your view is. You think that in most cases the ordinary teacher is quite capable of learning the work very satisfactorily if he gets opportunity?—I think so.

2704. Have you had any experience of the classes under Article 91 (d); that is, the classes for teachers?—No, I have not.

2705. You do not think that the mere attendance at a class under that Article by teachers would be sufficient to qualify them?—If they were physically good men, and took an interest in the subject, then I should say it would, because I think that all that is wanted up to fourteen years is simply physical exercises, with dumb-bells, or Indian clubs, bar-bells, hoop drill; that is quite sufficient, in my estimation, for pupils till they are fourteen. Gymnastic work should be given after that, then let the drill instructor come in.

2706. Then with regard to the introduction of the subject into the continuation classes, you spoke of the difficulty of grants, that the grants did not encourage it?—That is so.

2707. But then that is no interest to the teacher?—It is not; many teachers wish to have big grants; they think it a sign of the school flourishing.

2708. But the Department now forbids the payment of teachers by results?—Oh, that is so.

2709. They require a fixed salary?—I do not say that the teacher does it with the object of making money for himself, but purely in order to earn a big grant for the school.

2710. But if a School Board takes a proper view of its functions then the financial matter should bear upon the School Board only, not upon the teacher?—That is so.

2711. You must necessarily in the course of your work come very much in contact with boys from fourteen to seventeen or eighteen?—A good deal; I see a lot of them.

2712. Do you think there would be much resentment aroused by requiring them to attend classes for physical instruction or some form of drill?—I do not think it; I do not think there would.

2713. You have no doubt that it would be for their good?—I have not the slightest doubt upon that point.

2714. And you do not think, so far as your observation goes, that it would interfere with their employment?—Not in the least.

2715. The employers would probably rather prefer it?—They would; the discipline and the training would be very much to the benefit of the employer.

2716. And probably really make the lad a more valuable and serviceable servant?—Yes; I suggest that in this respect, those lads who get physical training in the continuation school should have the mark of proficiency put opposite their name, showing that they have gone through a course, because I think an employer of labour would prefer to have one of those lads than to have one who has not gone through a course from the discipline point of view.

2717. And you think, if there were opportunities open, they would be willing to go?—I think so.

2718. You do not think that public opinion would be against the application of a compulsory form of it to those who did not come willingly?—I don't think so, only I would make the scheme of working a very interesting one; I would not limit that entirely to military drill, because military drill of itself is apt to get monotonous. I would give them plenty of gymnastic exercises, parallel bars, and that sort of thing; that is what the lads thoroughly enjoy, a combination of physical exercise with military drill.

2719. And perhaps some other teaching at the same time?—Some other teaching distinctly; oh yes.

2720. That might be brought under the scheme of our Continuation Class Code?—So I believe. That system obtains in Germany; evening schools are compulsory there.

2721. *By Mr Shaw Stewart.*—As far as Edinburgh is concerned, you lay stress on the usefulness of a public gymnasium?—I do.

2722. For boys who have left school. Have you considered at all whether the pupils should be admitted free, or on a system of fees?—Well, I daresay it would be better to charge a small fee.

2723. Why?—Well, there might be a congestion; too many might wish to take advantage of one building.

2724. I thought perhaps you meant that they would value it more if they paid a little?—Yes, that element comes in, too: that they would.

2725. Sometimes it has been said that youths who have been through a course of physical training may be averse to enlist in Volunteers or militia, because they have to go through a certain amount of drudgery of physical training over again?—That is so.

2726. I suppose that might be obviated by a certificate earned in a large gymnasium being allowed to count in Volunteer training?—Yes, provided, of course, they get an elementary volunteer training—that is, that they had gone through the manual and firing exercises, and knew how to walk about.

2727. At any rate, it would absolve them from some of the elementary drill?—That is the point that lads most object to in volunteering, the long recruit drill.

2728. Then, one other point: we have had divergence in evidence about grading children according to their physical strength and their mental attainments. A witness, whom I may call an expert in physical training, said that they should be graded according to their physical strength. Another witness has told us that that might be a good thing, but it would not be feasible in a Board school. What is your own view?—It might be done; you might have them graded according to their physical strength, but it would involve a considerable amount of work.

Mr K. Whitton.

and beneficial.

Physical
training and
volunteering

Grading for
unnecessary.

2729. It would add a great deal to the teachers' time?—Yes, a great deal; but I find that the physically well-developed pupil and the badly-developed pupil get on splendidly together; the exercises that they get are quite suitable for the most delicate child.

2730. You think physical training could be applied then to classes as they are?—Yes, perfectly.

2731. *By Mr Alston.*—I understood you to say, Mr Whitton, in answer to Sir Henry Craik, that you would limit the teaching of physical exercises in the Board Schools to the boys within school age, that you would not go further than physical exercises; did I gather that as your answer?—Yes, that is pretty much what I should think.

2732. Because in your *précis* you are of opinion that military drill—and you gave a very full statement of what military drill, in your opinion, should be, namely, manual and firing exercises, and bayonet exercise, marching, etc.—should be made compulsory in the senior boys' classes?—Oh yes; I included that of course in the senior class, a combination of the two in the senior class, physical exercise and military drill.

2733. You do not limit this physical drill to the boys of school age in the continuation classes?—Oh, no.

2734. Would you advocate that in every Volunteer battalion, and in the interest of School Board schools, there should be, if possible, such companies as the company of the Royal Scots to which you belong?—I would. I think it would be a splendid thing if in each training college in Scotland where the number of students was sufficient to justify a company being formed, that there should be a company of that description.

2735. And that would provide a body of teachers who, while they may not be all experts like yourself, at any rate would be very strongly interested in all military exercises?—That is so.

2736. And make the best teachers?—That is so.

2737. Have you ever found that there is any objection on the part of parents to physical exercises applied either to boys or girls?—Very few.

2738. But you have?—Well, I have, but only in cases where the pupils were physically unfit.

2739. Well, but, of course, it would not be insisted upon in that case?—I do not remember of a case of one objecting to physical exercise, simply because it was physical exercise.

2740. No sentimental objection?—No sentimental objection.

2741. *By Mr Fergusson.*—In answer to Sir Henry Craik, you expressed a preference, I think, for the physical training in the Board Schools, the elementary schools, being done by the ordinary teaching staff; but do you wish to add to that any expert assistance, or do you think the staff could do without that?—Oh, I think they would be the better of having expert assistance, distinctly.

2742. Just now and again to overlook the work?—Yes.

2743. I did not understand what you meant?—In every school they could not probably get—

2744. You referred to some of the children being poorly fed? Are they sufficiently badly fed to make this physical training rather severe on them?—They are not.

2745. But if a child is getting very little food, is there no risk of overdoing it and overtaxing its strength?—No, I think not. The work is made so purely recreative that there is very little chance of them being overstrained.

2746. You think an ill-fed child is at no disadvantages as regards education?—Well, you cannot expect the ill-fed child to show up so well in lessons as the well-fed one.

2747. But is it as capable of learning?—Not quite; no, it cannot be.

2748. Do you think that School Boards ought to take any steps to try to ascertain which of the children

are badly fed, and why they are badly fed, so far as possible, and find a remedy?—Yes, I do think so.

2749. Is anything done in Edinburgh for that?—Not as far as I know. I believe in Sweden no child is allowed to take part in physical exercises until that child is medically examined to see whether he or she is fit to go through a course of physical exercises. We have not got that length yet in this country.

2750. Do you think, if the School Board authorities were to make some inquiries about the children that are badly fed, that it might not have beneficial results, that the parents might not, if they were spoken to, do better?—It might have that effect.

2751. And anything that would tend to make them better fed would be, of course, beneficial?—Better scholars and better in every way.

2752. You were very strong on the point of your exercises being done to music?—Yes, I am.

2753. My London coat does not allow me to give a practical illustration of what I mean, but do you not think that when you do these physical exercises to music, there is a sort of swing about the thing that is not nearly so good as when it is done to the word of command, 1, 2; you do not get the same prompt work?—Oh yes, I insist upon them going through their exercises; the music must be played smartly and everything must be done with the muscles kept pretty rigid.

2754. But do you get that as well to music, do you think?—Oh, distinctly I do.

2755. And they like it better?—They like it very much better. I go through the exercise to begin with without music and show them how it should be done.

2756. You said it was dealing with the continuation classes, I think, that some of the subjects being paid smaller sums than the others did not make any difference to the teacher in the way of his pay?—It makes no difference.

2757. If I understood one of the previous witnesses, he explained to us in some way or another that it did make a difference to the teacher's pay?—Well he must be paid a certain sum. I suppose if teachers could earn very good big grants for a School Board that the School Board might be inclined to give him more liberal remuneration, but we are not paid according to results.

2758. *By the Chairman.*—Now?—No.

2759. *By Mr. Fergusson.*—Well in some indirect way in many cases if the grant is small it lessens the teacher's chance?—It would.

2760. I understood him to say so: I do not know whether I was wrong?—I do not know if it would; I think not. The sole object I think that teachers—really there is a system of rivalry between them, and the success of their school is very often judged by the amount of grant, and they like to earn big sums.

2761. You expressed yourself very much in favour of a public gymnasium?—Yes.

2762. And you trusted some public benefactor might come forward. Well, we have been waiting for that public benefactor for rather a long time?—We have.

2763. So if a gymnasium is to be provided we must look to some other means. Why do you suggest that the Corporation should provide that gymnasium?—It is for the good of the town, for the behaviour of lads would be ever so much better, I think, if they went through a course of physical training; it would take the lads off the streets, the town itself would benefit—the whole town, all the people would be improved.

2764. But do you not think it is more a question for the educational authorities and for the Volunteer people to devise a scheme of gymnasia than for the town?—Yes; well, it might be done.

2765. Still you would like to see it done somehow?—I would like to see it done somehow; I think by the townspeople, probably they would be able to bear the expense more readily, seeing that it would be a boon to the town.

2766. Now as to the football. One of the witnesses we had this morning said he had given up playing football as an amusement, because there were so many

evils attached to it; is that your view?—There may be some evils attached to it, but you cannot get any game without having one or two. I think the benefits of football far outweigh any evils that there may be in connection with the game.

2767. Have you seen it in many districts besides your own?—I have, yes.

2768. You know that as it has developed it is called the curse of Scotland?—Yes; the professional. I do not think there is much fear of any of our school boys developing into professionals, because when they leave school at fourteen they do not play much football till they are men.

2769. One other question about a point I do not think you were asked about. If there is to be a system of physical training, would you advocate one system being adopted, or would you give each school considerable liberty in the system it followed?—I think it would be necessary to give a considerable amount of liberty, because what would be suitable in a city school would probably not be suitable in a country school. I think, however, that a Circular might be issued giving a general indication of the lines upon which physical training should be carried on, and that each school should submit a scheme of work for the approval of the Department.

2770. I suppose you approve of the Aldershot system?—Not entirely.

2771. Well, you might take that as a basis, I suppose?—That is so.

2772. And then you would allow each school to modify that, or make variations of it to suit their own schools?—Distinctly.

2773. Would not that create a difficulty, with the teachers going from one school to another and finding different systems at work?—Oh no; I think they very soon adapt themselves to the system.

2774. And the inspectors too, when they were going round, having a lot of schools to inspect, all doing different systems, would not that be troublesome?—Their experience would be widened. I think they would soon come to be able to know the different systems taught. I think that physical instruction should be carried on on lines suggested by the Department or by a Commission, but that a certain amount of latitude should be given to each school as to how the thing should be carried through. I do not think that a cast-iron rigid code would suit all schools.

2775. No, but a system which may be modified?—Yes.

2776. But you would have a considerable base?—Yes. I am quite in favour of that.

2777. How about the training of the teachers; would you have them trained on one system?—No; I do not think it would be advisable to train them on one system altogether. I think that the military system, pure and simple, is not suitable for school children. There are some exercises of the military system which would be quite unsuitable for girls—down on hands, for example. I think it would be better having a combination of both physical instruction—some system or other along with the Aldershot system.

2778. Taking the Aldershot system as the foundation, you would modify it to suit children?—Distinctly.

2779. But then you would make that your system; you would teach all your teachers; you would not allow them to be taught all sorts of different methods, would you?—No; I think, however, that the Aldershot system has a good deal yet to learn in the way of exercises for physical instruction.

2780. *By Professor Ogston.*—From some points in your typed evidence and from what you have said, it struck me that you have studied a good deal of the theory as well as the practice of physical training; am I correct in believing that?—That is so.

2781. I should like just to obtain on evidence from you one or two points regarding that; you speak of physical exercises being not intended to make strong pupils stronger, but to make weak ones fit. I suppose that is the essence of all physical training?—It is.

2782. That when you make a man healthy by

physical training, you cannot make him healthier by more?—That is so.

2783. And that those who apply physical training in excess produce disease?—They do. I have never come across a man yet who had developed himself abnormally but who always regretted it; he had great bunches of muscles upon him; unless he took a great deal of exercise he simply ran to adipose tissue—that is my experience.

2784. So that whether the enlargement was local or general he was diseased; he was morbid when it was excessive?—When it was excessive, yes.

2785. And that the application of physical exercise is intended to produce a proper balance between mind and body?—The same.

2786. Also at the age at which children would be subjected to it there are some important epochs, as, for instance, the age of fourteen that you mentioned, the age of puberty in boys?—That is so.

2787. Then connected with that, do you consider there are any very serious difficulties in adopting physical exercise to boys at that period, any very serious risks to be run?—No; I think not.

2788. And also in the case of girls, that physical exercise can be beneficially adapted to them without incurring inordinate risks about the same epochs?—I think so.

2789. What precautions would you say were necessary to guide such a course as this in instituting a system of physical exercise; are there any things that you would like to say should be avoided?—I cannot say that I have thought that out particularly.

2790. There is nothing specially occurs to you either in boys or girls?—I think that if the Commission is to approve of some system, that it ought to be a very liberal one, and that the exercises should be such as to be suitable—particularly suitable for both boys and girls. There are some exercises that girls get—I have seen them in schools jumping and running about and lifting their knees; for instance, there is that exercise on the hands; well, of course, it is an exercise that is totally unsuited to girls, totally unsuited, so that I think if a scheme is to be brought out that it should be on very liberal lines, a guide, that is distinctly what is wanted, a guide to physical training, because in hardly any school will you get the same system obtaining, and the same way of teaching. It is wanted very much.

2791. But beyond that general statement you do not want anything recorded as to what you consider the essence of a good physical training?—Well, I cannot say; I would probably need a little time to think that over before giving a reply.

2792. And beyond what you have said there is no point that you would like to lay before us as constituting a bad kind of system of physical training, no general theoretical consideration?—No; I would say not.

2793. Which system do you consider the best?—Well, I consider the system that obtains in the North of Scotland, in Aberdeen, about the best system, I think, for the training of children up to the age of fourteen. It embraces the military system, and it embraces the exercises that are best in the Swedish system. I have used these exercises myself for the last twelve years, with the result that the work of the school has been mentioned specially in the Blue Book by Dr Kerr, His Majesty's late inspector. I at the same time introduced one or two exercises of my own, but I found that the system is a particularly good system. It is called the Scottish system, I believe.

2794. Would you specify how you think it better than the Aldershot system?—Well, there is a greater variety of exercises for one thing. You begin with very simple exercises; every part of the body is developed by it. I may say that I have not studied the Aldershot system very particularly. I have been in the Aldershot gymnasium, but just on a visit. I can hardly think of a better system than that carried on by Colonel Cruden.

Mr
K. Whitton.

system
advocated.

Cruden's
system con-
sidered the
best for chil-
dren up to
fourteen.

Mr
K. Whitton.
12 May '02.

2795. And on the other hand, you know of no special point in which the Aldershot system is superior to it?—I do not. I have discussed the question with Captain Macnee, who is an Aldershot man; he has got the certificate, and he is of opinion that for the training of children the Scottish system is the preferable.

2796. Do you think that music superadded to a system is of very great importance?—It is.

2797. And could you specify why?—I think that physical exercises should be recreative. In the school where I teach, the exercises are given after the day's work. The child enjoys the exercises because it is a pure rest to the brain. I do not think there is anything in the idea of the brain and muscle working together; I think it is purely recreative, and the music and the drill brightens up the child after a hard day's work in school. I might illustrate that in this way, by interposing this argument. Suppose two men

Music of great
importance:
reasons.

take a walk into the country, six miles out, six miles back, they talk to one another the whole time and engage in a pleasant conversation; when they come back they really feel that they have not done very much walking. If a man is sent out to do that work, and has to keep his mind on it, he comes back pretty much fagged. The same thing applies to drill. When there is music along with the drill I find that it is so much better for the children, and it is a brain rest. That is my principal argument in favour of musical drill.

2798. And what advice would you give regarding the kind of music?—The music played should be national, and should be cheery and lively, popular tunes, good national tunes, Scottish tunes probably for Scottish children, and English tunes for English children. They enjoy them thoroughly when they sing them.

The witness withdrew.

Adjourned.

SIXTH DAY.

Tuesday, 13th May 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman*.

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSON.

Mr GEORGE M^CRAE, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary*.

Mr GEORGE W. ALEXANDER, M.A., examined.

2799. *By the Chairman*.—You are the clerk to the School Board of Glasgow?—Yes.

2800. To begin with, I will ask you just to run through the statement that you have handed in?—We got in a return from the various schools to find out what was actually being done at present, and we found, as I stated in the *précis*, the time varied in the infant departments from half an hour to rather more than an hour and a half a week. In the junior and senior divisions the time is practically half an hour throughout, although one or two manage to find one hour per week. In the advanced and higher grade departments the time varies from half an hour to three-quarters, and in the two high schools which we have under the Board, from three-quarters to two hours a week. I have noted that the system of instruction taken up is based mainly on Chesterton. Some years ago we had our teachers trained, and by way of securing something like uniformity without tying down the instructors and teachers too much, we issued Chesterton's book to the schools and asked the teachers to recognize that as the basis, although our work goes a great deal further than anything in that book. Then we noted that the Board had supplied a good deal of the simpler apparatus, in the shape of wands and bar-bells, clubs, and even single-sticks in a number of the schools, and in addition to that they have four gymnasia, which are used as centres, with fixed apparatus, and then a gymnasium in each of the two high schools. Two others are being erected at

present, which will serve as centres for the schools in the neighbourhood. The teaching is done, I think, in about equal proportions by special instructors and by the ordinary teachers of the schools. We have so many instructors visiting the schools. Some of them are there mainly for the purposes of supervision rather than for instruction, but the majority of them are doing the whole instruction which is being given in the schools. I was not certain whether swimming was included in the reference, but we put down some information as to what we are doing in that way. The Corporation have been good enough to give us their baths since 1893, and the older scholars of the schools in the neighbourhood of a bath go there in turn for one or two lessons a week, under instructors provided by the School Board. For the last eight or nine years we have had an average number of something like 2000 boys and girls. The results, in the case of the girls, have not been quite so satisfactory, and this year, by way of experiment, we have dropped the girls and confined the instruction to boys. The main difficulty with regard to the girls has been the want of satisfactory instructors. It is difficult to get women in Glasgow who are thoroughly well qualified to teach the girls. We have also found that the girls are somewhat timid about entering the water. Then we invited a report from the headmasters. We asked their opinion as to the work being done at present, and we found—I can give some particulars if the Commission will allow me to refer to my notes—that out of sixty-

eight headmasters who expressed an opinion, fifty-seven were thoroughly satisfied that the work done just now was both beneficial and successful. Five of them did not think it was of sufficient value, mainly because the time given was too limited, and six gave a somewhat qualified approval to the work; they thought that it was very good in the interests of the school discipline, but they were not quite so satisfied as to its value in improving the physique of the children. Then we found that twenty-three of them expressed an opinion on the best method of giving the instruction. Of these, eleven were in favour of the work being done by the ordinary teachers, five preferred special instructors alone, and seven of them preferred to have the work done by the ordinary teachers, with occasional visits from experts. There was a very general feeling in favour of more time being found, but the headmasters seemed to feel that with the present curriculum it was a very difficult thing to do. Coming to the suggestions which we sent up, the Board think that it would be a good thing if a little more time for physical training could be found, and they also would prefer that the work should be done by the ordinary teachers, which would throw us back upon the training colleges doing a little more for physical instruction. Then they would like to have a little more latitude in the way of providing accommodation, and also they would like to have some part of the expense met by the Parliamentary grant—the additional expense to which they have been put. With regard to the continuation schools, which were included in the reference, our work is somewhat limited. During the last winter we had classes only in nine schools, six of them for ordinary physical exercise for the ordinary scholars, and three for gymnastics—mainly for gymnastics, although a certain amount of time was given to drill. I have put in the *précis* that the time varied from thirty minutes to two hours per week, and the teaching is given by the drill instructors employed in the day schools. In one of the schools six hours' work is being given per week, and a number of the pupils attend all the six hours. Our suggestions in regard to that are mainly matters relating to the Code. We should prefer that a little more prominence be given to classes both for physical exercises and for gymnastics than is given at present. I shall be glad to expand any of the notes here in answer to questions.

2801. *By Mr Fergusson.*—With regard to the time, I think you said that thirty minutes a week was what was usually given, and in some cases sixty?—Yes.

2802. But if some can give sixty, why could not all?—Well, as a matter of fact there are only two schools giving sixty, and one of these schools is in a poor locality, where they take a somewhat shorter curriculum; the other school does it by cutting down principally the English, and to a certain extent the arithmetic.

2803. And do the English and the arithmetic suffer in the report of the school?—Not in that particular school; there is rather a better class of child there.

2804. I suppose some of those headmasters will be before us, will they not?—One of them will be here to-day.

2805. Chesterton's system is the basis of your work?—That is so.

2806. Is that founded on the Aldershot system, or what is called the Scottish system, which is Colonel Cruden's?—It is the system which Chesterton has issued in his book. I think it is founded on the Aldershot system, if I remember rightly.

2807. You have not any very intimate acquaintance with it?—I have no practical acquaintance with it; I know the book, that is all.

2808. You do not say anything as to whether you would advocate a public gymnasium in every town; have you ever considered that?—My Board have never considered that question.

2809. But you find the public swimming baths of great benefit?—We do. We have no swimming baths in our own schools.

2810. What exactly did you mean by saying that

you would like greater latitude in providing accommodation?—In our older schools, and in some of the schools which were transferred to the Board—some of the Church schools transferred—the playgrounds are naturally smaller than in the more modern schools, and there is absolutely no accommodation inside the school where drill can be given. The Board commenced some years ago to provide accommodation for drill at these older schools, but the Department objected to our covering up any part of the playgrounds, on the ground that the playgrounds were too small. We had one or two cases, but then we gave it up.

2811. If you have not got the space, what can you do?—Our feeling is that these drill halls are simply covered playgrounds, and we thought the Department might allow us to cover a somewhat larger portion of the playground than the existing sheds covered, looking to the fact that in most of these schools no additional ground can possibly be got. We did buy additional ground where we could get it, but in most of the schools no additional ground could be found in the neighbourhood, and it is the only way of providing accommodation.

2812. That is the only way you could see of doing it?—That is the only way we could see of doing it.

2813. *By Professor Ogston.*—One question suggests itself to me, on which I should like Mr Alexander's opinion. Have you had to deal with the instruction in physical training of incurable children in Glasgow?—No.

2814. You provide your incurable children in Glasgow with the ordinary education?—May I ask in what sense do you mean incurable?

2815. Have you got any special children's wards or special incurable hospital in Glasgow?—Oh, yes.

2816. They, of course, have a right to be educated?—Yes.

2817. And the School Board gives them the education?—No, not at present.

2818. It gives none?—No. There is one home for such children, the East Park Home; they provide a teacher themselves.

2819. An ordinary teacher?—An ordinary teacher, yes.

2820. Not paid by the School Board?—Not paid by the School Board, and the school is not under inspection.

2821. *By Mr Alston.*—What is the total number of children in Glasgow under the School Board?—In the School Board schools?

2822. Yes, in the School Board schools?—About 77,000 just now.

2823. That does not include Govan and Partick?—That does not include Govan or Maryhill or Springburn, simply the School Board area.

2824. Simply the School Board area of Glasgow. Have you any idea of the number, including these large districts which are practically the city?—I should think that in the Board Schools it would run up to something not less than 120,000; in the Board Schools alone.

2825. That is, practically, the population of children in the city for whom this physical exercise would be an advantage?—Yes.

2826. Are there many cripple, or infirm children in your area?—We have at present only one class for cripple children, with about thirty scholars in it—that is, physically defective children, as we call them; of course we have other classes for mentally defective children.

2827. Excluding the cripple or physically defective children, physical training would be advantageous for all classes other than the mentally defective?—I think so. I might say that the question of getting some form of physical training for weaker children who might be capable of any kind of curative physical training has been suggested, but we have never considered that we had any power to do that.

2828. Is the Glasgow School Board very hearty in this matter of physical training?—May I read a resolu-

Board's views.

tion which was passed last week? I can put in a copy. It was quite a short motion:—

'That this Board fully recognise the necessity for 'due attention being paid to the physical training of 'the scholars in the schools, so that they may grow up 'with sound minds in sound bodies. The Board have, 'during recent years, largely developed the facilities 'and opportunities for such training, and are anxious 'to adopt the most improved methods and appliances. 'At the same time the Board have a most decided 'objection to any system which introduces all the 'details and methods of military drill, and tends to 'encourage a spirit of militarism among the scholars, 'which, in their opinion, is opposed to the true interests 'of education.' That represents, I think, the present position of the Board.

2829. What is the date of that?—This was passed yesterday week.

2830. How did they come to introduce the last clause about the dangers of military drill?—I am afraid it was entered as a matter of precaution simply; I cannot explain it otherwise.

Swimming for
girls: lack of
teachers.

2831. You said it was a difficult thing to instruct girls in swimming on account of not being able to find teachers?—Well, we have had difficulty, we have had only one or two satisfactory teachers.

2832. Could that be overcome,—that is to say, are girls not instructed by male teachers. They are all in proper costume, and it has been found suitable as long as the public are not admitted?—Our Board prefer to have them taught by women. You must recollect that we only give the swimming during the summer months, and it is always more difficult to get teachers for a short period than teachers who are engaged for the whole year round.

2833. *Sir Henry Craik*.—Was that resolution which you handed in passed unanimously by the School Board?—There was one dissentient.

2834. In what direction was the dissent expressed?—I think it was to the last paragraph being included.

Militarism.

2835. And did the School Board feel that there was any real danger of this militarism which they had to guard against?—I cannot answer as to that.

2836. There was no discussion took place?—There was a certain amount of discussion on the motion, but any discussion turned mainly on the question as to whether the drill was to take a military turn for the older scholars, or be confined to what you might consider purely physical training.

2837. Did the School Board find that there was any objection of this sort raised by the parents?—There has never been any objection raised to anything we have done in the matter of physical training.

2838. Nor any withdrawal of children on the ground that it was tending to what is called militarism?—No; I have not heard of any. You see there is very little of what might tend in that direction, there is no military drill being given in our schools excepting the marching exercises.

2839. Is there any member of the School Board who takes a special interest in this part of the work?—There are one or two.

2840. There is no special committee?—Yes, there is a special committee for physical training.

2841. And does it visit the schools?—The members visit the schools at times; there is no special arrangement for visiting the schools at the time when physical training is being given.

2842. Have you any general exhibition of it?—Not any general exhibition of it, no; each year we have exhibitions by individual schools.

2843. But there is no systematic visiting of the schools at the time in order to inspect this physical instruction?—Not by the members.

Medical
examination.

2844. Do you seek any medical advice on the question?—We have not, so far.

2845. You have no medical examination of the scholars?—No.

2846. And do you know if the School Board would be in favour of such medical examination?—I think they would.

2847. With regard to the verdict of the masters, I would like to understand distinctly was there amongst the expressions of opinion any expression of opinion that physical exercises generally were not beneficial?—There was.

2848. It was not merely the inadequacy of the present physical instruction that was expressed?—No.

2849. But a feeling that the physical instruction was not for the advantage of the children?—In one or two letters there was a distinct statement that the physical training was of no use. I can produce a letter or two if you like.

2850. From teachers?—Yes, from teachers.

2851. I think we had better have those letters?—One headmaster puts down the want of success largely to the fact that the children in his school are badly clad and badly fed, and that therefore they are not in a condition to benefit by it. Then I think I can find one other more decided. This one may be taken as due to want of time: 'I am unable to say from my 'own observation that the children look on an average, 'in any noticeable degree, more or less robust than 'they did before the system of physical training was 'generally introduced. I do not think that any 'considerable advantage is derived by the pupils 'from the exercise given to them for about half an 'hour once a week.' That is on the question of time.

2852. Had you any opinion from the headmasters that the physical training, where it was not inexpedient on the ground of weak health or insufficient feeding, was an evil rather than an advantage in education?—I have a recollection that there was one. And this one was also on the ground of time: 'As to the effect 'of physical exercise on the physique of the children 'I am inclined to think its effect is almost *nil*. Its 'failure is due to the short time devoted to the 'subject per week, to the want of a drill hall, confining 'the effective teaching of it to the summer months, 'and to the want of a musical instrument.' There is a musical instrument in the school, but there is no place where it can be put so that it would be heard properly.

2853. Yes, but all that points to the fact that the teachers rather object to the lack of sufficient opportunities?—Yes.

2854. To the defects in the children which prevent them benefiting by it?—Yes.

2855. Not to the subject being an unimportant or unbeneficial one in itself?—Oh, no. I think they almost unanimously are of opinion that it is of benefit.

2856. Quite unanimously—do not put it almost unanimously. If it is not unanimous, please tell me?—It is due to the want of time.

2857. Certainly; but it is quite unanimous that the subject is one of great importance and productive of benefit. Is there any variation from that?—No. If you allow for the time factor, there is no variation.

2858. No variation as to the subject being one that is for the benefit of the children. Then as regards the training of teachers in your *précis*, you think that the ordinary teacher should be qualified for this work. You have had classes for the teachers, I think?—Yes, for some years.

2859. These classes are carried on by special experts?—By special instructors, yes.

2860. Generally retired non-commissioned officers?—Men who have been in the army, yes.

2861. And have any certificates been issued upon these?—Yes. We arranged for an examination by the British College of Physical Education, and the teachers who were able to pass the examination got the certificates of the College.

2862. For which they pay, I think?—For which they pay, or rather the Board has paid.

2863. You have now classes, I think, in operation which have been inspected by the inspectors of the Department?—Yes.

2864. The military expert who acts for the Department?—I think for the last two years, these classes (d) have been put under Article 91 (d) of the Code.

Code

2865. And the Department now issues certificates?
—Yes.

2866. I presume you would seek certificates from the Department instead of the British College?—Instead of the British College, yes.

2867. And you think that these classes afford sufficient opportunity for giving the teachers the necessary training?—The existing teachers, yes.

2868. One other question as to the greater facilities you desire to be granted to School Boards. Have you ever thought of having any field or larger playground common to all the schools?—I do not think it has occurred to us that we had any power to provide such a place.

2869. What in the Act would prevent you?—Well, it could not be provided in connection with any one school.

2870. Have you ever made such an application to the Department?—No; I do not think it has ever occurred to the Board to make such an application.

2871. Where do the scholars of the High School of Glasgow go for any games?—They have a field of their own, towards the coast of which the Board make a contribution.

2872. The Board make a contribution in that case? —Yes.

2873. They contribute to a field for the use of the better class of scholars, but they never thought of making such a contribution or making such provision for the poorer schools?—No; there is another point in it.

2874. Yes, but, as a fact, that is the case?—That is the position.

2875. Do you want to make any further explanation?—The High School goes in for games probably to a larger extent than any of the other schools.

2876. But do you not think you can encourage it in the other schools?—As to the other schools, there are parks in the neighbourhood of most of them, and in most of these parks, not all, there are special grounds set aside for children playing games, football, and cricket.

2877. But that cannot be under such supervision, or with such easy opportunities, as are provided in a field that belongs to the children only?—I don't think there would be very much difference between the present system and the children from a considerable number of schools using a special park.

2878. But it is found important for the boys of the High School?—Well, I am afraid it is more a matter of use and wont there.

2879. The subject has never occurred to the School Board?—It has never been specially considered as a definite question.

2880. Then with regard to continuation schools, you say that physical training should be an optional subject. It is an optional subject at present?—Not within the time set aside for the subjects in Division I.

2881. Do you not think it would be better to say it should be a compulsory subject in Division I.?—There is something to be said for that if Division I. were supposed to continue the whole day school curriculum, but as things are I do not think the Board would care to see it compulsory.

2882. Do you not think that for boys of the age that are attending continuation schools, it is perhaps more necessary and useful than at any other time?—That is my personal feeling, yes.

2883. But the Board, you think, would not agree with that?—I do not think that they would like to have it compulsory.

2884. But if it is beneficial for these boys, what is the objection to make it a necessary part of the course? —I think that they would feel that as the time is fairly limited, it is of more importance that the ordinary education should receive attention, and that boys can find some means of improving their physical side in other ways.

2885. Is it the case that there are opportunities in Glasgow for boys of that age for carrying on in sys-

tematic ways and under proper supervision physical exercise?—A large number of our boys are in the Boys' Brigade.

2886. And you think that adequately provides for the wants of this section of the community?—I think so. We have always taken the Boys' Brigade into account in the arrangement of our schools, and the Boys' Brigade have taken our classes into account in the arrangement of their meetings. I mean they have tried to avoid meeting on the same nights.

2887. But there are many, surely, and perhaps the more difficult members of that part of the community, who do not come under the influence of the Boys' Brigade?—There would be some difficulty in bringing them under the influence of the evening schools in the same way, I think.

2888. But suppose you had some compulsory power? —We should do our best if we had the powers to use them, certainly.

2889. You have no doubt that for a certain part of that class of youths there is great necessity for some sort of supervision and encouragement, interest in it being taken by some superior authority?—I agree with you that it would be a very good thing. I think that we arranged more widely for the ordinary scholars receiving physical drill under the previous Code.

2890. Then one word as to grants; you say that the grants for physical training should be increased?—Excuse me, no; there has been no grant hitherto.

2891. We could recognize physical training under the fourth section of the Continuation Code?—Oh, you are speaking of continuation schools; excuse me, I was going back. Yes, I am aware of that.

2892. You advocate the increase of that grant?—Yes; that is so.

2893. But is it not the case that our grants are arranged in proportion to the expenses of the various classes?—We do not find that the expenses of the physical training classes are so very different from the expenses of the other classes.

2894. Do you mean to say that you cannot get a drill-sergeant at a cheaper rate than you would get a man to teach a higher science or mathematics?—Oh, if you take our higher teachers—

2895. Yes?—I am speaking of the ordinary teachers. Our first suggestion here refers to Division I. classes.

2896. But we try as far as possible to bear three-fourths of the expense of your classes, whatever that expense is?—Yes.

2897. And you think that it is not an unfair demand that the School Board ought to bear one-fourth of the expense?—No; we shall bear a good deal more than that, I think.

2898. But we do pay our grants up to three-fourths? —That is your maximum, but you do not necessarily pay grants up to three-fourths.

2899. In the case of physical instruction, it will not go so high as three-fourths?—Oh, no; I do not think so.

2900. But if it did, you think the School Board ought to take the rest?—I do not think the Board would object to that arrangement.

2901. *By the Hon. Thomas Cochran.*—I think you said the instruction was very largely given either to teachers or the children, I did not gather which, by army instructors or by ordinary teachers?—In the ordinary schools.

2902. Yes?—Oh, to the children.

2903. To the children?—Yes.

2904. By what sort of army teachers?—Men who have been in the army, and most of them men who have obtained some kind of certificate for physical training or gymnastics when they were in the army.

2905. They at present give an adequate training, do they, to the children?—So far as the facilities will allow in the schools and the time.

2906. What facilities do you allude to?—I mean if it is a wet day you cannot take the children out to the playground; you must make the best of it in the ordinary class-room, either by having the children stand up in their desks or on the seats.

13 May '02.

Playgrounds:
special halls.

Military
training:
Board's
resolution.

2907. Are they generally fixed seats and graded floors?—Generally.

2908. You suggested enclosing some part of the playgrounds?—Yes; as a matter of fact we have some seven or eight special halls, perhaps a few more in the playground. Then, in all our new schools, we have a large central hall where the drill is taken.

2909. I wanted to ask you, if your training is now largely carried out by military instructors, it must partake to a certain extent of a military training?—So far as the physical exercises are concerned it does not. They do not give very much of what I understand is strictly known as military drill as apart from the physical exercises.

2910. I do not quite follow that, and I was looking at this resolution which says: 'The Board have a most decided objection to any system which introduces all the details and methods of military drill,' and I want to find out what they had in their mind when they passed that resolution?—Oh, well, I think I could probably explain that. They have in their mind drill which is confined to marching and to formation of companies, evolutions of various kinds, and to having rifles, with manual exercises, and that kind of thing.

2911. That is for the Board School children?—Yes.

2912. And what brought into their mind to raise such a point as that?—I am afraid I cannot explain that.

2913. You were present, were you?—I was present at the meeting, but I mean the mover of the motion drew it up. I suppose if one is to find a reason for it, it must be in popular discussion, that is all.

2914. But you speak of the good work done by the Boys' Brigade in Glasgow?—By the Boys' Brigade.

2915. The Boys' Brigade?—Yes, so far as I know it.

2916. They, I think, have a very distinctly military organisation and military training?—Yes.

2917. And you have found no harm result from that system of training?—I personally have not.

2918. And the School Board have not?—No, I think the School Board are in full sympathy with the Boys' Brigade—I am speaking generally.

2919. As far as you are aware there is no reason for this resolution?—Well, as I said before, I think it was passed as a matter of precaution more than anything else.

2920. But precaution against what?—Precaution against anything being done in the way of definite military training in connection with the schools.

2921. By whom?—By any one.

2922. Well, but they must have had somebody in their mind?—I cannot say that they had anybody in particular.

2923. Do you think that the system of physical exercises as carried out does foster a spirit of militarism?—The exercises at present in the schools?

2924. Yes?—No, I do not think so.

2925. *By the Chairman.*—How long have you been clerk to the School Board?—Ten years.

2926. May I ask how many different Boards you have been under in that time?—Four.

2927. Also, can you tell the Commission whether the composition of the present School Board has altered much at the last election?—No; the composition does not alter very much from election to election.

2928. I said at the last election; is the present School Board very much the same as the last School Board?—Very much the same; I think there were only two changes.

2929. I mean it would account for continuity of policy and so on?—Yes.

2930. How long has the attention of the School Board in Glasgow been drawn to physical training of any kind?—The first trace I could find of it was in 1883. The Board had the subject of drill in the various schools before them at that time, and they asked a return. At that time it was apparently left to the headmasters and the teachers to do as they chose in the matter, and they found that in the majority of the schools some kind of exercises was being given. Then they issued a circular asking head-

masters to give a little more attention to it, but nothing more was done till 1894, when the Committee on Physical Training was appointed, and they obtained a fresh return on what was being done, which showed that in all infant departments a considerable amount of physical exercise was being given, but in only a few schools was anything being done beyond the infant department and the younger scholars.

2931. Well, that was a sub-committee of themselves?—Yes.

2932. In 1894?—In 1894.

2933. And then subsequent to that?—Then the next year the Code made some form of physical exercise a condition of the higher grant for organisation and discipline which was a special grant at that time.

2934. Did the Board enter into that fully at once; I mean did they make any change in their procedure? Was it at that time that they went in for this special Chesterton?—They had already appointed so many drill instructors.

2935. Was it at that time that they adopted the Chesterton system?—Yes; previous to that they had some ten or a dozen instructors amongst whom the schools were allocated, and the teachers did not necessarily do anything in the way of teaching, but when this was put into the Code the Board made arrangements for having the teachers instructed in physical exercises, and it was at that time that they adopted Chesterton's book, which was one of those recommended by the British College of Physical Education.

2936. And they have kept to the same system ever since?—All I can say is that Chesterton's system is the basis. Each instructor adds to it as he sees fit, and of course we have since added pure gymnastics which are not covered at all by Chesterton's book.

2937. Who examines this instruction?—His Majesty's Inspectors.

2938. Do they ever have any assessor, any skilled assessor, with them?—I am not aware of them having had a skilled assessor in the day schools.

2939. Simply just the ordinary inspector examines that the same as he examines every other subject?—The same as he examines every other subject.

2940. You are here as representing the Board?—That is so; yes.

2941. You were not called, were you?—Not specially, no; the Board were asked to send a representative.

2942. Is that the reason why you are here instead of a member of the School Board?—That is so.

2943. I mean, could you explain?—The reason is that the Board thought that as I had been there through all the special arrangements in connection with this subject I had more information at my disposal than any member, and they thought in that way, as only one representative was asked for, it was better that I should come up.

2944. Considering that you had been there ten years?—That is so.

2945. Do you consider that the interest—you are answering for the Board, and so I can ask it of you—is growing as regards the members of the Board, or do you think that it is very much the same; it is just taken as a compulsory subject like anything else?—I think the members do take a considerable interest in it; and I think I can say for the great majority—if I cannot speak for all, it is because I have not been talking with them on the subject—that they would welcome more time being found for physical exercises.

2946. I suppose there is no sort of medical inspection in your schools of the children?—No; not of the children generally.

2947. I mean, certainly not those undergoing physical exercises in any way; nothing special?—No; the teachers themselves leave out any children who are manifestly unfit for it.

2948. But do they leave out children on their own responsibility, or do they require a doctor's certificate?—I think they do it on their own responsibility. The children may bring a medical certificate in some

7. W. cases. Perhaps you would put that question to Mr
A. Powell, who has had large experience.

2949. *By Sir Thomas Coats.*—You said that in one school the headmaster thought very little advantage was got from physical training because the children were ill-fed and ill-clothed; would that fact apply to more than one of your schools?—Yes; and the curious thing is that in one or two similar schools the headmasters think the physical training is all the more necessary because of that fact.

2950. Of the ill-feeding?—Because of the poorer physique.

2951. Then might I ask is there any means taken to inquire into the cause of ill-feeding and bad clothing, and any steps taken to remedy those things?—Oh yes, the teachers are asked to let the School Board know of any cases of neglect, and we are in touch with all kinds of benevolent agencies in Glasgow, and we are immediately able to find either food or clothing for really every case. We get much help, I may say, from the Charity Organisation Society.

2952. Then why should this objection be taken by the master of any school, seeing that provision is made for feeding and clothing the children?—I have read your his letter; I am afraid that is all I can say.

2953. You said, I think, in reply to the Chairman, that there is no medical supervision of the children?—No definite medical supervision, no.

2954. And there is no system adopted in any of the schools for taking the weights and measurements of children and watching their development or otherwise?—I believe the rector of the High School intends to institute a system of that kind.

2955. *By the Chairman.*—Oh, but at present, at the present moment?—At the present moment there is nothing; it will be so next year.

2956. *By Sir Thomas Coats.*—And it is not in use in connection with the Board Schools, at the ordinary Board School?—No.

2957. Would you consider that advisable and practicable?—Both. I am speaking for myself personally now.

2958. You think it would be both advisable and it would be practicable to do it?—Yes.

2959. *By Mr Fergusson.*—Might I ask one question about that resolution of the Board; was that resolution

passed in view of your coming here to give evidence?—That was so; yes.

2960. And it is the military idea that frightened some of the members of your Board?—That was so.

2961. Outside School Boards have you found prejudice against physical training when there was a military element introduced?—Yes, I have; I mean in general conversation with people one comes across. I have heard it expressed outside.

2962. Do you think the continual reference to military training, when you mean physical training, does some harm in that way?—That is possible. I mean it may be due, to a certain extent, to a misunderstanding.

2963. Have you heard very strong exception taken to the work of the Boys' Brigade simply on the ground of its military tendency?—Oh, yes, I have found that.

2964. Do you think that is peculiar to the west country, that feeling—the strength of that feeling?—No; I have heard it both in the east and in the west of Scotland.

2965. *By Sir Henry Craik.*—This motion was moved by Mr Dyer, I see?—Yes.

2966. Do you remember who seconded it?—Mr Laidlaw.

2967. And of course the first sentence of this motion expresses a view that I should think of such general agreement as hardly to need assertion; but the Board go on to say that they have largely developed the facilities and opportunities for such training during recent years. In what way have they done so?—Well, in the employment of instructors, in the providing of very large quantities of apparatus, in gradually establishing gymnasias in the various districts of the city which can be used as centres for the schools.

2968. *By Mr. Alston.*—Does the resolution of the Glasgow School Board, just read, commit them to disapproval of military drill for boys in continuation schools?—Yes, for advanced military drill.

2969. What they mean by military drill?—Yes.

2970. Then they cannot see their way to approve of military drill, as they understand it, in any shape in their schools, either in the ordinary schools or in the continuation schools?—No, that is the position.

The witness withdrew.

Mr JAMES POWELL, examined.

2971. *By the Chairman.*—You are the headmaster at Newlands Public School, under the School Board of Glasgow?—Yes.

2972. I may say shortly that you have been a Volunteer and an officer in the 47th Glasgow Cathedral Company of the Boys' Brigade?—That is so.

2973. And have a considerable knowledge both of military exercises and also of teaching them?—Yes; I have had a knowledge of that from 1877.

2974. Now, if you will kindly begin with your *précis* at physical training in Newlands public school?

The class teachers take their classes at stated hours once every week to the Central Hall, and there, for about thirty minutes, give a lesson in physical exercises. Boys and girls are taught at the same time. Drill consists only of the simplest elements, Chesterton's exercises, usually accompanied by music, forming the greater portion of the lesson. Delicate and deformed children are allowed to fall out, or are not drilled at all. Lately there has been added a lesson of five minutes every day. This is given in the classrooms, suitable exercises, involving no leg movements, being chosen. The scheme is that contained in Chesterton's *Manual of Drill and Physical Exercises*. I need not read the scheme. Advantages:—Military drill has a peculiar fascination for boys. They enter into it with the desire to be perfect, and respond to the word of command with an alacrity which calls forth a smartness and alertness in the whole bearing. Each boy feels he

is one member of a body of boys, all obeying the same command, and that prompt action must follow, if his company would excel. This smartness and obedience have a direct and most beneficial effect on the school discipline, and the respect which they feel it is right they should pay to the officer is easily encouraged and carried into the whole schoolboy life. The physical exercises, as given by Chesterton, have been found to be eminently suitable for mixed classes. They are not difficult, nor do they require concentrated or severe muscular effort, yet they call all the joints and muscles into action, and cannot but have the effect of improving the children's physique and health. Disadvantages:—Public elementary schools have now so many subjects that it is exceedingly difficult to give more than the bare minimum of time to physical training without giving too little to purely educational subjects. Reading, spelling, intelligence, arithmetic, writing, grammar, composition, geography, history, nature knowledge, singing, drawing, manual occupations, drill, swimming; besides which, in schools with advanced departments, French and mathematics must be taken, or kindred subjects, and in all, the girls must have cookery or laundry and needlework. This is a formidable list, yet each subject requires time and careful teaching, and all must be done in a week of twenty-five hours of secular instruction. Suggestions:—The boys' love for drill and physical exercise might be laid hold of by public schools, as the officers of the Boys' Brigade have

shown it can be done by Sabbath schools. Cadet corps or public school companies might be formed, and would produce in due time senior companies of those who had left school. The difficulty would be to secure officers to undertake the instruction and organisation. It could not be expected to get such voluntary enthusiasts who have done so much for the Boys' Brigade, but provision would have to be made sufficient to offer an incentive for the work. Advantage might be taken of the Boys' Brigade, an organisation already in existence, and by affiliating the companies with evening schools, as was done in 1891, give that pecuniary encouragement which would increase the number of companies and boys under its excellent control.

2975. Then I see that Chesterton was an army man, an Aldershot man, and an excellent gymnast himself. Were you aware of that?—All that I know of it is from the book, my lord.

2976. Do you go through this drill yourself?—Not personally now; my class teachers do.

2977. But you did?—I did.

2978. And your assistants do it now?—My assistants do it.

2979. Do they spend much time in giving what are called cautions, or do they keep as much as possible to the actual words of command?—Keep to the actual words of command.

2980. That is the instruction to them?—The instruction; yes.

2981. Quite right too; and, of course, a great deal is done with music?—Very largely with music.

2982. And you find that the children like that?—They enjoy the music; at the same time, I believe it to be a most excellent thing for the class to drill without the music; it is a more difficult test for a class.

2983. In addition to the music, do you ever do any singing?—No.

2984. While the exercises are going on?—No.

2985. You have seen it done?—I have seen it done; yes.

2986. But it never was done under you?—Very seldom; it is not done at all now.

2987. You have no medical inspection of your school or scholars?—No medical inspection.

2988. And therefore, if anyone is unable to perform any physical training, it is entirely in your option whether he or she should do so or not?—Quite so; the children are allowed perfect freedom there.

2989. Do you ever get a medical certificate sent with the child to say he or she is not able?—Not a medical certificate, but I have had a letter from the parent asking that the child may not have drill.

2990. You do not think the matter is sufficiently stringent to be done as to call for a medical certificate as an excuse?—No; not by any means. The teachers feel that if a child is delicate it would be unwise, and I watch this matter myself very carefully.

2991. And in the event of any child having strained himself in any way; such things may often happen?—The exercises are such that there is little probability of any child being strained.

2992. And supposing there is a child with, say, one leg or one arm, or anything of that kind?—They are allowed to fall out; they are not drilled at all unless they really wish it themselves. They enjoy the drill so much themselves.

2993. That is entirely left to you or your under teachers to decide?—Yes.

2994. Both you and your under teachers?—Yes.

2995. By Mr Shaw Stewart.—Do you find any disinclination among parents to encourage their children to take an interest in the drill and physical training?—We never had a single case of a parent asking his child not to have drill, except through a child being deformed or delicate.

2996. I suppose you would agree that physical training is intended to fit the boys and girls to make the best of their minds and bodies in any walk of life which they may afterwards take up?—I thoroughly agree; yes.

2997. And you consider that is sufficiently under-

stood by parents at present to be the aim of physical training in schools?—I do not know that the parents thoroughly understand that.

2998. Would it be advisable, do you think, that in any recommendation in favour of physical training it should be made clear that there is no military object implied; would it be well to make that clear to the public?—Well, I think it would have the effect on some parents of reassuring them that there was no ultimate object as regards militarism.

2999. But as a matter of experience you have not come across many instances of doubt in the parents' mind?—Not at all.

3000. Just two points I want your opinion on. We have been told that in Germany they are beginning to see the advantage of interspersing physical training during the whole school day, that is to say, devoting about five minutes or more at the end of every hour; do you think that would be a good system?—I have lately begun such a thing in a more limited manner by taking five minutes at eleven o'clock, besides the half hour's drill, and although it is too soon to speak of the results, I anticipate that they will be excellent.

3001. As regards grading the children according to physical strength and not according to their mental attainments, that is strongly pressed on us by experts, but schoolmasters have told us that practically it is difficult, if not impossible, to do: what is your opinion as to that?—I should say that classes are pretty well graded as it is. The mental attainments of children in any class usually form such a grading; for example, in Class II it is found that the great majority of children are between eight and nine years of age; it is an exception if a child is in the wrong class for physical training.

3002. And that exception, you think, could if necessary be dealt with on the teacher's own initiative?—The exercises are not so severe on a child that it need be felt, I think.

3003. By Sir Henry Craik.—Your service has been chiefly, if not entirely, in Glasgow?—Wholly in Glasgow.

3004. You have no experience in country schools?—None whatever.

3005. You say that the parents require to be reassured in regard to this physical instruction, that it has no tincture of the military element?—I do not say 'require'—I beg your pardon—I say it must tend to reassure them; but after all it is only through hearsay in casual conversation that I think there may be some who do not wish the military element in the schools.

3006. It is only a hypothesis that there is any objection to this military element?—Not only a hypothesis; I have heard it, but in casual conversation.

3007. And can you tell me what is the ground for that; are they afraid that their boys will enlist?—I can hardly say what their grounds may be.

3008. Do they object to the certain amount of discipline that it involves?—Certainly not; they cannot object to the discipline.

3009. Not if they knew the real welfare of their children?—That is so.

3010. It is not any averseness to the disciplinary element in it?—Not so.

3011. Do you carry on any continuation classes?—No; I have no continuation work.

3012. Do you ever attempt to encourage games amongst your pupils?—The playgrounds that we have, and the large number of children that are in the playgrounds, do not render them very suitable for such games.

3013. You have not good playgrounds?—We have a very good playground indeed compared with many of the schools in Glasgow, but still with the hundreds of children in the playground at one time, they cannot have suitable games, except running about in the playground.

3014. Has it ever occurred to you or been suggested that a general playground for the use of the schools in the poorer localities of Glasgow would be useful?—They really have such a thing, I think.

3015. Where?—In the public parks. There are recreation grounds in all the public parks.

3016. But of course you cannot have them under the same supervision that you can in your school or in your playground?—Really we have no supervision in the public parks.

3017. Have you any remedies to suggest for the disadvantages you name in your *precis*—the overcrowding of the curriculum?—I think that with the present Code that disadvantage will perhaps be gradually removed as the amount of instruction may go on for a little longer time. Instead of doing the work that has formerly been done in six years in the standards, it might go on to seven years.

3018. By the lengthening of the school life?—By the lengthening of the school life.

3019. Under the Act of last year?—That is pretty largely, I think, the tendency of the last instructions, keeping the children in the standards till they are fourteen years of age probably.

3020. Under the Act of last year?—Under the Act of last year.

3021. And a varied curriculum is rather an attraction to a pupil?—Yes; I should say that it was really the thing to stir up a pupil's enthusiasm.

3022. Certainly?—But the number of subjects are so many that a teacher has sometimes difficulty in crowding everything into the day.

3023. But the minimum number of subjects is not very large?—These are the subjects that we teach; those that I have named.

3024. I have got here the report of your school before me. You take a good many subjects you are not obliged to take up—I am saying it to your credit. I think the report is a most excellent one, and the instruction is very largely varied, but you go far beyond the minimum requirements; is not that so?—Not that I am aware of.

3025. Well, you take up manual occupations, colour work, clay modelling, cardboard modelling, as well as these physical exercises, which are developed in your school to a very considerable extent?—Yes; we give up one hour a week for this manual work, and that was because I believed it was most educative in itself.

3026. And you think a little variety in the curriculum is a good thing?—I believe in it.

3027. And that in that variety you certainly could find a good place for the physical instruction?—I have always done so. I have taught physical instruction long before it was required by the Code—since 1877.

3028. *By Mr Fergusson.*—I think you said that lately you had adopted a new plan of interspersing the physical training through the work of the day. What led you to do that?—Because I believe it to be a good thing, and because in my last report it was mentioned by the inspector that I allowed only the bare minimum.

3029. But you are only going to give five minutes; is this only done once in the course of the day?—Once per day.

3030. Do you think you could not find time for another five minutes?—Well, we might squeeze and squeeze; the time may come.

3031. As the Code is now, and with the greater freedom you have in dealing with the other subjects, you think you will be able to do it?—I would like to see what the effect of the present five minutes is.

3032. *By Professor Ogston.*—How many children have you to deal with Mr Powell?—An average attendance at present of about 1400.

3033. And how many of those would be delicate and deformed?—I should say about one to two per cent. do not take drill.

3034. Can you give any suggestion as to whether or not physical training should be applied to those delicate and deformed children?—No; I have no suggestion whatever to offer in that respect.

3035. *By Mr Alston.*—As a Lieutenant in the 47th Glasgow Company of the Boys' Brigade had you occasion to visit the homes of the children?—Occasionally.

3036. Did you find any opinion expressed by the mothers particularly as to the benefits of the drill and discipline?—They were at one with regard to the benefits.

3037. They never hinted at any objections to the Boys' Brigade on account of rousing the military spirit of the boy?—No; not that class of parents.

3038. And have you ever heard that objection, either serious or widespread, from the general public?—No; I have heard it casually only.

3039. Not the rule, but the exception?—Yes.

3040. Then would you approve of such drill as exists in the Boys' Brigade being allowed in the continuation schools?—I cannot speak for the continuation schools, but I do approve of the drill in the day schools. I have all along felt that I should like to carry on my boys with military drill and physical exercises after they left school, but I have never been able to see my way to carry on the drill after they leave the school.

3041. Such military drill, as we know of in the Boys' Brigade, you would like to apply in the schools?—I should.

3042. With the rifle; manual and firing exercises?—That is not essential, to my mind. I find that the boys, even without rifles, take an interest in military drill.

3043. Would the masters in the school have the same control over the boys as the officers of the Boys' Brigade Company have?—Yes, the masters of the schools would have, but there is a different feeling between the officers of the company and the teachers of a school at present.

3044. Would they attain the same discipline?—I should say so.

3045. And get the same good results from the drill and discipline as the officers of the Boys' Brigade?—Yes.

3046. *By the Hon. Thomas Cochrane.*—I see in the report to which Sir Henry Craik referred that you are described as an enthusiastic headmaster and supported by a loyal staff?—I have a very loyal staff.

3047. And you have taken a very great interest in this physical training?—Yes. I have always felt that it was the backbone to school discipline.

3048. And you have watched the results of the physical training with great care?—Yes, I have.

3049. And you have come to the conclusion which you put down in your paper, the advantages in physical training?—That is so.

3050. They tend to produce straightness and courtesy?—That is rather a clerical error in the School Board offices—alertness.

3051. By straightness do you mean moral straightness?—That was not my term at all, sir—alertness, obedience, courtesy.

3052. Has it any effect on the moral qualities as well—drill?—I find it makes boys thoroughly respectful; that the boys, after getting a lesson in saluting, take that as an example; lose their Scotch bashfulness, and are only too ready to take their caps off to the teacher, and thereby it is a beginning to general courtesy.

3053. Generally, you find it has a beneficial effect on the discipline of the school?—A very beneficial effect.

3054. You have read the last paragraph of the terms of reference to this Commission?—Yes.

3055. Which says: 'Thus contributing towards the source of national strength'; that the qualities that are brought out by physical training would contribute to the sources of national strength?—Yes.

Mr J. Powell.
13 May '02.

Boys' Brigade: their drill advocated for day schools.

Physical training: most beneficial.

The witness withdrew.

Mr
J. Craigen.
13 May '02.

Mr JOHN CRAIGEN, examined.

3056. *By the Chairman.*—You are Chairman of the School Board of Aberdeen?—Yes.

3057. Have you been so for long?—No, I have only been Chairman since October last. I have been a member of the Board for ten years.

3058. You have got a copy of your *précis*. I should like you just to go through that before us. I do not want you to go through actually every word that you say, but give us an ordinary statement, more or less on the lines that you have put before us, and then any questions members of the Commission may wish to put to you, I have no doubt you will be glad to answer?—Yes, my lord.

We have under the Aberdeen School Board twenty-seven elementary schools, one higher grade school, and two higher class (secondary) schools. These schools in round numbers accommodate 25,000 pupils. In our evening Continuation Classes we have 4000 pupils attending; not exactly children, of course, in the continuation classes. Then I might mention that in addition to the 25,000 pupils under the School Board there are probably about 4000 in the voluntary schools in the city of Aberdeen. In 1889 we adopted a syllabus of physical education. We have handed in a copy of the syllabus. In this syllabus the exercises there given are taken from the handbook, which we also have produced, the handbook of physical culture and musical drill by Colonel Cruden of Aberdeen. In 1895 the Code contained for the first time the provision that drill, or some other form of physical exercise, would be required in order to earn the higher grant for discipline. At that time, in 1895, we had already introduced drill into ten of our schools. The number of pupils amounted to 10,500, out of 19,000 on the roll at that time; that is to say, before 1895 we had introduced drill into fully half the schools. At the present time, we have gymnasia attached to all our schools except those that have about 5250 on the roll, that is to say, we have gymnasia attached to schools containing about four-fifths—nearly 20,000—of our scholars. In two years hence the number will be reduced still further, so that there will be only 2450 children attending schools that have no gymnasia. Then, with reference to advanced gymnastics, we have introduced that into five of our schools, where suitable exercises have been arranged for boys and girls over thirteen. These include the ordinary parallel-bars, ladder, vaulting-horse, etc.—all under competent instructors. We have always gone on the footing that it is not safe to have children engaged in advanced gymnastics without a competently-trained instructor to take charge of them, in case of any accident. Then, with regard to swimming, we have already introduced this into one school, but as we have no baths or swimming ponds attached to our schools, we have to send them to the Corporation baths. These are at the sea beach, and of course while suitable for the children in the east end schools, would not be suitable for the children further west, because they would have too far to go. Swimming will soon be taught to the children in a second school. We will have to send them to the Corporation baths. We pay a fee per class for sending them there. We have to get an instructor. As it happened, in the first school we had a janitor who was an expert swimmer. He took charge of the class, and did very well, and at the end of the session they had some aquatic sports, and everything went off very well. The children take to swimming very readily, and are very fond of it, and some of our masters think it is about the best form of exercise they can have; in fact, it is the common opinion that more swimming should be introduced if we could find more accommodation; but of course it is difficult to get baths or ponds for it. As regards outdoor drill, we have introduced that into twelve of our schools. In cases where we have sufficient playground the senior pupils of both sexes go through the usual forms of drill, marching, doubling, wheeling and so forth. We think

they are best to have a trained instructor. We have some cases where the ordinary teacher does it, and some of the teachers do it well. Others do not do it so well, and we require here and there to have a specially trained instructor. We think when we come to outdoor drill it is well to have a sharp strong word of command, and to have them under a man who has been trained to drill; these outdoor exercises, of course, only go on during the summer months. Then I have made a reference—I do not know that I need specially refer to it—to a communication we had in 1899 from General Chapman, and the views of the Board at that time. We give an extract from our answer to General Chapman; we produce the Board's minute on the subject. In the minute we stated that we preferred our own system. The sub-committee,—whose report was afterwards adopted by the Board,—resolved as follows:—

'The sub-committee, as far as its information goes, is not disposed to regard the displacement of existing arrangements by the army system as having anything to commend it, either in practice or results. The army text-book has not nearly the same variety of exercises as the text-book already in use in the Board's schools; its words of command are in many cases more complicated; its explanations are not so clear; and the musical accompaniments are treated as of little importance. Colonel Gildea's letter also contemplates the appointment of army instructors. At present physical education is undertaken by the ordinary staff of the Board's schools, supplemented by the help of trained teachers from the Physical Training College. While admitting the skill and undoubted efficiency of army instructors, the sub-committee prefer civilian teachers already practised in the handling of large classes of children. The former have experience only in the training of men who are already well disciplined, and whom they exercise for hours daily, and for months at a time. The work of a school instructor represents only half an hour's drill per day for each class, with different children to drill all the week through. The conditions of success in the one case are therefore very different from those in the other. . . . They consider the standpoint of the circulars to be too exclusively military, and their lack of any sort of recognition of the existing order of things in the Board's system of physical education, approved as it is by the Scotch Education Department, and in many cases warmly commended by H.M. Inspectors of Schools, as fatal to the acceptance of the propositions and suggestions in their present form.'

That is still the general view of the Board on that subject. Then, with regard to the welfare of the pupils, and the advantages to be derived from the drill, we sent out a circular to our headmasters, and we have got the replies, if you care to see them; but they are unanimous in saying that the drill—even the half hour per week that the children get—is of great benefit to them. It benefits them as regards their carriage, and, to some extent, as regards their physique, as regards the order and discipline of the school, their alertness and readiness to attend to the word of command, and so on. Even the short time that we can give them for drill is of great benefit, and all the masters lament that we cannot give them more. We cannot give them more than half an hour per week, because we cannot find time for more in our time-tables. We find more in regard to the very small children; they usually have about an hour per week for drill, but above the infant standards we can only find time for half an hour, and the headmasters say they cannot find time for more. I think, as a rule, the half hour's drill is given all at one time. It is arranged to be brought in on one particular day. In some of the schools, in the infant departments, they give them ten minutes or so at a time on different days, as they can find an odd ten or fifteen minutes. We at present spend fully £500 a year on drill instruction outside the ordinary teaching staff. Apart from our own staff altogether, we spend about £500 on drill

instructors and accompanists who play the pianos, besides supplying the gymnasia and apparatus and musical instruments. At present the Board is spending on drill instruction, outside of the salaries of its ordinary teaching staff, fully £500 per annum. This sum could be increased considerably in the interests of efficiency, and the sum does not include the Board's expenditure on drill apparatus or musical instruments, or interest on the cost of equipping its schools with gymnasia. We cannot see our way to go further at present, because we have a school rate of nearly 1s. 4d. per £, and the expenditure out of the rates has been going up at such an alarming rate of late. I may mention here that in 1892 every child in average attendance cost the rates 5s. 10d., but now, in 1901, every child in average attendance cost 19s. 1d. in Aberdeen, and our rate is close upon 1s. 4d. It has been over 1s. for the last eight years—considerably over 1s.—and we feel we cannot go further in this direction, unless we have some additional encouragement, some grant to assist us. Then I go on to refer to the advantages to be gained by the training, improving them in their carriage and physique, and all the more so on account of the mental output expected of the modern school child. They are very fond of it. The teachers bear testimony to the fact that even a meagre half hour per week of such exercises tends to correct a stooping gait or a slovenly carriage, to sharpen the ear to the words of command, and to habituate the child more readily to the disciplinary methods of school life generally. As a corrective to mental over-pressure, as a stimulus to physical development, and as an incentive to order and discipline, the value of physical education in schools goes, therefore, without saying, and the Board would welcome any prospect that offered it the means and the time to develop this side of its school work. Then we come to certain suggestions. We think that our present system in our schools up to the fourth standard—that is, up to the age of eleven or twelve—is all that is required, and we are content up to that point with such help as we can get from the block grant. But after that stage we think, when we come into the region of gymnastics proper, we require to have gymnasia at all the schools, and likewise suitable apparatus and trained instructors; and then, when we come to this stage, we feel that we require a grant to carry it forward successfully. I make certain suggestions, and first I suggest that a grant of 4s. should be given for every child trained in advanced gymnastics. These are suggestions for the future if we are going to carry forward gymnastic exercises. At present, where we go in for these higher gymnastics—that is to say, the children of thirteen and fourteen—we have to engage instructors from the Physical Training College, and we have to charge 1s. per quarter for those pupils who care to go in for this instruction, and we pay the Physical Training College the 1s. per quarter or 4s. per annum. The College provides an instructor and all the apparatus. Now, what we should wish to do would be, if we had the grant necessary to enable us to do it, to provide all the necessary apparatus, the instructors, and everything ourselves, and carry forward this work in the proper way in which we should like to see it done. But the reason that we suggest 4s. is that we are paying 4s. at present for getting the work done. The outdoor drill would be covered by these grants; it can go on as a matter of course during four months of the year. Then, with regard to swimming, where we require special instructors, and require to provide swimming ponds or bathing places, we think that we would require a grant of 2s. for every pupil between twelve and fifteen who was certified to have, by such means, acquired the art. That is in case of a development of the system. The headmasters say they cannot find time or see their way to introduce more drill or gymnastics into the schools unless the Department could lighten some part of the school work. If their time-table could be relieved to the extent of half an hour, they would gladly put in another half an hour of drill. Of course, another way to do

it would be to extend the school day, but they all object to that. They say the school day is long enough at present. They begin at 9 in the junior classes, some at half-past 9, with an interval, and they go on till about 4 or half-past 4—I think the day, properly speaking, stops, but then there is usually half an hour for some special subject, and it takes them up to half-past 4, I think, usually before they get through the school day. Then I come to the further question—the continuation classes. Of course, there is a grant allowed under Division IV. of the Continuation Class Code, but we have never been able to go in for that grant—at all events to any extent. On the further question, embraced in the reference to the Commission, of the development 'in their practical application to the requirements of life of the faculties of those who have left day schools,' by the renewal of opportunities for physical training in continuation classes, the Board finds itself again confronted by the demands, still more imperious than in day schools, of other subjects for the full time available. A session of six months absorbing three nights per week of the spare time of young men and women engaged in industrial and commercial pursuits throughout the working day, and devoted to intellectual improvement in one or more of the varied subjects that now form the staple of continuation class study, does not open up possibilities of doing much, if anything, in the line shadowed out in the reference. But what we feel is this, that if we had better appliances in our day schools for the scholars of twelve, thirteen, and fourteen, then we would have gymnasia at all our schools; we would have all the appliances necessary at our day schools, and trained instructors where necessary. Then we could engraft all this upon the evening continuation classes; we could have the gymnastics for the boys—fifteen, sixteen, seventeen—in our evening continuation classes, and we could have the day school apparatus for gymnastics without any cost or expense. We would only have to pay for the instructors, because we would have our gymnasia; we would have our appliances for the day school and then we would only have to pay for instructors in the evening classes. In that way we could set ourselves to earn this grant which is already allowed in the Continuation Class Code, or we could set ourselves to earn a grant for gymnastics, and I think it could be done by probably having an extra day. Three evenings a week are certainly enough for young men and young women attending the classes for all the various subjects that they select under the Code, but I think they would go back probably for a fourth night for drill and gymnastics. They take to drill very readily, and if boys and girls could get first musical drill in the lower standards and then get the gymnastics higher up the school until they reached fourteen, I think it would be an incentive for them to go to the evening continuation classes to continue the drill and the gymnastics which they had got at the day schools, and the only way it could be done at present is by having a fourth night probably; that is to say, if our evening classes are on Monday, Tuesday and Wednesday, let us have say Thursday or Friday for drill and gymnastics, and then let attendance there count for the grant the same as attendance at the other subjects. That is the idea that has occurred to me in this matter. I think it practically exhausts my *précis*. I have one or two points additional. The only other suggestion—it seems to me doubtful whether it could be possible—is this: The continuation classes run from October to March, and I have been considering whether it would not be possible—of course we can merely form an opinion or an idea of it—whether there might not be a class continued in April and May for additional drill in connection with the continuation classes. Our Volunteers drill mainly in April, May, and June. I have brought the children from the lower stage up to fourteen, then the evening continuation class from fourteen, say, to seventeen, and if we could, somewhere at this stage, arrange for some outdoor evenings, or

Saturday afternoons or some other time during these months, when a class or classes could be formed of continuation class pupils apart from their ordinary class work or school work, that would carry them on to the period when they would be joining the Volunteer forces, or not doing so as the case might be; it is not obligatory. Then there is another point with regard to that: if they did go on drilling until they were, say, seventeen or eighteen, at continuation classes there is a danger that they might not join the Volunteer force if they had to put in the usual recruit drills. I do not know if that is outside the scope of the Commission, but I should imagine that if a young man who had been drilled all his life up to seventeen or eighteen, and then put himself forward to join any of the branches of the Volunteer force, and found he had to go and put in thirty very tedious recruit drills, doing what he already knew all about, he would not like it, and I think he is more likely to go forward if he were exempted from these drills. Then there is another idea, whether it should not be necessary to have some proper college for training instructors. Our idea is that although the ordinary school teacher can do a great deal, and do it very well, you cannot really get an ordinary teacher to do the whole work. And you require a certain amount of instruction, especially when you come to deal with gymnastics proper,—the horizontal-bar and parallel-bar, the vaulting-horse, and so forth. You require a skilled man to take charge of every boy as he is going through his exercises, otherwise it is very risky. In Aberdeen we allow no lad to go on without a skilled instructor, for fear of anything happening. If they have a skilled instructor we are relieved of anxiety. We never had an accident because we put a trained man in charge. They are thirteen and over when they come to gymnastics proper. Then in Aberdeen we have Boys' Brigade, but I do not happen to know very much about them. They are attached to churches principally, and I do not know if I can give you much information about them. But one of the weak points is that the boys seem to be allowed to do pretty much what they like; for instance, I heard of a case where a Boys' Brigade threatened to resign unless they got a horizontal bar. It seemed to me the system was not worth much if it was of such a nature that they could simply just throw it up or not as they liked. But I believe it is catching on; the boys like it, and there is a good deal in that. In Boys' Brigade they get a certain amount of drill and marching out. I am not speaking to that in evidence; I am simply referring to Boys' Brigade as a matter which might be inquired into, but I am not familiar with their working.

3059. *By Sir Henry Craik.*—You have considerable experience, of course, in regard to the finance of your own Board?—Yes.

3060. And as to the Day School Code and the Continuation School Code?—Yes.

3061. You indicated at the close of your evidence that you thought it would be very important that in these continuation classes there should be an extra evening for physical instruction?—Yes.

3062. But that that evening should be counted as an attendance?—Yes.

3063. But are you aware that that is perfectly permissible under the Continuation Class Code?—Yes; that is permissible.

3064. Then you do not suggest any change?—Not any change in that respect; but what we feel is this, that until we are thoroughly equipped in the day schools we can hardly afford to introduce it into the evening schools.

3065. You suggested as a possible change that you should be permitted to count an extra evening of attendance as something that would be new—a new suggestion?—Oh, I know we have it; I referred to that. I know we have it in the Division IV of the Continuation Class Code.

3066. The Code now permits what you wish?—Yes, but we cannot take advantage of it.

3067. Then you suggested that these continuation classes would be carried on in May and June, and that on Saturday afternoons there might be meetings for drill and other physical exercises?—Well, that is the only way in which it occurs to me that we could possibly develop it.

3068. Are you aware also that that is permitted by the Continuation Class Code, and suggested in certain of the Circulars of the Department?—It is suggested probably, but we have never been able to do it. We need instructors—special instructors.

3069. In order to do that of course you must have money; you get your money from two sources, from Imperial sources and from your local taxation?—Yes.

3070. But do you think that the contributions from Imperial resources to the local effort is too small?—Too small; we feel we have gone as far as we can.

3071. But you are aware that Parliament has considered this over and over again, and it is not the general idea that the Imperial contribution is too small in proportion to the local?—Well, we manage with a rate of 1s. 3d. and a fraction per £ to do what we are doing, but we feel we cannot do more.

3072. Do you think that the grants as far as this special part of instruction is concerned are less in proportion than they are for anything else?—Well, we have not gone into that; all I say is that our Board feels it cannot go further, or it cannot go much further, in this direction without additional money.

3073. Returning to your *précis*, you speak of the charge having increased from 1892 to 1901 from 5s. 10d. to 19s. 1d.?—Yes.

3074. Are you prepared to pledge yourself to that?—Yes, that is a fact.

3075. How much has your rate increased in that time?—Oh, our rate has not increased quite in the same proportion.

3076. Your rate is about 1s. 3d. now, and how much was it in 1892?—In 1892—I think it was just about that time—we used to have it about 10d., and then it went up to over 1s.

3077. Do you know what the average expenditure on the education of a child throughout Scotland is?—I forget; I will take it from you.

3078. Are you aware that it is about £2 14s.?—Well, I will take it from you that it is so.

3079. And that out of that, with the fee grant and the Imperial grant, about 32s. or 33s. is paid?—Yes.

3080. And any other resources of grant added to that, do you not think there must be some mistake when you say that in nine years your expenditure has swollen from 5s. 10d. per child to 19s. 1d., and yet that the result has only been that your rate has grown from 10d. to 1s. 3d.?—I refer, of course, to the expenditure out of the rates over and above the grants that we have been getting. The grants that we have been getting have been falling behind; we have been doing more than we have been getting from grants.

3081. I am not speaking of what you are doing; do you think that you are really spending 19s. 1d. on every child instead of 5s. 10d., and that that has only involved a growth in your rate of 5d.?—That is so. We had an abstract,—a statement of the whole thing before the Board a few months ago; I am only sorry I did not bring it along with me.

3082. That your expenditure has grown by 300 per cent. and has only added 5d. to your rate?—Of course our rating value has increased very much; every penny brings in far more now than it did.

3083. But do you really think that you would be able to prove that your expenditure has increased by 300 per cent. in nine years?—Yes, to the extent mentioned.

3084. Your expenditure out of the rates has increased by 300 per cent. in nine years?—Well, the increase is over 200 per cent.

3085. You think you will be able in the face of statistics to maintain that?—Yes, and I could give you the reasons for it. We are paying our teachers rather higher than we were, but that is only part of the increase. A teacher now is allowed to teach considerably fewer

children than he or she was allowed before. Then our pupil teachers cost us more than they did, and we are allowed to have fewer of them, and so much additional has gone for other subjects, such as cookery, and these other special things are all costing us so much extra. The expenditure per child has increased more than 200 per cent., but there is a difference between the Board's expenditure on school maintenance per child and the Board's total expenditure for which rates are levied. It does not follow that because the expenditure per child has gone up more than 200 per cent.—in other words, has more than trebled—that the school rate has gone up in the same proportion. The school rate has gone up more than 50 per cent., and the rise would have been larger but for the growing productivity of the Board's rating area.

3086. Have you ever balanced your expenditure upon cookery—that one subject—with your grant?—Well, we took cookery and one or two other subjects combined.

3087. Would you be surprised if I told you that in many School Boards they found that the grant for cookery has been to a large extent profit?—Well, I know that in several cases we have had to build cookery rooms, along with our gymnasia and other buildings.

3088. That the annual maintenance in many School Boards has not reached above the amount of our grant?—I do not think that is our experience.

3089. You spoke of lightening the curriculum. What are the subjects that the Code requires you to take up which you think might be thrown over?—Well, I really cannot say; I do not know.

3090. But how would you lighten the curriculum?—I cannot give any opinion; I do not see myself how it is to be done; we simply say unless the Department can see its way to do something we do not see how it is to be done.

3091. But what does the Department do in the way of crowding the curriculum; what does the Department demand that you think might be dropped?—Well, I cannot say; all I can say is that between the demands of the Department—

3092. But what are the demands of the Department? Will you point to any article of the Code which makes any demand on the part of the Department?—The Department does not directly demand time for all the subjects, but it places such financial inducements before managers as are tantamount to saying they cannot expect the highest grant unless all the subjects are taught or professed. The headmasters say they cannot do justice to the various subjects in less time.

3093. Then why do they not take fewer subjects?—That might be.

3094. They are perfectly at liberty to do that under the Code?—Well, they doubtless attempt all they possibly can in their anxiety to make the most of it and earn the highest grant.

3095. You spoke of some of the schools meeting at 9 or 9.30?—They begin to meet at 9—the juniors.

3096. Nine, and going on till about 4, with an hour's interval, that means about six hours?—They have an hour and a half, a good many of them.

3097. Well, say for twenty-five or thirty hours a week?—Yes.

3098. And you think half an hour is all you could get for physical instruction?—Yes, that is what the headmasters say they give them and they cannot see their way to give more. If pressure were brought to bear upon them they might manage to give more.

3099. Where could pressure be applied to them except from the School Board?—The School Board has not attempted to apply pressure; we are content with the weekly half hour.

3100. You think one-sixtieth part is the proper proportion for the physical training of the boy?—No; but we have not been found fault with for what we have done; we have given the half hour and we think we have done fairly well.

3101. But of course the pressure upon the masters can only come from the School Board?—The School Board, and the School Board has not seen fit to put

pressure upon the masters; they think they have been doing just about as much as they reasonably could be expected to do in the circumstances.

3102. You suggest a grant of 4s.; do you wish to go back to the old course by which particular subjects were paid at a particular rate and not a block grant for all the subjects?—Well, I do not suppose it would matter if we had a grant that would give us something additional, but we say it is costing us 4s. just now and if a 4s. grant were given that would meet it. Having in view that it costs us 4s., it does not matter very much in what shape the grant comes if we could get something additional.

3103. You mean that the taxpayers should pay it instead of the ratepayers?—Quite so. We think the ratepayers are doing all that could be expected of them. We do not see our way to go further, and we do not see our way to throw it on to the rates, and we are just content to go on as we are doing unless we are asked to do better in the matter of physical drill.

3104. But do you not think that out of a total expenditure of £2, 10s., if the taxpayer gives you about 35s., he is doing about as much as he ought properly to be called upon to do?—Well, the ratepayer looks at it from the point of view that his rate is 1s. 3d. or nearly 1s. 4d., and no chance of it being less as far as one can gather; and of course if it were not the question of the development of this subject, which we are all interested in and which we should like to see developed, we would be content to go on pretty much as we are doing and with the rate as it is, and if we are asked to do more we simply say candidly we cannot do more unless we get some help from some other source.

3105. Or cutting out some other subject?—That would not meet it. Cutting out some other subject would meet the extra half hour of ordinary drill say up to the fourth standard under twelve, but we come to the question of larger gymnasia, gymnastic appliances, trained teachers; and while we are going so far in that direction we are not going so far as we see it is possible we might go if we had some higher grant.

3106. But have you no means for getting your teachers trained?—Oh, yes.

3107. Have you a class for the training of teachers?—Oh yes; we have a Physical Training College that supplies us with teachers.

3108. But have you no class of your own for training them?—Well, we have never gone in for that.

3109. Why not?—We get them trained so readily in this college.

3110. But you pay for that?—No.

3111. Are you aware that the Department will give you three-fourths of the expense of training them if you train them yourselves?—Yes; well, I think it has been suggested; there has been some talk, and probably we might have gone in for that if it had not been that we had that college?

3112. Towards which you pay a large sum?—Yes, we pay in fees.

3113. And you get no assistance from the Department?—We do not pay for the training of the teachers; the teacher goes and takes classes there in preparing for being a teacher.

3114. Who pays?—The teacher. The teacher goes to the Physical Training College, attends his classes there, and takes his certificate.

3115. And you do not pay for it?—No.

3116. Why do you complain of the difficulty of getting trained teachers?—We have to pay the instructors that we engage from the college. Our own teachers, although they get a certificate from the Physical Training College as part of their equipment, are not all suited for drilling.

3117. But suppose you want to train your teachers, and the Department offers you the giant's share of the expenditure of doing so, why have you not used that opportunity?—Well, I can only say it is just because we have such good instructors ready at hand from the Physical Training College that we have been willing to pay them for their work when we required them.

Mr
J. Craigen.

Mr
J. Craigen.
13 May '02.

3118. I am not speaking of paying them for their work. You say the difficulty is to get teachers, and I tell you the Department offer the opportunity of training these teachers, and offer to pay three-fourths of the expense; you have not used that?—No.

3119. Instead, your teachers go to a private institution?—Yes.

3120. And they have to pay heavy fees?—Well, I do not think the fees are very heavy. What they get there is a certificate that they have attended a certain course of drill and they are qualified to teach drill, but when we get them we occasionally find they are not very well qualified to teach it, and in order to keep the drill up to the mark, we have to go to the college and get a certain number of expert instructors, and put them on to the higher departments, and set them to work here and there. But a good many of the teachers who have attended classes at the Training College do their work very well, just practically as well as the trained instructors of the College so far as drill is concerned.

3121. *By the Hon. Thomas Cochrane.*—I suppose you have visited some of those schools when physical drill is going on?—Yes, I have visited some of them.

Physical
drill :
generally well
done :
distinctly
beneficial.

3122. Can you speak as to its general efficiency?—Yes; oh yes. It is generally well done. There is a danger in the ordinary class teacher sometimes being a little slovenly. The expert instructor that we get from the college does it remarkably well, and a certain proportion of our ordinary teachers do it well.

3123. And the general results from your observation?—Oh, the general results, as far as they have gone, are satisfactory. There has been an improvement in the smartness and the carriage of the children. Every headmaster says that it has done a great deal of good already, but they would like to see more of it.

3124. That is the unanimous opinion of the masters?—Yes, unanimous.

3125. That it has done good to the pupils?—Yes, distinctly.

3126. And even your opinion, as an observer, is that it could be extended still further with advantage?—Yes.

Outdoor drill. 3127. Have you seen some of the outdoor drill you spoke of which takes place in one of your schools?—Yes; I saw it in one of the schools—King Street School.

3128. Could you give me the nature of it; what sort of drill it is?—It is just pretty much what I had as a Volunteer. Of course that is now twenty-five years ago, but it is just the ordinary drill in forming fours, marching, marching at the double, and wheeling, and so forth.

3129. Do they like it?—Oh, yes, they like it; they are very fond of it.

3130. There is no objection from the parents as to the military nature of the drill?—Oh no; not so far as that stage goes, not that at all events.

3131. They do not fear that in the schools the children are being taken out of the hands of the Prince of Peace and put into the hands of the man of war?—Oh, we hear murmurs occasionally that we are introducing too much of the military spirit, and we have a minority of the Board who think that we are just going far enough, but as far as we have gone we have been unanimous.

*Outdoor
physical
exercises ?
equivalent to
'military
drill':
objections to
latter.

3132. You have found it on the whole very beneficial?—Yes. When the question of military drill came up a year ago we called it outdoor physical exercises, because some of the members objected to call it military drill.

3133. You saw the benefit that was conferred upon the children, and you wished hard to avoid any objection on the part of the parents?—Quite.

3134. And alarming them?—As far as we have gone there is no objection practically; whether there would be any if we were to go much further it is hard to say.

3135. I see you talk of the Standard IV. and the Standard V.; that is a little antiquated description—Yes.

3136. You mean children of a certain age?—Yes.

3137. What age Standard IV.?—Standard IV. would be about eleven.

3138. Standard V.?—Standard V., twelve or thereby.

3139. And you spoke about courses of some advanced gymnastics extending over the remainder of the child's school life?—Yes, after about twelve say, the last two years or so of the elementary school, children of thirteen or fourteen; they are prepared to go in for something more of the nature of gymnastics. They get tired of the ordinary musical drill; it gets monotonous; but they are keen to have gymnastics. But when they come to that age we charge them 1s. a quarter. If there are as many in the school as will make a class they pay 1s. a quarter, 4s. a year, and we hand that 4s. a year to the Physical Training College, and they supply instructors and apparatus.

3140. And the children do this thoroughly?—They do that thoroughly.

3141. In any large numbers?—Oh, well, considerable numbers. We only have it in, I think, five schools. I think we will introduce it into a sixth very soon. The exercises laid down in the syllabus lodged are supplemented by some advanced gymnastics suitable for boys and girls of thirteen and over, including horizontal bar, parallel bar, bridge-ladder, and vaulting-horse exercises, under competent instructors.

3142. Do considerable numbers of pupils take it although they have to pay for this instruction?—Yes.

3143. Showing that it is popular?—Oh, no doubt it is popular.

3144. With them and their parents. Then you spoke of continuation schools?—Yes; in continuation schools after they have had their year or two of the gymnastics in the day schools we wish them to attend the continuation schools when they are fifteen and sixteen and seventeen, and where they get other subjects, all the usual subjects of continuation schools; but then if we had a night for gymnastic exercises they could go straight on from the day school into the evening schools and go on continuing the work which they had had, and we feel that if our day schools were properly equipped in this direction we could get all the apparatus of the day schools in our evening schools. It would be much more easy taking it up and less expense in the evening schools if we had our day schools better equipped.

3145. Then there must be a considerable class of young lads and girls too who do not attend the continuation classes?—Oh yes, that is so.

3146. And would physical exercise be of advantage to those also?—Well, of course it would be open to them to come and take these classes; they can come and take such classes as they like; they might come and take the gymnastic classes along with some others.

3147. Are there any idlers in Aberdeen who are unwilling to go to any kind of class or submit to any kind of discipline?—Oh yes, no doubt there are. We have 4000, which is a fair number, at our continuation classes. There are a good many more who might come if they chose. There are a good many who run after football matches and that sort of thing, who do not care for classes to improve themselves.

3148. Have you any what they call Hooligans—any wild, ruffianly fellows?—Well, not many of them. There is a great craze for football matches and that sort of thing. They run to see them and take a great interest in them, but I do not think we have very much of the rough element.

3149. Not much of the rough element?—No, and this 4000 stick to their work with a considerable amount of earnestness and attention, and do remarkably well.

3150. But you would not object to see all young fellows when they are growing between fourteen and seventeen or eighteen, subjected to a short period of physical exercises?—Oh, I think physical exercises are very good for them.

3151. It would do them a lot of good and no harm?—Quite so.

3152. *By Professor Ogston.*—Have you a medical

officer to the Aberdeen School Board?—Well, I do not think we have. We have a medical gentleman who attends to cases when he is specially instructed. Dr Rose does some work for us, but it is only as we specially instruct him. If there is a case of excuse for non-attendance, and the question of medical certificate coming up, if we are not satisfied we send a medical officer—Dr Rose—to examine the child; cases of that kind, but we have no regular medical officer. We have no one to examine the children, for instance, in connection with gymnastic work or anything of that kind.

3153. Have you had much need for a medical officer?—No. Whenever a lad states that he does not wish to take drill he is just marked off. Whenever the parents of any boy or girl state that they do not wish him or her to take gymnastics or drill, or anything of that kind, the teacher just marks him or her off on the register, and the boy or girl is not asked to go; for any weakness or if he is too delicate to take the exercises—or for any reason of that kind.

3154. Did you ever have under the consideration of the Board the appointment of a medical officer?—No; I do not think we ever seriously had.

3155. And have you any idea what amount is expended *per annum* in paying this gentleman who acts?—Oh, it is very little; it would only be a very few pounds. I could not say how much it is, but it is very small.

3156. So that if a medical officer became necessary in connection with the introduction of physical training, it would be a new source of outlay to you?—Yes.

3157. A considerable source of expense?—Oh, yes, if he had practically to examine every boy who went in for gymnastics.

3158. You would require a man of a very high class?—Oh, no doubt we would require a first-class man.

3159. And provide him with a correspondingly good salary?—He would require a pretty good fee; he would be doing other work likely, but he would require a pretty good fee if he had a retaining fee for all our work, or even if we paid him per head.

3160. By results?—Yes.

3161. The next thing I want you to give us some information about is, you have incurable children in Aberdeen to deal with under the School Board?—Yes.

3162. They are mostly in a ward of the Incurable Hospital?—There are a few there, I think.

3163. And them you provide with teaching?—I am not aware of that. Do you state that as a fact?

3164. Oh no; I ask it as a question?—No, I think not.

3165. Of course you would recognise it as a duty of your Board to teach children who are incurable?—Yes. We have had an inquiry lately about the number of lame, cripple children who had to be attending school, to consider how we could get them taught, and we deal specially with blind children and so on; but I do not remember of any children being taught in the Incurable Hospital at the present moment.

3166. Then about the weak and deformed children: how many did you find were under your management?—I do not remember the number; it was not a very large number. Of course they were of different degrees.

3167. Would you have 1 or 2 per 100?—I think, perhaps, 50 out of the 25,000. That is only about 2 per 1000.

3168. Do you give them physical training?—No, I do not think we do; no.

3169. And you have not any special information to give to the Commission regarding what you would recommend as physical training for those weaklings?—No.

3170. How do you teach girls swimming under the School Board?—We have only had one class from Hanover Street school, and I am not quite certain—I was not able to get down to their gala—that they are not all boys.

3171. So that really there may be no girls in Aberdeen being taught swimming?—I shall inquire as to

that. There is just one school had a class of about 60.

3172. You have no female instructors in swimming?—No; and that is what makes me think it was only boys, because it was the janitor of the school, who was an expert swimmer, and took an interest in it, and attended to them; so if we had girls, we would have required to have had a lady, I imagine, to attend on them.

3173. You give to girls gymnastics, I notice?—Well, we say gymnastics suitable for boys and girls of thirteen and over, and we will be giving gymnastics soon to the girls attending the High School; but I think we have done very little as yet with regard to giving gymnastics to girls.

3174. Have you had before you specially the necessity of dressing the girls for gymnastics?—I think it is only in the High School that we have been contemplating the gymnastics for girls. There is no doubt that would have to be kept in view.

3175. About dancing: do you teach dancing under the School Board?—Well, we have teachers of dancing who go to the schools, but it is an extra subject, and the pupils pay a small fee.

3176. So that it pays itself?—It pays itself.

3177. *By Mr. Fergusson.*—I think your Board, if I understood you right, is very much impressed with the advantages, from every point of view, of giving physical training?—Yes.

3178. And they would like to give more than they do at present?—They would like to give more; yes.

3179. But teachers say they cannot find the time?—Yes; every teacher says so. I have a bundle of replies here.

3180. Do not some of the schools give more than others?—Oh, very little. Some manage to give a ten minutes more.

3181. You think nobody gives much above that half hour?—No; some give only twenty minutes.

3182. You have no means of comparing a school that gives an hour with a school that gives only half an hour?—No, we have never been able to do that.

3183. In this present Code, teachers have got a pretty free hand compared to what they used to have; do you think it may be when the teacher sees that more attention is paid by the inspector to reading, writing, and arithmetic, and so on, and not very much attention to the physical training, naturally the teacher wishes to devote most of his time to the reading, writing, and arithmetic?—Yes; I expect that is their idea.

3184. If it was known that physical training was a subject on which the Department would require a greater knowledge, then the teachers would find means to devote a little more time to it?—Of course. I do not know as to the latter part of the question.

3185. You think it is impossible, that they have not got the time?—The teacher says he can only give more time to drill at the expense of some other subject.

3186. If I was to produce to you schools which give three hours instead of half an hour per week to physical training, and in reading, writing, and arithmetic their attainments were just as high as your schools, would not that rather shake your opinion of what your teachers tell you?—It would make us go for our teachers, and ask them to look into the subject.

3187. I notice in this appendix to your *précis*, your Committee did not like General Chapman's suggestions?—That is so.

3188. In their rejecting that, was there any idea of its being a military organization that was being put upon them?—There perhaps was a little of that in the minds of certain members of the Board, but the whole of us were of opinion that our own system of drill and gymnastics was preferable to the system that was proposed. We liked our own book better than the army book.

3189. You have noticed that if the military idea is cut out, physical training finds more universal acceptance than if military drill is always insisted upon?—That is so.

Gymnastics : seldom given to girls.

Time allotted to physical instruction : teachers' views : reasons.

'Physical training' more generally acceptable than 'military drill.'

3191. And you would be in favour of dropping that and treating it as physical training?—Yes; if you call it military drill, it sets up the backs of certain people to begin with, and you do not know exactly where you are.

3192. Have you many badly-fed children in your school in Aberdeen?—Well, not very many; we have means for feeding a good many of them.

3193. Will you tell me what these means are; what do you do?—Well, of course, it is outside the School Board.

3194. The School Board pay no attention to that whatever?—Yes; well, the School Board got up statistics by issuing a circular to the headmasters and asking how many of the children attending their school they considered underfed. The reports were sent in and we submitted them to the various agencies. We have an Educational Trust, a branch of which is a feeding school, and where about over 400 children get free meals. These are the children of parents in necessitous circumstances, but not in receipt of parochial relief: those who are out of work temporarily and so on. They have to fill up a schedule and send it in, and we take in their children and we feed them there, and they are always coming and going. We feed 400, three meals a day under this trust. That relieves the School Board and feeds the children to a considerable extent. When we found how many underfed children we had we inquired how many could be fed by the educational trust, and we got the trust to feed as many as possible. Then we found on inquiry that a certain number of them were in receipt of parochial relief and we called the attention of the inspector to them.

3195. At any rate, you took steps to find out about the children?—We did, and we felt as a Board that the only thing we could do was to try and find means for getting them fed through other agencies.

3196. And were your efforts successful to a large degree?—Yes; to a large degree.

3197. And do you find the good results?—Oh yes, we find that there are very few children attending the schools who are underfed, or who, if they care to make application, cannot get fed.

3198. I suppose you found that anything of that sort would tend to increase your attendance?—Oh, no doubt.

3199. And you depend on your attendances for grants?—Oh, yes our attendance officers are very

useful in looking after these cases and trying to deal with them.

3200. *By the Chairman.*—What is your opinion, please, as to the utilization of Saturday more than it is at present, and specially, say, for physical training or games?—Well, Saturday is the off-day of all the schools, and they have their cricket in summer and their football in winter.

3201. But only by themselves, not under any supervision?—Their games are not under any supervision.

3202. And what is more, the teachers generally have a conference, do they not, on Saturdays?—Oh, I think they have a holiday pure and simple on Saturday.

3203. But they do have conferences occasionally?—Oh yes, occasionally on Saturdays.

3204. And very often necessarily are out of the way?—Yes.

3205. You do think that Saturday would be unpopular if you were to utilize it as a compulsory day for anything?—Yes, I'm afraid it would.

3206. And yet, what is your opinion about children loitering about and doing nothing on Saturday; is that good for them?—No; only they go away pretty early, I think, to their sports and so on; they have matches on.

3207. Every child does not go to sports, I suppose?—Well, every healthy-minded child goes in for sports—more or less.

3208. Therefore you think it would be a great shame to cut into these sports as existing, especially cricket, in the summer?—Oh, I think so; I do not think I would interfere with the holidays.

3209. Now, you said something about parents' opinions; do you consider that parents' opinions are of great force in these days with the children, or with those between fourteen and eighteen in Aberdeen?—Well, perhaps, it is not very easy answering a question like that. You mean how far those from fourteen to eighteen in Aberdeen are under the control and management of their parents?

3210. Or how far the parents can influence their children's actions?—Oh yes; as long as the children are at home, or the young men are at home, the parents still have a considerable influence and control over them.

3211. Therefore you consider parental opinion is very important as regards any change in the law and regulations as regards any of these educational matters?—Oh, yes.

The witness withdrew.

Mr H. F. MORLAND SIMPSON, M.A., examined.

3212. *By the Chairman.*—You are the Rector of the Grammar School in Aberdeen, which is under the Aberdeen School Board?—Yes.

3213. Have you got your *précis*? Would you just go through it shortly, or make a statement from it? You start by saying you are a native of Newcastle-on-Tyne?—Yes.

3214. You were educated at Harrogate, Oundle, and Pembroke College, Cambridge, a member of your school XI. and XV. and of your college XV. and 2nd boat; B.A. (1st class, classical tripos) 1882; since then private tutor in Germany (1882); assistant master at Marlborough College (1883), and at Fettes College, Edinburgh (1883-1893), and after that you went to where you are now?—Yes. The Aberdeen Grammar School is a day school for boys, present numbers about 450, including elementary, middle, and upper schools, the last two regarded as secondary, ages ranging from four and a half to over twenty. The upper school is divided into (1) a Modern, or Science and Art side, ages thirteen to seventeen, and over; and (2) a Classical side, preparing for the University, to which it sends some thirty students annually. Many of these join the University Volunteers (Gordons and Medical), and are prominent in University games and athletics. A Former Pupils' Club, founded in 1893, now numbers

over 400 members, and has done much in this and other directions. Its main objects are 'to promote social intercourse among its members, and to keep them in touch with their old school.' Then I give statistics as to the ages of boys attending the school:—

	14-15	15-16	16-17	17-18	18-19	Over 19	Total
In June 1900	57	86	59	19	10	5	236
In June 1901	69	55	61	21	11	6	224

These I supplied chiefly with reference to the last paragraph on the question of a cadet corps in the school. The school serves all classes, from the richest to the poorest citizens, and offers many bursaries, and about fifty free places to poor boys. It is mainly a town's school, but also attracts a large number of scholars from the northern counties, some of whom board in the town, and others come in and out by train. The physique and previous training of the latter was a point upon which I might speak, if it interests the Commission, as a comparison between boys in town and country. The country boys reach us at a somewhat later age than the town boys. Naturally, they are trained in their own schools, as far as those schools would carry them; and as far as I have observed, though they are naturally, and as one would expect, of a healthier physique than the town boy, they are not trained to games and athletics,

Mr J. Craigen.

Parents' opinions influence

Mr H. F. M. Simpson, M.A.

Mr H. Simpson

Aberdeen Grammar School: description.

Town country comparison

drill and so on, to the same extent as in the town, probably from the want of appliances, etc., and also because physical training is perhaps not recognised as so necessary in the country schools. They are of a somewhat heavier build as a rule than the town boys. The kind of country lad we very often get is one who has shown he is a lad of unusual parts in the village school, and has come in with the sole purpose of pushing on to the University. He is a boy who sometimes sacrifices his physique completely, in some cases disastrously, to the need of getting on to the University. It is his sole object, as a rule, at school, and such a boy brings very little to us socially, to the school, and takes very little part in our games. Of course there are exceptions. He is probably intending himself for the ministry, or whatever the University may open out to him. I have already said that the school trains boys of all classes of the community, but if one were striking an average I should say probably the main bulk of the boys are of what one may call the lower middle class, very largely consisting of tradesmen's sons in the town, and the very low scale of fees enables such and even comparatively poor people to send their sons to it. That is what I referred to in speaking of the school's social status. It would perhaps hardly be fair to compare a school of this kind with the so-called Public Schools of England, where the pupils come from a wealthier class of society, and are more entirely in the hands of their teachers for training. I refer to boarding schools. I am not familiar with the English day schools so as to institute any comparison there, but possibly any comparison I should make between the Grammar School of Aberdeen and an English Public School would to some extent hold good as a comparison between an English day school similar in type and the so-called Public Schools of England. The physical training in the school—the only compulsory physical training we give is gymnastics for one period a week, which is more or less an hour in duration. That is given throughout the school with the exception of the two highest classes, where the boys have an extra strain put upon them in the way of preparation for the University, and those of them who come from the country at a late age have not had the previous training to take advantage of the class in that subject. The instructors are experts provided by the Aberdeen Physical Training College, and follow the system or syllabus of the Board. The value of it physically and morally I place high, but inadequate, because I do not consider one lesson a week sufficient physical training. The school stands in its own grounds, and there are about $7\frac{1}{2}$ acres of ground, somewhat irregular in shape, the buildings being planted in the middle of it. The actual ground available for football is about three acres, in a long piece hardly large enough to make a full-sized football pitch; and with 400 to 500 boys playing constantly over this ground, it is impossible to get anything like a good cricket pitch on it, though they do play cricket on it, as many as ten or a dozen games at a time. The members of the middle and upper school each subscribe 1s. a quarter towards the expenses of games, which is found to cover all we can spend on such a limited playground. Then there is besides a swimming club, with a small fee charged to members. Last year we had forty-five members. Once a year we hold athletic sports, which draw very well in the way of entries. As to the value of these sports, they are too occasional, and inferior as a discipline, because a boy in athletic sports is 'playing to his own bat' entirely instead of playing for his side. An ordinary healthy boy does not require special training. Excessive training for athletics would probably be bad for him. I think if any system of athletic sports could be devised extending them over the school course, instead of once a year, it would be an improvement. On the whole, I may say with many exceptions, these games are joined in heartily and played with spirit. The staff of schools of the Grammar School type does not, as a rule, embrace men physically trained to take an active part and interest in school games. The Board appoints the members of the staff, and my experience is that their qualifications

as to whether they are cricketers or football players, or take a direct interest in the games, are hardly ever inquired for. As to my opinion on the military instructor, I should prefer that the staff of the school should consist of qualified teachers, each of whom is capable, or should be capable, of taking his own class in drill, because I think he has a better grip of the class than a mere visiting master, and the merely military instructor is often somewhat rough in his methods with boys. That has been my experience of them, and that their discipline is sometimes defective in consequence, perhaps, of certain tricks of speech, roughness of manner, and so on. Generally speaking the gymnastics, including drill, are popular with the younger members of the school, but I have found cases where they become very unpopular with older members, owing to a certain distaste, partly due, perhaps, to the fault of an instructor, and partly due to a sense of awkwardness in boys who have not had the training of the classes below, in taking that particular work. With regard to our comparatively small contribution to the direct service of the State, that is a point which is of interest perhaps in connection with Volunteers and cadet corps. I have seen various statistics of the large number of old boys who have gone to the front from this and that school, from Fettes College, for instance, which is a comparatively small school in numbers compared with the Grammar School. But the boys of a school like that represent a different class. They are mostly boys who enter the army as officers, and can afford to do it. Our *cadet corps* consists of a class which cannot afford to be officers, and is too proud to enter the ranks as at present, so that really we have a very small number at the front, and it has been somewhat of a disappointment to me to find it so. I think, in fact, that the class chiefly represented in our school—the middle and lower middle classes—are not doing their duty to the State in direct service to it as compared with the upper classes and the common people. The question of a cadet corps is entirely one of means, of money. At various times I have had this matter before me, more particularly of late. I have made inquiries as to the expense, and have come to a very definite conclusion that if it were to involve the pupils and their parents in any expense, it would be very inadvisable to introduce it into such a school as ours. If we introduced a cadet corps into our school, costing them, say, £2 to £3, or £4 per head *per annum* for outfit, ammunition, and so on, it would probably result in driving a great many boys away from the school to places where there was no such institution to add to expenses. We hesitate to start a corps, not from any distaste to the thing itself, but simply on the question of ways and means. I think a cadet corps, if the means were found, would be exceedingly popular, and I should regard it as a very valuable thing in such a school.

3215. May I ask you how long you were a private tutor in Germany?—Nine months.

3216. Travelling or in one place?—No, I was mainly in one place, with a son of the late Sir John Fowler, the engineer.

3217. Was your attention much called in Germany to the system then prevailing there?—I have seen a good deal of it then and since.

3218. I mean enough for you to take notes and contrast them with anything in this country?—Oh, yes; I knew a number of the *primaier* or senior German boys in the local Gymnasium (secondary school), and since then I have made the acquaintance of schoolmasters who are particularly interested in physical education; Professor Kaydt, of Leipsic, for instance, who was sent by Bismarck to make a tour of inspection in our English and Scotch schools to study this very question. He stopped a week with us in Fettes College, and I have visited him since in Germany and have kept up some correspondence with him since.

3219. He came over principally to look at games, I suppose?—Entirely; that was his mission—the English system of physical education.

3220. But he did not go to Board Schools, I pre-

sume, or grammar schools, did he?—No; I do not think he saw anything of them.

3221. Nothing but the higher class public schools?—Yes; how he came down to Fettes I do not know, but it had a great reputation for football at the time.

3222. *By the Hon. Thomas Cochrane.*—You compared the physique of the country lads who came to you and the town lads. I think you said you could not draw any exact conclusions?—Well, I should be disposed to say that the country lad is physically better material, but the town lad is better trained.

3223. And as to development at the same ages?—Well, I have not statistics on that point. I think every school should keep a register of physical development, but there is none.

3224. We have had various evidence from different observers, some saying that the town lads are nearly as well developed where they have had physical training as the country lads?—I should not like to give a definite opinion upon that.

3225. *By Mr Shaw Stewart.*—I gather, Mr Simpson, that there is no considerable system of physical training at your school at present?—No.

3226. And quite apart from the military aspect of boys serving their country afterwards as soldiers, I suppose you would consider it a very good thing if physical training were more generally exercised in schools?—Yes, certainly; I think they would gain mentally very largely, and in discipline enormously.

3227. And do you think that a certain amount of time which is now devoted to lessons might be profitably given up to a systematic training in physical exercises every day?—Well, the pressure of subjects in our time-table is very great, and in the day school our time is limited by a number of boys having to catch a certain train to get away. The only day school I know of where the experiment of compulsory games has been made, and successfully, is the Edinburgh Academy, but there again you have a class of boys somewhat higher in the social scale, and therefore—it is perhaps a little paradoxical—more amenable to discipline.

3228. I was not referring so much to games as to physical exercises on a system, and what I should like to put to you is this, if you could devise a system of physical exercises for a short period daily although that might diminish some of the time devoted to learning, would not the mental as well as the physical results in your pupils be better at the end of the year?—I think certainly we should get better mental results if we could get more physical training into the boys, but I do not think it would be necessary for that purpose to sacrifice any of our present time-table devoted to other subjects. I should be disposed to lengthen the time-table in order to meet this need, and let those come who can.

3229. But how would you get your time?—Well, our school day, Mondays to Fridays, is 9 to 1 and 2 to 4. Boys up to thirteen years of age are in until 3 o'clock in the afternoon. This exercise would be practically 'games' to them, and might be taken chiefly out of doors. I do not think it would be any hardship to those boys to carry them on till about half-past 3 or 4 o'clock. The hours for the juniors are certainly shorter than in the elementary schools.

3230. *By Mr Fergusson.*—You say your physical training is inadequate?—Yes.

3231. Do you give less physical training than the elementary schools?—No, rather more. Our period once a week is longer, but what I mean is that one lesson a week is very insufficient; it seems to me very much like one meal a week, and that a boy should be getting exercise every day.

3232. You have no time, you say, to do it every day?—Well, we must leave it very much to their natural instinct to play. They do get play, a good many of them, in the form of cricket and football.

3233. Yes, but I mean physical exercises?—I should not consider it necessary to have drill every day.

3234. I do not mean drill, but just the ordinary exercises, to develop the chest and so on?—If the

teachers were all trained to it and had to have a certificate enabling them to take it at any odd five minutes in the class, the class would be very much brightened up by it. I know that by experience.

3235. If that was a matter that was looked into more closely by inspectors, of course managers would take care that they had people to teach this subject?—Yes.

3236. And so things might be expected to work better?—Yes.

3237. If it was known that the Department wished it, it would be more practised?—I understand from their reports that inspectors do, in fact, look into the question of drill and physical training in the elementary schools, but in a school like ours it is never inquired for by the inspectors.

3238. They never look at your physical work?—No.

3239. Do they report upon it?—In our lower school, which is very much on the footing of an elementary school, it is reported upon for the infants and juniors if they happen to see it, that is to say, if the teacher says:—'Would you not like to see them do some drill?' and takes them in it, but the ordinary gymnastics in the school are never looked at.

3240. Do you think you could not work a cadet corps unless you made it compulsory? You get over the difficulty of parents objecting to pay the money if it is compulsory?—I am afraid it would die a natural death in that case. They might take it up with enthusiasm just now, but after the war fever has passed over, the burden of it would fall very heavily on them, and I should not like to introduce a thing which a boy might feel some compulsion to join, and yet which his parents might find a considerable hardship. The effect of that, as I said, would be to keep a considerable number of boys away from the school, and send them to rival schools, cheaper schools.

3241. You think it would be a real hardship; it would not be that they would merely not choose to spend the money?—No; even our low fees, which amount to a maximum of £7 a year, are a great strain upon many of the people.

3242. *By Mr Alston.*—Do these figures in your *précis* refer to the upper school?—And part of the middle school. I took the age of 14 because I thought that was the age at which they would join a cadet corps.

3243. Then you approve thoroughly of the increase of physical training in the school?—Yes, certainly.

3244. You distinguish between the physical training and the drill and training of a cadet corps?—I should consider the drill and training of a cadet corps as part of the physical training.

3245. Then do you wish to add a cadet corps to the school in order that you might get more and higher physical training?—That would not be my object entirely. I think it is the duty of these schools, inasmuch as they are State schools, to train the boys to take their part in the defence of the country. That would be the first object of the cadet corps, and the physical training second to it.

3246. Then probably it would be from those boys in the upper and middle schools, namely the 224, out of whom you would form your cadet corps?—Yes.

3247. Then probably that corps would not exceed 100 boys?—If all the boys joined I think we might put them down at 200, excluding the physically unfit.

3248. As the cadet corps of the school?—Yes.

3249. You indicated that the expense might be £3 or £4 a year?—Yes.

3250. The first cost for uniform outfit stands, that is not repeated?—Well, a growing lad will soon grow out of his uniform between fourteen and eighteen; he will need a change.

3251. It is to be hoped it will be the kilt?—Kilts certainly—the Gordons.

3252. The subsequent year's expense would not be so great—a little for ammunition?—My inquiries amounted to a good deal on these heads.

3253. Is that so?—Yes; I made inquiries of a friend of mine at one of the English public schools where there is a cadet corps, and his advice was very

Mr H. F. M. Simpson

13 May

Cadet corps
undesirable
use of
sion.

Cadet corps
objects

Cost of
habit

strongly against doing it unless you could do it well, which means a question of expense. He put the uniform at about £3, and I think I may state that the boy would have to undergo that cost at least twice between the ages of fourteen and eighteen; he would soon grow out of his uniform.

3254. Do you think that in the case of the 200 boys who would probably form your cadet corps, the parents would find the expense a burden?—Well, that is practically all the available boys of the school, and a great many are so poor that every additional pound is a hardship.

3255. Suppose there were only 100, would that objection still remain?—I should be afraid of keeping away boys from the school because there is the possibility of them wanting to join the cadet corps; they are eager to do it because perhaps it is the thing to do, while the parent, finding it a great strain, would rather send them off to some other school, a rival school in Aberdeen.

3256. Do you think the expense would be a fatal objection?—A very serious one. I have no doubt the thing would be joined with enthusiasm at first, but these troubles would tell in the long run against the corps.

3257. *By Professor Ogston.*—Your school is one very peculiarly situated, is it not; you have few schools throughout the country to which it could be compared?—Only the other burgh schools of Scotland. The High School in Edinburgh, the Glasgow High School, and so on, are very much on the same footing, and Dundee.

3258. Do you not train a great many more lads to enter directly into the University than is usual in such schools?—I am not familiar with the case in Edinburgh; I think it certainly is true as compared with Dundee.

3259. You do train a great many, do you not, who enter the University directly?—Yes; out of about every hundred who leave the school annually, we reckon twenty-five to thirty go to the University.

3260. And you have made, I think, very strenuous efforts to improve the school under your charge, particularly in the way of introducing physical training?—Games generally; yes. The physical training, as gymnastics and musical drill, existed in the school before I came. That was introduced by the Board.

3261. But you have been interested in this matter, and made distinct efforts, have you not, to do what was in your power?—Yes, I have endeavoured to organize the games in the school.

3262. And yet you are not satisfied with what you have succeeded in doing. You have been baffled, have you not?—Because I see so many boys who, in my opinion, are quite physically fit to take their part in cricket and football and so on, just loafing away, not joining in the games at all, and sometimes discouraged by their parents from taking a part in the games.

3263. And you think it would be better for your school if compulsory physical training were generally introduced?—That would have to come as something required of us from above. I do not think that any school or perhaps any School Board is strong enough to do it. It would be looked at by the public somewhat askance at first.

3264. I do not quite understand. Would you welcome it or not being introduced into your school and other schools similarly situated?—I should.

3265. You mentioned that country boys, I think you said, sometimes injure their health by over-study?—I am speaking of the kind of boy who comes in to get a bursary at the University, for his last year or two's training in town. These are often boys who have to live very hard on very little means, and practically spend their whole time in 'grinding' for their bursary, their one end and aim in life. They cannot go to the University unless they get it, and I have observed cases where their work has told very heavily on such boys. They have not looked the same boys at the end of a school term or session as when they came fresh from the country.

3266. You have found it killed or permanently

injured them?—I do not know enough about their subsequent history to say that. In only one or two cases have I known of it doing them serious injury, to be certain of it.

3267. And you think that a compulsory physical training would tend to prevent this?—Well, there is more in the question with regard to those boys. Some of them have to live on very insufficient means, and if they had to have compulsory training, you would have to devise some system of compulsory feeding too to meet their case.

3268. Then your school is really peculiar in that respect. You might be using a two-edged weapon if you introduced compulsory physical training?—Well, it might be taking too much out of them.

3269. Do you think that compulsory physical training would injure their mental requirements when they intend to enter Universities?—Speaking of these peculiar boys?

3270. Of your boys, yes?—No, I think they would be the better for it. My experience of boys at Fettes was that they could work longer hours and produce very excellent results, while at the same time taking a great deal more out of themselves physically than our boys do as a rule.

3271. Could you tell me in a few words what is the essence of the Stockholm system which you approve of?—The allusion in my *précis* is in reference to a central institution they have in Stockholm for the training of teachers, who, as I was informed, are men of a social standing in the schools quite equal to that of the rest of the staff. I am not prepared to give you the details.

3272. It refers to the principle of getting high-class teachers?—Yes, and recognized by a Government institution.

3273. Have you any suggestion to make regarding the physical training of ailing, weakly boys?—No; that is a question for their homes in the case of day boys, unless Boards appoint a doctor, who should say whether such and such a boy is fit to take games or not.

3274. *By Sir Henry Craik.*—Your school is under the inspection of the Department?—Yes.

3275. The inspection is carried on by a number of different gentlemen, each of whom takes a special subject?—Yes.

3276. Then unless you specially asked for the inspection of the physical instruction, possibly those special examiners would not turn their attention to it?—No; it would not be expected of them.

3277. But the Department imposes upon you no curriculum?—No.

3278. It has no power to do so?—In physical training; no.

3279. You stated, I think, in the past experience of the Department in relation to the school, they have found it confirmed that there was a tendency rather for the boys to overstrain themselves in their mental work?—Yes.

3280. I think the Department have had to remonstrate a little with the number of subjects that they took up in certain cases?—I do not remember that particular instance.

3281. Has the Department not had to limit the number of subjects that they went in for in the Leaving Certificate Examination?—Not more in our school than in Scotland generally.

3282. I am speaking of Scotland generally, too, but also in regard to your school, the Department had one or two cases, had they not, and with your agreement they pronounced the opinion that they took up too many subjects?—No; I cannot recall it.

3283. Was there not some correspondence between the assistant director, Mr Macdonald, and yourself on the point?—No. I have not had any correspondence with him since this question arose.

3284. But they do as a fact take up sometimes as many as four Honours subjects in the Leaving Certificate?—We might propose, on occasions, to offer as many as five; if the boy had already got Honours in one or

Mr H. P. M. Simpson, M.A.

13 May '02.

Boys : tendency to mental over-strain : lack of physical development

Mr H. F. M. Simpson, M.A. other subject it would be simply taking the subject over again.

13 May '02.

3285. Do you not think that five Honours subjects in a single year is an undue pressure for a boy?—It depends very much upon the boy. We had a case of four Honours last year, in which I do not think it was a strain at all upon the boy.

3286. But the Department has placed a limit upon subjects now?—Yes, I am aware of it.

3287. Having been impressed with the idea that there was overstrain?—They have reduced it to three Honours.

3288. Then that indicates that apart from any regulations there is a tendency amongst those ambitious boys slightly to overwork themselves?—The way is this; the boy has got to take five subjects in any case, and if he is going in for a University examination, say a year after the Leaving Certificate Examination, he must keep up his five subjects. It is just a question of being examined; he has to take all five in any case for the University, whether he is to be examined in them in the Leaving Certificate or whether he has to drop two and specialize in three.

3289. But, at all events, the recent regulations indicate on the part of the Department an opinion that there has been rather an over-pressure?—Yes, that is the feeling in the University too.

3290. A feeling which is also felt by the University? To get the subjects reduced to four.

3291. Therefore, as I say, apart from all regulations there is a tendency on the part either of the boys or of their parents rather to overstrain the intellectual part of their work at the expense of the physical development?—Yes, I think so.

3292. That is the general effect of your evidence, I take it?—Yes.

3293. Do you think that you could suggest any remedy by which these boys might be made to take a larger part than you say they do in contributing to the general strength of the nation?—I think a cadet corps would help if the Government would make up its mind to impose it upon us with sufficient means to do it,—

3294. Would be a benefit to the boys?—Would be a benefit to the boys; it is for military men to say whether it would be a benefit to the army.

Honours subjects reduced.

Cadet corps : beneficial to intellectual work.

3295. But it would not be harmful even if it, to a certain extent, tended to restrict their intellectual work?—No; it is quite possible that their intellectual work would benefit by it in the long run.

3296. *By Mr Shaw Stewart.*—May I put one more question rather following out Sir Henry Craik's questions; at what age do the boys come to your school?—We have an elementary department; they begin at about four and a half; infants.

3297. I thought your school was more for boys over fourteen?—Yes; then the secondary part of the school begins in the middle school at about the age of eleven.

3298. I should like to ask this question; would it not be easier for boys over fourteen to take the physical exercises if they had had some training as small children in physical development?—It is very necessary it should be progressive; yes, but they do get it in the elementary schools to some extent, and in our own elementary school on the same lines as in the Board's general elementary schools.

3299. But I suppose you consider that it is not really systematic?—Oh yes, as far as it goes; they have one period a week the same as the rest of the school.

3300. But one half hour a week is hardly systematic training?—Well, it is an hour with us, but it is one continuous hour.

3301. Would you like to see that extended in the elementary department of physical training; would you like to see the physical exercises amplified in the elementary?—In the general Board Schools?

3302. Yes?—Yes; I think it would probably be an advantage if they could do more that way than they are doing at present.

3303. Would it not make it easier for boys when they get older to divide their attention more between their physical and their mental development?—Yes.

3304. If they had a proper training as small boys or girls?—Yes. Still some of the boys who come to us and who have not had it before, say, boys entering later in the school, have a distinct distaste to begin what their companions are practised in, and as they look clumsy and loutish at it they take a dislike to it.

3305. But if they had had a proper training before, these games and exercises would come much easier to them?—Yes.

The witness withdrew.

Adjourned.

SEVENTH DAY.

Wednesday, 14th May 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT :

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSON.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr JOHN MACKENZIE, examined.

Mr J. Mackenzie.

14 May '02.

3306. *By the Chairman.*—You are headmaster of the Holburn Street Public School, Aberdeen?—I am.

3307. Which is under the Aberdeen School Board?—It is.

3308. And you are Secretary to the Aberdeen Head Teachers' Association?—I am.

3309. You have been twenty-six years in the service of the Board?—Yes.

Mr H. J. Simpson.
13 May

Physical exercises should progress from infancy upwards

J. Mackenzie.
14 May '02

3310. And a headmaster for twenty-two of those years?—I have.

3311. Will you kindly read out your notes so that every member of the Committee may hear it?—In 1889 a syllabus of musical drill was adopted for the guidance of the Board Schools in the matter of physical education. Experience has proved the wisdom of introducing musical accompaniments, as without these drill becomes monotonous to children and they soon get tired. Music is also an aid to regularity of movement, and it is of use in punctuating exercises. The graduated course shown in the syllabus is now practised in most of the schools under the Board. On an average each class in Junior and Senior Divisions receives thirty minutes special instruction per week in the school gymnasium. In addition, classes are arranged daily in the playgrounds and marched into school. In schools with central halls pupils are marched in and out to musical accompaniments. The gymnasia are furnished with dumb-bells, bar-bells, Indian clubs, and where advanced gymnastics are practised, with parallel bars and vaulting-horse. Want of sufficient floor space and want of time restrict the full development of this part of education. The classes in an ordinary public school usually number sixty to sixty-five pupils, and in practising Indian clubs not more than forty or so can be on the floor of any of the school gymnasia at one time. Instructors.—When first introduced the subject was taught by specially trained visiting instructors from the Aberdeen Physical Training College. Now it is largely undertaken by the ordinary school staff. Advanced gymnastics, however, are still taught by visiting instructors. They are on the staff of the Physical Training College; they have been specially trained both in the College and at other institutions, and one, at least, was an instructor at one time at Aldershot, I think, but he has devoted his attention to this work and has been for a number of years on the staff of the Physical Training College almost since its institution. Experience here also has proved that in the elementary school the ordinary class teacher, when trained to teach this subject, is the most suitable instructor up to a certain point; being already familiar with the handling of large classes. Expert supervision and assistance would, however, be of advantage in the higher classes, and here military drill in a modified form might be introduced. In the case of Merit Certificate classes specially trained instructors should be employed in order to give point and finish to the exercises practised by those about to leave school.

The ordinary drill-sergeant or army instructor is not, as a rule, suited for the work as taught in elementary schools, more especially in the lower classes. He has been trained to drill the adult already strong and, to a large extent, disciplined, and it is thought he is somewhat out of sympathy with the young at this stage of the elementary school.

Then the effects. The exercises now practised in the schools in Aberdeen have been found admirably suited to the age and class of pupils attending the elementary schools. They add a charm and attraction to school life which purely military drill does not, and the effects are seen in the bearing of the pupils, in the development of alertness and ready obedience to command. They also prove a corrective to slouching gait and habit, rounded shoulders and stooping. Altogether they have an important reflex influence on the powers of application and on character, and the whole tone and discipline of a school is affected thereby. Physical drill and exercise in connection with evening continuation schools.—Here advanced gymnastics and military drill could, it is believed, be rendered attractive and useful, and be a means of keeping up a continuous course of training which should count for something in the case of those becoming Volunteers or joining the regular army. One evening a week might be set apart in connection with evening classes for such training either during the course of evening classes throughout the winter and spring, or it might be during the summer months.

What is actually going on in continuation schools.

There has been in a few of the schools an attempt at introducing physical exercises. A good many years ago before the introduction of the recent Evening School Code there was an evening set apart for recreation, as it was called, in which physical exercises formed a large part of the instruction, and when it was possible to get an evening set apart for the purpose, the classes were very popular, the pupils turned out well on the evenings, and they had practice in parallel bars and vaulting-horse and ladder, and so on. I think that was stopped after a while when the Evening Continuation Code was altered, and since then, as far as I know, there has only been one case in which military drill in a modified form has been tried in one of the schools, that is in the evening school connected with the one in which I am employed. The pupils had dummy rifles or something of that sort with which they practised in school. But it was found that the accommodation was rather limited, and the following winter the class went to the Physical Training College on the evening set apart for that work so as to have more floor space for practice, and they attended well and it seemed to be a popular exercise. That is, as far as I know, all that has been done in the past. Now as to suggestions. More suitable accommodation needed, more gymnasia, possibly free for evening classes, more apparatus, competent instructors, grants in aid, special provision for the training of teachers, and as inducements, certificates of proficiency that would be recognised at headquarters. If possible, the whole system should be organised and correlated so as to culminate in a fully-trained manhood.

3312. *By Sir Henry Craik.*—Let me ask you what do you mean by a grant in aid?—Well, as far as I know, the Board found that in employing visiting instructors the expense came to be pretty heavy, and when the teachers were found qualified to do it in the ordinary elementary school they gradually enlisted them for the purpose of carrying on this work. If grants or payments were made so as to enable the Board to supply a fully-trained staff of visiting teachers, the work would be better done, because, I think, assistance is needed to the ordinary staff in order to keep the subject to a high mark of proficiency.

3313. But there are other subjects for which you bring in expert teachers, are there not?—Well, in cookery there are visiting teachers, and elocution.

3314. Yet there is no special grant for elocution?—No.

3315. Do you wish to revert to the system by which grants should be made for special subjects?—No.

3316. Then why would you make physical instruction an exception?—Well, I do not know, sir, unless it is with the view of meeting or of raising the subject into a more prominent place than it has in the curriculum of the school.

3317. But that is not the method the Department has taken to raise other subjects?—No.

3318. Then with regard to the training of teachers, has there been any advantage taken of the opportunities in the Code for training the teachers in Aberdeen?—Not to my knowledge.

3319. You are aware that such classes are permitted under Article 91 (d)?—Yes.

3320. But those opportunities, although you think them desirable, have not been availed of by the School Board of Aberdeen?—No; not for this subject.

3321. Nor have they applied for certificates from the Department?—No; not for this. The School Board has always understood that the subject was well taught, as there had been no fault found with it, and I suppose they had no desire to press it further.

3322. Have you ever had any objection raised by parents to the physical instruction?—In very few instances; scarcely ever.

3323. You have conducted, yourself, Continuation Classes?—I have been the head of an evening school for a number of years, but did not teach this subject.

3324. Was it a popular subject with the pupils at these Continuation Classes?—Oh, yes.

Mr
J. Mackenzie,

Continuation
Classes.

Mr
J. Mackenzie.
14 May '02.

3325. Of what age would these lads be?—Well, up till lately, they would be from thirteen to fourteen on.

3326. And now, with the increased school age, they will probably be above fourteen?—From fourteen, yes.

3327. You found that their being kept for part of the time at physical instruction was not resented?—No.

3328. *By Sir Thomas Coats.*—You talk of want of floor space for carrying out physical drill; I did not quite understand whether you referred to the gymnasium or to the classrooms?—Well, to both. If you wish to utilize your gymnastics in the classrooms we find that the floor space is very limited, and in the gymnasium for Indian clubs, bar-bells, and so on, the space is also inadequate.

3329. What is to prevent the available floor space for this purpose being improved in the classrooms?—Expense.

3330. Have you graduated platforms and fixed desks in the schools?—They are fixed.

3331. Would it interfere with the teaching if the floor was level; would it be less suitable for teaching purposes?—Yes; it is most suitable in the present form for the teaching of the ordinary subjects.

3332. Would it be a great expense to remove that staging and so arrange the desks that they could—some of them could—be put aside to give more floor space for this work once or twice a week?—It would cause a good deal of confusion probably during the course of the ordinary school day's work.

3333. That is, if you took it every day in same classroom?—Yes.

3334. But suppose you were to take it three days a week in the same class-room, would that really be an objection—an insuperable difficulty?—I think so.

3335. Even though you were to have the floors level?—Yes.

3336. *By Mr Shaw Stewart.*—You have had a great deal of experience for a great number of years; I want to ask you about the physical training in the younger classes. Skilled witnesses have told us that it is very important that small children should be exercised on tiptoe, and for that purpose that boots should be removed. Do you look on that as practicable?—No, I do not think it would be. The time is the great point there. The drill is taken at all hours of the day, at least it goes on at all hours of the day, and the changing of boots and so on would always be taking up more time.

3337. But if it were found to be a matter of great importance that children should be exercised without boots, could not that particular physical exercise be fixed for a particular period of the day which would be least inconvenient for the purpose?—Well, there is such a number of classes that it is hardly possible to get all the subjects put in during the ordinary school day.

3338. You see we have been told that it is very important for children who have an inclination to flat feet that they should be early exercised, perhaps only for a few minutes at a time, without boots?—I scarcely think that it would be possible to do it, in the ordinary course of the school day's work, with large classes.

3339. Well, I would put it to you in this way. Supposing it were found advisable to have a considerable increase of school time devoted to physical exercises, say at least twenty minutes a day for the small children, do you not think that boots could be dispensed with in that case, supposing that you were taking out some subject in order to extend the time to be devoted to physical exercises?—Well, if that were done the matter might be managed.

3340. You do not think it absolutely impossible to contrive?—Not absolutely, but there would be difficulty.

3341. There would have to be a change in the timetable and system of teaching?—Yes, oh yes.

3342. *By Mr Fergusson.*—Continuing that subject Mr Shaw Stewart has been asking you about, yours is a town school?—Yes.

3343. And you are not much troubled with children

coming wet to school; they have not far to come; it is not like a country school?—No.

3344. How would it meet the case of the boots if whenever the children came in in the morning they were put into canvas shoes, and remained in canvas shoes all day?—That would be all right.

3345. That would answer all purposes?—That would answer all purposes.

3346. Might I ask you have you great knowledge yourself of physical training; can you teach all your classes all the physical exercises?—Well, I hold no certificate, but I have practised all the physical exercises.

3347. You consider you have a good knowledge?—Yes, sir.

3348. You could put your classes through their different exercises?—Yes.

3349. If there is a want of space inside, why not take the children outside to put them through their exercises?—Well, sometimes the playgrounds are not suitable.

3350. Well, but in your particular case, in the schools in Aberdeen that you know, are they not suitable?—Not in some parts.

3351. I suppose they could be made suitable easily?—I see no reason why they should not.

3352. A playground which is not suitable for putting a squad through physical training cannot be much of a playground?—In some cases the playground is very limited in Aberdeen, but in a good many schools there is ample space for that, and it is done in outdoor drill in a good many of the schools now; in ten of the schools I think there is outdoor drill now.

3353. So that that difficulty of want of space in one way or another might be got over if you were very anxious to get over it?—Well, in a good many of the schools the playground space is limited still.

3354. Surely it is as large as a large room?—Yes; but we find the gymnasium sometimes small enough for an ordinary class to drill in.

3355. Yes; but I can hardly imagine a playground that is smaller than a gymnasium?—No.

3356. You think the expert supervision is required in the higher classes, but the teachers can manage the elementary?—Yes, sir.

3357. When you say expert supervision you mean an expert who comes round now and again; you do not mean an expert should take the whole of the instruction?—Not the whole of it, but I think his assistance would be necessary on frequent occasions.

3358. Once a week?—Once a week, yes, at least.

3359. You would be content to put the whole of your classes through their drill and physical exercises with the assistance once a week of an expert who supervised?—Yes.

3360. You spoke of drill instructors, of whom you expressed rather a poor opinion; do you draw a distinction between the drill instructor and the gymnastic instructor?—Yes.

3361. The drill instructor is a retired non-commissioned officer—an army sergeant?—They used to be, but the instructor just now has the training of this special kind in addition to his military.

3362. But then he is a gymnastic instructor, is he not; he is not a drill instructor only?—There is one of the staff that visits some of the schools who is both a drill instructor and a gymnastic instructor.

3363. A gymnastic instructor must have a drill certificate, but a drill instructor need not have a gymnastic instructor's certificate?—That is the point.

3364. Would you be prepared to say that physical training after the age of fourteen—from fourteen to eighteen—should be made compulsory for all boys?—I should not say compulsory.

3365. You would not say so?—No.

3366. And if anyone else said it should, would you differ from him?—Yes.

3367. And why?—Because I think it can be carried on without being made compulsory, if a course were arranged in such a way that the drill or whatever

exercises they put in between fourteen and seventeen would count for so much when they become Volunteers or when they join the regular army.

3368. Yes, but everybody is not going to be a Volunteer. What proportion of the lads do you think you would get if it was voluntary? Whatever system you invented, what proportion would you hope to get of the lads after they left school?—I think the majority would be quite willing to take part in physical exercise and drill—the majority of those attending the evening schools would do so without compulsion.

3369. Suppose you did not find it come up to your expectation and you got a very small proportion, would you then be prepared to consider, looking to the advantage of physical training, making it compulsory?—No, I would not.

3370. You would not under any circumstances?—No.

3371. You do not think people would like that?—I do not think so; I think it would operate against the getting of them to join these classes.

3372. If they were compulsory that would not matter, you know?

3373. *By Professor Ogston.*—You have to teach both boys and girls in your school?—Both.

3374. How many boys?—Including all divisions of the school?

3375. Yes; an approximation will do?—490 boys.

3376. And girls?—about 480.

3377. Do you find that the same system of physical training is suitable to both?—Yes, up till we come to the advanced gymnastics—what we call advanced gymnastics; the same course is given to both, and found quite suitable.

3378. And you do not find that the girls are apt to be neglected in the matter in comparison with the boys?—I do not think so.

3379. Neither when they are younger nor when they are older?—No.

3380. Do you teach dancing?—Yes.

3381. And do you recommend it for any special purpose; say for girls?—I think it makes them lighter in movement, and smarter in movement, and altogether gives them a taste for this sort of exercise.

3382. It forms a part of their physical training?—Yes.

3383. And is taken by all?—Not by all.

3384. How do you work that?—A charge is made for this particular subject—a small charge—for those wishing it; it is quite voluntary; we do not make it compulsory all over the school.

3385. *By Sir Henry Craik.*—Is yours a free school? Yes, sir.

3386. What is the age of those children who pay those fees?—Well, all ages; I should say from ten.

3387. But I think the rule of the Code lays down that in order to have the fee-grant no fees whatever must be charged between three and fifteen?—But the subject is taken out of school hours.

3388. You mean you withdraw a certain part of the instruction from the cognisance of the Department altogether, and do not ask it to be counted as part of the instruction?—No.

3389. And then you feel yourself justified in a free school in charging a fee for it?—For this particular subject.

3390. That is sailing very near the wind.

3391. *By the Chairman.*—Advanced gymnastics?—Advanced gymnastics are charged for too.

3392. *By Sir Henry Craik.*—I am not sure that the Department would pay the fee-grant if they knew it on those conditions?—A small charge is made for advanced gymnastics in the same way.

3393. *By the Chairman.*—When you say extra time, what time do you take for this extra thing that payment is required for; when is it done?—Generally before the regular school time-table in the morning or in the afternoon.

3394. *By Sir Henry Craik.*—Is it on the time-table?—No, it is not on the time-table.

3395. *By the Chairman.*—Has this been going for long, these extra things?—Oh yes.

3396. Then in your school, at what time actually, how early in the day, would this be done; at what time in the day would this extra instruction be done in your particular school—9 o'clock I mean, or when?—Four o'clock to 5; some time between 4 and 5 once a week.

3397. And can you give any idea what numbers, say to-day, are doing that?—Probably—

3398. I mean it is purely a voluntary thing, as you say; I merely wanted to know how the voluntary feeling goes—what sort of percentage?—From sixteen to twenty-eight of a class.

3399. Of a class of fifty?—No; of the whole school.

3400. Sixteen to twenty-eight out of the whole school?—Out of the whole school.

3401. Oh, not more than that?—No; in some schools the percentage is much larger, according to the class of children attending a particular school.

3402. But this is not confined to your school, is it; it is done in many schools—most schools?—In a good many.

3403. In a good many in Aberdeen?—Yes.

3404. Have you any knowledge of any schools not in Aberdeen; I suppose not?—Of the country schools of Banffshire I really know something.

3405. You do?—Yes.

3406. It is a long while ago since you were there?—Yes.

3407. I mean things have altered so much since?—They have altered a good deal.

3408. What is your opinion as to the advantages of any medical inspection of children going through physical exercises in schools; do you consider it is necessary, or do you consider that you and your assistants are sufficiently qualified to judge whether the children are capable of going through the various exercises or not?—Well, generally I should say.

3409. There is no medical supervision of children as school children?—Not unless the question is raised by a parent or anything of that kind. There is no regular medical inspection.

3410. But if the question be raised by a parent, do you mean that a medical officer appears in the school; no; he sees the children at their own homes, does he not?—Yes, that is so.

3411. Do you encourage in any way, yourself, as part of your duties as schoolmaster to your pupils, the playing of any games or not?—No.

3412. Have you ever known teachers actually teaching games as well as teaching other things?—Oh yes.

3413. You see no objection to it, do you, or do you think a teacher has enough to do without troubling his head about that sort of thing?—I think the teacher generally finds he has got enough to do, unless he is an enthusiast in any particular game.

3414. And, therefore, on behalf of the hard-worked teacher you would be rather against teachers' supervision of ordinary games?—Yes.

3415. Have you ever considered the subject of a child being taught a game instead of learning it for himself?—Oh yes.

3416. I mean I do not quite know how far you are interested in physical training of all sorts, including games, or whether you are more interested in what we call books?—I think that in cricket and football I have known teachers; I have taken part myself in the teaching of cricket to boys, but it is not generally done.

3417. No, it is not generally done; are there any opportunities in Aberdeen for school children playing games properly?—Just in the ordinary school playground.

3418. There are no fields?—Well, we have got public parks.

3419. But are they allowed to play in the public parks?—Yes; in some of them they can get permission.

3420. But I mean do they play as individual children of the city or do they play as a school?—In clubs.

Mr
J. Mackenzie,
14 May '02.

Mr
J. Mackenzie.
14 May '02.

3421. Have you any clubs in your school—cricket clubs or football clubs—solely composed of those at the school?—Not at present; we had a football club.

3422. A school football club?—A school football club, but not now.

3423. Is it likely to come up again?—I do not think so; the difficulty was getting ground to play on.

Games.

3424. *By Mr Shaw Stewart.*—In continuation of the Chairman's question to you about games, would you favour any outside assistance in organising boys' games from old pupils, say, Young Men's Christian Associations or similar outside aid; would you welcome it if it were obtainable?—I think it would be very desirable if the schools could be got together for that purpose.

3425. It has been suggested to us by a former witness, or more than one witness I think, that schools might group together and secure the use of public parks on certain days in the week in large towns or cities?—For games.

3426. For games?—Yes.

3427. Of course the teachers could hardly be expected to take the whole burden of organising these games, and it has been suggested to us that outside voluntary aid might come to the assistance of the teachers. I want to ask you whether you think that practicable, and if practicable whether you would welcome it, whether you would think favourably of it?—I should think favourably, but I am not altogether sure as to the practicability of the idea.

3428. I want your opinion as to that, as to the practicability of it?—There would be a difficulty in getting boys from different schools brought together unless they were in one particular district of a city.

3429. The schools would have to be grouped according to the convenience of bringing them together at one part of the city, but if that difficulty were surmounted do you see any difficulty as to getting the

voluntary assistance?—I think there would be difficulty in getting voluntary assistance.

3430. It has never been tried yet?—I do not think so.

3431. *By Sir Henry Craik.*—About this question of the fees, I understand that the habit is common to other schools besides your own of charging a fee for this advanced physical instruction and dancing?—Yes, sir.

3432. In your own school from 16 to 20 scholars out of 970, take this advanced physical instruction?—Join the dancing class and advanced gymnastics.

3433. The pupils that join that class would be of rather a better social class than the others?—That is so; yes.

3434. Therefore one can hardly say from that how many would take it up if it were a free class?—Oh, not at all; I think a great many more would take it up.

3435. But for the sake of the small fee the School Board think it expedient to limit the number to those who can pay?—I think that is so.

3436. With regard to the employment of a part of Saturday for such instruction, do you think that that would be an undue burden upon the pupils?—Oh, I should think so.

3437. They would resent giving even an hour or two hours on a Saturday afternoon to meet together at a general park and go through some form of drill?—I think the majority would.

3438. And you think it would be an undue burden upon the teaching staff too?—Oh yes.

3439. It would interfere with that free day?—Yes.

3440. *By Mr Ferguson.*—If somebody was wanted to help in the games and look after the games, these gymnastic instructors, if you had them, would be very useful for that purpose?—Yes, certainly.

3441. They are generally men who know something about all sorts of games?—Yes.

The witness withdrew.

Rev. D. B.
Cameron.

The Rev. D. B. CAMERON, examined.

3442. *By the Chairman.*—You are the Chairman of the Dundee School Board?—Yes, my lord, I am.

3443. And for how long, pray, have you been so?—For a little over two years.

3444. That is to say, during the present terms?—Yes. I have been a member of the School Board for about twenty-five years.

3445. You have your notes before you; will you kindly go through them?—The following is a motion, which, on my recommendation, was adopted by the Dundee School Board:—

'That, in the opinion of this Board, it is desirable that provision be made for further instruction in physical exercise combined with military drill, and that a Committee be appointed to draw up a scheme on the basis of Lord Balfour's recommendation, contained in a letter from the Education Department of date February 1st, 1900.'

I shall be prepared to submit to the Royal Commission evidence on the nature and extent of the training at present given in Dundee, the methods on which it proceeds, and the qualifications of the teachers engaged in it. I shall state that calisthenics, bar-bell, dumb-bell and Indian club exercises are successfully carried on in all the School Board schools, while military drill has been successfully taught in several of them, conspicuously in the Morgan Academy, in connection with which there is a cadet corps. But in my opinion, generally speaking, the training is not sufficiently thorough and systematic; too little time is devoted to it, and in many cases the teachers possess no special qualifications for carrying it on. While I do not approve of military men taking the place of the ordinary teachers, who are best acquainted with the physical and mental capacities of the children, I am of opinion that classes might with great advantage be established under military men for the instruction of such teachers as required it, and that the Education Department might be asked to extend

Dundee
School
Board:
resolution.

Physical
training in
Dundee:
extent.

Teachers.

the grant now offered in the Code for nature knowledge and free-arm drawing to the instruction of teachers in military drill.

I am further of opinion that the schools might with advantage be divided into groups, and a cadet corps formed in connection with each group, none but pupils above the fifth class being permitted to join. Boys should be encouraged to continue in their respective corps after leaving school, and until they have reached the age of seventeen, when they might and probably would become Volunteers. For the above purpose it might be necessary (considering the circumstances of many of the pupils) that the Government should give additional financial aid. I am of opinion that physical training combined with military drill is far more beneficial and useful than many of the severer forms of gymnastic exercises engaged in by young men. I think it is good for the pupils bodily, mentally, and morally (and I will be glad to state reasons for my opinion), not only fitting them for their future occupations, but adding an important element in maintaining the strength and security of the empire. Such exercises tend to strengthen and develop the muscles without overstraining them, as some of the severer forms of gymnastic training do. They promote habits of ease and grace in form and movement, saving the pupils from that awkwardness and ungainliness so common, especially amongst the young and old, of the lower working classes of Dundee. By developing the physical powers of the pupils they improve the health, and render them more fit for the employments in which they are to be engaged in after life, and, besides, they are a pleasant recreation from severer studies. That, I think, is a distinct advantage, and a strong reason why they should be encouraged. Besides, they induce habits of order, forethought, precision, punctuality, self-restraint, rendering the pupils more resourceful in times of emergency, abler to face difficulties

Cameron.*

14 May '02.

and to adapt themselves to changed and changing circumstances. These habits, moreover, often extend their influence into the moral side of action; self-respect gives rise to mutual respect, and mutual respect is fostered by pupils being compelled to act in combination. For example, a habit of self-restraint in those who are young often prevents in later life those outbursts of bad temper which sometimes disgrace men and women both in public and in private life. Then I think that physical training, combined with the simple elements of military drill, may be argued in the interests of the country. A boy exercised in military drill must to some extent realise his citizenship, and realising his citizenship, he will realise the duties which it involves. One of these is the duty of serving as a soldier for the safety of his native land. Means should, I think, be devised for providing such a training as would enable young men easily to act in this capacity when required.

3446. May I ask you, as regards your own appreciation of physical training, whether that has always been so, or whether it has increased of late years?—It has been always so, but not to the same extent; it has increased of late years.

3447. You, like a good many other people, have been inclining more to seeing the advantage of it?—Yes.

3448. Some years ago you would rather have thought that it was rather outside the province of education as education?—Fifteen years ago I would.

3449. But I meant a change has rather been coming over your opinion?—Yes; quite.

3450. And I suppose, also, that of other people that you know?—That is so.

3451. The members of your Board to some extent?—That is so, because if I may be permitted to say so, about fifteen years ago a motion was made that something should be done in the way of permitting physical drill, and that motion was defeated.

3452. On the score of its interfering with the mental curriculum of the school?—Yes, and the education generally of the school.

3453. That, therefore, as I said before it was not then considered part of education, but you think, to a large extent, it is now?—Yes.

3454. I mean, of course, it is a part of education; it is laid down to be a part, but what I mean is, is it considered by the body politic?—That is my opinion, my lord.

3455. Do you lay down any rules for the schools under your Board as to what time and in what manner this training is to be done in the elementary schools?—The headmaster draws up a time-table.

3456. And that time-table is sent to the inspector?—Is sent to the inspector.

3457. Do you see that time-table, as matter of fact, of the different schools?—Yes.

3458. All laid before your Board and considered?—It is not formally laid before the Board, but the School Board is divided into committees, having charge of groups of schools, and each committee knows the time-table that is used in each group of schools.

3459. You leave it, then, to the schoolmasters to lay down the time and the mode in which this instruction is to be given?—That is so.

3460. I assume I am right in saying that there is no sort of medical inspection of pupils in any of your schools?—There is none.

3461. Even with regard to the considerable advance in physical exercises that has taken place of late years?—There is none.

3462. Have you ever considered it, either yourself or has your Board ever considered it?—Whether there should be a medical inspection?

3463. Whether there should be any medical inspection of children in schools, as school children, with reference to the physical exercises that they are now called upon to go through?—That has not yet been considered by the Board.

3464. And you have never considered it yourself?—Yes, I have considered it.

3465. What opinion have you come to?—I think there ought to be.

3466. Do you see any practical difficulty? Do you see any great expense in it?—It would certainly add to the expense, but I think the money would be profitably spent.

3467. But you do not think that it would fall under ordinary questions of public health authority, under the power of public health authorities?—I do not think so.

3468. You do not think public health authorities are responsible for the health of the children in the school?—I think they are, but I do not think a public body of that kind would care to undertake it.

3469. But you do not think it is their obvious duty, as part of the public health generally?—I think it is the obvious duty of some body or other to do it.

3470. You understand what I mean—it is not from the mental exercises, it is from the additional physical exercises?—Yes.

3471. And therefore, in the same way as there is no medical inspection, there are no statistics taken in any way as to the development of the children?—I agree that there should be.

3472. There are none at present?—There are none at present.

3473. Nothing whatever?—No.

3474. And you do not know of any in Dundee?—I know of none.

3475. Is there any public gymnasium in Dundee?—Public gymnasium.

3476. Are there no statistics or anything there? I mean, is it the habit to enter there for a course of instruction?—Yes.

3477. Do you happen to know, on entering for a course, is there not a system of weighing and measuring and so forth, and again at the conclusion of such a course?—No, I do not think there is. The gymnasium is not in connection with any public body. In many towns, I understand, the Town Council have it under their supervision. In Dundee it is not; it is a private corporation.

3478. I should like, further, to ask you whether you have to bear in Dundee with a great deal of opposition or with a considerable amount of opposition to this idea of physical exercise?—There is opposition to the idea of physical exercise combined with military drill.

3479. Of course we all read the newspapers?—Quite so. The opposition comes from a very small section of the community. It is bitter, but I do not think it is influential or widespread.

3480. And you have no objection to that being put down as your deliberate opinion?—I have none.

3481. That the opposition is confined to a very small section of, shall I say, the population of Dundee?—Yes, you may, my lord.

3482. I want to know rather what form such opposition seemingly takes?—Well, we have had—

3483. I mean, there are two sides to a question. Can you give me the opposite side, as presented to you by this small body in Dundee? What seems to be the objection?—Oh, encouraging what is called—miscalled—the military spirit. That is the objection; that is the form it takes.

3484. What do they mean by the military spirit?—Fighting, I should say, for the love of fighting. I mean by it a high sense of honour, of loyalty to one's king and country—patriotism, in short.

3485. But I mean do they regard the practice of physical training by children and also those a little older as detrimental to their moral habits?—No, I do not think so.

3486. You do not think that is the opposition?—No, I do not think that is the opposition; it is the encouragement of what is miscalled the military spirit. That is the objection; that is the form which it takes.

3487. But do they say that it makes boys more ready to fight one another in the streets?—No, I never heard that.

3488. There must be something at the bottom of

Rev. D. B.
Cameron.
14 May '02.

their opposition?—Yes, the fostering of the military spirit and love of fighting for fighting's sake.

3489. But not in the streets?—Not in the streets; a love of going to war, for example.

3490. Does that include the love of going to war too?—It may; but I do not think that the result of physical exercise is to make boys more ready to fight one another in the streets.

Boys' and
girls' training.

3491. *By Sir Thomas Coats.*—You talked principally, I think, with regard to this physical development in regard to the boys; you have not said anything about the girls: do the girls have the same training as the boys?—Well, not exactly; they have training in calisthenics, and bar-bell, and Indian club exercises—those in the senior division. In the infant and junior divisions they are confined to free movements and exercises with tambourines and flags, and so on. They are not asked to undergo any severe physical exercise. As a rule the exercise is adapted to the capacities of the different sexes.

3492. Up to what standard would the pupils take the same exercises?—The exercises in the junior division of a class are confined to free movements and musical drill.

3493. The boys and girls take the same exercises?—In those classes; yes, they do.

3494. And at what age or what standard do you differentiate between the training of the boys and the girls?—Well, I should say from ten years of age.

3495. You begin to alter it then?—In some cases; but, as I say in my statement, physical training is not sufficiently systematic in our schools, and that is why I am anxious to have a committee appointed to make it more systematic. It is capable of great improvement. Of course they can differentiate in all the schools what kind of exercises should be engaged in by different sets of pupils. They take into consideration the age and the sex, but I do not think it is sufficiently done.

Different
systems.

3496. Are the masters in the different schools allowed to choose their own system of drill, or does the Board lay down any special system to be followed generally throughout the schools?—Hitherto the Board has not laid down any system, but I think that is a great mistake.

3497. They have not even recommended a special system?—They have not; it is left to the headmasters, therefore the system is different in different schools to some extent, but I do not think any harm accrues to the pupils from the exercises being too severe.

Teachers.

3498. Have the teachers had any systematic training for imparting instruction?—Well, I should think about 40 per cent. of them have. They have certificates from the training colleges. I do not attach much importance to them: one holds a certificate from Cruden's gymnasium in Aberdeen, and two or three have certificates from the public gymnasium in Dundee. Then, again, fifteen have been or are at present members of the Volunteer force; they are Volunteers.

3499. And are the lady teachers instructed as well as the men? Of course they do not belong to the Volunteer corps?—No, of course not; but as a rule they take the certificate that is given by the Free Church Training Colleges. They have been in the habit of issuing certificates for physical drill, but I do not attach very much value to those certificates.

Cadet corps.

3500. You talked of it being advisable to have schools grouped, and cadet corps formed from these groups of schools: would you have these cadet corps attached to the Volunteer battalions in Dundee, or what would you recommend about that?—Yes, there is one in connection with the Morgan Academy, which is attached to the 1st Forfarshire.

3501. That is a higher class school, I suppose?—It is.

3502. But in the Board Schools how old would you suppose the boys would be just before leaving the school?—Before leaving the school.

3503. How old would the boys be in these cadet corps?—Before leaving the school?

3504. Is it before leaving school you do this or afterwards?—Oh, before leaving.

3505. The cadet corps?—The cadet corps.

3506. Yes?—In the ordinary schools, when they are leaving, after they have attained the school age of fourteen, we have no more control.

3507. Not at all after they have left?—Well, in many cases I think it might be advisable, perhaps, shortly before they left, in order that we might not lose our hold over them afterwards.

3508. There would be a certain expense, of course, in conducting this cadet corps?—There would. Yes; that is the difficulty, because most of the children are not in the circumstances to pay for their own uniform; but I think the age of fourteen would be the best age for forming a cadet corps, just before they leave school. I have some information about the Boys' Brigade.

3509. *By Mr Alston.*—Are you a minister of the Church of Scotland?—I am; yes.

3510. Are there other ministers on your Board?—Oh yes; there are seven, including two priests.

3511. Out of how many members?—Fifteen.

3512. Nearly 50 per cent.?—Yes; but I am the only minister of the Church of Scotland.

3513. Then they came to this decision just recently embodied in this resolution?—Yes, on the first Monday of this month. Resolu
Board.

3514. Was it unanimous?—It was not. In the last division there was a minority of two.

3515. That is 13 to 2; it was carried by 13 to 2?—They were not all present; I think two were absent. There were two votes taken on my motion. The mover of one of the motions wished me to exclude from it the allusion to military drill, and I refused to do so. Another wished the motion to be delayed until the Royal Commission had concluded its meetings.

3516. The ultimate decision, however, carried this emphatic clause—physical exercise combined with military drill?—Yes.

3517. With some dissentients?—I think by recollecting I can give you the exact numbers; nine voted for my motion, and two voted against it, for the clause about military drill.

3518. Then it was practically carried fairly unanimously?—It was; yes.

3519. And, of course, with the full appreciation of what military drill meant as applied in the school itself?—Oh, I think so, from the opposition excited in the minds of the two who opposed it.

3520. Then in trying to carry this, had you in view what is generally believed to be the rough population in Dundee?—Very much.

3521. You thought that it would be a very valuable means in your hands to assist in improving the condition of this rough juvenile population in Dundee?—Yes.

3522. You were asked by the Chairman if there was any opposition to the instruction in military drill, and your answer was, very little amongst the general public?—Yes, very little. Milit m.

3523. It is a feeling against militarism, I think, rather than against drill?—It is.

3524. Did you ever find opposition on the part of the parents of the children?—No, I have not.

3525. Have you heard approval of it expressed by the parents?—Yes; and the fact that so many parents encourage their children to join the Boys' Brigade is a proof that the parents are not opposed to it. Boys ign

3526. Is it the case in Dundee that the parents encourage their children to join the Boys' Brigade?—A great many do; there are 800 in the Boys' Brigade at present in connection with different churches.

3527. That is the strength of the Dundee battalion of the Boys' Brigade?—Yes, divided into twenty companies.

3528. And has it been found to be a very valuable organisation in Dundee?—Yes, I think it has done a great deal of good.

3529. Of course they use military drill in a very advanced form?—Yes.

3530. As a means of attracting the boys?—Yes.

3531. Is not that the case?—Well, of course the boys are only allowed to wear a white belt and use toy guns.

Rev. I
Came
14 May

D. B. 3532. It cannot be the uniform that attracts them?
 —It cannot be the uniform that attracts them.

3533. Because it consists merely of a cap, a haversack, a belt and a model rifle?—Yes.

3534. Then it must be the military drill that attracts them.

3535. Would you find it to be a sufficient attraction for the boys in your school, say after school age, in the same way be found a sufficient attraction to bring these boys to the continuation classes?—My opinion is that it would not. If they were formed into cadet corps it might have that effect. I do not think you can expect boys to continue in the Boys' Brigade until they are fifteen or sixteen years of age.

3536. Of course you are aware that the Boys' Brigade age is from twelve to seventeen?—Yes; well, I think the time is too long to expect boys to continue in the Boys' Brigade, and they ought to be formed into a cadet corps, but of course the difficulty is the financial difficulty.

3537. In connection with the school the financial difficulty would bulk very largely, I suppose?—Yes, it would.

3538. Then if cadet corps were attached to the Volunteers would you approve of that?—I would.

3539. And when the boy had passed the Boys' Brigade age you would advise him to join the Volunteers?—Yes.

3540. You were asked about uniformity in the system of instruction in physical exercises; you say it varies in Dundee in the different schools?—It does.

3541. Would it not be of advantage to adopt one system, one approved system?—Yes, generally speaking it would.

3542. It would be an advantage to the teachers as well, would it not?—It would.

3543. *By Mr Fergusson.*—About this question of physical exercise combined with military drill, when you use the term physical exercise, do you not include any drill at all in that?—Oh, yes.

3544. There is a certain amount of drill included in a course of physical exercise?—Yes, there is marching, of course.

3545. Then what do you wish to add to it when you add the words 'military drill'?—Oh, well, rather more than the simple marching.

3546. Does not the physical training cover the whole thing. All that you want to teach boys up to fourteen?—Well, I do not know that it does; there might be physical training apart from any form of military drill at all. If you sent a boy to a gymnasium he gets physical training there; I do not suppose he gets any military drill.

3547. It depends upon what you call military drill. Policemen are drilled, and sailors are drilled, most people are drilled; why did you insist in retaining the words 'military drill' when you knew it was stirring up a hornet's nest?—Well, it did not occur to me that it would stir up a hornet's nest. I do not think I am responsible for it; it is those who set up the hornet's nest, who are responsible, I am not.

3548. But you know there is a small but aggressive minority who do not like the word 'military'?—Yes; well, I think they ought to be educated.

3549. And you get all you want when you say physical training, do you not?—Well, I am not quite so sure of that, because, as I say, the training given in a gymnasium is purely physical training.

3550. Yes, in a gymnasium; but by physical training one does not mean only what you get in a gymnasium. There you have what are called applied gymnastics?—Yes.

3551. What are called free gymnastics include a certain amount of movement, marching about in open order and in close order, and so on?—Yes.

3552. However, I will not pursue that matter any further. You said that one of the troubles was that there was too little time devoted to physical training?—Yes.

3553. That objection has been very frequently

raised. We are told that there are enough subjects already in the curriculum, and teachers cannot find time for another, and so they propose to limit the physical training; but do you view physical training as of such importance that you would say you must have a reasonable amount of physical training first, and then you may spread your other subjects over the remaining time?—Yes; I should go that length.

3554. You would say that physical training was so important as a foundation for mental teaching?—Yes.

3555. You would rather have a moderate time for physical training, and then fit in the reading, writing, arithmetic, and so on as best you could?—Yes.

3556. Now you speak of the expense, but what is the great expense in teaching physical training? There is an instructor to pay, I suppose?—Yes; of course I disapprove of any outside instructor being brought into any school.

3557. You disapprove of that?—Yes.

3558. You wish the ordinary teaching staff to do all the physical training?—I do.

3559. But do you think they are competent to do that just now?—They are not.

3560. They would have to be trained?—Yes; about 40 per cent. are fairly competent.

3561. At anyrate, for a time you would require some outside supervision?—Yes.

3562. But you think when the teachers had received training and got their certificates, that it would be safe to leave them without any supervision?—That part of the education would be inspected, I should imagine, like the other parts of it.

3563. Would you have a special inspector for that or not?—It would be advisable to have an inspector specially qualified.

3564. But you are not satisfied with the training teachers have received; you do not think though they have received a certificate it is of much importance, you said?—Yes, I say so; that is my opinion.

3565. You think there ought to be some better system of making a certificate a more real test of teaching drill and physical exercise?—I think the Education Department might do for physical training what they have done for nature knowledge and free arm drawing. They give special grants for the instruction of teachers in those subjects.

3566. Are there any of the ordinary subjects that are taught now under the present Code that you would care to see done away with if more time was necessary; is there any way of lightening the course?—Well, rather than that physical training should suffer, I should give up manual instruction.

3567. Anything else?—It depends very much on the subjects included in the curriculum of each school. I should require to know that, before saying which subject I should omit.

3568. *By Mr Shaw Stewart.*—I have just one question to ask you on the subject of the opposition to physical training. I will ask you this; if this Commission recommended the extension of physical training on a reasonable basis, and if they made it clear that the object is to enable boys and girls to make the best use of their bodily and mental powers in all walks of life, would that remove the dislike that you have noticed to physical training in certain quarters?—I believe it would to a large extent.

3569. Would it remove all reasonable opposition to it?—Well, it ought.

3570. *Sir Henry Craik.*—The Department draws the distinction in the Code between military drill and physical exercise?—Yes.

3571. Do you think that there is a real basis for this distinction?—Yes, I do think that it is well founded.

3572. You do not think that the military drill has certain advantages which are not included in the physical exercises?—Oh yes, I think it has.

3573. Then there is a distinction?—Well, in that sense there is a distinction.

3574. You think that the military drill adds to

Rev. D. B. Cameron.
 14 May '02.

Physical training of great importance.

Teachers.

Physical training: opposition.

Physical exercise and military drill: distinction.

Rev. D. B.
Cameron.
14 May '02.

physical exercises a certain amount of moral training by discipline, by comradeship, by obedience?—I do.

3575. And that that is valuable not merely for its physical effects but also for its moral effects?—I do.

3576. Therefore you think that the Code rightly makes a certain distinction between the two? The circular to which you refer, Lord Balfour's circular, does insist specially upon drill and the effects of that drill?—Yes.

3577. And you find these in your experience are valuable?—Yes.

3578. With regard to your schools, I presume you have different degrees of excellence in the physical training or military drill in your different schools?—Undoubtedly.

3579. And you mention one as standing out conspicuously, viz., Morgan's Academy?—Yes, and Blackness School.

3580. That school is under your Board?—Yes.

3581. It is a fee-paying school?—Yes.

3582. And therefore presumably attended by rather the better class in Dundee?—Yes.

3583. And its physical instruction is superior to that in the schools attended by the children of the poorer classes?—Yes.

3584. Is there no special fee for the physical instruction in that school?—None.

3585. Not even for advanced physical instruction?—None.

3586. The fee charged to the pupils covers the whole?—Yes.

3587. Is there a subscription to the cadet corps?—I believe there is, although the parents in most cases are quite willing to defray the cost.

3588. But of course that would apply only to the rather better-class parents?—Quite so.

3589. That is therefore an opportunity not open to the poorer parents in Dundee?—Precisely.

3590. And which you would desire to see open to the poorer parents?—Yes.

3591. With regard to the suggestion that the same advantages should be given for the instruction of teachers in military drill as are given for their instruction in nature knowledge and free-arm drawing, are you aware that the Code does offer the same advantages?—In the evening continuation schools.

3592. No; Classes for Teachers under Article 91 (d)?—I did not know that.

3593. You have no classes for teachers in military drill?—None.

3594. Are you not aware that they are started in various other places under that Article?—I was not aware.

3595. But you think that the use of such opportunities would meet the suggestion you make?—Yes; I do quite completely.

3596. You have in Dundee a large amount of youthful employment?—Yes; I am sorry to say we have.

3597. You have special difficulties in Dundee with the boys who have just left school for the first two or three years?—With the boys who become half-timers especially.

3598. You have more half-timers in Dundee, I think, than in any other place in Scotland?—That is so.

3599. Would it be any pressure upon these boys, or would it interfere unduly with their opportunities for employment, if you required them to attend continuation classes?—Half-timers are obliged to attend school, as you are aware, Sir Henry, every alternate day.

3600. But I meant those who were past fourteen?—Oh yes; after they have become full-timers.

3601. After they have a right to become full-timers?—Would it be a hardship to them?

3602. I ask you would it be a hardship to them to require a certain amount of attendance at a continuation class?—They might regard it as a hardship, but I do not think that really it would be.

3603. And if such continuation class covered physical instruction, you think it would be greatly for their benefit?—It would be greatly for their benefit, yes.

3604. And improve the state of the streets in Dundee very largely?—Yes. Unfortunately a great many of those who go to mills as half-timers remain in the mills as low mill-hands. They never make more than about 10s. or 12s. a week.

3605. And some sort of care, discipline, and supervision for a certain number of hours in the week would be of incalculable advantage to that class?—It would.

3606. Such advantage that you think the State would be justified in making it compulsory?—Yes; I think it is of the greatest importance.

3607. And there is no place, I suppose, in Scotland where you can speak with more practical experience of that than in Dundee?—None.

The witness withdrew.

Physical training: advantages should be extended.

No teachers' classes under Art. 91 (d).

Rev. D. B.
Cameron.
14 May '02.

Continuation Classes: half-timers: compulsion desirable.

Mr W. B.
Irvine.

Mr WILLIAM B. IRVINE, examined.

Mr W.
Irvine.

3608. *By the Chairman.*—You are the Rector of Morgan Academy in Dundee?—Yes.

3609. And you have been so for twelve years, and this Academy is under the School Board?—Yes.

3610. Had you any experience elsewhere before that period, twelve years ago?—Oh yes; I was twenty-five years teaching before that.

3611. Where?—In Dundee.

3612. Always in Dundee?—Yes; always in Dundee.

3613. All your teaching experience has been in Dundee?—Oh, yes; I was in a proprietary school in Dundee since 1864—a school belonging to Dundee merchants.

3614. You do not know anything about education outside Dundee?—I was in Edinburgh before that, but I was only twenty years of age when I came to Dundee, so that my experience in Edinburgh was somewhat limited.

3615. And a long while ago?—Thirty-eight years ago.

3616. Have you got a copy of your notes?—I have.

3617. Well, would you please go through them, and then any questions can be put to you afterwards?—The first point is the practical working of physical training in the day schools. In the day schools physical training is given throughout the year to all the pupils in the infant, junior, and senior divisions. Lessons are given

usually twice a week, and these in general take the form of marching drill and extension exercises, with or without apparatus and music. Most of the teachers show considerable aptitude for the class of work, and in many cases a high standard of proficiency has been reached. The existing opportunities for physical training.—These are as noted above. Additional opportunities are afforded in the Dundee Public Gymnasium and in the gymnasium connected with the public baths. The extent to which use is made of them.—Both of these institutions were well attended for some time after they came into existence. Of late there has been a falling off in the attendance, other forms of exercise coming into favour—cycling and football. I should say perhaps I have no right to speak about an institution that is not under my own charge. I know the state of matters very well in Dundee. It just occurred to me after I wrote that the falling off is not so much in the case of the public baths as in the case of the Dundee Public Gymnasium, which is not nearly so prosperous as its friends would like it to be. In connection with the public gymnasium a course of lectures and classes for teachers were arranged for and carried out. These were well attended and very useful. How far such training prevails in the various schools under the Board.—As noted above, physical training forms a regular part of the week's

Public gymnasium Dundee.

Physical training: existing opportunities; use made of them.

work in every school under the Board, and has a place in the time-table. What the Board has attempted in this direction.—(1) The Board has granted to all its schools a plentiful supply of the usual apparatus (I except my own school; they expect our children to purchase their own apparatus, but the expense is trifling), such as dumb-bells, bar-bells, Indian clubs, etc.; and (2) equipped a gymnasium in the Morgan Academy. When I came there the first year I asked the Board for the money. They gave it at once, and they gave it without demur. How far successful and beneficial, and how far the reverse.—Physical training has for a good number of years been a feature in the Board Schools in Dundee, and in my own school (the Morgan Academy) since it was opened in 1889. I consider it wholly beneficial, and I believe it is much appreciated by the children and their parents. When I say beneficial I mean physically and morally and intellectually. I can speak of the moral aspect later on if necessary. I think these were the chief points that were noted in the letter that I got, and after that followed suggestions. When pupils have finished the ordinary course of a day school, and have entered an advanced department or an evening continuation school, it is likely that a new departure in physical training should be made to maintain their interest in the subject. When boys and girls have had six or seven years of various forms of physical exercises, the exercises are apt to get a little stale, and I felt I had to give them some new interest when they left the sixth class and entered the advanced department. And this, I believe in the case of boys, may well be done by the introduction of military drill. This form of drill is to a limited extent taught in several schools in Dundee, but I think it might be further extended and developed. Embodiment in a corps, I believe, is what is wanted to put it on a proper footing. It puts it above the routine—outside the routine of work. But in the ordinary Board School the expense stands in the way. To obviate this I would suggest the formation of a school corps, with a simpler uniform than that of a regular cadet corps. The uniform of our cadet corps with the belt costs 25s. The boys are quite willing to stand the cost, but then when you come down a bit in the social scale you cannot get that. Rather such as is used in the Boys' Brigade. Well, they have a cap and a belt, that is all, and that, I suppose, would not cost more than about 4s. or 5s. I thought to be safe I would say 4s. or 5s., because our field service cap for our boys costs, I think, 1s. 6d. Such a corps is more attractive to the older boys, while its effect on their physique, health, and moral tone is only good—altogether good. The boys look upon themselves—well, I was going to say they look upon themselves as officers and gentlemen in a way—I can tell the difference in the demeanour of a boy in the corps from that of another boy who may be fairly good. The question of drill instructors should, I think, be considered. In many schools there are to be found members of the staff fairly well acquainted with military drill. Outside instructors should not be engaged for teaching in the school, but they might be employed in drilling such members of the staff as are willing and ready to assist with the classes. I do not think that drill instructors—experts, you might say—should be engaged for teaching in the school. I have had something to do with military men in the gymnasium. I first of all had a very nice fellow from the 75th, a corporal, and he was the only successful one. I have had four or five since. The boys want to take liberties with them, and the men are not able to keep the boys in their place. I have found that. But I would use these instructors to drill such members of the staff of the schools as are willing and ready to assist with the work.

3618. *By Mr Shaw Stewart.*—With regard to the latter part of your statement, would it not be the best way of teaching physical exercises in schools, if all the school teachers had previously gone through a thorough course of physical training, and received a certificate?—Yes, I believe that. That is what I hint at in my last sentence.

3619. But your last sentence hints at such members of the staff as are willing and ready?—Well, they would all be willing.

3620. They would all be willing?—Yes, there is a way of making people willing.

3621. If you make it worth their while?—Well then, if you make it worth their while—that is it. Of course you must try and get enthusiasm in the matter too. You see, all work in the corps is voluntary work. One of my assistants who was in the Volunteers is the honorary captain, and it is all done in his own time, and in the boys' own time, and with great enthusiasm.

3622. But then I understood that you would favour a system by which all school teachers should in future go through a training, a systematic training, and receive a certificate?—Just so. Just as we do with drawing and other subjects.

3623. And that their work should be supervised from time to time by expert instructors?—I should say expert inspection as well.

3624. And would you be in favour of those expert inspectors reporting direct to the Department?—Quite. If you want to make it thorough you must do that.

3625. Well now, with regard to the training of the teachers. We have been told by a skilled witness that such a training should be two hours a day for six months. Do you think that is a course through which future teachers would be willing to go?—They might be willing, but I do not see how it could be done. I do not think it is practicable, if you consider that these teachers have all come into existence almost since the Education Act of 1872.

3626. I beg your pardon. I am speaking of future teachers. We could hardly expect existing teachers to go through such a course; but I am speaking of young teachers in future?—They have all been born, you may say, since the Education Act came into force, and they have been under some sort of physical training and military drill, very likely all of them already, and I think that might stand for something. They have a fair notion of what to do, I think, that something less than two hours a day would make them efficient.

3627. That is your opinion with regard to existing teachers. But now, speaking of the teachers of the future, would it not be possible for each of those to go through such a course as I have mentioned?—You cannot get the time; two hours a day is too much. They do not get two hours a day for anything else.

3628. But if they could not get a certificate for less?—Well, of course, if they say so; but two hours a week would qualify a man, if he goes on for a session, in drawing, for instance, or in some other thing.

3629. You think two hours a day for six months would be out of the question?—I think so. That is my humble opinion. I do not think it would work.

3630. *By Professor Ogston.*—Have you to deal with girls at all in your Academy?—Yes. I drill some of the girls myself.

3631. What numbers of boys have you?—I have about 340, I think, altogether.

3632. And how many girls?—A little more—about 350.

3633. And what are the ages from?—From under five to over eighteen.

3634. Do you give the same training to the boys as you give to the girls?—Not quite.

3635. In what respect do you find it necessary to modify it for the girls?—For instance, we do not give the girls the same amount of marching and military evolutions as we give to the boys.

3636. And what takes the place of that?—Well, take the work of the seventh girls, for instance (about 54 of them); they have light Indian clubs, and go through a series of movements to music with these.

3637. Then as regards swimming. Have you found any difficulties in teaching it to the girls?—We have never had swimming. We are rather far away from the water where we stand, but some of our pupils do go down to the baths; they have special facilities in the way of cheap tickets, but it does not form an item in my scheme.

14 May '02.

Cadet corps:
cost.

3638. *By Sir Henry Craik.*—You say the cost of the cadet corps in your school is 25s. ?—About that.

3639. What is the lowest age you admit a pupil to the cadet corps?—They must be twelve years of age; that is the War Office regulation.

3640. What grant do you get from the War Office? Nothing.

3641. Nothing?—They gave us 100 carbines—50 beauties—new ones, small bore, and 50 old ones, large bore, for drill purposes; that is all we got from them.

3642. You could not contemplate the introduction of such a scheme into poorer schools than your own unless there was a grant for it?—Well, I think you would require to get a grant. I did not presume to say that; I had it in my mind all the time.

3643. But without a grant you do not see the possibility of its being introduced into the poorer schools?—The churches have their brigade companies.

3644. But I am speaking of a cadet corps?—No, a pure cadet corps cannot come any lower down than our school; we are just low enough.

3645. You think that the cadet corps, however, has a strong educational influence?—Well, it helps the tone of your school very much at any rate.

3646. And do you think that such a cadet corps might take the place of a continuation class, and be aided as a continuation class?—Yes. I am very strongly of that opinion. One of my men, in fact the captain of our cadet corps, is engaged in evening school work, and I spoke to him before coming away. I said: 'What do you do?' He said: 'I offered to 'my boys'—he is the headmaster of the evening school—'I offered to my boys to drill them, and one boy 'responded. That boy, however, had been in our 'cadet corps before, and had now left school.' That is all the response he could get, and he was of opinion, if he had been able to say, 'Now I will form you into a 'corps,' he would have had 30 or 40.

3647. But do you see anything to prevent the recognition of a cadet corps as a continuation class under drill-sergeants, and being paid as a continuation class?—Oh, I think that is quite good.

3648. And do you think that the educational influence would justify that payment being made as an educational payment rather than as a War Office pay-

ment?—Yes. If you want drill thrown open to these older boys, you will get it at once if you make a corps, but I do not think you will get it without it. That is my idea.

3649. I want to know whether you think that the educational effect of a cadet corps is sufficiently great to justify its recognition as the subject of an educational payment, instead of a War Office payment: do you think so?—Yes; I do.

3650. Can you tell me what the rates of the continuation class payments generally are?—The grants, you mean?

3651. The grants, yes?—I do not know.

3652. But suppose the grant for a continuation class amounted to about £1 a head, that would enable you to run a cadet corps in the poorer schools?—The slump grant; the overhead grant?

3653. Yes?—That is a question for the managers to speak of; I do not know the details.

3654. No; but I say suppose the Continuation Class Code reached £1, would it enable you to run a cadet corps fairly well—£1 a head?—I am doubtful.

3655. It would go a long way towards it?—Oh yes.

3656. *By Mr. Fergusson.*—You said you had a Gymnasium in the Morgan Academy?—Yes.

3657. Is that gymnasium used by the children of the other schools in Dundee?—No.

3658. But might it not be used by them?—Well, we would not like it.

3659. Why not?—Oh, I suppose sheer selfishness. Well, it is not conducive to discipline to have children from another school coming.

3660. But not at the same time. Why should not each school in Dundee have for a day, or for an hour or two the use of your gymnasium?—They might.

3661. Is your gymnasium empty for many hours in the week?—It is in use all day, either for physical drill—

3662. All day?—Oh, we are always using it.

3663. Then there would not be opportunity for anybody else to use it?—It would not suit during the day; they might come on a Saturday or in the evening.

3664. You use it for drill; you use it as a drill-hall as well as a gymnasium?—It is a big place. Half the ground is covered with apparatus, and the other half is free floor for formation and arm exercises.

The witness withdrew.

Mr W. C.
Bridgeman.

Mr W. C. BRIDGEMAN, examined.

Mr W.
Bridgeman.

3665. *By the Chairman.*—You are Chairman of the Physical Education Sub-Committee of the London School Board?—I am. Everything that we do has to go through two other committees before it gets to the Board, so I mean that we have not a free hand exactly on our sub-committee.

3666. Would you kindly go through your notes just to speak to them and on them?—Mr Chesterton can speak much more to the details of the working of our system than I can; I think he is coming before you. The only difference in the system, as described in his book, is that we have left off lately the use of fixed gymnastic apparatus in the ordinary day schools because we found there were several accidents from the use of it in the playgrounds on the asphalt and so on. It was very difficult that it should be supervised, and we thought on the whole it was better to take it away. We had a few things like horizontal bars and things of that sort in the playgrounds that they used to use, and now we have discontinued that, and we do not have gymnastic apparatus of a fixed kind, I mean parallel bars or horizontal bars, for the use of ordinary day school scholars, only in higher grade schools; and we have altered the time rather so as to give a longer lesson instead of a lot of small lessons. We now have three lessons a week of twenty minutes' duration each instead a lot of smaller lessons we used to have before. The reason for that was that so much time was taken up going backwards and forwards up and

down the stairs that we found that really we hardly any time for the actual drill. I think that having regard to the amount of other lessons we have to do under the School Board in London—and I suppose it is not my province here to say whether we teach too many subjects or too few—that we could not very well get any more than that, and therefore I think that the opportunities given now under our present system are quite sufficient, and I can certainly see a very marked improvement in the children who have gone through it since the time they have come into the school when you look at them again in two or three years, and I think Mr Chesterton could give you more conclusive evidence as to the very measurements and so on. It goes on now in all the day schools under the Board, and it is practically bound to be given by teachers who are capable of teaching it, because we insist upon their going through a course of training and getting certificates. If they do not get those certificates within a given time we stop their increase of salary except in some special cases where there is some physical debility. Occasionally there may be a teacher who has got some physical infirmity which may prevent him going through the course, but yet he might be able to give the instruction. I do not quite see how we could extend the system very much further in our day-schools now without interfering with the other lessons, and I do not think it would be desirable to give longer lessons than twenty minutes

at a time, because I think the children lose interest in it, and I think it is rather a fatiguing thing, especially if it is done out of doors where you cannot have music. I am bound to say that where it is possible I would much rather devote any further time at our disposal to organised games. I should not like to see drill done out of school hours, I mean to extend the school hours, say, to 1 o'clock instead of 12 in order to give more drill. I think it would be a great pity to lose the time we get there, which is very often given to organised games. I think that the value of organised games as far as the character of the children goes is perhaps greater than the more rigid drill, because it keeps them more in their place and they get a spirit of *esprit de corps* in their love of their own school when they play constantly. They have a sort of League matches in cricket and football and so on between the schools, and I think the boys who play in the teams either at football or cricket show more improvement than one would expect, because I think of the nature of the game being freer. I think it gives them an opportunity of showing their own character and capabilities more than when they are under the very strict discipline that they would be in drill. What I have said about competitions in drill I put in because at one time under the Board we used to have a sort of competition between different schools for banners and things that were offered, and it led to a good deal of time being taken up out of school, and a good deal of work being done which was really more show work than real physical exercise, and all sorts of fantastic things came in, and the children and teachers were very much overworked in getting up their classes for this competition, and I think it had a very bad effect. Now we select certain schools to take part in the display—I cannot remember whether it is once in every two years or three years—in the Albert Hall. We had one last year, and the schools are selected by our organising teachers to show there, and there is nothing to be gained by one more than another; they merely each do their best in their own particular form of drill, and it represents much more what they are actually doing every day in the school than it did under the old form of competition. Then, as regards the evening schools, I have not a great experience of them. I am not on the Evening Schools Committee, but I fancy if any more advanced military drill is desirable at all it could be done to much greater advantage there than anywhere else. There are a great many gymnastic classes. I do not know how many scholars come to gymnastic classes, but I should think nearly all of those who come would be available for further military drill, and I think it would do them more good than the gymnastics they get under the evening school teaching, because I think that the majority of the people who go to evening schools do not get full advantage out of the gymnastic teaching. I am rather inclined to think that the teachers concentrate their efforts on a few of the best and most promising pupils, and they do not care so much about those of average abilities. As to the swimming, I do not know whether that is relevant really to your inquiry. That is extremely popular, especially amongst the boys. We find some difficulty with the girls, because so very few of their teachers are able to go into the water and teach them in any way at all. As a rule, we can get a master who will go in with the boys, and who can teach them to a certain extent, but with the girls we have often to appoint some outside teacher. It is not very easy to do, and it is a very expensive business. No doubt the children are very much better for it, and I think they enjoy it very much, and I think it develops them physically, but it has not much of the element of discipline in it. I think if the members of the Commission could see a school actually drilling it would give them more idea than anything I could say.

3667. I should like to ask you one or two questions as to the time that this drill is done in elementary schools?—It is all worked in with the time-table.

3668. What is the custom?—It is different in each

school. Of course, it works in with the time-table of the school.

3669. How are your time-tables settled?—They are settled by the head teachers in each department.

3670. Have they got to be approved by anybody after that, or are they entirely on the responsibility of the head teacher?—They have to be approved by our Board inspectors.

3671. You have an inspector for your Board?—We have got eight inspectors under the School Board that are entirely under our own jurisdiction.

3672. I am asking that because it differs a little in different places?—Yes.

3673. These inspectors are really under your jurisdiction and orders?—Yes.

3674. And they report on the efficiency of the classes they have examined direct to your Board?—Yes.

3675. Do they report elsewhere?—No.

3676. Do you report elsewhere—to the Department?—I believe we do. I should not like to say for certain.

3677. The Department is in the background?—They have general control, but we have also organising instructors of physical education—two men and three women.

3678. I should like to ask you how long have you been chairman of this sub-committee?—I should think, for about four years, but I am not quite certain. I went on the Board about five years ago; yes, I should think between three and four years I have been.

3679. When you say that you notice a great alteration, is that simply your knowledge from what you can see, or have you got any statistics that you go upon?—I have not got any statistics.

3680. But I mean saying that?—In saying that I go by what I can see, but Mr Chesterton will be able to produce you statistics.

3681. Yes, but your statement that you saw this, was simply what you saw; you have not gone into the statistics?—No; I think that they will bear it out.

3682. May I ask you whether there is any medical inspection of the children, especially as regarding the children under physical instruction?—The teachers are expected to take note of any children who appear not to be strong enough to go through it, but I could not say if any further medical inspection takes place.

3683. Is it left to the teacher to absolve those children?—I think it is, but Mr Chesterton will be able to tell you better than I can, or Miss Kingston, who I think is coming before you.

3684. Do you find any difficulty in getting teachers to take an interest in the teaching of games as well as the teaching of other things, or do you rely on outside teachers?—The division I know, the only division I really know well, is the division of Hackney, and there we have what is called—I cannot remember what its actual name is, but it is an association of teachers, and one or two other people who take an interest in the games, and they organise all these League matches and all the rest of it between these different schools. I think it is called the Hackney Schools Athletic Association or something of that sort.

3685. Do you have reports, as chairman of the Physical Education Sub-Committee, of the games?—The games are not supposed to come under me at all.

3686. Under whom are they?—I do not know.

3687. You mentioned them, that is why I asked you?—I mention this because I feel it rather strongly personally.

3688. They are not under you; are they under any authority?—No; they ought to be.

3689. They are not under any authority?—No; they are left rather to chance, I think.

3690. Then your reference to them was rather upon what you wished should be the case?—Yes.

3691. Rather than what is actually?—Well, it very often is the case, but it is more the result of accident than design of the Board that the thing is well done.

3692. You do not know enough about it to be able to tell the Commission where the children are able to

Inspectors.

Medical inspection.

Games : teachers.

Games : parks and open spaces.

Mr W. C.
Bridgeman.
14 May '02.

play in any organised way?—Well, in different parts of London; in South London there are a lot of open spaces about Wandsworth, and all about there; in our part of London, Hackney, which I represent, there is Hackney Downs where they are allowed to play to a certain extent. There is Finsbury Park and Victoria Park. On Hackney Common they do not play much. There are one or two places where they might be allowed to play where the London County Council will not let them, but it is really quite impossible in certain parts of London for them to have these games at all. For instance, a place like the middle of Hoton, they cannot get to a place and back and play a game in the interval between 12 and 2, and have their dinner.

3693. Can you tell me how many schools are under your sub-committee in the way of physical education?—About 450 or 500; all the schools of the Board.

3694. Do you make a point of visiting these schools, or do you simply take the written report of your examiners on them?—Our five instructors are supposed to go over the whole of the ground. The two men go over the boys' department and the three women over the girls' and infants', and of course it is impossible for any person to have knowledge of all the 450. The proper way to do it is for each divisional member to know what is going on in his own school and report.

3695. I did not want to say as much as that, but is it done as a matter of fact?—I do not think that it is very thoroughly done.

3696. Then you rely upon reports?—Our organisers do their work extremely well, and we have great confidence in them, and whenever they think there is anything going wrong they report to us and we inquire into it.

3697. What I wished rather to know was what ultimate report is made; is there a report made to the Board of Education as to the physical?—There is a report made by the organising instructors. It is made to our school management committee, and I suppose that the report of the school management committee, which embodies it, does go to the Education Department, but I do not know.

3698. You do not quite know?—No.

3699. After all, it is a very large affair?—Yes. It can only work properly when each member of the Board will take the responsibility for his own schools which are distributed to him.

3700. I forget at this moment, although I have had the pleasure of voting for some of you, how many members have you?—We have got fifty-five, I think.

3701. Fifty-five on the whole School Board?—Yes; but, of course, you cannot divide the number of schools equally amongst them, because in some of the districts which we represent there are many more schools than in others. Now, for instance, in Westminster, which, I think, has five members if not more, there are only about four or five schools, but in Hackney, in my division, where there are five members there are nearly seventy schools, I think; so one member might get one school to look after in one division, whereas he may have thirteen or fourteen or fifteen in another.

3702. Can you tell us at all how far the sphere of the Board extends. I mean not only in London, but into Greater London to a certain extent; could you give us at all the boundaries?—Well, I could with a map; I do not know quite how I could give it you without. It goes down to Woolwich in one end and it goes to—

3703. Ealing or anywhere there in the west?—I think that comes into some suburban Board. The Board of Tottenham on the north is a separate Board; we come up to the border of that and nearly to Stratford on the north-east and to Poplar and down to the Thames and Southwark and then round by Woolwich.

3704. You are not merely under the London County Council directions; I mean you go into various counties, County Council areas, do you not?—I do not think we do, but I should not like to say.

3705. Hornsey for instance?—Hornsey is not; Hornsey has got a School Board. I rather think we

absorbed it the other day, but it was separate when I first went on the Board.

3706. Hornsey is not in the London County Council; that was an instance I was to give you?—I am not quite sure; I would not be certain about that. When I first went on the Board, Hornsey was not under the Board; I am not quite certain whether it is now.

3707. But I suppose you have increased your authority of late years, your influence?—Very little. Since I have been, Penge I think we absorbed. I don't think the area is very much altered.

3708. *By Sir Henry Craik.*—You spoke of the discontinuance of gymnastic apparatus for children in the ordinary day schools?—Yes.

3709. You said that gymnastic work was discontinued except in the higher grade schools?—Yes.

3710. What do you mean by the higher grade schools?—Well, we have got now a certain number of schools which we call higher grade schools under the School Board which include both the higher elementary schools under the higher elementary minute, and a certain number of schools which are run as higher grade schools and only get grants as ordinary schools.

3711. Are these schools where there are fees charged?—Oh, no.

3712. But what differentiates the children who are attending them?—Well, they are supposed to draw from the contributory schools round the more efficient children.

3713. And for these children you do provide some gymnastic training?—Yes, there is a school in Tower Hamlets, called Cable Street, where there is a regular gymnasium.

3714. Then you think it an advantageous thing although you have been obliged to discontinue it for the ordinary schools?—I do not know what the Board may think; I do not.

3715. You do not think it would be for their advantage?—I do not believe in fixed gymnastic apparatus for children under fourteen myself.

3716. It is for the older scholars?—Evening schools; but the reason why it was discontinued was because the Department said that it ought to be.

3717. About the comparison of the games and the physical exercises, you prefer the games rather than the formal physical exercises?—Out of school hours; I should be sorry to see time out of school hours taken with formal drilling rather than with free organised games.

3718. But are there not many children in the London schools that are poorly developed and who would be rather thrust aside in games by the stronger children?—Oh yes, there are, no doubt.

3719. And physical exercise under the supervision of a skilled teacher might develop these weaker children?—Yes.

3720. For instance, in football and cricket only a comparatively small number will show any marked aptitude for these games?—Quite, yes; but the benefit upon these small numbers is very much marked. I think you can notice it very much.

3721. But to arrange the greater number of perhaps weak and not very sufficiently nourished children it would be necessary to have them under some systematic training and under the eye of a trained teacher?—Yes; but I do not think with the insufficiently nourished children it would be any better to take drill than to take the free games. I think it would be worse because it is more of a strain upon them.

3722. Do you try organising your games in the schools?—In some schools; it really depends very much on the teachers. In some schools there are teachers who organise games. We have got various games they do play in the playground. Fives in some places and rounders. There is a book Chesterton has written on playground games which gives a good many suggestions. The teachers have all got that book, I think.

3723. At your exhibition last year there were some specimens of the teaching of games?—At one school,

Mr W. C. Bridgeman.
14 May '02.

I think Eltringham Street, gave a display—a sort of leap-frog and all that sort of thing.

3724. Did that impress you well?—No; I did not think very much of it.

3725. You spoke of your teachers having to get certificates; where do they obtain these?—There are some colleges which we recognise as giving a training that is good enough for us to accept them straight off, and when teachers do not come from these colleges they have to sit for an examination in theory, and they also have to go through an examination in practice after a course of, I think, twenty-three lessons from one of our organising teachers. That is done in the evening.

3726. That is a system of certificates conducted by the Board itself?—Yes.

3727. And, of course, applying only to its own teachers?—Well, we occasionally give them to teachers who begin in our service and who have gone out of it. If they begun in the course, we sometimes allow them to continue after they have left our service, but only very exceptionally.

3728. But you have no system of certificates issued by the Board of Education such as by our own Department in Scotland?—No.

3729. You object to the competition in drill between the various schools. How do you select those schools that are shown in the exhibition?—Well, the organising teachers bring up a certain number of schools to our committee as those who have tried hardest and done their best. Last year I succeeded in getting the committee to agree that no two schools should compete two displays running except where it was impossible to get another school in the district good enough.

3730. Your present system is one of selection tempered by rotation?—If possible we want to get as many as we can to go in hard for it, and the old system rather discouraged that because the same schools were selected over and over again. Now, I think, we shall get a great many more who are fit to go in.

3731. Have you in London heard any objections on the part of parents to physical instruction?—No; I have not heard of any. Some parents object to the girls going down to the playgrounds without their hats; that is the only thing. They attribute every disease they catch to that.

3732. But no objection to military drill or anything of that kind?—It has not reached my sub-committee.

3733. *By Professor Ogston.*—Do you subject your candidates for teacherships to any medical examination as to their fitness?—Yes; we have a medical adviser for the School Board, who has to see them all, I believe.

3734. And to certify that they are healthy and well-formed, and so forth?—Well, I do not know; I cannot answer exactly what test he puts them to. We should not reject a teacher necessarily because he was unfit to give a display in physical exercise, for instance.

3735. You have no set formula that the medical examiner has to answer as to health, physical capacity?—I am afraid I cannot answer that; not that I know of.

3736. *By Mr. Fergusson.*—You say that the fixed gymnastic apparatus has been discontinued, that is what is called applied gymnastics?—It is things like parallel bars, horizontal bars, and ladders.

3737. These were out in the playground, and the children used them without any supervision?—Yes, they might.

3738. But still I understood you to say that in your opinion no children under fourteen should receive any training in applied gymnastics—that is, gymnastics with apparatus?—I think they are as well without it, considering the amount of time that we have got.

3739. What sort of physical training do you give; what do you include under the term physical training?—Well, they have marching and all extension motions. I sent in a book which gives illustrations of the things they do; they have dumb-bell exercise, wand exercises; and of course the infants have a modified form.

3740. That all comes under physical training?—Yes.

3741. What do you include under the term military drill?—Do you mean as I have mentioned it here?

3742. What do you recommend; you recommend physical training which includes a certain amount of marching?—You mean in day schools?

3743. Yes?—Yes; I recommend extension motions, marching, and simple formations like fours.

3744. That is what you call a proper scheme of physical training?—For children under fourteen years.

3745. And you give sixty minutes in three lessons of twenty minutes?—Yes.

3746. Sixty minutes a week?—Yes.

3747. Do the teachers make any objection or say they have not time for it?—The head teachers, when we first started it a year or two ago, said they could not work it in with their time-table, but now they have all done it and are rather glad of it.

3748. It was rather an imaginary objection?—I think so.

3749. When you told them they had to do it, they did it?—Yes; the organisers told me they have had no difficulty in carrying it out.

3750. Do you know are the ordinary subjects in your English education the same as in Scotland—reading, writing, arithmetic, history, geography, drawing, singing?—Yes.

3751. And do you have what we call nature knowledge?—That is what we call object lessons, I should think.

3752. Have you anything else?—We have chemistry.

3753. That is an extra; these that I mentioned are the ordinary subjects, are they not?—No; these are the ordinary.

3754. They manage to get their scholars efficient in all these, and put in sixty minutes' physical training besides?—Yes; they come into the time.

3755. Do they?—Yes; they are not outside the time some of these other subjects.

3756. Chemistry, and these things?—Yes.

3757. Have your Board any printed rules as to the education that the teachers are to have in physical training?—They are expected to obtain certificates qualifying them to give instruction; failure to obtain such certificates entails a stoppage of increase of salaries, and so on; I think there are printed rules on that subject?—Mr Chesterton can tell you that, because he has to prepare them for it.

3758. Then as regards the evening schools, you recommend some change there?—Well, I recommend that if there is to be any extension of the military side of the drill it would be better done there than anywhere else. I have a very poor opinion of our evening schools as worked in London at present, although I cannot speak with very great experience. I cannot help thinking that a little more discipline would improve them.

3759. Would you continue the physical training there?—What I mean was more a regular sort of military drill, and possibly Morris tube shooting, and that sort of thing.

3760. But no more advanced course of physical exercises, what I call physical exercises, as distinguished from drill?—Yes; I think all these things are good for them.

3761. What would your view be about making such a course compulsory on all lads between fourteen and eighteen. I suppose you admit the advantage to the youth of that age of being physically trained?—Oh, I do.

3762. Do you think it is of so much importance that you would like to see a course of physical training made compulsory between these ages?—Fourteen to eighteen?

3763. Yes?—Well, I do not think it would be necessary to extend it over so many years. I should have thought two years; I should like to see them have two years.

3764. However long it was?—It is rather a difficult question to answer off-hand, but I should be inclined,

Compulsion for two years after school desirable.

Mr W. C.
Bridgeman.

14 May '02.

Underfeeding:
special
committee.

on the spur of the moment, to say that I thought it would do much more good than harm.

3765. I suppose you have a good many children who are not very well fed; how do you deal with them?—Well, there are very few that are not well enough to take their ordinary physical exercise lesson.

3766. Is any special supervision given to the matter. Suppose a child is obviously not fit; suppose it comes to school without having had anything to eat, is any notice taken of that?—Well, nearly all the children get a meal by some agency or other.

3767. But what; is it a School Board agency?—Well, we have got what is called the Under-fed Children Sub-Committee in the Board, which is supposed to put any children who come to school insufficiently fed into communication with the voluntary agency to feed them.

3768. The School Board does recognise its duty in the matter and uses its best endeavours?—We do not recognise that it is our duty to feed them out of the rates that we raise.

3769. Not to feed them, but to see that they are fed?—Yes.

3770. You have a special organisation for that purpose?—We have got a committee, and we communicate with the different agencies—the London Schools' Dinners Association, *The Referee* Fund, and all the private funds which feed, and each teacher has to make a list of the children who go every week, and so on.

3771. You try and secure, as far as you can, that they are fed?—We try; yes. I am quite sure that there are no children really underfed now in the London Board Schools.

3772. But there would be a difficulty if it were not for these agencies?—There would be; yes. I think if anything, there are children who could be fed at home going to these agencies rather than children who come to school and are not discovered.

3773. There is some misuse?—Yes; I do not think that any child could possibly be long in school without the teacher finding out.

3774. What I wanted to get was that the School Board try to secure that they are fed?—Yes.

3775. *By Mr Alston.*—In your answer to Sir Henry Craik I think you said you exacted twenty-three lessons from the teachers?—I believe it is twenty-three; I would not be absolutely certain as to the number.

3776. You make it compulsory that they shall take this instruction?—Well, of course, if they do not want an increase in their salary they need not take it.

3777. Does it depend only upon desiring an increase; it is not a *sine qua non* as being teachers?—I think not.

3778. We were told by one witness that to make a teacher perfectly competent to instruct in physical exercises in the school it would require two hours a day for six months. Is there anything like that conceived by your Board?—Our teachers have all been through training colleges, or nearly all of them; they have had a good deal of teaching there.

3779. Before they come to you?—Yes.

3780. That is above and beyond the twenty-three lessons?—Yes.

3781. Then do you find these teachers are all perfectly competent, when so qualified, to take the physical exercises in any school?—I should not like to say that any of them is perfectly competent.

3782. Would you require expert supervision?—Well, our organisers go round and watch their work and report from time to time. There are teachers who have gone through this course who do become slack, and there are some for whom the course is not sufficient. I should be very sorry to say they are all perfectly competent to teach that or any other subject.

3783. Do you work upon a uniform system of instruction?—There is a syllabus that we issue for physical training and for the boys—yes. I think there are very few boys' schools that still have the Swedish system, and all the others use what we call Chesterton's system, and the girls practically, I think—yes, the majority of them at any rate—the Swedish system.

3784. You do not insist upon a uniform system of teaching physical drill?—We allow either the Swedish or Chesterton.

3785. *By Mr Shaw Stewart.*—Just one question on the subject of games, on which I know you have got considerable experience. It has been suggested to us that supposing in towns and cities schools contained ground for games, teachers might be relieved from the organisation of these games by outside voluntary assistance; have you ever had any experience of that in connection with the School Board?—I think it would be a very good thing if the managers of schools could make some sort of physical exercise sub-committee amongst themselves. I have often thought of that and wondered if they could work it, but in London our object is to let the managers of our schools do nothing at all.

3786. What do you mean by the managers of your schools?—We are the managers, the School Board is, but we have a board of local managers who meet once a month, and under our system they are allowed to discuss the matters of no consequence.

3787. Including games?—No; they are not consulted about that. They ought to be, I think.

3788. Oh, I see?—But as a rule the difficulty in getting managers is because they say when they are managers there is nothing for them to do, and I think if there was something definite of that sort for them to do, they would get very much better managers. There are a few instances of outside people who help, and they are of very great value both in contributing prizes and things of that sort, and also in actually looking after the games, but as a rule the vast majority of the work is done by the teacher.

3789. It would relieve the teachers, of course, a good deal if some outside help could be obtained?—It would; but it is an immense advantage to the teacher to be in it all, because it just gives him the popularity with the boys which helps him to do his work in the school to greater effect.

3790. Yes, but I suppose the teacher would welcome good assistance from outside?—Yes; I do not think he would like to be out of it himself. I think the good teachers like to be in it.

The witness withdrew.

Miss E. KINGSTON, examined.

3791. *By the Chairman.*—You are Organising Teacher of Physical Education for Girls and Infants to the London School Board generally or to any particular school?—To the London School Board generally.

3792. Generally, for everything?—No; for the physical exercises of the London schools.

3793. But all the schools?—No; one-third of the London schools. I am one of three organisers.

3794. Can you tell us what sort of number of schools is under you?—I think 180 schools, two departments in each school.

3795. Girls' department and infants' department?—

Girls' department and infant department, and in some schools we have three—the junior children. I take the junior children, boys and girls are taken together.

3796. I think it would be convenient if you were to go through what you have put down here?—I shall be very pleased to. First of all, with regard to our work. We organise the work, and teach the teachers, first of all, and what we teach the teachers we expect them to impart to the children. We give them a course which is taken in the girls' school chiefly. We moderate it a great deal, of course, for infants, but we practically start our course with infants. With infant children we

Miss E.
Kingston.

take the elementary positions. They are very elementary, but they are preparatory to the work of the girls and the junior children, and we give a course of twenty-five lessons to the teachers who attend our classes, and at the end of the course they are subjected to an examination, one part of which is a practical examination on the practical part of the work that they have taken, and one part is a theoretical examination that is based chiefly upon the points which I have mentioned there. The first part of the theoretical examination deals with physiological work. It practically covers a course which is covered by the elementary stage of physiology, and the second part of it we take up the main parts relative to physical training, dealing chiefly with the children. We take up such points as ordinary physical deformities which are apparent to the teachers, and secondly with regard to the bad positions which children assume during school life, and certain points with regard to over-exercise, and how they should be watched by the teacher. Those deal chiefly with the theoretical part of physical exercise, and that is the course we take with our teachers. Then, with regard to the practical work, we see that that is carried out in the schools. I visit the schools every day, when I am not employed in the evenings, and inspect the work of these teachers who have been in training with me during a course, and put to rights anything which requires putting right, and help the young teachers forward in their work. Then, with regard to the others, those who have been in training in previous years, I inspect their work to see if the standard of efficiency is maintained that I have seen before. That work goes on in both girls' and infant schools, and that takes the greater part of our time. My colleagues are the same; I am one of the three who take the same. We work to that scheme of work. We take the Swedish system, and it has been in vogue in the girls' schools for eighteen or nineteen years. We have never changed our system since first it was started. Madame Osterberg, who was a Swede, first introduced it into the schools, and that is the system which is in vogue in the girls' and infants' schools to this day. We have never changed it. With regard to the upper standards, especially in our higher grade schools, we feel sure that the girls are physically fit to take work of a more advanced character, and we introduce, in order to make a little variety, as much as anything, a few dumb-bell exercises and a few bar-bell exercises, but we only give those to the schools. I only recommend them really to those schools where I consider the children are physically fit to do the work. By physically fit I mean well-nourished and developed generally. Then in very few schools, in our higher grade schools, I have recommended an apparatus. In all the classes from Standard V. upwards, most of them are working these advanced movements, and we do not take any work beyond that. We have three gymnasias which are fitted with what they call the fixed apparatus, but very little of it is used. I do not think the girls are at all fit to put on this apparatus, neither have they had sufficient training. If they could have been trained well for many years or with dumb-bells and bar-bells and with very light apparatus, perhaps they would be better fit to put upon the fixed apparatus. Then with regard to swimming, that is a point of course we are making great strides in, but there is nothing compulsory about the teaching of swimming. With regard to the teaching of our physical exercise it is made compulsory by the School Board; and they are obliged to give a certain time each week to nothing but physical exercises. That certain time is an hour per week. In infant schools it is a quarter of an hour; they have a quarter of an hour each day. But in the girls' schools they have the one hour, and that hour is divided according to Board rules. Now within the last month or two they have rearranged the work. We used to give them one lesson a week, one definite lesson of twenty or thirty minutes' duration and a few minutes each morning or afternoon, five minutes or ten minutes, but I found on inspecting the work that these five minutes were not used; five minutes are so easily

slipped, not perhaps intentionally, but it is gone before the teachers realised that the five minutes is done. Practically it was five minutes down on the time-table, and it was not used at all, the children did not get the benefit of the work that I should have liked them to have had. Then we altered the time and divided the hour into four quarters of an hour or three twenty minutes' lessons, and most of the schools now are working the three twenty minutes' lessons with the exception of the higher grade schools, and they are allowed to take two half hours a week in place of the three twenty minutes' lessons, partly because it is easier to arrange the time-table. In all our ordinary schools now we are working the three twenty minutes' lessons and the teachers are finding the benefit of the work in getting the three definite lessons a week. Then with regard to the question of swimming, that, as I say, is not compulsory, but each year as I visit the schools, I recommend or advise the teachers to see what they can do with regard to the teaching of swimming, and last year I am glad to say we have made rapid strides. The year before, I think it was 1900, we had nearly 900 girls who took what we call the certificate which is issued by the Board for swimming twenty yards. At the end of the last swimming season we had 1062 swimming certificates, but that does not mean that that was all the children really who are taught to swim. There are others who perhaps do not go in for the certificate and can swim a few yards; then perhaps the following year they will be able to complete the required length, so that each year we are making strides in regard to that. And the teaching of life-saving, too, is making a very marked progress. This year, I am glad to say, our Board of Education has recognised the scheme of work which has been drawn up by the Life-Saving Society (whose president is the Prince of Wales), and which does a great deal to help us in this branch of work in the schools. The scheme has been adopted by the Board of Education; a grant is to be paid on it, I think, in the following year, but they have left out, we are very sorry to see, the main point with regard to the teaching of life-saving. They recognise the work which is done on the land, that is, the form of drills that we use, but they do not recognise the teaching in the water. They have left out what we call all our water practice, which is certainly to be regretted, because the land drill is no use without the water practice. That, of course, does not require any explaining at all, but still we are making progress in that direction, and I am hoping that the Board will soon make it compulsory that we shall take swimming. Until then we must be content to go on slowly as we are doing, but we are making progress certainly in that direction. Then a question about competitions was raised. We do give displays each year. The competitive element, I am glad to say, has been entirely done away with. We found that the competitions were really too great a tax upon the children. The organisers laid down certain rules with regard to children not doing more than could be done in the ordinary time-table time, that is, according to the hour a week, but we found that with all our rules it was impossible to say that it was done, and we found that the children were certainly being overtaxed physically, but now that it is turned into a kind of display the teachers do not mind at all; they do their best, and that is really all that they are called upon to do, so it is not a question of who comes out top. With regard to the question of the selection of schools for the displays, no school is allowed to enter for a competition or a display unless all the classes in the school, that means from Standard I. and upwards in the girls' school, are being instructed not only to the best of the teachers' ability but producing excellent results. They must produce excellent results throughout the school; that means that every child in the school which is selected to take part in the competition is receiving excellent instruction, and no school is allowed to enter unless that rule is carried out. In regard to the scheme of work, that is practically left to the organisers and the teachers in charge. They take sometimes what they

would like; we guide them a great deal in the selection of their work. Is there any other question that the Commission would like to put to me?

3797. I think you mentioned something about skipping?—Yes, we take skipping. I cannot say that it is taken in an organised way. Some schools will take it up and do a little during the winter months, but it is only very few schools that we mention; I should think about half a dozen schools now do a little skipping, and they take that in the playground more as a form of recreation. With regard to the pupil teachers, that is rather an important branch of my work. I cannot say that the work is altogether satisfactory in the pupil teachers' centres. We have one or two centres where the headmaster perhaps is an enthusiast in that respect, and he does all he can to give the girls as much exercise as it is possible to give them, but the curriculum, of course, is so crowded that they are glad to leave out any subject that it is possible to leave out. They do get a lesson in most centres about once a fortnight, from half an hour to an hour's duration, which is practically, from a physical point of view, of no good whatever to them. I do not think I can say in any pupil teachers' centre in London they have a lesson every week.

3798. Then fire drill, does that affect the girls?—Yes, it is made compulsory, but the whole school takes part in that. As I stated here, a bell is rung from the outside as a rule—the school bell, and all the three departments have to be prepared to answer that bell, and we get very sharp work done at times with it from the buildings. Of course we have not two buildings scarcely alike, so we have to arrange the drill. It is left entirely to the teachers to arrange to get out of the buildings in the quickest way they can, and we find on an average it is done in from two to three minutes, sometimes less, sometimes a little more. We get a big school of three departments, sometimes 1500 or 1600 children, out in the playground in that time, and that is practised very regularly too, and at times when the teachers are not prepared for it.

3799. You mentioned roof playgrounds. Are there many of them?—Yes, many, and particularly in poor districts, where they are glad to use them. Generally where there is a roof playground there is no hall, what we call a central hall in the schools, and the playground, which is down below, is very often much blocked in with houses. So they really do not get the proper air down there. The roof playgrounds are used to very great advantage by the children, and they are used a very great deal in regard to the physical exercises. In fine weather they are all taken upstairs.

3800. The floor of the roof playground is not flat, is it?—It is stone—asphalte, as a rule.

3801. Not lead?—Oh, no, no.

3802. Do you find much difficulty in getting teachers to understand what you call the Swedish system?—No, none whatever. We have a scheme of work which is put into the hands of the teachers drawn up for each standard in the school. It is a graded scheme from Standard I. upwards, and the teachers work through that at the training class. The only difficulty is to really learn the commands, but when they once have had a little practice with them they find no difficulty with them.

3803. But the commands are in English, I suppose?—The commands are in English, oh yes, certainly.

3804. Then as to the girls' dress, do you find any difficulty about that?—No. I think you will find, my lord, that the children's dress nowadays is better suited to physical exercise than it used to be.

3805. And requires no alteration?—And requires no alteration.

3806. Now what about older girls, girls over fourteen?—We encourage them as far as possible to come in a blouse for their drill, and in some schools they have even gone so far as to get a few children into proper gymnastic costume. A teacher can do a lot in that direction, and does do a lot. It is simply a matter of encouragement. But with regard to our teachers, they require to be in costume when they go through the course;

3807. And as regards swimming exercise?—Of course they are in costume for that, and the costumes, as a rule, are made in the schools.

3808. Who pays for these costumes?—The Board supplies the material, and the teachers make them in the schools.

3809. The teachers make them?—Well, the teachers and the children, I should say.

3810. It comes into the sewing class?—Into the ordinary school work.

3811. Therefore the cost is very little?—Very little, indeed.

3812. As the result of that?—It is not to be mentioned scarcely.

3813. But that is actually a definite object of the sewing work, the making of these costumes?—No, I should not say it comes in. It is taken, perhaps, to the younger children as a little practice work, but it is not done as proper sewing work—not for inspection.

3814. Not for inspection, but as regards the real work it is always something that is being done in that direction?—Decidedly, and it is a great help to the children. It is a training in the making of things of that description.

3815. I suppose very fine sewing is not required, is it?—Oh dear no, as long as it is suitable for the purpose.

3816. Rather superior basting?—Yes. Another thing, it encourages the children. They are interested in anything that they do like that for themselves, especially if they feel that afterwards they are going to use them.

3817. Have you had any complaints from mothers about the girls doing physical exercises or swimming?—No. We used to have complaints once upon a time with regard to drill. As far back now as six or eight years I heard complaints about one or two movements in the drill, but we never hear anything said about it now.

3818. They are getting educated up to it?—I hope so; any way we are doing it as a matter of course in the schools. Of course there are several children withdrawn from the instruction occasionally; there are bound to be cases of that sort occasionally amongst the numbers we have to deal with.

3819. You mentioned examinations; are these at fixed times or do you drop in on them whenever you think you will without any notice?—Without any notice; they never prepare their work for us; they do not know when we are coming.

3820. How long has that obtained?—About two years.

3821. Not much longer?—Not much, no.

3822. Before that?—We used to send a card to say we were coming.

3823. There was a regular high pressure?—Oh, we found that quite high, quite too frequently, but now I can really feel that with the present system of inspection that our work is certainly making rapid strides within the last two years.

3824. Who is it at the head of your operations in every way?—We are under a committee of the School Board called the Physical Educational Sub-Committee.

3825. And you actually get all your directions from them or you simply have to report to them?—Well, we report and make suggestions and they consider the suggestions, and if they think they are worth carrying out we have instructions to do so. Each year we have to send in what we call the annual report upon the progress of our work.

3826. And do I understand you that this sub-committee engages you and all the organising teachers?—Oh yes, but the Board practically engage us.

3827. And before you are engaged do you have to produce anything in the way of a certificate?—Now the Board are getting rather arbitrary with regard to the qualifications of their instructors. I have been doing the present work for thirteen years, and I was trained under the organiser who died two years ago, and she was practically one of the first who followed Madame Ostaberg, and I was taken from one of the schools of

the Board and trained for the purpose. I was with her in training for five or six years as her assistant.

3828. And of course you think it is a great advantage that there should have been no change during all this time in the one system?—That is where we have the great strength of our work. It is now we are beginning to see the results of it in some schools I have just lately been examining under a neighbouring Board other than the London Board. They were not satisfied, and there I found in all their schools that not only was there a different system in every school, but that there was a different system in every class in the school. The consequence was that as the children were drafted up into a higher class they had something fresh to learn in the way of formations and turns, and things which, from a physical point of view, are really not of any value to the girls; it is a comparative waste of time, so that the greater part of the work during the following year had to be wasted—the time was wasted rather, I should say, in recapitulating or doing work which should have been taught in Standard I. and wanted no fresh teaching.

3829. Do I understand that that was in a neighbouring School Board area?—Yes, in a neighbouring School Board.

3830. Then as regards voluntary schools, have you anything to do with them?—I have not.

3831. You have never been invited to them?—I have been; I have taught church school teachers. I have worked one or two classes of church school teachers, and have visited their schools to see their work done, but of course the conditions under which they teach are so different from our own. I do not think I have ever been in a voluntary school anywhere where I have seen a proper space for the children to drill, the forms and things, the whole apparatus of the school; it is so difficult for them to produce the results that we do.

3832. Were these Church of England schools?—Yes, mostly.

3833. Have you any acquaintance with Roman Catholic schools?—No; none whatever.

3834. You have never seen them, because I mean we have had certain evidence given to us that at some Roman Catholic schools they pay a great deal of attention to physical exercises; you don't happen to know anything that can substantiate that?—No; I do not.

3835. And other schools, other religious bodies, other than the Church of England?—I had a class once; it was a mixed class, mostly Church of England school teachers, and I had a few quite undenominational too. I had one or two Wesleyans; I visited one or two Wesleyan schools, two I have in my mind in particular, and there I found the condition much the same as they were in our Church of England schools. The conditions under which the children were taught, of course, hampered their work very much, and the children that I saw, the teachers' classes I examined, really had had no previous training, and of course the work comes very hard to the children for the first year or so; at any rate it is more difficult to them than if they are trained from infants upwards. I do not want you to understand that our work in an infants' school is of a very advanced nature. It is not. We deal chiefly with marching; we teach a lot of marching, walking, in infant schools, and simple arm extensions and shoulder-blade movements, and many of these we put to music, but we do not advocate music very much.

3836. To what do you attribute the fact of having more room in the schools to what apparently exists in the church schools?—The buildings are constructed so differently.

3837. No; but do you put it down to the fact of your being able to rate?—I expect that is it.

3838. As against the sum which has to be voluntarily given?—Some of our schools are quite as bad as many of the voluntary schools which I saw. I know several of mine in my east end district where the conditions are equally as bad, but there they have in many cases a roof playground, or if they have not that, they have a playground outside that they can use, but the volun-

tary schools suffer very much in that direction. They seem to have no space. They use the floor space in the rooms. They seem to have no proper playgrounds.

3839. As often as not an adjunct to the church, are they not?—Yes, more often than not; so that if they have any playground at all it is not worth the name of a playground; it is scarcely as large as the school itself, the space is very small; our Board Schools, even the worst of them, have an outer space somewhere where they can practise.

3840. Have you any experience in the way of physical education outside London, either from actual knowledge of it, or from what you have seen on your holidays and so forth?—I have been to Sweden and I have been through all the Swedish schools. When I say all, a fair proportion of the Swedish schools, that is the national schools there which take the same place almost as our large schools.

3841. Can you tell the Commission whether the drill—I suppose you have naturally seen it when you were there?—Yes; that was the purpose for which I went.

3842. Is very much the same given to girls there as is given to girls in London?—Yes; only I think we came back feeling satisfied we are rather a little in advance of them there.

3843. When was that, may I ask?—Nine years ago.

3844. For all you know Sweden may have progressed?—I am sure of it, because they have produced some very fine specimens, and I hear—this is only from hearsay—that in the American schools they are adopting the Swedish system throughout many of the girls' schools. It is becoming very general even there, but the Swedish system is taken throughout all the Swedish schools, throughout the schools in Stockholm, and they have but one system there the same as we have.

3845. Now, in other parts of this country do you happen to know that the Swedish system is adopted?—I do not.

3846. You have no reason to know?—I have no reason to know; I know in one or two of the big Boards of the North they do not, but one just recently has adopted it, or are going to adopt it, if they have not already started.

3847. *Sir Thomas Coats*.—I understand you to say that all the girls in the London Board Schools get physical training?—All, sir.

3848. And how long has this system been going on, I mean this thorough system of physical training for the girls—how many years?—It is quite eighteen or nineteen years I know. Madame Osterberg was the first to start it, and it was many years before I started, and that is thirteen years; this is my thirteenth year.

3849. And all given pretty much on the same system?—Exactly the same; I have not altered it at all. We have made progress and we have added to our exercises year by year, but the same system throughout has been in vogue since then.

3850. Has the amount of time given per week been increased lately?—Oh, yes.

3851. Very much increased?—I think two years ago the Board made it compulsory that the hour, one hour per week, should be given. That was really before our Board of Education took it up and showed definitely what we were to give, quite twelve months before they made that definite rule. Our London School Board were having an hour per week in their schools, but before that it was left to the teachers to put it in when they could, but they must put it in somewhere. The consequence was we used to get one half hour lesson a week; as a rule it was generally put in at the end of the afternoon session. That went on for many years; but, of course, the Board had made no special point in regard to it and there was nothing compulsory, so that really all we could do was to persuade the teachers to put it into a better place and to divide the half hour up into shorter lessons; but for the last two years we have had one hour per week, and within the last twelve months the Board have decided that they are to give three

Physical
training:
good effects.

definite lessons a week, that means three twenty minutes' lessons except in the higher grade schools, and there they have to get two half hour lessons per week.

3852. Have you noticed great improvement in the physical development and the health of the children, that is, in the children from the time they first came to the school, and after they have had this training?—Yes, I think you will find our progress is really wonderful—it is an exception now when we find a child really what I call badly shaped; of course there are many little physical defects which are always apparent to a teacher, such as poking chins and flat chests, but these are more uncommon than they used to be. The children are getting very much straighter. I must say the teachers are taking an interest in these children now, and I will often find when I visit the schools certain children who are malformed directly under the supervision of the teacher, directly under her eye, so that she can be near to counteract any little defect that is necessary. Of course there are some cases which really require different exercises to what they are having at school; they require medical treatment, but of course all the teachers can give them is just the ordinary school work.

3853. I think you said that teachers had lessons in physiology so that they were able to carry out special practice?—They are able to detect and correct minor faults in the children, and that I think of course is the chief aim of our work in schools—to counteract the little physical defects that you see in children—they are nothing serious, but they can be overcome quite well, and are overcome, too, by the system of physical drill.

3854. Then the time that the full hour a week was given was two years ago, I think you said?—Yes, about that.

3855. From that time have you noticed a great improvement on the children over the half hour?—Yes, I have no hesitation in saying that.

3856. *By Sir Henry Craik.*—Have you found any backwardness on the part of the ordinary teachers to recognise this subject?—No; but we have had to educate the teachers to it the same as we have had to educate the parents, but now we have our own teachers, of course it is compulsory that all teachers should be qualified according to Board rules. But that was not made compulsory until a year or two back, and then the teachers used to give if they wished, and others who did not consider themselves strong enough of course were left outside. When the Board made it compulsory that all must do it for about two years, we have been inundated with teachers who certainly were not physically suitable to undergo the course. They were too old, but they had to give it, and so they came and made the best of it, so that we really do accept from them what we would not accept from our younger teachers now. In our training classes we are getting girls who come almost direct from college; in fact, the college course now is the same in many colleges as our Board courses. I am teaching it in three of the training colleges myself, so that when these students come out of the training college, all they have to do is to sit for the Board's examination. The Board require them to do that, and the teachers accept it as part of their work; they do not question it at all.

3857. But at first they complained that it was adding to their work, and interfering with their rest?—Oh, very much.

3858. When they took it as matter of course as part of the curriculum the difficulty has disappeared?—We have no difficulty. I cannot say we have any at all. With regard to teachers they accept it; there are a few teachers who are allowed to be exempted. The Board will exempt any teacher if she will produce a medical certificate.

3859. Yes; but in no school is the absence of all physical instruction tolerated?—Oh no; nowhere, and all our teachers, I may say, with the exception of a few, are qualified to teach the subject that they have to teach.

3860. And when you began as inspectress did you find any schools where it was very much neglected?—

Oh, many, the greater part of them; we would perhaps find one teacher in the school who would be teaching one class, but there was nothing organised with the work. She took what she thought she would take. Then perhaps those children did not have any drill again until somebody else came along who could take them.

3861. Now they are educated to think differently?—Oh yes; I am sure they are.

3862. *By Mr Shaw Stewart.*—Referring to the syllabus of exercises, I do not see any provision made for any tip-toe exercises for small children?—Yes, we have numbers of tip-toe exercises.

3863. I must have overlooked it?—They are included in what we call our 'leg movements,' sir; our leg movements will include all exercises which have to do with the movements of the legs.

3864. For that purpose do you have to remove the boots?—No; there is one of our greatest difficulties, with regard to the children being so badly shod. You see their feet are so badly balanced on account of these boots. They would be better without them, but it is not always practical to take their boots off. Of course in England we do not have children without boots, they will have boots on if they are ever so old; if they have almost to be tied on they will have boots. In all the east end schools, I may safely say, I have never seen a girl drilling without boots.

3865. But would it be an advantage if the children put on shoes when they came to the school and kept them on?—Oh yes; I would like them to have what they call the Plimsoll india-rubber shoes.

3866. The movements would be more valuable?—Oh, much more perfect; we are obliged of course to work under disadvantages with regard to that.

3867. But do you think it would be practicable?—It would be a great expense; it is practicable enough.

3868. *By the Chairman.*—A great expense?—A great expense. We do get them in some of our schools; we encourage our children, we have done a lot in the last few years in that direction. The children are getting enthusiastic. It all depends upon the teacher. A good teacher will get her children to do almost anything, and can get almost anything from their parents. One school I have in my mind. I have gone into the school when they have been having their lesson, and if they know it is to be drill lesson they have old house shoes which are really not suitable for anything except for the house, and I have seen them tied on with pieces of string even, so long as they are able to move. The children realise that they cannot drill so well with boots which of course are fixed round the ankles or at the heels.

3869. But would the expense be very great if it was provided in some form by the schools?—No, not so great as it is for other subjects, and they would be a great benefit; not so great as some of the apparatus which is supplied.

3870. Do you think it would be of advantage to bear some of the expense of providing useful shoes?—Oh, certainly.

3871. Even at the expense of some other apparatus which is provided?—Certainly I do; oh yes.

3872. *By Mr Alston.*—What is the type of your lower class London children?—Well, I was going to make a comparison, but perhaps it is not right.

3873. I mean are they light in figure?—Yes, they are, but I think it is through bad feeding. They are so very thin; there seems to be nothing substantial about them. Really one feels when I have been giving a lesson to the children, perhaps, for ten minutes, these children will work with as much vigour as you wish them to work, but it slackens, it gradually goes off, and it is quite perceptible; they work up to a certain point, and they have not the stamina; they have not the grit in them to continue the movements with that amount of vigour that they had at the beginning.

3874. I think in Scotland the type of our lower class girl is rather thick-set and clumsy, with a rolling movement of the body and heavy clumping of the foot: is that so in London?—Well, of course, un-

gainliness is really one of the great things, but I do not say the London children are awkward; I would not say they were thick-set or awkward children by any means, and it is astonishing what can be done with them.

3875. I wanted to ask the question, because I think you will have less trouble in making your children acquire graceful attitudes and graceful movements than we have in Scotland with the same class?—Possibly. I was much struck in visiting Glasgow, about two years ago, to see the wretched state of the children there.

3876. On the streets?—On the streets, yes. I made the remark to a friend I was with there. I was amongst the slums of London the greater part of my week, but I do not think if I looked I could find children who were so badly shaped; there were so many rickety children, bow-legged children, children with their knees turned in. It was quite perceptible. Perhaps I am looking out for that more than an ordinary observer.

3877. No doubt you are?—But I was very much struck.

3878. Did you see any of the schools?—No, no schools.

3879. Neither the Board Schools nor the Reformatories?—No; I was only there during the holiday time, and the schools were closed.

3880. How far would you go in extending the time allowed for physical exercise, with due regard to the other branches?—To be of any real benefit to the children, they ought to have a drill lesson every day.

3881. To what would you go?—A quarter of an hour or twenty minutes is quite enough for the child to work well.

3882. You think that would not interfere with the school lessons?—I would not like to say. I have been a practical teacher myself, and I know the subjects, so many subjects have to be brought into that timetable, that one has to be almost grateful for small mercies in that direction; but looking at it from a health point of view I do not think the children would lose the time at all; they would not suffer from it in any way; in fact, the teacher would feel the benefit of the extra brightness the children would bring to their work after the lesson.

3883. One other point: we have had evidence as to the use of music in the physical exercises, and I think the evidence, except in one case, has all gone in favour of using music with the exercises. I think you are the second witness who has been distinctly against it?—I am distinctly against it.

3884. And upon very good grounds?—I have tried it; mind you, it is possible to get what I call excellent musical drill; I am not going to say that it is not, but it makes the work doubly hard. Teachers have told me; I have the advice really of good practical teachers on the point, and they assure me that to get good musical drill, done as it should be done, it is very, very hard work, because the children are simply carried away with the music, with the rhythm of the music, that they forget the proper execution of the movement, and I am strongly of opinion that every movement for girls—I am not speaking so much for infants, but for girls who can think—should be well thought out, and the mind should be brought to bear upon the movements themselves to a very great extent, and that cannot be done with the music, or is not done when music is brought into prominence.

3885. *By Mr Fergusson.*—I think your statement has been so very clear and so extremely interesting, if I may say so, that I have hardly anything to ask. There is one point I was going to ask you about, that is music, but you have said everything that I should have liked you to say, so I will leave it there?—I should like very much for the gentlemen of the Commission to see some of the work in our schools; it is so much more satisfactory to see what is being done. I do not mean any prepared work, but to see really what we are doing under ordinary circumstances every day; it would be so much more satisfactory to everyone concerned.

3886. I feel sure we shall all be very pleased; as to the system, you only teach the girls and the infants?—The girls, the infants, and the junior boys.

3887. You teach them what is known as the Swedish system?—I do.

3888. Are not the boys taught Chesterton's?—Yes, sir, I think they are now.

3889. That is different?—It is different; it is a mixture.

3890. Then in fact you have two systems in your schools; you have the Swedish and you have the Chesterton?—Yes, we have: we used to take the Swedish system in the boys' schools when we had no organiser, and Dr Brooman, who used to be our organiser some years ago, taught the Swedish system, but he has left the service of the Board and taken up medical gymnastics now.

3891. Is there no difficulty in having these two systems working in the same school?—We do not find the girls and the boys class clash at all, sir. There are very few schools where our boys and girls are taught together. There was only one point upon which we used to clash, and that was in the matter of turning, and turning taught used to be different, so that when our junior boys or infants went into the boys' schools the teachers used to tell me they had great trouble in undoing what had been taught, but now the turn has been made the same for both; that was only just a minor point.

3892. You know Chesterton's system?—Yes, I know it, sir.

3893. Do you think it is as good as the Swedish?—I suppose it would be considered prejudice if I say no. I hope it will not be. I am firmly convinced that there are many points in Chesterton's system which are quite right; there is no doubt about it; but it is a mixture, and if you have an excellent system in vogue from which I have seen such excellent results which we have, why introduce another?

3894. No, but would you be prepared to recommend that the Swedish system should be taught to all up to the age of fourteen?—Yes, sir.

3895. You would like to have the Swedish system and nothing but the Swedish system?—I should; certainly I should.

3896. At present you give twenty minutes three times a week?—That is so, except in the higher grade schools, and there they are two half hours.

3897. You would like to have a quarter of an hour each day?—Or twenty minutes each day.

3898. When your schools are inspected is your physical work very closely looked at by the school inspectors?—I am sorry to say it is not. We are not helped in the least by our Government inspectors; of course it all depends upon the inspector himself; in some districts he will ask to see it, and perhaps he will select one class from the whole school. Well, that is satisfactory so far as it goes, but in some districts it is entirely ignored.

3899. That must be rather discouraging to teachers?—It is because they feel it is not taken so much notice of, and, therefore, when they can spare a few minutes for other subjects they would not certainly give it to drill.

3900. *By Professor Oyston.*—I should like to ask Miss Kingston one or two questions where her experience of girls would be of assistance to us. First of all, might I ask to know how you test the medical fitness of your teachers who are entering?—We do not test them medically; we have no means, of course. Under the London Board no teacher is approved unless she has passed the medical officer in the first instance.

3901. You have a medical officer for the Board?—Yes.

3902. Who tests her upon some recognised system, and certifies that she is fit?—For her work as a teacher, and the examination now is very thorough indeed, almost you may say—

3903. Stringent?—Yes, stringent is a better word. The girls are medically examined to the very utmost, so that a girl now who comes under the Board is

Miss E.
Kingston.

14 May '02.

physically fit for her work. We very rarely have girls that we discover there is anything wrong with afterwards. Our teachers are stronger now, and it is merely that examination that they have to undergo—the medical examination.

3904. Well, then, as regards girls, do you find that they are susceptible of being disturbed in any way as regards the balance between their mental work and bodily work, especially by physical training?—No, sir; I have not found that at all. I find that the girls themselves are brighter after their lesson, and they do not require any calming down, any extra calming down as they do with the boys.

3905. And even at the period of adolescence you do not think that any system of physical training requires to be attended with greater precautions in the case of girls?—Most decidedly, and very especially in our higher grade schools; we have to pay particular attention to it, and the teachers are noted; they have special hints given to them with regard to the girls, and girls are often excused from their drill.

3906. Is there any useful point that you would like to tell the Commission regarding that, or does what you have said convey everything that you think necessary?—There is only one point with regard to that that I think should receive notice. Girls at that age will undertake more work to a certain extent than they will do when they are not quite so old, and I think the teacher is a little inclined to try fresh things at that age. She will try another system, or give them perhaps skipping, for instance, which I do not think is altogether good for girls, at that age particularly. I think we ought to be particularly careful with regard to that, and their work should be very, very gradual; they should not feel it, and they do not feel it under ordinary circumstances, unless an extra amount of work is put upon them. For instance, in the swimming, we find rather a difficulty with regard to that at that age. We like to get our girls a little younger, if possible, to start them swimming. We do not get them till Standard VI. or VII.—twelve or thirteen, or fourteen years of age. We like to get them in our Standard IV. when they are a little younger. We find the children are better able to stand the extra exertion there than they are later on. The girls fail very much when they get about thirteen or fourteen, and they do not like their drill then so much; it is more of an effort to them, and there is no doubt about it it is from a physical point of view, and we are obliged to think so.

3907. Is there any kind of physical training that you consider bad for girls?—The apparatus work.

3908. Distinctly bad?—I consider distinctly bad for girls; that is, what we call horizontal bars and parallel bars, and I think, in voluntary schools particularly and in schools where they have had no guidance with regard to the work, that there is a good deal of apparatus work in vogue you will find.

3909. And gymnastics of that kind you consider altogether bad for girls?—Altogether bad for girls; for girls of that age any way.

3910. Do you find much physical defect in children whom you come into contact with?—These defects really which are notable in all children as they are growing unless they are corrected. We get, for instance, what we call the poking chin; that is, I think, the worst fault to deal with. I think it is sitting at lessons with badly-constructed desks that brings it about. They get to that position, and that brings about the rounding shoulders, and the flat chest, and the protruding stomach—a very common fault that is amongst the children, but it is overcome. We try to overcome it. We have special exercises for overcoming it, and we work these exercises very regularly through, with the upper girls particularly.

3911. And the effect of the physical training, such as you advocate, in removing that, is very marked?—Oh, very marked, very marked, and it should be too, if the drill is good.

3912. Do you find many little deficiencies that are defects, but perhaps not deformities in the lower

limbs?—Not so many. It is a very rare thing to see a child what we call bow-legged.

3913. Or the reverse?—Or the reverse.

3914. Or flat feet?—The reverse. It is quite an exception, quite; but turned-in toes, which curve, I think, from the ankle joints, is the commonest fault about them. It is not so much the legs. I have tested children's legs often, and the legs from the ankles to the knees have been as they should be.

3915. And your observation has been very narrow, your test has been severe?—Oh, I have taken exceptional cases with children, and tried to find out really what has brought it about, and I find that the exercises overcome that a great deal. We do not have nearly so much of it, but what I have noted particularly amongst the children, and it is very marked, is that one of their arms is much longer than the other, which is a proof that one side of their body is developed to a greater extent than the other; that is very marked in the seniors.

3916. The right arm?—The right arm. Of course, it is the greater use, I presume, of that side of the body that brings it about. For that reason we start all our exercises and work them all from the left to encourage the use of the left side of the body.

3917. How far do you think that a medical inspection of the children in the schools would be of assistance in their physical training?—Well, I was going to make a proposal to the Board not long ago with regard to drawing from the classes all the children who had physical defects, putting them together in a class, and putting them under one special teacher, but it was a very big work, and I found that it would take a very long time to do it; but there is no doubt that the children would be benefited by the special attention. But if you do that, I do not think that quite comes within the range of our work. It comes into what we call medical gymnastics, and in ordinary work we ought not to deal with medical work.

3918. Would you say that one-third of the children whom you have in the junior classes would require to be put into this special medical contingent?—Oh no, sir; I should not say one-eighth.

3919. But one-eighth would be an approximation to the truth?—Yes; from just gauging the numbers roughly I should imagine that one-eighth would be quite near to it.

3920. And that would comprehend the children who are slightly defective, but, of course, not the exceptional cases of cripple or extremely deformed?—Not with curvature. Quite so, sir.

3921. How do you deal with cripples?—We do not do anything at all with them; if the child has curvature we withdraw her as a rule from the instruction. The exercises might benefit the child, but we are not to know exactly where the curvature is, nor yet what is the curvature, nor yet what has brought it about, so that you really might accelerate things which are at work rather than overcome them.

3922. But those children still attend school although not the physical training classes?—Yes. I came across a child the other day who had an iron up her back, her spine, marching with the other children. When it was proposed to withdraw her from the class there came the message: 'Please do not; let her be with the other children; it does not hurt her at all; she likes doing the work.' It does not hurt her at all, and she is very anxious to do what she can, and she was doing the exercises with the arms fairly well, and it evidently did not hurt the child or she would have stopped. But I do not encourage cases like that; I do not think it is exactly right.

3923. Have you been brought face to face with the question of dealing with incurable children?—Only from hearsay; in fact, I did visit a medical gymnasium once, that was Dr Rollis'. There I saw him doing medical work, but the exercises that he took were almost the same as we are teaching in our schools, only of a more advanced character, and exercises which were entirely suited to the patient.

3924. But you as an instructor under the London

School Board have no connection with the physical training of children who are incurable?—No, sir; not at all.

3925. Have you had any inquiry made to your knowledge regarding deficient eyesight?—We have had in schools. Of course children's eyesight is tested in schools now.

3926. Tested by a medical officer?—No; by the teachers. They have certain rules laid down with regard to the children's eyesight. They have a card of letters painted, and definite rules with regard to these letters, and if a child when he is admitted to the school is found to have defective eyesight, that is, cannot read letters below a certain standard, a note is immediately sent to the parents and the child is sent to the hospital to be supplied with glasses. Great attention has been paid to the eyesight of the children within the last twelve months; it is only just recently that this has been in vogue.

3927. Do you find that the physical training is beneficial to the manners of the children as well as to their carriage?—In school, yes.

3928. In school I mean?—Yes, decidedly, but out of school I cannot say very much about it, unfortunately.

3929. Have you any opinion regarding the effect of physical training upon the morals of girls?—Oh, yes; I have the greatest faith in that, and I really believe it is the means of restraining girls in many ways. It should have that result any way if it has not, it is one of our aims chiefly.

3930. In your evidence you spoke of life-saving apparatus. I suppose of course you do not regard that as a species of physical training; it is more a useful acquirement?—Of course swimming itself is a physical training; there is no doubt about it, it is one of the best forms of exercise that can be advocated, one of the very best, and of course life-saving, which I consider should follow swimming, is essential from a humane point of view, and is most useful; the children in the London Board Schools have saved many lives even in the ponds and places where they have been bathing. We have now a record list; we keep a record list of children who have done things of that description.

3931. So that although life-saving on land is not necessarily a species of physical training, you consider it a necessary corollary to swimming?—Very necessary.

Miss E.
Kingston.

The witness withdrew.

Adjourned.

EIGHTH DAY.

Thursday, 15th May 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT:

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr GEORGE M^CRAE, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr THOMAS CHESTERTON, examined.

3932. *By the Chairman.*—You are the Organising Teacher of Physical Education to the London School Board?—Yes, my lord.

3933. And how long have you been so?—Upwards of thirteen years.

3934. You have got your evidence before you: will you kindly go through it?—The importance of physical exercise is, at the present day, almost universally recognised, but the form most suitable to the requirements of school children varies in the opinion of authorities, some advocating military drill only, some favouring systematic physical exercises, and others recommending games. When the matter is carefully studied it will be found that all three forms of exercise are essential to the all-round development of children, and that no single form can be considered as sufficient for an ideal training.

Military drill is indispensable in securing discipline and a ready response to orders; systematic physical exercises provide beneficial training for all parts of the body, and aid in attaining that 'set-up' which is so essential in giving to children a smart carriage; while from games, although here the above-mentioned points

are only matters of secondary consideration, a great amount of physical and moral benefit is derived.

In the country and large public schools, where it is possible to obtain sufficient space for recreative purposes, games are to be strongly recommended, particularly for the elder children, but when children are restricted to a limited area, as is the case in many of the playgrounds of the metropolitan and large provincial schools, games cannot be advantageously employed. It is here that systematic physical exercises are essential, ensuring to each child as much healthy relaxation and exercise as time and circumstances will permit.

The primary object in teaching physical exercises in schools is to ensure the systematic and gradual development of all parts of the child's body by regular practice in rhythmic and attractive movements. Such movements are a decided aid to maintaining school discipline in that, when conducted by the teacher of the class, they enable him to get that instant attention to detail and smartness of execution which are so characteristic of good discipline. To a certain extent the brain, during such exercises, is inactive, obedience to command is the chief impression conveyed, and a habit of strict

Mr T.
Chesterton.

Instruction:
object.

Mr T.
Chesterton.

15 May '02.

attention is formed which proves of the greatest aid to the teacher.

A strong reason for the introduction of a rational system of physical training for children is the fact that in recent years teachers have become alive to the necessity of adopting some form of drill or physical exercises to maintain order and attention in their classes, and to secure change from the monotony of study.

Benefits.

The benefits derived from teaching systematic physical exercises to school children is seen in the fact that all the muscles are brought into play in turn, and thus uniform development attained; the result being a healthy body in the best sense of the term.

A second benefit may be seen in the change and relaxation from mental studies, for whenever a few minutes are devoted to physical exercises during the middle of a session, not only does the brain become rested, but the circulation of the blood is increased, after its partial stoppage with sitting, etc., and thereby a degree of freshness and an increase of energy cannot fail to be apparent in the ensuing work of the morning or afternoon session.

A third benefit is that it leads the children to realise the value of co-operation—they get together, all striving to make their own individual exertions as perfect as possible, so as to aid in the best possible manner in the general effect.

Closely allied to this, and in fact almost inseparable from it, we have the moral and æsthetic effects. Thus goodwill, sociability, and even sympathy are fostered. Their natural craving for rhythm is satisfied. They become conscious of steady regular movements which have a peculiar soothing effect upon the mind. Their sense of beauty in regularity of movement and effects is strengthened. Their sense of time and even tune is developed. Finally, they become smart and prompt in performing movements, and consequently acquire splendid habits of deportment. They become graceful in all their movements, and, moreover, gradually come to learn to obey commands without that fatal hesitation which breeds carelessness and slovenliness. Thus the general discipline of a number of children is greatly benefited, and smartness consequently becomes a habit. Habits are part of our personality, hence the discipline and tone of the school are raised to a high standard. This discipline leads to a desire to smarter appearance, for a child soon conceives that if his movements are smartened, so must the appearance be made to agree. The result of all this is that the boy becomes eventually a man who is always on the alert, and one who will take a distinct pride in his appearance.

System of
drill and
physical
exercise
described.

It is highly irrational under the existing extensive curriculum of our elementary schools, and the limited time during which the children are under the control of the teachers, to attempt to carry out any elaborate system of physical training during school age. It is chiefly the above consideration which led me to compile my system of drill and physical exercises. The system is one compiled solely for the use of children, and in its compilation I brought to my aid an experience of eighteen years in teaching all branches of physical culture. There is no claim to originality, the adaptation and classification of the exercises being the only part which is original. The classification is the result of a close study of the chief anatomical and physiological functions of the body, and was made under expert medical supervision and advice. The system is thus a scientific one. The classification has regard to the fact that each class in a school consists of a large number of children, irrespective of age, physique, and social position; hence the exercises are adapted to suit the average child (male or female) of school age. Each exercise serves some physiological purpose, nothing being introduced for the mere sake of display or effect. The exercises can be performed by the scholars while dressed in their ordinary clothing, and can be acquired by teachers of either sex under similar conditions. No movements of a grotesque character are found in the system, and nothing is introduced which necessitates the hands or any part of the children's clothing coming into contact with the ground. There are no movements of a compli-

cated character, and not one which cannot be imparted to a class of children in a few minutes, providing the exercises are taught in their progressive order. The object throughout is to produce general all-round development, and the strengthening of the various organs—particularly the heart and lungs—on which a large part of the functional activity of the body directly depends. The system admits that the constitution of a growing child requires all its nutrition for natural development, therefore muscular development is not the chief aim in view, though this is undoubtedly the result of regular and systematic physical exercise.

The exercises are arranged in a progressive form, commencing with the most simple movements, and gradually leading up to those of a more advanced nature. The exercises can be taught in different ways without any alteration—(a) as free movements by words of command; (b) by the aid of dumb-bells; (c) with or without dumb-bells to musical accompaniment.

Staves, wands, or bar-bells can be introduced with but slight alteration of the exercises. The exercises are arranged in the simplest manner possible, in order that they may be easily learnt by the teacher, who can readily select from them those most suitable for the scholars; all exercises are taught in two, four, or eight movements, and are so arranged that both sides of the body are equally exercised, either alternately or simultaneously.

Tables of exercises are entirely absent. The system being a simple, complete, and progressive one, the teacher can teach it without constant reference to a text-book or notes. Consequently teachers have a free hand in varying the exercises according to circumstances, e.g., time of day, indoors or out, weather, etc. Monotony is therefore absent, increased interest and benefit being the result. Still, a table of progression is given, beyond which teachers should not proceed with their pupils.

The exercises are preceded by a limited amount of military drill, which is used as an auxiliary to them. By it the children are taught how to assemble, to form classes, and to move from one point to another in an orderly and methodical manner. This drill is identical with that contained in the Infantry Drill Book, but nothing is taught which is not essential to the purpose.

It is erroneous to suppose by the foregoing that the system is a military one, although *all* the exercises contained in the military system of physical training are found therein. Just the contrary is the fact, for the military system is the outcome of the experiments made in compiling *this* system. The exercises are grouped into more complicated series in the military system, while in my system we have the elements from which the military system was compiled. The latter was compiled for adults, the former was evolved for children.

This system is widely known, and has been extensively adopted throughout the country. The army authorities (on the recommendation of the Inspector of Gymnasia, Aldershot) have adopted it exclusively for all their schools at home and abroad. It is also taught to the students whilst in residence at ten training colleges for teachers, and in the whole of the schools under the London Board, and in numerous provincial schools, including those in Glasgow. There are upwards of ten thousand school teachers, male and female, teaching this system to their scholars in the United Kingdom and in the colonies at the present time.

Whatever form of physical training is adopted in elementary schools, military drill should form its basis, but nothing beyond the simple elements of that drill should be practised. Military evolutions, such as squad and company drill, are not essential when dealing with the physical training of school children of either sex.

Military drill in schools pursued day after day would in time become very monotonous and irksome to both teacher and pupils owing to want of variety, and the same remark also applies to military physical exercises, which are neither sufficiently graded nor numerous enough to meet the requirements of elementary school children, who differ widely in age, physique, etc.

During school life every effort should be made to

improve the physique of the children, thus fitting them for whatever calling they may follow in after life. This can only be accomplished by a rational system of physical exercises—one compiled exclusively for school children, and so graduated as to be adapted to the use of scholars of varying ages.

On leaving school the time will have arrived when drill in a military sense would be necessary and beneficial for boys. If every boy from fourteen to eighteen years of age were compelled to join some organisation such as the Church Lads' Brigade, the elements of military drill acquired by him during school life, and the previous physical training received, would stand him in good stead, and the most irksome and distasteful part of military drill, viz., the elements already learnt, would be dispensed with. Consequently, he could at once, or with but little preliminary preparation, take his place in a company, and proceed with the more interesting part of the training, viz., the manipulation of the rifle. He would now have something fresh to learn, whereby his interest would be aroused, and, the reasons for the additional work being explained, a keen desire would be created in him to attain proficiency. On the other hand, if military drill had been incorporated in the school curriculum, the amount undergone day after day would destroy any interest in joining a Church Lads' Brigade unless some special inducements were offered him. The training he would now receive could be augmented by vigorous and systematic physical exercises on the lines of those practised by the young soldier, and, wherever practicable, gymnastics on apparatus might with advantage be added.

In evening continuation schools, wherever facilities exist, military drill could be made a most attractive feature, for the pupils attending such schools would be of such an age as to understand the object, and appreciate the value of a training of this description.

Military training as above suggested could be made most attractive in many ways, and could be carried out in such a manner that no one could look upon it as a mild form of conscription.

It is the bounden duty of every youth of this country to make himself thoroughly efficient, should the necessity arise, to take up arms in defence of home and empire.

3935. *By Mr Fergusson.*—The system you are speaking about is what is called 'Chesterton's System,' is it not?—Yes, sir.

3936. In the London School Board there is another system taught for girls?—Well, there is a system, sir, that was originated something like fourteen or fifteen years ago and was based on the Swedish system of drill, but since then it has been modified year after year, until it is very nearly identical with mine at the present time, that is, they use dumb-bells, clubs, and wands in the teaching of these exercises to children.

3937. Do you mean in all the essential points what is known as the Swedish system is the same as yours?—No, sir, not at all. The Swedish system is not the same as mine. The Swedish system denies the use of dumb-bells, clubs, or wands, and their exercises are compiled in a different way altogether. They are compiled more from a curative point of view than from a physical point of view—that is, they have been compiled from remedial gymnastic exercises.

3938. Do you not approve of the Swedish system?—Not altogether. A great number of the exercises taught in the Swedish system you will find in my system of drill, but I endeavour, as much as I possibly can, to make the work interesting by varying it, so that it may be used with dumb-bells or wands. As I said just now, the Swedish system denies the use of such apparatus altogether.

3939. Is that the main difference, then?—That is the main difference; and again, they have tables of exercises which are used day after day and week after week, with each class of children, and there is no variation at all, whereas with my system of exercises I teach the instructors the whole system and allow them to use their own discretion in imparting these exercises, where-

as with the Swedish system table of exercises, if they have a school without a hall, a corridor, for that school there will be exactly the same syllabus as for a better class school with every facility for drill. Of course that is irrational.

3940. We are sometimes pressed with the difficulty there is in elementary schools of finding time for all these physical exercises. Now, from what you have just read, may I say that you consider physical training of such importance that it should come first?—No, sir.

3941. And after that book-learning?—No, sir; I have often been accused of that very same thing. I have never anywhere, either by word of mouth or in anything I have written on physical training, said that physical education should be the first consideration. I consider it should be one of the most essential points in a school, undoubtedly one of the most important points, but I do not claim it should be of the first consideration.

3942. But it should be equal?—I consider more time should be devoted to that than at the present time.

3943. But if there is no time; if you have got to throw over something, some people say, 'Throw over physical exercise'?—Well, I do not think that would be right; I think that is one of the most essential points, as I said just now.

3944. You would prefer to give them all equal time?—If I could possibly arrange it; of course it cannot be done. As I said just now in my paper, with such a vast curriculum of work that they have in the schools—from twenty to twenty-three subjects they have in the higher grade schools under the Board—it stands to reason that physical training cannot have so much time devoted to it. They have sixty minutes a week, divided into three periods of twenty minutes each.

3945. Is that sixty minutes a week sufficient?—No, it is not. If I had my way I would not allow any school to have less than twenty minutes each session, morning and afternoon.

3946. That is forty minutes a day?—I know it cannot be done; that does not alter the facts of the case from a physical training point of view. In London, or crowded towns, where they get no exercise, except simply running about the street—nothing more than that—I consider if physical training were done thoroughly these children would derive a deal of benefit from systematic physical exercises, and I consider they should have as much as possible of it.

3947. Let me ask one other point. In several places throughout the paper you have read you refer to military drill and physical exercise. You say 'military drill is one part, physical exercise is another, games 'a third.' Then further on you say: 'military drill 'is indispensable,' and then again you say your system 'is compiled solely for the use of children'; and then you say 'that it is erroneous to suppose that the 'system is a military one.' Well, why do you call it 'military drill' if it is compiled only for children and it is not a military system?—I hardly follow.

3948. Well, what do you mean by military drill?—Yes, that is often confusing. The term 'military drill' is often confused with regard to physical training. Military drill consists, that is, the word 'drill' consists, of formations, turnings, marching, etc., so as to enable men to arrive at one position from another in a methodical way and in the least space of time. That is military drill; that is what military drill is taught to men for; it is simply the marshalling of a number of men and to enable them to move from point to point in a methodical way in a given time.

3949. That is drill?—That is drill. Now the physical exercise I am speaking of is simply exercise for the physique. Military drill is not taught to a recruit to improve his physique at all.

3950. I quite understand that, but when this is a form of drill that is specially constructed for children, why not call it 'drill' or school drill; why do you insist on calling it 'military drill'?—I do not call it 'military drill'; I say the drill itself, that is the

preliminary part of the drill, the formations are essential undoubtedly, and that should be taught strictly on military lines, but the physical exercises themselves are distinct from the drill.

'Militarism':
objections.

3953. Quite so; I quite understand that, but did you ever meet with any objections raised to teaching boys 'military drill,' on the ground that you were trying to make them soldiers?—Oh, yes, sir, I have had a lot of that. I have had a very painful experience of that on the London Board. My first instructions on coming to the London Board were these: I was told distinctly I was on no account to teach military drill, pure and simple, as laid down in the 'military red-book.'

3954. If these were your instructions, why do you insist on calling it 'military drill'?

3955. Why not say 'drill'?—Well, we will call it drill, if you like. It is based on military lines.

3956. Do you think it would get rid of any of these objections?—I beg your pardon. I see now what you mean. In my book I do not call it 'military drill'; I call it 'drill and physical exercises,' but the drill that I teach is solely military drill, but I leave out the word 'military.' It is advisable in many instances to do so. I may tell you distinctly that the drill I teach is purely and simply military drill, and the physical exercises that I am teaching now are my own composition. I was assisted by three men in doing it. That work is simply taught on military lines—purely and simply military lines; the essential drill is pure and simple English military drill.

Music.

3957. Do you approve of music?—I do, after the children have learned the exercises in a thorough manner, not before. In many cases you will see children placed in front of a teacher, and exercises performed at once by the aid of music. Someone will play a piano, and these children will place themselves in different positions in certain rhythm according to that music, which I do not approve of. I say, teach the children by all means to do the exercises in a thorough manner. First, see that each of the exercises is performed as accurately as you possibly can, and then afterwards, to vary the monotony, introduce the music, but only occasionally.

3958. You will not get the same smartness?—You will not get the same precision and smartness when music is introduced, but then again you can ensure a certain amount of benefit being derived from the music by introducing dumb-bells with these exercises; then they have a certain amount of weight which they must carry.

Time:
frequency, not
duration.

3959. I see in the second paragraph dealing with the benefits you say, 'Whenever a few minutes are devoted to physical exercises during the middle of a session, not only does the brain become rested but the circulation of the blood is increased,' etc. Have not the London School Board changed their system lately? Instead of giving a few minutes at short intervals they only have one twenty minutes' course, do they not?—They have three lessons a week of twenty minutes' duration.

3960. Do you prefer that to having five minutes or so more frequently?—That would be according to circumstances. If you take a school, say, three storeys high with a hall on the top, we will say, a teacher can bring his children out in that hall, and he could do, say, if he occupied the hall for ten minutes from the time he left the classroom until he got back, five minutes' systematic physical exercise in that time in the hall; but suppose he had to take these children down from the third storey high to the schoolyard, that alters the case again.

3961. That was explained to us, but I am putting it as a matter for the good of the child?—I say frequency and not duration should be the keynote of the whole matter.

Clothing:
boots.

3962. You say that using ordinary clothing is one of the advantages of your system; have you ever had any trouble with the children's boots for doing the tip-toe exercises and such like?—Not at all, not any trouble.

3963. You do not find that?—No; I have never seen any trouble at all.

3964. You have tip-toe exercises?—Raising the heel, rising on the fore part of the foot.

3965. But you do not find that the ordinary child's boot prevents it getting the full benefit from that exercise?—Well, a boy or girl badly shod naturally, of course, would not feel the same benefit, but I do not suppose you would get the same benefit from the work as you would from a child fairly well clad. Then, again, a child with bad boots, if they are poor boots and thin, yet it stands to reason you would get the action of the foot better than a boy with hobnailed boots on.

3966. I understand that, but if they have hobnailed boots on it would not be good, I mean it would be stiff?—Yes, there would be very little foot movement; all the work would be in the calf of the leg, or nearly so.

3967. *By Professor Ogston.*—Would you tell us in a few words, Mr Chesterton, how you came to devote yourself to this subject of physical training?—I was on the army gymnastic staff in Aldershot for a period of eighteen years teaching gymnastics from day to day, every day, and for a period of twelve years my duties were to teach officers' children from four o'clock till half-past five every evening.

3968. You were a soldier?—I was on the gymnastic staff in Aldershot. I was chief instructor. I left there and came under the London School Board.

3969. That was your original occupation, a soldier?—No; I joined the service when I was seventeen years of age.

3970. And you compiled this system under very careful advice, I suppose?—Under very careful advice indeed, and it took me something like five years to get all the data together with regard to it.

3971. You devoted a good deal of time to studying the subject?—My whole time was devoted to the subject; all my duties in the service consisted of nothing else but gymnastics. I had no other duty to perform.

3972. And you thought a great deal about it?—Most decidedly.

3973. You thought over the subject?—Yes.

3974. And read?—Yes.

3975. And visited other places?—Yes.

3976. So that you knew the respective merits of most of the systems before you compiled your own?—Quite so; both at home and abroad.

3977. What medical men assisted you in compiling your information?—Dr Reynolds, V.C., and Surgeon-Major Dean.

3978. You had three medical men?—Dr Reynolds, I say, was the first one, and Dr Roberts, who wrote the standard work on Anthropometry; perhaps you have seen the work, it is the standard work on the measurements, he assisted me, and Dr Savill; 70 Upper Berkeley Street, in London.

3979. They implanted into your system what you consider proper medical principles?—Yes.

3980. You claim that as one great merit?—I claim that, and it is based more on anatomical lines than on physiological lines. That is, the purpose to introduce exercise as nearly as possible to represent play for children more than actual physiological exercises.

3981. The principles on which you go in training children with physical exercise, could you in a brief sentence say what they are, or what it is; what do you aim at?—I aim as much as possible to develop the children in the limited time that we have had at our disposal; in that sense we have not had long, of course. Well, we aim at giving them exercises for all parts of the body, so as to ensure that every child gets a certain amount of work. We do not aim at that alone; the exercises are compiled to suit the peculiar classes, as it were, to suit the requirements of a large class irrespective of age or physique.

3982. Up to what point do you strive to educate them; what do you take as the goal of your education; do you understand me?—I do not quite follow you there.

3983. Well, if you went on with physical education indefinitely, you could make a man an acrobat or an athlete, or develop him in regard to some particular exercise; it is not your object to do that?—Certainly not.

3984. Then where do you stop; what do you aim at?—I aim at building them up as much as we possibly can, to bring them up as useful citizens, and as healthy fathers and mothers of a future generation. That is my view, not to bring them up as athletes.

3985. To bring the body into perfect physical condition, and then stop?—That is my object as far as we possibly can; remember we lose them at fourteen.

3986. And then stop?—We have to stop then.

3987. But you consider that you should stop when you have got the body brought up to a physical perfection?—I do not say that we could get them at physical perfection at fourteen years of age, it is as far as we can get with them at that age; we cannot go much further with them. Then the evening continuation schools should carry that on and provide private gymnasia.

3988. You have taken into account the medical peculiarities of children who are growing, of course, the tenderness and slenderness of the infants, the change of child into man or woman, and you have adapted your system to all those?—To those requirements and how it has been gradually graded from the youngest child up to the age of fourteen or fifteen years of age, and not beyond that.

3989. And in your system you claim that there are exercises which will suit the tender child, the adolescent boy or girl and the youth who is a little older?—Well, not quite that, no, I aim at working up to the age of fourteen, not to the youth after adolescence at all.

3990. Do you include gymnastics?—No, I do not interfere with the gymnastics at all. When you say gymnastics, do you mean gymnastics on apparatus?

3991. On apparatus?—No.

3992. Could you tell the Commission any precautions that your observation or experience has suggested as needful to be observed in regard to infants or children of puberty?—Precautions in what way?

3993. In case of their injuring themselves?—There is no exercise that I teach that they can possibly injure themselves with.

3994. You claim that your system is incapable of developing a rupture?—Oh! not at all, I do not interfere in any way with medical gymnastics, and the system of drill I am teaching has nothing at all to do with infants. I do not attempt to teach children, until after they have come from the infant school.

3995. Do you consider that anything special is required in regard to girls?—I think not. I have had experience in teaching both male and female teachers, and also in girls' schools, and I think up to the age of fourteen years there is no need for any difference in the system between boys and girls. I should think, of course, afterwards there should be.

3996. In the various systems of physical training that you have seen or studied, do you consider that there are any that are bad?—Well, I would not say bad, exactly bad, but some that I think would be simply a waste of time, and not beneficial.

3997. Could you say any points in which any of them are either bad or wasteful?—The very point that I was asked just now with regard to musical drill. I consider that in many instances, where teachers devote considerable time to musical drill—well, simple exercises of their own composition—there is no continuity in the exercises; there has been no gradual building up of these exercises, you may say. Perhaps the first exercise they will take with regard to children will be a violent one, and the next one will be one of the most simple character, simply because it fits in with their music. In a case like that I do not consider the children would be deriving much benefit from it. Those are all called systems; we have a plethora of systems.

3998. In training a child, both mentally and bodily,

what proportion of time would you give to the two parts—mental training and bodily training?—I should like to see twenty minutes, both morning and afternoon session, devoted to physical exercises.

3999. Forty minutes out of five hours?—Forty minutes out of five hours; yes.

4000. Do you think that medical inspection of children who are being adequately trained physically is a necessity?—Most essential, sir, and I should like to see it in every school. Forty minutes of physical training, supervised by medical men who have made the matter a study, or would make it a study, and would see the results of the work. When I started under the London Board, I particularly wished that to be done. I wished measurements to be taken, and I was forbidden to take measurements, seeing probably children's parents would object and cause a disturbance. I have taken measurements.

4001. Have you seen much of ailments that impede physical training, such as flat feet, knock-knee, curved spine, etc.?—Well, I have seen a number of cases in schools, and in cases like that the children are not allowed to take part in any of the exercises.

4002. What proportion of the children you have at present charge of could you say suffer from any such disability, even to a slight degree?—Well, very, very few; indeed, it is a rare thing to find children in schools who are so physically incapacitated to prevent them taking part in some of the exercises. Of course, if a child is deformed in the foot, we will say, or in the leg, we still give them exercises for the upper limbs; again, if a boy has lost an arm we still let him march the same as the remainder, though he could not take part in the exercises for the arm.

4003. Forgive me asking you to make your answers pretty short; we naturally would understand that. Has your training rendered you capable of detecting a knock-knee or a flat foot, or such deformity, with the eye?—Oh, yes, sir.

4004. Do you consider the effect of the system that you practise upon the child's manners is a good one?—I do.

4005. Can you say anything regarding its effect on their morals?—Well, I cannot say so myself personally, but I hear from the teachers that it has a considerable effect upon the children.

4006. Then would you tell us now shortly what your system is?—I am afraid I could not tell you shortly, sir.

4007. Perhaps I might make it possible for you to do so in this way. We know the system of army drill; we know the system of gymnastics, of exercises with apparatus, and of Swedish drill; do you adopt part of all those?—I do.

4008. You adopt whatever is best out of all those?—I have adopted whatever is best out of all those, and it has all been compiled in a progressive course, working from the head downwards.

4009. A well-considered course; but you say there is nothing special that you claim as your own?—I do not claim any originality as regards the exercises; the compilation of the exercises I claim is original.

4010. It is a selection of the best?—It is a selection of the best, undoubtedly.

4011. What about for infants six to eight?—I have nothing to do with infants at all. The infants under the London Board do simple exercises, something identical to the simple exercises that I teach to the older children—that is, the boys and girls in the ordinary schools.

4012. What age are the children that you have taught?—The youngest ones will be something between seven and eight years of age on coming from the infant schools into the boys' or girls' schools.

4013. How do you begin those young children?—By the simplest movements imaginable. They are formed up in classes out in the yards, they are numbered ones and twos, fours and sixes, rights and lefts, according to the capacity of the child. We teach them how to open a class in a practical way into four lines, so you can see what each class is

doing, and the children can see themselves and can see the teacher. We then take military drill pure and simple—that is, the marching at the intervals and the turnings, the simplest exercises in each group, head movements, simple arm movements, simple body movements, simple leg movements, after which marching is introduced.

4014. Then for older children about twelve to fourteen?—Yes, we base their work on the elements already taught. Any exercise taught in my system, that exercise is useful again directly they go to a higher class; the exercise they have already learned is a help to them, they simply add, as it were.

4015. Briefly?—My system of exercise is compiled the same as the alphabet, a, b, c, and so on, and when you have taught those letters you can put the a and b together, and the b and c together, and the c and d, and so on. After that you can put three letters together, afterwards four letters, and so on. It is built up in that manner.

4016. *By the Chairman.*—Strictly progressive?—It is as briefly as I can give it you. It would take an hour to show you what my work is like; you understand that.

4017. *By Professor Ogston.*—Do you, with the children of fourteen, add to what you have already taught the younger children, exercises with the bars?—Decidedly. These exercises, as I said just now, are gradually built up until the older scholars can do the whole of the work. The teacher has a free hand. If he says, 'My class is slack; it has got a little bit 'slow in the elementary movements,' he can go back over the most elementary part, and then add that again to the heavier part of the work as you may say; the advanced part of the work, with the elder boys and also the girls can be augmented without any alteration whatever by the use of dumb-bells, or wands, or staves some people call them.

4018. And when do gymnastics come into your system?—We do not introduce gymnastics at all. There are no gymnastics done whatever in the schools. I got the Board to agree with my suggestion that half a dozen schools should have a horizontal bar and a set of parallels, which I designed myself to fix up in the halls. The children could fix them up themselves. They were of very simple construction, and since then the Board of Education has said they do not consider gymnastics suitable for children under fourteen years of age, and the Board has stopped that.

4019. Do you include defence—the use of the rifle, boxing, fencing?—Nothing of that kind.

4020. Do you include swimming?—Yes; we have made a very strong point of swimming.

4021. Tell me where swimming comes in?—We do that with the elder children; it is called part of the physical exercise time. With sixty minutes a week, a teacher takes his class at 11 o'clock to go to the baths and he does not come back till 12; although these boys have only been twenty minutes in the bath it is called sixty minutes' physical exercise, and unfortunately they get no more.

4022. Do you teach swimming; any particular system or any particular exercise?—I teach swimming as laid down in my manual. The swimming is taught first of all on land. The boys and girls are exercised and taught on land in squads, then taken to the baths; the same exercises taught on the side of the baths, and put into practice in the water. These exercises you will see enumerated in my book.

4023. What are the tables of exercises to which you refer? You say in your evidence tables of exercises are entirely absent?—That is what I was speaking of just now, in answer to one of the gentlemen who asked me about tables. I was asked with regard to Swedish drill, in which they have tables of exercises supposed to be suitable for each class in a school. I do not agree with that idea at all, because I know no table can be suitable for any two classes of schools.

4024. What do you refer to in speaking of a table of progression in your own system, which is given, beyond which teachers should not proceed with their

pupils?—At the end of my manual you will find a table setting forth Standard I. a certain amount of work; Standard II. a certain amount, plus what was done in Standard I.; Standard III., a certain amount of work, plus what was done in Standard II., and so on. That is the table of progression, beyond which the teacher must not go with his class.

4025. *By Mr Shaw Stewart.*—You have told us that you have had some experience of objections to the spirit of militarism?—Yes, sir.

4026. Well, you can easily understand that this Commission cannot ignore that objection to the spirit of militarism. We shall have to consider that, of course. I see here you give your opinion that on leaving school the time will have arrived when drill, in the military sense, will be necessary and beneficial for boys?—Undoubtedly.

4027. There you very clearly lay down where you think military drill might usefully come in, after boys have left school?—Yes, sir.

4028. Now do you think that objection to the idea of militarism would be lessened if, in any recommendation we made as to drill in schools, we called it school drill instead of military drill?—My experience—I must explain at a little length; I cannot help it.

4029. I only want your opinion on that one definition, school drill, as a way out of the difficulty?—My opinion is this: first of all, I tell you I am heartily in love with military drill. I consider that every boy of this country should be compelled to learn military drill, that is, after fourteen years of age. It is no use before that age; but if you wish to introduce a system of physical exercises, my experience with the public in London, and also with our Board members, is this, that you may teach as much drill as you like, provided you do not call it military drill, but if you make use of the word 'military' you are stopped at once. Now, in the drill I am teaching now, I have, as I said just now, as much military drill as is given to a recruit before he gets a rifle put into his hands, and I think that is quite enough for any boy to learn, and I am positive, if I were to introduce anything under the Board, I mean twice as much again, if I did not use the word 'military,' there is not a person would say no to me; but directly I make use of the word 'military,' I am blocked at once. That is my experience.

4030. May I suggest that you should use the word 'school' drill?—It is called drill and physical exercises.

4031. You do not approve of music accompanying physical exercises?—Not in their elementary stage, not until they have become advanced exercises for the elder pupils, not with the younger ones, except for little children for their marching; undoubtedly it aids them considerably and entertains them.

4032. On the point only of physical exercise music is introduced to accompany them to avoid monotony?—Quite right, after the exercises have become familiar.

4033. Do you claim that the variety that you introduce into your exercises does away with the monotony and is a sufficient substitute for music?—It is for the lower classes but not for the older ones. When we have got to a certain extent of work you see they have to do a lot of exercises, judging their time with the elementary work, which is all done by the teachers' word of command; and by the repetition of words of command when the children become familiar with these exercises; then you repeat them time after time, and the more they are repeated the more benefit they derive from these exercises. It is there the music comes in, as it saves the teachers' voices and it is more entertaining for the children.

4034. And these exercises you prefer to take without music?—The elementary work, the actual foundation from whence the exercises are derived, the simpler movements. It is the combination of exercises where you introduce the music.

4035. One question on the subject of boots. You say that you have not found it advisable to remove boots for the feet exercises; you have not found that the boots get in the way of tiptoe exercises?—No, not at all.

Mr T.
Chesterton.

Continuation
Classes.

4036. I suppose the boots that you would see on children in a London school are very much lighter and thinner than the boots that you would generally find in a Scotch school?—I should think so; I saw them in Glasgow myself some time ago; I noticed the very same thing that you are speaking of.

4037. Would you not say that the thick boots that you saw in Glasgow interfere with tiptoe exercise?—I should think not, sir. I do not think they would be quite so beneficial as they would be with a lighter boot on, but I do not think you could go beyond that with it.

4038. You do not lay great stress on that?—Not at all.

4039. Yet we have had skilled witnesses who say it is very essential that boots should be removed?—I do not think that; you have no time to do it. If I had to compile a system of physical exercises where they could be suitably dressed in gymnastic costume, I should work on different lines.

4040. *By Sir Thomas Coats.*—With regard to physical drill, do you consider it essential to the health of the children in your London Board Schools that they get a certain amount of physical drill?—Decidedly. From their cramped position in classrooms it is relaxation for them—both for them and the teacher.

4041. You consider it absolutely necessary that they should get physical drill?—I do.

4042. Then you would insist on getting an adequate amount of time on the time-table for physical drill?—Undoubtedly.

4043. There is one point I did not quite understand in your statement: 'The system admits that the constitution of a growing child requires all its nutrition for natural development, therefore muscular development is not the chief aim in view, though this is undoubtedly the result of regular and systematic physical exercise.' Do you come across a number of underfed children in the London Board Schools?—A great number.

4044. Are they so far underfed as to interfere with the beneficial carrying out of physical drill?—Well, not quite, but in the case of those children we do not give them as much exercise as we would to a class of children who are well fed and well clothed. That is in the schools that you are speaking of. Now, where they are not well fed and well clothed, we do not give them such violent exercises as they would get in a better class of school.

4045. Then are these children we talk of confined to special schools or special districts?—It is generally the case.

4046. You do not find them mixed through in all schools?—You will find in better-class schools one or two children badly clothed and badly fed, but as a rule the poorer children are grouped together.

4047. Are any steps taken to see that these children who are apparently underfed get better feeding or are provided for?—Oh, yes; we have meal funds in connection with the Board with regard to the underfed children. That is all done specially by a special sub-committee of the Board, and the children are fed during the winter.

4048. But are they fed by the Board; do the Board provide money for feeding them?—No; it is got from outside.

4049. Then you talk of children after having left school; where you would give them physical drill or physical training only, getting instruction in military drill so that they might fit themselves for taking an active part in the defence of their country; how could you get these boys to attend these classes?—By making them entertaining in the shape of gymnastics. I should like to have the time to explain it to you; I think I could, too.

4050. You think that would be sufficiently attractive to get a large proportion?—I am positive it would, sir; positive, if some one were allowed a free hand to do it.

4051. Then, of course, you would give systematic gymnastic training?—Decidedly, to make it entertain-

ing, and then you could do your military drill without any obstacle whatever, and the children would come, and gladly come.

4052. Would you suggest that this should be carried on with other evening classes, or would you have special classes for gymnastics only. We have had witnesses here who suggested that in the continuation evening classes, where other subjects are taught, physical drill or physical training should be included in the teaching given?—Certainly it should.

4053. Would you suggest that these gymnastic classes which you approve of should be separate classes altogether, especially for gymnastics, or would you have them added on to a course of evening classes?—I see what you mean. I would make them special classes, and under conditions that if they came for an hour, half of that time should be devoted to gymnastics and the other half to physical training. On no consideration should a child come for half of that; if he comes for gymnastics he should have his physical training on military lines as well as his gymnastics.

4054. You scarcely see my point, which is whether you would approve of a bond between the mind and the body?—Decidedly, you mean to go to the evening schools for educational purposes as well as gymnastics.

4055. Exactly?—Decidedly.

4056. In the Board Schools do you find room within the schools themselves for giving your system of drill?—Ample in every school, either indoors or out. Of course in some schools we have no halls, therefore it has to be done in the open air when the weather is favourable, and in all the school yards with the sheds it can be given in those sheds in inclement weather, but we forbid the work being done in the classrooms.

4057. So you have no difficulty in the schools under the London School Board in getting sufficient room?—No difficulty; each teacher takes his work all the way through.

4058. *By the Chairman.*—What was your regiment when you enlisted?—In the second battalion the 14th Regiment. I was there only eighteen months. From there I went on to the gymnastic staff.

4059. Were you a non-commissioned officer?—A sergeant; I was a sergeant at the end of the eighteen months.

4060. What year would that be?—In 1870; I joined the service in 1868.

4061. And in eighteen months you were a sergeant?—Yes.

4062. When were you transferred to the gymnasium at Aldershot?—In 1870.

4063. As a lance-sergeant?—As a full sergeant.

4064. What was the reason of your being sent there; I mean was it on account of being known to be proficient?—You ask me the question; I must give it to you, my lord; decidedly. I was sent, the same as every young soldier, to go through a course in Chatham at the gymnasium, and I proved myself very adept in gymnastics.

4065. Then they called for an instructor from Aldershot, and therefore you were sent?—General Hammersley came to make his visit of the place, and selected me to go to Aldershot.

4066. I rather wanted to see why it was you were such a short while at your regiment, and such a very long time at Aldershot; it is not usual?—It is a very exceptional case.

4067. It is very complimentary to you?—It is a very exceptional case.

4068. Then during the eighteen months, I suppose you did a certain amount of drill as it was done then?—Yes.

4069. In your manual—I have just glanced through it—I see that you stick pretty closely to the squad drill and early drill instruction as laid down in the drill book?—Yes, my lord.

4070. Are you put out, like so many of us have been, by the changes in drill, that is to say, when a new manual of drill comes out, which is not infrequent, I am sorry to say, does it compel you to alter your

Mr T.
Chesteron.
15 May '02.

system?—No, it does not interfere with my work; it is very simple.

4071. You know at the present moment there is a scheme of drill which is so revolutionary, if I may call it, as to actually alter the turnings?—Quite right. I introduced these turnings in my book long before the service would adopt it. I suggested this five years before I left the service. They are in my book, that is thirteen years old; that is my suggestion. That is the book that is adopted for the army schools which is an abridgment of my work. This is the manual I go by; in that you will find the swimming drill as well as the other work. That is the military book, which is an abridgment of mine. (*Books handed in.*)

4072. I open this casually and I see standing at ease, you know that is going to be changed?—Yes, this also was my suggestion.

4073. But not here?—You will see it there, and illustrated.

4074. Slightly forward six inches?—I know it is, but if you will lend me the book I will show you the new. The last paragraph there, my lord (*indicating*).

4075. Yes?—So that, therefore, I am before the service, my lord; those were all my suggestions.

4076. You seem to have had some admirers?—I am pleased to say I have.

4077. Who flatter you by imitating you. Now, one question, what is your opinion about muscle being formed in children?—I do not look for muscular development at all; I get muscular development undoubtedly, but I do not aim at that alone.

4078. But is it developed; I want to know when you think it is developed in children, that is to say, children under the age of fourteen?—Under the age of fourteen there is a gradual development in the children, and I can give you statistics to prove that in regard to measurements I have taken.

4079. In the schools that you are responsible for, are your children taught by educational classes or by their individual sizes?—By their educational classes.

4080. That is to say, some are tall, some are short, and so on?—Decidedly.

4081. That, of course, is for general convenience that they come in their ordinary educational classes?—Decidedly.

4082. Though if you were to take the whole lot as a lot of boys, you would probably pick your big ones aside?—Of course I would, but you cannot do that in the time.

4083. I think you have answered Mr Shaw Stewart, that in certain exercises you approved of music?—Yes.

4084. Do you approve of singing?—No, not with the exercises.

4085. I notice you have got words to your songs in your book?—I introduce the singing in this way; the second and fourth lines of children will sing; the first and third lines will do the exercise, the second and fourth lines will sing for them and then they will reverse it, or I have a special class of children, half a dozen or so, who will sing for the remainder.

4086. Do you approve of singing in itself as a physical exercise?—Decidedly; and I allow the children in the exercise to shout, count the numbers audibly; by doing so they do not hold their breath. It is an unconscious respiratory movement; they count the numbers audibly; it is rhythm; it is music in itself, and saves the teacher's voice.

4087. *By Mr Alston.*—The ground has been so well covered that there seems only one point left. Without saying a word about the merits of your book, we gather that you would approve of a uniform system of instruction?—Undoubtedly.

4088. In all schools?—Decidedly.

4089. And that such a system could be built up medically and professionally?—Decidedly.

4090. Would you allow the teachers to exercise any discretion as to varying the system, or would you prefer that it should be carried on as you call it from a, b, onwards?—Yes, it must be so, otherwise you would never get uniformity in the schools, and where

a teacher handed over his class to the other, that teacher could not go on with the work.

4091. It is a building up system?—It must be to have uniformity in schools.

4092. And you would advocate that uniformity?—Undoubtedly, that is the first consideration.

4093. Apart from your own book, a uniform system must be adopted?—It must be, and a progressive course as well.

4094. There are two different systems and methods of instructing boys and girls in London?—There are two different systems.

4095. Then there are really two systems in London, one for instructing boys and one for instructing girls in physical training?—Yes.

4096. Do you approve of there being two?—No.

4097. You think one would be better for both sexes?—I think one would be far better.

4098. That there is nothing that a girl requires in physical exercise different from a boy?—Not till after fourteen years of age.

4099. The other point is the emphasis you laid on military drill, which has been brought out by several questions, particularly by Mr Fergusson. I fancy you have been biased in favour of military drill from having been in the army, and having been so long an instructor at Aldershot?—No; not that alone. I have often been accused of the contrary, because I do not have so much military drill as some people wish to go in for. I do not hold with a schoolboy having a wooden gun, for instance, and I do not hold with company drill for them, because it is simply useless. A child sees no value in it, and he gets no physical benefit from it.

4100. That is for the senior boy of school age?—Yes.

4101. You defy public opinion when you have done with him in the school?—Catch him then, by all means, and give him some military drill.

4102. In fact you would compel him to join the Church Lads' Brigade, or some other organisation?—I would, sir, if I had my will.

4103. That is military drill?—And teach him to handle a rifle; a good moral training as well as a physical one.

4104. *By Mr Fergusson.*—There was one expression you used, if I took it down right, in speaking of gymnastics in evening schools, I want to ask you about. You very strongly advocated gymnastics, and you added if one was allowed a free hand. What do you mean by that?—When you were speaking of putting gymnastics and military drill together in the evening schools; I think that was it.

4105. You said, if some one were allowed a free hand?—I say if the man who organised the work were allowed to do it, that is to introduce the military drill with the gymnastics, he could make a success of it, but I say there is so much opposition to it, that is what I am speaking of.

4106. From whom?—From people in authority.

4107. What do you consider is a satisfactory class for teaching; what number of children?—I would not exceed 40.

4108. You teach them in the open shed outside. What space is large enough for teaching 40 children under your system?—Well, I should say 40 children could be easily drilled in a room say half as large again as this. There would be ample room then both for their marching and for their physical exercise; 40 children could be accommodated in this room at physical exercises.

4109. A room half as large again as this one would be ample?—A room half as large again as this would be ample for physical exercises, and marching as well. That is, you would put them in file and march them round each angle of the room. You are speaking in respect of space.

4110. What shall we call the size of this room—25 by 18?—You could put 40 children in this room and do physical exercises. I do not say the advanced exercises, but you could actually do a course of physical exercises in this room.

4111. *By Professor Ogston.*—You have noted measurements of the physical condition of children?—I have.

4112. Of various ages?—Yes.

4113. And for a considerable period in the same child?—No, we have not had the opportunity.

4114. Measurements of boys?—Boys only.

4115. Do your measurements permit of your comparing the condition of one child at one age with the same child at another age?—Yes.

4116. So that from them you could show improvement?—Yes.

4117. Would they be such that we could compare them with the standard of London children?—These will be London children that I am speaking of.

4118. Any other children besides London children?—Yes.

4119. Country children?—Yes.

4120. What measurements did you take?—Height, muscle, chest measurement—height and chest measurements only in the case of the ordinary day school children; but on board the training ship *Shaftesbury* at Gray's we have measured the boys all over. I can show you the improvements there, but in our elementary schools I have taken nothing but height and chest measurement.

4121. But in the others you have height, weight, chest girth, and perhaps muscle girth?—Forearm, upper arm, biceps, calf, thigh, and so on.

4122. Any head measurements at all?—No.

4123. Could you supply us with those?—Yes.

4124. Could you supply us with them very fully. We have a great want of statistics on the point, therefore what I mean is could you give us them pretty fully?—Well, I can give you measurements that have been taken with our boys on board the *Shaftesbury*. I can give you the results of measurements taken at a Union School near Aldershot, where my system of physical exercises has been threshed out, and I can give you the measurements of children in the London board schools, and the development that has been obtained through different years. It would be very brief. I have not got their length measurements, but if you will glance over that it will give you some idea of what I mean. These are measurements as they were taken, that is the second measurement; one paper compares with the other one. (*Figures put in.*)

4125. Those are all you have?—No. I brought those in case the question were asked me to-day.

4126. They are typical of what you have?—Yes. I have more at home. These are simply what I have run out to-day roughly, and if you glance through that it will give you a good idea.

4127. Those are not reduced to averages, I see; they are individuals?—That set corresponds with the one the Chairman has; one is before the course, the other is after.

4128. Can you spare these?—I do not think you will be able to wade through them. If you would like the whole of those statistics, I will work them out for you with pleasure.

4129. You said that both had been taken—the measurements—by you?—Yes, sir.

4130. Was there any rational objection that you ever heard?—Well, the only objection was I was told by the Chairman of my Committee, when I first started, that I must not take any measurements, as probably the children's parents would object to it, therefore I was on no account to do it, unless I had his permission. I never got his permission to do it.

4131. Do you suppose the children's parents would

object to it?—As a parent, I should like my children measured, to see what progress they did make.

4132. Can you conceive any objection to it?—I do not see why there should be any objection.

4133. *By Mr Fergusson.*—Do you make allowances for the boy being older and his natural growth?—I show there the height, weight and chest measurement he should be at a certain age, and then I give you what he has arrived at after physical training, and then what he should be according to the same rule. In the first place, I give both those. I make allowance for the time.

4134. *By Sir Henry Craik.*—I observe that over a course of years there has been an increase in the average height?—There is, sir, a very marked increase.

4135. Not quite uniform; it is average?—No; if you take the last three years, there has been a vast increase compared with the first three years.

4136. In this first table you have the ages of children from eight to fourteen, average children, I presume?—Average children.

4137. In the second table they are specially-selected football and cricket champion teams?—Yes, from one district in London I took those.

4138. Then the increase in the number of average children is much more marked, is it not, than the increase in the number of those selected?—Quite right, sir.

4139. If that is true, then, it would show that the physical exercises were working up the poorer specimens?—Quite right; in the aggregate they get the better results from it.

4140. *By the Chairman.*—That is rather what we would like to get from you generally, if it is always a favourable increase?—I can give you the whole of those statistics. I can send them on to you with pleasure.

4141. But I mean would you say, as a rule, that the statistics prove that there is always an increased measurement as the result of physical exercises?—Yes, my lord.

4142. And never a contrary result?—No, my lord.

4143. *By Sir Henry Craik.*—You quote Dr Roberts as showing that the average height of the boys in public schools is above the height of ordinary children by a certain amount.—Yes.

4144. You, of course, are dealing rather with a class of children not so well developed?—The general public, we will say.

4145. Not so well developed physically?—No.

4146. Comparing the results of your measurements, did you find that the improvement was more marked in the training ships like the *Shaftesbury* or in the ordinary schools?—On the training ship, because they get considerably more physical training.

4147. And better feeding, perhaps?—Better feeding, and more regular feeding.

4148. So that your statistics have rather shown that that regular feeding and regular work did develop the boys more quickly than the less physical work and the worse feeding?—Quite right, sir.

4149. *By the Chairman.*—Are these statistics as you would like them handed in?—I would rather make them more readable if you would allow me to submit them to you.

4150. We should be very grateful to you if you would?—I shall make them more readable. I put them on a paper to read to you in case I was asked.

4151. It is very important to know the date when those were taken?—I have the dates. I will put them more fully for you, and send them on with pleasure.

4152. If you can do that we shall be very much obliged to you?—I shall hand in the whole data.*

The witness withdrew.

Mr JAMES MALLOCH, examined.

4153. *By the Chairman.*—You are the headmaster of Blackness School, Dundee, and Lecturer on Education, University College, Dundee?—Yes, my lord.

4154. You have your notes; will you please go through them?—I have treated the question:

I. *Generally.*—There is no systematic organisation or

scheme of instruction in physical training connected with the Dundee schools. During the past fifteen years, however, endeavours have been made to promote various forms of physical education. This has been due

Mr J.
Malloch.
Physical training in Dundee: no system.

* See Vol. I. Appendix II.

Mr J.
Malloch.

15 May '02.

more to the individual initiative of several of the headmasters than the result of specific injunctions of the School Board. The work done has consisted of spasmodic attempts to foster the interest in school life and to relieve and brighten the tedium of the ordinary work by easy drill exercises. But these have not been deliberately adopted with a view to any practical application to the requirements of life. The School Board has readily and generously provided simple apparatus whenever asked, so that there is now a fairly general plan in operation of teaching those easy exercises to the younger pupils. This has become somewhat more thorough, and certainly more extensive, since the Code required that provision be made for 'adequate physical exercise according to an approved scheme,' Art. 19, A. 1, 4 (a).

Difficulties.

These schemes, presented to His Majesty's Inspector for the district, are entirely individual, without any relation to those of other schools, and are limited by reason of—:

1st. The qualifications of the existing school staff.

2nd. The nature of the school buildings to accommodate the work.

3rd. The fact that there has been no recognised scheme of training or any standard by which this instruction might be judged.

Blackness
School :
scheme.

II. *Particularly.*—In Blackness School (accommodation 1242 pupils) each child receives one hour's specific instruction per week in this subject.

Infant division, three periods of twenty minutes.

Junior " two " thirty "

Senior " " " " "

The detailed scheme is in the hands of Sir Thomas Thornton, LL.D., Clerk to the Board. I think that generally this is the amount of time devoted to this form of instruction in most of the board schools of Dundee.

The School Board—

A. Has been content with satisfying itself that the necessary 'adequate provision' demanded by the Code appears in the school scheme of work and in the timetable.

B. Has provided all the apparatus desired by the headmaster to carry out his approved scheme.

C. Has recommended all its teachers who have no apparent qualifications to teach this subject to attend either Saturday or evening classes in the Dundee Public Gymnasium.

D. Has given no instructions to its teachers as to the ends to be aimed at or the methods to be employed.

Instruction :
popular.

On the whole, the work done in Dundee, considered as preparatory work, has been undoubtedly successful. As a branch of instruction it is popular with both teacher and pupil. It has aroused an earnest desire for more systematic training on a thoroughly organised plan. It is also held universally amongst the teachers that we have advanced beyond the days when such instruction can be given only as an interesting interlude in the school curriculum, or for any purposes other than the physical, moral, and intellectual development of the pupils. In my experience physical training has proved beneficial—

Physical
training:
beneficial:
reasons.

1. In the formation of habits of order, precision, and punctuality.

2. In proving how easily and simply 'school discipline' is maintained amongst children who are regularly accustomed to engage in carefully-devised and interesting physical exercises.

3. Because of its undoubted moral effect in promoting self-control and true obedience.

4. As a relief to purely intellectual work in school, and a recognition of the fact that mental training should, as far as possible, correspond with physical development.

Suggestions.

I would suggest—

1. That during school life (5 to 14 years of age) any scheme to be devised might advisedly be drawn on the following lines:—

(a) *Infant School* (5 to 7 years of age).—Exercises in simple limb movements arising out of kindergarten play. These exercises should be assisted by every possible device of pretty and attractive apparatus.

(b) *Junior School* (7 to 10 years of age).—A beginning be made in mass exercises—simple company drill, various forms of marching, and exercises designed to develop the muscles of the arms, the legs, and the trunk.

(c) *Senior School* (10 to 14 years of age).—Complete course of company drill, all forms of marching exercises (the work to be done almost wholly in the open air).

2. After school days (14 to 16 or 17 years of age). Two hours per week necessary attendance during a period of twenty weeks on instruction in this subject in 'continuation classes.'

3. That all instruction in physical exercises be given by certificated teachers, teachers who have received adequate training while at college or university, and whose course of professional preparation ensures at least an elementary knowledge of the relations of mind to body, and both to morals.

4155. *By Sir Henry Craik.*—Have you any general supervision over this subject in the other schools or is your knowledge of it only confined to the Blackness School?—My knowledge of it is confined only to my own school.

4156. As lecturer on education in University College, Dundee, have you given any attention to this subject?—I have drawn up a scheme of physical training for the students in that College. It has been approved by the Department. I have the scheme with me.

4157. You make that a part of the curriculum in your course of lectures?—It is a part of the curriculum.

4158. Do the teachers from Dundee attend these lectures?—No, only the students in the College under training.

4159. Then it is only by a casual knowledge that you can give us the information about the Board Schools?—No; not altogether casual.

4160. It does not fall in the way of your strictly professional duties?—No, sir.

4161. Are there any classes for teachers under Article 91 (d) in Dundee?—No, sir; none in Dundee.

4162. At the end of the third paragraph of your notes you say, 'or for any purpose other than the physical, moral, and intellectual development of the pupils.' I do not quite follow that. What other purpose would you conceive besides those?—Well, this subject has been used for other purposes. For instance, I have used it myself for such purposes as public displays to get money for forming a school library, and so on. We have frequently had exhibitions of this in Dundee, attended by parents of the pupils, who have given money to see them. These displays are so popular, and by such means we have raised money.

4163. It stimulated the interest of parents?—Stimulated the interest of parents. Those are the purposes that I refer to.

4164. Blackness School is a free school, I suppose?—Yes.

4165. Is it attended by the poorest children?—No, not the poorest; probably the higher working class and the lower middle class—foremen in mills—their children, and the shopkeepers' children.

4166. And do you think that the physical instruction is rather more developed in Blackness School than in some of the poorer districts?—I know that it is.

4167. To what do you ascribe that?—To my own enthusiasm in the matter I ascribe it. I am very fond of this subject, and I ascribe any success in this direction I have had to practically undertaking this at the very beginning.

4168. Suppose a teacher equally enthusiastic had been in one of those poorer schools, would he have had as good opportunities as you have had?—Undoubtedly.

4169. The premises would have been as good?—Well, he could have utilised any premises in Dundee almost equally as well as I have utilised mine; I think it is possible.

4170. Why is it that in some of those poorer schools there has not happened to be a teacher with

Mr J.
Malloch.

School.

such enthusiasm?—It is a movement which is only spreading.

4171. Possibly there is not the same demand for it amongst the parents?—Quite as much demand, I think, in any part of the city as where I teach.

4172. The need of it is probably greatest in the poorest districts?—Undoubtedly.

4173. And yet you say in your own it is better developed, and I suppose still better developed in the fee-paying schools, like the Morgan Academy and the Harris Academy?—Well, I do not know that they have given the attention to it that I have. I tried it experimentally.

4174. Have you any experience in continuation classes?—None whatever.

4175. But you advocate, I see, two hours per week necessary attendance during a period of twenty weeks for boys from fourteen to sixteen?—Yes; I think that would be a very good thing.

4176. You mean compulsory attendance?—Yes, I do.

4177. And you think public opinion is ready for that?—Quite ready.

4178. You are convinced of the advantage it would be to those boys?—The great advantage.

4179. *By the Chairman.*—The twenty weeks that you recommend, is that immediately after such children reach the age of fourteen?—Yes, my lord, I think so; just to continue it so that there might be no break in the work.

4180. That would leave them in a fitter condition before they had attained the age of fifteen?—This is only a suggestion.

4181. I know, but have you ever considered that a certain amount of physical training should not be given to that boy up to the age of eighteen?—My desire was only to have this work continuous after school days.

4182. You mean it is the first step, as it were?—The first step; in fact, you might call it compulsory volunteering, if you can use such a term.

4183. It would be, as it were, prolonging the compulsory education age to fifteen or sixteen instead of fourteen, where it has got to at present?—Yes; in this subject at least, my lord.

4184. Although you have no acquaintance with continuation classes as regards your teaching, of course, you naturally know a good deal about the subject?—Yes.

4185. And would it be your opinion that in such continuation classes physical training should not be separated from the mental training, or should be separated?—It should never be separated.

4186. In the continuation classes?—In the continuation classes.

4187. But, of course, as to separation, it is a thing that should be done in the same day or in the same week?—Certainly.

4188. Both the physical part of the education and the mental part?—Yes; I look upon the physical training of all children from an educational point of view, purely and simply.

4189. The one helps the other?—The one is coincident with, and cannot exist without, the other.

4190. What I rather mean is, it would be quite possible that the physical part of the education should be given in one place, and the mental part should be given in another?—Oh, yes; quite possible.

4191. That might be so, rather more liberty for education?—Yes.

4192. I think the Commission would like to hear something about the opposition that there is in Dundee to any of these ideas for improving that physical education?—I think the opposition is of no consequence, in my opinion; it is a very small opposition.

4193. Do you think the opposition comes from any particular class, or does it come from parents in general?—Certainly it does not come from parents. I have had fifteen years' experience of this with great numbers of children, and I have never yet had one parent object to his child being drilled as I have drilled him.

4194. *By Sir Thomas Coats.*—You advocate one hour per week being given to physical drill; do you think that one hour can be quite easily taken for that purpose without interfering with the mental training of the children?—Certainly, sir.

4195. And you consider that it is essential?—Absolutely.

4196. That you have an hour—at least an hour?—Yes. I do not think less time would bring about what we wish.

4197. In other words you think that this hour devoted to physical training would quite make up for the loss of the hour?—To my mind it is a gain to every subject in giving this hour; I mean that we are not taking from any subject by giving it to this physical training; we are helping every other subject.

4198. Do you consider that one hour is sufficient, or would you go further?—I should not go further meantime.

4199. *By Mr Shaw Stewart.*—In your scheme of suggestions, I see for boys between ten and fourteen you recommend company drill and all forms of marching exercises, but would you neglect what is called physical exercises?—No, certainly not, sir.

4200. You did not mention them?—I have not mentioned them there, but these are the new things that I would like to introduce in each school, carrying all those physical exercises I have mentioned in a continuous system—from the infant school straight through.

4201. I am glad to get that point clear. Then you would be in favour of certificated teachers taking instruction; would you be in favour of that teaching being subject to periodical revision by experts?—Certainly, sir.

4202. And should these experts report straight to the Department?—Certainly.

4203. *By Mr Fergusson.*—Then you are very much impressed with the value of physical training from an educational point of view?—I am. If you will allow me, I will mention an experiment I made, which will prove how deeply I am impressed with this matter.

When I opened my present school thirteen years ago I had a staff that I did not know anything of, and the first morning I had 600 children, who came from different schools, and who did not know me, and whom I did not know. I resolved that for the first ten days, at least, I should give no instruction except such instruction as might be called physical training. I instructed my teachers to get into relationships with their children by drilling them, by taking them into the playground, by playing with them, by doing anything that they might have a cordial relationship with each other, and I found that it was chiefly through the physical exercises that I brought that about. I would not allow a single book to be bought or a single bit of ordinary school work to be done for those ten days. That was in September 1889. My school was examined in March—the following March—six months, and I received from His Majesty's inspector the highest possible grant in that short time for 1000 children, who had accumulated by that time. I attributed that to this system of getting my pupils and my teachers into close relationship, and that can be done best possibly through physical exercises.

4204. Then hitherto the physical teaching in Dundee has been, you may say, rather haphazard?—It has.

4205. And you wish to have it reduced to a thoroughly organised system?—Yes.

4206. Now you were asked about the feeling which exists in Dundee, the feeling in some quarters against introducing military training into school. You say there is only a small body of people who hold those views?—Very small.

4207. And not among the parents?—I have never met it.

4208. But still it is held among some members of School Boards, who can make their weight felt in that way?—Well, their voices only, sir.

4209. So that it is a factor which has to be reckoned

Mr J. Malloch.
15 May '02.
Physical drill: time.

Physical exercises: continuous.

Teachers: supervision by experts.

Physical training: of great value.

Mr J. Malloch. 15 May '02. with?—I should not reckon with it, sir; I do not think it is worthy of being reckoned with.

4210. But do you not think, if you can carry everybody along with you in arranging a system of physical training, it would be much better to do so?—Undoubtedly.

Physical training: order of importance. 4211. Members of School Boards, I suppose, are of some weight. Well, now, do you find any difficulty as regards the time required for teaching physical training. We are told that the curriculum is overloaded, and that there is a great difficulty in finding time?—I find no difficulty; I should give more time to it and it would repay me.

4212. You do not think it would interfere with the other work?—Not at all, sir.

4213. That is your experience—your practical experience?—My experience of fifteen years.

4214. You put physical training as the most important?—I do, sir.

4215. Book-learning second?—I do.

Compulsion. 4216. You say you have not much experience of continuation schools, but you recommend compulsory physical training?—I do.

4217. Let me suggest to you another plan, and I should like to ask you what you think of it. Supposing you make some sort of education compulsory from fourteen to sixteen or seventeen, and you make physical training and gymnastics a special feature, and make them to count as attendance; make them attractive, but not compulsory, if the pupil prefers another subject?—I should like it to count as a subject undoubtedly, but I am so much impressed with the value of it that I should wish that every pupil in those years should have that subject, although the pupil had no other subject.

4218. Do you think it would be quite fair to make that compulsory, when the effect might be to exclude the pupils from learning more mathematics or more French, or whatever they wished to learn?—Not to exclude other subjects; certainly not, sir.

4219. They have not time for everything?—They have not; but by that time they are specialising. This is a thing which is not special at all, it is general to every individual, the development of their bodies.

4220. You would be prepared to make physical training compulsory and let the other subjects take their chance?—I would.

4221. By Professor Ogston.—In your lectures in the Dundee University you deal with this subject, I suppose?—Theoretically.

4222. You theoretically teach those who are being trained for the profession of education?—I do, sir.

4223. Is there any standard work on the subject that has yet appeared?—No.

4224. It is being formed?—It is being formed.

4225. You deal with girls as well as with boys in the Blackness School?—Yes.

4226. And in training your teachers you also consider sex and age?—That is quite true, sir.

Curriculum: theoretical scheme suggested. 4227. In theory what proportion would you assign the mental, and what the physical training?—You mean in the curriculum?

4228. In a perfect scheme of education. You are a teacher of it; I ask you the question, because you lecture on this in the University, and your views are therefore important; as a theorist, what proportion would you assign?—I would base all education, of

course we must base all education, on the activity of the child first of all, and, working from the activity, which is the physical activity of the child, we can develop it into the co-ordination of the mental and the physical. In other words, I would base all educational work upon the first free play of the child's physical movements, and then work out this physical training so as to co-ordinate him as a good citizen.

4229. So that question, as I put it, does not admit of a yes or no answer?—I think not.

4230. Is there any other point that you, having thought upon this subject, and having lectured upon it, would like to put before the Commission besides what we have asked or what you have volunteered?—My ideas are formed altogether from an educational point of view. I first wish to take a hold of the child as an active being, and to get at his mental development through his physical activity, and by means of physical exercises in early life, I think I can teach him the principle of subordination. By means of commands deliberately given I think the child also learns the resources of his own body. He is also conscious of the power that he has over his body; he feels also in these exercises that he is one of a corporate body, and is working along with others; and by these means I think he is learning to become a good citizen, because citizenship, to my mind, is a question of the co-ordination of the units, and I think if we teach the child first the great principle of subordination, then he will get to some feeling of self-control, and his obedience will not be as the pure mechanical, selfish obedience that sometimes we have in pure militarism, but it will be the true obedience, where he has the control of his will over his actions. I may not be plain, but I feel very strongly in this matter, that in the ordinary affairs of life we should try, as far as possible, to make the child automatically virtuous. In the ordinary affairs of life we can reach the best through physical training. As long as he is automatically virtuous in the ordinary affairs of life, he has more mental energy to devote to the greater ones, therefore psychologically I think physical training is the best avenue of approach that we can have to mental development in the child. We cannot approach the child's mind except through the body, and we cannot teach the semi-mechanical virtues to this child unless through the physical exercises that we devise for him.

4231. Lastly, are those views that you have just expressed similar to those that are taught by the other lecturers on education in the Scottish Universities?—I do not think the lecturers on education in the Scottish Universities, probably with one exception, have taken this matter up in a very great degree.

4232. By the Chairman.—Just one question: have you ever thought that in bringing everyone, as it were, to a common level, you are necessarily damaging individuality?—My lord, I think I am promoting individuality by that means.

4233. And you think that not only are you teaching boys and girls to obey, but you are teaching them to command in later life, if necessary?—Yes; it is only those who learn to obey who know how to command.

4234. Yet I may put it to you that some of the greatest commanders that we have known have been the most insubordinate when in a subordinate position: is that not so?—I do not doubt it; but I am speaking of the general question, theoretically.

The witness withdrew.

Adjourned.

NINTH DAY.

Monday, 26th May 1902.

At 36, Great George Street, Westminster, S.W.

PRESENT :

THE RIGHT HON. THE EARL OF MANSFIELD, *Chairman.*

The Hon. THOMAS COCHRANE, M.P.

Sir THOMAS GLEN COATS, Bart.

Sir HENRY CRAIK, K.C.B.

Mr M. H. SHAW STEWART, M.P.

Mr J. C. ALSTON.

Mr J. B. FERGUSSON.

Mr GEORGE M'CRAE, M.P.

Professor OGSTON.

Mr R. B. PEARSON, *Secretary.*

Mr WILLIAM SCOTT, examined.

4235. *By the Chairman.*—You are the representative of the School Board of the parish of Dundonald, in Ayrshire?—Yes, my lord.

4236. And you are also headmaster of the Portland Public School in Troon?—Yes.

4237. And have been so for 27 years?—Yes.

4238. The population of Troon you say is 4696?—That is so.

4239. And comprises three schools, namely, Troon Portland Public School, Dundonald Public School and Loans Public School?—That is for the whole parish of Dundonald; only one school for Troon.

4240. And there is also a Roman Catholic School in Troon with about 70 scholars?—Yes.

4241. That makes altogether about rather over 1000 scholars, counting the Roman Catholics?—Yes, counting the Roman Catholics.

4242. A new school was recently erected?—That is so.

4243. It contains a hall 32 feet by 24 feet where children get physical drill; and you say piano, dumb-bells, bar-bells and Indian clubs have been provided both for Troon and Dundonald schools?—Yes.

When the new school was completed, the Board appointed a competent drill instructor who had been trained in the Royal Navy, and holds a certificate from the National Physical Society of Great Britain. He performs the duties of school janitor at Troon, and he is also compulsory officer and drill instructor for the schools at Dundonald and Loans as well as Troon. The Board has all along recognised the importance of physical training. At Dundonald School, which was erected in 1896, there is a hall 60 feet by 24 feet for drill purposes. In the infant department at Troon there is a classroom with piano, for the infants getting free exercises from the teachers. The extent to which use is made of drill by the scholars is as follows:—In Troon School, senior division, there are six classes, each containing from 30 to 40 scholars. Each class gets half an hour's drill per week with dumb-bells, bar-bells and Indian clubs. The scholars march to music on entering and leaving the school. In Dundonald, senior division and part junior, there are three classes, also containing from 30 to 40 scholars. The drill is the same. At Loans there is one class numbering from 15 to 20, which gets half an hour per week of drill with dumb-bells and bar-bells. There is no hall. The drill is done in the playground when the weather is favourable. When the weather is unfavourable, the class gets free exercises in the school. I have no hesitation in stating that the children enjoy these drills. The majority of the pupils are very fond of drill, and there is only an occasional boy or girl who does not take to it. Drill is compulsory in the schools for all the children, except where the parents request exemption on account of the child's health. In my

opinion the drill is beneficial to the children, and more drill is desirable. This might be provided by extending the time-table. I think a gymnasium for continuation classes would be both attractive and beneficial. There are continuation classes at Troon, but no drill or gymnastics are taught.

4244. *By the Hon. Thomas Cochrane.*—Is the public hall at Troon fitted up as a gymnasium?—No, sir; not the public hall.

4245. You call it a public hall in connection with the school?—Oh, no, just a hall for drill purposes; the entrance hall, in fact.

4246. Is it suitable?—It is rather small. Were it larger we would be able to give more drill, because the classes are restricted to some thirty or forty at a time.

4247. In Dundonald parish, which embraces Troon, you get a mixed population, purely agricultural in Dundonald parish?—Agricultural in the parish, and in the burgh of Troon there are a good many workmen, and pretty mixed.

4248. All the children take part in these physical exercises?—Yes.

4249. And they all benefit?—I think so; I am sure of it.

4250. You think from your experience that it does them all good?—That is so.

4251. The purely agricultural children, it does them good too?—Undoubtedly.

4252. But it is more necessary in the case of the town children?—I should think so.

4253. Half an hour per week, is that the allowance?—That is the allowance in the meantime. Time: insufficient allowance.

4254. Is that sufficient?—I do not think so.

4255. What would you suggest as being sufficient?—At least two hours a week, and for the senior scholars about a quarter of an hour or twenty minutes per day.

4256. That would be the boys and the girls alike?—The boys and the girls alike.

4257. Would you give both sexes similar physical exercises?—Yes, so far as the drill that we give them, that is dumb-bell, bar-bell, and Indian club exercise.

4258. They are all suitable for the children of both sexes up to fourteen years of age?—Yes.

4259. And they get benefit from it?—Yes.

4260. There is no swimming, I think, taught at Troon?—No.

4261. I think there are no facilities for swimming at Troon except in the sea?—Not in connection with the school.

4262. And your naval instructor, what system does he teach; you said you had an instructor who had been in the navy, I think?—He was a trained A.B. in the navy, and he teaches physical drill, that is the drill as set forth by the National Physical Society of Great Britain. Instructor naval.

Mr
W. Scott.
26 May '02.

Mr
W. Scott.

26 May '02.

4264. He has a certificate?—He has a certificate from them.

4265. And you approve of his system?—Yes.

4266. It is calculated to develop the better physical qualities of the children?—Yes.

4267. *By Mr McCrae.*—Are the continuation classes taken much advantage of in your district?—I think fairly well.

4268. How many nights a week do they meet?—Four nights.

4269. You say they get no opportunity at all for physical training?—They have not hitherto.

4270. Could that be worked in during the four nights, or would you require an extra night if it were added to your curriculum?—It might be worked in during the four nights, or it might be added; either way might be done. We have not tried it yet.

4271. How would you suggest that training should be given, by a special night, or would you give a certain amount of the time per night to it?—I am not sure which would be the best way.

4272. Then what facilities could you give for that; you would have the use of the hall you refer to?—I think we would have to build a special hall for the purpose, a special gymnasium.

4273. Where do your continuation classes meet?—In the school.

4274. *By Sir Thomas Coats.*—In this half hour which is given per week for the physical training of the children, is it very evident that the children are getting benefit from it?—Well, I would judge from this, that in a few cases weak children complain of it doing them harm, so that if it should do weak children harm, it would, I think, benefit healthy children.

4275. Does that follow, do you think?—It is a negative way of looking at it, certainly.

4276. How long has that been going on in the school?—This is our second year.

4277. Only the second year?—Only the second year.

4278. So you have not had an opportunity of seeing what it would do, that is by the younger children taking it and following it up for a long time?—No.

4279. And for half an hour during the two years the benefit cannot be very evident, I should think?—No; only getting half an hour per week; I think more should be given.

4280. You have no means of gauging the benefit; you do not take any notes about the children?—No, further than observation.

4281. *By Mr Shaw Stewart.*—You mention that sometimes weak children complain of the exercise given being too much. Do you frequently get complaints of that?—I should think about 10 per cent.

4282. You would agree, of course, that the object of physical exercise would be to make weakly children stronger?—That is what I tell them when they do make any complaint of that kind. Sometimes we have a complaint of a child having a weak heart. Well, we do not risk anything there. Sometimes parents in their ignorance complain of the children having pains in their arms.

4283. I thought you said the children themselves complained?—Well, the children complain in the first place, of course.

4284. Would not physical exercises benefit them more if they had more frequent exercises for a short period at a time?—Well, sir, a shorter period would be right once they had learned the movements, but I think half an hour at a time is little enough until the movements have been learned.

4285. Well, but supposing for the small children they received ten minutes every day?—I speak more for the senior children. That is so with regard to the juniors.

4286. Ten or twenty minutes, then, for a weakly child, would probably do that child good if he or she persevered in it daily?—I should think so.

4287. That is your opinion?—Yes.

4288. *By Professor Ogston.*—How many children have you whose parents object to their getting physical

training?—About half a dozen; on the score of it being injurious to the children do you mean?

4289. No; I mean on any grounds?—They do not object unless they think it is injurious to the child.

4290. So that six out of the thousand is about the number?—Not more.

4291. But over and above that, you think that there are 10 per cent. of weak children?—Yes, who are now and again complaining temporarily.

4292. *By Mr Fergusson.*—If you think that the physical training is good for the children, and the half an hour is not sufficient, as you have told us, why do you not increase the time?—The reason we have not increased it is because we have not time. The only way that I can see in the meantime is to lengthen the timetable, and why we have not done it, we had a disinclination to lengthen the working day for the children.

4293. Well, but is that the only way? Can you not shorten the book work and lengthen the physical work?—Well, there are so many subjects, it is very difficult to do so.

4294. You have not sufficient faith in the physical training to trust that a little more physical training would compensate for the loss of time in the other subjects?—I think we might add half an hour per day for physical training without taking anything off the other subjects.

4295. Your experience is only in your own school and in the parish of Dundonald, this is only the second year?—This is only the second year.

4296. Had you no experience before of teaching children physical exercise?—Yes. We always gave them something, but not to the same extent as we do now.

4297. But have you yourself had much experience of physical training?—No, sir, further than that I used to give them military drill in the playground.

4298. What are your boys doing when the girls are doing their sewing?—They are getting these physical drill exercises; that is the time they get them.

4299. What are they doing when the girls are getting their physical exercises?—Well, they are getting some other work in the classrooms.

4300. But is there not a time that you can devote to boys? Girls do all the same subjects as the boys, and also sewing, might not the boys employ the time that the girls are doing sewing in physical exercises?—That is the time the boys get their physical exercises.

4301. There is also the time the girls are getting their physical exercises; does that only amount to half an hour a-week?—Yes, sir.

4302. You say you do not know what system exactly is taught by your instructor?—The system taught by the Physical Society of Great Britain.

4303. It is not Cruden's?—It is something similar to Cruden's.

4304. Is there much drill in it? when I say drill, I mean marching about; or is it mostly what are called the extension motions?—Yes, sir; not much marching.

4305. Mostly the arms and legs?—Mostly the arms and legs; yes.

4306. Have you any children who are not properly fed: underfed children?—Well, very few.

4307. Where are they, in the town or the country?—They are connected with the shipbuilding yard mostly.

4308. Now do you deal with them in any way: do you take any steps to see that they are better fed?—No.

4309. Nothing is done?—Nothing is done in connection with the school.

4310. Have you any experience of the difference between what you get out of a child when it is fairly fed and a child when it is underfed?—Well, they are so few that are in that position that I have not given it much consideration. What I refer to as underfed children would be, perhaps, the children of parents who misbehave.

4311. They neglect their children, in fact?—Yes.

Mr
W. Scott.

23 May '02.

Physical training; more desirable.

Continuation Classes.

Physical training: benefit.

Complaints from children.

Underfed children.

4312. But you take no official notice of that?—No, sir.

4313. *By the Chairman.*—You are here representing your School Board, are you not?—Yes.

4314. Are you on the School Board, or how do you come here to represent them?—I am headmaster.

4315. I mean, what acquaintance have you with the proceedings of the School Board; how is it you came here as their representative, that is what I want to know; are you in a position to be able to answer for them—for their opinions?—Oh, yes; I got instructions from the School Board clerk.

4316. And what did he say as to the attitude of the School Board as regards this Commission, or did he say nothing; I want to know—I mean, how far are you here as representing the School Board?—To state that the School Board will, as far as possible, advance the opportunities for physical education.

4317. That they were practically speaking favourably to not only the present physical education in schools, but even to an increase of it: is that so?—Quite so.

4318. I mean, you are here authorised to say that?—Authorised to say that; yes.

4319. When you said that you thought half an hour a week was not sufficient, you did not only say it of yourself, but you said it as representing the School Board?—Yes.

4320. And that is their opinion on the matter?—Yes.

4321. Have you ever heard in your district any com-

plaints or remarks about any possible increase in physical training?—No, not outside.

4322. I mean lately, with reference, say, to this Commission, whether there has been any talk about anything that you could speak to?—Well, the only thing I could say is, there has been some talk about the military drill as apart from the physical drill.

4323. What do they mean by 'military drill'?—I suppose what they mean by 'military drill' is company drill, including front-formings, rear-formings, turnings, and so on, and marching.

4324. And these forms of physical training are considered wicked, is that so?—I do not think so. I know that one or two members of our Board are afraid that perhaps by getting drill of that kind it might tempt lads to enlist when they became old enough for this purpose.

4325. It might be made so attractive to them that they might be induced to enlist?—That is the view of some of them; that is not my opinion.

4326. You said some time ago you used to do military drill in the playground?—Yes.

4327. Was that ever objected to in those days?—Oh, no.

4328. How did you come to be able to give 'military drill,' as you call it?—Well, I have been a volunteer officer for a number of years.

4329. And did you find any reluctance on the part of the children to be drilled in military drill?—No; they seemed to enjoy it.

The witness withdrew.

Mr GEORGE YOUNG BAIN, examined.

4330. *By the Chairman.*—You are a member of the Kilmarnock Burgh School Board?—Yes.

4331. And have been so for fifteen years?—Yes, that is so.

4332. You were also for five years a member of the Town Council?—Yes, my lord.

4333. You have also been a Magistrate?—For three years.

4334. And have also taken an active interest in the training of the young?—That is so. The Burgh School Board have six schools, besides the Academy, with a school roll (including 259 at denominational and private schools) of 6368, an average attendance of 5404, being 84·86 of the roll. In all the elementary schools in town there has been for many years past physical training to a greater or lesser extent, consisting of drill, besides exercises with dumb-bells, barbells, Indian clubs, expanders, wands, rings, hoops, etc., and in one of the largest schools (Bentinck) they have also had military drill with sham guns. In the case of the Hamilton school, which was formerly the Academy, they have appliances for gymnastic exercises. It is now an elementary school. As regards the Academy, with accommodation for about 1000 pupils, in addition to the above appliances in use in the elementary schools, the janitor is a retired drill sergeant, who drills all the pupils in a central hall, and there is a well-equipped gymnasium and swimming bath, which are largely taken advantage of, besides a workshop for manual instruction in woodwork under the charge of a skilled mechanic. Generally speaking, the opportunities given are fully taken advantage of both by boys and girls, and are appreciated more than the ordinary school work. The teachers report that it has had a very beneficial effect on the scholars—promotes discipline, and has had a very good influence on their physique. The reasons therefore are, no doubt, that the pupils enjoy the exercise, and strive with each other to excel. Recently at the Academy there has been started, with considerable success, a cadet corps, which numbers over 100, and this branch of physical exercise is very popular, and likely to increase. If physical exercises are to be much extended, it would be necessary to have a drill hall or other covered enclosure, to enable the exercises to

be carried on independent of the weather. To supply these would add considerably to the expense, and it is suggested that in some way or other grants should be given for such buildings, or perhaps that an annual grant should be given for efficiency of the pupils in attendance on such exercises—something similar, perhaps, to the grant at present given for drawing. If grants were given, or some similar encouragement, greater time could be given to such exercises, and consequently, it is hoped, greater good would result to the health, discipline, and moral and physical culture of the pupils.

4335. What knowledge have you of the examinations in your schools in this physical training; were you ever present at them?—In the elementary schools it has been made a special feature of at all our annual examinations, so that, instead of the old form, which we had in Scotland, of examination by reading, writing, or recitation, it has taken the form for many years past of showing what they can do with physical exercises. Inspection.

4336. And have you been present at those examinations?—Oh, at all those.

4337. And who has examined them—the Inspector?—Oh, no, not at them.

4338. But I want to know have they not been examined in physical exercises by the Government Inspector?—Well, I am not aware.

4339. Therefore you have not been at the inspection by the Government Inspector of physical training in any of your schools?—No.

4340. You have no medical examination in any way of the scholars under your School Board?—Oh, nothing of that kind. Medical inspection.

4341. As scholars I mean?—Not as scholars.

4342. Have you ever formed an opinion or thought of the subject whether it would be beneficial or not to have a medical examination of scholars?—Well, I have never thought much about that; but, generally speaking, the parents have told me that their children were very much benefited in their general health by the exercises they were receiving at school.

4343. Have you known any instances to the contrary where they have not been benefited; where they have been overworked, as it were?—No; none of the

Mr.
W. Scott.
26 May '02.

Physical and military drill: objection to latter.

Mr.
G. Y. Bain.

Mr. G. F. Bain. headmasters have given a single report on that, with the exception of one.

26 May '02. 4344. You have not heard it by common hearsay?—No.

4345. It has not come up at the School Board elections, or anything of that kind?—Oh, no, nothing of that kind.

4346. Have you had any discussions on the subject of this Commission at your Board?—Yes, we had.

Board favourable to more physical training.

4347. May I ask you whether the Board has taken any decided view about it; has it considered it sufficiently, or did it merely decide to send you up here to make a general recommendation?—We have been very favourable to the continuance of this special training, so much so that the new academy that we built,—it has only been in use for four years, what we call our best school, the only fee-paying school in the Burgh with accommodation for 1000 pupils—has had all the latest appliances and buildings for physical training, attached to and carried on, in connection with it.

4348. And have you heard anything in the Burgh of Kilmarnock deprecatory in any way of more physical instruction than has hitherto been given?—Nothing; no, rather the opposite.

4349. No accusations of a tendency towards militarism?—Nothing of that kind.

4350. And you would be in the way of hearing such things, I suppose?—Oh, certainly.

4351. If there had been any feeling in the matter?—I would have known it; indeed, we have a class I have not reported on here; I can give you a little further information in regard to that.

4352. By all means do?—I have it written out here with reference to the cadet corps and the continuation classes in connection with the Academy in physical training.

Cadet corps started.

4353. We shall be glad to hear that?—The Academy cadet corps was commenced in March 1901; it numbers 100, and is attached to the 1st Volunteer Battalion Royal Scots Fusiliers, and is drilled by Captain Yuille, who is a certificated teacher on the staff of the school. Three hours' drill per week is given, after school hours. The War Office has supplied, free of charge, 50 carbines serviceable and 50 of same for drill only. All expenses for clothing have been borne by the parents of the corps, but the belts were supplied by voluntary public subscriptions. The School Board erected covered armracks at its own expense. As yet no shooting-range accommodation has been provided, but we have prospects of the use of a local safety one which is shortly to be erected in the vicinity of the town, but we would require to pay for it. Ammunition, instruction, and proper keeping of arms will come to be a charge. The corps has lately been highly approved by the Commander-in-Chief for Scotland, Sir Archibald Hunter, and specially well commended, on Tuesday last, 20th May, by the Adjutant, Captain Swetenham, who has since sent Captain Yuille a contribution of £5 towards enabling the cadet corps to perform their musketry this year. The janitor of the Academy, Sergeant-Major Fairbairn, is a fully qualified gymnastic instructor, and a member of the National Society of Physical Education, London. He holds a Saturday class in Kilmarnock for teachers throughout the county of Ayr, to qualify them to give physical training in their various schools. He has also published a small book on the subject. I have a copy here. Besides these there is a football club in connection with the Academy, and annual public athletic sports, to which the public are invited. Evening gymnastic and physical drill classes have been held for the past two years, and have been well attended, two and a half hours twice weekly for six months—October to March inclusive. The expense to the Board in connection with this class is considerable, a small fee (5s. I think) only being charged. With regard to physical drill and manual instruction in woodwork, lessons are given free to Academy senior pupils during the whole year. Then we have a large swimming bath for use of boys and girls in all the Board Schools. It was opened towards the end of last year. We could not get water

Gymnastic instructor.

Classes held.

Swimming.

or it would have been opened earlier. One penny per bath is charged. I think that gives you a good idea of what we are doing in Kilmarnock, and the feeling generally has been favourable, indeed, I have some young men in connection with my establishment who have attended those classes and been greatly benefited by them, and took a great liking for them.

4354. *By Mr Alston.*—The cadet corps is attached to the Academy?—Yes.

4355. That, of course, is a well-to-do school?—Yes; all the other six are non-fee-paying; they are elementary schools; the Academy is the only fee-paying school we have under the Board.

4356. On the part of the parents of the boys in the Academy there is no difficulty as to meeting the cost of the uniform?—They are only wearing their first suits yet.

4357. Do you happen to know what it costs—the outfit?—Oh, it was not very much—just a suit; I think about two guineas—the belts, as I say, were subscribed for by public subscription by a few friends.

4358. But the School Board would not see its way to attach a cadet corps to the other schools; have you other schools in Kilmarnock?—We have others, what we call our purely elementary schools.

4359. The Board would not see its way to attach cadet corps to them?—No.

4360. But on the other hand you know apparently some little body at military drill with sham guns?—That is the elementary school. The headmaster of that school (Mr Walker) was a very strong volunteer, and he has given them a little more than the other schools without any charge for it.

4361. Then it is the same military drill as the cadet corps get?—Not to the same extent; only with little wooden guns at intervals and not so much as the cadet corps.

4362. But you call it military drill; you mean a little more than marching and turning?—Oh, yes; I think so.

4363. Then do we understand that the School Board of Kilmarnock are quite favourable to the extension of physical exercises, and even to the introduction of military drill?—Well, they have said nothing to the contrary. Of course, from the point of view of the health of the pupils as a groundwork, the Board are very favourable to physical exercise—physical training.

Physical exercises militarily no objection on score of military

4364. But they do not draw the line at physical exercise and bar military drill?—No, they have said nothing to that effect.

4365. Have you found any objection on the part of parents to the introduction of military drill solely?—None; I have spoken to a number of the lads who are members of the cadet corps, and they are all proud of it—the lads themselves. I met them a few weeks ago going to church parade one Sunday morning. I said, 'Well, boys, where are you going this morning?' 'Oh, church parade.' They were waiting on one another to go up the road in the outlying better class part of the town. They were quite proud of the position they had in going along with the other volunteers to church parade, so, I say, there has been no feeling, as I have seen it expressed in some other places, of fear that it encourages the spirit of militarism too much among the lads.

4366. But that is not the Kilmarnock view?—Not the Kilmarnock feeling, as far as I have heard of it.

4367. The boys enjoy the drill, but the question is, do the parents object on that account?—Nothing that I have heard.

4368. We have evidence which seems to point to this; but some members of school boards object to it in case the boys enlist?—We have no fear of that in Kilmarnock.

4369. The Kilmarnock Board at any rate do not take that view?—No; indeed, during the last two or three years, since October 1900, the volunteer force has been very largely augmented; a great many young men have joined the volunteer force, and are liking it, apparently.

4371. Is there anything known in Kilmarnock about the Boys' Brigade?—Nothing formally. No; I think nothing to any extent. There is something in connection with some of the churches, but nothing to any extent.

4372. *By Mr Fergusson.*—How much time per week did you say was devoted to physical training?—In the cadet corps?

4373. No; for physical training in your elementary schools?—Well, some of them are allowed by the Code two half hours per week during school hours.

4374. What do you actually do?—Well, in the Academy they have more after school hours.

4375. Oh, yes, but that is after?—After.

4376. Perhaps you do not know the exact time that is devoted in the school?—Some get half an hour and some get two half hours per week; that is in our elementary schools.

4377. I see you say in your last paragraph, 'If physical exercises are to be much extended, it would be necessary to have a drill hall'; but can you not extend the physical exercises by extending the time, continue doing them in the same way as you are, but increase the time devoted to them?—In our purely elementary schools we have not space inside the school.

4378. But if you have space to do half an hour you have space to do one hour, and if you have space to do one hour you have space to do two hours?—But outside exercises cannot be engaged in all the year round for want of accommodation outside.

4379. No, not all the year round, not every day. I know we have a bad reputation in the West, but it is not always raining even in Kilmarnock?—No.

4380. But do you not think that is one way? You say very truly that it is very expensive to build a drill hall, but do you not think you can increase your physical training by increasing the time devoted to it?—That could be, certainly.

4381. That might be one way of doing it?—Oh, yes.

4382. Is this swimming bath in connection with the Academy, or is it a public swimming bath?—It has been built by our School Board for the use, primarily, of the scholars attending all the schools under the Board in town.

4383. Was that built at the expense of the rates?—Yes.

4384. And you found it very beneficial?—It is not long started, but it will be.

4385. Is it popular?—We have had very little experience of it yet; it is only since the month of October that it was started, and the weather has been very cold. It has got a bad start, but I know many who are attending it and enjoying it very much.

4386. There was no objection on the part of the ratepayers to its being constructed?—Oh, no; so much so that the Town Council, with the sanction of the Education Department, gave us liberty to grant them part use of it for the public; there is a general feeling in favour of it; they are looking forward to building one in connection with the town, I think.

4387. *By Sir Thomas Coats.*—With regard to the Academy; you say there is accommodation for 1000 in the Academy, but how many scholars are there actually there at present?—The roll, you mean.

4388. Have you any idea roughly how many there are there?—Between 800 and 900.

4389. And would half of these be boys?—You see it is partly a purely elementary school. The ground floor is elementary—it is a three-storey building—and the first and second floors are, I think, solely for the higher grade department. I should say one half are boys, the other half girls.

4390. What proportion would there be of the higher grade?—I am not quite sure, but speaking from memory there is about an equal number.

4391. Half, do you think?—Yes; 400 to 500 in the higher grade department.

4392. Taking it that half of these would be boys, there would be between 200 and 250 boys?—Yes, in the higher grade department.

4393. Nearly half of these boys are in the cadet corps?—One hundred, fully, as I said.

4394. It is only the older boys who will be in the cadet corps, of course?—Oh, certainly; yes.

4395. Besides this cadet corps, do you give special attention in the Academy to physical exercises; I mean outside of those who belong to the cadet corps?—Oh, yes; I think I mentioned that we give that after hours in the Academy.

4396. For both boys and girls?—Yes.

4397. I wished to know, seeing you had a cadet corps, that the other children were not neglected with regard to physical training?—Oh, no.

4398. And how long is it since you had this cadet corps?—Fifteen months.

4399. *By Mr McCrae.*—In the case of the Hamilton Apparatus school, you say that they have appliances there for gymnastic exercises?—Oh, very small, for strengthening the arms and running along.

4400. Any horses; any wooden horses?—No, they have no room inside; it is a little shed outside.

4401. And that rule applies to all your elementary schools. Have you no hall where they can drill in at all. In the Bentinck school do these boys who have the guns drill outside?—Yes, they drill outside.

4402. How are you situated with regard to the continuation schools—the evening schools?—We have continuation schools—the evening schools?—We have continuation schools: time.

4403. What training do they get; what hours do you give them?—They get two and a half hours twice weekly. It is given on two separate nights.

4404. How many nights a week do those classes meet?—Two, for six months—October to March inclusive.

4405. For the physical training alone?—For the physical training alone.

4406. Alone?—Yes.

4407. And how many nights do those schools meet for ordinary work; do they meet every night?—You mean the lads and girls attending the Academy after hours.

4408. After hours?—After hours.

4409. Do they meet every night; do they get instruction every night, I mean in the ordinary school work?—I am not quite sure whether it varies it every night with different lads and girls. Where there is a large number there is only a certain number you can take. It has been very much appreciated. The father of one girl, a big strong girl, was speaking to me last week. He said his daughter had been wonderfully improved in her health and physique and general bearing by the exercise she has had at the Academy, it has tended very much towards her health; and the same with the boys, I think.

4410. Do any of these pupils attend the physical training class only, or must they take the other subjects likewise?—Is that the evening continuation.

4411. In the evening continuation schools?—Oh, I think the bulk of them are lads who may be taking one subject, but they are bound to do that; they are young men who have gone to business and have had two hours a week, I understand, but a number of them attend other branches of education; the Science and Art School, or other branches of education.

4412. What professions do the girls follow generally after they leave school in Kilmarnock?—Well, that is a wide question.

4413. Dressmaking?—The Post Office is beginning to open up a very good thing for girls with proper education; the Post Office, the Telegraphs, typewriting in our large factories and large works.

4414. And the boys; what do they generally follow after?—Oh, we prepare them for the University in the Academy; they go direct from the Academy to the University, and they have been very successful.

4415. But the boys who have been attending the evening classes, will they go to the University?—No; we have large factories, engineering works; the Glasgow and South-Western Locomotive Works are in Kilmarnock.

Interval
between boys
leaving school
and going to
work.

nock, employing some 1300 or 1400 hands, and the Glenfield Hydraulic Engineers employ about 1500 hands.

4416. Is there any interval, do you think, between the boys leaving school and going to work, or do they just go to work immediately after they leave school?—From our Academy?

4417. Generally; I rather indicate from the elementary schools?—As you know, lads often get through all the elementary work by the time they are twelve years of age, and for children of poor working-class parents there has been a difficulty between the age of twelve and fourteen. They could not be taken into public works to learn a trade properly till they were fourteen years of age, and in many cases it would be a little against them leaving school so early.

4418. What do they do in the interval?—Good boys, clever boys, had the opportunity of coming from the free schools to the Academy free of charge, and that has been taken advantage of to some extent.

4419. But I mean those boys who have really left the elementary school at that early age; do they go as message boys before they learn a trade?—As message boys very largely, and a very useful thing for them.

4420. Can they leave school before they are 14 years?—Not according to the latest Code regulatiou, except by the special permission of the Board.

4421. You were speaking prior to that?—They could leave.

4422. After 12 years?—Yes.

4423. *By the Hon. Thomas Cochrane.*—As you were just saying, the boys are kept compulsorily at school until they are 14 years of age under the present regulations?—Under the present regulations they are.

4424. But when after fourteen years of age there is an interval sometimes of a year or two before they get permanent employment?—There is no difficulty in Kilmarnock.

4425.—I know Kilmarnock well; it is a very thriving town?—There is no difficulty; they all get employed.

Playgrounds.

4426. About playgrounds: are there good playgrounds in Kilmarnock in connection with the schools?—Oh, we have been improving since I went into the Board. The improvement in playgrounds and school premises generally has been wonderful, and we are adding to two of our schools just now—elementary schools. And that drill shed I was speaking about, for outside drill, is what all the headmasters of our elementary schools are feeling a want of. It could be done with very little expense.

4427. A kind of shed?—A shed which is supported on iron pillars.

4428. It would be of great advantage?—It would be of great advantage. If this is to be encouraged it

would not take much; I do not think it would be an expensive thing at all.

4429. Where do they play now, beyond the playground in the Kay Park?—Most of them have large enough playgrounds; one of our elementary schools has a public park—the Barbados Park—within easy distance, so that they can hear the school bell from the Park.

4430. And they play organised games there—football?—They have not room for football proper in the playground of the schools.

4431. Not much room?—No.

4432. Would there be any advantage in taking a field somewhere for the combined schools of Kilmarnock where they could play games in a proper manner?—Well, they have that in the Barbados Park; it is convenient; there are a number of football pitches there.

4433. They can nearly all play?—Oh, yes.

4434. You have got a good swimming bath now?—A good swimming bath.

4435. The Fenwick water supply is in operation, but have you got an instructor to teach swimming?—Sergeant-Major Fairbairn is a qualified instructor. We have got an assistant for him very lately to take some of the work that he had; we are feeling our way in the matter.

4436. Have you got any female instructor to teach the girls?—No; Sergeant-Major Fairbairn is a married man, and he teaches the girls.

4437. There has been no objection?—No, no objection. We may require to have a female by and bye.

4438. The Academy cadet corps seems to be very successful?—Oh, most successful.

4439. It is a well-arranged school—the Academy?—A very well-arranged school.

4440. You are a large business man too, are you not?—Yes.

4441. You have experience of those boys after they leave school—in business?—Yes.

4442. And do you find that the physical training makes them better?—Oh, certainly. I have in my employment a certain number who have attended those classes of Sergeant-Major Fairbairn.

4443. And you find them smarter and better?—Oh, yes; they tell me themselves they are very much benefited by it.

4444. So that—as you say in your concluding passage—it really does improve the health, the discipline, and the moral and physical culture of the pupils?—Quite true.

4445. From your experience as a public man and a business man, you are very strongly in favour of physical training for children?—Physical training, whatever use it may be put to in later years, I think it is a good thing to give it them as far as practicable; there is no doubt of that.

The witness withdrew.

Mr
C. J. Shearer.

Ardrossan
School Board.
Physical
training:
amount given.

Mr C. J. SHEARER, examined.

4446. *By the Chairman.*—You are the Chairman of the Ardrossan School Board in Ayrshire?—Yes, my lord.

4447. Will you read your notes?—Ardrossan parish, which contains the town of Ardrossan and half of the neighbouring town of Saltcoats, is a seaboard parish with a population just under 12,000. It possesses three excellent public schools, and an Academy, managed by the School Board, consisting of an elementary department and a recently-added secondary department, built and equipped to meet modern educational requirements. The School Board is very desirous of keeping abreast of the times, and in regard to physical training has done perhaps as much as could reasonably be expected from it. In the playgrounds of the two public schools where boys are to be found, parallel bars have been provided; the boys are taught the usual military drill, and are, in the higher standards, exercised in the use of dumb-bells and Indian clubs, while the girls in the public schools are taught the bar-bell exer-

cises. In the Academy, military drill—full squad and company drill—is taught to both girls and boys, the sexes being drilled separately. In the lower standards both boys and girls are taught 'free' gymnastics and Swedish drill. In the upper standards (elementary department) the boys are exercised with dumb-bells and Indian clubs, and the girls with bar-bells. In the secondary department the girls in their third (and last) year are taught the use of Indian clubs, the boys being trained to use them in all three years. In addition, boys in their third year are regularly trained in Grecian exercises. At their annual closing exhibitions and at the entertainments they have given, the Academy always seeks to make a special feature of physical exercises. The pupils and instructor are, however, somewhat severely handicapped by the want of a gymnasium, instruction having to be imparted in covered sheds of very limited extent. The School Board does not see its way at present to build one, as the Academy, a young and struggling institution, has been a somewhat heavy

G. Y.

C. J.

burden upon the ratepayers of the parish. I would suggest that in ours and similar parishes (possessing a population of 10,000 and upwards), where no facilities of the kind exist, a suitable building should be erected by the County Council or by the Imperial authorities, which would serve as a centre for physical culture for all the day schools, and which would be available, through the medium of evening classes, for the youth of the district. Our Academy instructor last winter opened a continuation class of the kind, and, in spite of a total absence of gymnastic appliances beyond those used in the day school, achieved a fair measure of success. He believes that were a gymnasium provided he could attract a large evening class for physical exercises. In my opinion these exercises should be made a compulsory subject in the continuation curriculum, and either facilities such as I have indicated be provided, or a grant sufficient to induce school boards and others to erect premises and provide appliances of their own should be offered by the Education Department.

4456. *By Mr. Fergusson.*—These gymnastic appliances are all outside: you have none under cover?—The only fixed appliances we have are parallel-bars, which are out in the playground in the open air. Yes; we have nothing under cover.

4457. You talk of the 'usual military drill': is your drill all conducted on purely military lines?—Yes, the squad company drill—the usual military.

4458. Is that taken from a military drill book; what book is used in the teaching?—I do not quite understand. Our instructors are all ex-army men, and I understand they teach exactly the same as they would teach the recruits in the drill ground.

4459. That is the military drill book?—The military drill book, I suppose it is.

4460. What, exactly, are Grecian exercises?—Grecian exercises are mostly performed double by two boys. If you will permit me I will show you. Two boys take hold of one another, and as one goes forward the other goes back (*indicating*).

4461. A sort of wrestling entertainment?—Yes; but they work one another backwards; each boy is a lever and support for the other; they are very pretty.

4462. What length of time is devoted to physical training in the elementary schools?—Half-an-hour per week.

4463. You say you would like to make physical training compulsory in the continuation classes?—Yes.

4464. Would you make anything else compulsory? would physical training be the only compulsory subject?—That is the only subject I should think particularly of making compulsory as a special subject. Four subjects, as you are aware, must be taken nowadays to qualify, but a large option is granted; I should make physical instruction the only compulsory subject.

4465. Do you mean compulsory for those who are taking continuation classes; or do you mean that you would make physical training compulsory for every boy between the age of fourteen and eighteen?—Yes, for every boy who attended the evening continuation classes.

4466. You would compel every boy to attend?—No, but in the evening classes I should make that a compulsory subject; they might use their option with regard to the other three subjects, but one of them ought to be physical training.

4467. You would not be inclined to go a step further and say all lads between fourteen and say seventeen or eighteen must take some sort of training, physical or otherwise?—Well, I should on principle—theoretically I should approve of that highly; but of course it would necessitate a very large extension of arrangements, and particularly with regard, I mean, to drill sheds, a gymnasium or something of that kind.

4468. But if it could be managed, you think it would be beneficial?—I doubt very much whether all the boys—all the youth of a district—could be taught, with the present facilities—or, rather, want of facilities—that we possess. We have a volunteer drill hall, of course, at home, which might be utilised for something

of the kind, but at present we have nothing in the nature of a gymnasium.

4469. Do you ever hear any objection to the military form of training by the parents?—Not in our locality.

4470. And you would like, if you could get it, a Public public gymnasium; you think it would be a great gymnasium. benefit?—I think it would be of great advantage, because I honestly do not see how, within reasonable limits of time, we are to provide one at the Academy, because, as I stated, it is a burden on the rates, and I think the ratepayers would resent the idea of a gymnasium being built there.

4471. Your idea would be, one that would be used by the children and by continuation classes, and perhaps by volunteers?—The volunteers have a drill hall of their own.

4472. Can you not get the use of that?—Well, it might be arranged possibly; but I believe the volunteers use it several nights a week for themselves.

4473. *By Mr Shaw Stewart.*—Does your school inspector take a special interest in physical training?—Mr. Lobban? Well, not so far as it has been brought under our notice; he is a very zealous inspector, but, I think, he believes more in head work than in hand work, so far as I can see.

4474. Then to what do you attribute this special interest taken in physical training in Ardrossan; is it the interest taken by the School Board?—Well, we are rather a progressive community, and we rather pride ourselves in keeping as far abreast of the times as can be expected from a small community. We are rather an ambitious Board, I may say.

4475. You attribute it to the special interest taken by the School Board?—By the Board.

4476. And their knowledge of the good influence of physical exercise?—Purely that, I think, sir.

4477. *By Sir Thomas Coats.*—Mr. Fergusson asked you about the compulsory training of boys between fourteen and eighteen in physical drill?—Yes.

4478. Well, I do not understand whether he quite brought out the information; whether it would be possible to get hold of these boys; do you think it would be possible to make drill for all children from fourteen to eighteen compulsory?—I do not see why it should not be done; just as the Department has raised the school age practically to fourteen. It has always been theoretically fourteen, but lately they have raised it practically to fourteen. I do not see why the school age for physical training should not be raised to eighteen.

4479. You do not think there would be any objection to it—objection on the part of the boys themselves and of the parents?—There would be in certain quarters, no doubt; but I do not know anything that is not objected to. We should be prepared to meet a certain amount of objection. Certainly there is a great cry in the air of militarism, as you know—some people see the thin end of the wedge in military drill—but for my own part I would disregard anything of that kind.

4480. So you think it would be quite possible to make military training compulsory from fourteen to eighteen?—I do not see why it should not be done from a national point of view; if the Imperial authorities require it, surely we are all willing to agree to it.

4481. Have you a large proportion of volunteers in Ardrossan in proportion to the number of the people; have you two companies?—We have one company in Ardrossan, and one in Saltscoats. I do not know what the proportion of volunteers per head is in most districts, but ours is not a large company. We have a company of about 80—I do not know what the proportion is in other places. It is not as much as it might be or ought to be.

4482. *By the Hon. Thomas Cochrane.*—I think you have said with truth you are a very go-ahead people in Ardrossan?—Well, we are; especially as a Board. We are ambitious to do all that lies in our power; we are a very ambitious Board, and we are very anxious to provide every possible facility for the education of the

*Mr
C. J. Shearer.*

26 May '02.

Physical training appreciated by Board.

Boys between fourteen and eighteen: drill should be compulsory.

Mr
C. J. Shearer.
26 May '02.

district, and to do everything that lies within our power; I think I may say so without ostentation.

4483. As a Board you are really fully persuaded of the advantages to the children of physical training?—As a Board, oh, yes, very much so. It is a cause of great regret and grief to us that we are not able to provide the gymnasium for the Academy; we are honestly distressed about it, and we have many times considered the question whether or not we could dare—in the existing state of our finances—to propose a gymnasium for the Academy. We have come to the conclusion that at present it is almost hopeless—the bulk of us have, at least.

4484. I think there are ladies on the School Board at Ardrossan too?—There was one lady; she has retired.

4485.—She took an active interest in these matters?—Well, not in physical matters; I fancy not in physical drill.

4486. And is the Board persuaded that the training is also good for the girls as well as the boys.—Oh, certainly. We should not dream in our schools of making any difference between girls and boys. In regard to the present exercises, we think they are just as suitable and as necessary for the girls as for the boys; in fact it is an indirect way of benefiting the boys ultimately.

4487. It does good to both sexes?—Yes, undoubtedly.

4488. Are there any weakly children at Ardrossan?—Yes, I suppose so. We have a large influx of outside population. The other day I was in the school with the Inspector, and some question arose about the locality of the children, and he asked those who were born outside the parish to stand up, and between one-third and one-half of the children stood up; they had not been born in the parish at all.

4489. Of course there are neighbouring towns, Saltcoats and Stevenston—they may have been born there and shifted in the course of their work?—They came from a very wide district—from England and Shetland—all over Scotland and the North of England. But as a rule our children are healthy.

4490. The children are very healthy?—Our children are healthy.

4491. But you do not have any who complain that the exercises are too much for them?—I have never heard any complaint of the kind; we have carefully restricted the weight of the dumb-bells, for instance. I believe our average weight of dumb-bell is below that of most school boards. I have heard of schools which use dumb-bells which I consider are positively dangerous to young children—dumb-bells weighing 5 to 6 lbs.

4492. I think the general consensus of opinion is that dumb-bells of a few ounces are quite sufficient?—I believe Sandow says 2 lbs. is the proper amount for a full-grown man to use; we use 2 lbs. in the lower standards and 3 lbs. in the upper. I think those are quite heavy enough myself.

4493. In some of the playgrounds at Ardrossan I think you have covered sheds for drill purposes?—We have covered sheds at all our schools, but they are of very limited extent. They could not be utilised as drill sheds except in the most limited form. They would not permit of marching or anything of that kind; they would not permit of movement.

4494. They are just really big enough to shelter the children for a few minutes on a wet day?—That is all they are intended for—keeping them from the rain.

4495. You would like to see that extended?—Yes; they ought to be extended. For the purposes we are discussing they are absolutely of no use to us—as a drill shed.

4496. There is plenty of opportunity, of course, for fresh air at Ardrossan?—Oh, yes, yes; we do not suffer from the want of that.

4497. *By Sir Henry Craik.*—What is the status of this school that you speak of as the Academy; is it a Higher Class school or a Higher Grade school under the Code?—A higher grade school with an elementary

department. Till three years ago it was an elementary Academy. The School Board added a secondary department, and it has now been raised recently to a higher grade school.

4498. It gets a grant under the Code—under Chapter IX. of the Code?—We get the Parliamentary grants in the elementary department, but not in the secondary department; in the secondary department we are entirely dependent on the County Council; we get no grant from the Department in the secondary department.

4499. Then you are a higher class school; you do not come under Chapter IX. of the Code?—We are not a higher class school—only a higher grade.

4500. Then you do get grants under the Code?—In the elementary department.

4501. No, in the higher grade department if you are higher grade school; unless you are a secondary school, you must get grants from the Department?—I think not in our secondary department.

4502. Yes, unless you are a higher class public school you ought to, and you must be under the Code?—We certainly do not get the ordinary Department grants.

4503. Then you are a higher class school?—Well, not properly speaking. A higher class school, I understand, implies one of eight or nine in all Scotland.

4504. Oh, no, no; a great deal more than that?—We are on different lines; I think they are very limited in number.

4505. There are about thirty higher class schools in Scotland under school boards?—Are you not including higher grade schools?

4506. No; higher class schools not under the Code?—These higher class schools have inspectors of their own; they are not inspected by the ordinary inspector.

4507. Are you inspected by the ordinary inspector?—By the ordinary inspector; yes.

4508. Then you may take it from me, Mr Shearer, that you do get grants under the Code, which I am positively certain is the fact; you get grants in the Ardrossan Academy?—We get County Council and technical grants, if you mean technical grants as coming from the Department.

4509. Oh, no, quite apart from these?—I think not; surely not.

4510. You say you are not a higher class school?—No.

4511. Then you are certainly eligible for grants under the Code, and if by any means or other you do not get them, I cannot understand it—you are certainly eligible for them?—I shall certainly take a note of it, but I am equally certain that we get no grants under our secondary department, except the County Council grant and technical grant.

4512. I am quite aware that you get grants from the County Council for technical purposes?—Yes.

4513. I am also aware that you get grants from the Secondary Education Committee of the County?—Yes.

4514. But you must either be a higher class school—in which case you would have got a considerable grant from the Department, not, certainly, less than £300 a year, under the Act of 1898—or else you come under the Code, in which case you would get grants of about £5 a head, whatever the class of school. I want to show you that you not only get a considerable grant from the county authorities, but, one way or another, you must get grants from the Department?—You are referring to the grant £2, 10s., £3, 10s., and £4, 10s. We do get these.

4515. That is exactly what I pointed out; that is under the Code?—Well, it is in a way.

4516. It is just as much under the Code as any other grant under the Code?—Quite so; I did not understand.

4517. Then you do get grants under the Code?—Oh, yes, of course.

4518. Besides these higher grade schools, there are some thirty schools under School Boards in Scotland

which get no grant under the Code at all, which are supported entirely by the School Board fund?—Yes.

4519. In your case you get a grant from the Technical Committee of the County Council?—Yes.

4520. You get a further grant from the Secondary Education Committee of the county?—Yes.

4521. And you get a grant ranging from £2, 10s. up to about £5 a head for all your pupils, from the Department?—In the higher grade, yes; quite so.

4522. The Department lays down certain conditions and instructions; amongst these, that there shall be adequate physical instruction?—Yes.

4523. That is a condition?—Yes.

4524. Therefore, to fulfil the conditions of these grants—these very liberal grants—you must spend a certain amount of money from the local rates?—Yes.

4525. What do you estimate to be the cost of your building in a school like yours—Ardrossan Academy—per head?—The building cost—of the secondary department, for instance?

4526. Yes?—Our elementary school cost us, on an average, £12 to £13 per head.

4527. And the secondary department will cost rather more?—Rather more, yes, exactly; I do not know exactly; it would cost more.

4528. What would be the cost of erecting a gymnasium?—We have discussed the matter, and we understand it could be done for £600, but that would be a limited—a very limited—gymnasium.

4529. We will say £1000?—It would take £1000 to build a proper gymnasium.

4530. What is the average attendance at your Academy?—About 300.

4531. Then the cost of building a gymnasium would be something like a quarter of the amount of building your school—one-fourth or one-fifth?—Yes, it would work out something like that.

4532. Parliament, of course, has not, as yet, consented to aid School Boards in building their premises?—Not directly.

4533. Why should it make an exception in the case of building drill-sheds?—Because this is more of an Imperial, and becoming a national expense. It seems to me to be becoming a question of paramount interest; this question of physical education is becoming more and more important.

4534. It is an important part of the general education of the pupils?—Yes.

4535. And it is one of the conditions under which the Code grants are paid; why should we pay for buildings for this part of the instruction any more than any other?—It would depend upon the assistance we got. I would put it in this way. A sufficient inducement has hitherto been given to encourage educational bodies to educate up to the necessary standard, whereas sufficient encouragement has not hitherto been given to educate up to the physical standard; that is how I should put it.

4536. But these grants, under Chapter IX. of the Code, are only about two years old?—Yes.

4537. You had absolutely nothing until two years ago?—That is so.

4538. Surely, when this increased liberality was shown on the part of the Treasury, did it not entitle Parliament to demand from the local authorities some additional equipment?—Well, I am afraid school boards did not quite see it in that light; they looked upon it rather as payment for work done before than as an encouragement to do anything more; I think that is rather how they looked upon it, as a reward of past services.

4539. *By Mr Alston.*—You tell us that your Board is exceedingly anxious to get a gymnasium?—Yes.

4540. And also that the Academy instructor believes that were a gymnasium provided he could attract a large evening class for physical exercises?—Yes.

4541. When you speak of a gymnasium, do you mean a hall fitted up with gymnastic appliances?—Yes, a complete gymnasium.

4542. Parallel-bars, vaulting horse, ladders, rings?—Trapezes, and that sort of thing.

4543. And you have parallel-bars at present in the open air?—In the open air.

4544. Does your Board think that instruction in applied gymnastics is valuable?—They look upon it, in regard to the Academy at least, as absolutely essential. In such an Academy as ours, we consider our equipment is entirely incomplete without a gymnasium; we are ashamed of the want of a gymnasium.

4545. You mean for the physical improvement of the boys?—For the physical improvement of the boys, and of the girls to a certain extent; the girls for parallel bars, at least.

4546. Are the physical exercises themselves not sufficient?—Well, in these days, I fancy no self-respecting Academy considers itself complete without a gymnasium. It may be a fad, but other institutions of the kind have it, and we feel that we are lagging behind as regards the Academy itself. I mean to say that supposing it could be proved, almost proved, that these physical exercises were not absolutely necessary, we still feel that other Boards are giving them, and that, therefore, we are neglecting our duty, so to speak.

4547. But you have not had it proved to you that applied gymnastics are a necessity of physical education for the boys?—No.

4548. Is it competition and sentiment?—Oh, I do not by any means think so; but there is something to be said for it.

4549. What other Boards do?—It lowers the status of our Academy, I consider; but apart from that, I should like to see a gymnasium at every Board School, for that matter, not from any sentimental point of view, but from a national point of view.

4550. May we take it as a fact that applied gymnastics are not a necessity at all?—I suppose such people may be found.

4551. Then, so far as regards parallel-bars in the open air, are the boys allowed to use them without supervision?—Yes, they are allowed to use them without supervision, certainly.

4552. Is that wise or safe?—Well, really I do not think any danger could happen. They are not very high; they are not more than, I suppose, 3 ft. 8 ins. or 10 ins. from the ground.

4553. Even so, it is generally accepted that applied gymnastics should be always under a skilled instructor?—The instructor instructs the boys at certain times, but they are not in any way closed when the boys are not with the instructor. I mean there is no method of cutting the boys off from them; they are in the playground, and whenever the boys are in the playground they have free access to them.

4554. In the gymnasium—supposing you get it—*Instructor.* would you have a competent instructor and all gymnastics practised under proper supervision?—Oh, undoubtedly, yes; but we have a very competent instructor, and it would then, of course, be under the supervision of the instructor.

4555. *By Mr M^cCrae.*—I think you said that the reason why you had not a gymnasium in connection with the Academy was because of the charge on the rates!—The charge on the rates, yes.

4556. Then you are in favour of a central gymnasium?—Yes, strongly so; I think it should be available for the other schools as well. *Public gymnasium advocated.*

4557. To be erected by the County Council?—Or the Imperial authority.

4558. But if it were erected by the County Council, it would be a charge on the rates, only you would have a larger area to draw from?—Precisely; yes. Whatever method, it would be a charge on the rates indirectly; but, of course, there would be a larger area.

4559. Then if it were erected by the County Council, would those outside the Ardrossan parish get any advantage from it?—We have scholars coming from the surrounding towns— from West Kilbride, Saltcoats, Stevenston, and Largs; they would, of course, benefit, but not always in the evening continuation classes; it would not be available for them all in the evening continuation classes.

*Mr
C. J. Shearer,
26 May '02.
Applied
gymnastics.*

Mr C. J. Shearer. 4560. But you think it would be a fair charge on the general county rate all over?—I think so.

26 May '02. 4561. Then with regard to the continuation classes; is the instruction given on a part of an evening devoted to the other subjects, or do they have a special evening for physical training?—As I mentioned in my statement, last winter our instructor at the Academy tried the experiment of a class running concomitantly with the other classes; but he suggests that it would be much better to have it on a separate night—a free night quite apart from the ordinary nights, that is to say, that on the evening when he was to have his physical exercises the pupils came from one class to another—came only for a portion of the time; he wants them to come fresh to him for a longer period—for two hours in one evening; he would prefer that.

Continuation
Classes.

4562. How many nights a week do your evening continuation classes meet?—They meet four nights a week.

4563. *By the Chairman.*—Have you any experience of seafaring people?—In what respect; we are, of course, a seaport; in what respect do you mean?

4564. Well, with regard to boys after they leave school; I mean do many of them go to sea?—Oh, yes, I see what you mean; not so many as one would expect. As far as I know not a great many of our boys go to sea; not a great many; we are not a producing town for the sea. Saltecoats—our neighbouring town—once had a great reputation, and, I believe, still has; but in the town of Ardrossan, so far as I know, not many boys make the sea their profession; so far as I know, I do not hear of many going.

Mr C. J. Shearer.

Alloway
School:
description of
facilities, etc.

Class of
children.

Teachers.

4565. *By the Chairman.*—Have you got a copy of your notes; will you please go through them?—I have been twenty years in the service of the Alloway and Ayr Landward School Board as Headmaster of Alloway School.

In 1895 a new school was erected with accommodation for 270 scholars in four classrooms, with central hall, gymnasium, soup kitchen, etc.

There are at present 229 names upon the registers, and the average attendance for the year to date is 204.

The children belong to the agricultural class, to coachmen and gardeners, and the majority of them have upwards of two miles to walk to school. I had no special training for physical work, but when the new school was nearing completion the subject was beginning to be recognised as an essential part of the curriculum of every well-organised school, and so I prepared a scheme of exercises from various books upon the subject, and these were executed out of school hours.

I am assisted by one male and two female certificated teachers, each of whom undertakes all the subjects of study (including physical training) belonging to his or her own class. They also had no special training for the work.

In the central hall, which measures 66 ft. by 12 ft., the physical work is done when the weather is unfavourable for doing it in the playground. Here also during five months of the winter time soup and bread is supplied to the scholars—the record number partaking in one day being 170. There are two large, well-drained playgrounds, in which, when the weather is suitable,

the exercises are done. Games in their season—cricket, football, baseball, etc.—are entered into with much spirit, the assistants and myself taking an active part with the children—a practice which, though depriving us of a fair amount of our spare time, has a most beneficial effect upon the tone of the school.

The gymnasium is situated midway between the boys' and the girls' playgrounds. It measures 30 ft. by 20 ft., and is fully equipped.

When physical training became a part of school work necessary to earn higher grants, the School Board arranged for the assistance of a military expert. Since this plan was instituted there have been three military physical instructors, each with a course of his own—a circumstance not very agreeable to the regular staff. The present one is Sergeant Edwards, of Ayr Barracks. He visits the school one hour every week, puts the classes in turn through their exercises, sees the teacher do the work, and checks mistakes. The teacher then carries on the work till the next visit of the sergeant to that particular class.

Boys and girls take the same exercises. The former have three hours a week, the latter one. The infant classes have half an hour, with odd minutes between lessons. Only those children who procure a medical certificate are exempt. (I have here a copy of my time-tables to show you.)

The training is divided into three parts—drill, physical exercises, and gymnastics, the last-named being optional. (Drill takes about a quarter of the time.)

All the exercises are according to the Aldershot cur-

Mr J. Turnbull.
27 May '02.

Games.

Gymnasium.

Expert supervision.

Boys at girls: allotted

Division of training

riculum, with, besides, special exercises for dumb-bells and bar-bells. The work for infants is slightly modified.

Such is a sketch of the physical training carried out in Alloway School, and I have no hesitation in saying that the benefits direct and indirect, derived are manifold.

The children take great delight in the work, and their parents are quite satisfied. The weak ones become stronger, the slow ones smarter, the slovenly are braced up, and the general health of all is improved, the whole having a telling effect upon the attendance. I should like to add a few general observations.

All teachers should receive a special training for the work and be examined by an expert.

The school staff should undertake the work under the supervision of a visiting instructor. The instructor could visit several schools in a district, and thus expense would be lessened.

Physical work should be done in the open air. The reasons are obvious.

There should be a universal system, so that the children of migratory parents could carry from one school to another the exercises, just as they carry the rules of grammar and arithmetic.

The other subjects of instruction do not suffer, but are benefited by the extra time devoted to the subject.

The list of subjects (necessary) is surely complete. The latest—free-arm drawing—is but a branch of a subject already on the list.

Not until the exercises are executed in perfect style should there be a musical accompaniment. It is quite impossible for a teacher to keep an eye on the movements of, say, fifty scholars, and at the same time play an accompaniment. For precision and accuracy the work is best done by numbers.

It would be a great advantage if the children were graded and taught according to their size and strength, but where there are two or three teachers this plan would cause endless disturbance of classes and lessons. Besides, teachers know their own flock best.

Children who are underfed are quite unable to do mental work, much less physical. It is the duty of every teacher who has the welfare of his pupils at heart to see that ample provision is made in the way of a sufficiency of proper food and clothing, and that cleanliness exists. Cases of neglect should at once be reported to the proper authorities.

Physical training should be made a branch of the work of the continuation school.

Lads from fourteen to eighteen years of age should be compelled to join a cadet corps, where, instead of the drudgery of everlastingly drilling, the attractions—all of a physical type—might be gymnastics, cross-country harriers, games, rifle shooting, etc.

These, in my opinion, if properly carried out, will make our young men fit to uphold the nation's welfare.

4566. *By Mr McCrae.*—Was the gymnasium erected by the School Board?—It was not, sir.

4567. How did it come into existence?—By my efforts in raising money. When the school was erected and physical training, as I have said, came into existence as a subject, I went round friends in the locality; we have many good friends; and I was able to collect the sum of £229 and, by means of school concerts, to furnish the gymnasium.

4568. It was all done by voluntary subscription, really?—The School Board gave me a contribution; I forget the amount now.

4569. I notice that you give the boys longer exercises than the girls?—That is so; the reason of that is the girls have three hours' sewing, and what are we to do with the boys during the sewing hours. The boys must get more of some subject than the girls; we might give them arithmetic, history or grammar, but we give them physical work.

4570. I notice you are in favour of a universal system?—Yes; it is a very great disadvantage for a boy coming to my school from another school knowing nothing about the training; his exercises—if he has any—are likely to be different from the exercises

we go through, and therefore I would have all schools to take the same system.

4571. Then your view would be that the Central Education Authority should have a scheme?—Yes.

4572. Drawn up, of course, in consultation with medical experts?—That is my opinion.

4573. And that that should be applicable all over Scotland?—All over.

4574. Would you allow any deviation from it at all?—I should certainly say that all essential work should be tabulated by the Board, and then, if the teacher liked, he might introduce a little extra work, but I would certainly have one system.

4575. Have you anything to do with the continuation schools?—No, I have nothing to do with the continuation schools.

4576. You could not give us any information with regard to them?—I am sorry I cannot. All I know is that in the town of Ayr nothing is done in the way of physical work.

4577. Not in the continuation schools; are you sure of that?—Not in the continuation schools.

4578. I notice that you say the lads from fourteen to eighteen should be compelled to join cadet corps?—Yes, I would make it compulsory.

4579. Do you think that Scotland is ripe for such a scheme?—I know that a great many of our young lads in the town of Ayr are just loungers, and I think it would be far better for them if they had some kind of compulsory physical recreation to take up their time.

4580. Do they go direct to employment after they leave school in your district?—In my district, if they do not attend the secondary school in the town of Ayr they go direct to employment.

4581. There is no interval between?—There is no interval between.

4582. *By Mr Alston.*—I notice in speaking of the universal system, which you desire, you say you prepared yourself a scheme of exercises from various books?—Yes, sir.

4583. How many books did you consult, for example?—I had Chesterton's book for one; I had a Glasgow book, I cannot at this moment tell you its name; at the time this physical work came about, there was a whole host of books upon the subject, but I was advised to get Chesterton's book. I am sorry I cannot tell you the name of the other.

4584. You consulted a good many?—Three books at least.

4585. Did you form an opinion as to which was the best for your purpose?—No; I just picked up a series of exercises which I thought would be best for the benefit of the children.

4586. Without consulting medical opinion?—Without consulting medical opinion.

4587. Do you know the Swedish drill at all?—I do not know it; I have never seen it; I have only read about it.

4588. You are quite satisfied that it would be a manifest advantage to the schools if one system were adopted?—Yes, I am quite of that opinion.

4589. You speak of musical accompaniment to the drill; on what account do you object to the musical accompaniment?—As I said, I would have the exercises done by word of command. When there is a musical accompaniment, unless the instructor is free to move about and watch the movements, the work is likely to be slovenly done, and therefore I would object to a musical accompaniment until everything was perfectly correct.

4590. You say so?—Yes.

4591. Because the instructor could not at the same time play?—Oh, no.

4592. But of course you could get a pianist?—Yes.

4593. Very often young ladies lend a hand in these matters?—Certainly; I sometimes ask a senior girl.

4594. You are quite satisfied that the drill should be perfectly learned without a musical accompaniment?—Certainly.

4595. And only then should they be treated to music?—Yes.

*Mr
J. Turnbull.*
27 May '02.

Cadet corps
for lads from
fourteen to
eighteen :
compulsory.

Uniform
system.

Music unde-
sirable at
first.

Mr
J. Turnbull,
27 May '02.

4596. Have you seen the defects of the musical accompaniment?—Yes; I am of opinion that if a lady sits down to play with, perhaps, forty-five children in the hall, it is quite impossible for her to play and at the same time keep her eye upon her pupils.

4597. Then as to the gymnasium; it is fully fitted up, I see; fully equipped?—Fully.

Gymnasium:
supervised.

4598. Then the exercises in the gymnasium; are they carried on under supervision of any kind?—Yes, there is the sergeant who comes from Ayr; he comes, as I have said, once a week, and he is in the gymnasium part of the time, and no exercise is given unless he or I am there.

4599. No boy could injure himself?—No boy is allowed in the gymnasium unless I am there.

Military drill.

4600. You do not refer to what we have been calling distinctively 'military drill' except in your second last paragraph, where you refer to cadet corps?—Yes.

4601. Is there any drill of the military kind in the school?—It is all military drill, this drill we go through; it is squad drill—forming fours, front forming, right forming—that is the drill with this unfortunate term attached to it.

4602. Without the use of any arms?—Without the use of any arms.

4603. Or with the officers or non-commissioned officers?—Without them.

4604. When you speak of cadet corps, all that is implied?—Yes.

Continuation
Classes.

4605. Then you think the military drill in itself—the mere movements in military drill—would not be sufficient attraction for the boys in continuation classes?—Well, I do not know; you might repeat your question, please.

4606. The military drill in the mere formation of fours or marching, such as you do in the school, suppose you in the continuation classes introduced that in rather a fuller form, would it be sufficient to attract the boys, not of course under compulsion, but would it attract them naturally?—I am afraid it would not.

4607. You therefore think the cadet corps would be the greatest attraction, with all the subsidiary matters which you name here—namely, gymnastics, cross-country harriers, games, rifle shooting, etc.?—So much time is given nowadays to football and other sports, which are entirely outside any system except a club, I think that these might attract young men.

4608. Is there any school near you where a cadet corps could be raised?—In the town of Ayr there is a secondary school.

4609. In your neighbourhood is there any feeling against military drill of any kind?—I have never heard it expressed.

4610. Not among the general public?—No.

4611. *By Sir Henry Craik.*—Neither you yourself nor your assistants have had any special training for this work?—None, sir.

4612. Do you do it solely from studying it in a book?—Solely from the book and what I had seen.

4613. You have not been a volunteer officer?—I have not.

4614. And the assistants, how did they learn to do it?—Principally from me and from the military men who trained us; we have had three military men.

4615. What did they do; they had classes?—The military men?

4616. Yes?—Yes, they came; for instance, the military man comes to-day, he has my class, spends the whole hour, goes through the exercises, and shows me what I am to do during the interval till his next visit. That is the training we have had.

Teachers'
classes under
Art. 91. (d).

4617. And there have been no classes for teachers in the subject under Article 91 (d) of the Code?—There have been classes in Ayr.

4618. For physical drill?—For the teachers?

4619. Yes?—From the Aberdeen Training College, I think it was.

4620. And these were done under the Article of the Code?—I think so.

4621. And received grants?—I could not say. You

understand me. It is on the Aberdeen system; there is a physical training college there—Cruden's.

4622. I quite understand that, but I rather wanted to know what provision there was for training teachers and how far that was used. I do not refer to the institution or the system, but rather to the grant that is given for it?—Well, I do not know that there is any grant given; the teachers paid so much.

4623. The teachers have paid for it?—I think so.

4624. Then you did not know that the Code did allow classes to be formed for teachers?—Oh, yes, I knew that, but it is only within the last two years that there has been such a thing in Ayr.

4625. Yes, but it has been even in the last two years; whether it is within the last two years or not you have means now of getting your teachers trained through the Code?—Yes. Yes, I know that.

4626. What I want to know is, has use been made of the Article of the Code in training teachers for the physical drill?—In the case of Ayr it has been; they came from all the surrounding districts.

4627. Then you would send your assistants to such a class?—I would not think of sending them when we have got the man at home.

4628. Oh, no; but if there was a new man?—When we have got a man within our own doors—and a splendid man—it is like private tuition.

4629. With regard to games, have you given them any instruction in games?—Oh, well, we are cricketing regularly. We have a very large playground, as I have said, and we have a field—a very nice field, where games are carried on by the boys—and the girls are not neglected.

Games
playg
and fi

4630. Was that field provided by the School Board?—Oh, no.

4631. Voluntary contributions?—Yes.

4632. *By Professor Ogston.*—There is one part of your evidence that is not very clearly expressed, if you will forgive me: 'And so I prepared a scheme of exercises from various books on the subject, and these were executed out of school hours': was that the preparation of the scheme that was executed out of school hours, or the exercises?—The exercises were done after school hours—after four o'clock.

4633. You still do so?—Oh, no; it is part of the work upon our time-table now.

4634. How many medically exempt children have you?—I do not believe that in the five years there have been more than half a dozen.

Child
medi
exen
unde
very

4635. Out of your 229 annual pupils?—Yes.

4636. How many children are underfed?—In my case, a very, very few; I could put them, perhaps, at less than a dozen.

4637. Out of 229?—Yes.

4638. *By Mr Fergusson.*—Though you yourself and your assistants received no special training, and you have not found any disadvantage, still you think that for the schools of Scotland it would be necessary to have some special teaching for schoolmasters?—I do.

Teac s.

4639. You do not know much about the classes that have been carried on for teachers?—It is only hearsay; I have only heard about those classes.

4640. Did hearsay say they were satisfactory or unsatisfactory?—Well, it had not a very high opinion of them.

4641. And they have not been much taken advantage of. You tell us that before your new school was built you did not go in for much physical training?—For the pupils?

4642. Yes?—No, we had no room.

4643. Since 1895 you have done a good deal and an increasing amount. Could you tell us whether you see any effect on the children; are the children in any way better than they were before 1895, when you did no physical training whatever?—Well, I really think that they are sharper and stronger. If we may judge by their strength, at the end of a term they can do their exercises with much more vigour, and when taken to the gymnasium a boy who could not lift himself off the floor will now pull himself up to his chest four or five times.

Phy
trai
ben
al.

4644. But has that had any effect on their general health; do you think you can see an improvement; do you think that it enables them to do their book work better?—Well, I think it certainly freshens them up. During a lesson in grammar or geography we sometimes stop and have a few exercises. Even that itself does a good deal to brighten them up.

4645. And interests them generally in their work?—Yes.

4646. You take three hours off your school day for the physical training of the boys, and you think that it certainly has not lowered the standard of your book work?—I am quite sure of it.

4647. My lord, as we are so often told that it is impossible to spare more than half an hour, and this witness speaks to three hours, and the point is a very important one; may I ask that the last report by His Majesty's Inspector on this school be read by the Secretary?

By the Secretary.—‘This school is conducted on thoroughly sound lines, and in every department the children are receiving a training of the highest educational value. Faultless discipline is maintained without effort, and the whole tone of the school is admirable. The instruction keeps well in view the importance of training the intelligence of the children, who in consequence show in all their work great readiness and resource. The form of the written work is particularly fine. In some of the junior classes greater speed in summing might be secured by systematic drill in the arithmetical tables. Drawing is very good. Singing and needle work are taught with marked success. A specially pleasing feature is the attention which is given to drill and gymnastics, which have been developed to such an extent as to give the school a unique position in the district.’

4648. *By Mr Fergusson.*—I take it from His Majesty's Inspector's report that it seems to say that the three hours devoted to physical training has had no bad effect on the book work of the school?—Oh, I know from experience that it has not.

4649. And putting it farther, your scholars have to compete for bursaries and in other ways with the children of all the surrounding districts, and the burgh schools; what are your results there?—The results in these competitions, which are open to the greater part of South Ayrshire and to the Ayr Burgh schools, are that we always hold our own; indeed, we have gained two and sometimes three bursaries every year, and twice topped the list. In an examination held during the past month we took the first and third places against all the town schools, and I can safely say that we have not a bit gone back because of the amount of the physical work. I may say further that the children have no home work. I do not give them home lessons to do; the work is all done in school, because I think the children who come long journeys ought to spend their time in play, and then I find them much better when they come in the morning.

4650. And still you can get these results?—And still I have got these results.

4651. You are not afraid to compare with anybody else?—No.

4652. Then as to the games; you say you look after their games—a practice which, though depriving us of a fair amount of our spare time, has a most beneficial effect upon the tone of the school? I suppose you could hardly expect everybody to do that?—Oh, no.

4653. But is there any plan you could suggest by which more attention might be given to teaching the children how to play games properly?—Well, if the teacher is an enthusiast he will find a means of entertaining his children, taking an interest in the games, and teaching them properly; there are several ways he can do it. I get the boys to draw a plan of the playground on the blackboard showing the various positions in cricket. Likewise the girls; they have drawn a plan on the blackboard showing where they stand when playing rounders.

4654. You are not afraid to devote some of your

school time to showing them these things?—Oh, not a bit; we even started them during the winter time with ping-pong. Not during school hours, of course. We try to interest them in all work.

4655. We have been told once or twice of the overcrowding of the curriculum, which, I see, you refer to; have you any spare time; could you take on any more subjects?—No, I could not; you have them all here. Reading, writing, arithmetic, mental arithmetic, needlework, singing, history, geography, nature knowledge, grammar and analysis, poetry, drill, drawing, spelling, Bible and composition. There is the whole collection here.

4656. But still you will not say that it is overcrowded at the present moment?—I have got enough, and I wish no more; so far as we are concerned, we are full up.

4657. You distinctly say that each boy gets three hours—because in asking a previous witness about that I said: ‘I suppose the time-tables would show?’ and he said, ‘The time-tables are misleading.’ Now, you have got your time-tables there; do they show what every class is doing at every moment of the day?—Yes, you may come, and you will find everything going on according to the time-tables; any divergence is entered in the log.

4658. A time-table that is misleading is not a time-table at all?—I cannot see that any time-table should be misleading; it is against the regulations.

4659. Now one question about the feeding. You say there are not many of your children who are underfed. The children of the ploughman class and farm labourers are probably your poorest?—A few of the farm labourers, especially that migratory population which is continually on the move.

4660. Well, quite apart from that, you carry out a system of giving broth and bread to your children during the winter months?—For five months.

4661. Not entirely because they would be underfed if you did not give them that, but you find that it is convenient. The parents like it; it is a convenient way of feeding the children?—Oh, yes, and in a great many cases it is the best food they get during the day.

4662. The best meal of the day. Well, do you think that has any marked effect on their general condition?—Oh, yes; we can get more work out of them.

4663. You can get more work out of them?—I am quite sure of that.

4664. Both mentally and physically?—Yes; they get a good basin of the very best soup—as much as they can take—and bread.

4665. And you see the benefit; you are sure of it. —I am quite sure of it.

4666. Just one other matter. Do you find any difficulty with the boots—the country boots that your children wear—doing some of your exercises, tiptoe exercises and so on?—No, I find no difficulty in that. The biggest difficulty occurs during the summer months, when the children come barefoot.

4667. You do not like bare feet?—Not in the playground. The playground has been covered for some time with granite chips. It is very sore upon the feet; but when we take them to the hall, then it is all right.

4668. We were told that the boots were so stiff that it was impossible to get the ankle-work and the foot-work that was desirable?—I have never noticed that, nor has the sergeant said anything to me about it.

4669. But still you have shoes for the purpose?—We have shoes for the purpose. We have gymnastic shoes, and we have strong leather shoes which the children wear on wet days if they come with wet feet.

4670. If you want to provide shoes or anything of that sort, have you not found that there is no easier way of getting money than by the aid of the children's concerts or other entertainments given by them—you can always make money that way?—That is the way it has been done in the past.

4671. Do you think it would be useful to put ideas of this sort before School Boards; not in the way of making anything compulsory, but simply suggesting

Mr J. Turnbull,
27 May '02.

Curriculum.

Feeding.

Meals given.

Boots.

Financial aid:
concerts, etc.

Mr
J. Turnbull.
27 May '02.

matters to them which have been found to work well in other places, but which they may never have thought of. Do you think this would be useful?—It would certainly be useful.

4672. Is this way of raising money for school purposes much used?—I know of one—the neighbouring schoolmaster, in Dalrymple, does the same thing; he gets up entertainments for the purpose of providing dumb-bells, bar-bells, etc.

4673. It is not necessary that everything should be put on the rates?—Not at all.

4674. *By Mr Shaw Stewart.*—You have had considerable experience of both games and physical exercises in your school?—Yes, sir.

4675. I would like to ask you this; I quite understand that games are very good for the tone of the school, but do you consider that physical exercises are more valuable for the development of the weakly boys than games, if you have to compare the two?—I would certainly advocate physical exercises, because in them there is a regular course gone through for every part of the body, the exercises are drawn up with this aim in view, whereas in games they do not do that.

4676. And the least strong boys in games may perhaps not be taking any useful part at all?—None whatever—sitting aside.

4677. So that in your view this Commission ought to pay particular attention to the value of physical exercises?—Yes.

4678. Regularly carried out?—Regularly carried out.

4679. *By Sir Thomas Coats.*—I should just like to ask one or two questions to emphasise what you have already said about the physical training of children: do you consider physical training essential to the health and welfare of the children?—I certainly do consider that physical training is for the health of the children, and if their health is improved, surely it should combine with their welfare.

4680. Then you would put physical training first, that is, that you would make that an essential part of the training; whatever else must go, you would devote an adequate amount of time to physical training?—I would, sir.

4681. Do the children remain in your school for a considerable length of time; I mean the same children; do you bring them on from the infant department until they leave school, or are there many changes?—There are a great number who remain from the beginning to the end. There are a few who pass out of our hands every year, but the children that do remain we know perfectly well what an improvement has been wrought upon them by the work. Between forty and fifty come and go in the year.

4682. Then by your system of training do you carry the children from one standard to another, that is, in the higher standards, do you give them an increased and altered system of drill so as to bring the training on from the infants to those who leave?—The infants do exercises without appliances; the stronger boys—the boys about to leave school—work with dumb-bells, gradually increasing the weight of the dumb-bells and the bar-bells.

4683. If you had time you would give the girls the same amount of physical training that you give the boys; you see the sewing takes up their time?—Yes.

4684. Do you consider it beneficial to the girls to give them the same amount of time that you give to the boys?—I would certainly consider it beneficial to the girls.

4685. In the different subjects in your time-table that you ran over, I do not think I heard you say anything about cooking; do you give cooking in the schools?—No, we have no cooking.

4686. Might I ask if the girls in your school get an opportunity of learning cooking in their homes?—Well, I would certainly say they do.

4687. The reason I ask is this, in manufacturing towns girls are married direct from the factory, and have no training in cooking, except what they get at school.

4688. And no sloyd work?—None.

4689. Regarding the underfed children, you say they ought to be looked after, but how would you look after these children. We know that you do it in your own school; there is a system of doing it; but in schools generally, say in town schools, how would you suggest that these poorly-fed children should be looked after?—Well, were I an assistant and found a boy in my class whom I knew from his appearance and from his conduct in his daily lessons was underfed, I would report that to the headmaster. Surely it would be the headmaster's business to report the matter to the proper authorities, such as the Parish Council, that they may enquire into the affairs and see if this child was being sent out improperly fed.

4690. That is trying to compel the parents to feed their children properly?—That is so.

4691. You think it is more neglect than the want of the necessary means?—Yes, I think so.

4692. Then with regard to the evening classes, you say you would make physical training compulsory from fourteen to eighteen, but is that all the training you would advise in regard to evening classes; would you not make them take up other subjects as well, and make physical training a part of the course?—Oh, certainly, I mean that.

4693. You mean that. I did not quite understand.

4694. And you think there would be little difficulty in inducing the children to attend evening classes?—Oh, there would be a difficulty.

4695. Would that be on the part of the parents or the part of the children?—It would be on the part of the children, I think. I am afraid the children—

4696. *By the Chairman.*—You said you thought the children would object to that; do you find the children are very glad when their school time is over?—Oh, no.

4697. I rather gathered that you made it so pleasant for them that they were sorry to leave it?—They have before now asked me to spend the time in the gymnasium rather than have a half-holiday. They are very fond of the gymnasium.

4698. You have not been asked any questions about work on Saturday; how do you think that would answer?—On Saturday?

4699. Well, in any sort of shape, that is to say, interfering with the Saturday in any way; it would be very unpopular, would it not? I am afraid of that; do you mean who would carry it?—The teacher? the teacher to be employed on the Saturday?

4700. That would not be popular?—Oh, no, we must have our Saturday.

4701. And the children say the same, 'And we must have our day'?—Well, no, oh, no. If the children were taken in hand by someone who would interest them in play, for instance, in games or physical work; I know perfectly well I could get many of the children to come to me on Saturdays.

4702. Otherwise, speaking seriously, you think that it would be very hard on the teachers if their holiday was infringed upon in any way?—Yes, I think so.

4703. It is infringed to a certain extent, that they have to get their own teaching; they have to learn training sometimes on Saturdays, have they not?—Yes, that is the case; a number of them attend classes for woodwork, and for free-arm drawing, etc.

4704. That is one thing, and this would be quite another thing?—Quite another thing.

4705. And you said you did not give your children anything to do at their homes; why is that?—Because what they do at their homes is very often done by some other body, and a great many of them have not a proper place to do it.

4706. But you are very singular in that practice, are you not?—Yes, I know we are.

4707. Why do other teachers give the children work to do in their homes?—I cannot say, unless it is because they are unable to overtake the work in school.

4708. But it is almost universal in Scotland, is it not?—Well, I would not say that.

Games versus
physical
exercises.

Physical
training most
essential.

Progressive
system.

Girls and
boys should
receive same
amount of
training.

4709. Do you know any other instance?—Where they do not go in for it?

4710. Yes?—I could not say.

4711. Do you know or do you not know?—I do not. You understand what I mean when I say no home work. If I give a child a short exercise to write down it will only take that child five or ten minutes to do the work. In some schools they give them as much as keeps them till ten o'clock at night.

4712. And after they have had their walk of two or three miles?—Two or three miles. In my case it would be perfectly ridiculous. Some of these children leave home at seven o'clock in the morning, and they do not return until six at night; they are perfectly done when they reach home, and could do no more work.

4713. When you say they are perfectly done, are they all the more done by having had physical exercises in school?—No, I do not say that. We give them a great amount of mental work, keep them busy all the day long, and then they have the long walk home. When the children leave school they take out their snack—their bits of bread—which is a good thing for them; the great majority of them do this when they leave school at four o'clock.

4714. What is the custom with regard to flitting—farm servants—do they flit half yearly or yearly?—Generally yearly.

4715. Does not that disturb your school very much?—Very much, that is one of the greatest drawbacks to my school, a certain portion of the population is continually moving.

4716. That is one of the principal reasons why you want a definite curriculum of physical training for every school?—Yes.

4717. A standard?—A standard.

4718. *By the Hon. Thomas Cochrane.*—I think Alloway is rather specially situated?—Yes, I must say we are specially situated.

4719. You have got a good many well-to-do families all round?—Yes, that is so.

4720. Perhaps they are gardeners and coachmen that you alluded to as sending their children?—Yes.

4721. We must not particularise too much from your experience?—No, it would be a mistake.

4722. They are the children, the sons and daughters of the gardeners and coachmen: they are a higher class—a little more intelligent than the agricultural labourers?—Oh, they are, yes.

4723. More ready to assimilate knowledge, and when you say you do not give out any home work, do you think that in some instances the fathers and mothers do not give them a sort of coaching at home?—Well, I do not think that there is much coaching at home.

4724. I was rather asking from the experience of my own coachman; I know he tells me—he is a very well-educated man—that he gives a little private teaching to his children when they come home?—It depends on the school they attend. It may be the work of a secondary department, and they are not able to overtake all the work in school.

4725. But we cannot take you as quite a type of an ordinary Scotch country school, the class of children that you have?—Oh, I think you might; a country school in Ayrshire.

4726. I see that you recommend that there should be some fixed scheme of drill and training; you think that would be an advantage?—I think so; I am quite sure of it.

4727. Do you recommend any special scheme?—I have no special scheme to recommend.

4728. Have you seen the manual of drill by Chesterton—his latest?—I have seen one of his books some time ago.

4729. This one (*showing*)?—No, I have not seen that.

4730. The advantage you derive from that would be that the course of training would be continuous in school?—All over—continuous.

4731. And you see no drawback to it; that any

individual school might require a different system of training?—No, I do not see it; I think there could be a system that might be adopted by all schools.

4732. A uniform system?—I think so—a great amount of it can be done in the school, in the classroom.

4733. There is one paragraph here that is not quite clear to me; the list of subjects is surely complete?—Yes, it is surely. Curriculum.

4734. Is that a euphemism rather for overcrowded?—I mean to say it is complete, sure enough, without any more. Some would like to introduce Cooking, others Woodwork.

4735. In the marginal note you put 'overcrowded curriculum'; you go a step further in the marginal note?—It was in regard to the talk of so many new subjects being added. That is why I put 'overcrowded' in the marginal note. So far as we are concerned we are not overcrowded.

4736. You were not overcrowded?—I am not overcrowded; you see there is no Cooking in our school and no Woodwork.

4737. You read out a good list of subjects which you taught in your school, but it seemed to me that some of the items really were only parts of the ordinary instruction?—Quite so, that is right.

4738. For instance, reading, prose and poetry, grammar and composition, would all come under the proper teaching of English?—Yes.

4739. You could not teach English without these subjects?—Oh, no.

4740. From the results you have obtained, your curriculum does not seem really to be overcrowded?—No.

4741. You think the children are quite able to learn all that you have down in the time?—Quite able.

4742. There is only one other question, the latter part of which rather answers the former of it, that is, the grading of classes. You think it would be of great advantage if the children were graded?—Yes. Grading of classes.

4743. Then, I think, the objections you add at the end, 'it would cause endless disturbance of classes and lessons; besides, teachers know their own flock best'?—Well, the sergeant would like to have them all in the class doing physical work of the same height; he would like to put this one into the next class, and so on, but that would interfere very much with the class work, and upset all the arrangements.

4744. You are satisfied with the ordinary class grading?—Yes, and if I find any particular child unable to get on with the work of his own class, I give that child less work to do.

4745. And you think the advantage on the whole is rather in favour of the children being taught by their own teachers?—Yes. Teachers: ordinary staff plus experts.

4746. Supervised by a qualified instructor?—That is my opinion.

4747. That they take a greater interest and obey their own teachers probably more promptly and better?—They do.

4748. I should only like to ask you further whether you have had any technical classes for technical instruction?—None in my school. You see we are within two miles of Ayr, and if any wish they may attend the science and technical classes there. Some of them do attend them—boys and girls who have got the Merit Certificate.

4749. They go to learn cooking, some of the girls?—No, I have no girls going to the cooking.

4750. Dairying?—No.

4751. I forget what technical classes are available at Ayr?—It is under the County Council. There is dressmaking, I think: and there is cooking, I am sure, but beyond that I do not know.

4752. There is not much being done?—No, I do not think so.

4753. *By Mr Alston.*—In answer to Mr Fergusson, you told us that with the very full amount of physical training, such as you are able to put into your school week, there was no interference with the other branches of study, that they were not any the worse of the con-

Mr
J. Turnbull.
27 May '02.

siderable amount of physical training which you have been able to carry out. Would you go further and say that the children were the better of the physical training in regard to other studies?—Yes, I should go further and say they were the better for it.

4754. Brighter?—Brighter, yes.

4755. More alert?—Smarter in every way.

4756. And amenable to discipline?—Yes.

4757. That also improves the other branches of the school curriculum?—I am quite sure of it.

4758. *By Mr Ferguson.*—I do not know if you quite understood, or whether I quite understood, when Mr Cochrane was asking you whether Alloway was a fair example of a school. It is true, as you say, that there are a large number of coachmen's children and gardeners' children, and so on; but is it not really a very good example, because you have every class of child that you can imagine. You have gardeners and coachmen, farm labourers, farmers, factors—you have got every sort of child, have you not?—The only one we want is the minister's.

4759. You have got an experience of every class of child?—Yes.

4760. And therefore you can form a very fair judgment?—Yes.

4761. There is one other point that I do not think you were asked, as to medical supervision; would you

Medical
inspection:
unnecessary.

desire any medical supervision of your school; that it should be examined medically at the beginning of your school time or any other time?—So far as I am concerned I have never seen any reason that we should.

4762. You think that with your experience and the female teachers, and all accustomed to children, you can see pretty well if there is anything wrong?—Yes, I think I consider myself quite able to notice when anything is wrong.

4763. Would you object to a doctor looking at your children at the beginning of every school term?—Not at all. In our case it would be superfluous, as the parents are ever ready to call in medical advice.

4764. Then what about the school premises; would you like the sanitary inspector to inspect your school premises at intervals; would you think it was a good thing generally?—I have seen school premises which were not in a very pleasant condition, and would have been the better of a visit from a sanitary inspector.

4765. Within your knowledge school premises are not always as sanitary as they should be?—That is so.

4766. And you see no reason why the sanitary inspector should not look at the school as well as at the pig-sty?—But if the teacher is doing his duty—

4767. That is an 'if.' You think it might do good in some cases?—I do.

The witness withdrew.

Mr
A. Andrew,
B.A. Lond.

MR ARCHIBALD ANDREW, B.A. Lond., examined.

4768. *By the Chairman.*—You are headmaster of Ochiltree Public School?—Yes.

4769. Just read through your notes, please, will you?—I. The system of physical training obtaining in Ochiltree day school is that of Colonel Cruden (Aberdeen), with the use of dumb-bells, bar-bells, and Indian clubs to music (vocal and instrumental).

II.—Continuation Classes.—Evening classes have been held here, but not continuously, and there was no physical drill given.

The following exercises suggest themselves as appropriate in a system of physical training.

1.—Day Schools.

(a) Dumb-bell, cross-bar, Indian club and bar-bell exercises, and the skipping rope.

(b) Football, swimming, cricket, and tennis.

2.—Evening Continuation Classes.

(a) Fencing.

(b) Football, swimming, etc.

(c) Formation of branches of Boys' Brigade.

It may be observed that in a system of physical training, all the above exercises could not be introduced in schools in country districts.

Under any system there should be sufficient accommodation and efficient and systematic instruction.

Schools in country districts are placed at a disadvantage for variety of drill and physical culture compared with the larger schools in populous centres.

Students should undergo a systematic course of training, together with military drill, during their period of training as teachers.

In the event of School Board areas being extended, country schools would be benefited by the appointment of a competent instructor and school officer for the district.

As an aid to all-round development, I am of opinion that it is desirable to form rifle clubs in parishes or districts, and that every youth be required to attend meetings for practice in shooting and for drill on the volunteer or other similar system.

4770. For the convenience of the Commission, would you kindly state what sort of a school yours is, what your average attendance is, and what class of children attend it; what sort of a school to begin with. Is it a country school?—It is a country school.

4771. And the average number in attendance?—The average number in attendance last year was 127 or 128—128, I think, so far as I recollect; but the

Ochiltree:
description.

number on the roll is 145 just now. Six years ago it was 170.

4772. What is the population of the parish, do you know?—The population of the parish is about 2000; but the number of children just now is low. It depends upon the crop of children at the time. It is likely to rise, if anything, now.

4773. *By Mr Shaw Stewart.*—I see in your suggested list of four items you make no mention of free movements. You start at once with dumb-bells, cross-bars, Indian clubs, and so on. Have you left them out intentionally—physical drill without apparatus of any sort—or have you intended it to be understood that you begin with that?—We have had no drill except with dumb-bells and bar-bells and Indian clubs. We have no free exercises.

4774. No free exercises at all?—No, we continue with the dumb-bells and bar-bells and Indian clubs and cross-bars.

4775. Is that following Colonel Cruden's system?—Yes, Colonel Cruden has free exercises, but we never introduced the free exercises at all. We got dumb-bells, bar-bells, and Indian clubs, and have continued with these.

4776. Is that because you have not time or because you do not attach so much value to the free movements?—Well, we have never started the free movements. We have adopted these without considering the free exercises at all, because the dumb-bells and the bar-bells give them something in their hand.

4777. You have not studied the value of the free movements?—No.

4778. I see you do the movements to music?—Yes.

4779. How do you correct mistakes in the individual pupils while the music is going on?—Before taking them to music, we usually go over the exercises carefully first.

4780. Then you do not use the music until they are fairly perfect?—Not until they are fairly perfect.

4781. Have you any experience in evening continuation classes?—Very little.

4782. *By Mr Ferguson.*—Who superintends your physical training in Ochiltree?—I do it myself.

4783. But have you no trained instructor?—No.

4784. Never?—No. A number of teachers two years ago had lessons from Colonel Cruden's instructor.

4785. Would you like to have now and then a visit from an expert just to supervise the work and to give

J. Turnbull

Sanitary
inspector.

A. Andrew
B.A. Lond.

Exercise
given.

Musi

Expe
ance

you hints?—Well, I think that would be preferable.

4786. Have you never tried to have that?—When physical drill was introduced, I tried to arrange with a neighbouring parish, but failed to do so.

4787. But if arrangements were made so that every now and again you could have a visit from a trained instructor, would you welcome that?—Well, I think that would be preferable, as I have stated here.

4788. *Mr Alston*.—Among other things suggested to be tried is the formation of branches of the Boys' Brigade?—Yes.

4789. You refer of course to the country generally, because in a small parish like Ochiltree?—We have our Boys' Brigade in Ochiltree.

4790. Connected with one of the churches?—Yes, with the two churches—Parish and U.F. churches.

4791. And you could not increase the number of companies; they must be connected, you know, with a Christian organisation?—Yes.

4792. You could not increase the number of companies in Ochiltree?—No; but the number in the company at present might be increased in that connection.

4793. Your remark must refer to the formation of such companies over the country as far as possible; that would be one of the advantages you would desire to have?—Yes.

4794. Then you speak about the students undertaking a systematic course of training; you mean the future teachers?—Yes; students as teachers.

4795. And you would have these teachers thoroughly instructed?—Yes.

4796. Do you know their sentiments towards the introduction of physical training into the schools; are the teachers all favourable towards it?—Yes, I think they are generally favourable. Some complain of not having sufficient time, that is the only thing.

4797. That is the only objection they have?—Yes. Some take it too long at a time; but there is a general inclination for it.

4798. You refer also to military drill?—Yes.

4799. Do you mean more than simple movements—turnings, etc.?—Well, I would not do more than simple movements amongst boys.

4800. When you speak of Boys' Brigade companies, that means purely military drill?—Yes.

4801. But in the school you would simply have marching movements?—Marching movements and turnings; simple drill.

4802. Would you prefer to have an expert coming regularly to examine them?—Yes, it would be preferable, but that would only be in larger areas as a rule; small school boards would not combine; I am afraid it could not very well be done, that is my opinion.

4803. Only one more question. Is there any objection on the part of parents, or the general public, to military drill such as is practised in the Boys' Brigade?—Well, one or two have had a feeling thinking that it has a tendency to militarism, but that is a mistaken idea altogether.

4804. And that idea is exceptional?—Oh, yes, quite exceptional.

4805. Have you had any objection on the part of parents as to giving girls physical drill?—No, none. There are a few delicate children, but, of course, they are let off.

4806. They, of course, would be exempted at any rate?—But there is no general feeling against it by any means.

4807. *By Mr McCrae*.—What time per week do you give to physical drill?—I take boys on Thursday about half an hour and the girls on Friday, half an hour.

4808. That is half an hour per week each?—Half an hour per week each; yes.

4809. At what age do you start them with the physical drill?—We take the whole school always.

4810. Do you start the very youngest ones with dumb-bells?—No, not with dumb-bells. I think free exercises were mentioned; I should have said that the

female assistant gives free exercises. I leave them partly to her. These are free exercises.

4811. That is what I thought?—I should have said so.

4812. *By Mr Shaw Stewart*.—But there is only half an hour a week?—Yes. Just about half an hour a week.

4813. *By Mr McCrae*.—And that is done without dumb-bells?—That is done without dumb-bells from the infants up to what we call the second standard—about eight or nine years of age, all above that age have dumb-bells or bar-bells, and the very oldest, Indian clubs—a few of the senior boys and girls.

4814. I notice in the last paragraph you recommend shooting; I suppose that is more from a patriotic view than from the point of physical development?—Well, it is partly that too; I think it is part of physical and national development to have rifle practice certainly.

4815. And do you recommend that the rifle club should be formed in the parish or in connection with the school?—It should be formed in connection with the parish or district.

4816. By whom?—Well, in the Dalmellington district (Ayrshire) there is a rifle association, and there is a feeling generally to have a rifle association in our own parish, not of the youngsters, but of the lads of from seventeen or upwards, young lads and men—adults.

4817. *By the Hon. Thomas Cochrane*.—You alluded to the Dalmellington range; that is kept up by the enthusiasm of Mr Thorneycroft, I think, very largely?—Yes; I am not a member of it, but a neighbour teacher of mine is an enthusiastic member of it; I heard him speak of it.

4818. I believe they appreciate it very much?—Yes, they do.

4819. You do not directly see the effect of physical training upon your scholars, but I understand you approve very highly of physical training?—Oh, yes; it is a relief from ordinary work sometimes, and if it is not carried too far to make it worrying and wearying to them, it is certainly a capital exercise for them, there is no doubt.

4820. And they appreciate it?—Oh, yes.

4821. You think that the system of physical training could not be introduced more in schools in country districts, I see?—Well, not all that is mentioned here; we might have fencing. Football and some of the other exercises here, of course, are more or less left to voluntary societies. Such as swimming—we could hardly have it in country places.

4822. You could have all these under heading football, cross-bar, Indian club, bar-bell exercises, and skipping rope?—Yes, I have sufficient accommodation in the school for the exercises you mention. During wintry weather, such as last winter, it would be very seldom that we could have these outside.

4823. Are your floors graded with fixed seats?—Fixed seats, yes, but there is a good deal of floor space in front of the desks.

4824. Do you approve of graded-in schools, and fixed seats?—You mean rising.

4825. Yes, rising?—Yes.

4826. Do you find any advantage in them?—Yes.

4827. It rather reduces the floor space for the purpose of drill?—It would not reduce the floor space. We have plenty of floor space in front, even though we had a gallery.

4828. You have sufficient space in your school to go through physical exercises?—Yes, but not in all schools; some would require accommodation.

4829. *By the Chairman*.—When was your school last inspected in physical training?—It was inspected at the annual examination—that is in November.

4830. When was it last inspected—last November?—Yes.

4831. By whom?—By Mr Lobban, H.M. Inspector of Schools.

4832. He examined it, and what did he say; shortly, what was his report about it, on physical training only?—Yes, that was mentioned in the general report. I

could not exactly say, but he approved of the drill that we took, in general terms. I do not recollect exactly what he said, but we showed him specially the exercises we had in bar-bells and dumb-bells and Indian clubs.

4833. What sort of length of time did that inspection take?—Of the physical training?

4834. Yes?—Of the drill?

4835. Yes?—A quarter of an hour, I think.

4836. For the whole school?—No, he took specimens of the different exercises in the senior division only.

4837. But is it his custom to examine every one or to take specimen children; I mean, is there room for it?—It is his custom to take the classes as a whole, not individuals.

4838. So that every child in the school is examined in physical training?—Yes; not individually, but as a class. We have two divisions in our school; the junior division is managed by a lady assistant, and she gives the free exercises as I have stated. Mr Lobban took the senior department. The boys and girls were taken separately in different exercises, some with Indian clubs, some with dumb-bells. They were both examined with dumb-bells, and some of the bigger boys with Indian clubs.

4839. *By Mr Fergusson.*—I had not seen that report when I asked you—that very excellent report by the inspector on your school. Now, do you attribute any of the very excellent results that are mentioned there to your physical training, or do you think you would get just as good results if you had no physical training

Report on
school.

The witness withdrew.

Mr
A. Moody,

MR ALEXANDER MOODY, examined.

4848. *By the Chairman.*—You are the headmaster of St Quivox Public School?—I am.

4849. Where is that?—It is about two miles from the town of Ayr.

4850. How many children have you in your school in average attendance?—In average attendance about ninety.

4851. You have no room I see in your school for physical training?—No floor space, my lord.

4852. That is on account of the space taken up by the desks?—That is the fact.

4853. In stormy weather, which I suppose sometimes happens in Ayrshire, like everywhere else, then there is no physical training?—Well, the days that we cannot take it; supposing it is a very very stormy day to-day, I take it next day if it is a good day.

4854. And you think that if there were a shed put up in the playground it would be of great advantage?—I think so, in all rural schools, as a shelter for the children; but it would act as a drill place too.

4855. You have no experience of continuation classes, have you?—None, my lord.

4856. But you have the idea that the physical training required in the day schools should be carried into the continuation classes?—I have; yes.

4857. With the addition of cross-bar exercises, fencing, swimming, cricket, and so forth?—Yes, my lord.

4858. Does that include football?—Well, of course, football is a thing that is coming in; I scarcely thought I would suggest.

4859. I did not know whether it was in the word ' &c. ' ?—I meant that.

4860. You also suggest the formation of Boys' Brigades and rifle shooting clubs?—I do, my lord.

4861. Is that for their own benefit physically or for any other reason?—Well, shooting is a great thing nowadays, and I thought, perhaps, after they come to the age of being able to handle a rifle that it would be better to have it.

4862. That they would be none the worse for it?—That they would be none the worse for it.

4863. What is the system that you go on in your school?—Colonel Cruden's system.

Floor space.

Covered shed.

Continuation
Classes.

Boys' Brigade.

Cruden's
system.

whatever?—I think the report would have been quite independent of the physical training; but the physical training was part of the work examined, and is included in the general report.

4840. What I meant was, does it help your book work; does it brighten up your children?—Oh, yes, certainly.

4841. I do not think physical training is specially mentioned there, but it is a most admirable report?—It is referred to.

4842. *By Sir Henry Craik.*—I wish to correct one point about that. You said this was at the end of the school year?—No; the end of the school year is in January.

4843. That, perhaps, gave rather a false impression that the Inspector only visited at the end of the school year?—Yes, during the course of the school year; it was in November he came.

4844. He does not necessarily come at the end of the school year; he comes at an unannounced time?—An unannounced time, and Mr Lobban is arranging the work of inspection.

4845. Never mind Mr Lobban; what I want the Commission to understand is that he comes at any time during the school year that he pleases?—Any time.

4846. And last year he did not come at the end of the school year, but during the course of the school year?—Yes.

4847. And he might come two or three times?—Yes, two or three times, any time.

4864. And who teaches that?—I do.

4865. Only; or have you any assistance?—No one but myself.

4866. You have not got this ex-army man that I see you recommend to be appointed instructor?—No.

4867. You think it would be an advantage?—It would be.

4868. And a help to you?—And where there are two or three parishes contingent he could do perhaps the officership and drill instructor as well.

4869. Who would pay him—the United School Board?—I think the School Board would pay him; they ought to pay him.

4870. The group of Boards?—The group; yes.

4871. Have you any assistant teacher in your school?—I have a lady teacher.

4872. Does she know anything about physical training?—Well, very little; she does merely the youngsters, you understand, under seven.

4873. How does she come to know the little that she does know?—Just from book.

4874. I mean have you taught it her, or has she been taught elsewhere?—She never was taught elsewhere. I told her she must do it, and I take them all from what we call the junior, that is over seven.

4875. She teaches them up to seven?—She teaches them up to seven.

4876. And you take them on beyond that?—Yes.

4877. How often do you take them?—Twice a week. Time.

4878. For how long?—Twenty-five minutes.

4879. Twenty-five minutes twice a week?—Yes.

4880. Twenty-five minutes at a time?—Twenty-five minutes at a time.

4881. That is fifty minutes in a week?—Well, about an hour a week, I might say.

4882. And do you do a continuous course under Colonel Cruden's system?—Yes.

4883. That is to say, do you give the younger ones a different class of exercise to what you give the older ones?—No, they all begin.

4884. From seven to fourteen they all do the same thing?—They all do the same thing.

4885. Varied, it may be, from day to day?—From day to day; yes.

A
A. M.

Teacher
assistant
work.

Cruden's
system:
continuo
course.

4886. But there is no difference between them?—
No difference, no; just continuous.

4887. Have your children far to go in many cases?—
Well, about two miles or three miles. It is wholly rural; my school represents ploughmen's and farmers' children.

4888. Do you ever hear of their being very tired at the end of the day after they had come home?—I never heard any complaint in that way.

4889. You would not be at the other end, so you would hardly see them, but you might have heard?—No; but still they are always very early in the morning.

4890. What time do you begin school?—I begin school at nine o'clock, but they are there about eight in the morning. I have no difficulty in getting them to come to school.

4891. Not even in the winter?—Even in the winter.

4892. I suppose they keep on the same boots that they come in all day, do they?—Oh, yes.

4893. You never had any notion of giving them a change of feet?—No; the Board never suggested that.

4894. And you never suggested it to the Board?—No, I never did.

4895. Do you pay much attention to the children's health as regards the physical exercises; do you often find that you have to exempt a child from doing any exercises because it is not strong?—If I see a case—but there is never a case of that kind that has come under my observation—I would do that; I would put it aside and exempt it from any physical exercises.

4896. You, I suppose, are in the way of knowing whether a child is sickly or not?—Well, from observation. I am not a medical man.

4897. Do you mean to say that you do not have such things as sickly children?—Very few.

4898. Very few?—Very, very few indeed.

4899. Have you not had any influenza?—Yes; we have had that, and measles and scarlet fever, just what you would get in a rural school.

4900. You have never found any after-result?—No, none, and I have had no reports from the parents, at any rate.

4901. In your time-table how do you style physical training; you prepare a time-table do you not?—Yes, sir. Approved of.

4902. What do you put down in it?—Drill.

4903. Simply drill?—Simply drill.

4904. Not 'physical drill' or 'military drill,' or anything, simply 'drill' alone?—Drill; physical drill.

4905. You do call it physical drill?—Physical drill.

4906. In the time-table?—In the time-table.

4907. And do you say in accordance with Colonel Cruden's system?—Not on my time-table; but when I am asked to fill up a certain form for the Department, I say 'Physical Drill, according to Colonel Cruden's system.'

4908. *By the Hon. Thomas Cochrane.*—Have you been through a course of training in physical drill?—I have, sir.

4909. Where was that?—In Ayr.

4910. Who was the instructor?—It was under the Aberdeen Training College, an expert sent down from there; it was a Mr Joseph that drilled us.

4911. You got good instruction in the system, did you?—Well, yes, I thought so.

4912. And you think that the system is well qualified to bring out the physical development of the children?—I do think so.

4913. *By Sir Henry Craik.*—Were you a Training College student?—I was, sir.

4914. Then you had no drill at the Training College in your time?—Yes, we had, but you could not say it was to any great extent; we were drilled; we had fencing and ordinary military drill, you understand.

4915. Which Training College?—The Established Church, Glasgow.

4916. And is it developed now further in the training colleges?—I cannot say.

4917. The class at Ayr which you attended was one where the teachers paid their own fees, I presume?—Yes.

4918. You were not helped by the School Board?—No, we were not.

4919. The facilities for obtaining that have been increased lately, have they not?—Well, yes, I think so.

4920. *By Mr Fergusson.*—Are your children of the well-to-do class?—Farmers and farm labourers.

4921. Have you any poor children; poorly clad, poorly fed?—None; no.

4922. They are all well found?—Yes.

4923. You say you have never had the assistance of a trained instructor?—I have never had.

4924. Would you care to have that?—I would like very much; I think I have suggested that in my evidence.

4925. One hour a week is the time you devote?—Time. Yes.

4926. Can you not do more?—Well, we might do more, but you understand everything is crowded in. We have a very short day in a sense, and we have so many subjects to undertake that you cannot do too much.

4927. Mr Turnbull, who came before you, I see, gives his boys three hours and his girls two; do you think you could not do that?—Mr Turnbull is on quite a different footing from me.

4928. *By the Chairman.*—Perhaps you would explain to the Commission why. Because we do not know; I do not know; I am perfectly ignorant on the subject; would you kindly explain what you mean?—Mr Turnbull you referred to here, did you not, well, he has everything thoroughly up to the mark, you see, —I know nothing so far as a gymnasium is concerned, you understand; my gymnasium is just merely the playground.

4929. *By Mr Fergusson.*—That does not quite answer my question. Why could you not devote longer time to the physical training without interfering with your other subjects?—Well, I could; but we must make a decent appearance in everything, you know; and if I devote too much time to physical training, it is taking it off the other subjects, perhaps.

4930. You would be afraid your other subjects would suffer?—Well, yes, because I take up the drill during the interval.

4931. Quite so; as a fact you are not convinced that the drill is of so much advantage to the other subjects?—I say it is; I say that drill is a proper thing if you have the time and every other convenience.

4932. *By Mr McCrae.*—Did I understand you to say that you took the drill in the interval?—Yes, sir. Drill taken interval.

4933. So that the hour that you have mentioned does not come off the school time at all?—That is so, sir.

4934. *By the Chairman.*—The dinner interval?—Yes.

4934A. *By Mr Shaw Stewart.*—Have you ever considered whether 20 minutes a day, say 10 minutes in the morning and 10 minutes in the afternoon, would not be a good thing for your pupils if you devoted that time to physical exercise instead of your giving twice a week 25 minutes?—We do so, sir. I have considered it.

4935. Have you ever considered whether it would not have a good effect on your pupils' wits as well as on their muscles if you gave them 10 minutes every day in the morning, even though that time came out of school hours?—Well, I cannot say; given any time it would be beneficial.

4936. Some of our witnesses told us that even at the sacrifice of a portion of lessons, if you devoted 10 minutes or 20 minutes a day to physical training they do their work better in the rest of lesson time, though that time may be shorter?—I would agree with that.

4937. But you have not yourself tried it?—No, I have never tried it, no.

4938. You think it might be a good plan?—It would be a good plan.

*Mr
A. Moody.
27 May '09*

Mr
A. Moody.
27 May '02.

4939. *By Sir Henry Craik.*—How long did you say you gave drill to the boys?—Twice a week, Wednesdays and Fridays, about 45 minutes; 25 minutes twice a week.

4940. And how long to the girls?—I drill the boys and girls together.

4941. And then do they get the same amount?—They get the same amount; yes.

The witness withdrew.

Mr
J. Mackenzie.

Mr JOHN MACKENZIE, examined.

4942. *By the Chairman.*—Are you a member of the School Board of Kingussie?—I am, my lord.

4943. Have you been a member longer than this present period?—I have been on six years now, more or less.

4944. Six years come next March?—Come next March; yes.

4945. Perhaps you will kindly go through your statement, will you?—We have got three schools in the district—Kingussie, Newtonmore, and Dalwhinnie. Newtonmore School is three miles distant from Kingussie, Dalwhinnie is fourteen.

Opportunities
limited.

Our opportunities are limited, as we have no covered court in which we can drill the senior boys in stormy weather; and also seeing that so much is expected of our pupils by the Education Department, we can afford very little time for drill and physical training.

We have to drill male pupils over ten years of age outside in the playground. The others receive their physical training in their classrooms.

Teachers plus
army man.

All our pupils are physically trained in the Kingussie School by qualified teachers, and boys above ten years of age are drilled twice a week by Sergeant McIntosh, an army pensioner. Independent of this, living as we do in a part of the country noted for its salubrity, and with all the other outside games entered into by the pupils, we consider physical drill less necessary than in crowded centres.

In Newtonmore School our drill instructor takes the senior boys for half an hour once a week, and the teachers drill their different classes twice a week.

In our very small school at Dalwhinnie the female teacher does what she can in this respect, but is not specially qualified.

For upwards of fifteen years a retired army sergeant has invariably been employed to drill the older boys in our principal schools. We may state that we have always a considerable number of male pupils in this school over eighteen years of age, and deem it a hardship that no grant can be earned by these from the Education Department.

Military drill.

It is essential for the welfare of the country that young men of this age be more or less instructed in military drill, and the Board hope that in order to enable them to do this, a sum equal to the grant they are deprived of by the Education Code be given, and thus they may be enabled to pay more attention to this branch of physical training. Some of the older pupils have at times joined the local volunteer corps, but their doing so interfered more or less with their studies.

Grant.

The training has been highly successful, and the pupils have been physically benefited by it, but doubtless this would have been more marked had it been possible to devote a longer time to it, and a substantial grant given.

The pupils in our schools are well educated, as a rule, before leaving, and on doing so, rarely remain for any time in the parish. They go to large cities, the colonies, etc., where better salaries can be obtained than here; consequently there is not the same need for continuation classes in our district as in some others.

Suggestions.

We may mention that we would like our young men to have some technical training before leaving our higher department school. This we would prefer to more time being spent on military drill, as the use of arm and muscle would in our opinion go far to develop both mind and body, and certainly would contribute towards 'the sources of national strength.' This, however, the School Board find beyond their powers on account of the small population, as the cost of maintenance would be too great, for extra teaching apparatus and courts

would be required. They consider it a matter worthy of the attention of the Government.

For the last few years a good many of the young men educated at our public schools have joined the army, and have invariably distinguished themselves. The physical training received while pupils must have conduced to their decision and success, and were the terms of enlistment more lucrative, probably more would have offered themselves for that profession.

4946. But of course it is approachable by rail?—Yes, Newtonmore is quite approachable; it is within easy distance; you can cycle or walk there. Dalwhinnie is not so easily got at; the train service is not very good there.

4947. *By Professor Ogston.*—This is a tolerably typical Highland district that you represent?—It is.

4948. Would you think that the compulsory instruction in such a subject as swimming would be at all practicable in it?—Well, I hardly think at present it would, but it would be a great advantage to the pupils if they could be taught to swim.

4949. And the difficulty would come in in the question of cost?—Principally in the cost, but I have no doubt that something might be arranged outside in the river or something of that sort; it is a matter that could be gone into.

4950. *By Sir Henry Craik.*—You say in one paragraph that you think a grant ought to be given to pupils over eighteen years of age. Have you many pupils in your day schools over eighteen?—There are a good many at present.

4951. With what object are they staying?—I suppose studying for the University.

4952. But if they are going to the University, do they not go there before they are eighteen?—They generally stay a little while longer with us.

4953. Do you not think that a boy ought to be getting done with an elementary school at eighteen?—You would think so.

4954. Do you really think the Department would be justified in paying grants at ordinary day elementary schools for young men over eighteen?—In connection with the physical training of these boys.

4955. But are they boys over eighteen; are they not young men?—They have been considered as boys there.

4956. Are they going to give their whole time to military drill, their whole day?—No, not the whole day.

4957. Then ought they not to be employed in some way at eighteen years of age during the day?—Well, they put in the whole day in school training.

4958. And you think, all over the country, that you ought in the elementary school under the Code to give facilities to young men over eighteen to receive grants as if they were children of school age?—I think this is an exceptional case.

4959. But is there not opportunity for those older boys going to continuation classes at the intervals of their employment?—There are no continuation classes in our district.

4960. Why do you not open them?—We have not got the pupils; we have only got the day school pupils.

4961. Are there no young men employed in the neighbourhood?—Well, there are very few who stay with us; they generally clear out.

4962. At what age?—They generally clear out about fifteen, sixteen, seventeen or eighteen.

4963. Then the number you have to provide for at eighteen is small?—These are not our own boys, these are boys coming in from other districts to our school

4964. They could carry on continuation classes and be employed during the rest of the day?—It would be a difficulty getting employment for them there.

4965. For boys over eighteen?—Yes, in our district.

4966. Then surely they will go away; they will go somewhere where they can get employment, but do you think you would encourage them in not seeking employment by paying them grants?—The Board at least thought they would be able to teach them a little bit more of military drill.

4967. But you could do that in Continuation Classes; you could have classes for military drill and receive grants for it, but do you deliberately as a member of a School Board think it would be a good thing to keep a young man over eighteen sitting in an elementary school the whole day instead of seeking for employment, and do you think that the State would be justified in paying for such a young man?—Well, seeing that they are there, they consider it a hardship that they do not get something for them.

4968. *By Sir Thomas Coats.*—Do you know what time is given weekly in the schools for physical drill, say for children up to fourteen?—In the Kingussie School the army sergeant drills the boys for half an hour twice a week.

4969. That is, they get an hour a week?—They get an hour a week.

4970. Each schoolboy?—Each schoolboy; yes.

4971. The infant classes get the same time?—The infant classes are taught by the teachers; from ten up to twenty-two years the sergeant teaches these; in the infants' department the teachers take the physical training.

4972. And do they get as much; do they get an hour a week?—Yes, more or less, an hour a week.

4973. What proportion of children would remain in your initiatory schools after fourteen?—Well, I could not say for certain the proportion.

4974. You could not give us a rough idea?—I could not; I would not like to say exactly.

4975. But would there be many; are there many who remain beyond fourteen?—Yes, there are a good many.

4976. A good number?—Yes, a good number.

4977. How far do they go on; do they get special instruction?—Yes, special instruction; they take the leaving certificate.

4977A. And they can go right from these schools to the University?—They can; yes; from Kingussie school.

4978. *By Mr Fergusson.*—You spoke of the limited space for physical exercises, but you have some room inside your school where you can give some physical exercise, have you not?—Well, the juniors can be drilled inside.

4979. I am not talking of drill, I am talking of physical exercises?—No, there is no room for that sort of thing.

4980. You do not require a room larger than this for doing all these motions; I am not speaking of being drilled in companies and so on?—The different classes.

4981. What is called physical exercise; do you do nothing but drill in your school?—We do nothing but drill; no.

4982. You do not do all these movements with the arms?—The female pupils are drilled in the dumb-bells and the bar-bells.

4983. Have you no free movements of the arms?—Oh, yes, the juniors get all that.

4984. That is done in the classroom?—In the classroom; yes.

4985. Then there is room in the classroom?—For the classes that are in the room simply.

4986. You might extend that training by devoting more hours in the day to it. It is not necessary to have a larger place because you take more time over it?—Well, it is not necessary to have a larger place if you do not put the other classes into the same room to get the same form of drill.

4987. Have you only one room?—No, there are

several rooms, but they are all trained in their own rooms—the different classes.

4988. If you can do half an hour's physical training you can do one hour or two hours, it is only a matter of devoting a little more time surely?—They find that they cannot spare the time, I believe.

4989. That is another thing. That is not the fault of not having a covered court, as you call it?—Yes.

4990. You think you have no time; you have so many other things to do you cannot devote more than an hour a week?—That is so.

4991. You have never tried, though, to see, if you devoted two or three hours to physical training, whether it would have a bad effect on your other lessons?—Well, it has been the opinion of the Board that they could not spare it.

4992. I understand you take more time in drill than you do in the free exercises?—That is for pupils from ten years upwards—ten or eleven years upwards.

4993. *By Mr Shaw Stewart.*—Have you been through any system of physical training yourself?—I have never been through any special training. I have been in the local volunteer company.

4994. You do not know the value of free movements?—I can see it. It is quite apparent.

4995. Quite apart from drill?—Quite apart from drill; yes.

4996. You chiefly devote your physical training to drill?—To drill; yes.

4997. *By Mr McCrae.*—I think you said that some of the older pupils have joined the volunteer corps, but that their doing so interfered more or less with their studies. Does that apply to those boys above eighteen years of age?—Yes, and some of them under that—from sixteen to eighteen.

4998. Is that really so; are the Volunteer requirements so very great there that they would interfere with their ordinary studies?—Well, the drill for the Volunteers takes place in the evenings, and it was understood that the boys lost more time than they were entitled to lose getting drilled with the Volunteers.

4999. I notice you put great emphasis here on the military drill; is that rather from the patriotic point of view, seeing that you believe in physical training, and you would rather have drill than gymnastic exercises?—It is a question of the word altogether, I expect.

5000. No, it is not a question of the word; we will take a lad at seventeen; you want to give him some physical training; do you think it better that he should be drilled, so that he might be useful as a citizen soldier, or that he should get gymnastic exercise?—I would certainly train him as a citizen soldier.

5001. Have you formed any opinion as to the value of the different forms of training on the individual?—No, I have not; but I think he would be more useful to the community if he learned a little bit of military drill.

5002. We would all grant that. You say that the School Board finds it beyond their powers, on account of the small population, to incur the cost of extra apparatus and courts?—Yes.

5003. Have you considered the possibility of having a central institution for your part of the county?—Well, that was talked about there too; that was the only possible way of getting out of the difficulty, we thought.

5004. And is that not a way out of the difficulty?—I think so.

5005. How would the rate be levied—on the county rate?—Well, in proportion to the number of pupils that would be drafted into the central school somehow or another.

5006. *By the Chairman.*—I should like a little more information as to these elderly infants; how many schools have you in Kingussie—more than one in Kingussie itself?—No, just the one.

5007. Newtonmore is another; one in Kingussie and one in Newtonmore and one in Dalwhinnie?—And one in Dalwhinnie, yes.

5008. How many are there in the school at Kingussie?—There would be about 250, I think.

Mr

J. Mackenzie.

27 May '02.

Time.

Drill and free exercises.

Military drill and gymnastic exercises.

Cost: central institution.

Pupils: number over eighteen.

Mr
J. Mackenzie.
27 May '02.

5009. And Newtonmore?—In Newtonmore about 70 to 80, and Dalwhinnie probably about 30.

5010. They are younger children at the Dalwhinnie one, are they not?—They are younger children.

5011. Do I understand that when they get older they leave Dalwhinnie and come into Newtonmore and Kingussie?—They come into Kingussie to get further instruction.

5012. As to the number in Kingussie alone, out of this 250 how many do you say there are over eighteen—twenty?—No, there are not twenty over eighteen, perhaps about a dozen; I could not be certain.

5013. But you think there is a dozen?—Yes, I think there is.

5014. And it is not an exceptional thing; it is a habitual thing?—It has been going on for years.

5015. Without much increase or decrease?—Well, more or less the same average; it might be more, it might be less, than what I say.

5016. Do any of your boys go in for the ministry?—A good many of them.

5017. Where do they go to; I mean you cannot help them very largely there; where do they go to?—They go right away into Glasgow or Edinburgh to the University.

5018. When do they go; at what sort of age?—These are just the very boys that I am speaking of now, these older boys.

5019. They do remain on in the elementary school till eighteen or over, and then go right into Edinburgh or Glasgow?—And then go right into Edinburgh or Glasgow.

5020. And otherwise unless they are going in for that sort of life they nearly all leave beforehand?—They leave beforehand.

5021. Then those that you mentioned in your

statement as having joined the army, when did they leave you; about the age of fifteen?—They left at fifteen to eighteen.

5022. That is a very large class; there is a great many that go into the army, are there not?—No, there are not very many in our district who go into the army.

5023. Where do the rest of them go?—Well, they go abroad.

5024. At the age of fifteen?—About fifteen; they generally go into business for a little while in this country and then go abroad.

5025. Do many of them get employment as ghillies and that sort of thing?—Very few of the boys in the school—very few.

5026. About the girls; do they do any physical training after fourteen?—Oh, yes, all the time; they are there, and get trained with musical drill.

5027. Have you got many girls who remain on till eighteen too?—There are not so many girls remaining on till eighteen.

5028. What happens to them?—Unless they go in for teaching or something of that sort, they clear out.

5029. They go to their homes after fourteen, do you mean?—Not quite so early as that.

5030. They do stay on largely?—Yes, a good proportion of them stay on after fourteen.

5031. Do you consider that they are quick at learning, or rather the reverse, up there?—I should say they are quick at learning.

5032. And fond of it?—And fond of it; yes.

5033. Do they like these physical exercises or do they hardly think them much; they are naturally pretty strong and pretty healthy, are they not?—Yes, and there is a good deal of sport outside, that they do not require so much physical training as most other children.

The witness withdrew.

Mr
T. Wallace.

Mr THOMAS WALLACE, examined.

5034. *By the Chairman.*—You are the headmaster of the Inverness High School?—Yes, that is so.

5035. And how long have you been so?—Over thirty years.

5036. Would you mind reading your notes?—

Opportunities now available.—For the last twenty years, physical training has formed part of the ordinary curriculum of the High School, which has over 1000 pupils, and is divided into Infant, Junior, Senior and Secondary Departments.

Infant Department.—Exercises in free gymnastics are regularly given to the pupils of from three to six years of age; dumb-bell exercise to those from six to seven; and bar-bell exercise to those from seven to eight years.

Junior Department.—In the classes corresponding to old Standards I. to III., all the pupils receive regular exercises with dumb-bells, bar-bells, Indian clubs and marching exercises.

Senior and Secondary Departments.—In the classes corresponding to old Standards IV. to Ex-VI., in addition to the above exercises in the Junior Department, the boys get military drill in the summer months.

By military drill, I do not mean such exercises as are likely to make soldiers of them, but exercises combined with marching to develop the physical powers. Ordinary military drill does not develop the physical powers, as has been proved by actual experiment. Given a certain number of boys and divide them into two companies. Give one military drill, the other physical training, and measure their chests.

The boys have also received instruction in gymnastics—parallel-bars, horizontal ladder and the horse.

The classes are drilled by their own teachers.

The janitor, who was a retired sergeant of the Seaforth Highlanders, and a capital drill master, assisted with the gymnastic exercises and the military drill.

In addition to the exercises and drill, the pupils are

marshalled and marched to music to and from their classes at every interval and change.

This I look upon as an essential point, because the effects of the drill lesson should be seen in all the children's movements, and in the prompt use of muscular power in obedience to the dictates of mind, so that such powers become automatic and thus bring the powers of the body under the immediate control of the will. In fact, I think the effect of all these exercises should become automatic in the children.

Other Schools in Inverness.—In the other schools under the Inverness Burgh School Board the pupils are trained in dumb-bell, bar-bell, Indian club exercises and military drill.

The pupils of all the schools are taught swimming in the Public Baths. Each school has a day set apart for itself.

A medical officer is appointed by the Board to visit regularly all the schools, and report once a month on the hygienic and sanitary state of the buildings and the general health of the pupils.

At present fifty-two of the country teachers are receiving instruction in physical training from Sergeant Coxhead, who is employed by the Education Committee of the County Council. I think he is stationed there to push this question of physical drill as far as he can at all points. I think these are all the points in connection with the work that is being done at present, as far as I am aware. Then the next point is—

Such training conducive to the welfare of the pupils.—Physical training should have a prominent place in the education of the youth of this country, and should form part of the ordinary curriculum of all our schools, and more time given to it. No boy's or girl's education should be considered complete without it. I think that the time that is usually set apart for it in the ordinary time-tables is not sufficient to carry it out successfully. It is generally on the time-table about

half an hour per week. I think that half an hour per week is not sufficient. That is my opinion, because—

(a) It encourages a normal development of physical powers.

(b) It prevents disease.

(c) It produces the joint action of mind and body through the medium of the senses, and it becomes automatic, as I have said already.

When carried on from right motives, and under careful and thoroughly qualified instructors, it improves the health of the pupils, and exercises a beneficial influence on the ordinary discipline and tone of the school. It not only strengthens and develops the physical powers, but fits the pupils for the better performance of the other subjects of instruction. I believe we have medical evidence to show that it also contributes toward brain-growth and to the symmetrical development of the mental faculties. It gives the pupils confidence and self-reliance, and, in the matter of military drill especially, it promotes good-comradeship and self-denial, and shows the necessity at times for sacrificing individuality for the sake of the community, which, I think, is a very important point in the training of young people. There are several other exercises that have this tendency, namely, —conducive to the welfare of the pupils—such as well-organised games, dancing, rowing—where that can be obtained—cricket and football. All these I mention, when properly superintended and conducted. The last two generally appeal only to a few—cricket and football. The next point is the opportunities for continuing such training after the present school age. Hitherto much of the good work done in many schools has been practically lost after the pupils leave school, for want of opportunities to continue it.

When pupils leave school at fourteen years of age, they are only beginning to benefit by such training, and consequently their attendance at continuation classes till they are seventeen years of age should be made compulsory, and physical training included in the curriculum.

This would enable them to have a three years' course in ordinary education, differentiated with a view to practical life, and to carry on physical training from a regular course of gymnastics to infantry drill, skirmishing and scouting for boys.

An advanced course could also be prepared for the girls.

In addition to the continuation classes, cadet corps would do much to keep the boys together after they left school.

The establishment of gymnasiums in burghs and districts would do good in this direction, and this, I believe, is not so difficult a question now as it would have been a few years ago, as we have village halls, recreation rooms and drill halls, which are daily on the increase in the country. Gymnastic apparatus in connection with these would make the matter easier.

School cycling corps and swimming clubs, when properly conducted, prove excellent auxiliaries.

I would suggest annual reviews and inspections of all the schools in a burgh or district; not by way of display, but by way of bringing the different schools together, and creating a wider interest in this direction.

The institution of awards—such as medals or certificates—to those who had completed such a course is worth considering.

An extra grant might also be offered to any volunteer corps, on behalf of all recruits possessing such certificates.

Then the last point I take up is the difficulties to be overcome:—

Want of properly qualified Instructors.—Most Normal trained students are qualified, but the older members of the teaching profession, and those who enter it from the universities, are not always so qualified.

This will cure itself in time if such training were made compulsory in our schools; for then managers and members of school boards would not employ teachers without this qualification.

Every training college and university should have a gymnasium, and every student should be made to pass through a compulsory course, especially those who mean to follow the teaching profession.

The course of training should include a knowledge of anatomy, physiology, psychology and hygiene. Text-books to be prescribed. Questions on the above should form part of the certificate examination. I am very pleased to see that a new drill-book has received the sanction of the Board of Education, and that book—I mean to substitute for the one in use—Major Cruden's—the only book that has been used in the North.

The other difficulty is the want of proper rooms in the schools. Most large schools have halls, but the majority have only the ordinary class-rooms, which are not suited for a full course of training. Covered sheds in the playground are used in Continental schools, and I think an extension in this direction might meet the difficulty so far. Another difficulty is the older teachers at present in office, and especially those in charge of schools single-handed, however willing, find it very hard and difficult to go through a course of training. To meet the requirements of such cases, qualified instructors should be appointed by the Education Department to give lessons to the pupils in a group of schools periodically, or were such instructors employed by a school board, or group of boards, an extra grant should be made for a few years, until matters rectify themselves.

Another difficulty is the want of apparatus, which school boards are not always willing to supply. I may say the want of appreciation of the value of such training by the general masses, and even among the well-educated classes, by some school boards, and, I fear, I must add by some teachers. There is another difficulty, and that is the change of teachers in large schools, especially the change of staff. Where they change frequently, you find you do not always get a man or woman who is qualified, and then there is a break in the course of the training.

Healthy men and women are the best assets a nation can have, and the strength of the Empire will be greatly increased when all our young men receive a thorough physical training. I think these are all the points that I have taken up.

5037. *By Sir Henry Craik.*—You have a long experience of school life in Scotland; thirty years I think you said?—Yes, over that.

5038. Then you have seen great changes in regard to this part of work?—Very great indeed.

5039. But although yourself a teacher, not amongst the youngest grade, you have found it expedient to interest yourself in it, and you have developed it in your own school?—I have done so.

5040. And have you seen great advantages in the course of that time upon the pupils?—Certainly; the health of the pupil, as a rule, has improved, although that is not the only thing that has improved, and that is not the only thing that has improved the health of the pupil; in my experience, of course, better buildings and all that kind of thing; but in the ordinary organisation of the school decidedly, there has been a great difference since more attention was paid to this subject in my school under my own experience.

5041. Then you were more or less of a pioneer on the subject in your own district?—Well, I have tried to be that all through, not only upon this but on all other subjects. Several things that have become compulsory now, I am pleased to say that I had practised them before they actually formed part of the curriculum of the school according to Code.

5042. Your experience, like my own, goes back a long time. Twenty years ago it was comparatively rare to find it in the schools?—Very rare; I do not remember it twenty years ago.

5043. But you say in your own school you have had it?—Yes, I have had it for that time.

5044. Now what were the difficulties that you had to encounter. You say an apathy on the part of parents?—Yes, and want of willingness to supply apparatus in the first instance.

Mr T. Wallace.
27 May '02.
Suggestions.

Accommodation.

Teachers.

Apparatus.

Personal experience.

Former difficulties.

Mr
T. Wallace.
27 May '02.

5045. On the part of the School Board?—Yes.

5046. That was the result of the apathy of the parents on the subject?—I suppose the result of apathy all round.

5047. And a belief that this was not properly a part of education at all?—Quite so.

5048. But you have had the help of the Inspector, Mr Robertson—his cordial co-operation in this move?—Yes, certainly, and the Inverness School Board, I must say, have shown a willingness to fall in with this or with any other improvement when we can show a sufficient reason for it. I must say I do not feel it a difficulty in my case, but I know it is a difficulty in other places from my own knowledge of other schools and other schoolmasters.

5049. You found your difficulty to proceed not only from a fear on the part of parents of what is called 'militarism,' but from apathy towards this part of education altogether. They did not recognise that it was an important part of education for their own children?—No.

Military drill:
no objections
recently.

5050. Latterly you say even the objection to the military drill has disappeared greatly?—Well, I have not heard any objection to it lately.

5051. Is there a fear that it might lead to enlistment or joining the army?—I think that must be in the case of very few; I speak from my own knowledge only.

5052. I would ask you, as acquainted with the character of that neighbourhood very largely, is there such a fear of joining the army?—I have not heard it expressed.

5053. You send a large number of recruits to the army every year?—Yes, a large number.

Army as a
career.

5054. And looking, on the whole, to the career that these men lead, you would say it is not a bad opening in life for them?—No, I should say it is a very good one.

5055. There is not much reason in the prejudice, if any such exists, against their joining that career?—No, I do not think so.

5056. So that if, to a certain extent, the development of physical exercises were to lead to a greater desire to go into this career of life, you see no great evil in that?—I see the contrary.

5057. And you have had, of course, from Inverness-shire conspicuous examples of great services rendered to the country by the pupils of the ordinary country schools?—The pupils of my own school number between 25 and 30 in the first contingent of Lovat's Scouts and the Cameron Volunteers.

5058. I think that Sir Hector Macdonald was a pupil of an Inverness school?—I cannot say. He was not a pupil of mine.

5059. He was in an Inverness school?—He went from Inverness. There is another school in town, the Merkinch, situated quite close to the militia barracks, and the headmaster—with whom I had a conversation before coming away here—can give account of 138 of his boys who have gone to the army. This school being contiguous to the barracks, no doubt helped to develop this spirit.

5060. And many of these become non-commissioned officers at least, if they do not even rise higher?—Yes, I suppose they do; I do not know any of them personally.

Medical
inspection:
medical officer
reports
monthly.

5061. Following the course of your evidence, you spoke of a medical officer being employed by your School Board?—Yes.

5062. That is not common amongst the school boards of Scotland?—I do not think so.

5063. Was it by your advice or suggestion?—No, it was not, it came from the School Board itself.

5064. What are the functions that he performs?—He comes round and looks over the buildings, the outhouses and offices, sees that they are properly kept in a sanitary condition, and in case of epidemics he visits and gives his opinion as to whether the school should be closed or children kept away, and also in the case of defaulters I have used him once or twice. We get an excuse, the child is not able to come to school, it is not well. We send the medical officer, and he

says so far as he can see the child is very likely well enough, and ought to go to school. That is one way in which he helps us.

5065. I suppose you have not very many cases in your school of underfeeding, or weakness caused by it?—No, not with me.

5066. But his attention might be directed to such a case if it arose?—I am sure it would—quite sure, because he has full power to look into all these matters, and report. He reports once a month. He comes round to my school once a month—the Board meets once a month.

5067. To go on, you speak of the difficulty of getting properly qualified instructors; now would you prefer that the instructors should be persons who are skilled, experts in physical exercises only, or that they should be the regular teachers of the school, trained to add this to their other qualifications?—I should prefer the trained teacher.

5068. The regular teacher?—The regular teacher of the class.

5069. Getting instruction in this special subject?—Getting instruction in this special subject from a thoroughly qualified instructor.

5070. You think he has a better hold over the pupils?—Yes, I think so.

5071. And it would work into the general work of the school better?—That is in my experience and what I have found most beneficial. As a rule you require a class teacher to be present while the visiting master is doing his work, and I think it is far better when the class teacher is thoroughly qualified in all subjects that are taught in the class.

5072. Then you think that in the training colleges there is much more encouragement given to this subject than there used to be?—Yes, I am sure there is.

5073. Then you speak of the Universities?—Yes.

5074. You know the University, I suppose, as an old University man?—Although not a University man, I know a good deal about them.

5075. And there, you think there is much neglect of it?—Well, I could not say that; but what I should like to advocate is that all students, at least those who mean to follow the teaching profession should go through a course of training.

5076. But why should you confine it to those who mean to follow the teaching profession?—I should not like to confine it to them; I think it should be given to everyone. But in the case of prospective teachers it should be compulsory.

5077. Do you not think the Universities of Scotland might do a great deal more than they do for the physical training of their students?—I have no doubt there is great room for improvement, and I should think if the physical training is at all of importance and essential for the health and physical development of the youth of the country, we cannot omit the Universities.

5078. Certainly not?—I do not think so.

5079. You speak of qualified instructors being appointed to give instruction to a group of schools; why should such instructors be appointed by the Department, why not by the School Board?—Well, I am afraid unless you make the subject a compulsory one it would not be universal.

5080. The Department does not appoint any teachers as yet; it leaves that to the School Board?—Still, I think in this particular case it would only be for a short period until the older men were wrought out and fresh men came in. I give the alternative, I think.

5081. But do you not think that it would be better that the Department should confine itself rather to granting certificates and to inspecting classes, and should leave the local management to appoint the teachers?—Yes, it is a question more of payment, however. Would the Department be prepared to make an additional grant for a year or two to enable the School Boards to provide such an instructor?

5082. Of course it is a condition of the grant at present?—Yes, it is a condition at present.

Mr
T. Wallace.
27 May '02.

5083. *By Professor Ogston.*—How many schools has your medical officer to look after?—Five.

5084. And the total number in these would be?—Between 5000 and 6000, I think.

5085. His duties, therefore, would occupy a large proportion of his time?—I could not say how much. He visits me once a month, or if I send for him he comes if I have anything special to lay before him.

5086. And his duties with you are to examine, amongst other things, the buildings?—Yes, and the closets, lavatories, drainage, etc.

5087. Their sanitary condition?—Yes.

5088. And their ventilation?—Yes.

5089. And the state of the playgrounds and air spaces.—Yes.

5090. Does he help you at all with the medical examination or attendance upon your teachers?—With the pupil teachers?

5091. Yes?—But not with the others.

5092. They do not come under him?—He examines them and grants a medical certificate to the pupil teachers when necessary before their examinations, but I think that is all the connection he has with the teaching staff.

5093. He does not certify the physical health of those who are joining you as teachers?—Not as far as I know.

5094. Nor attend to their complaints of illness from overwork or nerve weakness?—We have never had such a case before us, and I do not know whether the School Board would require him to do so or not.

5095. And regarding the children, he also helps you?—Yes.

5096. He makes a general examination of the appearance of health?—Yes. He visits the rooms, and if there is any special case of weakness, his attention is called to it, and he certifies whether that child is fit to be in school or not.

5097. His work, to be efficient, depends a great deal upon the teacher—upon your calling his attention to anything special?—Yes, I think that is so.

5098. He does not enter fully into a medical examination of the children, such as stripping them naked and making them pace before him—observing weakness and deformity?—No.

5099. Do you consider that such an examination as I have spoken of—stripping them—is at all a necessity? Does your present plan, I mean, answer well?—Yes, I think it does.

5100. It is adequate?—There might be an objection, I think, to that part; on the part of the parents there might be a little difficulty if he were to enter into such a minute examination; we might have the parents objecting to that.

5101. But an examination in that style, you think, perhaps not so minute, but in that style, is not required of a medical officer to a School Board?—No, I would not think so.

5102. Your long experience leads you to say that, with your assistance, that which your Inverness School Board medical officer does at present is sufficient?—It is sufficient, I think.

5103. Has he any other duties except those of school board medical officer?—Yes. He is one of the medical practitioners of Inverness.

5104. Is he a medical officer of health?—No; he is Dr Lang, one of the medical men of Inverness.

5105. Do you know whether such an appointment requires a large salary?—I do not know. I do not know what his salary is. I should not think so; I would not think it would require much.

5106. Have you had occasion to consult him upon any other points regarding the health or the hygiene of your schools beyond those that you have mentioned?—None.

5107. All the other things work fairly satisfactory—automatically?—Yes, very well.

5108. Could you refer us to any medical proof that physical training promotes brain growth?—Well, I quoted from Dr Crichton Browne. Of course I cannot speak of this from my own personal knowledge, but

from a paper written some time ago by Dr Crichton Browne, I think, on education and the nervous system.

5109. Can you recall whether that was a general paper, or whether it had any statistics to support it?—It had statistics, I think.

5110. And you found them convincing?—Yes.

5111. They referred, of course, to children?—To children; it was written about the time when there was such an outcry about over-pressure; I think some time ago when there was such an outcry about over-pressure and examination.

5112. My last question is, do you find a female teacher necessary for teaching the girls swimming?—I do not know of any.

Swimming girls: female teacher.

5113. I do not see that all your girls are taught swimming?—They have got the opportunity, but I am afraid they do not all avail themselves of it.

5114. Should you consider a female teacher extremely desirable for swimming?—For the girls?

5115. For the girls?—I should think so; I think it would be better.

5116. It would be a useful reform to introduce?—Yes; I think so.

5117. Could she be utilised for anything else?—I do not think she could be utilised for anything else in Inverness with the number of schools and the number of pupils.

5118. You could not get one of the female teachers employed in your schools who was specially trained to give instruction in swimming and who could add that to her other duties?—Of course her other duties would require to be lightened, but I should think that would be quite possible.

5119. I suppose it would be only in summer or in the warmer months of the year that the swimming would be taught?—It could be all the year round; if the bath was heated.

5120. Would it, in your opinion, render the teaching of swimming to girls more practicable if it were found possible to utilise one who already taught for the purpose of teaching the swimming?—You mean a female?

5121. Female?—Yes; I think so. I think it would be, at least in Inverness. I am of opinion that it was because it was taught by a man that the girls did not take advantage of it more than they did. A few of them did at first, but I do not think there are many of the girls now.

5122. Have you yourself personally seen the swimming classes of the boys?—Yes.

Swimming boys.

5123. So that the teaching is not a pretence but a reality?—No. Each school in Inverness has a day set apart for teaching it in the baths, and then a certain number go down at a time. We have an evening devoted to the High School, one to Farraline Park, another to Central, another to Merkinch, another to Clachnaharry, and so on, and in that way the schools do not meet.

5124. At what age do you commence to teach them swimming?—Boys from Class IV. and upwards, that would be ten and eleven.

5125. Have you ever seen any harm to the children from compulsory swimming classes?—Never.

5126. No deaths?—No; I never heard any complaints or any deaths.

5127. *By Mr Shaw Stewart.*—You told us that you preferred the new physical drill book issued by the Department to Colonel Cruden's; would you shortly say why?—The new book is more in keeping with the military; it dovetails in, and teachers of drill have told me that where pupils have been taught by the one, and then the military drill coming after the other, that there is a little loss of time. If it is to go on to military drill, I would prefer to have the book that would lead right up through; because it has an amount of physical exercises as well.

5128. Speaking of the teachers and the difficulties to be overcome, you say that the want of appreciation of the value of physical training on the part of some teachers is one of the difficulties?—Yes.

5129. And you have already told us that you think

Mr T. Wallace.
27 May '02.

teachers should be trained; would you go as far as this: that a man who fails to appreciate the value of physical exercise is not fit to be a teacher?—Not of that particular subject.

Teachers: physical training a necessary subject.

5130. But you have already told us that it is a very important subject?—Yes.

5131. And you said—I think I took the words down—that no boy's or girl's education could be complete without physical training?—Yes.

5132. Would you go so far as this; would you say that a man who fails to appreciate that value should not be a teacher?—Not if the subject is included in the curriculum of ordinary school education.

5133. But you are of opinion that it should be included in the curriculum?—Yes, quite so. If it is included I should say that he was not fit.

Continuation Classes: compulsion.

5134. One question as to the compulsory attendance at continuation classes; do you think that compulsory attendance could be secured for boys from fourteen to seventeen?—Yes, I think so.

5135. What penalties would you devise to make it succeed?—I could not say that; I do not see where there would be any more difficulty in making it compulsory than in making the ordinary school curriculum compulsory; Government compels every boy to attend school.

5136. You are dealing with boys who have left school?—There should be no more difficulty with them than there is with them up to fourteen. If the Government decide that a boy should be educated up to fourteen, and that his education is not to be considered complete until he is seventeen, there should be no greater difficulty.

5137. He is harder to catch after he is fourteen?—Harder to catch?

5138. Harder to catch and keep?—At present when it is voluntary that he should attend, but if it is made compulsory, and his education would not be completed until he is seventeen, I do not see why there should be such a difficulty.

5139. I do not say it should not be done, but you have not considered how it should be done?—I have not considered it further than I have stated.

5140. *By Mr Alston.*—You speak in one case of a retired sergeant of the Seaforth Highlanders, and in another of Sergeant Coxhead; are both these men experienced under the old system of drill, or are they quite up to date?—The officer of the Seaforth Highlanders that I referred to was the ordinary janitor and compulsory officer of the school, and it was part of his duty to give the boys drill and physical training. The other—Sergeant Coxhead—is, I understand, a gymnastic instructor attached to the *Depôt* of the Cameron Highlanders at Inverness.

Teachers and military drill.

5141. Could the teachers themselves undertake the military drill?—Yes, they do so now.

5142. Your own teachers?—Yes, the teachers of the classes.

Expert: important.

5143. Would it be advisable that an expert—that is to say, a man who comes from the centres of instruction—should occasionally visit and see that they are carrying out the work properly?—I think that would be of great importance.

5144. An ex-sergeant would not do for the post?—Such a man as Coxhead, I think, would do.

5145. Because in former evidence we have had the question of the old army sergeant—non-commissioned officer acting as janitor—and some witnesses thought they could get on very well with him; others said on no account would they employ an old army man?—Well, if I had only had experience of one I might be of the same opinion; but the last man we had, I think, there could not have been a better man. I am very sorry to say I have lost him; he has gone to a better appointment at Dunfermline High School.

5146. Did he maintain good discipline with the boys?—Yes.

5147. Do you find it improves their conduct in the other departments?—I think so.

Time.

5148. Then do you say that you have half an hour per week?—Yes.

5149. And you consider that not sufficient?—Yes.

5150. We have had that allowance pronounced ridiculously small?—I think it is.

5151. How far would you go then?—Of course, in introducing that as a new subject, we would require, in the first instance, to consider what subject on the time-table could be eliminated.

5152. Would it be necessary to eliminate anything?—Well, it would in my case.

5153. Would it?—Yes, because I have a very heavily burdened time-table.

5154. Are you fuller than in other schools?—Yes, because, having a secondary commercial department, I feel it to be my duty to teach a certain amount of the secondary subjects that are taught in the secondary departments, so as to give the boys a fair chance in passing on, so as not to lose time, and in that way my time-table is pretty well burdened.

5155. But you think it worth your while to eliminate something in order to give much longer time to physical training for the children?—I would. I think two hours a week on the Continent is the minimum, as far as I have read.

5156. Would that be considered a burden by the teachers?—I do not think so, except with some who consider anything except 'grinding' a waste of time.

5157. Mr Shaw Stewart called your attention to your statement that you feared that some of the teachers did not appreciate this physical training; I think this is the first time we have had that brought before us?—What I mean by that is that some have a wrong conception of what physical training really means. You have one teacher who goes into it from the physical training point of view, while another one may go through it just in routine fashion. That is what I mean.

5158. Quite so, but if the Department insisted upon physical training having greater attention, both the opinions of the School Board and of those teachers would be brushed aside?—Yes.

5159. And on the part of the teachers—those who are competent to teach physical training—you would find no objections from its being a greater burden upon the day's work?—I do not think so; and if they were thoroughly trained themselves from the beginning, both in physical exercise and drill combined, because I think the two are joined together, they would then go to their work from a different standpoint. What I refer to is the man or the woman who has not had the training, or very little of it, who simply goes through it in a routine fashion.

5160. But in the new condition of things, it will come about that there will be a different feeling on the part of teachers altogether?—Oh, certainly it will come about.

5161. I think you said that in your opinion continuation classes should be compulsory?—Yes, that is my opinion.

5162. Up to seventeen years of age?—Yes.

5163. Then in the case of boys, would you go on, as one of the subjects in the continuation classes, with physical training?—Yes.

5164. And military drill also?—Yes.

5165. You would carry that department a stage further than in the school, giving military drill?—Yes, certainly; not to go over the same subject again, or the same part of it again, but to go on a step higher.

5166. Do you think without compulsion that the boys would go to the continuation classes, either to the military drill or anything else?—Without compulsion, well, a good many of them, I should say the majority, would not, sir.

5167. You advocate the introduction of the cadet corps. Would that be sufficient attraction to boys over present school age?—I think, if it were begun early in school age and continued throughout, there would be a greater chance of continuing it in the continuation classes.

5168. But if during school age where would you find the money; what would the parents of your

boys say?—I think there are ways and means of getting over that. For instance, in the starting of my gymnasium, I got up a school concert by which I got more than sufficient to meet the requirements. There are ways and means of getting it, I think, if people are willing.

5169. That is to say, in some schools they could find the money?—All schools, I think, could do a good deal to help themselves.

5170. We have been told by some witnesses that it would be an impossibility in some schools, and on that point the parents would rebel; it would mean an expenditure of about £3 in the first place?—Well?

5171. Perhaps in your High School you could get a cadet corps attached to the school. Well, now, if so, you would get no military drill for the boys in continuation classes; they would have had sufficient drill in their cadet corps?—Yes.

5172. Could not something be added on; could the drill in the cadet corps not be restricted so that when they left school they might go on to something higher?—That is to say, restrict the drill of the cadet corps while under school age, and then advance to the higher branches, say company work after?—Yes.

5173. That is quite possible?—Of course, to be thoroughly carried out it must be graded, and this last part of it should be the part that would be most attractive.

5174. Then I think you used the expression—or its equivalent—that some objected to the military drill for fear of the boys joining the army?—Yes.

5175. Is that prevalent in Inverness?—I do not think so. I have heard it in discussing the question outside, but I have never heard it from parents.

5176. Upon what is that based, the objection to the

boy joining the army?—It is a general impression, I think, that the intention of this Commission is to make soldiers of them; there is a general impression of that kind.

5177. And do you think that that sentiment has been brought to the front since the remit of this Commission was published?—No, I would not say so.

5178. Is it not connected with the old Scotch feeling about the army—when they spoke of a boy or a man having gone for a soldier they meant the wreck of his whole life?—I think it is the remnant of that.

5179. It is not the fear of militarism?—No, I think it is just the relic of the old opinion that when a man went to the army he went to the bad altogether.

5180. *By Mr Fergusson.*—We have been told by one witness that the Saturday whole holiday for children was a mistake, and that the children are out of a job, and their parents would much sooner be without them, and it was suggested that the children might be brought together in a central place, and that would be a good time for physical training, it would not imply any more work on the ordinary teacher of a school, but would be under special instructors, physical or otherwise; now, what do you say to that—say for two or three hours on Saturdays?—No, I do not think I would advocate that.

5181. You would not?—No.

5182. Why?—Well, in the first place the pupils look upon Saturday as their day, and I think you would have very great difficulty in getting them together.

5183. Then you do not agree that they are out of a job, and that they would be only too happy to do something, that they would sooner go to school than be idle?—No, I do not think so, sir.

The witness withdrew.

Mr WILLIAM BRUCE, M.A., M.D., examined.

5184. *By Professor Ogston.*—You have several qualifications; I think you are an M.A.?—Yes.

5185. And a Doctor of Medicine?—Yes.

5186. And an honorary LL.D.?—I am.

5187. And you have had a very large medical experience?—More than forty years'.

5188. You have had experience as a general practitioner for a long time?—Yes.

5189. For twenty years?—For thirty years.

5190. In various parts of Scotland?—In Aberdeenshire and Ross-shire.

5191. And you are also Medical Officer of Health?—I am for Ross and Cromarty.

5192. A very large district?—Yes.

5193. Embracing large towns and poor country districts?—Not many large towns.

5194. But a good deal of contrast between the best and the worst?—I think I ought to say not so much as usual; that the towns are mostly country towns—Tain and Invergordon; Stornoway first, which is the biggest of all.

5195. You are also a consultant, are you not?—I am.

5196. And of late years you have had a very large experience in consultation?—Well, I have had a certain experience; yes.

5197. And you are also a member of the Medical Council of Great Britain?—I have the honour to be the direct representative of the Scottish practitioners in the Medical Council.

5198. And have held that for many years?—I am now in the fourth quinquennion; that has just begun.

5199. That is sixteen years?—That is sixteen years.

5200. So that not only as a general practitioner have you been familiar with all kinds of medical questions, but you have dealt with questions of general health and other things that do not fall within the province of the ordinary practitioner?—That is so.

5201. Have you been a member of the School

Board?—I had been Chairman for some years of the Dingwall School Board; I am not Chairman at present.

5202. What years were those?—Well, I could not specify, but I should think it is two years since I retired, and some years before, I was Chairman, and before that I was a member.

5203. Have you paid any attention to the question of physical training?—I have paid particular attention to that question.

5204. As a part of general education?—I have.

5205. And have you formed any opinion upon it, regarding the theory of it, that you would like to submit to the Commission; could you guide us to any principle that might be aimed at in applying physical education as a branch?—Of course, as a medical man my first reason for insisting on physical training is the health reason.

5206. That it promotes health?—Yes, I feel that very strongly.

5207. You think that a healthy child should receive not only mental but physical training?—I am entirely with Professor Huxley in that; I think it should stand exactly on the same level.

5208. And when a child has once been rendered healthy by a judicious combination of physical and mental training, there is no point beyond that to which it can be wisely developed?—Oh, well, yes; looking at it as a citizen of the Empire, I think it might very properly be developed into military training.

5209. I suppose that you would consider any excess of mental work tends to disease?—I can say so from my own experience.

5210. And any excess of physical training would also tend to disease?—Oh, yes, I think that goes without saying.

5211. So that in an ideal system of education one should not aim at athleticism?—To put my position—I put it like this, that while you regulate mental training you should also regulate physical training. I think it is necessary that you should have physical training must be regulated.

Mr T. Wallace.
27 May '02.

Leisure time :

with
Saturdays
undesirable.

Mr Wm. Bruce,
M.A., M.D.

Physical
training :
health.

Mental and
physical
training must
be regulated.

Mr Wm. Bruce, M.A., M.D.
27 May '02.
training in the same way; it is advisable to have it under proper control, because I am certain that physical training carried out without proper guidance and without proper advice may end in serious mischief to the human body. That I know.

Moral effect. 5212. It might also impair the balance between the brain and the body, to the deterioration of the brain power?—Yes; and here I might say a word about its moral effect. I think if you have physical training under proper control and management, it is not so apt to run to the excess of idleness and mischief and all sorts of trouble, and hence that is another reason for having it under proper control; that you regulate it.

5213. Is the balance between a sound mental condition and a sound bodily condition more easily disturbed in children than in adults?—Yes, much more easily.

Girls. 5214. Is it more easily disturbed, do you consider, in girls than in boys?—Yes, I should think so, simply because their nervous system is 'higher strung'—to use a common phrase.

5215. And, therefore, an ideal physical training would require to be a matter very well thought out?—Clearly.

5216. And applied judiciously?—Yes, most certainly.

Physical training: should begin in nursery. 5217. Is there any special period of a child's life at which you consider the balance between the mental and bodily health would be more readily disturbed than at others?—I have ventured to say, and I hold to it, that physical training should begin in the nursery; luckily the first thing that happens to a child when it is born, is that it is put in a bath so that it exercises its lungs. The due exercise of the lungs is the most important thing at an early age, and speaking from my own experience, even my own family, when I look back to it, I think that the physical training which would end in improved development of the chest is very frequently neglected, that it must be done in a systematic way, not merely left to chance, but done systematically, having the object that you wish to attain properly in view.

5218. So that dealing with the question of school life, you think that physical training is important to be initiated at once and to continue to the end?—To be initiated at once and to continue to the end.

Morals. 5219. Is the period of adolescence (puberty) a specially tender one?—I think this is one of the most important points of all from the moral point of view. I think it is held by everyone who has considered this question that physical training, the actual tiring as it were of the muscles, is a great bar against many immoral practices. I think everyone allows that the mere training of the muscles, the mere tiring out of the system, has a stimulating effect which reduces the chance of vice greatly.

5220. And that observation you would apply to both sexes?—Well, I would not like to apply it so much to girls, but I certainly apply it to boys, and no doubt in a measure it holds good with girls also.

5221. You do not think that a judicious physical training would adversely affect puberty in boys?—The opposite.

5222. Nor in girls?—Under certain restrictions and precautions.

Physical training and mental development. 5223. Do you consider that physical training endangers subsequent mental development?—No, but I am quite satisfied in my own mind, having thought a good deal on that subject, that you might nourish the brain at the expense of the body. It is no use having good brains and well-developed brains unless you have a muscular system which will enable the man who is trained in that way to lead a healthy life, and if I go a step further, I may say that I have known cases in my own experience of men who have neglected their bodies so as to induce disease, but at the same time no doubt these men, and I have one or two in my eye, were great scholars.

5224. And conversely do you think that a man may endanger his mental ability by devotion to physical exercise?—Not for one moment if, as I began by

saying, all this is done under proper restrictions and precautions. If it is done under rule and kept to that and under wise advice on the part of the teacher or trainer who gives the physical exercise.

5225. But a national system of physical education should not aim at producing athletes?—Oh, certainly not.

5226. Are athletes short-lived?—Pardon me a moment, that a national system of mental training should produce great scholars, I am not quite sure that that is the object; I think it is the opposite. The way that I look at it, as a practical man having to do with children and looking round the world, is, you want to deal with an individual and put him in the best possible condition both mentally and physically.

5227. Athleticism is likely to shorten life, I suppose?—I have known it have a bad effect.

5228. But judicious physical training is not likely to shorten life?—It should lengthen it.

5229. Are there any precautions that your experience suggests as advisable in the case of physical training in boys?—No, I have thought of that. I am not aware that such teachers as I have come into contact with have ever attempted anything beyond what is right. The person employed in Dingwall is a retired sergeant, and I have never seen him encourage the least attempt beyond what was quite within the capabilities of the boys.

5230. You have seen physical training carried out in many diverse districts, or at least know of its being so?—Yes, I have known something of it.

5231. And you do not think that such difficulties as poor playgrounds, rough playgrounds, exercised on with bare feet or anything of that sort, are serious drawbacks to carrying out physical training in all the localities that you know of?—Well, take Dingwall, which I know thoroughly; the playground there is very damp, and very dirty, and I think if anything of the kind is to be done it will lead to what I think will be a great reform, it will lead to the covering in of a large part of the playground. We have no part covered in, and I think it is a great mistake, and I would be very glad to see that forced upon the school authorities, because on other grounds the children must play, that is physical exercise, but on a wet day, their feet all wet, and amongst mud, it is a source, to my knowledge, of great complaint by the parents.

5232. But still those difficulties are not an insuperable bar to the introduction of physical training in all the diverse quarters that you are Medical Officer of Health for?—Oh, no; and I notice throughout the country that they have taken to erect sheds and shelters for the children independent of physical training.

5233. It could be applied in the best school in Dingwall, and in the poorest school in the Hebrides?—Quite so.

5234. Then about girls, could you advise us regarding any precautions that it would be wise to keep in view in carrying out the physical education of girls?—Well, I think myself—and I hope the Commission will not think for a moment that I am arguing for professional reasons in favour of the provision, because it does not affect me personally at any rate—I think clearly that there should be some sort of consulting medical man in connection with every School Board; a man who could be consulted upon different points.

5235. You forgive me, doctor, I will take you upon that point later on?—Then will you ask the question again?

5236. I was asking if from your own individual knowledge there are any precautions that you think the Commission should keep in view provided they were instituting a system of physical training for girls?—Yes, I think there ought to be precautions.

5237. And regarding them, what has your experience led you to conclude is necessary in the way of precautions?—Unfortunately I cannot help the Commission, because I do not know of any great amount of physical training in connection with any of the schools that I am acquainted with where girls are taught; I cannot speak practically.

5238. I might ask your attention to some of the points that have come before us; the question of corsets has been mentioned?—I think the corsets should not be.

5239. And dress in teaching?—I think you must have a special dress.

5240. You think that is absolutely indispensable?—Oh, yes, I think so.

5241. We have been brought into contact with various systems of physical training, some of them involving gymnastics and others mere motions, physical exercise rather than drill or gymnastics; do you think that for all of those a dress would require to be provided for the female children attending all the board schools?—I am sorry to say that I do; I have thought of it, and I do think so.

5242. I wished just to hear your deliberate well-considered opinion. Then in regard to the teaching of girls, do you consider that female teachers are necessary to teach them physical drill?—I do not see any reason why women are necessary; I have not considered that; I think it would be advisable to have women where they could be got.

5243. I might put my question otherwise. A girl from the first year of entering the school to the last year of leaving it, do you think that the whole of her physical training education might be conducted by a man?—Well, I am not quite sure. I would like to say this, that I do not see why the bulk of it—most of it—should not be conducted by a man. I have been a strong advocate for mixing boys and girls, and I do not see why they should be treated differently; but there may be special cases, I would not like to say.

5244. May I take the question of swimming; it has been suggested that that might be a branch of physical education. Do you think that the instruction in swimming could be given to girls by a man?—Up to a certain age, I should think, probably.

5245. You would not advocate the use of women teachers for teaching girls swimming?—Oh, certainly I would advocate it; I thought you were talking of men teachers.

5246. I was talking of both to see what was practicable?—I should think, as a measure of prudence, that at a certain age it should be a woman who should teach, and I do not see why a woman should not teach them all through.

5247. If instruction in swimming were made a part of physical training, you do not consider it absolutely necessary that there should be women teachers?—I think it is highly advisable, something to be aimed at.

5248. Would you recommend dancing?—I do, very strongly.

5249. As a physical training for children?—Yes.

5250. Dancing and kindred motions?—Yes.

5251. For both boys and girls of all ages?—Of all ages; yes.

5252. Is cooking a necessity in your experience and in your district?—Cooking is an excellent thing, but how far the cooking that is being taught is doing any good—if my friend will pardon me—I am not quite sure.

5253. At any rate it is a part of physical training, I suppose?—No, it is not a part of physical training.

5254. And so we may leave the subject there, knowing that in your district you have not found reasons strongly to recommend it?—Oh, well, we have recommended it—but I am not quite sure I am here to say that we have recommended it—and are taking our own part in having cooking lessons; I am not quite sure of the effect, but that might be my ignorance.

5255. Could you tell us whether there are many essentials enter into an ideal physical training; is there anything beyond mere motions and drill and rhythm in it?—Of course, looking at it as an ideal training, it should be a system which is adapted for training every muscle in the body, more especially, as I said a little while ago, the muscles of respiration. Every muscle of the body ought to be brought into action, and, so far as I understand the Swedish system, it aims at that.

5256. The motions of breathing and balancing and respiration are all meant to be trained in an ideal system of physical training?—If it is not interfering with the course of the examination, I should like to say a word about respiration, because I have some ideas about this respiration. Having studied this subject a good deal, I am strongly of opinion that the act of fixing the attention on lessons interferes with the breathing. It is said that stooping and so on and bad desks do so, but I am absolutely sure that the mental attention reacts in a bad way upon the breathing, and if that is so, I do not think that I could use a more potent argument in favour of counteracting that by some physical exercises. I am quite sure that the breathing is an operation which is described as automatic and necessary, like any other operation of the body may be neglected, and the consequence is the chest is not developed, and you have a predisposition to bring on disease, and if the effect of fixing the mental attention steadily is to neglect the breathing, I think you are bound on the other hand to provide the remedy, that is by special training of the respiratory muscles.

5257. My next question, although it appears not to really bear upon that is, have you in your experience seen a good deal of improvement in schools?—Great.

5258. Better light, larger rooms, and better hygiene altogether?—Yes, that is so.

5259. Do you think that that improvement, apart from physical training, is sufficient to account for the improved condition of children in schools where physical training has been available for years?—I am very glad you asked me that question, because, no doubt, while the schools have improved very much, on the other hand the amount of time devoted to lessons has increased greatly—very largely—and I hold and have felt for a long time that with all due respect to spending money, and with regard to the regulations of the Department and so on, especially from the medical officer of health point of view, that the provision for ventilation and air in schools is decidedly insufficient. I hold that the provision, which has certainly been much enlarged and increased, is still greatly below what it ought to be in an ideal schoolroom if you wish to have the children in a perfectly healthy condition.

5260. That would be an argument in favour of physical training and development of breathing and so on?—It is so.

5261. But do you think that the testimony that we have received regarding the benefit that physical training has produced is explicable on the supposition that the physical training has produced no change, but that all the benefit has been from larger classrooms, better air, and better hygiene?—I do not.

5262. You consider that the physical training has been a benefit and independently of anything else?—Independently of that certainly.

5263. Could you tell us what theoretically should be the proper proportion of time devoted to physical training and mental training in a school?—No, I am sorry to say I could not.

5264. You place them on a point of equal eminence in regard to importance?—I do.

5265. But you have no guidance for us in regard to the relative time?—I ought to explain; while I do think so, it does not follow that it is necessary to devote the same amount of time to each.

5266. Quite so; that I quite understand. Do you think half an hour a week is sufficient for physical training for a child?—I think it would be ridiculously small. Perhaps I might explain, as, having to do with schools, as Chairman, I know the difficulty of fitting in everything, and, hence, while I am advocating very strongly physical training, I would not advocate anything which would seriously interfere with the ordinary school work. I can say that I have tried my hand with very poor results on school timetables, I leave that entirely—one must leave that—to the masters and to the department.

5267. There are one or two other points that, from your large experience, I should like to bring out your

Ambulance
work.

opinion upon. We have heard of many other things that are not, one would judge, a necessary part of physical training, such as ambulance work; do you consider that ambulance is a form of physical training?—I do.

5268. And you would recommend that—perhaps not to every child at all years, but children as a rule—some form of ambulance instruction should be given?—I would, most certainly.

5269. Could you give any reason for that opinion?—Well, I look upon it as a good means of physical training, and I look upon it as an interesting thing, and also I consider that, like the other training, it is a training which will be carried out later in life to a larger extent.

5270. Would it be of distinct benefit as saving of life and suffering occasionally, do you think?—I am not quite sure about that.

5271. In the case of children, you could not be quite sure about that being a serious matter?—No.

Saturdays:
whole holiday
undesirable.

5272. The next point I want to draw your attention to is the Saturday holiday; do you think that is a necessity?—Well, I am old enough to have been attending school when there was no Saturday holiday, and I am very strongly of opinion that the whole day on Saturday devoted to play for the poorer children is a great mistake. Now I can speak from large experience about that, because if you go amongst the poor people you will find that on a wet day, with the children at home, they do not know what to do with them; they would be thankful if they were at school on a Saturday or doing something; they cannot amuse them, cannot regulate them, cannot manage them, and they are simply in the way, and just giving them a long whole day on Saturday with nothing earthly to do or to amuse themselves—I do not believe in it.

Manners.

5273. You have told us that physical training, properly applied, has a beneficial influence on morals and development; do you think it has a beneficial influence upon manners?—Most certainly.

Medical
inspection:
what it should
include.

5274. Now we come to the question of the medical inspection. I have a number of points that I would like to put before you regarding that. I gather that you think medical inspection is needed?—I do.

5275. It is needed for the scholars?—Yes.

5276. Is it required for the teachers?—Oh, yes, certainly; but of course a teacher is a grown-up man, he is independent.

5277. And for buildings?—And for buildings; yes.

5278. And equipment?—Yes.

5279. And there are various special points such as eyesight?—Yes.

5280. You think it is required for that?—Oh, very much; and teeth.

5281. And ears?—Especially teeth.

5282. Anything regarding ears—ear disease?—Oh, yes, in cases of discharge from the ear, it would be of very great importance that they should be seen and recognised, because they lead, as we know, to great mischief, and also, of course, with relation to the throat, which may lead to the discovery of scarlatina or diphtheria, or some of those things.

5283. Those points neglected sometimes lead to death?—No doubt; in the case of diphtheria I hold that it leads very, very largely to the spread of the disease.

5284. And in the case of ears sometimes to sudden death from brain disease?—It is so.

5285. Well, now to go back a little again, would you examine the scholars for anything else besides those things, would you subject them to a physical examination as to the chest, spine, knock-knees, flat feet, by stripping them and examining them?—Yes, I think there ought to be a schedule of all those points, which should be filled up, and if I might go back a little, the doctor might give a warning to the drill instructor as to not forcing a child to more than he is able, just as we have to give certificates against playing football and so on.

5286. We had a witness before us from your district, and when that question was put to him his opinion was

that that could be dispensed with; that the average intelligent teacher interested in his profession could draw the doctor's attention to any medical defect without the necessity for such a careful examination; pray tell us your opinion?—Well, the answer to that is in the simplest possible form, that to my knowledge there is no end of these defects that have been spoken of that have not been recognised or taken any notice of. I do not think there is any attempt, for instance, to make out whether a child is short-sighted or not; I never heard of any teacher making any attempt of that kind. I may have heard it once but not more, but it is of the first importance.

5287. And all this is to the permanent detriment of the child?—And take another case of a deaf child, it might be said an ordinary teacher ought to know whether a child is suffering from ear disease; but does he? I say he does not.

5288. And now regarding the teachers themselves, do you think that the teachers that you know are all fit to teach physical education to children?—Oh, no.

5289. Some are old; too old, are they not?—Well, I do not know how old a man may be that may not learn, because if I may diverge for a moment, we had students who were grandfathers and grandmothers studying Nature Knowledge in Dingwall, the other day, and learned it too, so far as to be able to teach it. I think a man might probably, however old he was, if he had enthusiasm; that is what is wanted.

5290. On looking through your wide and varied district, do you think that you know of any system of physical education which all these teachers could adequately teach in their schools?—I see no difficulty.

5291. You think that there is a system of physical education that could be taught by every one, however old, however fat, for example?—I think he could teach all that if he did not aim too high in country schools; he must not do so, of course.

5292. The system, of course, must be adapted to the locality?—Of course in Dingwall we have a retired army sergeant.

5293. Do you think anything regarding the musical faculty could be inspected by a medical officer?—I doubt it.

5294. What diseases prevail in children in your district which impede their utility as citizens?—Well, I should think that a general want of muscular development and the proper use of their muscles is almost common to the most of the children, and I hold that that does impede their usefulness; apart from a military purposes altogether, I think it does impede their usefulness.

5295. Does that statement refer both to the rural and to the urban districts?—Yes, it does.

5296. Have you much flat feet and orthopaedic deformity?—Yes, a good deal.

5297. All of which would be greatly benefited by a thorough medical examination?—Yes, it would.

5298. Then as regards the medical officer, would you make him a special medical officer of the School Board without any other duties?—We are in a state of flux about that, and I should think that if it were possible it would be well to make a combination of a whole county, and possibly to pay one man to do it. Of course if you specialised the work you would get it much better done, but I think in most of the instances you would have to trust to the local man.

5299. The expense, of course, would be very great, almost prohibitive, if every School Board had to appoint a medical officer who had no other duties?—It would be impossible as School Boards are constituted; it might not be impossible with a County Board.

5300. It could not be worked out generally, suppose they had no other duties?—Oh, no.

5301. Then what duties do you think would be most naturally combined with those of a School Board medical officer?—There is one duty which practically, I think, might very well be combined with those duties I have spoken of, and that is the duty of giving certificates for absence. That is a difficulty, as Chair-

man of the Board, that we had to face. In the case of a scholar absenting himself, we made it a rule that he should have a medical certificate, but they said: 'We are not able to pay for a certificate,' and we were in a hole.

5302. Do you think that a medical officer of health's duties could be well conjoined with those of a School Board medical officer?—You mean the medical officer, say in Dingwall?

5303. You are a medical officer yourself; say, doctor, would it be possible for you or one situated in a similar district to yourself?—Well, I should say this, I think—but it is on the spur of the moment—that if we were dealing not with separate School Boards but with a large County Board, the medical officer of health, if he had nothing else to do, no other duties except health duties, in our county, he could very well, if he had to deal with one board, then he might do it by periodically visiting or in some other way.

5304. Of course you would require a medical man of very high qualifications for such a post?—Oh, clearly I see that difficulty.

5305. And he would require a very high salary?—Yes, but it might very well be that it would be part of his duties as medical officer of health for the county.

5306. That brings out what I wanted your opinion upon. You consider that the expense of instituting medical officers to School Boards would be prohibitive unless their duties were conjoining with something else?—Yes; but I think at the same time, as long as local School Boards last that it would be good policy on the part of the Department, or the Board, to have a man to whom they could apply, who probably would not have to go through the thing in the minute way that we were talking of, but to whom the school-masters might apply in cases of difficulty.

5307. Could that be conjoined with the duties of parochial medical officers?—I think it might very well be combined.

5308. You think that the parochial medical officers, of whom you have knowledge, would be fit to undertake the duties of School Board medical officer?—Yes, but with the restrictions that I have said. I think if it is to be had in the ideal way that it would require a very highly specialised man, and you could not expect the parochial medical officer to be a specialist.

5309. I see you would both have them and a consultant?—No. I think if you had one man, probably you would not need the second man. But I do not know when you may get a specialist, and therefore I would recommend, in the meantime, that you take the other man; but he does not go so deep into the subject, as it were.

5310. I do not quite understand you. Suppose you had to put this in force to-morrow, you would appoint your parochial medical officers, and then you would appoint a specialist, say in main districts, who would advise in cases of difficulty?—No, I would not appoint a specialist, unless we come to a state of things where there is a county School Board.

5311. To sum it all up, I understand that you consider that physical training cannot be introduced as a compulsory branch of education without some form of medical inspection?—Well, I think it would be advisable, at any rate.

5312. Now with regard to abnormal children, do you think there is a large proportion of weaklings amongst school children?—Yes, a good large proportion.

5313. Would you place it as high as five per cent. to ten per cent., as we have heard?—Yes, I think it is not unlikely. I am sorry I have not the figures.

5314. And then you have actual deformity, such as curved-spine or rickets?—Not as high as that, of course.

5315. Is there a large proportion of them—a sensible proportion of them?—Well, a sensible proportion.

5316. Requiring medical inspection?—Yes.

5317. And cripples—actual cripples?—Yes, it is so.

5318. Have you any incurables; have you ever had

to deal with the question of educating incurables?—No.

5319. Neither their mental training nor physical training has come before you in your School Board experience?—No; they are simply excused; they are struck off the roll.

5320. They get no education?—They get no education.

5321. Except what may be given to them voluntarily?—No. There has been no attempt in our quarter to do it.

5322. Tubercular children, children with tubercular glands, are not quite so prevalent in Scotland?—I do not think they are so prevalent in Ross-shire as in Aberdeenshire. I do not know why.

5323. But you think that another reason why the medical officer might be of value—that he might discover the early existence of these constitutional diseases?—Yes, very important.

5324. Then regarding games, do you consider games a form of physical training?—I do.

5325. And that they might advantageously be substituted for it everywhere, or in certain districts?—No, not from my point of view, because, in the first place, it is a purely voluntary thing, and in the second place, from paying some attention to that, I am inclined to think that probably the children who most need exercises or games are precisely the children who do not take them.
